Testing an SSL Database Connection	242
Box.com Activities	242
Overview of Box.com connector	243
Creating or editing an endpoint for Box.com activity	244
Selecting or editing a Box.com endpoint	245
Create Folders activity	246
Adding the Create Folders activity in the orchestration	246
Creating, selecting, or editing a Box.com endpoint	247
Configuring the activity	248
Mapping the inputs of the activity	248
Mapping the outputs of the activity	249
Note about deploying a Box.com orchestration	249

Update Folders activity	249
Adding the Update Folders activity in the orchestration	250
Creating, selecting, or editing a Box.com endpoint	250
Configuring the activity:	251
Mapping the inputs of the activity	251
Mapping the outputs of the activity	253
Note about deploying a Box.com orchestration	253
Delete Folders activity	253
Adding the Delete Folders activity in the orchestration	254
Creating, selecting, or editing a Box.com endpoint	254
Configuring the activity	255
Mapping the inputs of the activity	255
Mapping the outputs of the activity	256
Note about deploying a Box.com orchestration	256
Get Folder Details activity	257
Adding the Get Folder Details activity in the orchestration	257
Creating, selecting, or editing a Box.com endpoint	258
Configuring the activity	258
Mapping the inputs of the activity	259
Mapping the outputs of the activity	260
Note about deploying a Box.com orchestration	260
Copy Folders activity	260
Adding the Copy Folders activity in the orchestration	261
Creating, selecting, or editing a Box.com endpoint	261
Configuring the activity	262
Mapping the inputs of the activity	262
Mapping the outputs of the activity	263
Note about deploying a Box.com orchestration	263
Create Folder Shared Link activity	264
Adding the Create Folder Shared Link activity in the orchestration	264
Creating, selecting, or editing a Box.com endpoint	265
Configuring the activity	265
Mapping the inputs of the activity	266
Mapping the outputs of the activity	267
Note about deploying a Box.com orchestration	267
Upload File activity	267
Adding the Upload Files activity in the orchestration	268
Creating, selecting, or editing a Box.com endpoint	268
Configuring the activity	269
Mapping the inputs of the activity	269
Mapping the outputs of the activity	270
Note about deploying a Box.com orchestration	271
Download Files activity	271
Adding the Download Files activity in the orchestration	272
Creating, selecting, or editing a Box.com endpoint	272
Configuring the activity	273
Mapping the inputs of the activity	273
Mapping the outputs of the activity	274

Note about deploying a Box.com orchestration	274
Update Files activity	274
Adding the Update Files activity in the orchestration	275
Creating, selecting, or editing a Box.com endpoint	275
Configuring the activity	276
Mapping the inputs of the activity	276
Mapping the outputs of the activity	277
Note about deploying a Box.com orchestration	278
Delete Files activity	278
Adding the Delete Files activity in the orchestration	279
Creating, selecting, or editing a Box.com endpoint	279
Configuring the activity	280
Mapping the inputs of the activity	280
Mapping the outputs of the activity	281
Note about deploying a Box.com orchestration	281
Get File Details activity	281
Adding the Get File Details activity in the orchestration	282
Creating, selecting, or editing a Box.com endpoint	282
Configuring the activity	283
Mapping the inputs of the activity	283
Mapping the outputs of the activity	284
Note about deploying a Box.com orchestration	284
Copy Files activity	285
Adding the Copy Files activity in the orchestration	285
Creating, selecting, or editing a Box.com endpoint	286
Configuring the activity	286
Mapping the inputs of the activity	287
Mapping the outputs of the activity	287
Note about deploying a Box.com orchestration	288
Create File Shared Link activity	288
Adding the Create File Shared Link activity in the orchestration	288
Creating, selecting, or editing a Box.com endpoint	289
Configuring the activity	290
Mapping the inputs of the activity	290
Mapping the outputs of the activity	291
Note about deploying a Box.com orchestration	291
Search Files activity	291
Adding the Search Files activity in the orchestration	292
Creating, selecting, or editing a Box.com endpoint	292
Configuring the activity	293
Mapping the inputs of the activity	293
Mapping the outputs of the activity	294
Note about deploying a Box.com orchestration	295
Create Users activity	295
Adding the Create Users activity in the orchestration	296
Creating, selecting, or editing a Box.com endpoint	296
Configuring the activity	297
Mapping the inputs of the activity	297

Mapping the outputs of the activity	298
Note about deploying a Box.com orchestration	299
Update Users activity	299
Adding the Update Users activity in the orchestration	299
Creating, selecting, or editing a Box.com endpoint	300
Configuring the activity	301
Mapping the inputs of the activity	301
Mapping the outputs of the activity	302
Note about deploying a Box.com orchestration	303
Delete Users activity	303
Adding the Delete Users activity in the orchestration	303
Creating, selecting, or editing a Box.com endpoint	304
Configuring the activity	304
Mapping the inputs of the activity	305
Mapping the outputs of the activity	305
Note about deploying a Box.com orchestration	306
Get User Details activity	306
Adding the Get User Details activity in the orchestration	307
Creating, selecting, or editing a Box.com endpoint	307
Configuring the activity	308
Mapping the inputs of the activity	308
Mapping the outputs of the activity	309
Note about deploying a Box.com orchestration	309
Create Groups activity	310
Adding the Create Groups activity in the orchestration	310
Creating, selecting, or editing a Box.com endpoint	311
Configuring the activity	311
Mapping the inputs of the activity	312
Mapping the outputs of the activity	312
Note about deploying a Box.com orchestration	313
Update Groups activity	313
Adding the Update Groups activity in the orchestration	313
Creating, selecting, or editing a Box.com endpoint	314
Configuring the activity	314
Mapping the inputs of the activity	315
Mapping the outputs of the activity	315
Note about deploying a Box.com orchestration	316
Delete Groups activity	316
Adding the Delete Groups activity in the orchestration	317
Creating, selecting, or editing a Box.com endpoint	317
Configuring the activity	318
Mapping the inputs of the activity	318
Mapping the outputs of the activity	319
Note about deploying a Box.com orchestration	319
Get Group Details activity	319
Adding the Get Group Details activity in the orchestration	320
Creating, selecting, or editing a Box.com endpoint	320
Configuring the activity	321

Mapping the inputs of the activity	321
Mapping the outputs of the activity	322
Note about deploying a Box.com orchestration	323
Add Users to Groups activity	323
Adding the Add Users to Groups activity in the orchestration	323
Creating, selecting, or editing a Box.com endpoint	324
Configuring the activity	325
Mapping the inputs of the activity	325
Mapping the outputs of the activity	326
Note about deploying a Box.com orchestration	326
Delete Users from Groups activity	326
Adding the Delete Users from Groups activity in the orchestration	327
Creating, selecting, or editing a Box.com endpoint	327
Configuring the activity	328
Mapping the inputs of the activity	328
Mapping the outputs of the activity	329
Note about deploying a Box.com orchestration	329
Create Folder Permissions activity	330
Adding the Create Folder Permissions activity in the orchestration	330
Creating, selecting, or editing a Box.com endpoint	331
Configuring the activity	331
Mapping the inputs of the activity	331
Mapping the outputs of the activity	333
Note about deploying a Box.com orchestration	333
Delete Folder Permissions activity	333
Adding the Delete Folder Permissions in the orchestration	334
Creating, selecting, or editing a Box.com endpoint	334
Configuring the activity	335
Mapping the inputs of the activity	335
Mapping the outputs of the activity	336
Note about deploying a Box.com orchestration	336
Create Documents for HTML View activity	336
Adding the Create Documents for HTML View activity in the orchestration	337
Creating, selecting, or editing a Box.com endpoint	337
Configuring the activity	338
Mapping the inputs of the activity	338
Mapping the outputs of the activity	339
Note about deploying a Box.com orchestration	340
Update HTML View Documents activity	340
Adding the Update HTML View Documents activity in the orchestration	341
Creating, selecting, or editing a Box.com endpoint	341
Configuring the activity	342
Mapping the inputs of the activity	342
Mapping the outputs of the activity	343
Note about deploying a Box.com orchestration	343
Get Document as Extension activity	343
Adding the Get Document as Extension activity in the orchestration	344
Creating, selecting, or editing a Box.com endpoint	344

Configuring the activity	345
Mapping the inputs of the activity	345
Mapping the outputs of the activity	346
Note about deploying a Box.com orchestration	346
Get HTML View Documents activity	347
Adding the Get HTML View Documents activity in the orchestration	347
Creating, selecting, or editing a Box.com endpoint	348
Configuring the activity	348
Mapping the inputs of the activity	349
Mapping the outputs of the activity	350
Note about deploying a Box.com orchestration	350
View Document as HTML activity	350
Adding the View Document as HTML activity in the orchestration	351
Creating, selecting, or editing a Box.com endpoint	351
Configuring the activity	352
Mapping the inputs of the activity	352
Mapping the outputs of the activity	353
Note about deploying a Box.com orchestration	353
View Box.com File as HTML activity	354
Adding the View Box.com File as HTML as HTML activity in the orchestration	354
Creating, selecting, or editing a Box.com endpoint	355
Configuring the activity	355
Mapping the inputs of the activity	356
Mapping the outputs of the activity	357
Note about deploying a Box.com orchestration	357
Coupa Activities	357
Creating or editing an endpoint for Coupa activity	358
Custom Fields support	359
Objects Supported by the Coupa Connector	359
Using the Coupa Create activity	360
Using the Coupa Query activity	362
Using the Coupa Retrieve activity	363
Using the Coupa Update activity	365
Domino Activities	366
Overview of the Domino connector	367
Creating or editing an endpoint for a Domino activity	369
Creating a Domino document	370
Updating a Domino document	373
Retrieving a Domino document	377
Querying Domino documents	379
Querying views for Domino documents	384
Deleting a Domino document	386
Getting events from Domino server	389
Getting invitations from Domino server	390
Getting notices from Domino server	391
Processing calendar events in Domino server	392
Processing calendar notices in Domino server	394
Creating calendar events in Domino server	395

Updating calendar events in Domino server	396
Deleting calendar events from Domino server	397
Specifying Retry and Delivery Options for Domino activities	398
Prerequisites to use Domino inbound activities	400
Get Created Documents activity	401
Get Updated Documents activity	403
Get Deleted Documents activity	404
Handling Date/Time and Time zone data types	406
Rich text support for Domino connector	407
Troubleshooting and support	408
Dropbox Activities	408
Creating or editing an endpoint for Dropbox Activity.	409
Selecting or editing a Dropbox endpoint	409
Activity: Download File	410
Add the Download File Activity in the orchestration	410
Creating, selecting, or editing a Dropbox endpoint	411
Mapping the inputs of the Activity	411
Click on Map Input link in Configure Activity section displayed below the orchestration.	412
Mapping the outputs of the Activity	412
Note about Deploying a Dropbox Orchestration	413
Activity: Upload File	413
Add the Upload File Activity in the orchestration	414
Creating, selecting, or editing a Dropbox endpoint	414
Mapping the inputs of the Activity	415
Click on Map Input link in Configure Activity section displayed below the orchestration.	415
Mapping the outputs of the Activity	417
Note about Deploying a Dropbox Orchestration	419
Activity: Commit a Chunked Upload	419
Add the Commit a Chunked Upload Activity in the orchestration:	420
Creating, selecting, or editing a Dropbox endpoint	420
Mapping the inputs of the Activity	421
Click on Map Input link in Configure Activity section displayed below the orchestration.	421
Mapping the outputs of the Activity	423
Activity: Get File Details	423
Add the Get File Details Activity in the orchestration:	423
Creating, selecting, or editing a Dropbox endpoint	424
Mapping the inputs of the Activity	424
Click on Map Input link in Configure Activity section displayed below the orchestration.	425
Mapping the outputs of the Activity	426
Note about Deploying a Dropbox Orchestration	428
Activity: Get File Copy reference	428
Add the Get File Copy reference Activity in the orchestration	429
Creating, selecting, or editing a Dropbox endpoint	429
Mapping the inputs of the Activity	430
Click on Map Input link in Configure Activity section displayed below the orchestration.	430
Mapping the outputs of the Activity	431
Note about Deploying a Dropbox Orchestration	431
Activity: Copy File	431

Add the Copy File Activity in the orchestration:	432
Creating, selecting, or editing a Dropbox endpoint	432
Mapping the inputs of the Activity	433
Click on Map Input link in Configure Activity section displayed below the orchestration.	433
Mapping the outputs of the Activity	434
Note about Deploying a Dropbox Orchestration	435
Activity: Delete File	435
Add the Delet File Activity in the orchestration:	435
Creating, selecting, or editing a Dropbox endpoint	436
Mapping the inputs of the Activity	436
Click on Map Input link in Configure Activity section displayed below the orchestration.	437
Mapping the outputs of the Activity	437
Note about Deploying a Dropbox Orchestration	438
Activity: Move File	439
Add the Move File Activity in the orchestration:	439
Creating, selecting, or editing a Dropbox endpoint	439
Mapping the inputs of the Activity	440
Click on Map Input link in Configure Activity section displayed below the orchestration.	440
Mapping the outputs of the Activity	441
Note about Deploying a Dropbox Orchestration	443
Activity: Search Files	443
Add the Search Files Activity in the orchestration:	443
Creating, selecting, or editing a Dropbox endpoint	444
Mapping the inputs of the Activity	444
Click on Map Input link in Configure Activity section displayed below the orchestration.	445
Mapping the outputs of the Activity	445
Note about Deploying a Dropbox Orchestration	446
Activity: Get Shared Link	447
Add the Get Shared Link Activity in the orchestration:	447
Creating, selecting, or editing a Dropbox endpoint	448
Mapping the inputs of the Activity	448
Click on Map Input link in Configure Activity section displayed below the orchestration.	448
Mapping the outputs of the Activity	449
Note about Deploying a Dropbox Orchestration	450
Activity: Copy Folder	450
Add the Copy Folder Activity in the orchestration:	451
Creating, selecting, or editing a Dropbox endpoint	451
Mapping the inputs of the Activity	452
Click on Map Input link in Configure Activity section displayed below the orchestration.	452
Mapping the outputs of the Activity	453
Note about Deploying a Dropbox Orchestration	454
Activity: Create Folder	454
Add the Create Folder Activity in the orchestration:	454
Creating, selecting, or editing a Dropbox endpoint	455
Mapping the inputs of the Activity	455
Click on Map Input link in Configure Activity section displayed below the orchestration.	456
Mapping the outputs of the Activity	456
Note about Deploying a Dropbox Orchestration	457

Activity: Delete Folder	457
Add the Delet Folder Activity in the orchestration:	458
Creating, selecting, or editing a Dropbox endpoint	458
Mapping the inputs of the Activity	459
Click on Map Input link in Configure Activity section displayed below the orchestration.	459
Mapping the outputs of the Activity	460
Note about Deploying a Dropbox Orchestration	461
Activity: Move Folder	461
Add the Move Folder Activity in the orchestration:	461
Creating, selecting, or editing a Dropbox endpoint	462
Mapping the inputs of the Activity	462
Click on Map Input link in Configure Activity section displayed below the orchestration.	463
Mapping the outputs of the Activity	463
Note about Deploying a Dropbox Orchestration	465
Activity: Get Folder Details	465
Add the Get Folder Details Activity in the orchestration	466
Creating, selecting, or editing a Dropbox endpoint	466
Mapping the inputs of the Activity	467
Click on Map Input link in Configure Activity section displayed below the orchestration.	467
Mapping the outputs of the Activity	469
Note about Deploying a Dropbox Orchestration	470
Activity: Get User Details	471
Add the Get User Details Activity in the orchestration:	471
Creating, selecting, or editing a Dropbox endpoint	472
Mapping the inputs of the Activity	472
Click on Map Input link in Configure Activity section displayed below the orchestration.	472
Mapping the outputs of the Activity	473
Note about Deploying a Dropbox Orchestration	474
Activity: Preview File	475
Add the Preview File Activity in the orchestration	475
Creating, selecting, or editing a Dropbox endpoint	475
Mapping the inputs of the Activity	476
Click on Map Input link in Configure Activity section displayed below the orchestration.	476
Mapping the outputs of the Activity	477
Note about Deploying a Dropbox Orchestration	477
Activity: Restore File Revision	478
Add the Restore File Revision Activity in the orchestration:	478
Creating, selecting, or editing a Dropbox endpoint	478
Mapping the inputs of the Activity	479
Click on Map Input link in Configure Activity section displayed below the orchestration.	479
Mapping the outputs of the Activity	480
Note about Deploying a Dropbox Orchestration	482
Eloqua Bulk API Activities	482
Creating or editing an endpoint for Eloqua Bulk API activity	482
Using the Eloqua Bulk API Create Import Definition activity	483
Using the Eloqua Bulk API Create Export Definition activity	485
Using the Eloqua Bulk API Get Import Definition activity	487
Using the Eloqua Bulk API Push Data for Import activity	488

Using the Eloqua Bulk API Synchronize Data activity	490
Using the Eloqua Bulk API Get Synchronization Status Details activity	491
Using the Eloqua Bulk API Get Export Definition activity	493
Using the Eloqua Bulk API Get Data for Export Definition activity	494
Using the Eloqua Bulk API Update Import Definition activity	496
Using the Eloqua Bulk API Update Export Definition activity	497
Using the Eloqua Bulk API Delete Import Definition activity	499
Using the Eloqua Bulk API Delete Export Definition activity	500
Eloqua ReST API Activities	501
Creating or editing an endpoint for Eloqua Rest API activity	502
Custom Objects/ Custom Fields Support	503
Input XML	503
Objects Supported by the Eloqua Rest API Connector	504
Using the Eloqua Rest API Create activity	505
Using the Eloqua Rest API Delete activity	506
Using the Eloqua Rest API Retrieve activity	507
Using the Eloqua Rest API Update activity	508
Email Activities	509
Creating or editing an email endpoint	510
Get Email activity	513
Send Email activity	517
Testing an SSL email connection	521
Force.com Bulk API Activities	522
Preparing Data for the Force.com Bulk API connector	523
Creating a Force.com Bulk API endpoint	523
Specifying the Retry options for Force.com Bulk API activities	524
Using the Force.com Bulk API Batch Insert activity	525
Using the Force.com Bulk API Batch Update activity	527
Using the Force.com Bulk API Batch Upsert activity	528
Using the Force.com Bulk API Batch Delete activity	529
Using the Force.com Bulk API Get Batch Status activity	530
Using the Force.com Bulk API Get Batch Results activity	531
FTP Activities	532
Creating or Editing an FTP endpoint	533
Configuring the FTP endpoint for the Parse Directory Listing Example	536
FTP Poll Directory activity	538
FTP Put File activity	545
FTP Get File activity	551
Parse directory listing example	557
Testing an FTPS server connection	559
HTTP Activities	560
Creating or editing an HTTP endpoint	561
HTTP Receive Request activity	567
Decompression with the HTTP Receive Request activity	571
HTTP Send Response activity	573
Compression/Decompression with the HTTP Send Response activity	577
HTTP Post Request activity	579
HTTP Get Request activity	586

HTTP Head Request activity	592
HTTP Invoke Request activity	599
HTTP Put Request activity	606
HTTP Delete Request activity	612
Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity	619
Troubleshooting and support	623
Infosphere MDM Activities	625
Overview of InfoSphere MDM and Cast Iron Connector	625
Creating or editing an endpoint for MDM Connector activity	626
Updating modified MDM model or WSDL	628
Starting an MDM service activity	628
Adding an activity	629
Creating an endpoint	629
Configuring the activity	630
Specifying retry options	630
Mapping activity input	631
Mapping activity output	632
Troubleshooting and support	632
Insightly Activities	633
Overview of Insightly connector	634
Creating or editing an endpoint for Insightly Activity	634
Insightly Creat Objects Activity	636
Insightly Update Objects Activity	637
Insightly Retrieve Objects Activity	638
Insightly Delete Objects Activity	639
Specifying Retry Options for Insightly REST API Activities	640
JDE Activities	641
Overview of the JD Edwards (JDE) connector	642
Creating or editing an endpoint for a JDE activity	643
Importing JDE Libraries	644
Installing JAR files to connect to the JDE server	645
Using the JDE Invoke Business Function activity	646
Using the JDE Poll Real-Time Events activity	647
Specifying Retry and Delivery Options for JDE Activities	649
JIRA Activities	650
Overview of JIRA connector	651
Creating or editing an endpoint for JIRA Activity	652
JIRA Creat Objects Activity	654
JIRA Update Objects Activity	655
JIRA Retrieve All Objects Activity	656
JIRA Delete Objects Activity	657
JIRA Retrieve Objects Activity	658
JIRA Search Objects Activity	660
Specifying Retry Options for JIRA REST API Activities	662
JMS Activities	663
Creating or editing a JMS endpoint	664
Specifying delivery rules and retry parameters for JMS activities	665
Specifying delivery rules parameters for JMS activities	666

Specifying retry parameters for JMS activities	667
Get Message activity	668
Adding a JMS activity to an orchestration	668
Changing the Activity Name	669
Picking a JMS endpoint	669
Configuring the Get Message activity	670
Mapping the Inputs	670
Mapping the Outputs	671
Poll Message activity	672
Adding a JMS activity to an orchestration	673
Changing the Activity Name	673
Picking a JMS endpoint	674
Configuring the Poll Message activity	674
Mapping the Outputs	675
Publish Message activity	676
Adding a JMS activity to an orchestration	676
Changing the Activity Name	677
Picking a JMS endpoint	677
Configuring the Publish Message activity	677
Mapping the Inputs	678
Send Message activity	679
Adding a JMS activity to an orchestration	680
Changing the Activity Name	680
Picking a JMS endpoint	680
Configuring the Send Message activity	681
Mapping the Inputs	681
Subscribe Message activity	682
Adding a JMS activity to an orchestration	683
Changing the Activity Name	683
Picking a JMS endpoint	684
Configuring the Subscribe Message activity	684
Mapping the Outputs	685
Creating a JMS endpoint to a WebLogic server	686
LDAP Connector Activities	687
Overview of the Lightweight Directory Access Protocol (LDAP) connector	688
Creating LDAP Entry	689
Delete LDAP Entry	692
Retrieve LDAP Entry	693
Retrieve LDAP Entry	695
MS Dynamics AX Activities	697
Services Provided	698
Authentication supported	699
Creation and Deployment of new port on IIS	699
Creating a MS Dynamics AX Endpoint in Cast Iron	700
Using the MS Dynamics AX Invoke service Activity	701
Connector Operations	701
Services	703
Advance shipping notice	703

Operations and their Mandatory fields	704
Fixed Asset	704
Operations and their Mandatory fields	705

MS Office 365 Activities	752
Creating or editing an endpoint for MS Office 365 activity	753
Using the MS Office 365 Send Mails activity	754
Using the MS Office 365 Get Mails activity	755
Using the MS Office 365 Delete Mails activityUse the Delete Mails activity to delete a mail in MS Office 365. Deleted Contents might not be recoverable.	757
Using the MS Office 365 Move Mails activityUse the Move Mails activity to move a mail to another folder or copy a mail to another folder in MS Office 365.	758
Using the MS Office 365 Respond Mail activity	759
Using the MS Office 365 Update Mails activityUse the Update Mails activity to change writable properties on a draft or existing message in MS Office 365. Only the properties that you specify are changed.	760
Using the MS Office 365 Create Draft Mails activity	761
Using the MS Office 365 Get Folders activity	763
Using the MS Office 365 Create Folders activity	764
Using the MS Office 365 Update Folders activity	765
Using the MS Office 365 Delete Folders activity	766
Using the MS Office 365 Move Folders activity	768

Using the MS Office 365 Create Contacts activity	769
Using the MS Office 365 Update Contacts activity	770
Using the MS Office 365 Get Contacts activity	771
Using the MS Office 365 Delete Contacts activity	772
Using the MS Office 365 Get Contact Folders activity	773
Using the MS Office 365 Create Calendars activity	775
Using the MS Office 365 Update Calendars activity	776
Using the MS Office 365 Get Calendars activity	777
Using the MS Office 365 Delete Calendars activity	778
Using the MS Office 365 Create Calendar Groups activity	780
Using the MS Office 365 Update Calendar Groups activity	781
Using the MS Office 365 Get Calendar Groups activity	782
Using the MS Office 365 Delete Calendar Groups activity	783
Using the MS Office 365 Create Events activity	784
Using the MS Office 365 Update Events activity	786
Using the MS Office 365 Get Events activity	788
Using the MS Office 365 Delete Events activity	789
MS Office One Drive Activities	790
Creating or editing an endpoint for MS Office 365 OneDrive activity	791
Using the MS Office 365 OneDrive Create Folders Activity	792
Using the MS Office 365 OneDrive Upload Files Activity	793
Using the MS Office 365 OneDrive List Folder Contents Activity	794
Using the MS Office 365 OneDrive Download Files Activity	795
Using the MS Office 365 One Drive Get Properties Activity	797
Using the MS Office 365 One Drive Update Properties Activity	798
Using the MS Office 365 One Drive Copy Files or Folders Activity	799
Using the MS Office 365 One Drive Delete Files or Folders Activity	800
MS SharePoint Activities	802
MS SharePoint Connector Overview	802
Creating or editing an endpoint for MS SharePoint activity	803
MS SharePoint Upload File Activity	805
MS SharePoint Update File Activity	806
MS SharePoint Delete File Activity	807
MS SharePoint Download File Activity	808
MS SharePoint Create Folder Activity	809
MS SharePoint Update Folder Activity	810
MS SharePoint Delete Folder Activity	811
MS SharePoint Retrieve Folder Activity	812
MS SharePoint Retrieve User Activity	813
Specifying the Retry options for MS SharePoint REST API activities	814
MS Dynamics CRM Activities	815
Creating and editing the MSDynamics CRM endpoint	816
Using the MSDynamics CRM Create activity	818
Using the MSDynamics CRM Update activity	819
Using the MSDynamics CRM Delete activity	820
Using the MSDynamics CRM Retrieve activity	821
Specifying retry parameters for MSDynamics CRM activities	822
MQ Activities	823

Creating or editing a MQ Activity endpoint	824
Installing JAR files to connect to the MQ system	826
Defining and loading an XML schema for a MQRFH2 header	826
MQ Get Message activity	827
MQ Put Message activity	832
MQ Poll Queue activity	835
MQRFH2 XML data and schema examples	837
NetSuite Activities	841
Creating or editing a NetSuite endpoint	842
Add Records activity	843
Using the Add Records activity	844
Mapping the inputs for the Add Records activity	845
Mapping the outputs for the Add Records activity	846
Attach Records activity	846
Using the Attach Records activity	847
Mapping the inputs for the Attach Records activity	848
Mapping the outputs for the Attach Records activity	849
Delete Records activity	849
Using the Delete Records activity	850
Mapping the inputs for the Delete Records activity	851
Mapping the outputs for the Delete Records activity	851
Detach Records activity	852
Using the Detach Records activity	853
Mapping the inputs for the Detach Records activity	854
Mapping the outputs for the Detach Records activity	854
Get Records activity	855
Using the Get Records activity	855
Mapping the inputs for the Get Records activity	856
Mapping the outputs for the Get Records activity	857
Initialize Record activity	857
Using the Initialize Record activity	859
Mapping the inputs for the Initialize Records activity	860
Mapping the outputs for the Initialize Records activity	860
Search Records activity	861
Using the Search Records activity	862
Mapping the inputs for the Search Records activity	863
Mapping the outputs for the Search Records activity	863
Update Records activity	864
Using the Update Records activity	864
Mapping the inputs for the Update Records activity	865
Mapping the outputs for the Update Records activity	866
Upsert Records Activity	866
Using the Upsert Records activity	867
Mapping the inputs for the Upsert Records activity	868
Mapping the outputs for the Upsert Records activity	869
Troubleshooting and support	869
Oracle CRM On Demand Activities	870
Creating or editing an Oracle CRM On Demand endpoint	871

Specifying the Retry options for Oracle CRM On Demand activities	872
Using the Oracle CRM On Demand Insert Object activity	873
Using the Oracle CRM On Demand Update Object activity	874
Using the Oracle CRM On Demand Query Object activity	875
Using the Oracle CRM On Demand Delete Object activity	877
Oracle E-Business Suite Activities	878
Overview of the Oracle E-Business Suite connector	879
Installing JAR files to connect to Oracle E-Business Suite	880
Creating or editing an endpoint for an Oracle E-Business Suite activity	880
Using the Oracle E-Business Suite Create Objects activity	882
Using the Oracle E-Business Suite Update Objects activity	883
Using the Oracle E-Business Suite Delete Objects activity	885
Using the Oracle E-Business Suite Retrieve Objects activity	886
Specifying Retry and Delivery options for Oracle E-Business Suite activities	887
Prerequisites for starter activities in Oracle E-Business Suite	889
Using the Oracle E-Business Suite Get Created Objects activity	891
Using the Oracle E-Business Suite Get Updated Objects activity	893
Using the Oracle E-Business Suite Get Deleted Objects activity	894
PeopleSoft activities	895
Overview of the PeopleSoft connector	896
Creating or editing an endpoint for a PeopleSoft activity	897
Installing JAR files to connect to the PeopleSoft server	898
Using the PeopleSoft Create Component Interface activity	899
Using the PeopleSoft Update Component Interface activity	901
Using the PeopleSoft Delete Component Interface activity	902
Using the PeopleSoft Get Component Interface activity	903
Using the PeopleSoft Find Component Interface activity	905
Creating events table and compiling PeopleSoft JAR files	906
Using the PeopleSoft Get Created Component Interface activity	909
Using the PeopleSoft Get Updated Component Interface activity	910
Using the PeopleSoft Get Deleted Component Interface activity	911
Specifying retry and Delivery Options for PeopleSoft Activities	912
QuickBooks Activities	914
Services Provided	914
Creating or editing an endpoint for Intuit QuickBooks activity	915
Regeneration of Access Token	916
Required connection Headers	916
QuickBooks Supported Objects	917
Using the QuickBooks Create activity	918
Using the QuickBooks Delete activity	919
Using the QuickBooks Update activity	920
Using the QuickBooks Query activity	921
Using the QuickBooks Retrieve activity	922
RightNow SOAP API Activities	923
Overview of the RightNow SOAP API connector	924
Creating and editing a RightNow SOAP API endpoint	924
Using the RightNow SOAP API Create Objects activity	926
Using the RightNow SOAP API Get Objects activity	927

Using the RightNow SOAP API Update Objects activity	928
Using the RightNow SOAP API Destroy Objects activity	929
Using the RightNow SOAP API Query Objects activity	931
Specifying retry parameters for RightNow SOAP API activities	932
Salesforce.com activities	933
Creating or editing a Salesforce.com endpoint	935
Configuring Salesforce.com activities	937
Migrating Salesforce.com projects	938
Setting Salesforce.com configuration properties	938
Specifying the Retry and Time Out parameters for Salesforce.com activities	939
Understanding and setting polling preferences for the Salesforce.com connector	940
Convert Lead activity	941
Map the input of the Convert Lead activity	942
Map the output of the Convert Lead activity	942
Set password activity	943
Reset password activity	944
Send email activity	945
Create Objects activity	946
Map the input of the Create Objects activity	947
Map the output of the Create Object activity	948
Delete Objects activity	948
Map the input of the Delete Objects activity	949
Map the output of the Delete Object activity	950
Get Deleted Objects	950
Map the input of the Get Deleted Objects activity	951
Map the output of the Get Deleted Object activity	952
Get Updated Objects	952
Map the input of the Get Updated Objects activity	953
Map the output of the Get Updated Object activity	954
Get User Information activity	954
Map the output of the Get User Information activity	955
Get Server Timestamp activity	955
Map the output of the Get Server Timestamp activity	956
Merge Objects Activity	957
Map the input of the Merge Objects activity	957
Map the output of the Merge Object activity	958
Poll Deleted Objects activity	959
Map the output of the Poll Deleted Object activity	959
Poll Updated Objects activity	960
Map the output of the Poll Updated Object activity	961
Query Objects activity	961
Configuring the Query Objects activity	963
Retrieve Objects activity	965
Search Objects activity	967
Undelete Objects activity	968
Configuring the Search Objects activity	969
Update Objects activity	971
Upsert Objects activity	972

Salesforce Analytics activities	974
Overview of the Salesforce Analytics connector	975
How to Install the Salesforce Analytics Connector	975
Use case with CSV format data	976
Use case with XML format data	976
Create Dataset Activity	977
Load Data Activity	978
Load Data Activity - Continued	979
Update Dataset Activity	980
Retrieve Dataset Activity	980
Example 1: How to Configure the Write XML Activity for XML Data	981
Example 1: Continued	982
SAP activities	983
Overview of the SAP connector	984
Creating or editing a SAP endpoint	984
Downloading and installing the SAP Jar Files and DLLs	987
Configuring Single Sign-on (SSO) and Secure Network Communications (SNC) for SAP connector	988
SAP Invoke BAPI activity	989
SAP Invoke RFC activity	993
SAP Receive IDOC activity	997
SAP Send IDOC activity	998
SAP Receive RFC activity	1002
SAP Send RFC Response activity	1003
Troubleshooting and support	1004
SAP C4C Activities	1014
Overview of SAP C4C Core Connector	1014
Creating and editing a SAP C4C Core Endpoint	1015
Using the Query Activity	1016
Using the Manage Activity	1017
Using the Invoke Service Activity	1019
Specifying the retry options for SAP C4C Core activities	1020
X.509 Certificate Authentication for SAP C4C Connector - Points to remember	1021
ServiceMax activities	1022
Creating or editing a ServiceMax endpoint	1023
Configuring ServiceMax activities	1026
Setting ServiceMax configuration properties	1026
Specifying the Retry and Time Out parameters for ServiceMax activities	1027
Understanding and setting polling preferences for the ServiceMax connector	1028
Poll Updated Objects activity	1029
Get Updated Objects	1030
Poll Deleted Objects activity	1032
Get Deleted Objects	1033
Create Objects activity	1034
Update Objects activity	1036
Upsert Objects activity	1037
Delete Objects activity	1039
Undelete Objects activity	1040
Retrieve Objects activity	1041

Query Objects activity	961
Configuring the Query Objects activity	1045
Search Objects activity	1047
Configuring the Search Objects activity	1048
Convert Lead activity	1050
Merge Objects Activity	1052
Get User Information activity	1053
Get Server Timestamp activity	1054
Send email activity	1055
Set password activity	1056
Reset password activity	1058
Service Now Activities	1059
Creating or editing an endpoint for ServiceNow activity	1059
Using the ServiceNow Create activity	1060
Using the ServiceNow Retrieve activity	1061
Using the ServiceNow Update activity	1062
Using the ServiceNow Delete activity	1063
Siebel activities	1064
Overview of the Siebel connector	1065
Installing JAR files to connect to the Siebel server	1066
Creating or editing a Siebel endpoint	1067
Using the Siebel Create Objects activity	1069
Using the Siebel Update Objects activity	1072
Using the Siebel Delete Objects activity	1073
Using the Siebel Query Objects activity	1075
Using the Siebel Execute Business Service activity	1077
Prerequisites for starter activities in Siebel	1079
Using the Siebel Get Created Objects activity	1081
Using the Siebel Get Updated Objects activity	1082
Using the Siebel Get Deleted Objects activity	1084
Specifying Retry and Delivery Options for Siebel Activities	1086
Siebel properties file	1087
Silver Pop Activities	1089
Creating or editing an endpoint for Silverpop Activity.	1089
Selecting or editing a Silverpop endpoint	1090
Activity: Add Contact	1091
Add the Add Contact Activity in the orchestration	1091
Creating, selecting, or editing a Silverpop endpoint	1092
Configuring the Activity	1092
Mapping the inputs of the Activity	1092
Click on Map Input link in Configure Activity section displayed below the orchestration.	1093
Mapping the outputs of the Activity	1095
Note about Deploying a Silverpop Orchestration	1095
Activity: Add Lead	1096
Add the Add Lead Activity in the orchestration	1096
Creating, selecting, or editing a Silverpop endpoint	1096
Configuring the Activity	1097
Mapping the inputs of the Activity	1097

Click on Map Input link in Configure Activity section displayed below the orchestration.	1098
Mapping the outputs of the Activity	1100
Note about Deploying a Silverpop Orchestration	1100
Activity: Update Contact	1100
Add the Update Contact Activity in the orchestration:	1101
Creating, selecting, or editing a Silverpop endpoint	1101
Configuring the Activity	1102
Mapping the inputs of the Activity	1102
Click on Map Input link in Configure Activity section displayed below the orchestration.	1103
Mapping the outputs of the Activity	1104
Note about Deploying a Silverpop Orchestration	1105
Activity: Update Lead	1105
Add the Update Lead Activity in the orchestration	1106
Creating, selecting, or editing a Silverpop endpoint	1106
Configuring the Activity	1106
Mapping the inputs of the Activity	1107
Click on Map Input link in Configure Activity section displayed below the orchestration.	1107
Mapping the outputs of the Activity	1109
Note about Deploying a Silverpop Orchestration	1109
Activity: Select Contact	1110
Add the Select Contact Activity in the orchestration	1110
Creating, selecting, or editing a Silverpop endpoint	1111
Configuring the Activity	1111
Mapping the inputs of the Activity	1111
Click on Map Input link in Configure Activity section displayed below the orchestration.	1112
Mapping the outputs of the Activity	1113
Note about Deploying a Silverpop Orchestration	1115
Activity: Select Lead	1115
Add the Select Lead Activity in the orchestration	1115
Creating, selecting, or editing a Silverpop endpoint	1116
Configuring the Activity	1116
Mapping the inputs of the Activity	1117
Click on Map Input link in Configure Activity section displayed below the orchestration.	1117
Mapping the outputs of the Activity	1118
Note about Deploying a Silverpop Orchestration	1120
Activity: Remove Contact	1120
Add the Remove Contact Activity in the orchestration	1121
Creating, selecting, or editing a Silverpop endpoint	1121
Configuring the Activity	1122
Mapping the inputs of the Activity	1122
Click on Map Input link in Configure Activity section displayed below the orchestration.	1122
Mapping the outputs of the Activity	1123
Note about Deploying a Silverpop Orchestration	1124
Activity: Remove Lead	1124
Add the Remove Lead Activity in the orchestration	1124
Creating, selecting, or editing a Silverpop endpoint	1125
Configuring the Activity	1125
Mapping the inputs of the Activity	1126

Click on Map Input link in Configure Activity section displayed below the orchestration.	1126
Mapping the outputs of the Activity	1127
Note about Deploying a Silverpop Orchestration	1128
Security Token Service (STS) activities	1128
Creating or editing an STS endpoint	1128
Using the STS Get SAML 2.0 Token activity	1131
SugarCRM activities	1134
Creating and editing a SugarCRM endpoint	1135
Using the SugarCRM Upsert Object activity	1136
Using the SugarCRM Get Reports activity	1137
Using the SugarCRM Delete Object activity	1138
Using the SugarCRM Get Object activity	1140
Using the SugarCRM Query Object activity	1141
Using the SugarCRM Get ServerInfo activity	1142
Using the SugarCRM Get UserInfo activity	1143
Using the SugarCRM Search activity	1144
Using the SugarCRM Set Relationship activity	1145
Using the SugarCRM Delete Relationship activity	1146
Using the SugarCRM Get Relationship activity	1147
Specifying the Retry options for SugarCRM activities	1149
SugarCRM REST API Activities	1150
Creating and editing a SugarCRM REST API endpoint	1151
Using the SugarCRM REST API Get UserInfo activity	1152
Using the SugarCRM REST API Get ServerInfo activity	1153
Using the SugarCRM REST API Get Reports activity	1154
Using the SugarCRM REST API Create Object activity	1155
Using the SugarCRM REST API Get Objects activity	1156
Using the SugarCRM REST API Delete Object activity	1157
Using the SugarCRM REST API Update Object activity	1159
Using the SugarCRM REST API Search activity	1160
Specifying the Retry options for SugarCRM REST API activities	1161
Taleo activities	1162
Creating and editing a Taleo endpoint	1163
Using the Taleo Create Attachments activity	1164
Using the Taleo Create Objects activity	1165
Using the Taleo Get Objects activity	1167
Using the Taleo Search Objects activity	1168
Using the Taleo Delete Objects activity	1169
Using the Taleo Set Associated Users activity	1170
Using the Taleo Set Binary Resume activity	1171
Using the Taleo Submit Candidates activity	1172
Using the Taleo Update Attachments activity	1173
Using the Taleo Update Objects activity	1174
Using the Taleo Upsert Objects activity	1176
Specifying retry parameters for Taleo activities	1177
Web Services Activities	1178
Creating or Editing a Web Services Endpoint	1179
Creating or editing an endpoint for an Invoke Service activity	1179

Creating or editing an endpoint for a Provide Service activity	1182
Updating a Changed WSDL	1184
Updating a changed WSDL	1187
Web Services Invoke Service Activity	1188
Adding an activity	1190
Creating an endpoint	1190
Configuring the activity	1191
Specifying the retry options	1191
Mapping the inputs of the activity	1192
Mapping the outputs of the activity	1194
Invoking an Orchestration with Web Services Provide Service Starter Activity	1195
Compression/Decompression with the Web Services Invoke Service Activity	1196
Web Services Provide Service Activity	1199
Adding an activity	1201
Creating an endpoint	1201
Configuring the activity	1202
Mapping the outputs of the activity	1203
Decompression with the Web Services Provide Service Activity	1204
Web Services Send Reply Activity	1207
Adding an activity	1208
Configuring the activity	1208
Mapping the inputs of the activity	1209
Web Services Send Reply with Fault Activity	1210
Creating the Required Fault Names	1210
Configuring the Activity	1211
Map the Inputs of the Activity	1212
Compression with the Web Services Send Reply Activity	1212
Troubleshooting and support	1214
Workday Activities	1215
Overview of the Workday connector	1215
Creating and editing a Workday endpoint	1215
Using the Invoke Workday activity	1217
Specifying the retry options for Workday activity	1219
Zuora Activities	1220
Overview of the Zuora connector	1221
Creating and editing a Zuora endpoint	1221
Using the Zuora Create Objects activity	1222
Using the Zuora Update Objects activity	1224
Using the Zuora Delete Objects activity	1225
Using the Zuora Query Objects activity	1226
Using the Zuora Amend Subscription activity	1228
Using the Zuora Create Subscription activity	1229
Using the Zuora Generate Invoice activity	1230
Specifying the Retry options for Zuora activities	1231
Using Secure Connectors	1232
Variables	1234
About variables	1234
Creating variables	1237

Create a new variable using the Create New Variable option	1237
Create a new variable using the Select Inputs or Select Outputs buttons	1238
Create a new variable using the toolbar menu	1239

Documentation for older versions of WebSphere Cast Iron

For older versions of WebSphere® Cast Iron products, the following archive files are available for you to download:

- [WebSphere_Cast_Iron_v6.0.0.zip](#)
- [WebSphere_Cast_Iron_v6.1.0.zip](#)
- [WebSphere_Cast_Iron_v6.3.0.zip](#)

The archive files contain the following content sub-directories:

- /plugins : Contains Eclipse plugins for use in IBM Knowledge Center - Customer installed edition or in Eclipse help
- /html : Contains normalised HTML + HTML TOC, for use as an HTML web site or local files

What's New for This Release

IBM® WebSphere® Cast Iron® delivers new and enhanced features.

- [Version 7.5.0.1](#)
- [Version 7.5.0](#)

Version 7.5.0.1

IBM WebSphere Cast Iron Version 7.5.0.1 contains new features and updates for the following components:

- Studio
- Live
- Connectors

Studio

This section describes new features and updates for Studio. For more information about connector new features and updates, see the Connectors section.

- Swagger support in HTTP connector
- New connectors are available for download. For more information about the new connectors, see the Connectors section.

Live

This section describes the updates and improvements made for Cast Iron Live.

- Push WSDL / Swagger from Cast Iron Project to API Management

Connectors

Along with updates to the existing connectors, Cast Iron now supports the following applications:

- Insightly
- JIRA
- MS SharePoint

Version 7.5.0

IBM WebSphere Cast Iron Version 7.5.0 contains new features and updates for the following components:

- Studio
- Live
- Connectors

Note:

- From Cast Iron version 7.0 onwards, Cast Iron uses IBM Java™, 7.
- Studio Cloud in Cast Iron Live version 7.5.0 supports both Java 7 and 8.

Studio

This section describes new features and updates for Studio. For more information about connector new features and updates, see the Connectors section.

- Platform enhancements and serviceability improvements to strengthen infrastructure and robustness.
- New connectors are available for download. For more information about the new connectors, see the Connectors section.

Live

This section describes the updates and improvements made for Cast Iron Live.

- Studio Cloud in Cast Iron Live version 7.5.0 supports both Java 7 and 8.
- Cast Iron Live Studio Cloud now supports Apple Mac OS also.

Connectors

Along with updates to the existing connectors, Cast Iron now supports the following:

- Connectors for IBM Products
 - IBM InfoSphere Master Data Management (MDM)
 - IBM Silverpop
- Extensive support for Microsoft Dynamics suite of applications
 - MS Dynamics CRM
 - MS Dynamics AX
 - MS Dynamics GP
 - MS Dynamics NAV
- Popular SaaS Applications
 - Salesforce Analytics
 - SAP C4C
 - Coupa
 - Oracle Eloqua
 - ServiceNow
 - MS Office 365
- Cloud storage solutions
 - MS Office 365 One Drive
 - Box.com
 - Dropbox

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_introduction.html

Development Environment

The Integration Appliance combines data integration, transformation, routing, monitoring, and management capabilities in a single product. During run time, the Integration Appliance shares data and processing among databases, enterprise applications, legacy systems, and business applications.

Capabilities

- Broad support for the following industry-standard formats:
 - XML (W3C XML Schemas, DTDs, and XML documents)
 - Flat File, raw text, and raw binary data types
 - Supports many character encodings including UTF-8, US-ASCII, ISO- 8859-1, SHIFT_JIS, EBDIC-XML-US, and EUC-JP
 - Commercial database systems, including Informix[®], Sybase, DB2[®], MySQL, Oracle and others through Sequelink.
 - System-specific protocols, such as SAP IDOC and IBM[®] MQ Series
 - Web Services
- Ability to transform data easily from one format to another format, for example: Flat File data to XML data.
- Guaranteed message delivery by means of a built-in message repository that holds all messages processed by the Integration Appliance.
- Support for a variety of application programming styles: synchronous and asynchronous (request/reply, store-and-forward, publish/subscribe).
- Support for data transfer through configurable ports for HTTP, secure HTTP (HTTPS), FTP, secure FTP (SFTP).

- Support for client-side PKI authentication—the ability to connect to a secure server from the Integration Appliance.
- Ability to be managed remotely, from anywhere on the network, using a Web Management Console (WMC) and Command Line Interface (CLI).
- Support for email-based notifications using your network's SMTP-based email system and simple network management protocol (SNMP) traps.

Components

The development environment contains the following hardware and software components:

Studio

A graphical tool used to create integration projects on your Windows development environment. You publish integration projects from Studio to the Integration Appliance.

Integration Appliance

An appliance that connects directly into a network and runs the integration projects that you create using Studio.

Web Management Console (WMC)

A browser-based console that you use to manage the projects on the Integration Appliance.

Command Line Interface (CLI)

A set of commands that you can use to manage the projects on the Integration Appliance.

- [Development process example](#)

The steps in this topic provide an example of the development process for an integration project:

Feedback | Notices

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_dvlpmentenv.html

Development process example

The steps in this topic provide an example of the development process for an integration project:

Procedure

1. Develop your integration project using Studio on a standard Windows 2000/XP machine.
2. In Studio, verify that the orchestration is valid.
3. Publish the integration project to the Integration Appliance.
4. Open a browser on a Windows 2000/XP machine. In the browser, start the Web Management Console (WMC). From the WMC, issue a request to the Integration Appliance to deploy the orchestration job (instance) of the integration project.
5. An event triggers an orchestration job to be created and to start processing the activities that make up the orchestration. For example, a file being placed in a particular directory on a FTP server can trigger an orchestration job to be created and start processing.

6. From the WMC, verify that the orchestration job has completed and that no errors have occurred.
7. Modify the integration project in Studio. For example, your original integration project checks if a file appears in a particular directory on the FTP server and now you want to modify your integration project to move the file from the FTP source directory to an FTP output directory.
8. In Studio, verify that the project updates are valid by using the Verify tab to run each affected orchestration.
9. From the WMC, undeploy the original integration project.
10. Publish the modified integration project to the Integration Appliance.
11. From the WMC, deploy the modified integration project.
12. An event triggers an orchestration job to be created and to start processing the activities in the orchestration.
13. From the WMC, verify that the integration project has run.

file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_developmentprocessexample.html

Integration Appliance

The Integration Appliance is a rack-mountable appliance comprised of redundant and hot-swappable components

Components that can be used in the Integration Appliance include network ports, hard-disk drives, RAM, cooling fans, and other critical components, that ensures fault-tolerant operations.

Use the Web Management Console (WMC) and the Command Line Interface (CLI) to manage the Integration Appliance.

Parent topic: [Introduction](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_integrationappliance.html

Web Management Console

The Web Management Console (WMC) is a browser-based application hosted by the Integration Appliance

The WMC can configure and monitor hardware, orchestration, and network status of an Integration Appliance, using a Web browser.

System Administrators can use the WMC for the following monitoring tasks:

- Obtaining Integration Appliance status information, such as memory-usage statistics, disk-space statistics, CPU status, fan status, and power-supply status.
- Obtaining overall processing information at a glance, and then drill-down on specific orchestrations and obtain comprehensive information about specific messages, activities, errors, and other details.
- Viewing logs and error notifications.

In addition to the WMC, you can also use the Command Line Interface (CLI) to perform many administrative and monitoring tasks. For more information on the CLI, see the Command Line Interface reference.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_webmanagemenconsole.html

Studio

Studio is a development tool for designing and building integration projects.

In Studio, you build orchestrations that model business-process and data integration solutions. Studio provides a palette of activities that you drag onto the Studio Workspace and then configure. During run time, these activities perform actions, such as polling for a insert event in a database table. An orchestration is made up of one or more activities. An integration project can contain one or more orchestrations.

You can design simple point-to-point orchestrations, as well as more complex orchestrations that involve multiple endpoints, without writing any code.

After building an integration project, you publish it to an Integration Appliance.

Studio Layout

The main pane of Studio contains the following two sections:

Workspace

Visible on the left side of the main Studio pane. As you create components, such as Endpoints and flat File Schemas, property panes for the component display in the Workspace. When you create a new orchestration, a blank orchestration are displayed in the Workspace. You drag activities from the Activities tab into the orchestration displayed in the Workspace. When you configure an activity of an orchestration, the configuration panes of activity are also displayed in this Workspace.

Tabs

On the right side of the main Studio pane, the following tabs are available:

- Project

- Activities
 - Variables
 - Functions
 - Verify
- [The Project tab](#)
The Project tab contains folders for each component
 - [The Activities tab](#)
An activity performs a particular operation in an orchestration, and are organized into categories on the activities tab
 - [The Variables tab](#)
The variables used in the current orchestration are listed in the Variables tab.
 - [The Functions tab](#)
The functions that you can add to a map between input and output parameters of an activity are listed in the Functions tab.
 - [The Verify tab](#)
By simulating the DataPower Cast Iron® Operating System, the Verify tab allows you to test orchestrations within a project and resolve any issues before deploying the project to the Integration Appliance.
 - [Understanding nodes and mappings](#)
The integration projects that you build using Studio are based on industry standards, including BPEL4WS (business process execution language for Web Services), WSDL (web services description language), and other XML based standards.
 - [Understanding parameters](#)
Parameters are values that are passed to activities from an orchestration, or to the orchestration from an activity. The values from parameters are used to initialize the variables that comprise the orchestration.

file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_studio.html

The Project tab

The Project tab contains folders for each component

The following component folders can be accessed from the Project tab:

- Orchestrations
- Endpoints
- Flat File Schemas
- Stylesheets
- Transformations
- WSDLs
- XML Schemas

When you create new instances of a Project tab component, these instances display within the appropriate component folder.

To create new instances of any of the components in the Project tab, right-click on the folder (e.g., Endpoint) to display a menu and select the create option. The component is then created and displays under the appropriate folder, and given a generic name: Orchestration, Orchestration1, and so on. You should rename all components to something meaningful in the context of your integration project.

You can create these components in any order. To ensure that all components are available, create Flat File Schemas, and upload XML Schemas, WSDLs, and Stylesheets before you start defining the orchestration.

Orchestrations

Orchestrations are the central component of any integration project. An orchestration contains a sequence of activities that perform a specific business process. For example, an orchestration could get a Flat File from a FTP Server, take the data from the Flat File, transform it, and then save the result into a database. An integration project must contain at least one orchestration.

Endpoints

Endpoint components display in the Endpoint folder of the Project tab and specify the connection information required to connect to the various external systems or endpoints. The Integration Appliance supports connecting to Endpoints of many types including Email (SMTP, POP), FTP, SFTP, HTTP, HTTPS, JDE, JMS, MQ, NetSuite, PeopleSoft, Salesforce.com, SAP, Siebel, Web Services, and many commercial database systems.

Each type of endpoint has an associated configuration pane where you specify endpoint connection information. For example for a database endpoint, you must provide a database name, server name, user account, and password. You may, however, want to specify a different set of configuration information when you move from a testing environment to the production environment. You can simplify the process of moving from one set of connection information to another (for example: from one database to another) by defining configuration properties (or name/ value pairs) in studio, to define the configuration information.

Flat File Schemas

A Flat File Schema defines the parsing rules, content, and structure of a Flat File. Flat Files are any non-XML text data, such as comma- and tab-delimited files and EDI or industry-specific textual formats, such as the Health Level 7 (HL7) format for the health care industry.

In addition to supporting variable-length Flat File formats that use delimiters to distinguish one record or field from another, studio also supports fixed-length records and fields such as the COBOL copy book format. In studio using the Flat File Schema Editor, you can create definitions for either type of text file and groups.

Stylesheets

An XSLT Stylesheet defines how to transform XML data from one format to another format. You can upload a XSLT Stylesheet into studio and add an Apply XSLT activity to your orchestration that uses the XSLT Stylesheet during run time.

Transformations

The Transformation folder contains standalone maps. A standalone map represents a set of one or more mappings between source and destination nodes.

For example, you can create a standalone map called myMap that contains a set of mappings between a source XML Schema called IncomingOrder and a destination XML Schema called ShippingOrder. A standalone map can be used to create any number of Map Variables activities in the same orchestration or in other orchestrations in the same project. You can create a Map Variables activity from a standalone map by dragging the standalone map from the Transformations folder to an empty node on the orchestration. A Map Variables activity based on the standalone map is created.

WSDLs

A WSDL (Web Services Description Language) is an XML document that describes a Web Service. It defines how to access a Web Service and the operations available for the Web Service.

XML Schemas

An XML Schema defines the content and structure of XML data. XML Schemas are typically stored in files that end with the .xsd extension. Once you upload an XML Schema into a project, you can use that XML Schema to create variables used in the activities of an orchestration.

Parent topic: [Studio](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_theprojecttab.html

The Activities tab

An activity performs a particular operation in an orchestration, and are organized into categories on the activities tab

Activities are organized into the following general categories:

Transform activities

Transform activities transform data from one format to another. For example, the Read Flat File activity converts Flat File data to XML data. The transform activities are listed under the Transform folder of the Activities tab.

Logic activities

Logic activities affect the processing flow of an orchestration, such as control-flow logic, branching, or looping (for example: the For Each and the While Loop activities). The logic activities are listed under the Logic folder of the Activities tab.

Utilities activities

Utilities activities are utilities that start or act on the current orchestration job (or instance of the orchestration). The utilities activities are listed under the Utilities folder of the Activities tab.

Connector activities

Connector activities perform operations on the various external systems associated with the orchestration. Connection-oriented activities are grouped into various folders named for the type of system, such as Database, Email, FTP, HTTP, JMS, Salesforce.com, Siebel, MQ, SAP, and Web Services.

To use any activities, drag the activity icon from the Activities tab to the orchestration in the workspace. To configure the specifics of an activity, click the icon in the orchestration. The configuration pane displays underneath the orchestration.

The configuration pane includes an activity-specific Checklist to guide you through the configuration of each activity. A key part of configuring most activities involves the mapping of input and output parameters.

Parent topic: [Studio](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_theactivitiestab.html

The Variables tab

The variables used in the current orchestration are listed in the Variables tab.

Variables are used in the context of a specific orchestration to bind data sources to an orchestration, and to pass (or operate on) data values created as the result of orchestration processing. An orchestration's variables are typically initialized by the parameters from the specific activities that make up the orchestration.

Variables can store primitive data, such as a string or integer value, or can represent an entire XML Schema or a fragment of an XML Schema. In Studio, you can automatically create variables for the orchestration using the Mapping Editor's Copy button. In the Variables tab of Studio, you can create a variable based on a fragment of an XML Schema, by dragging a fragment (or sub-node) of an XML Schema from the Schema of pane, into the Variables pane.

Parent topic: [Studio](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_thevariablestab.html

The Functions tab

The functions that you can add to a map between input and output parameters of an activity are listed in the Functions tab.

You can add functions to the mappings between the input and output parameters of an activity to alter the data flowing through the orchestrations. Using the functions available on the Function tab, you can complete the following actions:

- calculations
- converting datatypes
- re-formatting data
- combining multiple data fields into a single field

For the list of functions available with Studio and for reference information about each function including the input and output parameters, see the Mapping Function Reference section of the Studio online help.

From the Functions tab, you drag the desired function onto the link between an input and output node of the Mapping editor. If the functionality you need is not available in one of the standard Studio functions, you can create your own custom functions. For more information, see the Mapping Custom Functions section of the Studio online help.

Feedback | Notices

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_thefunctionstab.html

The Verify tab

By simulating the DataPower Cast Iron[®] Operating System, the Verify tab allows you to test orchestrations within a project and resolve any issues before deploying the project to the Integration Appliance.

When initiating a test run, you can start a single orchestration or all the orchestrations in a project. Studio runs one orchestration job for each orchestration. You can start and stop orchestrations, and view orchestration monitoring logs from the Studio toolbar or from the Verify tab.

If the orchestration is invalid, a message dialog displays possible resolutions. In the workspace, Studio highlights each activity in the orchestration as the activity is processing the data. As Studio runs the orchestration, the Verify tab provides orchestration job details such as activity name, processing status, variable/parameter names, and variable/ parameter data in a tree view. If an error occurs, Studio highlights the node where the error occurred. Clicking the node takes you to the location of the error, where you can resolve any issues before running another instance of the orchestration.

When you click a node in the tree view, Studio displays in the Properties Pane the Checklist task that corresponds to the node. For example, when you click an activity node, Studio displays the Configure panel for the activity in the Properties Pane. When you click the Map Outputs node, Studio displays the Map Outputs panel in the Properties Pane. If you click a mapping variable or parameter, the data displays in the Variable/Parameter Message Data section of the Verify tab.

While Studio only runs one orchestration job for each orchestration, you can start the same orchestration multiple times. The Verify tab displays the results for each run of the same orchestration under a separate instance. For example, Instance #1 and Instance #2. You must allow an orchestration job to complete before you can run another instance of the same orchestration.

Note: Studio does not persist the results of the runtime test. When you close the orchestration tab, you lose runtime results for the orchestration.

Additional Requirements

Depending on the activities in the orchestration, Studio might require more input to run the orchestration job.

For example, an orchestration with a database activity requires that you generate database assets before running the orchestration in Studio, just as you must do in the WMC before running the orchestration on the Integration Appliance. If the orchestration contains an HTTP Receive Request activity, you must post a message to the specified URL. Studio provides an HTTP Post Utility to help you post a message. If the orchestration contains an FTP Poll activity, you must place a file in the specified location before Studio can run the orchestration. Studio prompts you for this information before it runs an orchestration.

Since the Verify tab allows you to simulate the runtime on the Integration Appliance, you can also specify Kerberos Protocol settings in Studio to test the settings before actually deploying to the Integration Appliance. Specifying these setting in Studio does not impact the runtime on the Integration Appliance. You must specify the Kerberos Protocol settings in the WMC to allow the Integration Appliance to authenticate the server that the Integration Appliance is communicating with. For more information about specifying Kerberos Protocol settings for the Integration Appliance, see the WMC Online Help.

Navigating the Verify Tab Toolbar

The following table describes the Verify tab toolbar:

Table 1.

Icon	Description
	Starts the open orchestration. The orchestration must be valid before Studio can run an orchestration job.
	Stops the running orchestration job immediately. Studio does not allow the orchestration job to complete before stopping.
	Starts all the valid orchestrations in the project that are not already running. If an orchestration is already running when you click this icon, Studio does not rerun the orchestration.
	Stops all running orchestration jobs immediately. Studio does not allow the orchestration jobs to complete before stopping.
	Displays orchestration monitoring data in a table or text format.
	In the Workspace, highlights the activities in the execution path of the orchestration job, which allows you can follow the logic Studio used to complete the orchestration job. Different instances can have a different path depending on the inputs and orchestration logic. Click this icon to toggle between providing and not providing a highlighted path.
	Assigns the results from the selected instance to the Map Inputs and Map Outputs, so that when you run a test from the Properties Pane, Studio populates the inputs and outputs with the results of the orchestration job.
	Deletes one or more selected instances from the orchestration details tree. To delete multiple instances hold the Shift key or Ctrl key, select the instances you want to delete, and click the icon.
	Expands all the nodes under the selected node in the orchestration details tree.
	Collapses all the nodes under the selected node in the orchestration details tree.
	Expands a single node under the selected node in the orchestration details tree.
	Collapses a single node under the selected node in the orchestration details tree.

file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_theverifytab.html

Understanding nodes and mappings

The integration projects that you build using Studio are based on industry standards, including BPEL4WS (business process execution language for Web Services), WSDL (web services description language), and other XML based standards.

You do not are not required to know the technical details of these standards to use the product. Nonetheless, as you work with Studio, you are exposed to the XML content of your inputs and outputs. Since orchestrations running on the Integration Appliance use, process, and deliver messages in an optimized XML format, all data and its definition is presented as a hierarchy of nodes, as in an XML document.

For example, columns in a database table are represented as nodes. As another example, Flat File Schemas are defined in Studio as a series of record, field, or group nodes in a tree structure that comprises a root node containing descendents (children, grandchildren, etc).

There are two basic distinctions between node types in Studio:

- Structure nodes are nodes that convey information about structure only. An example of a structure node is a record definition (defined for a Flat File Schema). Structure nodes can contain other structure nodes, and nodes that contain data.
- Data nodes are nodes that can contain data.

In a typical complete node representation, the top node is often referred to as the root node—root in the sense that it contains all other nodes. Subsequent nodes are descendent nodes comprised of both structure nodes and data nodes.

A key part of designing an orchestration is specifying the mapping between nodes, that is, defining how nodes and the data they contain should be used and transformed in the course of orchestration processing.

Several XML-specific characteristics can be associated with nodes; these characteristics are represented as an additional icon adjacent to a node in a tree. These properties include:

- Recurring - denotes that a node can repeat (either a specified number of times or an unbounded number of times). Each time a recurring node repeats is an occurrence of the node.
- Nillable - a boolean property that denotes whether the data node to which this property is associated can have an attribute set to `nil` by the application. The nillable mechanism is defined by the XML Schema recommendation as a way to identify non-required data elements that are empty vs. those that convey a null data value.
- Optional - denotes whether an optional node exists or not.

Studio activities contain embedded maps that you must configure at design time, in the context of an orchestration, to define how actual parameters should map to variables, and how the variables should be processed in the orchestration.

The characteristics and node structure of the node tree in the right pane of the mapping editor determines whether a node from the left pane can be mapped to the right pane.

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_understandingn odesandmappings.html

Understanding parameters

Parameters are values that are passed to activities from an orchestration, or to the orchestration from an activity. The values from parameters are used to initialize the variables that comprise the orchestration.

Parameters can be either input parameters or output parameters. Activities can either contain just input parameters, just output parameters, or both.

You map variables of an orchestration to the input parameters of an activity in the Map Inputs task. During run time, the values of the variables are passed into the input parameters of the activity and are used by the activity. For example during run time, the FTP Put File activity creates a file using the name provided in the input parameter called filename and with the data provided in the input parameter called data. The values for the filename and data input parameters are populated by the data in variables in the orchestration.

Output parameters are return values from an activity. For example, the FTP Poll Directory activity passes three output parameters to an orchestration, as shown in the following table, each of which can be used to initialize a variable in the orchestration. Output parameters can be mapped from an activity to the orchestration.

Table 1.

Activity	Parameter	Description
FTP Poll Directory	filename	Name of the file obtained from the FTP server.
FTP Poll Directory	data	String containing the contents of the file.
FTP Poll Directory	timestamp	Timestamp on the file.

Installation and configuration

This topic discusses the installation and configuration steps you must complete before you build and run an integration project.

Integration Appliance

The Integration Appliance is shipped with DataPower Cast Iron® Operating System preinstalled. You must however, set up and configure your Integration Appliance before publishing and deploying your integration project to the Integration Appliance. Setup might include installing additional connector licenses. For more information, see the Installation Guide. Once the Integration Appliance is set up, configured, and available to the network, you can bring up the Web Management Console by entering the following URL into the address field of a browser: `https://hostname`

Where hostname is the name of the Integration Appliance. This name was assigned to the Integration Appliance during the installation process.

The Web Management Console opens to the Login screen in the browser window. The default login account and password is `admin/!n0r1t5@C`

You can also access the Integration Appliance through the Command Line Interface.

Studio

To start creating integration projects to run on the Integration Appliance, you must install Studio on a Windows development workstation. Your Windows development workstation must meet some minimum hardware and software requirements. For more information, see the Installation Guide.

Once you have Studio installed, you can log into the Solutions Repository and access a repository of template integration projects (TIPs). Each TIP addresses a specific integration project scenario. For example, you can find a TIP for integrating data from a Salesforce.com endpoint to a database endpoint. When you select a TIP from the Solutions Repository and download the TIP to your workstation, a wizard opens and guides you through the configuration steps.

Note: The Solutions Repository contains TIPs that have been certified, as well as uncertified TIPs. Anyone who has access to the Solutions Repository can upload a TIP. For more information about creating, modifying, and searching for TIPs, see the Studio online help.

 Last updated: Wednesday, February 17, 2016
`file:///dcs/markdown/workspace/Transform/out.html`

`http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_installationandconfiguration.html`

Deployment concepts

Use Studio to create integration projects, which you deploy to the Cloud using the Management Console or deploy to the Integration Appliance using the Web Management Console. A deployment of a project contains all runtime components necessary to run the processing defined in the orchestrations of the project.

With respect to deployment, there are two important concepts to keep in mind as you develop a project:

- Publishing and Deploying are two distinct steps. Publishing is the act of promoting a project from Studio to an integration environment (cloud or Integration Appliance) or to another intermediate location. A project does not run in the integration environment until you deploy it.
- Projects can have multiple configurations that support completely different environments (development, test, production). Using Studio to create configuration properties for projects offers greater flexibility at deployment time, because you can bind the properties to different environments.

The Integration Appliance provides the following two options for getting your projects from Studio to the Integration Appliance:

- Projects can be published directly to an Integration Appliance.
- Projects can be exported from Studio to a staging location and then uploaded to an Integration Appliance.

Whether you export from Studio and later upload to the Integration Appliance or publish directly to the Integration Appliance from Studio, the project does not run on the Integration Appliance until you deploy.

- [About configurations](#)

You publish a project to the Integration Appliance. The WMC then runs a configuration of the project. Once you publish a project to an Integration Appliance, the WMC creates a default project configuration. The default project configuration settings enable all orchestration in the project and allow you to quickly deploy a project.

Feedback | Notices

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_deploymentconcepts.html

About configurations

You publish a project to the Integration Appliance. The WMC then runs a configuration of the project. Once you publish a project to an Integration Appliance, the WMC creates a default project configuration. The default project configuration settings enable all orchestration in the project and allow you to quickly deploy a project.

You can create numerous configurations of the same project on your Integration Appliance. Each configuration can connect to a different endpoint, if you have used configuration properties to specify the connection information for the endpoint. For example, one configuration could connect to a test database while another configuration connects a production database. Project configurations are created using the WMC, and by default, are not deployed when they are created.

Publishing

Publishing is the process of bundling up a specific integration project (the named project in Studio) and preparing the project for deployment on an Integration Appliance. When you publish a project, Studio creates a runnable version of the project and sends it to the Integration Appliance that you specify.

Exporting

Exporting is a process very similar to publishing in that it compresses your project, but instead of pushing the result to the Integration Appliance, you give the file a name and save it for subsequent uploading to the Integration Appliance. For example, this allows for additional testing by a quality control team.

Uploading

Uploading is the process of moving a project that has been exported from Studio to the Integration Appliance. A menu selection is available for this task in the WMC.

Deploying

Deploying is the process of instantiating all the runtime components necessary so that the Integration Appliance can perform the actual integration. Deploying presumes that a project has been published or uploaded to the Integration Appliance. Use the Web Management Console to deploy a project configuration.

Understanding configuration properties

Configuration Properties simplify the deployment process in moving from a development environment to a production environment. Rather than hard-code configuration details into the endpoint properties, you can create Configuration Properties, and then use these property names in the configuration pages of your endpoints.

This is because endpoints created in Studio are configured with specific address information (hostname, IP address) and other details (user account, password). These details may need to be changed at deployment for the specifics of the actual environment in which the project will run (assuming that the development, test, and production environments use different servers and systems).

At deployment, the values associated with the properties can be changed to the appropriate hostnames, IP addresses etc.

For more information about creating configuration properties, see the Studio online help.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_beforedevelopingyourprojects.html

Planning an Integration Project

When beginning the development process for an integration project you must define the integration scenario before using Studio to translate the project requirements into an orchestration.

Defining an integration scenario

When defining an integration scenario, specify a clear goal. With this goal in mind, identify the high level project requirements:

- Endpoints - From what source system and to what target system are you moving the data?
- Formats - What is the format of the data from the source system? What data format does the target system accept?
- Transformation - If the source data and target data have different formats or structure, then what type of data transformation is needed? Are there any special processing rules?

For example, if your goal is to consolidate multiple purchase orders and place the consolidated purchase order into a supplier's database. High level project requirements might include the following details:

- Endpoints - The source system is an FTP server. The target system is an Oracle database.
- Formats - The source data is pulled from CVS flat files stored on the FTP server. The target database requires data in table format.
- Transformation - A flat file to table transformation is required. Also orders from locations that have sales tax should be processed differently than orders from locations without sales tax.
- Overall goal of the integration project. For example, combining a flat file purchase order with an XML purchase order, into a single large purchase order that is stored in the supplier's database.

For example, you want to consolidate multiple purchase orders, verify that they conform to a specific format, and then:

- A few Flat File sources need to be consolidated into a target XML file.
- Files from one FTP site need to be moved to another.

Parent topic: [Before developing your projects](#)

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_planninganintegrationproject.html

Translating project requirements into Studio components

After identifying high-level goals for your integration project, you can start analyzing more specific aspects of the integration project and identifying the Studio components that you can use to accomplish your goals.

You can start by analyzing the following characteristics of your integration project:

- From what source, or sources, do you want to obtain the data, and to what target do you want to transmit the data? These sources and targets (databases, FTP servers, HTTP servers, Email, etc) comprise the endpoints that are created as part of a project in Studio.
- In what format is the source data, and in what format is the required target data? Text-based files, including EDI formats, CSV, and other formats can be defined in Studio as a Flat File Schema that converts the data into the appropriate format for the Integration Appliance. In addition, a Flat File Schema can be used to produce data in a flat file format to be used outside of the Integration Appliance. XML-based data can be included in an integration project by uploading the appropriate XML Schemas (.xsd) or document type definitions (.dtd) to Studio.
- Does the data format or structure need to change from source to target, and if so, how does it need to change? Should some of the processing be based on the content itself?

Identifying these requirements provides the information needed to define (in Studio) one or more orchestrations that comprises a set of activities, including transformations on data. Transformations convert data from one format to another. For example converting Flat File data in a CSV (Comma Separated Values) format to XML data. Transformations can also suppress data, add data, alter datatypes, and perform calculations.

Integration appliance configuration tips

You might want to make the changes to your Integration Appliance configuration. This topic covers some changing passwords, creating users and groups and optimal performance configuration.

Change the default password

Using the Web Management Console:

1. In the upper right corner of the WMC, click your username.
2. Select Change Password.
3. Enter the old and new passwords, and confirm the new password.
4. Click Save.

Using the Command Line Interface:

1. Use an SSH connection to log in to the CLI, by starting an application like PuTTY.
2. Enter the appliance-host-name.
3. If needed, select SSH as the connection protocol or set other connection parameters offered by the application.
4. Initiate the connection. The login prompt displays at first access.
5. Log in to the Integration Appliance using the default username and password [Username=admin, Password = ! n0r1t5@C].
6. Run the following command: `auth set user admin <old_password> <new_password>`

Create users and groups, and define appropriate privileges.

As you would with any multi-user device, be sure to create users and groups and provide access to the Integration Appliance using the rule of 'least privilege,' that is, users should have no more privileges than necessary to do their jobs. For more information about setting privileges, see the Web Management Console online help.

Configure the Integration Appliance for optimal performance

For better performance, once an integration project has been deployed to production and runs as expected, tune the following parameters:

- For each orchestration, change the logging level from the All option to the Error Values option.
- For each notification, set the Level exceeds field to the Critical option.

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_integrationapplianceconfigurationtips.html

Studio best practices

Some guidance for using Studio to its full potential.

Establish naming conventions for your organization

Provide unique, meaningful names (meaningful in the context of the business problem being solved) for all your Studio projects and related components—files, folders, projects, orchestrations, endpoints, and so on. Names should be:

- Unique - Studio is case sensitive: filename1, FILENAME1, and FileName1 are three different files. However, do not rely on capitalization to distinguish among Studio projects, it can lead to confusion.
- Descriptive - For example, a project that integrates suppliers and an inventory system might be called “SupplyChainIntegration.”

Back up projects frequently

In multi-user environments especially, be sure to back up projects frequently. You can quickly back up all Studio project components by simply creating a compressed file of the contents in a specific project's directory. Store the compressed file elsewhere, in a secure location. Ideally, in a version control system that will let you also track project changes.

Store projects in a central location

Place all project files in a central location, preferably using version control software, so that projects are easy to find and previous iterations are easy to recover (this is especially important if you have numerous developers working on the same project).

Design orchestrations for optimal performance

When possible, preprocess as much input data using the native facilities of the source systems before integrating. Transforming data outside the source system adds to the processing overhead. If performance becomes an issue, investigate how you can minimize the use of the Map Activity in an integration project's orchestration.

For example, if you are integrating data from several different database systems, consider creating extract tables that preprocess the data, rather than trying to resolve all differences among disparate data types in the orchestration.

Use Configuration Properties for endpoint definitions

Rather than hard-coding details in your project endpoints, you can use properties for some of the details. You define these configuration properties in Studio and then use the Management Console to specify various runtime values. Before deploying the project, you must configure the properties for the actual endpoints in the production environment. For more details, see the online help.

Test activities and all definitions in Studio, as you design

As you use Studio to design all the elements of an orchestration, be sure to use test data wherever appropriate to ensure that mappings work as expected. Before publishing a project, test all mappings and flat-file schemas using Studio.

Set up development and test environments

Ideally, you should set up development and testing environments that mirror your production environment, including replicating data sources and targets in the test environment.

- Extract (or replicate) production data to your development and test environments.

Before deploying the project, you must configure the properties for the actual endpoints in the production environment by changing the Configuration Properties. See the Management Console online help for details.

Upgrading v6.x.0.x to v7.0.0.x

The underlying OS versions used in Cast Iron v6.0.0.x and Cast Iron v7.0.0.x are different. A direct upgrade from v6.0.0.x to v7.0.0.x is not supported.

Upgrading the physical appliance

1. If you are using a v6.0.0.x physical appliance, then upgrade this appliance to v6.4.0.x, and then from v6.4.0.x upgrade it to v7.0.0.x.
2. If you are using a v6.1.0.x physical appliance, then upgrade this appliance to v6.4.0.x and then from v6.4.0.x upgrade it to v7.0.0.x.
3. If the physical appliance is of v6.3.0.x or v6.4.0.x, then upgrade the appliance directly to v7.0.0.x.

Upgrading the virtual appliance

1. If the virtual appliance is of v6.0.0.x, OR, if you have upgraded from v6.0.0.x to any of the following versions: v6.1.0.x, v6.3.0.x, or v6.4.0.x, and currently you are using either v6.1.0.x, or v6.3.0.x, or v6.4.0.x, do the following:
 - a. Save your Projects and User Settings from the appliance using Repository > Import/Export in Web Management Console (WMC).
 - b. Install a fresh instance of Cast Iron v7.0.0.x on the appliance and restore the Projects and User Settings.
 - c. Upload the vendor libraries (required by your projects) to WMC.

Note: Attempting an upgrade to Cast Iron v7.0.0.x on HVE running Cast Iron v6.0.0.x directly or indirectly will lead to an unusable system. This MUST NOT be attempted.
2. If you have a fresh installation of v6.1.0.x, then upgrade this appliance to v6.4.0.x and then from v6.4.0.x upgrade it to v7.0.0.x.
3. If you have a fresh installation of v6.3.0.x or v6.4.0.x, then you can directly upgrade to v7.0.0.x.

For further assistance, contact IBM Support.

Glossary

A glossary of terms

Activity

A complete, functional unit of processing within an orchestration. Activities include flow-control (logic) activities; data activities to facilitate consumption and transmission of data; and activities that enable integration with database systems, enterprise systems, Web servers, e-mail servers, and other systems. An orchestration contains a series of activities.

Assets

Supplemental configuration files, scripts, or other materials associated with a specific activity. For example, the buffer table scripts created for a database insert activity are assets. Assets are controlled by the Web Management Console. Access privileges to assets can be given to users beyond the users of the WMC. For example, DBAs can be given privileges to the assets associated with a database activity so that they can create the required tables or triggers.

Buffer table

An auxiliary table used in conjunction with various Database Module Activities, such as the single-table insert, update, or delete database activities. When you configure one of the database DML (data manipulation language) activities, Studio generates a SQL script that can be used to create the appropriate trigger on the database table; the buffer table gets populated when the triggering event (INSERT, UPDATE, DELETE) occurs. The buffer table provides the means to capture database changes and initiate processing by the orchestration.

Command-line interface

A text-based alternative to the Web Management Console for configuring, managing, and querying an Integration Appliance.

Control table

A database table that facilitates using database endpoints in integrations. As it does with buffer tables, Studio generates scripts to create control tables that can be used to ensure that inserts, updates, and deletes to specific tables occur once and only once.

Deploy

Create an instance of a project configuration on an Integration Appliance.

Document

Any of the XML Schema files, DTDs, and other configuration files that comprise integration projects.

Dynamic delimiters

A delimiter that is obtained from within the fields of the message itself, such as an HL7 PID (patient ID) message header that denotes the beginning of a new record in a file containing a batch of electronic health records.

Empty placeholder

Appears in activities that have multiple branches as an initial placeholder for the activities in that branch. Dropping other activities on this icon removes it.

Endpoint

Is an external system, such as a database server, FTP server, e-mail system, or enterprise application that the Integration Appliance connects to either get data or return data during run time.

Flat file

A file containing non-XML data. Flat files are typically of two types: delimited, in which a comma, tab, white space, or other delimiter is used to separate variable-length fields and records; or positional, in which fields and records have a fixed width.

For each

A activity that iterates over a message structure where the data repeats.

Flat File Schema

Defines how to interpret a specific set of Flat Files. Studio creates flat-file schema (XML Schema) based on the configuration you define in the Message Definition pane. A flat-file schema is used in conjunction with Read Flat File activity to convert a source flat-file into XML.

Function

String, mathematical, and miscellaneous functions provided by Studio that you can use in defining processing in your orchestrations. In addition to the pre-built functions, Studio lets you build your own custom functions and add lookup tables.

Integration project

The various inputs, outputs (endpoints), mapping and schema definitions (transformations, message formats), orchestrations, and configuration information that comprise an integration solution as designed in Studio and deployed to the Integration Appliance.

Job

A specific runtime instance of an orchestration.

Map

A component that lets you bind input parameters to variables, and variables to the orchestration. Many Studio activities contain embedded maps that you must configure at design time, in the context of an orchestration, to define how actual parameters should map to variables, and how the variables should be processed in the orchestration. In addition to the embedded activity maps, Studio has a stand-alone Map activity that can be used to bind any type of input and output to the orchestration.

Node

All data input to or output from the Integration Appliance is materialized in Studio as a series of nodes, as in a tree-like, hierarchical structure. In many cases, the nodes represent the structure and content of an XML document, but in many cases they don't (e.g., rows in a database table display as nodes). Nodes in Studio convey information about structure; the type of content that can be supported; or additional characteristics of the data.

Orchestration

The specific sequence of processing activities (such as data mapping, transformation, and control logic activities), endpoints, and data types defined and configured using Studio and deployed to run on the Integration Appliance.

Parameter

A value passed to an activity or to an orchestration. For example, filename and data are two of the parameters that can be passed from an FTP endpoint to an orchestration.

Pick

An activity that determines what starter activity to launch based on the action that has occurred. For example, a Pick activity could contain three branches, one that contains a Get Inserted Rows activity, one that contains a Get Deleted Rows activity, and the other contains a Get Updated Rows activity. If an UPDATE event occurs on the database, an instance of the orchestration is created and branch that contains the Get Updated Rows activity is invoked.

Project

A project defined and created using Cast Iron® Studio. Each project has a properties file (filename.sp3) and several additional metadata files and folders that comprise all integration elements - orchestrations, endpoints, XML schemas, Flat Files - and their specific configuration (variables, parameters).

Publish

Copy all project files from Studio to an Integration Appliance or to an intermediate staging area, such as a shared directory on a file server, for subsequent runtime configuration and deployment to a specific environment. The Publish process encompasses validating the project; creating a .par file of project configuration documents; and sending the package to the Integration Appliance specified.

Record identifier

A special field that delimits records in certain types of Flat Files, such as EDI (electronic data interchange) or HL7 (Health Level 7) files. For example, an HL7 PID (patient ID) number is a record identifier.

Repetition delimiters

A delimiter in a Flat File that is used when the data lacks a unique value, such as record ID, to distinguish one record from another.

Replace

Appears in Pick and other activity branches as an initial placeholder for the endpoint activity to receive a message for that branch. Dropping a Receive endpoint Activity on this icon removes it.

Stored procedure

A functional code unit that resides in a database and is ran explicitly by invoking its name. Stored procedures can be used to populate buffer tables when specific insert, update, or delete activities occur on a particular database table.

Studio

An integrated development environment (IDE) for creating, configuring, and publishing integration projects and the orchestrations they comprise. Studio projects run on the Cast Iron Integration Appliance.

Terminate

Stops orchestration processing.

Transformation

Converting data from one format to another. For example converting Flat File data in a CSV (Comma Separated Values) format to XML data. Transformations can also suppress data, add data, alter datatypes, and perform calculations.

Trigger

A type of database stored procedure that is called implicitly when a triggering event occurs. In the Database Module, a "triggering event" as an INSERT, UPDATE, or DELETE on a table.

Variable

Used to pass data values processed by an orchestration. Variables are used by maps to identify the source and target. Some Activities create variables automatically.

While loop

Initiates and continually processes any children activities for as long as a specified condition is true.

IBM Cast Iron Studio

IBM® Cast Iron® Studio is a development tool that is used to design, test, and publish integration projects to an IBM Cast Iron Integration Appliance. Studio provides numerous entities that you can drag into a workspace and configure as part of one, or more, business-process orchestrations that comprise an integration project.

Before you start, read [Studio basics](#) to familiarize yourself with the Studio environment and the terminology used, then refer to the topics in the help to find out how to complete specific tasks.

For detailed information about deploying your projects and working with them on the Integration Appliance, see the [Web Management console](#) help.

For a conceptual overview of Studio, including a step-by-step sample of how to create, test, and publish a project, see the [Introduction to getting started](#) section.

IBM Cast Iron Studio introduction pane

When you first launch Studio, the IBM Cast Iron Studio introduction pane is displayed. If Studio was closed while editing an existing project, Studio automatically loads the last edited project. To edit the loaded project, click an entity in the Project tab.

The following options are available from the IBM Cast Iron Studio introduction pane:

- [Create Project](#) - Launches the New Studio Project dialog box. Use the New Studio Project dialog box to create a new empty project with a default empty orchestration.
- [Open Project](#) - Launches the Open dialog box. Use the Open dialog box to browse for and open an existing project file. A Studio project file ends in the .sp3 extension.
- **Recent Project** - To view a project that was recently opened, click directly on project name under the Recent Projects folder. ^
- **View Help** - Launches the Studio help.
- **Find Solutions** - Launches the Template Integration Projects (TIPs) [Searching for Template Integration Projects \(TIPs\)](#) dialog box, which allows you to search for TIPs from the Cast Iron solutions repository. ^

Working with projects

This page is the starting point for finding information about working with projects using IBM® Cast Iron® Studio.

- [Studio basics](#)
Studio provides an environment called a Workspace in which you can design and configure your integration projects. The Toolbox is the area next to the Workspace where multiple tabs contain components that you use to build an integration project; components such as endpoints, schemas, orchestrations, style sheets, transformation, WSDLs, activities, variables, and functions.
- [Creating a new project](#)
Each time you create a project, a project properties file is also created with the project name. These property files are used when you export or publish projects.
- [Protecting a project with a password](#)
In Studio, you can protect a project by assigning a password to it.
- [Opening a Project](#)
When you first launch Studio, the Project last worked on is opened by default. There are several ways to open a different project.

- [Saving a Project](#)
You can save a project using the Studio toolbar.
- [Renaming a Project](#)
You can rename a project using the Studio toolbar.
- [Publishing a Project](#)
When you publish a project, Studio connects to an Integration Appliance and directly updates the Integration Appliance with the documents that make up the project. Publish a project when the project is complete, has been validated, and has been tested in Studio. You cannot publish a project that has not been successfully validated.
- [Exporting a Project](#)
Export saves all the orchestrations, endpoints, schemas, and other items associated with the project, into a single file that ends in the .par extension.
- [Configuring Project Settings](#)
You can assign a unique version number to a project using the Project Settings dialog box.
- [Setting Preferences](#)
You can specify Project, Orchestration, Flat File, SSL/Kerberos, Session Login, and XML Schema preferences from the Preferences dialog box. You can change preferences at any time.
- [Creating Configuration Properties](#)
Create configuration properties or name/value pairs in a project. Use configuration properties to supply the default values for destination nodes of a map in the Mapping Editor. ^Â
- [Editing Configuration Properties](#)
You can edit configuration properties in Studio and in the Web Management Console (WMC).
- [Creating Global Configuration Properties](#)
When a global configuration property is created, you can import the global configuration property into a project as a project configuration property.
- [Searching for Template Integration Projects \(TIPs\)](#)
Template Integration Projects (TIPs) are stored in the Cast Iron solutions repository. Through the Configuration Wizard, TIPs guide you through the configuration steps for an integration scenario. TIPs can be downloaded to your local machine. The login window is pre-populated with the User Name and Password to make it easier for you to download the TIPs, without registration.
- [Installing Module Provider Libraries](#)
Both IBM Cast Iron Studio and the Integration Appliance require library files (.jar and .dll) associated with instances of certain connector types to be imported. For example, the following connectors require additional libraries: Database Connector, JDE, JMS, MQ, PeopleSoft, and SAP. These files must be present in Studio to enable ^Â configuration of the endpoints and orchestrations that use any of those connectors.
- [Uploading Files into a Project](#)
You can upload only specific types of files into a project. For example, if you plan on mapping a string to XML data (valid to a particular XML Schema), you must first upload the XML Schema file (ends in the .xsd extension) into the project before mapping the nodes in the XML Schema.
- [Uploading Included XML Schemas](#)
An XML Schema or WSDL document can include other XML Schemas in the main document, using Schema Inclusion, Schema Inclusion with Redefinition, or Importing a Namespace.
- [Specifying the Location of a File to Upload](#)
Files can be uploaded into a project from a web location (HTTP or FTP Server) or from the local file system.
- [Valid External File Types for a Project](#)
When building orchestrations, you can upload XML Schemas or other files into your project to complete configuration tasks. External files are used in connection activities and orchestrations that use a message that Studio cannot generate an XML schema for automatically. You must supply an XML schema or DTD if the message must be transformed or if you need to define a job key for the message.
- [About Valid Names](#)
To be valid, the names for projects, Endpoints, orchestrations, stylesheets, Flat File Schemas, XML

Schemas, WSDLs, and transformations must not exceed 42 characters and must not contain any of the reserved characters or words.

- [Undo and Redo Operations](#)

Studio stores up to the last 100 actions you make and you can undo and redo those actions. You can undo and redo an action that you take on the fields in the UI, orchestration views, Mapping Editor, project tree, configuration properties, and variable panel activities.

- [Updating a Changed XML Schema](#)

If you created a project that uses an XML Schema and the XML Schema changes, you can attempt to update the existing XML Schema with the new XML Schema.

- [Using the Project Explorer](#)

The Project Explorer dialog box list the set of entities of the current type, that have been already defined for the project.

- [Using the HTTP Post Utility](#)

This utility provides a simple HTTP client interface that enables you to post messages/requests to HTTP servers, which is useful for orchestrations that have an **HTTP Receive Request** activity as the starter activity.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_workingwithprojects.html

Studio basics

Studio provides an environment called a Workspace in which you can design and configure your integration projects. The Toolbox is the area next to the Workspace where multiple tabs contain components that you use to build an integration project; components such as endpoints, schemas, orchestrations, style sheets, transformation, WSDLs, activities, variables, and functions.

Toolbar icons

Directly under the Studio toolbar menu options are the following Studio toolbar icons:

- New Project:  [Create Project](#)
- Open Project:  [Opening a Project](#)
- Save Project:  [Saving a Project](#)
- Close Project:  see [Saving a Project](#)
- Undo:  Allows you to undo previous actions.
- Redo:  Allows you to redo previously undone actions.
- Cut:  Removes an entity and saves a copy of the entity in the clipboard that can be used later by a paste action. For example, from an orchestration you can remove and store an activity to the clipboard. For more information, see [Working with activities in an orchestration](#)
- Copy:  Saves a copy of the selected entity into the clipboard that can be used later by a paste action.

- Paste:  Copy the stored entity from the clipboard.
- Delete:  Removes the entity. The activity is not saved in the clipboard.
- Validate Project:  Validates all the orchestrations in the project. If an orchestration is invalid the invalid orchestration icon  is displayed next to the orchestration in the Project tab. If the orchestration is invalid, click the orchestration to view the errors in the Validation Results window.
- Publish Project:  Opens the [Publishing a Project](#) dialog box. From the Publish Project dialog box, you can publish a project to an Integration Appliance
- Export Project:  Opens the Save dialog box. From the Save dialog box, you can save all the orchestrations, endpoints, schemas, and other objects associated with the project, into a single file that ends in the .par extension.
- Project Documentation Generation: Generates and saves project documentation as an HTML file.
- Preferences:  Opens the Preferences dialog box. You can specify Project, Orchestration, Flat File Properties, SSL/Kerberos, Session Login, and XML Schema preferences from the Preferences dialog box.
- Help:  Opens the Studio help. You can also connect to the **WebSphere Cast Iron Community** by selecting the option from the main Help menu.

Orchestrations and the Workspace

When you select an orchestration a tab view of the selected entities is displayed in the upper half of the Workspace. For example, if you double-click an orchestration in the Project tab, a graphic view of the orchestration is displayed as a tab. An orchestration or workflow contains the logical flow of your integration. Drag-and-drop activities from the Activity tab onto the orchestration to visually define the logical flow of your integration. For a list of other entities configurable from the top half of the Workspace, see the Project tab.

The lower half of the Workspace is where you define or configure the activities you added to the orchestration. It is referred to by different names, depending on what you are doing at the time. If you are creating a map, this area is called the Mapping Editor. If you are configuring endpoints or configuring an activity, it is referred to as the Properties pane.

Toolbox tabs

The Toolbox comprises five sideways-oriented tabs: Project, Activities, Variables, Functions, and Verify.

Note: You can make the Toolbox larger or smaller by moving the invisible slider between the Workspace and the Toolbox.

Project tab

The Project tab contains folders that store the basic entities that make up any integration project. These folders are initially empty. The Project tab contains the following folders:

Endpoints

Specifies the connection information required to connect to the various external systems. The Integration Appliance supports connecting to endpoints of many types including FTP, SFTP, HTTP, HTTPS, Email (SMTP, POP), SAP, MQ, Web Services, and many commercial database systems.

Flat File Schemas

Defines the content and structure of a Flat File. Flat Files are any non-XML text data, such as comma and tab-delimited files and EDI or industry-specific textual formats, such as the Health Level 7 (HL7) format for the healthcare industry.

Orchestrations

Contains a sequence of activities that performs a specific business process. Orchestrations are the central entity of any integration project.

Stylesheets

Defines how to transform XML data from one format to another. You can upload an XSLT Stylesheet into Studio and add an Apply XSLT activity to your orchestration that starts the XSLT Stylesheet during run time.

Transformations

Contains stand-alone maps that represents a set of one or more mappings between source and destination nodes.

WSDLs

A WSDL is an XML document that describes a Web Service. It defines how to access a Web Service and the operations available for the Web Service.

XML Schemas

Defines the content and structure of XML data. XML Schemas are typically stored in files that end with the .xsd extension. When you upload an XML Schema into a project, you can use that XML Schema to create variables used by the activities of an orchestration.

In addition, the following icons are provided:

- New Orchestration:  Click to create an Orchestration.
- New Endpoint:  Click to create an Endpoint.
- New Flat File Schema:  Click to create a new Flat File Schema.
- New Standalone Map:  Click to create a Standalone map.
- Add Document:  Click to upload a file into the current project.
- Revalidate Project:  Click to validate the orchestrations in the current project.

To view the entities that make up the Project tab as a list view:

1. Select Edit > Preferences from the Studio toolbar menu. The Preferences dialog box displays.
2. Select the Show the entities of the Project tab as a list check box.

To view and configure an existing entity in the Project tab, open an entity choose from one of the following options:

- Double-click the entity in the Project tab
- Select the entity in the Project tab and press Return.

The properties of the entity show in the Properties pane. Clicking an orchestration in the Project tab, validates the orchestration. If the orchestration is invalid, the orchestration warning icon is displayed , and the Validation Results window opens next to the Project tab. Click the error message in the window to open the appropriate panel to fix the error.

To rename or delete an entity in the Project tab, right-click the entity and from the list select Rename or Delete.

To copy and paste an entity in the Project tab:

1. Select an entity in one of the folders in the Project tab.
2. To copy the entity, enter the key sequence: \hat{A} CTRL+C.
3. To paste the entity, enter the key sequence: CTRL+V. A copy of the entity displays in the Project tab.

To view the entities of the Project tab as a list, select the Show entities of the Project tab as a list check box in the Preferences pane of Studio. For more information, see [Setting Preferences](#).

When the Project tab opens, a Dependencies pane shows by default in the Project tab. Selecting an entity in the Project tab shows the entities that are directly dependent on this entity in the project, which entities in the

project would be incomplete if this entity was removed.

For example, if you had FTP endpoint that was used by the **FTP Poll Directory** and **FTP Put File** activities of the BatchOrder orchestration, clicking the FTP endpoint in the Project tab, displays the BatchOrder orchestration in the Dependencies pane because the endpoint is used by the orchestration. If you deleted the FTP endpoint, the BatchOrder orchestration would be incomplete. If you select the BatchOrder orchestration, you would not see the FTP endpoint listed in the Dependencies pane because you can delete the BatchOrder orchestration without affecting the FTP endpoint.

By default, the Dependencies pane appears underneath the Project tab. You can hide the Dependencies pane, by clearing the Show dependant project nodes check box for the Project in the Preferences pane. To view the preferences for a project, select Edit > Preferences from the toolbar menu and then select Project in the left pane. The preferences for the project display.

Activities tab

An activity performs a specific operation in an orchestration. Activities are organized into the following general categories on the Activities tab:

- Transform
- Logic
- Utilities
- Archives
- Cryptoservice
- Database
- Data Quality
- Domino
- Email
- Force.com Bulk API
- FTP
- HTTP
- JDE
- JMS
- MQ
- NetSuite
- PeopleSoft
- SAP
- Salesforce.com
- ServiceMax
- Siebel
- STS
- Web Services
- Workday

Variables tab

Variables are tools for orchestrations. They are used to bind data sources to orchestrations and pass or operate on data values as they pass through the orchestration. The Variables tab provides an area where you can create and edit variables.

Functions tab

Functions are tools used in the Mapping Editor. Use the tools to specify how to transform data as it passes through an orchestration. If the functions provided in the Functions tab do not meet your needs, you can create

your own custom functions.

Memory usage and garbage collection

If the Show memory usage in status bar option is selected in the Preference dialog box, a memory bar and trash can icon is displayed as shown in the following figure. This memory bar displays how much memory is currently used by Studio, compared to the total memory that is currently allocated to Studio (520 MBytes) from the Operating System, as shown in [Figure 1](#):

To request that Studio attempt garbage collection, reclaiming any unused memory inside of Studio, click the trash can icon located to the right of the memory bar. Clicking the garbage collection trash can icon might reduce the amount of memory Studio is currently using internally, potentially increasing the performance of Studio when working with a large project. Clicking the garbage collection trash can does not reduce the memory used by Studio from the operating system, the size of this memory remains constant to the 520 MBytes size initially allocated to Studio.

Entity tabs

To manage the Entities tabs: in the upper half of the Workspace, the entities selected from Project tab are displayed as tabs (for example: Orchestrations and Endpoints). You can manage these tabs by right-clicking a tab and selecting the appropriate action from the menu:

- Close: Close the tab that you right-clicked on to open the menu.
- Close Other Tabs: Close all the open entity tabs except the entity tab that you right-clicked to open the menu.
- Close All Tabs: Closes all the entity tabs currently open.
- Close All But Current Tab: Close all the open entity tabs except the entity tab that is currently selected.

To navigate to hidden entity tabs, when many entitles have been opened from the Project tab, the hidden tabs icon  is displayed as shown in [Figure 2](#).

Figure 2. Hidden Tab

To access the hidden entity tabs, click the hidden tabs icon . A list of all the currently opened tabs is displayed. Select one of the tabs from the menu.

Creating a new project

Each time you create a project, a project properties file is also created with the project name. These property files are used when you export or publish projects.

Procedure

1. Select File > New Project
2. Enter CTRL+N, or click the New Project toolbar icon The New Studio Project dialog box is displayed.
3. Enter a name in the Project Name field. The name of the project cannot be longer than 42 characters and cannot contain any reserved characters or words. For the list of reserved characters and words see

[About Valid Names.](#)

4. In the Project Directory field, click [...], to browse for the folder in which to save the project. The Open dialog box is displayed
5. Select a folder and click Open.
6. Click OK.

Parent topic: [Working with projects](#)

Protecting a project with a password

In Studio, you can protect a project by assigning a password to it.

Before you begin

This password does not protect a project that has been exported from Studio or published to an Integration Appliance. This password is not used by the Integration Appliance.

Procedure

1. Select Project > Permissions > Protect from the Studio toolbar menu. The Enter Project Password dialog box is displayed.
2. In the Enter Password field, enter a valid password. Passwords must be 4-15 characters in length and contain at least one letter and one number. Once a valid password is entered, the message displayed at the end of the dialog box changes from `Enter password` to `Confirm password`.
3. In the Confirm Password field, enter the same password. The message displayed at the end of the dialog box changes from `Passwords do not match` to `Passwords match` when the correct password is entered in the Confirm password field.
4. Click OK.

Results

The project is now protected with a password.

What to do next

Note: Studio does not store passwords. If you forget the password for the project and Studio does not currently have that project open, you must rebuild the project. If the project is still open, you can change the current password as described in the following topics.

- [Changing a password associated with a project](#)
If a project is protected with a password, it can be changed from the Studio toolbar menu
- [Removing a password associated with a project](#)
If a project is protected with a password, it can be removed from the Studio toolbar menu

Changing a password associated with a project

If a project is protected with a password, it can be changed from the Studio toolbar menu

About this task

The option to change the password is only available if the project has already been protected with a password.

Procedure

1. Select Project > Permissions > Change Password from the Studio toolbar menu. The Enter Project Password dialog box displays.
2. In the Old Password field, enter the existing password assigned to the project.
3. In the New Password field, enter a new valid password. Passwords must be 4-15 characters in length and contain at least one letter and one number. Once a valid password is entered, the error changes from `Invalid password selected` to `Passwords do not match`.
4. In the Confirm Password field, enter the same new password. Once the same password has been entered in the Confirm Password field, the message displayed in the dialog box changes from `Passwords do not match` to `Passwords match`.
5. Click OK.

Results

The project password has been changed.

Parent topic: [Protecting a project with a password](#)

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_removing_project_security.html

Opening a Project

When you first launch Studio, the Project last worked on is opened by default. There are several ways to open a different project.

About this task

The following steps explain how to open a project using the menu toolbar. You can have only one project open at a time.

Procedure

1. Select File > Open Project , or select the Open Project  toolbar icon.
2. Navigate to the location of the project you want to open.
3. Select the project to open. Either:
 - o Select a project file that ends in the .sp3 extension and click Open.
 - o To view a project that was recently opened, select File > Reopen Projects > *OldProjectName*, where *OldProjectName* is the name of the recently opened project.

If the project is secure, you must enter a valid password to open it.

What to do next

You can also open a project using the Studio Introduction pane or by using the keyboard.

- Using the Studio Introduction pane, click Open Project to display the Open dialog box
- Using the keyboard, use CTRL+o to select a project file that ends in the .sp3 extension

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_Opening_a_Project.html

Saving a Project

You can save a project using the Studio toolbar.

About this task

To save a project to the file system using the default project name, choose one of the following options:

- SelectFile > Save Project from the Studio toolbar
- Press CTRL+S
- Click the Save Project toolbar icon 

Procedure

1. Choose one from one of the following options:
 - Select File > Save As from the Studio toolbar
 - Press CTRL+AThe Save As dialog box displays.
2. In the Project Name field, enter the new name of the project.
3. Optional: By default, the project is saved into the directory location specified by the Default Create Path field of the Preferences dialog box. To specify a different directory location, click Browse.
4. Click OK.

Results

The Saving Project progress dialog box displays as the current project is saved using the new name. The new project is saved into a directory on the local file system and the new project is opened and displays in the Project tab. The original project remains unchanged since the last time it was saved to the local file system

What to do next

To close the current project, choose from one of the following options:

- SelectFile > Close Project from the Studio toolbar.
- Click the Close Project toolbar icon .

Parent topic: [Working with projects](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_saving_closing_a_project.html

Renaming a Project

You can rename a project using the Studio toolbar.

Procedure

1. Choose one from one of the following options:
 - o Select File > Rename Project from the Studio toolbar
 - o Press CTRL+RThe Rename Project dialog box displays.
2. In the Project Name field, enter the new name of the project.
3. Optional: By default, the renamed project is saved into the directory location specified by the Default Create Path field of the Preferences dialog box. To specify a different directory location, click Browse.
4. Click OK.

Results

If the project was changed since the last save, the current project is saved before the project is renamed.

The Saving Project progress dialog box displays as the current project is renamed and saved into a directory on the local file system using the new name. The current project with the new name is opened and displays in the Project tab. The original project with the old name no longer exists on the local file system.

What to do next

To close the current project, choose from one of the following options:

- Select File > Close Project from the Studio toolbar.
- Click the Close Project toolbar icon .

Parent topic: [Working with projects](#)

Publishing a Project

When you publish a project, Studio connects to an Integration Appliance and directly updates the Integration Appliance with the documents that make up the project. Publish a project when the project is complete, has been validated, and has been tested in Studio. You cannot publish a project that has not been successfully validated.

About this task

You can publish multiple projects to the Integration Appliance.

Note: If you attempt to publish a project from Studio to the Integration Appliance and a project of the same name already exists on the Integration Appliance, whether the project gets published depends on the status of the project on the Integration Appliance:

- If any of the orchestrations in the project have been deployed on the Integration Appliance, the new project does not get updated on the Integration Appliance.
- If all the orchestrations in the project have been removed from the Integration Appliance, the new project from Studio overrides the existing project of the same name on the Integration Appliance.

As an alternative to publishing a project, you can choose to export a project. Exporting is typically used for publishing projects to production environments where administrators need to control the timing and impact of the deployment. For more information about exporting, see [Exporting a Project](#).

Note: To publish a project, Studio relies on the supported SSL and TLS protocols enabled in the SSL/Kerberos - Preferences window. You can select the TLSv2 or TLSv1.2 protocol. The default is TLSv2.

Procedure

1. Select File > Publish Project or the Publish Project toolbar button.  The Publish Project dialog box displays.
2. In the Host name field, enter the host name or the IP address of the Integration Appliance you want to publish the project to. This is the host name for the management interface (mgmt).
3. Enter the `User Name` and `Password` for the Web Management Console (WMC) account for this Integration Appliance. The default account name is `admin` and the default password is `!n0r1t5@C`.
4. Optional: To specify that the project documents are to be sent over HTTPS to the Integration Appliance, select the Security check box.
5. Click OK. Studio connects to the Integration Appliance and updates the Integration Appliance with the documents that make up the project.
6. When the publish is confirmed, click OK.

Parent topic: [Working with projects](#)

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_Publishing_a_Project.html

Exporting a Project

Export saves all the orchestrations, endpoints, schemas, and other items associated with the project, into a single file that ends in the .par extension.

About this task

Exporting is typically used for publishing projects to production environments where administrators need to control the timing and impact of the deployment. When a project is exported to a PAR file (in Studio), an administrator can use the Web Management Console (WMC) to upload the project to the Integration Appliance. This two-step process (exporting to a PAR file and uploading a project using the WMC) is equivalent to publishing a project directly from Studio to an Integration Appliance.

Procedure

1. Select File > Export Project from the toolbar menu or select the Export Project toolbar button . The Save dialog box displays.
2. Navigate to the directory where you want to save the exported project.
3. Optional: Change the name of the exported file. Keep the .par extension.
4. Click Save.
 - o If successfully exported, a project file shows in the specified directory. The file name is the same as the current name of the project with a .par extension. For example, if you export a project named *MySimpleProject*, the project is saved in the *MySimpleProject.par* file. A dialog box displays indicating that the export process was successful.
 - o If there are problems with the project it is not exported; the Exporting Results dialog box displays with a list of problems that must be corrected before the project can be successfully exported.
5. Click OK.

What to do next

For more information about exporting a project into the Integration Appliance using the WMC, see the WMC online help.

Parent topic: [Working with projects](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_Exporting_a_Project.html

Configuring Project Settings

You can assign a unique version number to a project using the Project Settings dialog box.

About this task

When you publish a project to the Integration Appliance, the version number associated with the project is visible in the Web Management Console (WMC). By changing the version number in the Version field, you can

publish different versions of a project, even if the project itself hasn't changed. The different versions of the project are listed separately in the WMC and can be deployed individually.

Procedure

1. Select Project > Project Settings from the menu toolbar. The Project Settings dialog box displays.
2. Enter a version number in the Version field.
3. Enter a description of the project in the Description field.
4. Enter any comments for the project in the Comments field
5. Click OK.

Parent topic: [Working with projects](#)

Setting Preferences

You can specify Project, Orchestration, Flat File, SSL/Kerberos, Session Login, and XML Schema preferences from the Preferences dialog box. You can change preferences at any time.

Procedure

1. Select Edit > Preferences option from the toolbar. The Preferences dialog box opens.
2. In the left pane, select the type of preferences to change:
 - o Appearance
 - o Project
 - o Orchestration
 - o Flat File
 - o SSL/Kerberos
 - o Session Login
 - o XML Schema
 - o Current Project
3. Specify, select, or clear preferences in the dialog box.
4. Click OK.

Results

The tables in the following topics describe the Appearance, Project, Orchestration, Flat File, SSL/Kerberos, Session Login, and XML Schema preferences available from the Preferences dialog box.

Using the Appearance preferences you can change the application display and font.

- [Project Preferences](#)
Project preferences can be set using the Preferences dialog box.

- [Orchestration Preferences](#)

Project Preferences

Project preferences can be set using the Preferences dialog box.

Table 1.

Button or Option Label	Description
Open editor automatically for new orchestrations	<ul style="list-style-type: none"> • If this check box is selected, when you create an orchestration the orchestration is automatically displayed in the main Studio pane. • If this check box is cleared, when you create an orchestration the orchestration is not automatically displayed in the main Studio pane.
Reopen the last project when studio starts	<ul style="list-style-type: none"> • If this check box is selected, the last project opened in Studio is opened again when Studio is restarted. • If this check box is cleared, no project is opened when Studio is restarted.
Always overwrite existing projects	<ul style="list-style-type: none"> • If this check box is selected, when creating a project with the same name as an existing project already saved in the default directory, the new project is created, overriding the existing project and no warning dialog box is displayed. • If this check box is cleared, when creating a project with the same name as an existing project already saved in the default directory, a warning dialog box is displayed asking if you want to override an existing project.
Always ask to save project before closing	<ul style="list-style-type: none"> • If this check box is selected, when a project is closed, a dialog box asking if you want to save the project is displayed even if no changes have been made to the project. • If this check box is cleared, when a project is closed and no changes have been made to the project, a dialog box is not displayed asking if you want to save the project.

Button or Option Label	Description
Show dependant project nodes	<ul style="list-style-type: none"> If this check box is selected, the Dependencies pane is displayed underneath the Project tab. For more information see Dependencies Pane in the Project tab. If this check box is cleared, the Dependencies pane is not displayed underneath the Project tab.
Show memory usage in status bar	<ul style="list-style-type: none"> If this check box is selected, a memory bar displays underneath the 4 sideways-oriented tabs: Project, Activities, Variables, and Functions. For more information see Memory usage and garbage collection. If this check box is cleared, a memory bar does not display underneath the four sideways-oriented tabs: Project, Activities, Variables, and Functions. For more information see Memory usage and garbage collection.
Show the entities of the Project tab as a list	<ul style="list-style-type: none"> If this check box is selected, the entities in Project tab display as a list. If this check box is cleared, the entities in Project tab are grouped in folders.
Clear Recent Projects	Click Clear Recent Projects to clear the cache of projects you have recently opened and listed when the File > Reopen Project toolbar menu option is selected.
Default Create Path	Click Browse... to select the default directory path where new projects are saved.

Orchestration Preferences

Orchestration preferences can be set using the Preferences dialog box.

Table 1.

Button or Option Label	Description

Button or Option Label	Description
By Default Animate Orchestration Views	<p>This is a global option that determines the behavior for all orchestrations. By default, this option is selected and all actions that occur in the Studio Workspace are animated.</p> <p>Clear this option, to turn off workspace animation. When this option is clear and you perform action in the Workspace, such as adding an activity, the Workspace snaps into place.</p> <p>You can override this option at the individual orchestration level, using the Animate Graph orchestration view icon. However, if the global option is modified after you set the option for an individual orchestration, the global change overrides any individual orchestration setting you previously set.</p>
Use Old Orchestration View	Select this option to view an orchestration as it would display in Studio 3.X. When you select this option, Studio 4.X orchestration view improvements are no longer available. For a complete list of 4.X orchestration view improvements, see the Studio Release Notes®.
Maximum Job Instances to be displayed	Determines the maximum number of jobs that can display in the Verify tab. For example, if you specify 2, the status of two jobs display: instance #1 and instance #2. If you run the orchestration again, the Verify tab displays: instance #2 and instance #3.
Show Activity ID	When you select this option, ID numbers display in the activities of an orchestration.
Enforce Strict Validation for Reply activities	By default, this option is selected. If you clear this option, Studio allows more than two Reply activities on the execution path. Reply activities include: Web Services Send Reply , Web Services Send Reply with Fault , and HTTP Send Response .
WS Provide-Generate WSDL compatible with 3.6.x version	<p>Typically, when you upgrade projects that contain Web Services Provide Service activities, the Studio generates a WSDL with a new namespace. Select this option so that Studio keeps the 3.6X WSDLs instead.</p> <p>If you select this option, Studio does not generate WSDLs with the most current namespaces.</p>
CDK Log Enable/Disable	Select this option to view CDK Connector activity log (or flow) in the Verify pane.

Other Preferences

Appearance, Flat File, SSL/Kerberos, Session Login, XML Schema, and Current® Project preferences can all be set using the Preferences dialog box.

Table 1. Appearance Preferences

Button or Option Label	Description
<i>Application</i>	
Use native application frame	Indicates that if you select this check box, the look and feel of the operating system will be applied to the application window.
Use Color Scheme	Indicates the color schemes available to customize your application display. This option is available only if the Use native application frame options is not selected.
<i>Font</i>	
User Interface	Lists the font types available to change the font of the user interface. The Reset button allows you to set the default font.
Data Fields	Lists the font types available to change the font of the data fields. The Reset button allows you to set the default font.

Table 2. Flat File Preferences

Button or Option Label	Description
Maximum Preview Size of Sample File (in KBytes)	<p>When testing a Flat File Schema, this field specifies how many KBytes of data is displayed in the source pane - the left side of the Test tab. This field is useful when you have a large source data file and you need to only view the top portion of the file to design the Flat File Schema.</p> <p>This field does not affect the size of the file that is transformed when you click the Test icon in the Test tab. The entire source data file is transformed if the Maximum Size of Sample File (in KBytes) field is set to a large enough size to load the entire file.</p>
Maximum Size of Sample File (in KBytes)	When testing a Flat File Schema, this field limits the size in KBytes of the test data that is loaded into Studio for testing a Flat File Schema. The maximum supported sample data size is 2000 KBytes. If you specify a value greater than 2000 KBytes in this field, Studio resets the value to 2000 KBytes.

Table 3. SSL/Kerberos Preferences

Button or Option Label	Description
Kerberos Realm	Specifies the Kerberos realm.
Kerberos Server Name	Specifies the Kerberos server name.
KeyStore Password	Provides the password to access the keystore.
KeyStore Path	Specifies the path to the local Java™ keystore.

Button or Option Label	Description
TrustStore Password	Provides the password to access the truststore.
TrustStore Path	Specifies the path to the local Java truststore.
SSL Protocol	Use the drop-down menu to specify the SSL Protocol. TLSv2 is the default and enables all SSL and TLS protocols (including TLSv1.2) for SSL negotiation. TLSv1.2 enables the SSL communication using the TLSv1.2 protocol only.

Table 4. Session Login Preferences

Button or Check Box Label	Description
Username	Studio uses this user name to log in to the Cast Iron® TIPs repository.
Password	Studio uses this password to log in to the Cast Iron TIPs repository.
URL	Specifies the URL to the Cast Iron Service Login. Note: Do not modify the default value.
Host Name	Specifies a proxy host if you choose to use one.
Port	The proxy server port. By default, 8080.

Table 5. XML Schema Preferences. The following preferences determine the number of child levels, which Studio allocates and displays, for each XML Schema (including WSDLs) in the currently opened project.

Button or Check Box Label	Description
Number of child node levels allocated in memory for the schema	Specifies the number of child node levels that are allocated in memory for the XML Schema. The number of child nodes allocated in the internal tree that stores the metadata of the XML Schema in Studio. Note: Specifying a large number of child node levels can adversely affect the performance of Studio. The recommended value for this preference is 6.
Number of recursive node levels	Specifies the number of recursive node levels allowed and graphically displayed. Note: Specifying a large number of recursive node levels can adversely affect the performance of Studio. The recommended value for this preference is 3.
Number of child node levels that are initially expanded when a schema is displayed graphically	Specifies the number of child node levels that are initially expanded when an XML Schema is displayed graphically. For example if this limit was set to 6 in the preferences and a variable was selected for the From Orchestration pane of the Map Inputs task contained 8 node levels (<i>input/po/purchase/widgetId/price/discount/special/december</i>), only the first 6 levels (<i>input/po/purchase/widgetId/price/discount</i>) would be displayed in the Map Inputs task. You can expand a child node manually, by clicking the + sign next to the unexpanded child node. Note: Specifying a large number of child node levels can adversely affect the performance of Studio. The recommended value for this preference is 4.

Button or Check Box Label	Description
Number of child node levels allocated in memory for the substituted types of schema	Specifies the number of child node levels that are allocated in memory for the substituted types of XML Schema. The number of child nodes allocated in the internal tree that stores the metadata of the substituted types of XML Schema in Studio. The default value is 10. The minimum value is 4. Note: Lowering this value decreases the memory requirement for child node levels in Studio.

Note: A word about memory consumption: Studio allocates memory for each variable or parameter displayed in the Variables or Mapper panes and generates metadata in a tree structure with each node containing information about a specific element/complexType. Because elements or complex types have references to themselves, the tree depth of those elements can exceed ten levels, resulting in OutOfMemory errors. To avoid this, use the XML Schema preference parameters to improve memory consumption. For example, you can use the Number of recursive node levels function to limit how many times a self-referring node is added to the tree structure. Additionally, you can use the Number of child node levels allocated in memory for the schema function to control tree depth and prevent Studio from exceeding a certain limit.

Table 6. Current Project Preferences. The following preference determines whether the password is encrypted or not for the current opened project.

Check Box Label	Description
Backwards compatibility with pre-4.5 projects is not required	When checked, encrypts the password upon publishing. This is the default starting with the Cast Iron 4.5 release. Before the 4.5 release, passwords were symmetrically encoded. If you plan to have the current project send the password to pre-4.5 projects, clear the check box. This avoids errors when the password is consumed by pre-4.5 projects.

Creating Configuration Properties

Create configuration properties or name/value pairs in a project. Use configuration properties to supply the default values for destination nodes of a map in the Mapping Editor. Â

About this task

When you add configuration properties to the project, using the Project > Configuration Properties option of the Studio toolbar menu, you can choose from these properties to supply the values for some of the fields in

endpoints and default values for destination nodes in maps.

For example, if you created a configuration property named *myDatabaseName* of String type in Studio. While configuring your database endpoint, click the Database Name field and the  icon displays on the right side of field because at least one configuration property of String type was previously created. Click the  icon and select the *myDatabaseName* configuration property from the menu. The Database Name for the endpoint is supplied by the *myDatabaseName* configuration property during both design time (in Studio) and run time (on the Integration Appliance). A configuration property can be of type String or Password.

A destination node of a map is located in the right pane of the Mapping Editor. For more information, see [Assigning a Default Value for a Destination Node](#).

You can create configuration properties in the Configuration Properties dialog box or use the quick create method.

To create configuration properties using the Configuration Properties dialog box:

Procedure

1. Open a Project.
2. Select Project > Configuration Properties from the toolbar menu. The Configuration Properties dialog box displays.
3. In the Add Name field, enter the name of the property you want to create.
4. From the Type list, select either String or Password.
5. Click Create. The new property name and type display in the properties list.
6. Click in the Value column for the newly created property.
7. Enter a value for the property; if it is of type `password`, the value is masked.
8. Press Enter or click out of the Value table cell to stop editing.
9. Continue adding additional properties as required. When finished, click OK.

Example

Instead of creating configuration properties in the Configuration Properties dialog box, you can use the quick create option to define configuration properties directly from a text field in Studio. Fields that are enabled for the quick create option display a small green globe in the lower-right corner.

You can change the values of the configuration properties using the Web Management Console (WMC), like the configuration properties created in the Configuration Properties dialog box, after publishing a project.

Updating the value of the configuration property in the WMC does not affect the original value of the configuration property, that you defined in Studio.

To create configuration properties using the quick create option:

1. In an Enabled field, click the green globe. The Create Configuration Property window is displayed.
2. In the text field, enter a name for this property.
3. Click Create to save the entry as a reusable property.

The property displays in the current text field, the  icon is replaced by the green globe, and the property is saved in the Configuration Properties dialog box.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_Creating_Configuration_Properties.html

Editing Configuration Properties

You can edit configuration properties in Studio and in the Web Management Console (WMC).

About this task

Editing Configuration Properties in Studio

You can edit specific information for an existing property by opening the Configuration Properties dialog box and double-clicking the entry. This does not include changing the type. If you make a change and click OK, all of the applications of that property are updated automatically. You cannot delete properties that are in use in an orchestration. You can delete only unused properties or properties that you have removed from active orchestrations.

Editing Configuration Properties in the WMC

When the project is published to the Integration Appliance, you can change the values of the configuration properties using the WMC. For example, you can create configuration properties in Studio that stores the following database connection information for a database endpoint: hostname, IP address, username, and password. You can then publish the project to the Integration Appliance, deploy the project, and test against a development database. When testing is complete, you might want to connect to a different database; for example, your production database. Using the WMC, you can update the values of the configuration properties in the project on the Integration Appliance to point to the production database.

Results

Changes you make to configuration properties in a project configuration using the WMC are independent of values you specified for the configuration property in Studio. When you create project configuration properties in Studio and publish the project to the WMC, the WMC displays a Default project configuration. In this project configuration, and any project configuration you generate from the published project, you can use the WMC to modify the configuration property values you specified in Studio before publishing the project.

If you undeploy the project, update the configuration property values using Studio, and publish the project to the WMC again. The existing project configurations do not reflect the changes. To see the changes you just made to the configuration properties (using Studio), you must use the WMC to create a project configuration. This new project configuration displays the configuration property values you specified for the project in Studio.

What to do next

For more information, see "Enhancing the Simple Project" in the Getting Started Guide.

Parent topic: [Working with projects](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_Editing_Configuration_Properties.html

Creating Global Configuration Properties

When a global configuration property is created, you can import the global configuration property into a project as a project configuration property.

About this task

You can use global properties to supply the values for fields in endpoints or for default values for destination nodes in maps. Create global configuration properties in Studio using the Edit > Manage Global Configuration Properties option of the Studio toolbar menu. For example, create a global configuration property named dbPassWord of the type Password in Studio, then create a configuration property in your project by importing dbPassWord.

A global configuration property can be of type String or Password.

Procedure

1. In Studio, click Edit > Manage Global Configuration Properties.
2. Under the Global Property Lists pane, click New. The New Global Properties dialog displays.
3. Enter a name for the new global configuration property list and click OK. You can create one or more global configuration properties for each list.
4. Enter a name for the global configuration property that you want to create.
5. Select either String or Password from the Type list. If you select Password, the value is masked.
6. Click Create.
7. In the Value field, enter the value you want for the property.
8. Click OK. If you want to add more properties to the list, repeat steps 4 through 8.

What to do next

Import project properties into a global properties list by clicking Import, select the project property you want to make global, and click Add.

To delete a global property from a global property list, select the property and click Delete.

Searching for Template Integration Projects (TIPs)

Template Integration Projects (TIPs) are stored in the Cast Iron® solutions repository. Through the Configuration Wizard, TIPs guide you through the configuration steps for an integration scenario. TIPs can be downloaded to your local machine. The login window is pre-populated with the User Name and Password to make it easier for you to download the TIPs, without registration.

Procedure

1. From the Solutions menu, select Search For TIPs. The Login window is displayed with the pre-populated User Name and Password. These credentials have the access privilege only to download TIPs.
Note: You can also log on by clicking the Login link present on the right-hand side, near the memory bar.
2. If you already have the credentials to log on, specify the user name and password. You can specify default login settings for the central repository in the Preferences dialog.
3. Click OK. The Search window is displayed and a confirmation message displays at the end of the main Studio window.
4. In the Search window, choose Keywords, Filter, or My TIPs as the method by which you want to search for TIPs.
 - o If you select the Keywords search option, the Keywords field is displayed.
 - a. Enter a search keyword.
 - b. Click Go. The results are displayed in the Results table and a "Searching ... completed" message is displayed at the end of the Search window. For example, if you enter the keyword USECASES, all TIPs under the USECASES category in the Cast Iron solutions repository are returned.
 - o If you select Filter search option, the filter options: Source Endpoint, Target Endpoint, Integration Patterns, and Searchable Keywords are displayed.
 - a. You must specify a value for at least one filter option. The options lists provide valid values.
 - b. Click Query. The results are displayed in the Results table and a "Searching ... completed" message is displayed at the end of the Search window.
 - o If you select My TIPs, all TIPs that you have created are displayed in the Results table.
5. In the Results table, select a TIP. The details for the project are displayed in the details section.
6. Optional: You can rate the TIP that you have selected.
 - a. Click the Edit Review link. The Publish Review window is displayed.
 - b. Move the slider until the appropriate number of stars are highlighted. Rate the TIP on a scale between 1-5, 5 being the highest rating.
 - c. In the My Title field, add a brief description for your review.
 - d. In the My Summary field, add more details about your review of the project.
 - e. Click OK. Studio submits the review to the Cast Iron solutions repository.
7. In the Search window, click Download. The Select directory where to save the TIP window is displayed.
8. Specify the download directory and click Open. The project is saved to the directory you specified and Studio opens the Configuration Wizard for the project.

Installing Module Provider Libraries

Both IBM® Cast Iron® Studio and the Integration Appliance require library files (.jar and .dll) associated with instances of certain connector types to be imported. For example, the following connectors require additional libraries: Database Connector, JDE, JMS, MQ, PeopleSoft, and SAP. These files must be present in Studio to enable configuration of the endpoints and orchestrations that use any of those connectors.

About this task

For information about installing the required library files on the Integration Appliance using Web Management Console, see the WMC Online Help.

You need access to the connector-specific library files, either on your Studio workstation or through the network.

Procedure

1. With Studio open, select Tools > Install Module Providers. The Add Provider(s) dialog box displays.
2. Click the plus button under the relevant provider name. A text entry field and a browse button display to the right.
3. Click Browse, and use the browse dialog box to locate and select the files. Press the CTRL or SHIFT key to select more than one file.
4. Click Open to import the file contents. The library files display in the Add Provider(s) dialog box.
5. Click OK. When a library is installed or removed you are prompted to shut down Cast Iron Studio to apply the changes.
6. To apply the changes, click Yes then manually restart Cast Iron Studio. The library files are installed and you can proceed with your endpoint configurations. To return to the Add Provider(s) dialog box without applying the changes, click No.

Uploading Files into a Project

You can upload only specific types of files into a project. For example, if you plan on mapping a string to XML data (valid to a particular XML Schema), you must first upload the XML Schema file (ends in the .xsd extension) into the project before mapping the nodes in the XML Schema.

About this task

See [Valid External File Types for a Project](#) for a complete list of valid external file types.

There are three ways to upload a file from the file system into a project:

- Upload files into a project by dragging a file into the Project tab
- Upload files into a project by right-clicking the appropriate folder in the Project tab
- Upload files into a project by clicking Add Document in the Project tab

The following procedure describes how to upload files into a project by dragging a file into the Project tab.

Procedure

1. Select a file from a Windows folder in the local file system and drag into the Project tab.
 - If file is a supported file type and ends in the correct extension, a node displays under the appropriate folder in the Project tab with a default name. For example, if you dragged an XML Schema file called PurchaseOrder.xsd from the file system to the Project tab, a new node called PurchaseOrder shows in the XML Schemas folder of the Project tab. For a list of supported file types see [Valid External File Types for a Project](#).
 - If the uploaded file is an XML Schema or WSDL that includes other XML Schemas, the Uploading Included XML Schemas dialog box automatically displays. For more information, see [Uploading Included XML Schemas](#).
2. Optional: Change the default name.
3. Press Return.

- [Uploading Files into a Project using the Mouse](#)

There are three ways to upload a file from the file system into a project, this procedure describes how to upload files into a project by right-clicking the appropriate folder in the Project tab.

- [Uploading Files into a Project using the Add Document Button](#)

There are three ways to upload a file from the file system into a project, this procedure describes how to upload files into a project by clicking the Add Document button in the Project tab.

Uploading Files into a Project using the Mouse

There are three ways to upload a file from the file system into a project, this procedure describes how to upload files into a project by right-clicking the appropriate folder in the Project tab.

Procedure

1. In the Project tab, right-click the appropriate folder for the type of file you are uploading, and select Add Document from the list. For example, if you are uploading an XML Schema file, select the XML Schemas folder in the Project tab. The Add Document dialog box displays.
2. In the Location field, [specify the location of the file from an external web location or from the file system](#).
3. Optional: In the Name field, enter the name for the entity that you want to display in Studio. The name you enter must not exceed 42 characters, and must not contain any reserved characters. For a list of reserved characters see [About Valid Names](#).
4. Click OK.

Results

If the uploaded file is an XML Schema or WSDL that includes other XML Schemas, the Uploading Included XML Schemas dialog box automatically displays. For more information, see [Uploading Included XML Schemas](#).

The file is uploaded into the project.

Uploading Included XML Schemas

An XML Schema or WSDL document can include other XML Schemas in the main document, using Schema Inclusion, Schema Inclusion with Redefinition, or Importing a Namespace.

About this task

Schema Inclusion

You can include other XML Schema fragments into the main XML Schema or WSDL using the `include` element as shown by the following example: `<xsd:include schemaLocation="myTypes.xsd"/>`

Schema Inclusion with Redefinition

The XML Schema specification supports redefining definitions included by other XML Schema fragments in the current XML Schema or WSDL. For example, the `myTypes.xsd` XML Schema fragment defines a complex type called `PurchaseOrderType`. Another XML Schema called `PurchaseOrder.xsd` includes the `myTypes.xsd` XML Schema fragment using the `redefine` element and redefines the complex type called `PurchaseOrderType`.

You can include other XML Schema fragments into the main XML Schema or WSDL using the `redefine` element as shown in the following example: `<xsd:redefine schemaLocation="myTypes.xsd"/>`

Importing a Namespace

You can include a namespace into the current document using the `import` element as shown in the following example: `<xs:import namespace="http://acme.com/ns/example schemaLocation="mySchema.xsd" />` .

When you add or upload the main XML Schema or WSDL to the project using the Add Document dialog box, you are prompted to locate any included XML Schema or XML Schemas into the project, as shown in the following procedure. All the included XML Schemas must be located before the main XML Schema or WSDL document shows in the Project tab and can be used in the project.

Procedure

1. Upload an XML Schema or WSDL document into the current project. If the XML Schema or WSDL document includes other XML Schemas, the Uploading Included XML Schemas dialog box displays listing all the included XML Schemas as shown in [Figure 1](#).

Figure 1. Uploading Included XML Schemas

If the included XML Schema is automatically located, the checkmark icon  displays next to the XML Schema in the Uploading Included XML Schemas dialog box as shown for the `commonTypes.xsd` XML Schema in the preceding figure. If the main XML Schema or WSDL was located on the local file system, Studio looks for the included XML Schemas in the same directory and automatically locates them; for example, if you uploaded `mySchema.xsd` from the `C:\temp` directory and `mySchema.xsd` includes the `commonTypes.xsd` XML Schema, Studio automatically locates the `commonTypes.xsd` XML Schema in the `C:\temp` directory. If the included XML Schema is not automatically located, the warning icon  displays next to the XML Schema in the Uploading Included XML Schemas dialog box as shown for the `poTypes.xsd` XML Schema in [Figure 1](#).

2. Repeat the following steps to locate all the unlocated XML Schemas:
 - a. Select the XML Schema in the Uploading Included XML Schemas dialog box. The XML Schema is highlighted in the table as shown in [Figure 2](#).

Figure 2. Upload an XML Schema

- b. Click Locate. The Locate the Selected XML Schema dialog box is displayed.
 - c. In the Location field, specify the location of the included XML Schema from an external web location or from the file system.
 - d. Click OK. If the XML Schema is located, the checkmark icon  displays next to the XML Schema in the Uploading Included XML Schemas dialog box.
3. By default, the Store all the includes in the same project node as the main document check box is selected. When this check box is selected, the included XML Schemas and the main XML Schema or WSDL are uploaded as a single project node. When this check box is cleared, all the included XML Schemas and the main XML Schema or WSDL are all displayed separately in the Project tab. A checkmark icon shows next to every listed XML Schema indicating that all the included XML Schemas have been located.
4. Click OK.

Example

If the Store all the includes in the same project node as the main document check box is selected, only the main XML Schema or WSDL displays in the Project tab as shown in [Figure 3](#).

Figure 3. Example

With the check box selected, the included XML Schemas are still uploaded into the project but are not displayed in the Project tab, so you cannot individually update these XML Schemas in the project as described in [Uploading Included XML Schemas](#).

If the Store all the includes in the same project node as the main document check box is cleared, the main XML Schema or WSDL displays and all the included XML Schemas are uploaded in the project and show in the Project tab as shown in [Figure 4](#).

Figure 4. Example

With the check box cleared, all the included XML Schemas can be individually updated as described in [Uploading Included XML Schemas](#).

Note: If possible, always load the main XML Schema or WSDL with this check box selected (as one project node) to reduce potential dependency conflicts between XML Schemas. For example, if you upload the main *myTypes.xsd* file into the project with the Store all the includes in the same project node as the main document check box cleared, the following XSD files are also uploaded and show in the Project tab:

- `commonTypes.xsd`
- `poTypes.xsd`

If you created and uploaded a third XSD file called *myTypesTwo.xsd* that also included and used the types defined in the *commonTypes.xsd* file, and you then changed the names of the types defined in the *commonTypes.xsd* and used in *myTypes.xsd* outside of Studio and uploaded new versions these files, the *myTypesTwo.xsd* file in the project still refers to the original names of the types and is now invalid.

Specifying the Location of a File to Upload

Files can be uploaded into a project from a web location (HTTP or FTP Server) or from the local file system.

Procedure

1. To specify a location for the file from the local file system, choose from one of the following options:
 - Click Browse to browse for the file, and click Open.
 - In the Location field, enter the URI of the file on the local file system, for example:
`file:/C:/temp/mySchema.xsd`
2. To specify a location for the file from an external web location (FTP or HTTP Server), in the Location field enter the URI of the file using any of the following format descriptions:
 - `http://[username:password@]hostname[:portNumber]/location`
 - `https://[username:password@]hostname[:portNumber]/location`
 - `ftp://[username:password@]hostname[:portNumber]/location`

The preceding format descriptions contain the following representations:

- brackets [] - represent optional parameters and should not be included in the URI
- username - specifies the user name to connect to the HTTP or FTP server
- password - specifies the password of the specified user name to connect to the HTTP or FTP server
- portNumber - specifies the port number to use to connect to the HTTP or FTP server
- location - specifies the URL path to find the file. The URL must include the name of the file as shown in the following example.

Example

To upload the *mySchema.xsd* file from the *acme.com* FTP server in the */input* directory using the username *bob* with a password of *snippy1*, specify the following string in the Location field:

- `ftp://bob:snippy1@acme.com/input/mySchema.xsd`

Valid External File Types for a Project

When building orchestrations, you can upload XML Schemas or other files into your project to complete configuration tasks. External files are used in connection activities and orchestrations that use a message that Studio cannot generate an XML schema for automatically. You must supply an XML schema or DTD if the message must be transformed or if you need to define a job key for the message.

The types of files that you can upload into a project and the file extensions they are required to include:

Table 1.

Type	File Extension	Description
XML DTD	*.dtd	XML Document Type Definitions (DTDs) define XML message formats using a non-XML syntax. Studio automatically converts DTDs to XML Schemas when you load them into a project.
Web Services Definition Language	*.wsdl	An XML document that defines the W3C Web Services Definition Language. Studio uses WSDLs to describe all messages in integration transactions.
XML Schema	*.xsd	A definition of an XML message format using the W3C XML Schema language. Studio uses XML Schemas to describe all messages in integration transactions. Note: Only global elements are shown as schema types in Studio. A global element is an immediate child of the schema element. If the schema file contains no global elements, then the schema will appear to be empty in Studio.

About Valid Names

To be valid, the names for projects, Endpoints, orchestrations, stylesheets, Flat File Schemas, XML Schemas, WSDLs, and transformations must not exceed 42 characters and must not contain any of the reserved characters or words.

Reserved characters or words are listed in the following tables.

The names of activities must not exceed 30 characters and must not contain any of the reserved characters listed in the table provided in [Table 3](#).

Table 1. Reserved Characters

Reserved Characters	Description
&	ampersand
{ } [] < > ^	any brackets
*	asterisk
\	backslash
^	caret
:	colon
\$	dollar sign
/	forward slash
#	number sign
()	parenthesis
	pipe
.	period
?	question mark
;	semicolon
^	space
~	tilde

Table 2. Reserved Words for Windows

Undo and Redo Operations

Studio stores up to the last 100 actions you make and you can undo and redo those actions. You can undo and redo an action that you take on the fields in the UI, orchestration views, Mapping Editor, project tree, configuration properties, and variable panel activities.

Before you begin

Note: When you close Studio, the history of actions you have taken is cleared and you cannot undo or redo actions that occurred prior to you closing Studio.

Procedure

1. Select the Edit menu.
2. Select Undo, to undo the last action.
3. Select Redo, to redo the last action.

Results

You can also undo and redo actions using the following keyboard shortcuts:

- Ctrl + Z: Undo last action
- Ctrl + Y: Redo last action

Updating a Changed XML Schema

If you created a project that uses an XML Schema and the XML Schema changes, you can attempt to update the existing XML Schema with the new XML Schema.

About this task

Updating to a new XML Schema means that any of the project entities that interface with the XML Schema might be affected by the change. The following project entities can be affected by XML Schema change:

- Maps that refer to the XML Schema, both stand-alone maps and the inline maps in activities.
- Variables that refer to the XML Schema.

- XPath expressions in orchestrations.
- XPath expressions used in job keys.
- Some Endpoint configurations.
- Conditions defined in orchestrations.

During the update process, Studio reports which project entities are affected by the change before the change is committed.

For example, an XML Schema defines an input parameter to the Map Variables activity. In the From Orchestration pane of the Map Variables activity there are links between the nodes of the input parameter to the nodes of the output parameters. When the XML Schema that defines the input parameter is updated to the new XML Schema, those links might no longer be valid if the input nodes have been renamed or removed in the new XML Schema. You must recreate the links in order for the orchestration to be valid again.

In some cases, Studio completely prevents the uploading a new XML Schema for the following reasons:

- The new XML Schema is invalid.
- Uploading the new XML Schema to replace the existing one, would result in an invalid project.

Note: Updating an existing XML Schema (as described in the following procedure) is different from loading multiple XML Schemas into a project by either dragging a file into the Project tab or right-clicking on the XML Schemas folder in the Project tab and selecting Add Document. Updating an existing XML Schema replaces the existing XML Schema in the project while uploading the same file into the Project tab creates two instances of the XML Schema in the project.

Procedure

1. Open the XML Schema that is already used in the project that is to be replaced by the new XML Schema. Open the graphical representation:
 - a. Open the Project tab and double-click the XML Schema in the XML Schemas directory. The nodes of the XML Schema display in the XML Schema tab.
 - b. In the XML Schema tab, click any node of the XML Schema.
2. Select a new XML Schema to replace the existing XML Schema, using one of the following options:
 - In the graphic representation, you can drag an XML Schema file from the local file system onto the XML Schema open in the XML Schema tab.
 - Select the File > Update option on the Studio toolbar menu. The Update the Current Schema Document dialog box displays. In the Location field, specify the location of the new XML Schema from an external web location or from the file system.
3. Click OK. The Updating the XML Schema Affects the Listed Dependant Project Entities dialog box displays and any project entities that are possibly affected by the replacement of the original XML Schema with the new XML Schema are listed.
4. Optional: In the dialog box, click any of the listed dependent entities to view the affected entity in Studio.
5. Click Update. Studio attempts to update the project with the new XML Schema and the result of the attempted update depends on the following conditions:
 - If any of the changes in the XML Schema would result in a corrupted project after the update or the new XML Schema is invalid, an Error dialog box displays describing the problem with the XML Schema. Click OK. The update is canceled, the XML Schema reverts to the original XML Schema, and the project is not changed.
 - If the changes to the XML Schema would not result in a corrupted project and the XML Schema is valid, the update occurs and the original XML Schema is replaced by the new XML Schema. Some of the project entities might be invalid after the update and might require clean up. For example, links in the Map Inputs and Map Outputs panes might need to be recreated after the update. To find the validation errors, open an orchestration and select Orchestration > Validate from the Studio toolbar menu.

6. Click Close.

Using the HTTP Post Utility

This utility provides a simple HTTP client interface that enables you to post messages/requests to HTTP servers, which is useful for orchestrations that have an **HTTP Receive Request** activity as the starter activity.

About this task

To use this utility, either Studio or the Integration Appliance must be a web server capable of receiving messages from any http client interface.

Procedure

1. From the Windows Start menu, choose Programs > IBM > Cast Iron Studio > HTTP Post Utility. A web browser opens and displays the Post a Document page.

Note: If you are using the HTTP Post Utility with Internet Explorer 8, you must click the Information Bar and select Allow Blocked Content to avoid duplicate forms being displayed.

2. In the URL of Inbound Connector field, specify the hostname of the HTTP server, followed by the HTTP path.
3. In the Document to Post field, you have two options:
 - o Click Browse and open an existing file.
 - o Enter the message into the text field.
4. Click Submit to post the message.

Orchestrations

- [Configuring an orchestration to orchestration connection](#)
You can configure a Web Service endpoint to call another Web Service orchestration stored in the Integration Appliance, in the same project.
- [Creating an orchestration](#)
There are three steps to creating a completed orchestration: Create the new orchestration, rename the orchestration, and build the orchestration.
- [Renaming an orchestration](#)
Orchestrations are given default names when they are created. You can rename it from the Project tab.
- [Building an orchestration](#)
Studio provides visual cues in the workspace so that it is easier to see and control the placement of activities in an orchestration. When you drag-and-drop activities from the Studio Toolbox to the workspace, a green circle icon displays the target location in the orchestration where the activity is to be placed. When adding activities to the branches of logic activities, Studio highlights the target branch.
- [Verifying orchestrations](#)
Studio can simulate the Cast Iron® operating system (CIOS) runtime so that you can test orchestrations within a project and resolve any issues before deploying the project to the Integration Appliance.
- [Using SSL in Studio](#)
The Secure Sockets Layer (SSL) is the standard security technology for establishing an encrypted link between a server and a client. The encrypted link ensures that all data passed between the server and clients remain private and unchanged. To create an SSL connection a server requires an SSL certificate. This section provides an overview of using SSL in Studio, discusses Transport Layer Security (TLS) and SSL security, discusses certificates and supplies the procedures you need to properly import Certificate Authority (CA) and end-entity certificates and private keys for use when verifying SSL client authentication.
- [Importing an end-entity certificate](#)
An end-entity certificate is a digitally-signed statement issued by a Certificate Authority to a person or system. It binds a public key to some identifying information and is used for encryption, authentication, digital signatures and other purposes. The term “end-entity” is used to distinguish it from a

Certificate Authority certificate. The signer of the statement is the issuer and the entity discussed in the certificate is the subject.

- [Importing a Certification Authority \(CA\) Certificate](#)

Abbreviated as CA, a Certification Authority is a trusted third-party organization or company that issues certificates used to create digital signatures and public-private key pairs. Because they guarantee that the two parties exchanging information are really who they claim to be, CA's are a critical component in data security and electronic commerce. Although the relationship between CA's is most commonly hierarchical, CA certificates can also be used to establish trust relationships between CA's in two different public key infrastructure (PKI) hierarchies. A PKI is the set of people, policies, procedures, hardware, and software used in creating, distributing, managing and using digital IDs. In all of these cases, the CA certificate is critical to defining the certificate path and usage restrictions for all end-entity certificates issued for use in the PKI.

- [SSL server authentication](#)

SSL server authentication verifies that sites you communicate with are who they claim to be. Authentication confirms a server's identity through standard techniques of public-key cryptography to ensure that a server's certificate and public ID are valid and have been issued by a certificate authority listed in the client's list of trusted CA's.

- [Testing an SSL server connection](#)

After creating an endpoint for the server using SSL, you are ready to test the SSL server connection.

- [SSL client authentication](#)

Client authentication is similar to server authentication except that the server requests a certificate from the client to verify that the client is who it claims to be. The certificate must be an **X.509** certificate and signed by a certificate authority trusted by the server. You can only use client authentication when a server requests a certificate from a client. Not all servers support client authentication.

- [Using the Log Viewer](#)

Orchestration monitoring data is displayed in the Log Viewer in a table or text format.

- [Viewing an orchestration](#)

You can use orchestration view icons on the workspace, and View options from the Studio toolbar menu to manipulate your orchestration view in the workspace.

- [Validating an orchestration](#)

An orchestration must be valid (complete and correct) before you can publish it to the Integration Appliance. Use the validation feature in Studio to validate your orchestration.

- [Working with activities in an orchestration](#)

You can cut, copy, and paste activities, drag activities in an orchestration and add and delete new activities.

- [Printing an orchestration](#)

You can print an orchestration directly or view a print preview of an orchestration.

- [Processing orchestration jobs sequentially](#)

You can use the Process Orchestration Jobs Sequentially option when an orchestration contains activities that can conflict with each other when multiple instances of the orchestration are running. An instance of an orchestration is also known as an orchestration job.

- [Enabling persistence](#)

The Orchestration pane contains an Enable Persistence check box that by default is selected. The setting of the Enable Persistence check box affects the way orchestration jobs are restarted after a failure.

- [Adding a global exception handler to an orchestration](#)

During run time if any of the activities of the orchestration throws an exception, and a global exception handler has been enabled, the global CatchAll branch is run.

- [Saving an image of an orchestration](#)

You can save a graphical image of the current orchestration as a ,jpg file.

Configuring an orchestration to orchestration connection

You can configure a Web Service endpoint to call another Web Service orchestration stored in the Integration Appliance, in the same project.

About this task

You can configure an Orchestration to Orchestration connection by specifying the transport protocol to the endpoint location as local:// instead of the conventional http://.

You apply this option to either call (invoke) or provide endpoint type.

Procedure

1. Open a new or existing Web Service endpoint.
2. In the Type section, select either the Invoke option or Provide option. Invoke is selected by default.
 - o If you select the Invoke option, complete the following steps:
 - a. From the Location drop-down list, select Local
 - b. From the Orchestration drop-down list, select the orchestration you want to call.
 - c. From the WS Provide Activity drop-down list, select an activity.
Note: This activity is displayed only if the selected orchestration has a Web Services Provide Service starter activity and Local as the relevant endpoint. If you select an orchestration that does not have a Web Services Provide Service starter activity, then the WS Provide Activity menu is empty.
 - o If you select the Provide option, complete the following steps:
 - a. From the Transport drop-down list, select Local.
 - b. In the Path field, enter the path which is used to call the Provide activity.

Parent topic: [Orchestrations](#)

 Last updated: Wednesday, February 17, 2016

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring_an_Orchestration_to_Orchestration_Connection.html

Creating an orchestration

There are three steps to creating a completed orchestration: Create the new orchestration, rename the orchestration, and build the orchestration.

Procedure

1. Complete one of these three steps to create a new Orchestration:
 - o To create an orchestration from the toolbar menu, select Project > New Orchestration. A new orchestration is opened in the workspace. The new orchestration name is added to the Orchestrations folder in the Project tab.
 - o Click the New Orchestration button  in the Project tab.
 - o Right-click the Orchestration folder and select New Orchestration. A new orchestration opens in the main Studio pane. The new orchestration with a default name is added to the Orchestrations folder in the Project tab.
2. Optional: Change the default name.
3. Press Return.

Parent topic: [Orchestrations](#)

 Last updated: Wednesday, February 17, 2016
<file:///dcs/markdown/workspace/Transform/out.html>

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_building_an_orchestration.html

Verifying orchestrations

Studio can simulate the Cast Iron[®] operating system (CIOS) runtime so that you can to test orchestrations within a project and resolve any issues before deploying the project to the Integration Appliance.

Before you begin

When initiating a test run, you can start a single orchestration, or all the orchestrations in a project. Studio runs one orchestration job for each orchestration. You can start and stop orchestrations, and view orchestration monitoring logs from the Studio toolbar or from the Verify tab.

If the orchestration is invalid, a message dialog is displayed showing possible resolutions. In the workspace, Studio highlights each activity in the orchestration as the activity is processing the data. As Studio runs the orchestration, the Verify tab shows a tree-view of the orchestration job details including; activity name, processing status, variable/parameter names, and variable/parameter data. If an error occurs, Studio highlights the node where the error occurred. Clicking the node links you to the location of the error, where you can resolve any issues before running another instance of the orchestration. ^Â

When you click a node in the tree-view, Studio displays in the Properties Pane the Checklist task that corresponds to the node. For example, when you click an activity node, the Configure panel for the activity is

displayed in the Properties Pane. When you click the Map Outputs node, the Map Outputs panel is displayed in the Properties Pane. If you click a mapping variable or parameter, the data is displayed in the Variable/Parameter Message Data section of the Verify tab.

Although Studio only runs one orchestration job for each orchestration, you can start the same orchestration multiple times. The Verify tab shows the results for each run of the same orchestration under a separate instance. For example, *Instance #1* and *Instance #2*. An orchestration job must be complete before you can run another instance of the same orchestration.

Note: Studio does not persist the results of the runtime test. When you close the orchestration tab, you lose the runtime results for the orchestration.

About this task

Depending on the activities in the orchestration, Studio may require more input to run the orchestration job. For example, an orchestration with a database activity requires that you generate database assets before running the orchestration in Studio, just as you must do in the WMC before running the orchestration on the Integration Appliance. If the activities in the orchestration use the Secure Sockets Layer (SSL), you may need to understand SSL concepts and you may need to import certificates before verifying the orchestration. See [Using SSL in Studio](#) for more information.

If the orchestration contains an HTTP Receive Request activity, you must post a message to the specified URL. Use the HTTP Post Utility to post a message. If the orchestration contains an FTP Poll activity, you must place a file in the specified location, as prompted by Studio, before the orchestration can run.

Since you can use the Verify tab to simulate the runtime on the Integration Appliance, you can also specify Kerberos Protocol settings in Studio to test the settings before deploying to the Integration Appliance. Specifying these setting in Studio does not impact the runtime on the Integration Appliance. You must specify the Kerberos Protocol settings in the WMC to allow the Integration Appliance to authenticate the server that the Integration Appliance is communicating with. For more information about specifying Kerberos Protocol settings for the Integration Appliance, see the WMC Online Help.

Procedure

To specify Kerberos Protocol settings in Studio:

1. In Studio, select Edit > Preferences... . The Preferences dialog is displayed.
2. In the navigation pane, select SSL > Kerberos.
3. Specify the Kerberos Server Name.
4. Specify the Kerberos Realm.
5. Click OK.

Example

You can now test the orchestration, using the Kerberos Protocol, within Studio.

Table 1. Navigating the Verify Tab toolbar

Icon	Description
▶ ⌂	Starts the open orchestration. The orchestration must be valid before Studio can run an orchestration job.

Icon	Description
	Starts all the valid orchestrations in the project that are not already running. If an orchestration is already running when you click this icon, Studio does not rerun the orchestration. 
	Stops the running orchestration job immediately. Studio does not allow the orchestration job to complete before stopping.
	Stops all running orchestration jobs immediately. Studio does not allow the orchestration jobs to complete before stopping.
	Shows orchestration monitoring data in a table or text format. For more information about the Log Viewer, see Using the Log Viewer .
	In the Workspace, highlights the activities in the execution path of the orchestration job, so you can follow the logic Studio used to complete the orchestration job. Different instances can have a different path depending on the inputs and orchestration logic. Click this icon to toggle between providing and not providing a highlighted path.
	Assigns the results from the selected instance to the Map Inputs and Map Outputs, so that when you run a test from the Properties Pane, Studio populates the inputs and outputs with the results of the completed orchestration job.
	Deletes one or more selected instances from the orchestration details tree. To delete multiple instances hold the Shift key or Ctrl key, select the instances you want to delete, and click the icon.
	Expands all the nodes under the selected node in the orchestration details tree.
	Collapses all the nodes under the selected node in the orchestration details tree.
	Expands a single node under the selected node in the orchestration details tree.
	Collapses a single node under the selected node in the orchestration details tree.

Using SSL in Studio

The Secure Sockets Layer (SSL) is the standard security technology for establishing an encrypted link between a server and a client. The encrypted link ensures that all data passed between the server and clients remain private and unchanged. To create an SSL connection a server requires an SSL certificate. This section provides an overview of using SSL in Studio, discusses Transport Layer Security (TLS) and SSL security, discusses certificates and supplies the procedures you need to properly import Certificate Authority (CA) and end-entity certificates and private keys for use when verifying SSL client authentication.

SSL and Transport Layer Security

TLS 1.0 represents an upgrade of SSL 3.0. As an example, the TLS handshake protocol for establishing client/server authentication and encryption differs from the SSL handshake protocol. Additionally, TLS is now more extensible. Although they cannot interoperate, TLS provides a mechanism by which a TLS 1.0 implementation can revert to an SSL 3.0 implementation.

The TLS protocol uses public-key and symmetric-key cryptographic technology. Public-key cryptography uses a public key and a private key. Information encrypted with one key can be decrypted only with the other key. For example, information encrypted with the public key can be decrypted only with the private key.

Each server's public key is published, while the private key is kept secret. To send a secure message to the server, the client encrypts the message by using the server's public key. When the server receives the message, it decrypts the message with its private key.

Symmetric-key cryptography uses the same key to encrypt and decrypt messages. The client randomly generates a symmetric key to be used for encrypting all session data. The key is then encrypted with the server's public key and sent to the server.

TLS provides three basic security services:

- Message privacy – Achieved through a combination of public-key and symmetric-key encryption. All traffic between a client and a server is encrypted using a key and an encryption algorithm negotiated during session setup.
- Message integrity – Ensures that session traffic does not change en route to its final destination. TLS and SSL use a combination of public/private keys and hash functions to ensure message integrity.
- Mutual authentication – Exchange of identification through public-key certificates. Client and server identities are encoded in public-key certificates, which contain the following components:
 - Subject's distinguished name
 - Issuer's distinguished name
 - Subject's public key
 - Issuer's signature
 - Validity period
 - Serial number

You can also use secure HTTP (HTTPS) to ensure that a client's security information is not compromised when downloaded from a server.

Certificates

SSL uses digital certificates to authenticate the identity of the server and optionally the client. Digital certificates are issued by a Certificate Authority (CA), a trusted agency that is authorized to issue, renew and revoke digital certificates after verifying the identity and legitimacy of the requesting party. A CA certificate, which may be a root CA certificate or a subordinate CA certificate, includes the CA's signature and the period of validity. A CA guarantees the connection between a key and another CA or end-entity. A end-entity is a person, a role, an organization, a pseudonym or a piece of hardware or software.

Encryption and authentication are performed by means of a public and a private key. The public key is embedded into a certificate, known as a site or server certificate. The certificate contains several items of information, including the name of the CA that issued the certificate, the name and public key of the server or client, the CA's signature and the certificate's date and serial number. The private key is created when you create a self-signed certificate or a CA certificate request and is used to decrypt messages from clients.

A SSL or TLS session is established in the following sequence:

1. The client and the server exchange hello messages to negotiate the encryption algorithm and hashing function (for message integrity) to be used for the session.
2. The client requests an *ITU-T standard X.509* certificate from the server to prove its identity. Optionally, the server can request a certificate from the client. Certificates are verified by checking the certificate format, the validity dates and by verifying that the certificate includes the signature of a trusted certificate authority (or is self-signed).
3. The client randomly generates a set of keys that is used for encryption. The keys are encrypted with the server's public key and securely communicated to the server.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SSL_overview.html

Importing an end-entity certificate

An end-entity certificate is a digitally-signed statement issued by a Certificate Authority to a person or system. It binds a public key to some identifying information and is used for encryption, authentication, digital signatures and other purposes. The term "end-entity" is used to distinguish it from a Certificate Authority certificate. The signer of the statement is the issuer and the entity discussed in the certificate is the subject.

About this task

To import an end-entity certificate and private key, you must import a file in PKCS#12 format using the Java `keytool -importkeystore` command. PKCS #12, the successor to PFX from Microsoft, defines a file format commonly used to store *X.509* private keys with accompanying public key certificates, protected with a password-based symmetric key. PKCS #12 format files typically have a file extension of .pfx or .p12.

The following steps provide an example of how to import an end-entity certificate:

Procedure

1. Navigate to the Studio security directory. For example, C:\Program Files\IBM\WebSphere Cast Iron Studio 6.0\security.
2. Copy the PKCS #12 format file into Studio security directory, for example C:\Program Files\IBM\WebSphere Cast Iron Studio 6.0\security\certificate.p12.
3. Import the certificate and private key into the Studio keystore using the `keytool -importkeystore` command. For example: `keytool -importkeystore -deststorepass "keystore admin" -destkeystore certs -srckeystore certificate.p12 -srcstoretype PKCS12 -srcstorepass <certificatePswd> -srcalias <certificateAlias>`.

Results

At the conclusion of these steps, the certificate is imported into your Studio security directory. For more information about the `keytool -importkeystore` command, see:

<http://www.ibm.com/developerworks/java/jdk/security/60/secguides/keytoolDocs/keytool.html#importKeyStore>.

Importing a Certification Authority (CA) Certificate

Abbreviated as CA, a Certification Authority is a trusted third-party organization or company that issues certificates used to create digital signatures and public-private key pairs. Because they guarantee that the two parties exchanging information are really who they claim to be, CA's are a critical component in data security and electronic commerce. Although the relationship between CA's is most commonly hierarchical, CA certificates can also be used to establish trust relationships between CA's in two different public key infrastructure (PKI) hierarchies. A PKI is the set of people, policies, procedures, hardware, and software used in creating, distributing, managing and using digital IDs. In all of these cases, the CA certificate is critical to defining the certificate path and usage restrictions for all end-entity certificates issued for use in the PKI.

About this task

Perform the following steps to import a CA certificate.

Procedure

1. Open a command window.
2. Navigate to the server, and locate the certificate file `ca-cert` stored in the server.
3. Copy the `ca-cert` file and then navigate to the workstation where Studio is installed.
4. Using the command window, paste the CA certificate copy in the home directory of Studio: `C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x`.
5. Navigate to the security directory of Studio: `C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x\security`.
6. Run the following command to import the CA certificate file into Studio: `..\jre\bin\keytool.exe -import -v -keystore cacerts -storepass changeit -file ..\castiron_ca_cert.pem -alias alias_name` Where *alias_name* is the alias of the server CA certificate.
7. When you are prompted for a yes or no, type yes (**Y**) and press **Enter**.
8. Exit the command window.

Results

At the conclusion of these steps, the certificate is imported into your Studio security directory. For more information about the `keytool -import` command, see [keytool - Key and Certificate Management Tool](#).

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SSL_import_a_certif_authority_certif.html

SSL server authentication

SSL server authentication verifies that sites you communicate with are who they claim to be. Authentication confirms a server's identity through standard techniques of public-key cryptography to ensure that a server's certificate and public ID are valid and have been issued by a certificate authority listed in the client's list of trusted CA's.

Communication with "trusted" servers that possess authentication certificates issued by a certificate authority is critical to establishing a secure environment. Authentication certificates are digitally signed documents which bind the public key to the identity of the private key owner. Authentication happens at connection time and is independent of the application or application protocol. With SSL, authentication is performed by an exchange of certificates, which are blocks of data in a format described in the **X.509 ITU-T standard**. **X.509** certificates are issued and digitally signed by a certificate authority.

However using SSL does not guarantee that the client is communicating with the correct server. Consider the following scenario, in which "Server1" and "Server2" both have valid certificates from a CA that the client ("Client") trusts. Client wants a secure session with Server1, but Server2 wants to eavesdrop on their communication and is physically located in a place that makes it possible to do so:

1. Client sends a request for an SSL session to Server1. Instead, the request (and all subsequent traffic) goes through Server2. Instead of forwarding Client's request to Server1, Server2 responds directly to the request by sending its own certificate to Client.
2. Client receives Server2's certificate and checks its list of trusted CAs. Since Server2's certificate is signed by the same CA as Server1's certificate, Client accepts the certificate and creates a secure session with Server2.
3. Having completed the secure session with Client, Server2 requests and creates its own SSL session with Server1. From this point, Client sends encrypted information to Server2. Server2 decrypts the information, re-encrypts it, then sends it to Server1. It does the same for information flowing in the opposite direction. The result is that Server2 is able to read it and even change it, even though all data is encrypted as it flows over the Internet.

SSL server authentication is designed to prevent this outcome. When server authentication is enabled, the client, after ensuring that the server's certificate can be trusted, checks that the Internet name in the certificate matches the Internet name of the server. If they match, the SSL negotiation continues. If not, the connection ends.

With server authentication enabled, the security scenario outlined above would proceed as follows:

1. Client sends a request for an SSL session to Server1. The request (and all subsequent traffic) actually goes through Server2. Instead of forwarding Client's request to Server1, Server2 responds directly to Client's request by sending its own certificate to Client.
2. Client receives Server2's certificate and checks its list of trusted CAs. Since Server2's certificate is signed by the same CA as Server1's certificate, Client accepts the certificate and creates a secure session with Server2.

3. After the secure session has been completed, but before any real data has been sent or received, Client compares the Internet name in the certificate it received with the name of the server it wants to talk to. Since they do not match, Client knows that the connection should not continue and disconnects it.

Testing an SSL server connection

After creating an endpoint for the server using SSL, you are ready to test the SSL server connection.

About this task

Perform the following procedure to test the SSL connection to the server:

Procedure

1. Import the server CA certificate using the instructions in [Importing a Certification Authority \(CA\) Certificate](#).
2. Open the endpoint for the server.
3. For FTPS, SSL email and SSL database connections, verify the following login credentials for the server connection: server, Port, User, and Password.
4. For HTTP and Web Services connections using SSL, if the HTTP or Web Services server requires client authentication, configure a Client Certificate Alias Name as described in [Creating or editing an HTTP endpoint](#).
5. Click **Test Connection**.
6. If the connection is successful, use this endpoint in Studio orchestrations, then use the **Verify** tab features to evaluate the orchestration.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SSL_testing_a_SSL_server_connection.html

SSL client authentication

Client authentication is similar to server authentication except that the server requests a certificate from the client to verify that the client is who it claims to be. The certificate must be an **X.509** certificate and signed by a certificate authority trusted by the server. You can only use client authentication when a server requests a certificate from a client. Not all servers support client authentication.

When a server requests a certificate, the client has the option to send a certificate or attempt to connect without it. The server allows the connection if the client's certificate can be trusted. When a client attempts to connect without a certificate, the server might grant the client access but at a lower security level, as illustrated by the following sequence of events:

1. The client sends a request for an SSL session to the server.
2. The client receives the server's certificate and checks its list of trusted CA's. Since the server's certificate is signed by a trusted certificate authority, the client accepts the certificate. The server then asks the client for a certificate that identifies the client.
3. The client responds by sending a certificate or by trying to establish a session without one.
4. If the client sends a certificate, the server checks its list of trusted certificates. If the client can be trusted, the secure session is established. If the client does not send a certificate, normally the server terminates the session.

Using the Log Viewer

Orchestration monitoring data is displayed in the Log Viewer in a table or text format.

By default, the following orchestration monitoring data is displayed by the Log Viewer, in a table:

Time

Provides a timestamp of when the specified event occurred.

Level

Specifies the logging level for a specific event. Logging levels include: Off, Severe, Warning, Info, and All.

Type

Identifies the type of the activity that generated the event. For example, Scheduler, Mime, JMS, or HTTP.

Message

Provides details about a specific event.

You can filter the log events displayed in the table by specifying the logging level or an activity type from the Level and Type list. When filtering the log events by type, you can press the Shift key to select or clear multiple types.

To toggle between the text or table format, select or clear the View as Text option.

Click Clear to delete all orchestration monitoring data.

You cannot restore orchestration monitoring data to the log once the log has been cleared

Viewing an orchestration

You can use orchestration view icons on the workspace, and View options from the Studio toolbar menu to manipulate your orchestration view in the workspace.

About this task

The workspace denotes source and target endpoints by using blue and green separating lines, respectively. With the endpoints displayed, the workspace uses data flow lines to associate an endpoint with a specific activity so that you can associate an activity with its endpoint.

You can manipulate the orchestration view in the workspace using the following icons:

Orientation of Orchestration

You can choose to view the orchestration in a horizontal  or vertical  view.

Expand or Collapse Orchestration Activities

Expands  or collapses the activities in an orchestration.

Orientation of Endpoints

You can choose to view the endpoints in a horizontal  or vertical  view, relative to the orchestration.

Show/Hide Endpoints

You can choose whether to display endpoints for the orchestration in the workspace. Show/Hide endpoints that are oriented horizontally . Show/Hide endpoints that are oriented vertically .

Expand or collapse Orchestration

Expands , or collapses  the entire orchestration, not just the activities.

Animate Graph

 Animates the actions that occur in the workspace. By default, orchestration graphics in the workspace are animated and Studio smoothly transitions any modifications you make to an orchestration. Click the icon to disable the animations and have the actions occur more crisply. For example, when you add an activity to the orchestration, the new activity snaps into place.  

Navigate Satellite View

 You can view your entire orchestration and select a specific area to view.

Zoom Out

 Minimizes the view of an orchestration. 

Zoom In

 Enlarges the view of an orchestration.

Restore view to 100%

 Resets the zoom out and zoom in changes you made to the orchestration view.

Fit to view

 Resizes the orchestration to fit in the workspace.

Table 1. Studio toolbar menu options. You can control the magnification level to view an orchestration by selecting one of the following options from the View option of the toolbar menu. ¹

Option	Description
Zoom In	Increase the magnification level to view the orchestration.
Zoom Out	Decrease the magnification level to view the orchestration.
Zoom 100%	Returns the view of the orchestration to the normal magnification level.
View as Tree Flow or View as Flow	The View as Tree Flow option lists the activities of the orchestration in a top-to-bottom view. During run time, the flow starts at the top activity and continues downward. This view is useful for displaying large orchestrations. The View as Flow option lists the activities of the orchestration in a left-to-right view. During run time, the flow starts at the activity on the left side of the view and continues to the right. This is the default view.
Status View	Check box that defines if a status bar is displayed at the end of the main Studio pane. The status bar shows descriptions of the menu options.

You can also right-click anywhere in the orchestration (when the orchestration is displayed as a flow) and select one of the following options from the shortcut menu:

- Zoom In
- Zoom Out
- Zoom 100%

Procedure

1. To view a top-level scaled-down overview of the orchestration for navigating large orchestrations, Double-click the overview  icon. The top-level scaled-down overview of the orchestration is displayed in a small pane in the Orchestration tab.
2. Move the cursor into the small pane to change the section of the orchestration displayed in the larger detailed pane of the Orchestration tab.
3. Double-click in the small pane to remove the small top-level overview of the orchestration.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Viewing_an_Orchestration.html

Validating an orchestration

An orchestration must be valid (complete and correct) before you can publish it to the Integration Appliance. Use the validation feature in Studio to validate your orchestration.

Before you begin

To be valid an orchestration must met the following requirements:

- Have a starter activity or a Pick activity as the first activity. Starter activities are denoted in the Activities tab with the blue orchestration icon and a downward arrow . The first activity in each branch of the Pick activity must be a starter activity.

Note: All starter activities are represented in Studio by the inbound icon , except for the Schedule Job activity.

- Variables must be initialized before they are used. This includes variables that are initialized in the branches of an If.. Then activity. The variable must be initialized in all branches.

Procedure

1. Select the Project tab, and expand the Orchestration folder.
2. Select and open an orchestration from the Orchestration folder. A graphical representation of the orchestration is displayed in the Orchestration tab. Å
3. Validate your orchestration using one of the following options:
 - Select Orchestration > Validate from the menu toolbar. The Validation Results dialog box is displayed.
 - Press **ALT-F8**. The Validation Results dialog box is displayed.
 - Click an orchestration in the Project tab. If the orchestration is invalid, the Validation Results popup is displayed next to the Project tab and the invalid orchestration icon  is displayed next to the orchestration in the Project tab

The Validation Results dialog box lists the problem areas in the orchestration. Problems prefaced by a blue icon are informational; you will have to navigate to that area to fix the problem. Problems prefaced by a red icon are errors. Click the error message in the dialog box to open the appropriate panel to fix the error.

Validation ensures that all the basic requirements for an orchestration have been met. You must resolve all validation issues before publishing the orchestration to the Integration Appliance.

Example

To validate all the orchestrations in the project complete the following steps:

1. In the Project tab, click Revalidate Project . All the orchestrations in the project are validated. If an orchestration is invalid the invalid orchestration icon  is displayed next to the orchestration in the Project tab. If the orchestration is invalid, click on the orchestration to view the errors in the Validation Results list.
2. Select the Validate Project  toolbar button. All the orchestrations in the project are validated. If an orchestration is invalid the invalid orchestration icon  is displayed next to the orchestration in the Project tab. If the orchestration is invalid, click on the orchestration to view the errors in the Validation Results list.

What to do next

Validation icons are displayed throughout the orchestration providing visual clues to potential problem areas or to provide further information.

In Studio, the following validation icons are displayed:

 Warning icon

Click warning icons to learn what information is required to complete the configuration of the entity in the pane. For example, in an activity's checklist, the warning icon appears next the endpoint if an

endpoint has not yet been specified.

 Information icon

Click information icons to learn details about a entity in the pane, for example why a button has been disabled.

 Checkmark icon

Checkmark icon is displayed when all the information for a entity in the pane has been specified. For example, in an activity's checklist, the checkmark icon appears next to the endpoint if a valid endpoint has been specified.

A warning icon  displays in the upper-right corner of many panes (for example, the Endpoint configuration pane). You can click this icon to toggle the warning icons ON or OFF displayed in the pane. If turned OFF, the warning icons are not displayed in the pane.

Working with activities in an orchestration

You can cut, copy, and paste activities, drag activities in an orchestration and add and delete new activities.

About this task

You can cut, copy, paste, delete, and rename activities using any of the following methods:

- Keyboard shortcuts
- Right-click an activity and select an option from the drop-down list
- Select an activity and then select an option from the Edit toolbar menu
- Select an activity and then select a toolbar button.

Keyboard shortcuts and their menu option equivalents are listed in the following table.

Table 1. Keyboard shortcuts and their menu option equivalents

Keyboard Shortcuts	Right-Click Menu Options	Toolbar Menu Options	Toolbar Buttons	Action
CTRL + X	Cut	Edit > Cut		Removes the activity and saves a copy of the activity in the clipboard that can be used later by a paste action.

Keyboard Shortcuts	Right-Click Menu Options	Toolbar Menu Options	Toolbar Buttons	Action
CTRL + C	Copy	Edit > Copy		Saves a copy of an activity into the clipboard that can be used later by a paste action.
CTRL + V	Paste	Edit > Paste		Copies the stored activity from the clipboard into the orchestration.
Delete	Delete	Edit > Delete		Removes the activity. The activity is not saved in the clipboard.
F2	Rename	Edit > Rename	⌘	Opens a field so you can rename an activity in an orchestration.

Note: The keyboard shortcuts and menu options listed in the preceding table are only available when the orchestration is viewed as a flow and not when the orchestration is viewed as a tree. For more information, see [Viewing an Orchestration](#).

You can cut, copy, or paste activities within the same orchestration and between orchestrations in the same project.

You can drag an activity from one location in an orchestration to another location in orchestration by selecting the activity and dragging it to the new location.

You can make a copy of an activity, by selecting the activity you want to copy, hold down the CTRL key, and then drag the activity to new location. A copy of the activity is created in the new location.

Note: Drag functionality is only available when the orchestration is viewed as a flow and not when the orchestration is viewed as a tree. For more information, see [Viewing an Orchestration](#).

Procedure

1. Drag an activity from the Activities tab onto any green target in the orchestration.
2. Complete the properties of the activity in the Properties pane.
3. Optional: To rename the activity, select the Edit > Rename option in the toolbar menu. The activity name field becomes active. You can also use one of the alternate methods mentioned in Table 1.

What to do next

To delete an activity, select the Edit > Delete option in the toolbar menu. You can also use one of the alternate methods mentioned in Table 1.

Processing orchestration jobs sequentially

You can use the Process Orchestration Jobs Sequentially option when an orchestration contains activities that can conflict with each other when multiple instances of the orchestration are running. An instance of an orchestration is also known as an orchestration job.

About this task

For example, an orchestration could contain a Pick activity that contains branches for the Get Inserted Rows, Get Updated Rows, and Get Deleted Rows activities. The following steps show an example run time scenario for this orchestration with the Process Orchestration Jobs Sequentially check box not selected:

1. An insertion into the database occurs, triggering the first instance of the orchestration to be created.
2. The first instance of the orchestration starts processing the insert branch of the Pick activity.
3. Before Get Inserted Rows activity completes in the first orchestration instance, a deletion in the database occurs triggering a second instance of the orchestration to be created.
4. The second instance of the orchestration starts processing the delete branch of the Pick activity.

This is undesirable behavior because first instance of the orchestration (that is processing the Get Inserted Rows activity) should complete before the second instance of the orchestration starts to process the Get Inserted Rows activity to avoid a potential primary key exception in the database. These database actions should occur sequentially. To force the instances of the orchestration to run sequentially, select the Process

Orchestration Jobs Sequentially check box for the orchestration. With this option set, the instances of the orchestration are run one at a time and conflicts, like primary key exceptions, are avoided.

Complete the following steps to set all jobs to run in a single instance check box.

Note: Selecting this option decreases the performance of the project.

Procedure

1. Select the Project tab and expand the Orchestrations folder.
2. To open an orchestration, double-click an orchestration in the Orchestrations folder. The orchestration is displayed.
3. If the orchestration options are not displayed the bottom part of the orchestration tab, select Orchestration > Properties from the toolbar menu.
4. Select the Process Orchestration Jobs Sequentially check box. This option is automatically selected if the orchestration contains shared variables.

Parent topic: [Orchestrations](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Processing_Orchestration_Jobs_Sequentially.html

Enabling persistence

The Orchestration pane contains an Enable Persistence check box that by default is selected. The setting of the Enable Persistence check box affects the way orchestration jobs are restarted after a failure.

About this task

The effect of setting of the Enable Persistence check box is described by the following two options:

Enable Persistence check box is selected

During run time if an orchestration job is running and a failure occurs that causes the job to stop, when the orchestration is restarted, the original job continues processing where it stopped and no in-flight messages are lost.

Enable Persistence check box is cleared

During run time if an orchestration job is running and a failure occurs that causes the job to stop, when the orchestration is restarted, the current job does not complete and the in-flight messages are lost.

When the Enable Persistence check box is cleared the run time performance is improved.

You may want to enable persistence for the FTP Poll Directory activity. For example, if you disable persistence and have an orchestration job with a FTP Poll Directory activity with the Keep in place option selected, during run time if a failure occurs that causes the job to stop, when the orchestration is restarted it processes the file again. The state of the job is lost and Integration Appliance does not know that it has already processed the file.

The following activities require that persistence be enabled when the Exactly Once option is selected in the Delivery Rules for the activity:

Database

- Poll Table
- Get Inserted Row
- Get Updated Rows
- Get Deleted Rows
- Insert Rows
- Update Rows
- Delete Rows
- Call Procedure

Email

- Get Email

FTP

- Poll Directory

JMS

- Subscribe Message
- Poll Message

MQ

- Poll Message

SAP

- Receive IDOC
- Send IDOC

SFDC

- Poll Deleted Objects
- Poll Updated Objects

Domino®

- Get Created Documents
- Get Deleted Documents
- Get Updated Documents

Procedure

1. To change the setting of the Enable Persistence check box, select Orchestration > Properties from the toolbar menu. The Orchestration pane is displayed.
2. Select Enable Persistence check box.

Adding a global exception handler to an orchestration

During run time if any of the activities of the orchestration throws an exception, and a global exception handler has been enabled, the global CatchAll branch is run.

About this task

The following figure shows an example orchestration:

In this example, if either the Database Get Inserted or the Database Insert Rows activities fail and throw an exception, the If..Then activity in the CatchAll branch is run.

Procedure

1. Right-click the start icon  of the orchestration and from the menu, and select the Add CatchAll Branch option. The CatchAll branch is added to the orchestration and the following variables are automatically created:
 - o `faultName` - During run time, the `faultName` variable contains the name of the exception thrown by an activity in the orchestration.
 - o `faultData` - During run time, the `faultData` variable contains the error message associated with the exception. This additional information is only currently returned for the Web Services activities. For Web Services activities, the `faultData` variable contains the fault.
 - o `faultInfo` - During run time, the `faultInfo` variable returns the following nodes:
 - `name` - During run time, the `faultInfo/name` node contains the name of the exception thrown by an activity in the orchestration. The `faultInfo/name` node is an `xsd:QName` type.
 - `message` - During run time, the `faultInfo/message` node contains the error message associated with the exception. The `faultInfo/message` node is an `xsd:string` type.
 - `activityId` - During run time, the `faultInfo/activityId` node contains the activity ID that uniquely identifies the activity where the exception occurred. The `faultInfo/activityId` node is an `xsd:int` type.
 - `activityName` - During run time, the `faultInfo/activityName` node contains the activity name where the exception occurred. The `faultInfo/activityName` node is an `xsd:string` type.
 - `faultTime` - During run time, the `faultInfo/faultTime` node contains the time the error occurred. The `faultInfo/faultTime` node is an `xsd:dateTime` type.

Note: The exception name returned by an activity in the `faultName` variable and the `faultInfo/name` node may change in a future release.
2. Configure the CatchAll branch by dragging activities from the Activities tab to the CatchAll branch, as shown in the preceding figure.

Results

Note: The scope of the `faultName`, `faultData`, and `faultInfo` variables is limited to the CatchAll branch. This scope limitation means that the value of the these variables is only guaranteed to be valid within the CatchAll

branch. For example, if you add a If...Then activity that tests the value of the faultName variable, the If...Then activity must be placed inside the CatchAll branch as shown in the preceding figure.

Saving an image of an orchestration

You can save a graphical image of the current orchestration as a ,jpg file.

Procedure

1. To create, or open, an existing orchestration double-click an orchestration in the Orchestrations folder of the Project tab. A graphical representation of the orchestration is displayed.
2. Click an activity in the orchestration and select the Orchestration > Save as an Image option from the Studio toolbar menu. The Save Orchestration Flow to an Image dialog box is displayed.
3. Browse for a directory location.
4. In the File Name field, enter the complete name of the file including the jpg extension. For example:
ProcessPO.jpg.
5. Click Save. The image file is saved to the file system.

Parent topic: [Orchestrations](#)

Creating an endpoint

You can create an endpoint from either the Activities tab or the Project tab. Use the Activities tab when you are in the process of building an orchestration and want to use the endpoint straight away. Use the Project tab to configure a set of endpoints for later use.

Creating an endpoint from the Activities tab

1. Drag a connection activity from the Activities tab to the orchestration. The **Checklist** is displayed in the lower left side of the pane. The summary information is displayed, on the right.
2. By default, the Activity Name displayed is the name of the connection activity; for example, `FTP Poll Directory`. To change the name, enter the new name in the field.
3. Select Pick Endpoint from the **Checklist**. The endpoint pane is displayed to the right.
4. Click New. The Create Endpoint dialog is displayed.

Note: The dialog contents vary depending on what type of connection activity you create.

Creating an endpoint by right-clicking in the Project tab

1. Right-click on the endpoints folder in the Project tab.
2. Select Create Endpoint > *EndpointType*, where *EndpointType* is type of endpoint. A new endpoint is created and displayed under the endpoints folder in the Project tab with a default name. An Endpoint tab is displayed in the main Studio pane.
3. Change the default name.
4. Press Return.
5. Configure the endpoint by specifying values in the Endpoint tab.

Note: The fields in the tab are identical to the fields displayed for the same type of endpoint created from the Activities tab.

Creating an endpoint by clicking the New Endpoint icon in the Project tab

1. Click the Project tab.
2. In the Project tab, click the New Endpoint icon. A list with all types of endpoints is displayed.
3. Select an Endpoint type.
4. Change the default name.
5. Press Return.

Creating an endpoint by right-clicking in the Project tab

1. Right-click on the endpoints folder in the Project tab.
2. Select Create Endpoint *EndpointType*, where *EndpointType* is type of endpoint. A new endpoint is created and displayed under the endpoints folder in the Project tab with a default name. An Endpoint tab is displayed in the main Studio pane.
3. Change the default name.
4. Press Return.
5. Configure the endpoint by specifying values in the Endpoint tab.
Note: The fields in the tab are identical to the fields displayed for the same type of endpoint created from the Activities tab.

Downloading plug-in connectors

Plug-in connectors are additional connectors that you can download into Studio and access like a built-in connector. When you download a plug-in connector, the connector is displayed in the Activities tab with all the other built-in connectors. You can now drag the plug-in connector activities into the Studio workspace to create an orchestration.

About this task

When you download plug-in connectors you can view available and installed plug-in connectors. Click the Available tab to view the names and versions of all the plug-in connectors that are available for download. Click the Installed tab to view the names and versions of all the plug-in connectors that you have already downloaded and installed on Studio. You can check for updates to these lists on startup or at one of the following intervals: daily, weekly, on alternative weeks, monthly, or never. Select the update interval and click Check Now to refresh the lists.

To download a plug-in connector complete the following steps:

Procedure

1. Select Solutions > Plugin Connectors. The Login window is displayed.

Note: If you are already logged into the IBM® Cast Iron® services, the Plugin Connector window is displayed and you can omit steps 2 and 3.

2. Specify the user name and password that IBM Support has provided you with. If you do not have login information, request a login from IBM Support.
3. Click OK. The Plugin Connectors window is displayed.
4. In the Available tab, select a connector.
5. Click Install. The plug-in connector is displayed in the Installed tab.

Using an existing endpoint

You can define an endpoint and reuse it for connection activities within the same project.

Procedure

1. Select the connection activity from within the orchestration.
2. Click Pick Endpoint from the Checklist.
3. Click Browse. The Project Explorer dialog box displays.
4. Select an endpoint from the list and click OK. The endpoint information is displayed.

Parent topic: [Connection Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn_Using_an_Existing_Endpoint.html

Polling interval behavior

Some starter activities poll for a change in state at the specified polling interval. Once the poll occurs and the change of state is detected, an orchestration job is started to start processing.

For example, during run time, the **FTP Poll Directory** activity polls for the existence of the specified file or files on the FTP server at the specified location and polling interval.

You specify the polling interval for the starter activity in the **Delivery Rules** task of the **Checklist** for the activity. The polling interval determines how often a poll occurs to check for a change in state. Once an orchestration that starts with a polling starter activity is published and deployed, the first poll occurs when the orchestration is deployed and the second poll occurs at the next time interval in the polling schedule. For example, if the polling interval is 10 minutes and the orchestration is deployed at 10:14 PM, the first poll occurs at 10:14 PM and the second poll occurs at 10:20 PM, which is the next interval of 10 minutes, as shown in the following figure:

The intervals start at the beginning of the hour, 10:00 PM in this example.

Note: When specifying the polling interval in days, the Integration Appliance uses UTC time zone and not the local time zone to determine when to poll. When the Polling Interval is set to `days` in the **Delivery Rules** task, the Integration Appliance polls at the start of the day (00:00) using the UTC time zone and not the local time zone specified for the Integration Appliance. For example, if your Integration Appliance is set to Pacific Standard Time (PST) which is 8 hours behind Coordinated Universal Time (UTC) and the Polling Interval was set to 1 day, the poll occurs at 00:00 in the UTC time zone which is equivalent to 4:00 PM (16:00 in 24 hour time) in the PST time zone.

The following starter activities poll for a change in state:

- Database Get Inserted Rows
- Database Get Updated Rows
- Database Get Deleted Rows
- Database Poll Table
- Get Email
- FTP Poll Directory
- MQ Poll Queue

Using the Shift-JIS encoding

During run time, if the Shift-JIS encoding is specified, the Integration Appliance will not convert some of the double-byte characters.

About this task

The Integration Appliance does not convert the double-byte characters listed in the following table: Â

Hexadecimal Shift-JIS Character Code	Hexadecimal Unicode Character Code	Description
0x815C	U+2014	Em Dash
0x8160	U+301C	Wave Dash
0x8161	U+2016	Double Vertical Line
0x817C	U+2212	Minus Sign
0x8191	U+00A2	Cent Sign
0x8192	U+00A3	Pound Sign
0x81CA	U+00AC	Not Sign

Use the CP943 encoding instead of the Shift-JIS encoding.

About the Template Integration Project (TIP) Configuration Editor

Use the TIP Configuration Editor to drag objects from Studio into the TIP Configuration Editor workspace to create and modify Template Integration Projects (TIPs), which you can upload to the Cast Iron[®] solutions repository for other users to access.

When you have created a TIP, you can use the Configuration Wizard to configure the project for your integration scenario.

When you close the TIP Configuration Editor all changes are saved. However, if you close the project in Studio before you save your changes in the TIP Configuration Editor, the changes you made in the TIP Configuration Editor are not saved.

You can launch the TIP Configuration Editor from the Studio menu. Select Tools > TIP Configuration Editor.

TIP Configuration Editor Workspace

The TIP Configuration Editor workspace contains the Edit and Preview tabs.

In the Edit tab, you can use the interface to build the pages for each step in the TIP. You can use this interface to drag images directly into the Description and Summary Content fields. By selecting the Show Markup option at the bottom of the tab, you can edit the underlying HTML source for the page.

You can view the page for the TIP step in the Configuration Wizard use the Preview option.

TIP Configuration Editor Modes

The TIP Configuration Editor has a compact mode, which shows only a panel with the Steps list. Click the compact mode icon, in the upper right corner of the Steps list, to collapse or expand the TIP Configuration Editor. When you select the Sync Selection option at the end of the Steps list, the Studio application is opened

and automatically navigates to the entity corresponding to the step in the TIP Configuration Editor that you are editing.

Creating a Template Integration Project (TIP)

You can create, and modify, Template Integration Projects (TIPs) using the TIP Configuration Editor to drag objects from Studio into the TIP Configuration Editor.

About this task

You can upload to the Cast Iron® solutions repository for other users to access. After using the TIP Configuration Editor to create a TIP, you can use the Configuration Wizard to configure the project for your integration scenario.

Important: Only the creator of a TIP can modify the TIP. However, after you upload your TIP to the Cast Iron solutions repository and it is certified by IBM®, you no longer have the ability to delete your TIP from the Cast Iron solutions repository.

Procedure

1. From the Studio menu, select Tools > TIP Configuration Editor. The TIP Configuration Editor window shows.
2. Define the steps for the TIP using one of the following methods:
 - Adding one of the TIP Configuration Editor's predefined step types:
 - a. Click Add. The Select Type window opens.
 - b. Select the appropriate option and click OK. The new step is displayed beneath the highlighted step in the Steps list. You can shuffle the order of the steps by selecting the step and moving it to the appropriate locations on the list.
 - Dragging a Studio object into the TIP Configuration Editor:
 - a. Select a Studio object.
 - b. Drag the object to the appropriate position on the Steps list. You can shuffle the order of the list by selecting a step and moving it to the required position on the list.
 - c. Optional: You can drag images directly into the Description and Summary Content fields of the various steps.
 - Deleting a step:
 - a. Select a step in the Steps list. Your selection is indicated by bold type
 - b. Click Delete.
 - Renaming a step:
 - a. Double-click a step in the Steps list. The step name becomes an editable field.
 - b. Enter the required name of the step.

Or

- a. Select a step in the Steps list. Your selection is indicated by bold type.
 - b. In the Edit tab, edit the value in the Name field.
3. In the Edit tab, define properties for each step:
- a. Select a step in the Steps list. Your selection is indicated by bold type. The Edit tab opens a form showing the properties for the selected step.
 - b. Optional: Optional: Select the Show Markup option to view the HTML markup for the Description and Summary Content sections of the form. Right-click these sections to see a list of available HTML styles.
- In the HTML source view, you can add images to the Description and Summary Content fields by dropping an image into either field. The image is converted to a file with a `â€œ.b64â€` extension, which can be referenced as a relative path. For example: ``.
- Referencing images outside of the project structure is supported by using fully-qualified HTTP paths. For example: ``
- Note: Selecting the Show Markup option only shows the HTML markup for the selected step.
- c. Complete the form.
 - d. Preview the results in the Preview tab.
4. Click Close. The TIP Configuration Editor saves all changes and closes.

Verifying a Template Integration Project (TIP)

You can verify a Template Integration Project (TIP) from the Studio menu using the same process as for verifying an orchestration.

About this task

Procedure

1. From the Studio menu, select Solutions > TIP Configuration Editor. The Configuration Wizard is displayed.
2. If the TIP does not have a Verify Orchestration step, add one before the Finish step. To add a Verify Orchestration step, select Tools > Edit Configuration Wizard and add a Verify Orchestration step.
3. Click Next to step through the orchestration.
4. When you reach the Verify Orchestration step, click Start Orchestration.

Parent topic: [Template Integration Process \(TIPs\)](#)

 Last updated: Wednesday, February 17, 2016

Searching for Template Integration Projects (TIPs)

Template Integration Projects (TIPs) are stored in the Cast Iron® solutions repository. Through the Configuration Wizard, TIPs guide you through the configuration steps for an integration scenario. TIPs can be downloaded to your local machine. The login window is pre-populated with the User Name and Password to make it easier for you to download the TIPs, without registration.

Procedure

1. From the Solutions menu, select Search For TIPs. The Login window is displayed with the pre-populated User Name and Password. These credentials have the access privilege only to download TIPs.
Note: You can also log on by clicking the Login link present on the right-hand side, near the memory bar.
2. If you already have the credentials to log on, specify the user name and password. You can specify default login settings for the central repository in the Preferences dialog.
3. Click OK. The Search window is displayed and a confirmation message displays at the end of the main Studio window.

4. In the Search window, choose Keywords, Filter, or My TIPs as the method by which you want to search for TIPs.
 - o If you select the Keywords search option, the Keywords field is displayed.
 - a. Enter a search keyword.
 - b. Click Go. The results are displayed in the Results table and a "Searching ... completed" message is displayed at the end of the Search window. For example, if you enter the keyword USECASES, all TIPs under the USECASES category in the Cast Iron solutions repository are returned.
 - o If you select Filter search option, the filter options: Source Endpoint, Target Endpoint, Integration Patterns, and Searchable Keywords are displayed.
 - a. You must specify a value for at least one filter option. The options lists provide valid values.
 - b. Click Query. The results are displayed in the Results table and a "Searching ... completed" message is displayed at the end of the Search window.
 - o If you select My TIPs, all TIPs that you have created are displayed in the Results table.
5. In the Results table, select a TIP. The details for the project are displayed in the details section.
6. Optional: You can rate the TIP that you have selected.
 - a. Click the Edit Review link. The Publish Review window is displayed.
 - b. Move the slider until the appropriate number of stars are highlighted. Rate the TIP on a scale between 1-5, 5 being the highest rating.
 - c. In the My Title field, add a brief description for your review.
 - d. In the My Summary field, add more details about your review of the project.
 - e. Click OK. Studio submits the review to the Cast Iron solutions repository.
7. In the Search window, click Download. The Select directory where to save the TIP window is displayed.
8. Specify the download directory and click Open. The project is saved to the directory you specified and Studio opens the Configuration Wizard for the project.

Rating and Reviewing Template Integration Projects (TIPs)

You can rate and provide a review for all Template Integration Projects (TIP) that you download.

About this task

Ratings are given on a scale of 1-5, where 5 is the highest rating. When you submit your rating and review for a TIP, Studio uploads the information to the Cast Iron® solutions repository. Your rating is combined with any other ratings that have been submitted by other reviewers and the average is displayed in the Details pane of the specific TIP.

You can rate and review TIPs using the Configuration Wizard to complete TIP configurations or by accessing the Publish Review dialog box.

Procedure

When you open a TIP in the Configuration Wizard, the last step provides an opportunity to rate and review the TIP.

1. Select Solutions > Start Configuration Wizard. The Configuration Wizard opens.
 2. Complete each step of the wizard or just click Finish to go directly to the rating and review page.
 3. In the rating and review page, move the My Rating slider until the appropriate number of stars are highlighted. Ratings are on a scale between 1 and 5; 1 is the lowest, and 5 is the highest rating.
 4. In the My Title field, add a brief description for your review.
 5. In the My Summary field, add more details about your review of the project.
 6. Click Submit Review. Studio submits the review to the Cast Iron solutions repository.
 7. Click Close.

Uploading Template Integration Projects (TIPs) to the Cast Iron solutions repository

You can upload Template Integration Projects (TIPs) that you have created to the Cast Iron® solutions repository.

Procedure

1. From the Studio menu, select Solutions > Upload Project to Repository. The Upload Project Wizard opens.
2. Enter the following summary information:

Option	Description
Parameter	Description
Name	Name of TIP.
Path	Specify the location in the Cast Iron solutions repository to which Studio uploads the TIP.
Category	Specify the type of TIP created: <ul style="list-style-type: none">○ Usecases○ Best Practices○ Utilities○ General
Description	Enter a brief description of the TIP.

3. Click Next.
4. Enter source and target endpoint information for the project:

Option	Description
Source Endpoint Parameter	Description
Name	Name of source endpoint.
Description	Enter a brief description of the source endpoint.
Version	Specify a version number for the source endpoint configuration.
Option	Description
Target Endpoint Parameter	Description

Option	Description
Name	Name of target endpoint.
Description	Enter a brief description of the target endpoint.
Version	Specify the version number of the target endpoint configuration.

5. Click Next.

6. Enter details about project patterns:

Option	Description
Parameters	Description
Name/Description	Name/Value pair for project patterns Click the appropriate field to specify the name and description for the project pattern. Click Add to specify additional patterns. Click Delete to remove specified patterns.
Searchable Tags	You can use this string value later to search for the project.
Creator	Identify the person or entity that created the project. For example: John Smith or IBM®.
Version	Specify the version of the TIP you are uploading to the Cast Iron solutions repository.

7. Click Finished. Studio uploads the TIP to the Cast Iron solutions repository.

Transform Activities

- [Map Variables Activity](#)
You can create a new Map Variables activity in an orchestration.
- [Read MIME activity](#)
During run time, the **Read MIME** activity reads the MIME header and the body of the message. The **Read MIME** activity breaks up the attachments contained in the body of the message and places the result into the parts XML output parameter, as shown in the figure below.
- [Write MIME activity](#)
During run time the **Write MIME** activity constructs a MIME header and the body of the message from multiple attachments contained in the parts XML input parameter and optionally the **mimeheader** input parameter, as shown in the figure below.
- [Read XML activity](#)
The **Read XML** activity takes an XML document and parses it to a defined schema. XML data is returned

from this activity as the output parameter and the data can be used in subsequent activities.

- [Write XML activity](#)

The **Write XML** activity takes a complex (XML) variable and outputs a string in the XML format containing the data held in the complex variable. This string can then be written to a file or a database.

- [Validate XML activity](#)

During run time, the **Validate XML** activity determines if the input XML data is valid to the specified XML Schema or WSDL.

- [Read JSON activity](#)

The **Read JSON** activity takes a JSON or XML message and parses it to a defined schema to generate an output structure that can be used by the orchestration. At runtime this activity parses the JSON message and generates equivalent XML that can be mapped to other Studio activities.

- [Write JSON activity](#)

The **Write JSON** activity takes a structure equivalent to JSON as input and outputs a string in the JSON format containing the data held in the complex variable. This string can then be written to a file or posted using HTTP.

- [Validate JSON activity](#)

During run time, the **Validate JSON** activity determines if the input JSON or XML data is valid to the specified XML schema.

- [Read Flat File activity](#)

The Read Flat File activity converts flat file data (non-XML data) to XML data by applying the specified Flat File Schema. XML data is returned from this activity as the output parameter.

- [Write Flat File activity](#)

The Write Flat File activity converts data from an orchestration into flat file data (non-XML data) that is valid to the specified Flat File Schema.

- [Apply XSLT activity](#)

You can use the Apply XSLT activity to transform XML data, stored in one XML variable, to XML data, stored in another XML variable, using the specified XSLT stylesheet.

Map Variables Activity

You can create a new Map Variables activity in an orchestration.

About this task

Using the Map Variables activity you can transform and initialize variables. You can transform the data from one or more source variables to the data stored in one or more destination variables. For more information see [About Maps](#).

You can create a new Map Variables activity by completing one of the following procedures:

Procedure

1. Open or [create an orchestration](#)
2. If the activity is mapping variables that conform to a particular XML Schema or DTD, upload the XML Schema or DTD file into your project using [Uploading Files into a Project](#).
3. Open the Activities tab.
4. Drag the Map Variables activity from the Activities tab onto the orchestration.
5. If not already selected, click Design The Mapping Editor is displayed in the lower part of the pane.
6. [Add variables](#) to the From Orchestration pane.
7. [Add variables](#) to the To Orchestration pane.
8. Drag a source node from the From Orchestration pane to a destination node in the To Orchestration pane. If the mapping is valid, a link (line) displays from the source node to the destination node, indicating that a mapping rule has been established. Repeat this step until all the required nodes have been mapped.
9. If possible, test your mappings to ensure that the output is what you expect. For more information, see [Testing maps](#).

Note: The Extensible Markup Language (XML) specification prohibits the use of non-printing unicode control characters. The accepted character range is:

```
Char      :=      #x9 | #xA | #xD | [#x20-#xD7FF] | [#xE000-#xFFFF] |
[#x10000-#x10FFFF]
```

Note: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#)

Read MIME activity

During run time, the **Read MIME** activity reads the MIME header and the body of the message. The **Read MIME** activity breaks up the attachments contained in the body of the message and places the result into the parts XML output parameter, as shown in the figure below.

For example, an orchestration could contain a **Get Email** activity, that during run time gets an email message from a POP3 endpoint and places the resulting email message in two variables, one XML variable that contains the mail header and another string variable that contains the body of the email message. The next activity in the orchestration could be a **Read MIME** activity that maps the contents of the mail header and the body variables to its input parameters. If the mail message contains attachments, the **Read MIME** activity then breaks up the attachments contained in the body of the message and places the result into the parts XML output parameter.

- [Adding a Read MIME activity to an orchestration](#)
Perform the steps in this section to add a **Read MIME** activity to an orchestration.
- [Mapping the input of the activity](#)
In this task, you map the XML variable containing the MIME header part of the mail header and the string variable containing the body of the message to the mimeheader and body input parameters of the **Read MIME** activity, respectively. Variables must be mapped to the mime header and body input parameters—both input parameters are required. The mime header input parameter is of type XML and the body input parameter is of type string.
- [Mapping the output to an activity](#)
In this task, you map the elements of the parts XML output parameter to variable(s).

Feedback | Notices

 Last updated: Wednesday, February 17, 2016
 file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add_Read_MIME_to_Orchestration.html

Mapping the input of the activity

In this task, you map the XML variable containing the MIME header part of the mail header and the string variable containing the body of the message to the mimeheader and body input parameters of the **Read MIME** activity, respectively. Variables must be mapped to the mime header and body input parameters—both input parameters are required. The mime header input parameter is of type XML and the body input parameter is of type string.

About this task

The following table defines the elements in the mimeheader input parameter:

Table 1.

Element Name	Default
mimeVersion	Currently not used.
contentType/mainType	Currently not used. The Read MIME activity determines if the message is multipart or not by parsing the message using the specified boundary delimiter
contentType/subType	Currently not used.
contentType/charset	Currently not used.
contentType/attribute/name contentType/attribute/value	The attribute element contains a set of attributes as name/value pairs. You can specify the boundary attribute that specifies the boundary delimiter between the multipart entities of the message. If you specify the boundary attribute, it overrides the default boundary set in the message itself. If no boundary attribute is specified in the message itself or using the attribute element, an exception is thrown during run time.
contentTransferEncoding	Currently not used.

Element Name	Default
otherMimeHeaders	Currently not used.

The message body can contain one or more MIME parts separated by the boundary value specified in the **contentType/attribute** element of the mimeheader input parameter. Each part contains a MIME header that describes various attributes of the associated part body. How the individual part is parsed depends on the values assigned to the following parameters in the entityMimeHeader of the entity body:

- Content-Type header
- Charset attribute within the Content-Type header
- Content-Transfer-Encoding

How the part body is parsed depends on the settings of Content-Transfer-Encoding and Content-Type:

Content-Type is equal to "text:"

- If the Content-Type is "text:" and the Content-Transfer-Encoding is "7-bit"/"8-bit" or "binary," the part body is converted to an UTF8 encoded string and copied into the **entityBody** element of the **parts** output parameter.
- If the Content-Type is "text:" and the Content-Transfer-Encoding is "quoted-printable," the part body is quoted-printable decoded, converted to an UTF8 encoded string based on the charset attribute and copied into the **entityBody** element of the parts output parameter.
- If the Content-Type is "text:" and the Content-Transfer-Encoding is "base64," the part body is base64 decoded, converted to an UTF8 encoded string based on the charset attribute and copied into the **entityBody** element of the parts output parameter.

If not explicitly specified in the part MIME header, charset defaults to UTF8. The only exception to this default behavior is when the Content-Disposition is equal to "attachment" and the Content-Type is equal to "text." In this case, the part is not be treated as text since the charset of the data cannot be known. In addition, the Content-Transfer-Encoding is set to "binary."

Content-Type is not equal to "text:"

- If the Content-Type is not equal to "text:" and the Content-Transfer-Encoding is "7bit"/"8bit" or "binary," the part body is converted to an UTF8 encoded string and copied into the **entityBody** element of the **parts** output parameter.
- If the Content-Type is not equal to "text:" and the Content-Transfer-Encoding is "quoted-printable," the part body is quoted-printable decoded, base64 encoded, and copied into the **entityBody** element of the **parts** output parameter.
- If the Content-Type is not equal to "text:" and the Content-Transfer-Encoding is "base64," the part body is copied as is (base64 data) into the **entityBody** element of the **parts** output parameter.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Map_Activity_Input_Read_MIME.html

Mapping the output to an activity

In this task, you map the elements of the parts XML output parameter to variable(s).

The entity/entityBody element of the parts output parameter contains the body and the attachments of the mail message. To access the body and the attachments of the mail message, you must iterate through the instances of the entity element using the For Each or While Loop activities

The order of the attachments and the body in the entity element depend on the email client that sent the message and the type of message (either plain text or HTML). For example, for a plain text email message sent from a Microsoft Outlook client, the parts output parameter consists of the following entity elements:

- The first **entityBody** element contains the body of the message.
- If an attachment was included in the message, the second **entityBody** element contains the first attachment.
- If a second attachment was included in the message, the third entityBody element contains the second attachment.

...and so on with the rest of the attachments.

You may need to decode the attachments before parsing the contents of the attachment. For example, an attachment that is encoded with the base64 encoding must be decoded before the contents of the attachment can be parsed by the Read Flat File activity. Another attachment might be text and therefore can be parsed without decoding.

Note: The Email and MIME activities can only process 8-bit or binary data using the UTF8 charset. Only MIME 1.0 compliant email messages are supported. The **Read MIME** activity can only parse email messages that have come from a MIME 1.0 compliant Email Server. If the message you are parsing in the **Read MIME** activity does not come from the Get Email activity but from another activity such as the HTTP Receive Request activity, you must create a Flat File Schema to parse the MIME header from the payload.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Map_Activity_Output_Read_MIME.html

Write MIME activity

During run time the **Write MIME** activity constructs a MIME header and the body of the message from multiple attachments contained in the parts XML input parameter and optionally the **mimeheader** input parameter, as shown in the figure below.

For example, an orchestration could contain a **Write MIME** activity, that during run time constructs a MIME header and a body of a message and places the result in two orchestration variables. The orchestration then invokes a **Send Email** activity that takes these two orchestration variables as input and builds a mail message and then sends that mail message to the specified SMTP endpoint.

The steps for adding and configuring a **Write MIME** activity in an orchestration are described in: [Adding a Write MIME activity to an orchestration](#).

- [Adding a Write MIME activity to an orchestration](#)
Perform the steps in this section to add a Write MIME activity to an orchestration.
- [Mapping the input of the activity](#)
In this task, you map the XML variables containing the MIME header and the parts (contains the attachments) to the mimeheader and parts input parameters of the **Write MIME** activity, respectively. Variable(s) must be mapped to the parts input parameter—this input parameter is required. The mimeheader input parameter is optional. If you do not map to or define default values for the elements of the **mimeheader** input parameter, default values are provided in the following table.
- [Mapping the output to an activity](#)
In this task, you map the **mimeheader** (of type XML) and **body** (of type string) output parameters to variable(s).

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add_Write_MIME_to_Orchestration.html

Mapping the input of the activity

In this task, you map the XML variables containing the MIME header and the parts (contains the attachments) to the mimeheader and parts input parameters of the **Write MIME** activity, respectively. Variable(s) must be mapped to the parts input parameter—this input parameter is required. The mimeheader input parameter is optional. If you do not map to or define default values for the elements of the **mimeheader** input parameter, default values are provided in the following table.

About this task

If the mimeheader input parameter is not listed in the **To Activity** pane of the **Map Inputs** pane, select **Map > Show Optional Parameters** from the toolbar menu or right-click in the **To Activity** pane and select the **Show Optional Parameters** option. If the **Map > Show Optional Parameters** option is not selectable in the toolbar menu, click on a element in the **Map Inputs** pane to make this option active.

The following table defines the elements in the mimeheader input parameter:

Table 1.

Child Element of the mimeheader Input Parameter	Default Value
mimeVersion	The standard MIME Version of 1.0 is assigned. The resulting MIME header is equal to the following setting: <code>MIME-Version: 1.0</code> .

Child Element of the mimeheader Input Parameter	Default Value
content Type	The value of the Content-Type setting in the resulting MIME header is equal to the following setting: <code>Content-Type: multipart/mixed</code> .
content Type/attribute/name content Type/attribute/value	The attribute element contains a set of attributes as name/value pairs. The boundary between attachments can be specified using a boundary attribute element. If a boundary attribute is not specified a default value is generated.
content Transfer Encoding	The value of the Content-Transfer-Encoding in the resulting MIME header is equal to the following setting: <code>Content-Transfer-Encoding: 7-bit</code> . NOTE: The Content-Transfer-Encoding you specify in this element for the main MIME header cannot be more restrictive than Content-Transfer-Encoding of the entity MIME headers. For example if you specify that the Content-Transfer-Encoding for the main MIME header is 7-bit but the Content-Transfer-Encoding specified in the entity MIME headers is 8-bit, the Content-Transfer-Encoding of the main MIME header is changed to 8-bit.

If you do not specify values for some of the child elements of the parts input parameter, defaults are described in the following table.

Table 2.

Child Element of the parts Input Parameter	Default Value
mim eVersion	The standard MIME Version of 1.0 is assigned. The resulting MIME header contains the following setting: <code>MIME-Version: 1.0</code> .
cont entT ype	The value of the Content-Type in the resulting MIME header contains the following setting: <code>Content-Type: text/plain; charset=US-ASCII</code> .

contentTransferEncoding	The value of the Content-Transfer-Encoding in the resulting MIME header depends on the Content-Type setting. If the Content-Type is equal to multipart, the resulting MIME header contains the following setting: <code>Content-Transfer-Encoding: 7-bit</code> . If the Content-Type is equal to text and charset is equal to not-us-ascii (where not-us-ascii is any type except US-ASCII) the resulting MIME header contains the following setting: <code>Content-Transfer-Encoding: quoted-printable</code> . If the Content-Type is equal to non-text, the resulting MIME header contains the following setting: <code>Content-Transfer-Encoding: base64</code> . NOTE: If the Content-Disposition is equal to attachment, the entity part is not treated as text.
-------------------------	---

The parts input parameter can contain one or more parts. Each part contains a MIME header that describes various attributes of the associated part body. How the individual MIME part is serialized depends on the values assigned to the following parameters in the mine header:

- Content-Type header
- Charset attribute within the Content-Type header
- Content-Transfer-Encoding

How the part body is serialized depends on the settings of Content-Transfer-Encoding and Content-Type:

Content-Type is equal to `text`:

- If the Content-Type is `text` and the Content-Transfer-Encoding is `7-bit`, `8-bit` or `binary`, the part body is converted from UTF8 charset to the charset specified and copied into the body output parameter.
- If the Content-Type is `text` and the Content-Transfer-Encoding is `quoted-printable`, the part body is converted from UTF8 charset to the charset specified, quoted-printable encoded and copied into the body output parameter.
- If the Content-Type is `text` and the Content-Transfer-Encoding is `base64`, the part body is converted from UTF8 charset to the charset specified, base64 encoded, and copied into the body output parameter.

If not explicitly specified in the part MIME header, charset defaults to "UTF8." The only exception to this default behavior is when the Content-Disposition is equal to `attachment` and the Content-Type is equal to `text`. In this case, the part is not treated as text since the charset of the data cannot be known. In addition for this case, the Content-Transfer-Encoding is set to "binary."

Content-Type is not equal to `text`:

- If the Content-Type is not equal to `text` and the Content-Transfer-Encoding is `7bit`, `8bit` or `binary`, the part body is copied to the body output parameter as is.
- If the Content-Type is not equal to `text` and the Content-Transfer-Encoding is `quoted-printable`, the part body is base64 decoded, quoted-printable encoded and copied into the body output parameter.
- If the Content-Type is not equal to `text` and the Content-Transfer-Encoding is `base64`, the part body is copied as is (base64 data) into the body output parameter.

See [Creating a Standalone Map](#) for general instructions on mapping.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Map_Activity_Output_Write_MIME.html

Read XML activity

The **Read XML** activity takes an XML document and parses it to a defined schema. XML data is returned from this activity as the output parameter and the data can be used in subsequent activities.

About this task

The input parameter of the **Read XML** activity expects XML text. This data can be obtained from various endpoint activities such as the FTP Poll Directory activity reading a file containing XML data or HTTP Receive Request activity. The input data must be a well formed XML document or the activity will error. You must create an XML variable (see the **Variables** tab) before you can use an XML Schema in the Configure task. The XML variable can be defined by adding an XML schema to the project or by using an existing variable.

Note: If no function is defined in the Map Outputs for the Read XML activity and there is a straight mapping, in the From Activity to the To Orchestration, the XML data is passed to the output activity without validating against the schema that is specified in the XML variable.

Note: If there are any functions or other changes to the mappings in the Map Outputs for the Read XML activity, and the content does not match the schema, then an empty XML document is provided as the output of the Read XML activity.

To add a **Read XML** activity to an orchestration:

Procedure

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.

2. Select the **Activities** tab and expand the **Transform** folder.
3. Drag the **Read XML** activity onto the orchestration. Place it to the right of an activity from which the orchestration will obtain the XML data (for example, an FTP Poll Directory).
4. Select the **Read XML** activity and configure it as described in [Read XML activity configuration](#).

- [Read XML activity configuration](#)

You can specify the XML Schema to apply to the **Read XML** input parameter.

- [Read XML map inputs](#)

You can map a string variable that contains the XML data to the input parameter of the **Read XML** activity called XMLText.

- [Read XML map output](#)

You can map the OutputXml output parameter that contains the XML data (stored as a string) to a variable valid to the specified XML Schema.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read_xml_Activity.html

Read XML activity configuration

You can specify the XML Schema to apply to the **Read XML** input parameter.

About this task

You must create an XML variable that defines the schema before starting this task.

Procedure

1. In the XML Variable that defines the XML schema to parse, click **Browse**. The **Select a Variable to Parse** dialog box is displayed.
2. Select the appropriate XML Variable and click **OK**.
3. Specify how to read the data passed into the XMLText input parameter during run time by selecting one of the appropriate options:
 - a. Select the **Data is text-Needs no decoding** option if the incoming data is text and does not need decoding.
 - b. Select the **Decode data using encoding type** option if incoming data is binary data that needs to be decoded using the specified encoding type. Set the encoding type by selecting a default encoding type from the **Decode data using encoding type** list or enter your encoding type by clicking in the **Decode data using encoding type** field and typing in your encoding type.
4. Click **OK**.

Parent topic: [Read XML activity](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read_xml_Activity_conf.html

Read XML map inputs

You can map a string variable that contains the XML data to the input parameter of the **Read XML** activity called XMLText.

About this task

XMLText is an input parameter of type string or base64Binary. During run time the string variable must contain well formed XML data before the **Read XML** activity is run. The Encoding input parameter is optional. (You are not required to map this input parameter). If the Encoding input parameter is not listed in the **To Activity** pane of the **Map Inputs** pane, select **Map > Show Optional Parameters** from the toolbar menu or right-click the **To Activity** pane and select the **Show Optional Parameters** option. If the **Map > Show Optional Parameters** option is not selectable in the toolbar menu, click a node in the **Map Inputs** pane to make the option active. The Encoding input parameter specifies how the incoming data is decoded when read.

Procedure

1. If no decoding is required, specify the string: text.
2. If decoding is required, specify the encoding type to be used to decode the incoming data. For example: UTF-8, US-ASCII, ISO-8859-1, EBCDIC-XML-US, or SHIFT_JIS.

Example

Optionally, you can override the Encoding setting you specified in the Configure task of the Checklist dynamically during run time, using the Encoding input parameter. For example, if you set the Encoding to UTF-8 in the Configure task but during run time you passed in the Encoding setting of Shift_JIS, the Encoding setting specified dynamically during run time overrides the original setting specified in the **Configure** pane. In this example, the Encoding is set to Shift_JIS. There is one exception to the dynamic overriding behavior: if the **XMLText is text-Needs no decoding** or **encoding** option is selected in the **Configure** task, the Encoding dynamically set during run time is ignored and no decoding occurs.

Parent topic: [Read XML activity](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read_xml_Map_Inputs.html

Read XML map output

You can map the OutputXml output parameter that contains the XML data (stored as a string) to a variable valid to the specified XML Schema.

See [Creating a Standalone Map](#) for general instructions on mapping.

During run time, an orchestration could invoke the following sequence of activities:

1. A FTP Poll Directory activity assigns the contents of a flat file to a String variable called **XMLRawContent**.
2. A **Read XML** activity assigns the contents of the **XMLRawContent** variable to the string input parameter called XMLText.
3. The **Read XML** activity converts XMLText to XML data and passes the XML data back to the orchestration via the output parameter. The contents of the output parameter are assigned to the variable valid to the XML Schema. The data XML input document can now be used and mapped within the orchestration.

Write XML activity

The **Write XML** activity takes a complex (XML) variable and outputs a string in the XML format containing the data held in the complex variable. This string can then be written to a file or a database.

About this task

The string is returned as an output parameter. The data from the orchestration must come from a complex variable which, on the variables tab, is indicated by the XML icon. You must create the input XML variable that defines the schema.

To add a **Write XML** activity to an orchestration:

Procedure

1. Create or open an orchestration. For more information, see [Building an orchestration](#). A graphical representation of the orchestration is displayed.
 2. Select the **Activities** tab and expand the **Transform** folder.
 3. Drag the **Write XML** activity onto the orchestration.
 4. Select the **Write XML** activity and configure it as described in [Write XML activity configuration](#).
- [Write XML activity configuration](#)
For this task, you specify the XML Schema for the inbound data. The inbound data must be defined by an

XML variable that defines the schema. You specify the XML Schema that applies to the input parameter.

- [Write XML map inputs](#)

You can map the data from variables of the orchestration to the InputXML parameter defined by the XML Schema specified in the Configure task.

- [Write XML map output](#)

You can map the XMLText output parameter that contains the XML data to a string variable.

Write XML map inputs

You can map the data from variables of the orchestration to the InputXML parameter defined by the XML Schema specified in the Configure task.

About this task

The Encoding input parameter is optional. You are not required to map this input parameter. If the Encoding input parameter is not listed in the **To Activity** pane of the **Map Inputs** pane, select **Map > Show Optional Parameters** from the toolbar menu or right-click in the **To Activity** pane and select the **Show Optional Parameters** option. If the **Map > Show Optional Parameters** option is not selectable in the toolbar menu, click on a node in the **Map Inputs** pane to make this option active. The Encoding input parameter specifies how outgoing data should be encoded for this procedure.

Procedure

1. If no decoding is required, specify the string: **text**.
2. If encoding is required, specify the encoding type that should be used to encode the outgoing data, for example: UTF-8, US-ASCII, ISO-8859-1, EBCDIC-XML-US, or SHIFT_JIS.

Example

Optionally, you can override the Encoding setting you specified in the Configure task of the **Checklist** dynamically during run time, using the Encoding input parameter. For example, if you set the Encoding to UTF-8 in the Configure task but during run time you passed in the Encoding setting of **Shift_JIS**. The Encoding setting specified dynamically during run time overrides the original setting specified in the **Configure** pane. In this example, the Encoding is set to **Shift_JIS**. There is one exception to the dynamic overriding behavior: if the **Data is text-Needs no decoding or encoding** option is selected in the Configure task, the Encoding that is dynamically set during run time is ignored. See [Creating an orchestration](#) for more information.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write_xml_map_output.html

Validate XML activity

During run time, the **Validate XML** activity determines if the input XML data is valid to the specified XML Schema or WSDL.

The **Validate XML** activity has the following limitations:

- The **Validate XML** activity only supports the validation of the selected root element of an XML Schema. The validation of XML Schema fragments is not supported. If the XML Schema contains more than one root (or global element), you must select one of the root elements.
- The **Validate XML** activity does not support the validation of XML data against a DTD.

Note: You must upload an XSD file (ends in the .xsd extension) that contains the XML Schema into the project before configuring the **Validate XML** activity. Upload the XML Schema into the project that is used to validate the XML data during run time.

The following table describes the result when an error or warning occurs when the **Validate XML** activity is parsing XML data against an XML Schema.

Table 1.

Error/Warning Type	Description	Example	Result
Fatal Error	Parsing of the XML data fails because of a severe problem and the parsing cannot continue. For example, the XML data is not valid to the XML Schema.	The XML data is not valid to the XML Schema. For example, the XML Schema defines that there should be a root element called <d> but the XML data contains the root element called <a>.	When a fatal error occurs, the current orchestration job stops processing” even the processing of the Validate XML activity does not complete. In addition, the activities in the orchestration after the Validate XML activity are not processed. The value returned from the Validate XML activity for the success output parameter is false but since the activity never completes, nothing is returned.

Error/Warning Type	Description	Example	Result
Error (recoverable)	An error occurs during the parsing of XML data but it does not prevent the parsing of rest of the XML data.	An XML element in an integer but a string is provided as a value: <code><a><count>two</count></code>	If only recoverable errors or warnings occur during parsing, the processing of the Validate XML activity completes and the activities in the orchestration after the Validate XML activity are processed. The value of false is returned from the success output parameter.
Warning	A warning occurs during the parsing of XML data but it does not prevent the parsing of rest of the XML data	Â	If only warnings occur during parsing, the processing of the Validate XML activity completes and the activities in the orchestration after the Validate XML activity are processed. The value of true is returned from the success output parameter.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add_Validate_XML_Activity_to_Orchestration.html

Configuring a Validate XML activity

Perform the steps in this section to configure a **Validate XML** activity.

Procedure

1. Click **Configure** from the **Checklist**.
2. In the **XML Schema** field, click **Browse**. The **Browse For Schema Type Element** dialog box displays. Select the XML schema to parse against during run time. You must select a root or global element and not a schema fragment. The selected XML schema defines the nodes that make up the **InputXml** input parameter in the Map Inputs task.
3. Select or clear the **Continue Parsing XML Data after First Recoverable Error** check box. (This check box defines the run-time behavior when a recoverable error occurs).

Results

If the **Continue Parsing XML Data after First Recoverable Error** check box is selected and only recoverable errors and warnings occur but no fatal errors, the processing of the **Validate XML** activity completes after the first recoverable error and the value **false** is returned from the success output parameter. Only the first error is returned in the **errors** output parameter. The activities in the orchestration after the **Validate XML** activity are processed.

If the **Continue Parsing XML Data after First Recoverable Error** check box is cleared and only recoverable errors and warnings occur but no fatal errors, the processing of the **Validate XML** activity processes all the recoverable errors and the value **false** is returned from the **success** output parameter. Messages about all the recoverable errors are returned in the repeating **Message** node of the **errors** output parameter. The activities in the orchestration after the **Validate XML** activity are processed.

Mapping the output to an activity - Validate XML

Do the steps in this section to map the output to an activity for **Validate XML**.

To map the output of the activity:

1. Select the **Map Outputs** task in the **Checklist**. The output parameters for the activity are displayed in the **From Activity** pane as described in the following table:

Table 1.

O u t p u t N o d e	Description
s	During run time, if the parsing was successful, the value of true is returned. If parsing was unsuccessful, the value of false is returned. If fatal errors occur during parsing, the value of false is returned. If recoverable errors occur during parsing, the value of false is returned. If only warnings occur during parsing, the value of true is returned. In addition, if no warnings or errors occur during parsing, the value of true is returned. Map from the success output parameter to a variable of type string. In XPATH expressions, compare the value of the string variable against the string values of true and false .

O u t p u t N o d e	Description
e r r o r s / e r r o r T y p e	The type of error/warning for the last error or warning that occurred during run time.
e r r o r s / M e s s a g e	A repeating structure that contains a string that describes each error and warning that occurred during run time. All parsing warnings, fatal errors, and recoverable errors are returned.

2. Map the desired output parameters to variable(s). See [Creating a Standalone Map](#) for general instructions on mapping. You are not required to map output parameters for this activity.

Parent topic: [Validate XML activity](#)

Related tasks:

[Read XML activity](#)

Read JSON activity

The **Read JSON** activity takes a JSON or XML message and parses it to a defined schema to generate an output structure that can be used by the orchestration. At runtime this activity parses the JSON message and generates equivalent XML that can be mapped to other Studio activities.

About this task

The input parameter of the **Read JSON** activity expects sample JSON or equivalent sample XML text. (Equivalent JSON or XML text is available from the JSON/REST API documentation). The input data must be a well formed JSON or XML message or the activity fails. If you do not use a schema, you must create a JSON variable (see the **Variables** tab) before you can use an XML schema in the Configure task. The variable can be defined by adding an XML schema to the project or by utilizing an existing variable. Once the JSON/REST sample is provided, the activity generates an equivalent structure for JSON/XML. The XML is mapped to the activity output which can be used by the orchestration. At runtime this activity consumes the JSON message and generates equivalent XML that can be mapped to other studio activities.

To add a **Read JSON** activity to an orchestration:

Procedure

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
 2. Select the **Activities** tab and expand the **Transform** folder.
 3. Drag the **Read JSON** activity onto the orchestration. Place it to the right of an activity from which the orchestration will obtain the JSON data (for example, an FTP Poll Directory).
 4. Select the **Read JSON** activity and configure it as described in [Read JSON activity](#).
- [Read JSON activity configuration](#)
You can apply a sample JSON or XML message to the **Read JSON** input parameter. Use of a schema is optional for this step.
 - [Read JSON map inputs](#)
You can map a string variable that contains JSON data to the input parameter of the **Read JSON** activity called JSONText.
 - [Read JSON map output](#)
You can map the OutputJSON output parameter that contains the JSON data (stored as a string) to a variable valid to the specified XML schema.

Read JSON activity configuration

You can apply a sample JSON or XML message to the **Read JSON** input parameter. Use of a schema is optional for this step.

About this task

If you're applying a JSON or XML message to the **Read JSON** input parameter, do the following steps:

Note: Because not all JSON messages contain a root node, Studio, by default, adds a virtual root element to all JSON messages during a write JSON activity. (Virtual nodes facilitate handling of rootless messages in Studio). To determine if a root node is present, view the message in the Configure panel. If the message does not contain a root element, Studio will automatically generate one during the write JSON activity and display it in the root element file. To remove the root element, delete it from the Configure panel so the output message matches the required structure.

Procedure

1. Click **Configure** from the Checklist. The Configure window is displayed.
2. In the Configure window, copy the JSON or XML message into the text area and click **Generate Output Map**. If you're specifying an XML schema to apply to the Read JSON input parameter, do the following additional steps: (a) In the **Select XML Schema** pane click the **Select XML Schema** button to browse for the XML schema, then (b) select the XML schema to parse against during run time and click **OK**. (You must select a root or global element and not a schema fragment).
3. Specify how to read the data passed into the **JSONText** input parameter during run time by selecting one of the appropriate options:
 - a. Select the **Data is text-Needs no decoding** option if the incoming data is text and does not need decoding.
 - b. Select the **Decode data using encoding type** option if incoming data is binary data that needs to be decoded using the specified encoding type. Set the encoding type by selecting a default encoding type from the **Decode data using encoding type** list or enter your encoding type by clicking in the **Decode data using encoding type** field and typing in your encoding type.
4. Click **OK**.

Read JSON map inputs

You can map a string variable that contains JSON data to the input parameter of the **Read JSON** activity called JSONText.

About this task

JSONText is an input parameter of type string or base64Binary. During run time the string variable must contain well formed JSON data before the **Read JSON** activity is run. The Encoding input parameter is optional. (You are not required to map this parameter). If the Encoding input parameter is not listed in the **To Activity** pane of the **Map Inputs** pane, select **Map > Show Optional Parameters** from the toolbar menu or right-click the **To Activity** pane and select the **Show Optional Parameters** option. If the **Map > Show Optional Parameters** option is not selectable in the toolbar menu, click a node in the **Map Inputs** pane to make the option active. The Encoding input parameter specifies how the incoming data is decoded when read.

Procedure

1. If no decoding is required, specify the string: text.
2. If decoding is required, specify the encoding type to be used to decode the incoming data. For example: UTF-8, US-ASCII, ISO-8859-1, EBCDIC-XML-US, or SHIFT_JIS.

Example

Optionally, you can override the Encoding setting you specified in the **Configure** task of the Checklist dynamically during run time, using the Encoding input parameter. For example, if you set the Encoding to UTF-8 in the Configure task but during run time you passed in the Encoding setting of Shift_JIS, the Encoding setting specified dynamically during run time overrides the original setting specified in the **Configure** pane. In this example, the Encoding is set to Shift_JIS. There is one exception to the dynamic overriding behavior: if the **JSONText is text-Needs no decoding** or **encoding** option is selected in the **Configure** task, the Encoding dynamically set during run time is ignored and no decoding occurs.

Read JSON map output

You can map the OutputJSON output parameter that contains the JSON data (stored as a string) to a variable valid to the specified XML schema.

See [Creating a Standalone Map](#) for general instructions on mapping.

During run time, an orchestration could invoke the following sequence of activities:

1. An HTTP Receive activity assigns the received body to a String variable called **JSONRawContent**.
2. A **Read JSON** activity assigns the contents of the **JSONRawContent** variable to the string input parameter called JSONText.

3. The **Read JSON** activity converts JSON data to XML data and passes the XML back to the orchestration via the output parameter. The contents of the output parameter are assigned to the variable valid to the XML schema. The data JSON input document can now be used and mapped within the orchestration.

Write JSON activity

The **Write JSON** activity takes a structure equivalent to JSON as input and outputs a string in the JSON format containing the data held in the complex variable. This string can then be written to a file or posted using HTTP.

About this task

The JSON string is returned as an output parameter. (This is only applicable if you use a schema). The orchestration data must come from a complex variable which is indicated by the XML icon on the Variables tab. You configure the activity by pasting a JSON or XML sample message (available in the JSON/REST API documentation) in the Configure panel. This generates a compatible input structure for mapping the input data, which is then converted to a JSON message.

To add a **Write JSON** activity to an orchestration:

Procedure

1. Create or open an orchestration. For more information, see [Building an orchestration](#). A graphical representation of the orchestration is displayed.
 2. Select the **Activities** tab and expand the **Transform** folder.
 3. Drag the **Write JSON** activity onto the orchestration.
 4. Select the **Write JSON** activity and configure it as described in [Write JSON activity configuration](#).
- [Write JSON activity configuration](#)
During this procedure, you apply a sample JSON or XML message to the Write JSON input parameter. If you prefer, you can also use a schema for this task.
 - [Write JSON map inputs](#)
You can map data from variables in the orchestration to the InputJSON parameter defined by the XML schema specified in the Configure task or use sample JSON/REST XML and the Configure panel to generate the input structure.
 - [Write JSON map output](#)
You can map the JSONText output parameter that contains the JSON data to a string variable.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write_json_Activity.html

Write JSON activity configuration

During this procedure, you apply a sample JSON or XML message to the Write JSON input parameter. If you prefer, you can also use a schema for this task.

About this task

Note: Because not all JSON messages contain a root node, Studio, by default, adds a virtual root element to all JSON messages during a write JSON activity. (Virtual nodes facilitate handling of rootless messages in Studio). To determine if a root node is present, view the message in the Configure panel. If the message does not contain a root element, Studio will automatically generate one during the write JSON activity and display it in the root element file. To remove the root element, delete it from the Configure panel so the output message matches the required structure.

Procedure

1. Click Configure from the Checklist. The Configure window is displayed.
2. In the Configure window, you can either use an XML Schema or JSON or XML message to generate map.
 - a. If you are specifying an XML schema to apply to the Write JSON input parameter, do the following:
In the Select XML Schema field, click the Select XML Schema button to browse and select XML schema. Select the XML schema to parse during run time and click OK.
 - b. If you want to use the JSON or XML message, copy the JSON or XML message into the Use JSON or XML message to generate the output schema text area.
3. Choose a Virtual Root Configuration.
 - a. When you use JSON or XML message to generate map, if more than one element present in JSON, then by default, Remove root Element is checked automatically.
 - b. When you use XML Schema to generate map, Remove root Element is not checked by default.

Note: If the Remove Root Element is checked, the first root element is skipped and the JSON text is created properly with the remaining elements. You can specify a Root Element Name. However if the Remove Root Element is not checked, then for all the complex types will not get the root element names and hence will be displayed as null.
4. Specify how the data defined by the OutputJSON output parameter is to be encoded:
 - a. Select the **Data is text-Needs no decoding or encoding** option if the data is text and does not require encoding.
 - b. Select the **Encode data using encoding type** option if outgoing data is binary data that requires encoding using the specified encoding type.
5. Set the encoding type using one of the following options:
 - a. From the Encode data using encoding type list, select one of the default encoding types.
 - b. Click directly in the Encode data using encoding type field and enter your encoding type.
 - c. Click OK.
6. Click Generate Map.

Mapping the output to an activity - Validate JSON

Do the steps in this section to map the output to an activity for **Validate JSON**.

To map the output of the activity:

1. Select the **Map Outputs** task in the **Checklist**. The output parameters for the activity are displayed in the **From Activity** pane as described in the following table:

Table 1.

Output Node	Description
-------------	-------------

O u t p u t N o d e	Description
s	<p>During run time, if the parsing was successful, the value of true is returned. If parsing was unsuccessful, the value of false is returned. If fatal errors occur during parsing, the value of false is returned. If recoverable errors occur during parsing, the value of false is returned. If only warnings occur during parsing, the value of true is returned. In addition, if no warnings or errors occur during parsing, the value of true is returned. Map from the success output parameter to a variable of type string. In XPATH expressions, compare the value of the string variable against the string values of true and false.</p>
e r r o r s / e r r o r T y p e	<p>The type of error/warning for the last error or warning that occurred during run time.</p>
e r r o r s / M e s s a g e	<p>A repeating structure that contains a string that describes each error and warning that occurred during run time. All parsing warnings, fatal errors, and recoverable errors are returned.</p>

2. Map the desired output parameters to variable(s). See [Creating a Standalone Map](#) for general instructions on mapping. You are not required to map output parameters for this activity.

Read Flat File activity

The Read Flat File activity converts flat file data (non-XML data) to XML data by applying the specified Flat File Schema. XML data is returned from this activity as the output parameter.

About this task

The input parameter of the Read Flat File activity expects flat file data. Flat file (non-XML) data includes comma-separated values (.csv) and other types of delimited files, as well as fixed-length text files that comprise many EDI systems. Flat File data can be obtained from various endpoint activities, such as the FTP Poll Directory activity, HTTP Receive Request activity, or Get Email activity.

For an example of using a Read Flat File activity in an orchestration, see *"Developing a Simple Project"* in the *Getting Started Guide*.

You must [create the Flat File Schema](#) before you can select a Flat File Schema in the Select a Flat File Schema field of the Configure task.

To add a Read Flat File activity to an orchestration:

Procedure

1. Create or open an orchestration. For more information, see [Creating an orchestration](#). A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the Transform folder.
3. Drag the Read Flat File activity onto the orchestration. Place it to the right of an endpoint activity from which the orchestration will obtain the flat file data (for example, an **FTP Poll Directory** activity).
4. Select the Read Flat File activity and configure it as described in [Configuring a Flat File activity](#).
 - [Read Flat File activity configuration](#)
You can specify the Flat File Schema to apply to the Read Flat File input parameter.
 - [Read Flat File map inputs](#)
You can map a string variable that contains the flat file data to the input parameter of the Read Flat File activity called Data.
 - [Read Flat File map outputs](#)
You can map the Xml output parameter that contains the XML data (stored as a string) to a variable valid to the specified Flat File Schema.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Flat_File_to_XML_Activity.html

Read Flat File activity configuration

You can specify the Flat File Schema to apply to the Read Flat File input parameter.

Before you begin

You must [create the Flat File Schema](#) before starting this task.

About this task

To complete the Configure task:

Procedure

1. In the Select a Flat File Schema field, click Browse... . The Project Explorer dialog box is displayed.
2. Select the appropriate Flat File Schema from the Flat File Schema folder and click OK.
3. Specify how to read the data passed into the Data input parameter during run time, by selecting one of the appropriate options:
 - a. Select the Data is text-Needs no decoding option, if the incoming data is text and does not need decoding.
 - b. Select the Decode data using encoding type option, if incoming data is binary data that needs to be decoded using the specified encoding type. Set the encoding type using one of the following options:
 - From the Decode data using encoding type list, select one of the default encoding types.
 - Enter your encoding type by clicking in the Decode data using encoding type field and typing in your encoding type.
4. Click OK.

Parent topic: [Read Flat File activity](#)

 Last updated: Wednesday, February 17, 2016

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read_Flat_File_Activity_Configuration.html

Read Flat File map inputs

You can map a string variable that contains the flat file data to the input parameter of the Read Flat File activity called Data.

About this task

Data is an input parameter of type string or base64Binary. During run time the string variable must contain flat file data before the Read Flat File activity is run. For more information see the following Runtime Example.

The Encoding input parameter is optional. You are *not* required to map this input parameter. If the Encoding input parameter is not listed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click a node in the Map Inputs pane to make this option active.

The Encoding input parameter specifies how the incoming data is decoded when read:

Procedure

- If no decoding is required, specify the string: `text`.
- If decoding is required, specify the encoding type that should be used to decode the incoming data. For example: `UTF-8`, `US-ASCII`, `ISO-8859-1`, `EBCDIC-XML-US`, or `SHIFT_JIS`.

Example

Optionally, you can override the Encoding setting you specified in the Configure task of the Checklist dynamically during run time, using the Encoding input parameter. For example, if you set the Encoding to `UTF-8` in the Configure task but during run time you passed in the Encoding setting of `SHIFT_JIS`. The Encoding setting specified dynamically during run time overrides the original setting specified in the Configure pane. In this example, the Encoding would be set to `SHIFT_JIS`. There is one exception to the dynamic overriding behavior if the Data is text-Needs no decoding or encoding option is selected in the Configure task, the Encoding dynamically set during run time is ignored and no decoding occurs.

See [Creating a map](#) for general instructions on mapping.

Parent topic: [Read Flat File activity](#)

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read_Flat_File_Map_Inputs.html

Read Flat File map outputs

You can map the Xml output parameter that contains the XML data (stored as a string) to a variable valid to the specified Flat File Schema.

About this task

See [Creating a Map](#) for general instructions on mapping.

Runtime Example

During run time, an orchestration could invoke the following sequence of activities:

Procedure

1. A FTP Poll Directory activity assigns the contents of a flat file to a String variable called *flatFileRawContent*.
2. A Read Flat File activity assigns the contents of the *flatFileRawContent* variable to the string input parameter called Data.
3. The Read Flat File activity converts flat file data to XML data and passes the XML data back to the orchestration via the output parameter. The contents of the output parameter are assigned to the variable valid to the Flat File Schema.

What to do next

For an example of using a Read Flat File activity in an orchestration, see "Developing a Simple Project" in the *Getting Started Guide*.

Write Flat File activity

The Write Flat File activity converts data from an orchestration into flat file data (non-XML data) that is valid to the specified Flat File Schema.

About this task

The flat file data is returned as a string output parameter. The data from the orchestration can come from multiple variables of different types. For example, the data from the orchestration could contain two sets of XML data valid to two different XML Schemas and a string.

Flat file (non-XML) data includes comma-separated values (.csv) and other types of delimited files, as well as fixed-length text files that comprise many EDI systems.

You must create the Flat File Schema before you can select a Flat File Schema in the Select a Flat File Schema field of the Configure task. See [Creating a flat file schema](#) for more information.

To add a Write Flat File activity to an orchestration:

Procedure

1. Create or open an orchestration. For more information, see [Creating an orchestration](#). A graphical representation of the orchestration is displayed.
 2. Select the Activities tab and expand the Transform folder.
 3. Drag the Write Flat File activity onto the orchestration
 4. Select the Write Flat File activity and configure it as described in [Write Flat File activity configuration](#).
- [Write Flat File activity configuration](#)
You can specify the Flat File Schema that must be applied to the outbound data.
 - [Write Flat File map inputs and outputs](#)
You can map the data from variables of the orchestration to the Xml input parameter defined by the Flat File Schema specified in Configure task.

Parent topic: [Transform Activities](#)

Write Flat File activity configuration

You can specify the Flat File Schema that must be applied to the outbound data.

Before you begin

You must first [create the Flat File Schema](#) before starting this task.

About this task

You can specify the Flat File Schema to apply to the input parameter. To complete the Configure task:

Procedure

1. In the Select a Flat File Schema field, click Browse.... The Project Explorer dialog box is displayed.
2. Select the appropriate Flat File Schema from the Flat File Schema folder and click OK.
3. Specify how to write the data returned by the Data output parameter during run time, by selecting one of the appropriate options:
 - a. Select the Data is text-Needs no decoding or encoding option, if the outgoing data is text and therefore does not require encoding.
 - b. Select the Decode or encode data using encoding type option, if outgoing data is binary data that requires encoding using the specified encoding type. Set the encoding type using one of the following options:
 - From the Decode or encode data using encoding type list, select one of the default encoding types.
 - Click directly in the Decode or encode data using encoding type field and enter your encoding type.
4. Click OK.

Parent topic: [Write Flat File activity](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write_Flat_File_Activity_Configuration.html

Write Flat File map inputs and outputs

You can map the data from variables of the orchestration to the Xml input parameter defined by the Flat File Schema specified in Configure task.

About this task

The Encoding input parameter is optional. You are not required to map this input parameter. If the Encoding input parameter is not listed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active.

The Encoding input parameter specifies how outgoing data should be encoded:

Procedure

- If no encoding is required, specify the string: `text`.
- If encoding is required, specify the encoding type that should be used to encode the outgoing data, for example: `UTF-8`, `US-ASCII`, `ISO-8859-1`, `EBCDIC-XML-US`, or `SHIFT_JIS`.

Example

Optionally, you can override the Encoding setting you specified in the Configure task of the Checklist dynamically during run time, using the Encoding input parameter. For example, if you set the Encoding to `UTF-8` in the Configure task but during run time you passed in the Encoding setting of `SHIFT_JIS`. The Encoding setting specified dynamically during run time overrides the original setting specified in the Configure pane. In this example, the Encoding would be set to `SHIFT_JIS`. There is one exception to the dynamic overriding behavior, if the Data is text-Needs no decoding or encoding option is selected in the Configure task, the Encoding dynamically set during run time is ignored.

See [Creating a map](#) for general instructions on mapping.

Parent topic: [Write Flat File activity](#)

Write Flat File map outputs

You can map the Data output parameter that contains the flat file data to a string variable.

About this task

See [Creating a Map](#) for general instructions on mapping.

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write_Flat_File_Map_Inputs.html

Apply XSLT activity

You can use the Apply XSLT activity to transform XML data, stored in one XML variable, to XML data, stored in another XML variable, using the specified XSLT stylesheet.

About this task

The Apply XSLT activity transforms XML data, stored in one XML variable, to XML data, stored in another XML variable, using the specified XSLT stylesheet. The XSLT stylesheet is created outside of Studio.

For example, if you have a XSLT stylesheet that converts XML data, valid to one XML Schema, to XML data, valid to a second XML Schema, you can create an Apply XSLT activity that calls this XSLT stylesheet to do this conversion in your orchestration during run time.

To create an Apply XSLT activity:

Procedure

1. **Upload** the XSLT stylesheet into the project.
2. **Upload** the XML Schemas or DTD files that define the input and output XML variables.
3. **Create** the following two XML variables:
 - o a variable to hold the input XML data based on a XML Schema or DTD.
 - o a variable to hold the output XML data based on a different XML Schema or DTD.
4. Add the Apply XSLT activity to your orchestration:
 - a. **Create** or open an orchestration. A graphical representation of the orchestration is displayed.
 - b. Select the Activities tab and expand the Transform folder.
 - c. Drag the Apply XSLT activity onto the orchestration
5. Configure the Apply XSLT activity:
 - a. In the Pick Stylesheet task, for the Stylesheet field click Browse. The Project Explorer is displayed.
 - b. Select the appropriate stylesheet and click OK. The stylesheet is displayed.
 - c. In the Checklist, select Set Input & Output.
 - d. In the Input pane, select Browse. The Select Variable pane is displayed.
 - e. Select a variable and click OK.
 - f. In the Output pane, select Browse. The Select Variable pane is displayed.
 - g. Select a variable and click OK.

Logic Activities

- [Logic activities overview](#)
Logic activities control the flow of an orchestration.
- [Terminate activity](#)
The Terminate activity stops all further orchestration job processing in the current branch.
- [Pick activity](#)
The Pick activity determines what starter activity to launch based on the action that has occurred during run time.
- [If..Then activity](#)
The If..Then activity tests the Where expression in the If branches to determine what branch of the If..Then activity to run.
- [Try activity](#)
The Try... activity attempts to run the activity or activities in the main Try branch.
- [Group activity](#)
Use this activity to group a set of activities in an orchestration. As a group, you can name, add comments, and collapse the block of activities as one entity.
- [While Loop activity](#)
The While Loop activity initiates and continually processes any associated activities for as long as the specified condition evaluates to true.
- [For Each activity](#)
The For Each activity iterates through recurring elements of a variable, performing other activities during each iteration cycle.
- [Split activity](#)
The Split activity is a variation of the For Each activity that can be used to break up very large messages to improve performance.
- [Break Loop activity](#)
During run time, when a Break Loop activity is processed, the processing flow breaks out of the current looping activity and continues to the next activity in the orchestration.
- [Continue activity](#)
The Continue activity jumps to the next item to process in the loop and is typically placed after an If or an If..Then activity.
- [Adding branches to the If..Then activity](#)
The If..Then activity supports multiple branches to handle different conditions.
- [Moving branches](#)
You can change the position of a branch within an If..Then activity or a Pick activity.
- [Defining conditions](#)
You can specify conditions in If..Then and While Loop activities to define a criteria that must be met before the orchestration continues with that branch.
- [Basic condition syntax](#)
There are various types of conditions that you can use to evaluate an XPath expression.
- [bpws:getVariableData function](#)
Use the bpws:getVariableData function to create conditions to access variable data.
- [Basic XPath expressions](#)
XPath expressions are used in orchestrations and flat file schema definitions when you need to identify

one or more nodes in a message or variable in order to access data or determine whether a condition has been met.

- [Testing XPath expressions](#)

Use the XPath Evaluator to test XPath expressions against test XML documents.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_logicactivities.html

Logic activities overview

Logic activities control the flow of a orchestration.

Logic activities provide the functionality described in the following table:

Activity	Description
Break Loop	Breaks out of a For Each, Split, or While Loop activity.
Continue	Jumps to the next item to process in a For Each, Split, or While Loop activity.
ForEach	Iterates through repeating nodes of a variable, performing one or more activities during each iteration cycle.
If..Then	Routes messages based on conditions to different branches.
Pick	Receives messages from one or more activities and selects one of them to start an orchestration.
Split activity	Iterates through repeating sections of a variable, performing one or more activities during each iteration cycle. The Split activity is a variation of the For Each activity that can be used to break up very large messages to improve performance.
Terminate	Stops all further processing of the current orchestration job.
Try activity. ..	Attempts to run the activity or activities in the main Try branch. If any exception occurs when running the activity or activities in the main Try branch, the CatchAll branch is run.

Activity	Description
While Loop	Initiates and continually processes any children activities for as long as a specified condition is true.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Logic_Activities_Overview.html

Terminate activity

The Terminate activity stops all further orchestration job processing in the current branch.

About this task

This activity is commonly used in the If and Else branches of an If..Then activity to stop orchestration processing after an error occurs.

Parent topic: [Logic Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Terminate_Activity.html

Pick activity

The Pick activity determines what starter activity to launch based on the action that has occurred during run time.

About this task

For example, a Pick activity could contain three branches, one that contains a Get Inserted Rows activity, one that contains a Get Deleted Rows activity, and the other that contains a Get Updated Rows activity. If an update event occurs on the database, an instance of the orchestration is created and branch that contains the Get Updated Rows activity is called.

When you add a Pick activity to an orchestration, two Receive branches are automatically added. You can add additional receiveEvent nodes to the Pick activity. A Pick activity is always a starter activity and in each branch of a Pick activity the first activity must be a starter activity.

The Receive branch contains a receiveEvent node and an empty placeholder. Each message is defined in a Receive branch that can contain other activities to handle that specific message.

Delete Receive branches if you do not want a receive operation to be a part of the Pick activity. Deleting the Receive node removes the entire Receive branch.

Attention: If a variable is not initialized in every branch of a Pick activity, the variable cannot be used outside the scope of a Pick activity. Attempting to use a variable outside the Pick activity that is not initialized in every branch results in an invalid orchestration. For example, a Pick activity has two branches, one that contains a Get Updated Rows activity and one that contains a Get Inserted Rows activity. The Get Updated Rows activity returns the data to a variable named updateResult while the Get Updated Rows activity returns the data to a variable named insertResult. These variables can only be used within the Pick activity and cannot be used in the activities that follow after the Pick activity in the orchestration. If the output of each activity is based on the same schema, you can however define one variable that both activities initialize. If all branches in a Pick activity initialize the variable, the scope of the variable includes all activities after the Pick activity and is not limited to the scope of the Pick activity.

To use a Pick activity complete the following steps:

Procedure

1. Drag the Pick activity from the Logic folder in the Activities tab onto the orchestration.
2. Select an inbound activity or the Schedule Job activity and drag it onto the receiveEvent placeholder.
3. To add an activity to the branch, drag the activity onto the empty placeholder.

Adding, editing, or deleting condition branches

The Pick activity can have several branches to process complex conditions

To add a branch to the Pick activity:

1. Click the Pick node.
2. Select Add Receive Branch from the list.

To edit a branch or activity name complete the following steps:

1. Select an activity or branch.
2. Select Edit from the list. The name is displayed in a box.
3. Select the current name, then enter the new one.
4. Press Enter.

To delete an activity or branch complete the following steps:

1. Select an activity or branch.
2. Select Delete from the list.

Note: If you delete a condition branch, all activities within the condition branch are also deleted.

Parent topic: [Logic Activities](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Pick_Activity.html

If..Then activity

The If..Then activity tests the Where expression in the If branches to determine what branch of the If..Then activity to run.

About this task

By default, each If..Then activity includes an If branch and an Else branch. You can [add if additional branches](#) to an If..Then activity.

When the Where expression in the If branch is equal to true, processing proceeds down that If branch of the orchestration. If an If..Then activity contains multiple If branches, the Where expressions in the If branches are tested in sequential order. When none of the Where expressions in the If branches are satisfied, processing proceeds down the Else branch.

You also have the option of [copying a branch](#) or [Else](#) branch from another If..Then activity.

To use an If..Then activity complete the following steps:

Procedure

1. Open the Activities tab and the Logic folder.
2. Drag the If..Then activity onto the orchestration.
3. Add more If branches as required.
4. Configure the If and Else branches.

Configure an IF branch

1. Select the If branch. The Expression Builder opens.
2. [Define conditions](#) for the branch.
3. Drag an activity from the Activities tab onto the empty placeholder.

Configuring an Else branch

1. Drag an activity from the Activities tab onto the empty placeholder.

Copying and pasting If nodes

1. Click the If branch and select Copy from the list.
2. Click on the If..Then activity in the orchestration and select Paste from the list.
Note: If and Else branches cannot be pasted outside of an If..Then activity. You cannot replace an If branch with an Else branch.

Copying and pasting Else nodes

Else branches can be pasted into a If..Then activity only if the If..Then activity does not already contain an Else branch.

1. Click the Else branch and select Copy from the list.
2. Click the If..Then activity and select Paste from the list.

Adding branches

1. Click the If..Then activity and select Add If.
2. [Define the conditions](#) and the activities for the branch.

Editing an activity or branch

1. Select the activity or branch to edit existing properties.
2. Select Edit from the list.

Deleting an activity or branch

1. Select the activity or branch to edit existing properties.
2. Select Delete from the list.

Note: If you delete a condition branch, all activities within the condition branch are also deleted.

Parent topic: [Logic Activities](#)

Feedback | Notices

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Switch_Activity.html

Try activity

The Try... activity attempts to run the activity or activities in the main Try branch.

About this task

If any exception occurs while running the activity or activities in the main Try branch, the CatchAll branch is run.

Right-clicking the mouse on the background creates a new CatchAll branch.

For example, the main Try branch can call the Database Insert Rows activity as shown in the following figure:

If the Database Insert Rows activity fails and throws an exception, the activity or activities in the CatchAll branch are run. In this example orchestration, when an exception is thrown by the Database Insert Rows activity, the Terminate activity runs thus terminating the current orchestration job.

To add and configure a Try... activity, complete the following steps:

Procedure

1. Open the Activities tab and the Logic folder.
2. Drag the Try... activity onto the orchestration. The Try... activity is displayed with the following branches:
 - o Try... branch
 - o CatchAll branch

When the first CatchAll branch is created, the following variables are automatically created:

- o **faultName** - During run time, the faultName variable contains the name of the exception thrown by an activity in the Try branch.
- o **faultData** - During run time, the faultData variable contains the error message associated with the exception. This additional information is only currently returned for the Web Services activities. For Web Services activities, the faultData variable contains the fault.
- o **faultInfo** - During run time, the faultInfo variable returns the following nodes:
 - **name** - During run time, the faultInfo/name node contains the name of the exception thrown by the activity in the Try branch. The faultInfo/name node is a xsd:QName type.
 - **message** - During run time, the faultInfo/message node contains the error message associated with the exception. The faultInfo/message node is a xsd:string type.
 - **activityId** - During run time, the faultInfo/activityId node contains the activity ID that uniquely identifies the activity where the exception occurred. The faultInfo/activityId node is a xsd:int type.
 - **activityName** - During run time, the faultInfo/activityName node contains the activity name where the exception occurred. The faultInfo/activityName node is a xsd:string type.
 - **faultTime** - During run time, the faultInfo/faultTime node contains the time the error occurred. The faultInfo/faultTime node is a xsd:dateTime type.

Note: The exception name returned by an activity in the faultName variable and the faultInfo/name node might change in a future release.

3. Configure the Try... and CatchAll branches by dropping activities from the Activities tab to the branches of the Try... activity as shown in the preceding and following figures.

Attention: The scope of the faultName, faultData, and faultInfo variables is limited to the CatchAll branch of the Try... activity. This scope limitation means that the value of these variables is only guaranteed to be valid within the CatchAll branch. For example, if you add an If...Then activity that tests the value of the faultName variable, the If...Then activity must be placed inside the CatchAll branch of the Try... activity as shown in the following figure:

Group activity

Use this activity to group a set of activities in an orchestration. As a group, you can name, add comments, and collapse the block of activities as one entity.

About this task

When you add a CatchAll branch to the group, the CatchAll branch runs as an exception occurs in the group of activities.

To use the Group activity complete the following steps:

Procedure

1. In the Studio toolbox, click the Activities tab.
2. Expand the Logic directory.
3. Drag the Group activity onto the orchestration.
4. Optional: Add a CatchAll branch.
 - a. Right-click the Group activity. An option menu opens.
 - b. Select Add CatchAll Branch. The CatchAll branch is displayed in the Group activity.

While Loop activity

The While Loop activity initiates and continually processes any associated activities for as long as the specified condition evaluates to true.

About this task

To define a While Loop activity complete the following steps:

Procedure

1. Drag a While Loop activity from the Logic folder of the Activities tab onto the orchestration. The [Expression Builder](#) is displayed.
2. Use the Expression Builder to [define conditions](#) in the While Loop activity. You must define a condition that evaluates to false to ensure that the loop ends. The variables needed to iterate through the conditions you specify are automatically created.
3. Drag an activity from the Activities tab onto the empty placeholder inside of the While Loop activity, typically, For Each, While Loop, or Split. Use the Break Loop or Continue activities to control iterations in these activities

Parent topic: [Logic Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_While_Loop_Activity.html

For Each activity

The For Each activity iterates through recurring elements of a variable, performing other activities during each iteration cycle.

About this task

When you drop a For Each activity onto an orchestration, Studio creates the following two variables:

- loopvalue_X - During run time, as the For Each activity loops through a set of recurring elements, the loopvalue_X variable contains the value of the current element.
- loopcounter_X - During run time, as the For Each activity loops through a set of recurring elements, the loopcounter_X variable contains the current count of the number of iteration cycles that have been processed by the For Each activity.

Where X is equal to the number of For Each activities that have been dropped on the orchestration. For example, when the first For Each activity is dropped on an orchestration, the variables called loopvalue_1 and loopcounter_1 are created.

Attention: Do not use the loopvalue_X and loopcounter_X variables outside of the For Each activity. The scope of these variables are limited to the For Each activity.

Â

To use a For Each activity complete the following steps:

Procedure

1. Open the Activities tab and the Logic folder.
2. Drag the For Each activity onto the orchestration.
3. In the Variable Name field, select a variable containing the recurring element that you want to loop through in the For Each activity.
4. In the Element Name field click [...] to browse for the recurring element that you want to loop through in the For Each activity. The Select Recurring Element window is displayed.
5. Select a recurring element and click OK.

Results

An XPath expression that refers to the recurring element is displayed in the Element Name field. The Variable Name field is automatically populated with the loopvalue_X variable created for this For Each activity. You can edit the generated XPath expression in the Element Name field.

You can add other activities within the For Each loop. Use the Break Loop and Continue activities to control iterations of the For Each loop.

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_For_Each_Activity.html

Break Loop activity

During run time, when a Break Loop activity is processed, the processing flow breaks out of the current looping activity and continues to the next activity in the orchestration

About this task

The Break Loop activity can only be used in any of the following looping activities: For Each, Split, and While Loop, as shown in the following examples.

To use a Break activity:

Procedure

1. Open the Activities tab and the Logic folder.
2. Drag a For Each, Split, or While Loop activity onto the orchestration.
3. Drop the Break Loop activity into the looping activity, as shown in the following example:
 - o To break out of a loop when a condition is true, see Example 1.
 - o To break out of a loop after a single iteration, see Example 2.

Example 1 - Break out of a loop when a condition is true

1. Drag an If..Then activity into the looping activity you set up, as shown in the preceding figure.
2. Drag an action activity (for example: the Insert Rows activity) onto the empty placeholder to the right of the Else node.
3. Configure the action activity.
4. Click the If node and enter a condition in the Expression Builder.
5. Drag a Break Loop activity onto the empty placeholder to the right of the If node.

At run time:

- If the condition in the If activity evaluates to true, the Break Loop exits out of the looping activity.
- If the condition in the If activity evaluates to false, the Else branch is started and the action activity (for example: the Insert Rows activity) is run.

Example 2 - Break out of a loop after a single iteration runs

1. Drag an action activity (for example, the Insert Rows activity) onto the empty placeholder inside of the looping activity you selected.
2. Configure the action activity.
3. Drag a Break Loop activity onto the empty placeholder inside of the looping activity.

At run time:

- The action activity (for example: the Insert Rows activity) runs only once before the Break Loop exits out of the looping activity.

Continue activity

The Continue activity jumps to the next item to process in the loop and is typically placed after an If or an If..Then activity.

About this task

The Continue activity can only be used inside one of the following looping activities: For Each, Split, and While Loop activities.

To use a Continue activity complete the following steps:

Procedure

1. Open the Activities tab and the Logic folder.
2. Drag a For Each, Split, or While Loop activity onto the orchestration.
3. Set up the looping activity to continue processing as shown in the following example.

Example - Continue processing when a condition is true

- a. Drag an If..Then activity into the looping activity you set up in step 1.
- b. Drag an action activity (for example: an Insert Rows activity) onto the empty placeholder to the right of the If node.
- c. Configure the action activity.
- d. Click the If node and enter a condition in the [Expression Builder](#).
- e. Drag a Continue activity onto the empty placeholder to the right of the Else node.

At Run Time:

- o If the condition in the If evaluates to true, the action activity runs.
- o If the condition in the If evaluates to false, the Continue activity in the Else branch runs and jumps to the next item in the looping activity.

Parent topic: [Logic Activities](#)

Adding branches to the If..Then activity

The If..Then activity supports multiple branches to handle different conditions.

About this task

To add additional If and Else branches complete the following steps:

Procedure

1. Select the If..Then activity in the orchestration
2. Right-click and select one of these options:
 - o Add If “ to add another branch with a condition.
 - o Add Else “ to add a final, catch-all branch to use when a message does not match any of the conditions in the If statements. (This option is only available if there is no Else branch displayed.)
 - o Double-click the If icon and enter a name for the branch.
 - o Use the Expression Builder to [define the conditions](#) for the branch.

Moving branches

You can change the position of a branch within an If..Then activity or a Pick activity.

About this task

To move a branch within an If..Then activity or a Pick activity complete the following steps:

Procedure

1. Select the branch you want to move. For an If..Then activity, select one of the If nodes; for a Pick activity, select one of the receiveEvent nodes.
2. To move the branch use one of the following actions:
 - o Select Orchestration > Go Up or Orchestration > Go Down from the toolbar menu.
 - o Right-click the branch and select Go Up or Go Down from the list.

Defining conditions

You can specify conditions in If..Then and While Loop activities to define a criteria that must be met before the orchestration continues with that branch.

In most cases, conditions test the value of data in a message or in other variables defined within the orchestration. Use the Expression Builder to define conditions.

Expression Builder

The Expression Builder is used to define conditions for If..Then and While Loop activities. It is displayed beneath the orchestration, in the Property pane, when you select an If..Then or While Loop activity in the orchestration.

These conditions are boolean expressions that describe the criteria against which the Integration Appliance compares a message. During runtime, the result of this comparison determines the execution path through the orchestration. For a complete list of operators that you can use in the Expression Builder, see [Valid Operators for Conditions](#). For more information about the order precedence of the conditions in the Expression Builder, see <http://www.w3.org/TR/xpath#booleans>.

The Expression Builder allows you to add, delete, and edit conditions as well as change their processing order.

To add a condition:

1. Click Add. A new condition displays beneath the existing list of conditions.
2. To or the new condition with the previous condition in the link, right-click and select or from the list.

To delete a condition:

- Select the condition, then click Delete.

To edit a condition:

- Select any field in the Expression Builder and make your edits. If the Expression Builder is not displayed, click Use Builder. You can edit left-hand expressions, select operators, and right-hand expressions.

-OR-

- Click Advanced to directly edit XPath expression that defines the condition. For more information, see [Basic Condition Syntax](#), [Basic XPath Expressions](#), and [bpws:getVariableData Function](#)

Note: Use the XPath Evaluator to [test XPath expressions](#).

To change the processing order of the conditions:

- Select a condition in the Expression Builder and click the up or down arrows.

Parent topic: [Logic Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

Basic condition syntax

There are various types of conditions that you can use to evaluate an XPath expression.

The most common operator used to evaluate an expression is = (equals), but you can use any valid XPath operator. See [Basic XPath Expressions](#) for a list of valid XPath operators.

The following examples demonstrate how to use various conditions to evaluate an XPath expression.

Example 1: Using string literals

String literals must be enclosed in quotation marks as shown in this example:

```
bpws:getVariableData('PatientInfo')/PV1/Department = 'ICU'
```

Example 2: Accessing variable data

Use the [bpws:getVariableData function](#) to access variable data

Using string literals in the `getVariableData` function:

The following example evaluates string nodes from two variables. The variable names in the `bpws:getVariableData` function are string literals.

```
bpws:getVariableData('PatientInfo')/PV1/Department =  
bpws:getVariableData('Orders')/PID/PtDept
```

Using numeric literals in the `getVariableData` function:

To evaluate numeric literals you must cast either one or both sides of the expression. For example:

```
number(bpws:getVariableData('PatientInfo')/PV1/Department) =  
bpws:getVariableData('Orders')/PID/PtDept
```

Â - OR -

```
number(bpws:getVariableData('PatientInfo')/PV1/Department) =  
number(bpws:getVariableData('Orders')/PID/PtDept)
```

Example 3: Numeric literals

Numeric literals do not require quotation marks. Placing quotes around a numeric literal transforms it into a string literal.

Valid numeric expression example:

```
number(bpws:getVariableData('PurchaseOrder')/PurchaseOrder/POTotal) >= 5000.00
```

Invalid numeric expression example:

```
number(bpws:getVariableData('PurchaseOrder')/PurchaseOrder/POTotal) >= '5000.00'
```

Parent topic: [Logic Activities](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Basic_Condition_Syntax.html

bpws:getVariableData function

Use the bpws:getVariableData function to create conditions to access variable data.

It can be combined with an XPath expression identifying specific nodes within the variable.

For example:

- To access the data in the POTotal node in a variable named PurchaseOrder, you would enter:
`bpws:getVariableData('PurchaseOrder')/PurchaseOrder/POTotal`
- To access the data in a primitive variable named ItemCount, enter:
`bpws:getVariableData('ItemCount')`

Parent topic: [Logic Activities](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_bpws_getVariableData_Function.html

Basic XPath expressions

XPath expressions are used in orchestrations and flat file schema definitions when you need to identify one or more nodes in a message or variable in order to access data or determine whether a condition has been met.

XPath is an XML standard that defines a grammar to identify nodes or sets of nodes (called node sets) in XML documents.

You can edit the default XPath expressions, generated in the following panes:

- In the Configure panes of the [For Each](#) and [Split activity](#) activities, an XPath expression is generated to define the recurring element. You can edit the default XPath expression displayed in the Element Name field.
- In the Configure panes of the [While Loop](#) and [If..Then](#) activities, an XPath expression is generated in the Expression Builder to define the conditions. You can edit the default XPath expression displayed by clicking Advanced.

XPath 2.0 is supported.

Selecting nodes by path

XPath describes the location of XML elements and attributes as a path similar to URLs or directories on your local file system. Each element or attribute is a node in a tree that begins with the root node. The root node contains the entire tree, so any node within the tree can be found by following a path down the branches.

The basic syntax is:

```
/root-node/child-node/.../final-element-node
```

```
/root-node/child-node/.../final-element-node/@attribute-node
```

You determine this path from the XML Schema that describes the messages.

XPath uses the @ symbol as a shorthand to identify attributes. Paths without @, or the attribute:: prefix, identify elements by default. For example:

```
Â /PackingSlip/PONumber/Item
```

identifies the Item element found inside PONumber in the PackingSlip root node.

Node names and XML namespaces

Node names can also appear with namespaces, such as tns:OrderNumber or *:Item. The portion of the name up to the colon is a prefix identifying a namespace and the colon is the delimiter between the namespace and the node's local name.

Namespaces are an XML standard used to uniquely identify elements or attributes when documents share content from several schemas. Cast IronÂ® Studio automatically assigns and manages namespaces for the XML Schemas used in configuration documents. Â

Note: Each schema within a WSDL definition can be defined by a namespace.

Select nodes conditionally with predicates

You might occasionally want to select a node only if some condition is met. These selection conditions are known as predicates.

You define predicates inside brackets, such as:

```
/PV1/PatientDepartment[text()='Nursery']
```

This expression selects the PatientDepartment node only if the data in the node is Nursery.

```
/Order/OrderDetail/Item[5]
```

This expression selects the fifth Item node within OrderDetail.

Valid operators for conditions

XPath expressions can also be boolean conditions that evaluate to true or false. These expressions can be used to select specific nodes or simply to identify a condition that must be met. You can use the [Expression Builder](#) to help you define conditions. XPath operators that can appear in expressions include:

- = equals
- != not equals
- < less than

- > greater than
- <= less than or equals
- >= greater than or equals

Functions in XPath expressions

XPath also contains functions that allow you to manipulate data from nodes. This can be useful in building subject lines that contain some constant text plus dynamic data from messages. XPath functions can also be used to handle requirements such as trimming space or ensuring that a job key is a string datatype. Some of the common XPath functions include:

concat()

you can combine any number of strings and the data from nodes in the order you specify the parameters. You can specify XPath paths as parameters. Specify constant text strings within quote marks. For example:

```
concat('New Order # ',/Orders/Order/OrdNumber)
```

count()

you can count the number of nodes in the parameter you specify. Typically the parameter is an XPath path expression that identifies several nodes, such as all the Item nodes that are children of PODetail. For example:

```
count(/Orders/Order)
```

normalize-space()

trims all leading and trailing space characters from the input parameter and also normalizes all space within the input to single space characters and single line feeds. For example:

```
normalize-space(/Job/Address/Line1)
```

number()

converts the parameter to a number datatype. This function can be used to ensure that strings are treated as numbers. For example:

```
number(/PurchaseOrder/POTotal)
```

string()

converts the parameter to a string datatype. This function can be used to ensure that numeric or date nodes are treated as strings. For example:

```
string(/PurchaseOrder/VendorID)
```

translate()

replaces individual characters with other characters in the first parameter you specify. The second parameter is the character or characters to replace and the third parameter is the replacement characters. This function can be useful for ensuring that job keys are all uppercase, for example.

```
translate(/Issue/ShortDescr,  
'abcdefghijklmnopqrstuvwxyz',  
'ABCDEFGHIJKLMNOPQRSTUVWXYZ')
```

For a complete list of XPath functions, see the XPath Specification (<http://www.w3.org/TR/xpath>).

Testing XPath expressions

You can [test your XPath Expressions](#) against XML test data using the XPath Evaluator.

Parent topic: [Logic Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Basic_XPath_Expressions.html

Testing XPath expressions

Use the XPath Evaluator to test XPath expressions against test XML documents.

To bring up the XPath Evaluator window, select Tools > XPath Evaluator option from the Studio toolbar menu. You can use the XPath Evaluator to test XPath expressions against XML files. You can edit the default XPath expressions, generated in the following panes:

- In the Configure panes of the [For Each](#) and [Split](#) activities, an XPath expression is generated to define the recurring element. You can edit the default XPath expression displayed in the Element Name field.
- In the Configure panes of the [While Loop](#) and [If..Then](#) activities, an XPath expression is generated in the Expression Builder to define the conditions. You can edit the default XPath expression displayed clicking Advanced.

Note: XPath 2.0 is supported.

The following table describes the functionality of the XPath Evaluator dialog box.

Field	Name Description
File	Specifies the directory location of the selected test XML file. Select the down arrow to select from the set of previously loaded XML files.
Browse..	Click Browse... to load the contents of the XML file from the file system.
Load Source	A graphical representation of the source XML elements to test against. Selecting a node in this text box generates an XPath expression that finds all occurrences of this element when this XPath expression is evaluated against the specified XML data.
Generated XPath Expression	XPath expression that is generated when an XML element is selected in the Load Source text box.
Copy	Copy the XPath Expression from the Generated XPath Expression field to the XPath Expression field.
XPath Expression	Specifies the XPath Expression used to evaluate or test against the XML data.
Run	Select Run to evaluate the XPath expression against the source XML test data. The results of the evaluation are displayed in the text box on the right side of the pane.

To evaluate an XPath expression complete the following steps:

1. Select the Tools > XPath Evaluator option from the Studio toolbar menu. The XPath Evaluator window opens.
2. Click Browse... to load a test XML file from the file system. A graphical representation of the text XML elements shows in the Load Source text box.
3. To specify an XPath expression, choose from one of the following options:
 - o Enter an XPath expression directly into the XPath Expression field.
 - o Select an XML element in the Load Source text box and click Copy to copy the XPath expression from the Generated XPath Expression field to the XPath Expression field.
4. Click Run. The result of running the XML data against the XPath expression is displayed in the right bottom pane. The following types can be returned:
 - o **number** – the value of the number is returned in the Value field as shown in the following figure:

- o **boolean** – the value of the boolean is returned in the Value field as shown in the following figure:

- o **Node Set** – the XML elements that match those displayed in the XPath expression, the Value field is blank, and the number of matching XML elements is reported as shown in the following figure:

- o **string** – the value of the boolean is returned in the Value field as shown in the following figure:

Create Job Keys Activity

The Create Job Keys activity sets the values of job keys dynamically during run time.

About this task

After the orchestration job has run on the Integration Appliance, you can view the values of the job keys in the Jobs detail pane of the Web Management Console (WMC). In addition, you can search for orchestration jobs using the primary key in the WMC. For more information see the WMC online help.

To create and configure a Create Job Keys activity complete the following steps:

Procedure

1. Create a Job Key by using the [Creating Job Keys](#) topic before configuring the Create Job Keys activity.
2. Add the Create Job Keys activity to your orchestration:
 - a. Create an orchestration using the [Creating an orchestration](#) topic, or open an existing orchestration. A graphical representation of the orchestration is displayed.
 - b. Select the Activities tab and expand the Utilities folder.
 - c. Drag the Create Job Keys activity onto the orchestration.
3. Configure the Create Job Keys activity:
 - a. In the Checklist, select Map Inputs.
 - b. You can either set the default value of your job keys or map variables to the job keys, as described in steps 4 and 5.
4. Set a default value for the job keys:
 - a. In the To Activity pane of the Map Outputs task, right-click the job key and select Define Default Value from the list. The Define Default Value dialog box is displayed.
 - b. Enter the required value in the Default Value field.
 - c. Click OK.

During run time, the values of the job keys are set to the values specified in the Default Value field.
5. Map variables to the job keys:
 - a. In the From Orchestration pane, click Add. The Add Variable dialog box is displayed. If any job keys have been created, they are displayed in the To Activity pane.
 - b. Select variables. These variables supply the values of the job keys during run time.
 - c. Click OK.

- d. Create mappings for each job key. From the From Orchestration pane, drag each variable to the corresponding job key in the To Activity pane.
During run time, the value of the job keys are set to the values of the corresponding variables.

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Log_Keys_Activity.html

Creating Job Keys

You can associate job keys (or identify keys) with a specific orchestration job.

About this task

You create job keys from the Job Identification pane in Studio. To launch the Job Identification pane, select Orchestration > Properties option from the Studio toolbar menu. In the Job Identification pane, define the name and type of the job key. You can also specify one job key as the Primary key.

During run time, a Create Job Keys activity dynamically sets the values of the job keys when an orchestration job runs on the Integration Appliance. After the orchestration job has completed, you can view the values of the job keys from the Web Management Console (WMC). In the WMC, you can also search for the value of a key. All orchestration jobs that contain keys with that value are displayed.

Note: When designing your orchestration, typically it is best to add only one Create Job Keys activity to an orchestration. If the first Create Job Keys activity in an orchestration has a map to the job key, during run time, the second Create Job Keys activity in an orchestration does not reset the value of the job key that was set by first Create Job Keys activity. The action of the second Create Job Keys activity is ignored.

Procedure

1. Create or open an orchestration. See [Creating an orchestration](#) for more information. A graphical representation of the orchestration is displayed.
2. Select Orchestration > Properties to open the Orchestration pane.
3. Click Add. A new key with default values is added to the Keys list.
4. Enter the configuration information for new job keys as described in the following table.

Field / Column	Description
Name (Required)	Specifies the name of the job key
Type (Required)	Specifies the type of the job key
Primary	Specifies that the key is the Primary key. You can only select one key as the Primary key

What to do next

To remove a key, select the key you want to remove and click Remove.

Parent topic: [Utilities Activities](#)

Log Message activity

You can use the Log Message activity to specify the alert levels and message text, which is displayed in the Integration Appliance orchestration monitoring logs and system logs.

About this task

Use this task to configure the Log Message activity. You can view the Integration Appliance orchestration monitoring logs and system logs from the Web Management Console.

Procedure

1. In the Studio toolbox, click the Activities tab.
2. Expand the Utilities folder contents, and drag the Log Message activity onto the orchestration. The Utilities Log Message Checklist is displayed.
3. In the Checklist, click Summary.
4. Optional Change the description in the Activity Name field.
5. Click Map Inputs. The Map Inputs workspace is displayed. The default parameters: level and message are displayed in the To Activity column.
6. Click Select Inputs. The variables associated with the orchestration are displayed
Tip: If required, you can create a custom mapping variable in Source or Destination column by completing the steps in [Creating Variables](#).
7. Choose a variable, and click OK. The variable and parameters are displayed in the From Orchestration column.
8. To link the activities, drag a variable from the From Orchestration list onto a parameter listed in the To Activity list. If a link can be established, a line connects the two.
9. Repeat this procedure to link other orchestration variables to this activity.

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Log_Message_Activity.html

Schedule Job activity

The Schedule Job activity is a starter activity that creates an instance of an orchestration at the specified date and time.

About this task

Use this task to add a Schedule Job activity to an orchestration.

Procedure

1. [Create](#) or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activity tab and expand the Utilities folder.
3. Drag a Schedule Job activity onto the orchestration.
4. Specify the Schedule setting in the Configure pane as described in the following table:

Option	Description
5 seconds	Specifies the orchestration to run once every five seconds.
10 seconds	Specifies the orchestration to run once every ten seconds.
20 seconds	Specifies the orchestration to run once every twenty seconds.
30 seconds	Specifies the orchestration to run once every thirty seconds.
60 seconds	Specifies the orchestration to run once every sixty seconds.
5 Minutes	Specifies the orchestration to run once every five minutes.
Hour	Specifies the orchestration to run once an hour at the specified time.
Day	Specifies the orchestration to run once a day at the specified time. The time is based on a 24-hour clock in the GMT timezone.
Week	Specifies the orchestration to run once a week on the specified day (Sunday - Saturday) and at the specified time (24-hour clock) based on the GMT timezone.
Month	Specifies the orchestration to run once a month on the specified date (1 - 31) and time (24-hour clock) based on the GMT timezone.
Year	Specifies the orchestration to run once a year on the specified date (month and day) and time (24-hour clock) based on the GMT timezone.

Note: The Schedule Job activity starts the orchestration on the specified time and date based on the GMT timezone. You must adjust the specified time and date for your timezone.

5. To map the output of the activity:
 - a. Select the Map Outputs task in the Checklist. The time output parameter is displayed in the From Activity pane. This is an optional parameter that during run time returns the date and time (in the XML Schema `xsd:dateTime` data type) that the orchestration started processing.
 - b. If desired, map the time output parameter parameters to variable(s). See [Creating a Map](#) for general instructions on mapping.

Note: To create an orchestration that starts on two different dates, for example: February 13, 2011 and April 21, 2011. Drop a Pick activity on the orchestration as the starter activity and drop into the Pick branches, two Schedule Job activities, one that starts on February 13, 2011 and the other on April 21, 2011.

Configuring an Archive activity

About this task

To configure an Archive activity, complete the following steps:

Procedure

1. Select the Configure task from the Checklist. The Configure task is displayed.
2. Select a format type as described in the following table:

Format	Archived?	Compressed?	Description
TAR	Yes	No	Specifies that input files and directories are archived using the tar format before being returned in the archive output parameter as a single value. The returned value is compatible with the archive format produced by the UNIX tar -cf command. This option returns a value that is compatible with a file that ends in the .tar extension.
TAR+GZIP	Yes	Yes	Specifies that input files and directories are archived using the tar format and then compressed using the gzip format, before being returned in the archive output parameter as a single value. The returned value is compatible with the archive format produced by the UNIX tar -cf command and the compression format produced by the GNU gzip command. This option returns a value that is compatible with a file that ends in the .tar.gz extension.

Format	Archived?	Compressed?	Description
ZIP	Yes	Yes	Specifies that input files and directories are compressed and archived using the .zip format before being returned in the archive output parameter as a single value. The returned value is compatible with the compression and archive format produced by proprietary compression products. This option returns a value that is compatible with a file that ends in the .zip extension.
GZIP	No	Yes	Specifies that a single input file is compressed using the gzip format, before being returned in the archive output parameter. The returned value is compatible with the compression format produced by the GNU gzip command. This option returns a value that is compatible with a file that ends in the .gz extension.

What to do next

Map the input of the activity.

Parent topic: [Archive activity](#)

Archive activity map input

About this task

To map the input of the Archive activity complete the following steps:

Procedure

1. Select the Map Inputs task in the Checklist. The Map Inputs task is displayed. The archiveEntries input parameter is displayed in the To Activity pane.
2. Map variables to the nodes of the archiveEntries input parameter. See [Creating a Map](#) for general instructions on mapping. The archiveEntries/entry node is a recurring node and each entry represents a either a single file or directory in the archive. The nodes of the archiveEntries/entry node are described in the following table:

Node Name	Required	xsd Type	Description
name	Yes	string	Specifies the name of the directory or file to be added to the archive. If the file or directory is located in a sub-directory, the value of the name node must contain the directory path of the file in addition to the file name. For example, to specify the file called file1.txt located in the directory called cat, specify the value: cat/file1.txt.
datetime	No	dateTime	Specifies the creation date and time of the file or directory to be added to the archive.
isdirectory	No	boolean	Specifies if the current entity is a directory or a file: <ul style="list-style-type: none">o true specifies the entity is a directoryo false specifies the entity is a file
content	No	base64Binary	Specifies the contents of the file or directory.
size	No	decimal	Specifies the size of the file or directory.
userid	No	string	Specifies the user ID of the file or directory.
groupid	No	string	Specifies the group ID of the file or directory.

Node Name	Required	xsd Type	Description
permissions	No	string	Specifies the permissions of the file or directory.

What to do next

Map the output of the activity.

Archive activity map output

About this task

To map the output of the activity complete the following steps:

Procedure

1. Select the Map Outputs task in the Checklist. The Map Outputs task is displayed. The archive output parameter is displayed in the From Activity pane. The archive output parameter contains the archived files and directories.
2. Map a variable to the archive output parameter. See [Creating a Map](#) for general instructions on mapping. For example, you could map the archive output parameter to a variable you created called *outdata*. You could then map the *outdata* variable to the data input parameter of the FTP Put File activity. During run time, the FTP Put File activity creates an archive file on an FTP server.

Parent topic: [Archive activity](#)

Unarchive Activity

The Unarchive activity extracts the input files and directories from the passed in archive during run time. At run time, the Unarchive activity determines the archive/compression types and unarchives/decompresses the archive appropriately

About this task

The supported unarchive and decompression formats are listed in the following table:

Decompression/Unarchive Formats	Description
tar	During run time, if the Unarchive activity determines that the archive type is tar, the passed in archive is extracted into its component parts (files and directories) and passed back from the activity using the archiveEntries output parameter. The extraction done during run time by the Unarchive activity is equivalent to extraction done on the command line using the UNIX tar -xf command.
untar and gunzip	During run time, if the Unarchive activity determines that the archive type is tar and the compression type is gzip, the passed in archive is first decompressed from the gzip format and then extracted into its component parts (files and directories) and passed back from the activity using the archiveEntries output parameter. The extraction done during run time by the Unarchive activity is equivalent to extraction done on the command line using the UNIX tar -xf command to files that end in the .tar extension. The decompression done during run time by the Unarchive activity is equivalent to the decompression done on the command line using the GNU gunzip command to files that end in the .gz extension.
zip	During run time, if the Unarchive activity determines that the archive/compression type is zip, the passed in archive is decompressed and extracted into its component files and directories, and passed back from the activity using the archiveEntries output parameter. The decompression and extraction done during run time by the Unarchive activity is equivalent to the decompression and extraction done using proprietary compression products to files that end in the .zip extension.
gunzip	During run time, if the Unarchive activity determines that the compression type is gzip, the passed in archive is decompressed from the gzip format and passed back from the activity using the archiveEntries output parameter. The decompression done during run time by the Unarchive activity is equivalent to the decompression done on the command line using the GNU gunzip command to files that end in the .gz extension.

During run time, if the passed in archive format is unsupported, the Unarchive activity produces an ActivityFailedException error and issues the following message:

```
Invalid or unsupported archive format
```

During run time, if the passed in archive is incorrectly formed, the Unarchive activity produces an ActivityFailedException error and issues the following message:

```
Error while reading archive
```

To add and configure an Unarchive activity in an orchestration complete the steps in the following procedures:

- [Adding an Unarchive activity](#)
- [Unarchive activity map input](#)
- [Unarchive activity map output](#)

Unarchive activity map output

About this task

To map the output of the Unarchive activity complete the following steps:

Procedure

1. Select the Map Outputs task in the Checklist. The Map Inputs task is displayed. The archiveEntries output parameter is displayed in the From Activity pane. The archiveEntries/entry node is a recurring node and each entry represents either a single file or directory in the archive. The nodes of the archiveEntries/entry node are described in the following table:

Node Name	Required	xsd Type	Description
name	Yes	string	Specifies the name of the directory or file that was extracted from the archive. If the file or directory is located in a sub-directory the value returned by the name node during run time includes the relative directory path of the file or directory. For example, if the archive contains the file called file1.txt located in the directory called cat, the value: cat\file1.txt is returned.
datetime	No	dateString	Specifies the creation date and time of the file or the directory in the archive.

Node Name	Required	xsd Type	Description
isdirectory	No	boolean	Specifies if the current entity is a directory or a file: <ul style="list-style-type: none"> o true specifies the entity is a directory o false specifies the entity is a file
content	No	base64Binary	Specifies the contents of the file or directory.
size	No	long	Specifies the size of the file or directory.
userid	No	string	Specifies the user ID of the file or directory.
groupid	No	string	Specifies the group ID of the file or directory.
permissions	No	string	Specifies the permissions of the file or directory.

- Map variables to the archiveEntries output parameter. See [Creating a Map](#) for general instructions on mapping. For example, you could map the archiveEntries output parameter to an *archiveEntries* variable and then add an For Each activity after the Unarchive activity to iterate through the instances of the *archiveEntries* variable. Each instance of the *archiveEntries* variable represents a file or a directory. You could add a If..Then activity to the For Each loop that tests the value of the isdirectory node and if the entity is not a directory, place the extracted file on an FTP Server using the FTP Put File activity. This example orchestration is shown in the following figure:

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_cryptoserviceactivities.html

Overview of the PGP activities

WebSphere® Cast Iron® Studio supports PGP encryption and decryption. You can import, store, and retrieve keys and certificates that are used for PGP activities.

PGP has its own keystore for managing keys. The keystore location depends on the tool used. The public and the secret key ring of PGP is for cryptography. Cryptoservice uses the PGP keys to encrypt and decrypt content.

Cryptoservice comes with a utility to extract the PGP keys and store the same in the `PKCS12` keystore.

For Cast Iron Studio, you must use the command line utility to import the extracted `PKCS12` to the Studio keystore.

For the On-Premise Appliance, you must import the extracted `PKCS12` to the Appliance keystore from the Web Management Console.

After completing the procedures mentioned above, you can encrypt and decrypt content.

- To encrypt content, you must encode the human readable content to `base64`, and then pass the `base64` content to PGP Encrypt activity. Then, configure the inputs and provide the public key to the activity, which in turn would return the encrypted data.
- To decrypt the content you must pass the encrypted data to the PGP Decrypt activity, and configure the input with the private keys and password. The output is `base64`. You must decode the `base64` data to get the original content.

Using the PGP Encrypt activity

During run time, the PGP Encrypt activity encrypts content. Complete the following steps to add and map inputs and output of the PGP Encrypt activity in an orchestration:

Parent topic: [Cryptoservice Activities](#)

Adding the PGP Encrypt activity

About this task

To add the PGP Encrypt activity in the orchestration, complete the following steps:

Procedure

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the Cryptoservice folder.
3. Drag the PGP Encrypt activity onto the orchestration. The Summary of the activity configuration checklist is displayed.

What to do next

Map the inputs of the PGP Encrypt activity.

Mapping the inputs of the activity

About this task

To map the inputs of the PGP Encrypt activity, complete the following steps:

Procedure

1. Select the Map Inputs task in the Checklist. The Map Inputs task is displayed. The `cryptoserviceEntry` input parameter is displayed in the To Activity pane.
2. Map the variables to the nodes of the `cryptoserviceEntry` input parameter. The nodes of the `cryptoserviceEntry/entry` node are described in the following table:

Table 1. Nodes of `cryptoserviceEntry`

Node name	Required	xsd Type	Description
-----------	----------	----------	-------------

Node name	Required	xsd Type	Description
content	Yes	base64Binary	Indicates the actual base64Binary content that must be encrypted.
keyhandle	Yes	String	Indicates the name of the GPG key that is used to encrypt the content.
password	Optional	String	Indicates the password that must be used to decrypt keyhandle.
armored	Optional	Boolean	Indicates the value that must be set for ASCII Armored output. The default value is False.

Note: 128-bit encryption level requires an 8-byte key, which must be a 32-character hexadecimal string.

Mapping the output of the activity

About this task

To map the output of the activity, complete the following steps:

Procedure

1. Select the Map Outputs task in the Checklist. The Map Outputs task is displayed. The PGP Encrypt output parameter is displayed in the From Activity pane. The PGP output parameter contains a variable that stores the encrypted content, which can be used in the orchestration.
2. Map a variable from the PGP Encrypt output parameter to another variable or activity in the orchestration.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PGP_Decrypt.html

Importing PGP keys

The `commandLine` utility that is discussed in this topic, extracts the private and public keys from the secure and public ring files, from the PGP/GPG keystore.

Procedure

To extract the keys from the PGP/GPG keystore, the `commandLine` utility uses the following parameters:

1. `commandLine` utility accepts the following parameters to extract the private and public keys:

```
extractPKCS12AndPublicKey.bat -privateKeyRingFile <file name of the secret key ring file> -publicKeyRingFileName <file name of the pub key ring file> -passphrase <password for the gpg keys> -keyStoreLocation <keyStore Location> -keyStorePassword <keystore password> -privateCertificateName <private certificate name> -issuerName <name of the certificate issuer> -certificateStartDate <start date> -certificateExpiryDate <end date> -algorithmName SHA256withRSA
```

For example:

```
extractPKCS12AndPublicKey.bat -privateKeyRingFile C:\Users\IBM_ADMIN\Documents\gpg\sekring.gpg -publicKeyRingFile C:\Users\IBM_ADMIN\Documents\gpg\pubring.gpg -passphrase castiron -keyStoreLocation C:\mykeystore.p12 -keyStorePassword changeit -privateCertificateName myKey -issuerName "C=US, ST=CA, L=Mountain View, O=Cast Iron Systems, CN=Cast Iron Appliance VMWSULXJE23SK6HO" -certificateStartDate 01-01-2013 -certificateExpiryDate 01-01-2015 -algorithm SHA256withRSA
```

2. `commandLine` utility accepts the following parameters to import the private and public keys to a Studio keystore file:

```
importPKCS12IntoJKS.bat -privateCertificateName <private certificate name> -pkcsKeyStoreLocation < PKCS12 keystore store that we created in step1 > -pkcsKeyStorePassword < password for the keystore>
```

For example:

```
importPKCS12IntoJKS.bat -privateCertificateName myKey -pkcsKeyStoreLocation C:\mykeystore.p12 -pkcsKeyStorePassword changeit
```

Note: Step 2 is not required for the appliance. You can import the generated PKCS12 keystore to the appliance through the Security menu on the Web Management Console dashboard. For more

information about importing certificates, see Cast Iron® Web Management Console documentation.

Troubleshooting and support

Troubleshooting techniques and self-help information help you identify and solve problems quickly. This topic provides potential solutions for issues you would have with the Cryptographic activities.

OutOfMemoryError exception thrown

Problem: The following exception is thrown when you use the PGP Encrypt activity, for FTP transfer of .zip file or a .tar.gz file:

```
Internal error: java.lang.OutOfMemoryError: Java heap space (data size is over 10MB)
```

Cause: Insufficient default heap allocation when starting Cast Iron Studio.

Solution: Increase the heap allocation when starting Cast Iron Studio, by giving the following command:
`CastIronStudio.exe -J-Xmx1024m.`

Data Quality Activities

- [About Data Quality Activities](#)
Use the Data Quality activities in Studio to migrate or load data into a new system and/or synchronize data between existing systems.
- [Filter and Profile Activity](#)
This activity filters data based on the Boolean expression you create and generates a profile summary of the cleansed data.
- [Creating Profile Summaries](#)
Use the Profile Summaries pane to specify parameters that determine the data that the Integration Appliance profiles.

- [Filtering Expressions](#)
A filter expression is an XPath query that specifies conditions (boolean expressions) that the Integration Appliance uses to route data to different outputs. You can create a filter expression using the Filter and Profile activity.
- [Lookup Activity](#)
Use the Lookup Activity to retrieve rows of data from a selected database endpoint and use values from those rows to replace or add values to the current recurring element, based on an exact or approximate match of values from the current recurring element that is used as a key to perform the lookup.
- [Sort Activity](#)
This activity allows you to sort inputs.
- [Merge Activity](#)
Use the Merge activity allows to join two sorted inputs. Both the left and right inputs must be sorted on a specified sort key before you can merge or join inputs. You must specify at least one sort key for both the left and right inputs. The Merge activity resolves any duplicates.

Feedback | Notices

file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_dataqualityactivities.html

About Data Quality Activities

Use the Data Quality activities in Studio to migrate or load data into a new system and/or synchronize data between existing systems.

From the Activities tab in the Studio toolbox, select the Data Quality directory. The Data Quality activities include:

- Filter and Profile “ Filters data based on the Boolean expression you create and generates a profile summary of the cleansed data.
- Lookup “ Retrieves rows of data from the database endpoint, which you select.
- Sort “ Sorts the inputs based on sort keys you specify.
- Merge “ Joins two sorted inputs.

The Integration Appliance has a Local Staging Database where you can stage the data. The Local Staging Database can be used to share data between jobs to facilitate an iterative data cleansing process. You can view and edit data in the Local Staging Database through the Web Management Console (WMC).

From the WMC, you can complete the following operations against the Local Staging Database:

- Start and Stop the database server
- Connect to the Local Staging Database
- Create tables
- Drop tables
- View tables and sort by columns
- Add rows
- Delete rows

For more information about performing these operations, see the WMC Online Help.

Configuring the Filter and Profile activity

About this task

To configure the Filter and Profile activity complete the following steps:

Procedure

1. In the Activities tab, open the Data Quality directory to find the Filter and Profile activity.
2. Add the activity to an orchestration. The Checklist and Summary for the activity are displayed beneath the orchestration.
3. From the Checklist, select Configure and specify the following information:
 - a. The variable name of the variable that contains the recurring element, which the activity loops through.
 - b. The element name of the recurring element in the variable, which the activity loops through.

Click the browse button to open the Select Recurring Element window, where you can view all the elements in the variable you selected. 

4. From the Checklist, select Filter Expression and [create](#) an expression that the Integration Appliance uses to filter data.

Note: The Integration Appliance can only create a profile for data that passes the filter expression. To profile all data, complete one of the following tasks:

- Click Advanced and enter the following expression: `true()`

OR

- Enter the expression: `1 = 1`
5. From the Checklist, select Profile Summary to **define** parameters for the data you want to summarize.
 6. Map the **output** of the activity.

Mapping Filter and Profile activity outputs

About this task

To map the outputs of the Filter and Profile activity complete the following steps:

Procedure

1. In the Checklist, select Map Outputs. The following elements are displayed in the From Activity pane: goodXML, badXML, summary, and summaryCharts.pdf.
2. Click Select Outputs... and select the output variables for the map. For instructions about creating variables, see [Creating variables](#).
3. As appropriate, map the output parameters to the variables. For general mapping instructions, see [Creating a map](#).

Creating Profile Summaries

Use the Profile Summaries pane to specify parameters that determine the data that the Integration Appliance profiles.

About this task

To create a profile summary complete the following steps:

Procedure

1. In the Activities tab, open the Data Quality directory to find the Filter and Profile activity.
2. Add the activity to an orchestration. The Checklist and Summary for the activity are displayed beneath the orchestration.
3. From the Checklist, select Profile Summary. The Profiles Summaries pane is displayed.
4. Click Add.
5. Specify values for the following parameters:

Profile Summary Parameter	Description
XPath	The XPath expression, relative to the recurring element you selected, that specifies the data to profile
Name	The name of the profile. The default is the XPath expression you selected.
Datatype	Specifies the data type as either text or number. By default, the data type is text. For a numeric data type, the following general statistics are generated: min, max, mean, count, sum, standardDeviation, variance. For a text data type, the following general statistics are generated: min, max. For both data types, histograms can be generated to show frequency counts for specific values or value ranges.
Histogram?	Specifies whether or not to generate a histogram. The default is <code>false</code> and a histogram is not generated. To generate a histogram, select the Histogram? field and select Generate Histogram. The value <code>true</code> is displayed in the field.
Max. Bins	Specifies the maximum number of bins for the histogram. Important: Only specify a value for this parameter if the datatype is specified as number. The default value is 0, indicating that no maximum exists.
Max. Values	Specifies the maximum number of values to use for the histogram. The default value is 0, indicating that no maximum exists.
Min. Freq.	Specifies the minimum frequency for values to be included in the histogram. This is a number between 0-1, indicating the ratio of the number of occurrences of a given value to all values. The default is 0.0
Chart	Generates a PDF of the chart type you specify: <ul style="list-style-type: none"> o bar o pie o none By default, the Integration Appliance does not generate a chart.

Filtering Expressions

A filter expression is an XPath query that specifies conditions (boolean expressions) that the Integration Appliance uses to route data to different outputs. You can create a filter expression using the Filter and Profile activity.

About this task

Use the Studio Builder tool to:

- Create a filter expression
- Add conditions
- Delete conditions
- Edit conditions
- Specify the processing order of conditions

- [Creating a filter expression](#)
- [Adding a filter expression condition](#)
- [Deleting a filter expression condition](#)
- [Editing a filter expression condition](#)
- [Changing the processing order of filter expression conditions](#)

Parent topic: [Data Quality Activities](#)

Creating a filter expression

About this task

To use the Builder to create a filter expression complete the following steps:

Procedure

1. In the orchestration, select the Filter and Profile activity to open the Checklist.
2. In the Checklist, select Filter Expression. The Builder is displayed in the Filter Expression pane.
3. Click the Left Hand Expression field to enter a parameter or click (...) for the elements of a selected variable to be displayed. Click (B) to select a new variable.
4. Click the Op list to select an operator for the condition.

For a complete list of operators that you can use in the Builder, see Valid Operators for Conditions

5. Click the Right Hand Expression field to enter a parameter or click (...) for the elements of a selected variable to be displayed. Click (B) to select a new variable.

Adding a filter expression condition

About this task

To add a condition complete the following steps:

Procedure

1. Click Add. Fields for a new condition are displayed. By default, the new condition is inclusive, using AND logic.
2. Optional: In the first column, select OR from the list to use OR logic.
3. Specify the Left Hand Expression.
4. Specify the operator for the condition
5. Specify the Right Hand Expression.

Lookup Activity

Use the Lookup Activity to retrieve rows of data from a selected database endpoint and use values from those rows to replace or add values to the current recurring element, based on an exact or approximate match of values from the current recurring element that is used as a key to perform the lookup.

To use the fuzzy lookup capability, you must use the Local Staging Database on the Integration Appliance. For non-fuzzy lookups, you can use any database endpoint that Studio supports.

Note: When the Lookup activity is run from Studio, lookup results are not cached.

Lookup activity requires a parameterized SQL query, an XPath query that indicates the recurring element, and an XPath query that indicates which value to use as the key for the lookup. A set of lookup values specifies how column values from the database result set should be mapped to elements or attributes of the current context node.

To complete a fuzzy lookup and approximately match the key, the Lookup activity uses the edit distance algorithm.

For example:

In the following table Names you want to perform a query on the last name Stark. The database contains the following records:

FirstName	LastName
Tony	Stark
Bruno	Star
Georgia	States
Howard	Stark

Issue the following query: `select * from Names where Col_LastName='Stark'`

In this example, the `key_length = length('Stark') = 5`

For comparing against the threshold, use the value `(1 - (edit_distance / key_length))`

The edit distance is $\text{edit_distance}(\text{Stark}, \text{Stark}) = 0$ and $\text{edit_distance}(\text{Stark}, \text{Star}) = 1$

- To pick up only Stark use threshold $(1 - (0/5)) = 1$
- To pick up both Stark and Star, but not States use threshold $(1 - (1/5)) = 0.8$
- [Using the Lookup activity](#)
- [Mapping Lookup activity outputs](#)

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/lookup_activity.html

Using the Lookup activity

About this task

To use the Lookup activity complete the following steps:

Procedure

1. In the Activities tab, open the Data Quality directory to find the Lookup activity.
2. Add the activity to an orchestration. The Checklist and Summary for the activity are displayed beneath the orchestration.
3. In the Checklist, select Pick Endpoint and select a database endpoint. For instructions on creating or editing a database endpoint, see [Creating or Editing a Database Activity Endpoint](#)
Note: To complete a fuzzy lookup you must select the Local Staging Database. To access the Local Staging Database:
 - a. From the Database Type list, select Local. Staging opens in the Database Name field.
 - b. In the Network Location Server field, specify the data IP address of the Integration Appliance, where the Local Staging Database is started. The Port is fixed at 1526.
 - c. Enter a User Name and Password.
Important: This login information must be for a user with Administrator or Publisher privileges on the Integration Appliance.
 - d. Specify any additional parameters. For more details about the database parameters. see [Creating or Editing a Database Activity Endpoint](#).
 - e. Click OK. The Database endpoint is displayed in the Endpoints directory of the Studio toolbox.
4. From the Checklist, select Configure and specify the following information:
 - a. The variable name of the variable that contains the recurring element, which the activity loops through.
 - b. The element name of the recurring element in the variable, which the activity loops through.

Click the browse button (...) to open the Select Recurring Element window, where you can view all the elements in the variable you selected.

5. In the Checklist, select Enter Query

- a. Specify the query for the lookup table.
 - For fuzzy lookups, you must specify exactly one parameter.
 - For non-fuzzy lookups, you can specify one or more parameters.
 - b. From the Encoding list, select the encoding type.
 - c. Click Validate Query

Note: If using a Local database endpoint, you must start the Local Staging Database on the Integration Appliance before you can view columns or validate queries. To start the Local Staging Database, in the Web Management Console (WMC), select Staging > Staging Database Start/Stop.
 - d. Click View Columns and select a table to view detailed column information for the table you select. The Hide Buffer and Control Table option is the default selection.
6. In the Checklist, select Setup Input Parameters. The query you entered in the previous step is displayed.

Specify the input XPath for each input parameter in the XPath column. The input XPath is an XPath expression that is relative to the recurring element which specifies the lookup key value that the query uses.

7. In the Checklist, select Setup Result Set.
 - a. Specify the output XPath for each row in the result set. The output XPath specifies the element or attribute relative to the recurring element that will hold the output value.
 - If the name of the element or attribute already exists, Studio replaces the existing value. Otherwise, Studio creates a new named element or attribute.
 - If the lookup fails to find a match, the row is sent to the badXML element.
 - b. Use the at-sign (@) at the beginning of the XPath expression to specify an attribute.
 - If the name of the element or attribute already exists, Studio replaces the existing value. Otherwise, Studio creates a new named element or attribute.
 - If the lookup fails to find a match, the row is sent to the badXML element.
8. In the Checklist, select Delivery Rules and specify the following delivery rules:

Delivery Rule	Description
Activity Timeout	Specifies in seconds the length of time that the Integration Appliance waits for the endpoint to respond. The default setting is 300 seconds.
Fuzzy lookup	Determines if the lookup is fuzzy. Select this option to perform a fuzzy lookup. Important: You can only perform a fuzzy lookup against a Local Database Endpoint. Note: Before you run the orchestration, use the Database Asset generation tool, in the WMC, to create an index table.
Output at most ___ match(es) per fuzzy lookup	Specifies the maximum number of matches to output per fuzzy lookup.
The similarity threshold ___ for a fuzzy lookup	Specifies the similarity threshold for determining a match during a fuzzy lookup (between 0 - 1). 1 = an exact match.
Ignore case (for fuzzy lookup only)	Select for your lookup to be case-insensitive.
Ignore leading and trailing white spaces	When selected, the Lookup activity ignores any white space that occurs before and after the data. For non-fuzzy lookups, you can only apply this option to the input value. For fuzzy lookups, you can apply this option to both the input value and the lookup table key.
Preload cache	Select this option to preload the lookup cache.

Delivery Rule	Description
Cache at most __ lookup results	Specifies the maximum number of lookup results to cache.

What to do next

Map the [output](#) of the activity.

Sort Activity

This activity allows you to sort inputs.

About this task

Important: Use the Sort activity to sort data before attempting to merge data with the Merge activity.

To sort inputs complete the following steps:

Procedure

1. In the Activities tab, open the Data Quality directory to find the Sort activity.
2. Add the activity to an orchestration. The Checklist and Summary for the activity show beneath the orchestration.
3. From the Checklist, select Configure and specify the following information:
 - a. The variable name of the variable that contains the recurring element, which the activity loops through.
 - b. The element name of the recurring element in the variable, which the activity loops through. Click the browse button (...) to open the Select Recurring Element window, where you can view all the elements in the variable you selected.
4. From the Checklist, select Sort Properties and specify the following information:
 - a. Optional: Select Remove Duplicates, so that the activity sends duplicates to the remainderXml element.
 - b. Click Add. A new row is displayed in the Sort Keys table.
 - c. In the XPath column, specify the recurring element.
 - d. Select the Sort Type field and from the list. Choose either ascending or descending sort order for the list. The default sort type is ascending.
 - e. Select the Datatype field and from the list, choose either the text or number data type. The default data type is text.
 - f. Optional: Select the Ignore Case option. If you select this option, the case of the data is ignored during the sort process.
 - g. Optional: Select the Ignore Leading and Trailing Whitespace option. By default, the sort process reads any white space around data. If you select this option, the activity ignores white spaces that can affect the sort results.
5. In the Checklist, select Map Outputs. The following elements are displayed in the From Activity pane: sortedXml and remainderXml.
 - a. Click Select Outputs... and select the output variables for the map. For instructions about creating variables, see [Creating variables](#).
 - b. As appropriate, map the output parameters to the variables. For mapping instructions, see [Creating a map](#).

Parent topic: [Data Quality Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/sort_activity.html

Merge Activity

Use the Merge activity allows to join two sorted inputs. Both the left and right inputs must be sorted on a specified sort key before you can merge or join inputs. You must specify at least one sort key for both the left and right inputs. The Merge activity resolves any duplicates.

Use an XPath query to specify the recurring element for each input. There are six types of merges:

Merge Type	Description
Merge and remove duplicates	Removes the duplicates that occur in both the left and right inputs. Studio sends any duplicates to the RemainderXML element.
Merge and keep left duplicates	Sends duplicates from the left input to the RemainderXML element.
Merge and keep all duplicates	Keeps duplicates from both inputs.
Inner join	Joins inputs on the specified keys. Any row that does not participate in the join is sent to the RemainderXML element.
Left outer join	Joins the inputs on the specified keys. Rows from the left input are kept in the merged output even if they do not participate in the join. Studio sends any rows from the right input that do not participate in the join to the RemainderXML element.
Full outer join	Joins the inputs on the specified keys. Rows that are not involved with the join are kept in the merged output.

Merge Examples:

Table 1 are the Left and Right inputs for this example. Table 2 are the expected results for each type of merge operation that the Merge activity supports.

In the following example, x is the key variable. Studio sends entries that are merged or joined to the mergeXML element and sends any entries that do not participate in a merge or join to the RemainderXML element.

Table 1. Left and Right Inputs

Left Inputs	Right Inputs
<pre><entries> <entry x=â€œ1â€œ y=â€œ10â€œ/> <entry x=â€œ2â€œ y=â€œ20â€œ/> <entry x=â€œ2â€œ y=â€œ21â€œ/> <entry x=â€œ3â€œ y=â€œ30â€œ/> </entries></pre>	<pre><entries> <entry x=â€œ0â€œ z=â€œ00â€œ/> <entry x=â€œ2â€œ z=â€œ22â€œ/> <entry x=â€œ2â€œ z=â€œ23â€œ/> <entry x=â€œ4â€œ z=â€œ40â€œ/> </entries></pre>

Table 2. Merge Results for Each Merge Type

Merge Type	Merge Results
Merge and remove duplicates	<pre><entries> <entry x=â€œ0â€œ z=â€œ00â€œ/> <entry x=â€œ1â€œ y=â€œ10â€œ/> <entry x=â€œ3â€œ y=â€œ30â€œ/> <entry x=â€œ4â€œ z=â€œ40â€œ/> </entries></pre>

Merge Type	Merge Results
Merge and keep left duplicates	<pre><entries> <entry x=â€0â€ z=â€00â€/> <entry x=â€1â€ y=â€10â€/> <entry x=â€2â€ y=â€20â€/> <entry x=â€2â€ y=â€21â€/> <entry x=â€3â€ y=â€30â€/> <entry x=â€4â€ z=â€40â€/> </entries></pre>
Merge and keep all duplicates	<pre><entries> <entry x=â€0â€ z=â€00â€/> <entry x=â€1â€ y=â€10â€/> <entry x=â€2â€ y=â€20â€/> <entry x=â€2â€ y=â€21â€/> <entry x=â€2â€ z=â€22â€/> <entry x=â€2â€ z=â€23â€/> <entry x=â€3â€ y=â€30â€/> <entry x=â€4â€ z=â€40â€/> </entries></pre>
Inner join	<pre><entries> <entry x=â€2â€ y=â€20â€ z=â€22â€/> <entry x=â€2â€ y=â€20â€ z=â€23â€/> <entry x=â€2â€ y=â€21â€ z=â€22â€/> <entry x=â€2â€ y=â€21â€ z=â€23â€/> </entries></pre>
Left outer join	<pre><entries> <entry x=â€1â€ y=â€10â€/> <entry x=â€2â€ y=â€20â€ z=â€22â€/> <entry x=â€2â€ y=â€20â€ z=â€23â€/> <entry x=â€2â€ y=â€21â€ z=â€22â€/> <entry x=â€2â€ y=â€21â€ z=â€23â€/> <entry x=â€3â€ y=â€30â€/> </entries></pre>
Full outer join	<pre><entries> <entry x=â€0â€ z=â€00â€/> <entry x=â€1â€ y=â€10â€/> <entry x=â€2â€ y=â€20â€ z=â€22â€/> <entry x=â€2â€ y=â€20â€ z=â€23â€/> <entry x=â€2â€ y=â€21â€ z=â€22â€/> <entry x=â€2â€ y=â€21â€ z=â€23â€/> <entry x=â€3â€ y=â€30â€/> <entry x=â€4â€ z=â€40â€/> </entries></pre>

Merging two sorted inputs

About this task

To merge two sorted inputs complete the following steps:

Procedure

1. In the Activities tab, open the Data Quality directory to find the Merge activity.
2. Add the activity to an orchestration. The Checklist and Summary for the activity are displayed beneath the orchestration.
3. From the Checklist, select Configure and specify the following information:
 - a. The variable name of the left variable that contains the recurring element, which the activity loops through.
 - b. The element name of the recurring element in the left variable, which the activity loops through. Click the browse button (...) to open the Select Recurring Element window, where you can view all the elements in the variable you selected. 
 - c. The variable name of the right variable that contains the recurring element, which the activity loops through.
 - d. The element name of the recurring element in the right variable, which the activity loops through. Click the browse button (...) to open the Select Recurring Element window, where you can view all the elements in the variable you selected. 
4. From the Checklist, select Merge Properties and specify the following information:
 - a. Select a [merge type](#) for the list.
 - b. In the Left Sort Key section, click Add. A new row is displayed in the Sort Keys table.
 - c. In the XPath column, specify the recurring element.
 - d. Select the Sort Type field and from the list. Choose either the ascending or descending to sort the list. The default sort type is ascending.
 - e. Select the Datatype field and from the list, choose either the text or number data type. The default data type is text.
 - f. Repeat steps (b - e) for the Right Sort Keys.
 - g. Optional: Select the Ignore Case option. If you select this option, the case of the data is ignored during the merge process.
 - h. Optional: Select the Ignore Leading and Trailing Whitespace option. By default, the merge process reads any white space around data. If you select this option, the activity ignores white spaces that can affect the merge results.
5. In the Checklist, select Map Outputs. The following elements are displayed in the From Activity pane: mergedXml and remainderXml.
 - a. Click Select Outputs... and select the output variables for the map. For instructions about creating variables, see [Creating variables](#).
 - b. As appropriate, map the output parameters to the variables. For mapping instructions, see [Creating a map](#).

Parent topic: [Merge Activity](#)

Database Activities

- [Creating or Editing a Database Activity Endpoint](#)
Endpoints provide the database connection information that Studio and the Integration Appliance use to connect to a database. [^](#)
- [Browsing Database Tables](#)
Use the Browse Database Tables dialog box to dynamically select a table from the current list of tables in the database specified by the Endpoint.
- [Character Encodings](#)
Set the character encoding at the database level, the table level, or the column or parameter level.
- [Database Entities and Activities](#)
- [Defining Columns for Old Values in Updates](#)
- [MaxPooledStatements Parameter](#)
The MaxPooledStatements parameter is automatically defined and set with a default value for all types of Database Endpoints.
- [Oracle, Sybase, DB2, and Informix Parameters](#)
In the Additional Parameters table of the Database Endpoint, define the connection parameters for Oracle, Sybase, DB2[®], or Informix[®] databases.
- [Retry Options For Inbound Database Activities](#)
[^](#) This section contains the procedure for configuring the retry options for the following inbound database activities: **Get Inserted Rows** activity, **Get Updated Rows** activity, **Get Deleted Rows** activity, and **Poll Table** activity.
- [Retry Options For Outbound Database Activities](#)
This section contains the procedure for configuring the retry options for the following outbound database activities: **Execute Query** activity, **Insert Rows** activity, **Update Rows** activity, **Delete Rows** activity, and **Call Procedure** activity
- [SequeLink Parameters](#)
- [Single-Table Inbound Database Activities](#)
During run time, single-table inbound database activities poll if a database operation has occurred on any rows in the specified columns of a database table at the specified time interval.
- [Single-Table Outbound Database Activities](#)
This section contains the procedures for configuring the following single-table outbound database activities.
- [Specifying Delivery Rules for Database Activities](#)
Specify how messages will be delivered at the Delivery Rules pane.
- [Viewing Column Details](#)
The View Column dialog box allows you to see detailed column information for tables as you enter a SQL statement in the **Enter Query** task of the **Checklist** for the **Execute Query** activity. This task describes how to access the View Column Details dialog box.
- [Working with Database Parameters](#)
Parameters supply database-specific connection information for an endpoint.
- [Call Procedure Activity](#)
During run time, the Call Procedure activity runs a stored procedure in a database. The stored procedure must be written and installed in the database before you can complete the configuration of the Call Procedure activity in Studio.
- [Execute Query Activity](#)
During run time, the Execute Query activity runs a select SQL statement.

- [Poll Table Activity](#)
The Poll Table activity checks if a database operation (insert or update) has occurred on any rows of a database table by checking the status of a special flag column at the specified time interval.
- [Testing an SSL Database Connection](#)

Creating or Editing a Database Activity Endpoint

Endpoints provide the database connection information that Studio and the Integration Appliance use to connect to a database. Â

Select or edit a database endpoint

1. In the Create Endpoint or Edit Endpoint pane, configure the fields as described in the following tables.
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that you can connect to the database. Click OK.

Database options

Table 1. Database options

Field	Description
Database Type	<p>Specifies the database type. If you select the Generic JDBC driver or MySQL, you must install the module providers into Studio. To add JDBC drivers into Studio, you add them to the Web Management console and then complete the following steps in the WMC.</p> <ol style="list-style-type: none"> 1. Go to Settings. 2. Select Design. 3. Select Libraries Environment and set it to the environment that you loaded the compressed files into. 4. Restart Studio. <p>Note: For JDBC drivers to access database endpoints for Cast IronÂ® Generic JDBC support, the JDBC driver must be:</p> <ul style="list-style-type: none"> • Type 4. • Must implement the JDBC 2.0 or greater specification. • Must provide support for the DataSource feature API. <p>Additional Parameters may be required for a Generic JDBC Driver. You should check the documentation for the driver you intend to use to see if any additional parameters are required. For more information about installing the JDBC libraries into the WMC, see the WMC Online help.</p>

Field	Description
Database Name	Specifies the name of the Database to which you want to connect. If connecting to Oracle RAC, see For Oracle RAC: . Note: For AS/400® DB2® databases, this is the collection name defined during installation.
Network Location: Server	Specifies the name or IP address of the machine where the database server resides. For Informix®, log into the Informix Server Administrator and select the Configuration > SQLHOST menu option to find the hostname. For Sequelink, enter the name or the IP address of the Sequelink server.
Network Location: Port	Specifies the port number of the database server listener. For Sequelink, enter the port number of the Sequelink server listener.
User Name	Specifies the username that the Integration Appliance uses to connect to the database. Note: For DB2, the user must have the permissions to create a package.
Password	Specifies the password associated with the specified username.
Additional Parameters	Specifies the database-specific information for an endpoint. See Working with Database Parameters for details. By default, the MaxPooledStatements parameter is automatically defined and set with a default value for all types of Database Endpoints.

Note: For some of the fields in the endpoint, you can define configuration properties to supply the values for these fields. The

icon displays when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.

For Informix Databases

To find the port number for an Informix database:

1. In an editor, open the following file: \$INFORMIXSERVER/etc/sqlhosts
2. Note the `servicename` found in the SERVER column.
3. In an editor, open the appropriate file for your system:
 - o UNIX - /etc/services
 - o Windows - \Winnt\system32\drivers\etc\services
4. In the file, search for the `servicename` to find the associated port number.

For DB2 AS/400 Databases

For some EBCDIC-US columns on DB2 AS/400, Studio cannot determine the correct size and type.

To pass an EBCDIC-US encoded parameter:

1. In Studio, open the orchestration containing a Database Connector activity.
2. Change CHAR type columns to VARBINARY type. The EBCDIC-encoded columns display as CHAR type columns in the data type of the outbound connector.
3. Use a map before the Database Connector to pad an EBCDIC-encoded parameter with spaces, so that the value of the parameter equals the length of the column.

For example, if the column length is 10 and the value is "abc", pad the column with 7 spaces.

If the EBCDIC-encoded value is not padded with spaces, the Database Connector pads the value with NULL. This can create inconsistent data and errors can occur.

To read an EBCDIC-US encoded column from a result set:

1. In Studio, open the orchestration containing the Database Connector Parameterized Query operation.

When you use a parameterized query to select an EBCDIC-encoded column from a database, the Database Connector returns values padded with spaces if the value is shorter than the column length.

For example, if the column length is 10 and the value is "abc", the Database Connector pads the column with 7 spaces.

2. Create a map after the Parameterized Query operation to trim the padded spaces from the XML result set.

For Oracle RAC:

IBM Cast Iron supports additional properties in the connection string that enable Oracle RAC connectivity. Use the following additional *Â* properties*Â* to connect with Oracle RAC:

1. `AlternateServers=(servername1[:port1]
[;property=value[;...]],
servername2[:port2]
[;property=value[;...]],...)`

Where:

servername is the IP address of the server

port is the port number of the server

property=value enter the ServiceName which is used as the Database Name. Entering a SID is optional.

2. `LoadBalancing=true|false`

Determines whether the driver will use client load balancing in its attempts to connect to a list of database servers, primary and alternate. The list of alternate servers is specified by the `AlternateServers` property. If set to true, client load balancing is used and the driver attempts to connect to the list of database servers, primary and alternate servers, in a random order. If set to false (the default), client load balancing is not used and the driver connects to each server based on their sequential order (primary server first, then, alternate servers in the order they are specified).

3. Use the service name in the Database Name of the end-point.

Connection Pool, Encoding, TimeOut, and Security Options

Default values are provided for the connection pool options. Change them as needed.

Table 2.

Field	Description
Connection Pool Options	Â

Field	Description
Initial Pool Size	Specifies the initial number of database connections that the Integration Appliance opens and places in the connection pool.
Minimum Connections	Specifies the number of database connections that the Integration Appliance always keeps open in the connection pool. Specifying 0 is supported.
Maximum Connections	Specifies the maximum number of database connections that the Integration Appliance can have open in the connection pool. Specifying 0 means the number of connections is unbounded.
Maximum Idle Time	Specifies the amount of time (in minutes) that a database connection can be open and idle before being closed by the Integration Appliance. Specifying 0 means that the connections are closed when they are returned to the pool - no idle time.
Reclaim Connections	<p>Specifies how often the Integration Appliance checks the connection pool to determine if any connections should be closed. For example, if the Reclaim Connections is set to 6 minutes, the Integration Appliance checks the connection pool every six minutes to determine if the total number of open connections in the pool are greater than the minimum number of connections. If the number of open connections are greater than the specified minimum number, the Integration Appliance closes any excess connections (over the number of Minimum Connections) for any connections that have exceeded the Maximum Idle Time.</p> <p>For example, the Minimum Connections is set to 2, Maximum Connections is set to 6, the Reclaim Connections is 6 minutes, and the Maximum Idle Time set to 2 minutes. A total of five connections are currently open in the connection pool. When the Reclaim Connections of 6 minutes is reached, the Integration Appliance checks the connection pool and determines that one connection has been idle for 3 minutes, one connection has been idle for 4 minutes, and three connections are still active. The Integration Appliance closes the two idle connections. After another 6 minutes, the Integration Appliance checks the connection pool again.</p>
Default Encoding	Â
Encoding Â	<p>Specifies the default character Encoding to use when connection to this database. To set the encoding type, choose from one of the following options:</p> <ul style="list-style-type: none"> From the Encoding drop-down list, select a default encoding type. Â Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type. <p>Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see Using the Shift-JIS encoding.</p>
Quoted Identifiers	Â

Field	Description
Delimit the identifiers for tables, columns, and objects with quotes	Specifies if quotes are used around the identifiers for database tables, columns, and objects in the generated SQL statements that the Integration Appliance and Studio uses to communicate with the database. Quoting an identifier makes the identifier case-sensitive. For example, the identifier string: <code>myTable</code> could refer to table named <code>mytable</code> or <code>MYTABLE</code> but the identifier string with quotes: <code>"myTable"</code> only refers to a table named <code>myTable</code> . Quoting an identifier also allows characters not normally found in database names such as spaces.
Security	Â
Enable Encryption	Specifies that the connection should use SSL.
Validate Server Certificate	Specifies that the client should validate the database server certificate. See Testing an SSL Database Connection .
Require Client Authentication	Specifies that the client present a certificate to the database server.
Connection Timeout	Â
Timeout after _____ second(s) when establishing a connection to the Endpoint.	<p>Specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. For a database activity, the amount of time the Integration Appliance attempts to establish a connection to the database before timing out. A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the Endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an Endpoint and the time it takes the Endpoint to respond. You set the activity timeout in Retry task of any of the following database activities:</p> <ul style="list-style-type: none"> • Execute Query Activity, see Execute Query Activity. • Single-Table Inbound Database Activities, see Single-Table Inbound Database Activities. • Single-Table Outbound Database Activities, see Single-Table Outbound Database Activities. • Poll Table Activity Call, see Poll Table Activity. • Procedure Activity, see Call Procedure Activity.

Browsing Database Tables

Use the Browse Database Tables dialog box to dynamically select a table from the current list of tables in the database specified by the Endpoint.

Studio connects to the database to get the current list of tables from the database.

To select a table choose one of the following options:

- Click on a table in the list and click OK.
- Double-click on a table in the list.

To change the list of selectable tables, use the following options:

- To see tables associated with a different schema, select a schema from the Filter by User Schema list.
- To see tables for all schemas, click Clear.
- To filter out any buffer or control tables created using the Web Management Console (WMC) that are used internally by the Integration Appliance during run time check Hide Buffer and Control Tables. The column names in these tables are prefaced by convention with the string: `IH:`

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Browsing_Database_Tables.html

Character Encodings

Set the character encoding at the database level, the table level, or the column or parameter level.

For example, the default encoding for your database might be set to UTF-8 but one table in that database might explicitly set the encoding to SHIFT-JIS. One column in this table might have the encoding explicitly set to ISO-8859-1 while all the other columns do not specify the encoding, so they inherit the default encoding of SHIFT-JIS from the table.

The Integration Appliance can convert from type of encoding to another during run time. For example, the orchestration might read in input data from a table with the encoding set to ISO-8859-1 and then write out that data to a column set to UTF-8.

To set character encodings:

- At the **Database** level - Select the encoding type from the Encoding list of the Edit Endpoint or Create Endpoint dialog box.

- At the **Table** level - Select the encoding type from the Encoding list in the Pick Table pane.
- At the **Column** level - Click on the Encoding field for the desired column in the Pick Table pane and select from the list.

See the following below for descriptions of the default character encoding types.

Note: You must leave the encoding field blank for the following binary Datatypes:

- Blob
- Binary
- Varbinary

To set the encoding type, choose from one of the following options:

- From the Encoding list, select a default encoding type.
- Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.

Some of the default encoding types are listed in the following table:

Table 1.

Encoding	Description
UTF-8	UTF-8 is a standard character encoding for Unicode or ISO-10646. Both of these standards assign a single unique number to each character used in modern languages. This is the default encoding.
US-ASCII	Also known as ASCII, this is the basic character encoding used on Windows and UNIX computers.
ISO-8859-1	Also known as Latin1, this encoding includes ASCII plus characters for many Western European languages.
EBCDIC-C-XML-US	This is the basic character encoding used on IBM® computers. EBCDIC-US, like ASCII, is a US-based character encoding.
SHIFT-JIS	Also known as Katakana, specifies the Japanese language. Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see Using the Shift-JIS encoding .

Database Entities and Activities

The following table shows the relationship between the database entities and the different types of database activities. In addition, this table describes how the database entity is created in the database.

Note: For DB2® UDB, the asset generation script limits the names of buffer and control tables to nine characters.

Note: For Generic JDBC Driver connections: The scripts used to generate assets are only a template based on the information available from the database. The scripts should be analyzed to confirm that the SQL syntax and datatypes are supported for the target database. If they are not, the scripts must be modified and run via another mechanism to create the required assets for the database.

Â

Database Entity	Associated Activity Description	How created?
Buffer Tables	<p>Used with the inbound single-table activities: Get Inserted Rows, Get Updated Rows, and Get Deleted Rows. The buffer tables contain the result of a database operation.</p> <p>For example, a Get Inserted Rows activity is polling for an insert on the database. When the insert occurs in the database, the buffer tables are populated with data that was inserted.</p>	<p>The buffer tables used with inbound single-table activities are created using the following procedure:</p> <ol style="list-style-type: none"> 1. In the Web Management Console (WMC), go to the Assets screen and execute the scripts. 2. From the WMC, deploy the project.
Control Tables	<p>Used with the following activities when messages are specified to be delivered exactly once:</p> <ul style="list-style-type: none"> • Insert Rows • Update Rows • Delete Rows • Call Procedure <p>Control tables are not needed if another delivery option is specified. Specify a delivery option in the Deliver Rules task of the Checklist for an activity.</p>	<p>The control tables used with activities are created using the following procedure:</p> <ol style="list-style-type: none"> 1. In the Web Management Console (WMC), go to the Assets screen and execute the scripts. 2. From the WMC, deploy the project.
Triggers	<p>Used with inbound single-table activities, Get Inserted Rows, Get Updated Rows, and Get Deleted Rows, to populate the buffer table.</p>	<p>The triggers used with inbound single-table activities are created using the following procedure:</p> <ol style="list-style-type: none"> 1. In the Web Management Console (WMC), go to the Assets screen and execute the scripts. 2. From the WMC, deploy the project.

Database Entity	Associated Activity Description	How created?
Stored Procedures	Stored procedures are required with the Call Procedure activity.	The stored procedure must be written and installed in the database before you can complete the configuration of the Call Procedure activity in Studio. The stored procedure is not created using the WMC. The database administrator must create the stored procedure directly in the database.
Sequence	Used with inbound single-table activities, Get Inserted Rows , Get Updated Rows , and Get Deleted Rows , for the Oracle database only.	Oracle only - The sequences used with inbound single-table activities are created using the following procedure: <ol style="list-style-type: none"> 1. Publish a project with an orchestration that contains the inbound single-table activity to the Integration Appliance from Studio. 2. Use the Web Management Console (WMC) to create the sequences in the Oracle database used by the orchestration. 3. From the WMC, deploy the project.

Defining Columns for Old Values in Updates

About this task

The **Get Updated Rows** (inbound) and **Update Rows** (outbound) activities can store both the new value and the original values of the specified columns during run time. For example an **Get Updated Rows** activity could be configured to stored both the original value of `Name` column and the new value of the `Name` column. [Figure 1](#) shows the transfer of example data when the **Get Updated Rows** activity is processed by the Integration Appliance after an update trigger event occurs:

Figure 1. Update old columns

Â

In the Old Value Columns for Updates dialog box, select the columns that you want to store the original values. The Old Value Columns for Updates dialog box is available by clicking Old Values in the **Pick Table** task of the **Checklist** for the **Get Updated Rows** and **Update Rows** activities. By default the name of the column used to store the original values is the original column name prefixed with the string: `old_`. For example if the original column name is called `FirstName`, by default the column used to store the original value of the update operation is called `old_FirstName`. This default name can be changed.

For some projects, you might want to also store the original values of the Primary Keys. For example, if your application actually changes primary key values during update operations as shown in [Figure 2](#).

Figure 2. Example 1

The purpose of the example orchestration is to keep the myInput database table in sync with the myOutput database table. The example orchestration contains a **Get Updated Rows** activity that polls for update events in the myInput table and an **Update Rows** activity that updates the myOutput table.

During run time, an update operation on the myInput database table occurs, changing both the value of the Name column and the primary key value for that row. This update operation is done outside of the integration project. In order for the orchestration to keep the myInput database table in sync with the myOutput database table, it needs access to the original primary key so it knows which row in the myOutput database table to update with the new primary key and the new value for the Name.

The old primary key can be saved to a variable by the **Get Updated Rows** activity to be used later by the **Update Rows** activity when updating the myOutput database table as shown in [Figure 3](#).

Figure 3. Example 2

myInput Database Table

Name	PK	...
HARRY	1

MaxPooledStatements Parameter

The MaxPooledStatements parameter is automatically defined and set with a default value for all types of Database Endpoints.

Attention: Changing the default setting of the MaxPooledStatements parameter can cause reduced performance.

The MaxPooledStatements parameter specifies the maximum number of prepared statements that are cached by the Database Endpoint. When the value of MaxPooledStatements parameter is greater than zero, the Database Endpoint creates a prepared statement pool to store PreparedStatement objects for later reuse. The performance cost of creating new PreparedStatement objects can be expensive, so storing and reusing existing PreparedStatement objects from a pool can result in a performance gain.

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MaxPooledStatements_Parameter.html

Oracle, Sybase, DB2, and Informix Parameters

In the Additional Parameters table of the Database Endpoint, define the connection parameters for Oracle, Sybase, DB2®, or Informix® databases.

:

Oracle

If the **Call Procedure** activity calls an Oracle stored procedure that returns a result set, you must define an Endpoint solely for that connector and add the parameter `procedureresult`. The value for this parameter must be 1.

If an Oracle database table name starts with a number, Studio throws an Invalid Trigger Specification error.

If the project uses database links with the Oracle 8.1.6 database, you must define the `supportLinks` parameter and assign it a value of `true` in the Database Endpoint. By default, the [MaxPooledStatements parameter](#) is automatically defined and set with a default value for an Oracle Database Endpoint. ^ ^

DB2

For the DB2 database, you must define the following two parameters:

- `LocationName` - Enter the location name defined during installation for the AS/400® DB2 database. Not required for UDB.
- `PackageCollection` - The value of this field depends on the system type of the DB2 database:
 - AS/400 ^ - Enter the collection name.
 - UDB ^ - Enter the name of the DB2 Database.

Note: The DB2 user must have the permissions to create a package.

By default, the [MaxPooledStatements parameter](#) is automatically defined and set with a default value for a DB2 Database Endpoint.

Informix

You must define the `InformixServer` parameter.

To find the Informix Server name search the `onconfig` file for `DBSERVERNAME` and specify its value for the `InformixServer` parameter.

By default, the [MaxPooledStatements parameter](#) is automatically defined and set with a default value for an Informix Database Endpoint.

Sybase

For a Sybase Endpoint, the `OverwriteCharLimits` parameter is automatically defined and set to the value of 32768. This parameter defines the size of character columns, for example: `vchars` and `chars`.

By default, the [MaxPooledStatements parameter](#) is automatically defined and set with a default value for a Sybase Database Endpoint. ^

Retry Options For Inbound Database Activities

Â This section contains the procedure for configuring the retry options for the following inbound database activities: **Get Inserted Rows** activity, **Get Updated Rows** activity, **Get Deleted Rows** activity, and **Poll Table** activity.

Specify the retry options for inbound database activities

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to a database. The following table describes the retry options for connecting to a database:

Table 1.

Field	Description
Retry	Â
1) Wait --- secon d(s) betwe en each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the database.

Field	Description
2) Try to connect ___ times before failing .	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the database before issuing an error.</p> <ul style="list-style-type: none"> ◦ If this parameter is set to "0", Studio does not try to reconnect. ◦ If this parameter is set to a value less than "0", Studio retries the connection indefinitely. <p>If an orchestration that starts with an inbound database activity is deployed and the Integration Appliance cannot connect to the specified database, the Integration Appliance logs the connections errors as Warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system log, resets the connection error count to zero, and continues to attempt to establish a connection to the database.</p> <p>For example: the retry count is set to 3. The first, second, and third connection errors are shown in the system log as Warnings. The Integration Appliance logs the fourth connection error as an Error and resets the connection error count to zero. Therefore, the fifth connection error generates a Warning in the system log. The Integration Appliance continues to attempt to establish a connection to the database.</p>
Activity Timeout	<p>^</p>
3) Time out after ___ seconds when the Endpoint does not respond to a request.	<p>Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For example, the amount of time the Integration Appliance waits for a response from the database after requesting that database polls for an INSERT trigger event, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the Endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. Set the connection timeout in Database Endpoint tab. For more information about connection timeouts, see Creating or Editing a Database Activity Endpoint.</p>

Parent topic: [Database Activities](#)

[Feedback](#) | [Notices](#)

Retry Options For Outbound Database Activities

This section contains the procedure for configuring the retry options for the following outbound database activities: **Execute Query** activity, **Insert Rows** activity, **Update Rows** activity, **Delete Rows** activity, and **Call Procedure** activity

Specify the retry options for outbound database activities

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to a database. The following table describes the retry options for connecting to a database:

Table 1.

Field	Description
Retry	^
1) Wait --- second(s) between each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the database.
2) Try to connect ___ times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the database before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains the outbound database activity and the Integration Appliance cannot connect to the specified database, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, the retry count is set to 3. The first, second, and third connection errors are shown in the system log as Warnings. The Integration Appliance logs the fourth connection error as an Error and stops processing the current orchestration job.</p> <p>Note: For the Database Execute Query activity, if you set this parameter to zero, the Integration Appliance retries the connection indefinitely.</p>
Activity Timeout ^	^

Field	Description
3) Time out after ____ secon ds when the Endpoi nt does not respon d to a reques t.	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For example, the amount of time that the Integration Appliance waits for a response from the database after requesting an Insert, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the Endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. Set the connection timeout in the Database Endpoint tab. For more information about connection timeouts, see Creating or Editing a Database Activity Endpoint .

SequeLink Parameters

The various parameters for a Sequelink Endpoint are listed in this section. Some parameters require that a **Parameter Value** is specified. You can also add additional parameters.

Note: When you specify SequeLink Server as the **Database Type** for an endpoint, the parameters listed in this section in bold display in the Additional Parameters table of the Endpoint pane.

MaxPooledStatements

By default, the [MaxPooledStatements parameter](#) is automatically defined and set with a default value for a SequeLink Database Endpoint. Â

ServerDataSource

This parameter is required. You must enter the Data Source Name in the **Parameter Value** field. The Data Source Name is specified in the Data Source Settings in the Sequelink Manager.

BaseDatabaseType

Enter the string: OTHERS.

DBLogonId

Enter the name of the user account to use to access this database. This is an optional parameter that duplicates the User Name property of the endpoint. Use this parameter if your SequeLink Server requires it. You must also complete the DBPassword parameter.

DBPassword

Enter the password for the account specified in DBLogonId. This is an optional parameter that duplicates the Password property of the endpoint. Use this parameter if your SequeLink Server requires it.

HLogonID

Enter the login or user name to use to access the host where the SequeLink Server is installed. This is an optional parameter that is only required if the SequeLink Server requires host authentication. You must also specify the HPassword parameter.

HPassword

Enter the password to use to access the host where the SequeLink Server is installed. This is an optional parameter that is only required if the SequeLink Server requires host authentication.

Single-Table Inbound Database Activities

During run time, single-table inbound database activities poll if a database operation has occurred on any rows in the specified columns of a database table at the specified time interval.

This section contains the procedures for configuring the following single-table inbound database activities:

- **Get Inserted Rows** - During run time, the **Get Inserted Rows** activity polls for rows being added to the buffer table from an INSERT trigger event. The Get Inserted Rows activity then maps the buffer data to variable or variables. ^ ^
- **Get Updated Rows** - During run time, the **Get Updated Rows** activity polls for rows being added to the buffer table from a UPDATE trigger event. The Get Updated Rows activity then maps the buffer data to variable or variables. ^ ^

- **Get Deleted Rows** - During run time, the **Get Deleted Rows** activity polls for rows being added to the buffer table from a DELETE trigger event. The Get Deleted Rows activity then maps the buffer data to variable or variables.

Figure 1 shows the transfer of example data in the UPDATE trigger event and the **Get Updated Rows** activity:
Figure 1. UPDATE trigger example

After publishing your orchestration with an inbound database activity to the Integration Appliance, you must create the buffer table and triggers using the Web Management Console (WMC) before the orchestration is deployed. For the Oracle database, you must also create a sequence using the WMC.

No Activity for that Operation Run-time Error

If an orchestration accesses a buffer table containing a row for an activity that is currently not present in the orchestration, the orchestration fails and following error is reported during run time:

The buffer table contains the *OperType* operation but there is no activity in the orchestration for that operation.

Where *OperType* is type of operation; for example, INSERT. The values of the IH_OPERATION_NAME column in the buffer table for the orchestration must be consistent with the database activities in the orchestration. For example, if a row in the buffer table contains the value: INSERT in the IH_OPERATION_NAME column but the orchestration does not contain a **Get Inserted Rows** activity, this error is reported. Each orchestration must have a separate buffer table. In addition, the triggers in the source table must be consistent with database operations specified in the buffer table. For example if the orchestration only contains a single inbound **Get Updated Rows** activity, the source database table must only contain a UPDATE trigger.

Add a single-table inbound database activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the Database folder.
3. Drag the desired single-table inbound database activity (**Get Inserted Rows**, **Get Deleted Rows**, or **Get Updated Rows**) onto the orchestration.
4. Select the activity.

Create, select, or edit a database endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
 - o Select an existing endpoint:
 - a. Select Browse. The Project Explorer is displayed.

- b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
 - o Select an existing endpoint and edit the endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK.
 - c. Click Edit. The Edit Endpoint pane is displayed.
 - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint, see [Creating or editing an HTTP endpoint](#).

Select the columns in the source database table that during run time the Integration Appliance polls for changes

1. Click Pick Table from the **Checklist**. The Pick Table pane is displayed.
2. Click Browse... to select the database table that is to be the source for inbound messages. The Browse Database Tables dialog box is displayed.
3. Select a table from the list and click OK. Column information for the selected table is displayed in the Pick Table pane.
4. If the character encoding for this table is different from the encoding for the database, enter another encoding using one of the following options:
 - o From the Encoding list, select one of the default encoding types. Â
 - o Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.

This sets the encoding for all the columns of the resulting buffer table.

Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see [Using the Shift-JIS encoding](#).
5. By default all columns in the source table are selected. Clear the Use check box to remove a column from resulting buffer table. Click Use All to reselect all the columns.
6. Click in the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click the Column Name heading of the column. An arrow is displayed to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with **a** and continuing to **z**. A down arrow indicates the column is sorted by reverse alphabetic order starting with **z** and continuing to **a**. Click the arrow to reverse the alphabetic order.
7. For the **Get Updated Rows** activity only - if you want the resulting buffer table to contain both the new values and the original values of the updated columns follow these steps:
 - a. Click Old Values. The Old Value Columns for Updates dialog box displays.
 - b. Select the Store check box for the database columns that you want to save the original values.
 - c. You can change the default names assigned to columns to store the original values. Double-click the appropriate Column Name to Store Old Value cell.
 - d. Click OK. Â The selected columns are displayed in the From Activity of the Map Outputs pane prefixed with the string: `old_`. You can map both the new and original values from the Map Outputs pane. Â

Note: For more information see [Defining Columns for Old Values in Updates](#).

8. If necessary, change the settings of the Data Type, Encoding, or Nullable values. Click the field to make a new selection.
 - o Data Type - Defaults to the data type for the column in the source database table. If the required data type for the column in the buffer table is different from the data type of the source table, select a different data type by clicking in the Data Type cell and selecting another Data Type from the list. You must select an appropriate data type for those data types that are marked UNSUPPORTED.

Note: For the XMLTYPE data type in an Oracle database and the MONEY data types in a SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.

Attention: You must select a compatible data type with the source data type to avoid invalid data during run time. For example, do not select the SMALLINT data type for the buffer table if the

source data type is INTEGER because during run time a large number stored in an INTEGER column will not convert correctly to the SMALLINT data type.

- o Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable.
 - o Encoding - Defaults to current default encoding that was set either at the database level or the table level. If the required encoding for the column is different from the current default encoding, select another encoding by clicking in the Encoding cell and selecting another Encoding from the list. ^
 - o Nullable - Defaults to the nullable setting for the column in the source database table. The Use check box must be selected for those columns where `nullable=false`. A column marked `nullable=false` cannot not contain a null during run time.
9. Click Reset to reset all column properties to their defaults. This also resets the Use check box for all columns.
 10. Click Refresh to update the list of columns in reference to the latest state of the source database. Recent changes to the source is updated in this pane.
 11. Configure the [Specifying Delivery Rules for Database Activities](#).
Note: If you select the Exactly once option in the **Delivery Rules** task, you must create control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.
Note: If you select the Exactly Once option, you must enable persistence. For more information, see [Enabling persistence](#).
 12. Configure the retry options. For more information, see [Retry Options For Inbound Database Activities](#).

Map the output of the activity

1. Select the **Map Outputs** task in the **Checklist**.

The output parameters for the activity are displayed under the rows element in the From Activity pane. The output parameters displayed in the From Activity pane correspond to the columns you selected in the **Pick Table** task. If the Batch option was selected in **Delivery Rules**, the multiple occurrences symbol displays next to the row element.

Note: For the **Get Updated Rows** activity only, if some columns were selected in the Old Values Columns for Updates dialog box (in the **Pick Table** task), these additional output parameters (by default prefixed with the string: `old_`) also display under the rows element. ^ You must map all the old value columns visible in the Map Outputs pane.

2. Map the required output parameters to variable or variables. See [Creating a map](#) for general instructions on mapping. You are not required to map the output parameters for these activities.
Note: After publishing your orchestration with an inbound database activity to the Integration Appliance, you must create the buffer table using the Web Management Console (WMC) before the orchestration is deployed.

Single-Table Outbound Database Activities

This section contains the procedures for configuring the following single-table outbound database activities.

These activities include:

- **Insert Rows** - This activity takes data from variable or variables that are mapped to the input parameters of the activity and inserts this data as rows into the specified database table.
- **Update Rows** - This activity takes data from variable or variables that are mapped to the input parameters of the activity and updates the rows of the specified database table with this new data.
- **Delete Rows** - This activity takes data from variable or variables that are mapped to the input parameters of the activity and deletes rows of the specified database table based on this data.

For the **Update Rows** and the **Delete Rows** activities, the Integration Appliance integrates the database table to determine which columns in the table are primary key columns. When the **Update Rows** or the **Delete Rows** activities are started during run time, the Integration Appliance uses the value of the incoming variable that contains the primary key number to determine which rows to update or delete.

For example, the `PK` column is defined in the database as being a primary key column for the database table. The Use check box is selected for the `PK` column in the **Pick Table** task of the **Checklist** for the **Delete Rows** activity. In the Map Inputs pane of the **Delete Rows** activity, the variable called `myIncomingPK` is mapped to the `PK` element of the row as shown in [Figure 1](#):

Figure 1. `myIncomingPK` is mapped to the `PK` element of the row

During run time, if the value of the `myIncomingPK` variable is equal to 3 the row with the `PK` equal to 3 is deleted from the table as shown in [Figure 2](#):

Figure 2. The row with the primary key equal to 3 is deleted

Variables in the Orchestration

myIncomingPK

3

The row with the primary key equal to 3 is deleted from the table.

Name	PK	...
HARRY	1	
FRED	2	
MARY	3	

The PK column is defined as a primary key column in the database.

If no primary key columns are specified in the **Pick Table** task of the **Checklist**, specify at least one column to act like the primary key. Specify acting primary key column or columns using the Configure Primary Keys dialog box, available by clicking Keys in the **Pick Table** task of the **Checklist** for the **Delete Rows** and **Update Rows** activities. If no primary keys are specified in the database table or selected as acting primary keys in the Configure Primary Keys dialog box, all the rows of the database table are affected by the delete or the update operation.

You can also use the Configure Primary Keys dialog box to specify additional columns to act as primary key columns. For example for the table in the preceding figure, you could define that the `Name` column should act like primary key column in addition to the `PK` primary column that was defined in the database as being a primary key column.

Add a single-table outbound database activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the Database folder.
3. Drag the wanted single-table outbound database activity (**Insert Rows**, **Delete Rows**, or **Update Rows**) onto the orchestration.
4. Select the activity.

Create, select, or edit a database endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
 - o Select an existing endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
 - o Select an existing endpoint and edit the endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK.
 - c. Click Edit. The Edit Endpoint pane is displayed.
 - o Create an endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an HTTP endpoint, see [Creating or editing an HTTP endpoint](#).

Select the columns in the source database table that during run time the Integration Appliance polls for changes

1. Click Pick Table from the **Checklist**. The Pick Table pane is displayed.
2. Click Browse... to select the database table that is to be the source for inbound messages. The Browse Database Tables dialog box is displayed.
3. Select a table from the list and click OK. Column information for the selected table is displayed in the Pick Table pane.
4. If the character encoding for this table is different from the encoding for the database, enter another encoding using one of the following options:
 - o From the Encoding list, select one of the default encoding types.
 - o Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.

This sets the encoding for all the columns of the resulting buffer table.

Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see [Using the Shift-JIS encoding](#).

5. By default all columns in the source table are selected. Clear the Use check box to remove a column from resulting buffer table. Click Use All to reselect all the columns.
6. Click in the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click the Column Name heading of the column. An arrow is displayed to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with **a** and continuing to **z**. A down arrow indicates the column is sorted by reverse alphabetic order starting with **z** and continuing to **a**. Click the arrow to reverse the alphabetic order.
7. For the **Get Updated Rows** activity only - if you want the resulting buffer table to contain both the new values and the original values of the updated columns follow these steps:
 - a. Click Old Values. The Old Value Columns for Updates dialog box displays.
 - b. Select the Store check box for the database columns that you want to save the original values.
 - c. You can change the default names assigned to columns to store the original values. Double-click the appropriate Column Name to Store Old Value cell.
 - d. Click OK. The selected columns are displayed in the From Activity of the Map Outputs pane prefixed with the string: `old_`. You can map both the new and original values from the Map Outputs pane.

Note: For more information see [Defining Columns for Old Values in Updates](#).

8. If necessary, change the settings of the Data Type, Encoding, or Nullable values. Click the field to make a new selection.
 - o Data Type - Defaults to the data type for the column in the source database table. If the required data type for the column in the buffer table is different from the data type of the source table, select a different data type by clicking in the Data Type cell and selecting another Data Type from the list. You must select an appropriate data type for those data types that are marked UNSUPPORTED.

Note: For the XMLTYPE data type in an Oracle database and the MONEY data types in a SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.

Attention: You must select a compatible data type with the source data type to avoid invalid data during run time. For example, do not select the SMALLINT data type for the buffer table if the source data type is INTEGER because during run time a large number stored in an INTEGER column will not convert correctly to the SMALLINT data type.
 - o Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable.
 - o Encoding - Defaults to current default encoding that was set either at the database level or the table level. If the required encoding for the column is different from the current default encoding, select another encoding by clicking in the Encoding cell and selecting another Encoding from the list.
 - o Nullable - Defaults to the nullable setting for the column in the source database table. The Use check box must be selected for those columns where `nullable=false`. A column marked `nullable=false` cannot not contain a null during run time.

9. Click Reset to reset all column properties to their defaults. This also resets the Use check box for all columns.
10. Click Refresh to update the list of columns in reference to the latest state of the source database. Recent changes to the source are updated in this pane.
11. Configure the [Specifying Delivery Rules for Database Activities](#).
 Note: If you select the Exactly once option in the **Delivery Rules** task, you must create control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.
 Note: If you select the Exactly Once option, you must enable persistence. For more information, see [Enabling persistence](#).
12. Configure the retry options. For more information, see [Retry Options For Inbound Database Activities](#).

Specify the target database table for the activity

1. Click Pick Table from the **Checklist**. The Pick Table pane is displayed.
2. Click Browse... to select the target database table. The Browse Database Tables dialog box is displayed.
3. Select a table from the list and click OK. Column information for the selected table is displayed in the Pick Table pane.
4. If the character encoding for this table is different from the encoding for the database, enter another encoding using one of the following options:
 - o From the Encoding list, select one of the default encoding types. Â
 - o Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.

This sets the encoding for all the columns of the resulting buffer table.

Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see [Using the Shift-JIS encoding](#).

5. By default all columns in the source table are selected. Clear the Use check box to remove a column from resulting buffer table. If a column is not selected, it is not displayed in the Map Inputs pane and is not updated at run time. Click Use All to reselect all the columns.
6. Click in the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click the Column Name heading of the column. An arrow is displayed to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with **a** and continuing to **z**. A down arrow indicates the column is sorted by reverse alphabetic order starting with **z** and continuing to **a**. Click the arrow to reverse the alphabetic order.
7. If necessary, change the settings of the Data Type, Encoding, or Nullable values. Click the field to make a new selection.
 - o Data Type - Defaults to the data type for the column in the source database table. If the wanted data type for the column in the buffer table is different from the data type of the source table, select a different data type by clicking in the Data Type cell and selecting another Data Type from the list. You must select an appropriate data type for those data types that are marked UNSUPPORTED.
 Note: For the XMLTYPE data type in an Oracle database and the MONEY data types in a SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.
 Attention: You must select a compatible data type with the source data type to avoid invalid data during run time. For example, do not select the SMALLINT data type for the buffer table if the source data type is INTEGER because during run time a large number stored in an INTEGER column is not converted correctly to the SMALLINT data type.
 - o Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable.
 - o Encoding - Defaults to current default encoding that was set either at the database level or the table level. If the wanted encoding for the column is different from the current default encoding,

- select another encoding by clicking in the Encoding cell and selecting another Encoding from the list. ^
- o Nullable - Defaults to the nullable setting for the column in the source database table. The Use check box must be selected for those columns where `nullable=false`. A column marked `nullable=false` cannot not contain a null during run time.
8. Click Reset to reset all column properties to their defaults. This also resets the Use check box for all columns.
 9. Click Refresh to update the list of columns in reference to the latest state of the source database. Recent changes to the source are updated in this pane.
 10. For the **Update Rows** activity only - Select the Insert row if row does not already exist check box, if during run time you want the **Update Rows** activity to first try and update the specified row but if the row does not exist, insert the row into the database table. ^
 11. For the **Update Rows** activity only - if you want to save both the new values and the original values in the database, follow these steps:
 - a. Click Old Values. The Old Value Columns for Updates dialog box is displayed.
 - b. Select the Store check box for the database columns that you want to save the original values.
 - c. You can change the default names assigned to columns that store the original values during run time. Double-click in the appropriate Column Name to Store Old Value cell.
 - d. Click OK. ^ The selected columns are displayed in the To Activity of the Map Outputs pane prefixed with the string: `old_`. You can map to both the new and original values from the Map Outputs pane. ^

Note: For more information see [Defining Columns for Old Values in Updates](#).
 12. For the **Update Rows** or **Delete Rows** activities only - To specify acting primary key columns in addition to any primary key columns already defined by the database, follow these steps: ^
 - a. Click Keys. The Configure Primary Keys dialog box is displayed.
 - b. To specify a column as an acting primary key column, click the column then click >>.
 - c. Click OK.

Note: If no primary keys columns (as defined by the database) were specified in the **Pick Table** task of the **Checklist**, you must specify at least one column as an acting primary key column.
Repeat this step to specify more acting primary key columns.
 13. Configure the [Specifying Delivery Rules for Database Activities](#).
Note: If you select the Exactly once option in the **Delivery Rules** task, you must create control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.
Note: If you select the Exactly Once option, you must enable persistence. For more information, see [Enabling persistence](#).
 14. Configure the retry options. For more information, see [Retry Options For Outbound Database Activities](#).

Map the input of the activity

1. Select the **Map Inputs** task in the **Checklist**.
The input parameters for the activity are displayed under the row element in the To Activity pane. The input parameters displayed in the From Activity pane correspond to the columns you selected in the **Pick Table** task. If the Batch Multiple Rows Per Message check box was selected in **Delivery Rules**, the multiple occurrences symbol displays next to the row element.
Note: For the **Get Updated Rows** activity only, if columns were selected in the Old Values Columns for Updates dialog box (in the **Pick Table** task), these additional output parameters (by default prefixed with the string: `old_`) also display under the rows element. ^
2. Map all the input parameters. See [Creating a map](#) for general instructions on mapping. You must map all the input parameters of the activity.

Map the output of the activity

1. Select the **Map Outputs** task in the **Checklist**.

The GetRowCount check box determines what is displayed in the Map Outputs pane:

- o If the Get Row Counts check box is cleared in the **Delivery Rules**, the Map Outputs pane is blank.
 - o If the Get Row Counts check box is selected in the **Delivery Rules**, the Map Outputs pane displays the rowCount element. If the Batch Multiple Rows Per Message check box is selected in the **Delivery Rules**, the multiple occurrences symbol is displayed next to the rowCount element.
2. If the RowCount output parameter is displayed, map the RowCount output parameter if wanted. See [Creating a map](#) for general instructions on mapping. You are not required to map the output parameters of the activity. If

Specifying Delivery Rules for Database Activities

Specify how messages will be delivered at the Delivery Rules pane.

The delivery rules for inbound and outbound activities differ, as described in the following sections.

Specify the delivery rules for inbound database activities

1. Select the **Delivery Rules** task from the **Checklist**.
2. Configure the Delivery rules as described in the following table which describes the delivery rules for the inbound database activities (**Get Inserted Rows**, **Get Updated Rows**, **Get Deleted Rows**, and **Poll Table**):

Table 1.

Name	Description
Polling Interval	Specifies the time interval to poll for changes in database. For example, the Get Inserted Rows activity polls for INSERT trigger events at the specified time interval. For more information, see Polling interval behavior .
Fetch size	Specifies how many rows the activity should retrieve from the buffer table at one time. The default is 500 rows per poll. The range is 1 - 10,000. Note: To improve performance, set the Fetch Size to the maximum number of rows you expect to retrieve from the buffer table.
Batch	Specifies the number of rows to batch into a single message. By default, batching is turned off (the Batch check box is not selected). To turn on batching, select the Batch check box then specify the number of rows to batch. The range is 1 - 10,000. If the Batch check box is selected in Delivery Rules , then the multiple occurrences symbol displays next to the row element in the From Activity pane of the Map Outputs task of the inbound activity.

Name	Description
Deliver Messages	<p>Select from one of the following options in the Deliver messages pull-down menu:</p> <ul style="list-style-type: none"> ◦ At least once - Specifies the message will be delivered at least once, but can be delivered more than once. This delivery option is typically used when the receiving system can detect or tolerate duplicate messages. ◦ Exactly once - Specifies the message will be delivered once and only once. If the Exactly once option is selected and the database is Sybase, the <code>OverwriteCharLimits</code> parameter must be set in the endpoint. For more information, see Oracle, Sybase, DB2, and Informix Parameters. <p>Note: If you select the Exactly once option, you must create some control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.</p> <p>Note: If you select the Exactly Once option, you must enable persistence. For more information, see Enabling persistence.</p>
Delete rows after they have been processed	<p>This check box is displayed only for the Custom Poll activity. The Delete rows after they have been processed check box is used by the Integration Appliance to determine the action for a delete request while running a Poll Table activity:</p> <ul style="list-style-type: none"> ◦ If the check box is enabled, during run time the Integration Appliance sets the flag column to <code>M</code> and then deletes the row. ◦ If the check box is cleared, during run time the Integration Appliance sets the flag column to <code>M</code> and then <code>P</code> but the row is not deleted.

Specify the delivery rules for outbound database activities

1. Select the **Delivery Rules** task from the **Checklist**.
2. Configure the Delivery rules as described in the following table, which describes the deliver rules for the outbound database activities (**Insert Rows, Update Rows, Delete Rows, Call Procedure**):

Table 2.

Name	Description
Deliver Messages	<p>Select from one of the following options in the Deliver messages menu:</p> <ul style="list-style-type: none"> ◦ At least once - Specifies the message will be delivered at least once, but can be delivered more than once. This delivery option is typically used when the receiving system can detect or tolerate duplicate messages. ◦ Exactly once - Specifies the message will be delivered only once. <p>Note: If you select the Exactly once option, you must create some control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.</p>
Batch __ rows at a time	<p>Specifies if the database operations on rows should be batched and how many rows to process by the database operation at one time. For example, if the size of the batch is set to 20 but 100 rows are processed by a database insert, 5 messages of size 20 are sent from the Integration Appliance to the database and then the final database commit message is sent.</p> <p>If the Batch __ rows at a time check box is selected in Delivery Rules, the multiple occurrences symbol displays next to the row element in the To Activity pane of the Map Inputs task of the outbound activity.</p>

Name	Description
Get Row Counts	Not available for the Call Procedure activity - This check box specifies that during run time the activity returns how many rows were processed per transaction. If the Get Rows Counts check box is selected, the rowCount is available in the From Activity pane of the Map Outputs pane of the outbound activity.

Viewing Column Details

The View Column dialog box allows you to see detailed column information for tables as you enter a SQL statement in the **Enter Query** task of the **Checklist** for the **Execute Query** activity. This task describes how to access the View Column Details dialog box.

Procedure

1. Create or open an **Execute Query** activity.
2. Select the **Enter Query** task from the **Checklist**. The Enter Query pane is displayed.
3. Click View Columns. The View Columns dialog box is displayed.
4. To change the data viewed in the View Columns dialog box, select from the following options:
 - To see detailed column information, select a table in the list. Column names, datatypes, sizes, and nullable properties display in the right pane.
 - To see tables in a different schema, select a schema from the Filter by User Schema list.
 - To see tables for all schemas, click Clear.
 - To filter out any buffer or control tables created by the Web Management Console (WMC) that are used internally by the Integration Appliance, select the Hide Buffer and Control Tables option.
Note: This filter only hides buffer and control tables that use the standard names generated in scripts from Studio.

Working with Database Parameters

Parameters supply database-specific connection information for an endpoint.

About this task

You can add and delete database parameters and edit parameter values as described in the following procedures.

To add a parameter to the endpoint:

Procedure

1. In the Project tab, click an Endpoint.
2. Click Add. The Database Endpoint Parameters dialog box is displayed.
3. Type the name of a new parameter in the Parameter Name field.
4. Type a value for the parameter in the Parameter Value field.
5. Click OK.

Results

To delete a parameter from the endpoint:

1. In the Project tab, click an Endpoint.
2. Click the Parameter Name of the parameter to be deleted.
3. Click Delete.

To edit a parameter value:

1. In the Project tab, click an Endpoint.
2. Click the Parameter Value to be changed, and enter a new value in the field.
3. Press Enter.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn_db_Working_with_DB_Parms.html

Call Procedure Activity

During run time, the Call Procedure activity runs a stored procedure in a database. The stored procedure must be written and installed in the database before you can complete the configuration of the Call Procedure activity in Studio.

Note: Function name overloading for stored procedures in the Informix® database is not supported. Stored procedures cannot have the same name in Informix even if their signatures are unique. The steps for adding and configuring a Call Procedure activity to an orchestration are described in the following procedures:

- [Add a Call Procedure activity to the orchestration](#)
- [Create, select, or edit a database endpoint](#)
- [Configure a Call Procedure activity](#)
- [Map the input of the activity](#)
- [Map the output of the activity](#)

Add a Call Procedure activity to the orchestration

1. [Create](#) or open an orchestration. A graphical representation of the orchestration opens.
2. Select the Activities tab and expand the Database folder.
3. Drag the Call Procedure activity onto the orchestration.
4. Select the Call Procedure activity.

Create, select, or edit a database endpoint

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:
 - o Select an existing endpoint:
 - a. Select Browse. The Project Explorer opens.
 - b. Select an existing endpoint and click OK. Skip to the [Configure a Call Procedure activity](#) activity procedure.
 - o Select an existing endpoint and edit the endpoint:
 - a. Select Browse. The Project Explorer opens.
 - b. Select an existing endpoint and click OK.
 - c. Click Edit. The Edit Endpoint pane shows.
 - o Create a new endpoint:
 - a. Select New. The Create Endpoint pane opens.
2. [Create or edit a database endpoint](#)

Configure a Call Procedure activity

1. Click Stored Procedure from the Checklist. The Stored Procedure pane opens.
2. Click Browse... The Browse Stored Procedures dialog box shows.
3. To see all the stored procedures in the database and not just those visible with the selected user schema, click Clear.
4. Select a Stored Procedure from the list.
5. Click OK. Parameter information for the selected stored procedure displays in the Stored Procedure pane.

Note: Deleting stored procedure call parameters from the middle of the parameter list is not supported. If you want to specify parameters in a different order than they are displayed in the list, you can create a wrapper stored procedure (for example, *WrapperStoredProcedure1*) that doesn't have gaps in parameters (that is, contains the exact subset of the parameters needed), then have the new stored procedure call the underlying stored procedure (for example: *BackendStoredProcedure1*) using the `@parameter = value` form supported by the Microsoft SQL Server. You can then have your orchestration use the wrapper stored procedure with only the parameters needed. Alternatively, you can provide the full set of parameters without omissions and default values in Studio for the original underlying stored procedure (for example, *BackendStoredProcedure1*). Note that while deleting stored procedure call parameters from the middle of a parameter list is not supported, parameters displayed at the end of a parameter list can be deleted.

6. To change the current character encoding (originally obtained from the database endpoint), select a different [encoding](#) option from the Encoding list. This changes the default character encoding for all the input parameters of the stored procedure.
7. By default, all the input and output (IN, INOUT, RETURN, OUT) parameters of the stored procedure are selected. You do not need to include all the input and output parameters defined for a stored procedure. Clearing the Use check box for an output parameter (INOUT, RETURN, OUT) means that the output parameter is not available in the Map Inputs task. Clearing the Use check box for an input parameter (IN, INOUT) means that the input parameter is not available in the Map Inputs task. Clear the Use check box only for input parameters that you do not need to specify input values at run time. Some input parameters of the stored procedure may have default values.

Most databases only return a single return parameter. For these databases, if the Use check box is selected for the return parameter, the return value is returned in the single results/result/RETURN_VALUE node in the From Activity pane of the Map Outputs task. The Informix database, however, supports multiple return parameters and for the Informix database, the return parameters are returned in the repeating results/result/result/resultsSets/any node. Even if one parameter is returned from the stored procedure, the return parameter is returned in the results/result/result/resultsSets/any node. Use the [CopyOf function](#) in the map to copy the contents of the result node (including the child node called resultSet) to a variable. In order for the CopyOf function to correctly copy the values of the source nodes to the destination nodes, the XML Schema of the destination variable must match the XML Schema of the source node. For more information, see [CopyOf function](#).

8. Click the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click in the Column Name heading of the column. An arrow shows to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with a and continuing to z. A down arrow indicates the column is sorted by reverse alphabetic order starting with z and continuing to a. Click the arrow to reverse the alphabetic order.
9. If necessary, change the settings of the Data type, Encoding, or Nullable values for each query input parameter. Click the field to make a new selection:
 - o Data Type - Defaults to the Data Type of the parameter. Select an alternate data type for the parameter by clicking in the Data Type cell and selecting another Data Type from the list. from the corresponding cell. You must change any data types that are UNSUPPORTED.
Note: (for MONEY and XMLTYPE data types) For the XMLTYPE data type in an Oracle database and the MONEY data types in an SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.
 - o Encoding - Defaults to current default encoding that was set either at the database level or the table level. If the required encoding for the parameter is different from the current default encoding, select another encoding by clicking in the Encoding cell and selecting another [Encoding](#) from the list.
 - o Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable.
10. Click Reset to reset all parameter properties to their defaults. This also selects the Use option for all parameters.
11. Configure [Delivery Rules](#).
Note: If you select the Exactly once option in the Delivery Rules task, you must create control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.
Note: If you select the Exactly once option, you must enable persistence. For more information, see [Enabling Persistence](#).
12. Configure the [Retry Options](#).

Map the input of the activity

1. Select the Map Inputs task in the Checklist. The input parameters for the activity are displayed under the calls element in the To Activity pane. The input parameters displayed in the To Activity pane correspond to the IN and INOUT parameters you selected in the Stored Procedure task. If the Batch Multiple Rows Per Message check box is selected in the Delivery Rules, the multiple occurrences icon displays next to the call element.
2. Map all the displayed input parameters. See [Creating a map](#) for general instructions on mapping.

Map the output of the activity

1. Select the Map Outputs task in the Checklist. The output parameters for the activity are displayed under the results element in the From Activity pane. The output parameters displayed in the From Activity pane correspond to the OUT, RETURN, and INOUT parameters you selected in the Stored Procedure task.

If the Batch Multiple Rows Per Message check box is selected in the Delivery Rules, the multiple occurrences icon displays next to the result element.

A repeating node called resultSet displays in the From Activity pane of the Call Procedure activity even if the stored procedure has no return parameters. During run time, if the stored procedure started from the activity returns a result set, this result set is returned from the activity in the resultSet node. For example, if the stored procedure starts a select statement, the result set from the select statement is returned in the resultSet node. Use the [CopyOf function](#) in the map to copy the contents of the result node (including the child node called resultSet) to a variable. $\hat{\wedge}$

Attention: In order for the CopyOf function to correctly copy the values of the source nodes to the destination nodes, the XML Schema of the destination variable must match the XML Schema of the source node. For more information, see [CopyOf function](#).

2. Map the required output parameters to variables. See [Creating a map](#) for general instructions on mapping. You are **not required** to map output parameters for this activity.

$\hat{\wedge}$

Execute Query Activity

During run time, the Execute Query activity runs a select SQL statement.

The Execute Query activity supports parameterized queries - a query that contains input, or input and output parameters. When input parameters are specified in a query, the value of the parameter is supplied at run time. The ? character in the following example select statement specifies that there is one input parameter:

```
select * from myUserSchema.mySourceTable where  
myUserSchema.mySourceTable.myColumn=?
```

In the preceding select statement, the * character, specifies that the query returns the column or columns found in the *mySourceTable* table as the output parameter or parameters. For example, if the *mySource table* contains two columns, one of type CHAR and one of type VARCHAR, the Execute Query activity returns two output parameters, one of type CHAR and the other of type VARCHAR.

Note: Only the select SQL statement is supported in the Execute Query activity. The insert SQL statement is not supported in the Execute Query activity.

The steps for adding and configuring an Execute Query activity to an orchestration are described in the following procedures:

- [Add an Execute Query in the orchestration](#)
- [Create, select, or edit a database endpoint](#)
- [Specify the query SQL statement](#)
- [Configure the input parameters for the query](#)
- [Configure output parameters](#)
- [Specify retry options for the query](#)
- [Map the input of the activity](#)
- [Map the output of the activity](#)

Add an Execute Query in the orchestration

1. [Create](#) or open an orchestration. A graphical representation of the orchestration displays.
2. Select the Activities tab and expand the Database folder.
3. Drag the Execute Query activity onto the orchestration.
4. Select the Execute Query activity

Create, select, or edit a database endpoint

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:
 - Select an existing endpoint:
 - a. Select Browse. The Project Explorer opens.
 - b. Select an existing endpoint and click OK. Skip to the [Specify the query SQL statement](#) procedure.
 - Select an existing endpoint and edit the endpoint:
 - a. Select Browse. The Project Explorer opens.
 - b. Select an existing endpoint and click OK
 - c. Click Edit. The Edit Endpoint pane opens.
 - Create an endpoint: Select New. The Create Endpoint pane opens.
2. [Create or edit a database endpoint](#)

Specify the query SQL statement

1. Select the Enter Query task from the Checklist. The Enter Query pane opens.
2. Enter the query in the white space displayed in the pane. Do not place semicolons at the end of your query.
3. Click [View Columns](#) to review column details for a selected table to assist you in building your SQL statement by entering valid table names and columns.
4. Select an alternate character [encoding](#) setting for the input and output parameters if the wanted encoding differs from the default encoding for the database using one of the following options:
 - From the Encoding list, select one of the default encoding types.
 - Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.

Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see [Using the Shift-JIS encoding](#).

5. Click Validate Query. This action checks if your query is valid and populates input and output parameters in the Map Inputs and Map Outputs tasks.
6. Enter a value into the MaxRows field. The MaxRows field specifies the maximum number of rows to return from the query during run time.

Note: If the same query is started multiple times on the same data, the same set of rows are returned. For example if MaxRows is equal to 1, the same row (the first row) is always returned each time the query is started - there is no iteration through the set of rows.

Configure the input parameters for the query

1. Select the Setup Input Parameters task from the Checklist. The Setup Input Parameters pane shows the input parameter or parameters of the query.
2. Click [View Columns](#) to review column details for a selected table to assist you in building your SQL statement by entering valid table names and columns.
3. Click in the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click the Column Name heading of the column. An arrow is displayed to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with a and continuing to z. A down arrow indicates the column is sorted by reverse alphabetic order starting with z and continuing to a. Click the arrow to reverse the alphabetic order.
4. If necessary, change the settings of the Data type, Encoding, or Nullable values for each query input parameter. Click the field to make a new selection:
 - o Parameter Name - You can change the default name to a more meaningful name. Parameters are listed in the order they are specified in the query.
 - o Data Type - Select a data type for this parameter.
Note: **(for MONEY and XMLTYPE data types)** For the XMLTYPE data type in an Oracle database and the MONEY data types in a SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.
 - o Encoding - Select an alternate character [encoding](#) setting for the parameter if the required encoding differs from the default encoding for the database.
 - o Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable.
5. Click Reset Values to interrogate the database and get the data types and size from the database. This overrides the data type and size set manually in the pane.

Configure output parameters

1. Select the Setup Result Set task from the Checklist. The Setup Result Set pane opens and the defaults for the output parameter or parameters of the query are listed.
2. Click [View Columns](#) to review column details for a selected table to assist you in building your SQL statement by entering valid table names and columns.
3. If necessary, change the settings of the Data type, Encoding, or Nullable values for each query output parameter:
 - o Parameter Name - You can change the default name to a more meaningful name. Parameters are listed in the order they are specified in the query.
 - o Data Type - Select a data type for this parameter.
 - o Encoding - Select an alternate character encoding setting for the parameter if the required encoding differs from the default encoding for the database.
 - o Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable.
4. Click Reset Values to interrogate the database and get the data types and size from the database. This overrides the data type and size set manually in the pane.

Specify retry options for the query

To specify the retry options for the query:

1. Configure the [Retry Options](#).

Note: For the **Database Execute Query** activity, if you set the retry option to zero, the Integration Appliance retries the connection indefinitely.

Map the input of the activity

1. Select the Map Inputs task in the Checklist. The input parameters specified for the query are the input parameters for the activity. The input parameters of the activity are displayed under the parameters element in the To Activity pane.
2. You must map all the input parameters of the activity. See [Creating a map](#) for general instructions on mapping.

Map the output of the activity

1. Select the Map Outputs task in the Checklist. The columns returned by select statement are the elements displayed under the rows/row element in the From Activity pane.
2. You are not required to map the output parameters of the activity. See [Creating a map](#) for general instructions on mapping.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db_execute_query_activity.html

Poll Table Activity

The Poll Table activity checks if a database operation (insert or update) has occurred on any rows of a database table by checking the status of a special flag column at the specified time interval.

During run time, for the insert and update operations, the Poll Table activity returns the data that has changed in your database table and directly maps that data to variables in the orchestration while the Get Inserted Rows and Get Updated Rows activities returns the changed data into a buffer table and that buffer table is mapped to a variable in the orchestration.

Note: Use the Poll Table activity instead of the Get Inserted Rows, Get Deleted Rows, and Get Updated Rows activities only when you must avoid adding triggers to your database.

Before configuring the Poll Table activity in Studio, you must first either create two additional database columns in your source database table or use two appropriate existing database columns from your database table. The following database columns are required in your source database table:

- A sequence column of Â INTEGER type - This column contains the primary keys (a sequence of unique numbers: 1, 2, 3 ...)

- A flag column of \hat{A} CHAR(1) type - This column contains a flag that the Integration Appliance uses during run time to determine if the Integration Appliance should process the row.

Before an orchestration with a Poll Table activity is run on the Integration Appliance, you must also populate these columns in your database table. Set the flag column to *P* if you do not want the Integration Appliance to process the row during run time. Set the flag column to *null* if you want the Integration Appliance to process the row during run time.

In the following example database table, all the values in the Flag column are set initially to *P*, as shown in the following figure:

Initial state of your source database table with additional columns required by the **Poll Table** activity.

Name	Sequence (Primary Key)	Flag
HARRY	1	P
FRED	2	P
NICK	3	P
BOB	4	P

Time
(in minutes)

1) Orchestration with **Poll Table** activity is deployed. This **Poll Table** activity is set to poll for a change in the database table every 1 minute.

2) The **Poll Table** activity polls for a change in the database table by looking for a null in the Flag column. No change, the activity does not process any data, the polling continues.

3) An update is done to the 3rd row in the database table from outside source as shown in the following figure.

NOTE: The outside source must also change the Flag value for the 3rd row from *P* to null.

Name	Sequence (Primary Key)	Flag
HARRY	1	P
FRED	2	P
MARY	3	<i>null</i>
BOB	4	P

-2-

4) The **Poll Table** activity polls for a change in the database table by checking if the value of the Flag column is set to null for any of the rows. In this example, the Integration Appliance processes the 3rd row and returns the 3rd row as data that is mapped to the

returns the 3rd row as data that is mapped to the specified variable(s).
In addition, the Integration Appliance changes the Flag column for the 3rd row to P for processed.

Name	Sequence (Primary Key)	Flag
HARRY	1	P
FRED	2	P
MARY	3	P
BOB	4	P

5) The next activity after the **Poll Table** activity in the orchestration is executed in the Integration Appliance.

Attention: You must manage the state of the flag column. After processing a row, the Integration Appliance changes the flag column to *P* for processed as described in the following example scenario:

1. A row is inserted into the database. The flag column is set to *null* for the row.
2. The Poll Table activity runs for the first time and sets the flag value to *P* for this row.
3. The same row is updated, and the Poll Table activity runs again. The row is not returned in the return data of the activity because the Integration Appliance checked the flag column and the flag indicated that this row had already been processed.

In order for a row to be processed again by the Integration Appliance, you must reset the flag column back to *null* before an orchestration job with a Poll Table activity accessing the same source database table is run.

The steps for adding and configuring a Poll Table activity to an orchestration are described in the following procedures:

- [Add a Poll Table activity in the orchestration](#)
- [Create, select, or edit a database endpoint](#)
- [Specify the columns of the source table to poll for database operations](#)
- [Select the Sequence and Flag columns](#)
- [Map the output of the activity](#)

Add a Poll Table activity in the orchestration

1. [Create](#) or open an orchestration. A graphical representation of the orchestration opens.
2. Select the Activities tab and expand the Database folder.
3. Drag the Poll Table activity onto the orchestration.
4. Select the Poll Table activity.

Create, select, or edit a database endpoint

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:

- o Select an existing endpoint:
 - a. Select Browse. The Project Explorer opens.
 - b. Select an existing endpoint and click OK. Skip to the [Specify the columns of the source table to poll for database operations](#) procedure.
 - o Select an existing endpoint and edit the endpoint:
 - a. Select Browse. The Project Explorer opens.
 - b. Select an existing endpoint and click OK.
 - c. Click Edit. The Edit Endpoint pane shows.
 - o Create a new endpoint:
 - a. Select New. The Create Endpoint pane opens.
2. [Create or edit a database endpoint.](#)

Specify the columns of the source table to poll for database operations

1. Click Pick Endpoint from the Checklist. The Pick Endpoint pane opens.
2. Click Browse. The Select a Single Source Table dialog box opens.
3. Select a table that during run time, the Poll Table activity polls for database operations.
4. Select a user schema from the Filter by User Schema list.
5. Select Hide Buffer and Control Tables to filter out any buffer or control tables used by the Integration Appliance.
 Note: This filter only hides buffer and control tables that use the standard names generated in scripts from Studio.
6. Select a single table from the list:
 - o Click >> to add a table.
 - o Click << to remove a table.
7. If you only want to poll for database operations on primary key columns of the source table, select the Select Only the Primary Keys from Table check box.
8. Click OK. The columns of the table show in the Pick Table pane. (If you selected the Select Only the Primary Keys from Tables check box only the primary key columns display.)
9. If the character encoding for this table is different from the encoding for the database, enter another [encoding](#) using one of the following options:
 - o From the Encoding list, select one of the default encoding types.
 - o Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.
10. Select the columns in the table that during run time you want the PPoll Table activity to poll for database operations (insert, delete, or update). By default all columns are selected. Clear the Use check box for unwanted columns. Click Use All to reselect all the columns.
11. Click the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click in the Column Name heading of the column. An arrow shows to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with a and continuing to z. A down arrow indicates the column is sorted by reverse alphabetic order starting with z and continuing to a. Click the arrow to reverse the alphabetic order.
12. If necessary, change the settings of the Data type, Encoding, or Nullable values for each query input parameter. Click the field to make a new selection:
 - o Data Type - Defaults to the data type for the column in the source database table. If the required data type for the column in the buffer table is different from the data type of the source table, select a different data type by clicking in the Data Type cell and selecting another Data Type from the list. You must select an appropriate data type for those data types that are marked UNSUPPORTED.
 Note: (for MONEY and XMLTYPE data types) For the XMLTYPE data type in an Oracle database and the MONEY data types in a SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.

- Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable
- Encoding - Defaults to current default encoding that was set either at the database level or the table level. If the required encoding for the column is different from the current default encoding, select another encoding by clicking in the Encoding cell and selecting another [Encoding](#) from the list.
- Nullable - Defaults to the nullable setting for the column in the source database table. If nullable = false, then the column must be included in the message. The Use check box must be selected for those columns where nullable=false. A column marked nullable=false cannot not contain a null during run time.

Select the Sequence and Flag columns

1. Select Choose Columns from the Checklist.
2. Select a Sequence Column from the list. This is the sequence column of `INTEGER` type containing the primary keys (a sequence of unique numbers: 1, 2, 3 ...) that you either added to your source database table or determined that you could use an existing column in your source database table.
3. Select a Flag Column from the list. A flag column of `CHAR` type containing a flag that the Integration Appliance sets to `P` when the Integration Appliance has processed the row. The Integration Appliance uses sequence and flag columns to check for duplicate messages. In addition, both columns and the setting of the Delete rows after they have been processed check box in the Delivery Rules pane are used by the Integration Appliance to determine the action for a delete request:
 - If the Delete rows after they have been processed check box is selected, the Integration Appliance sets the flag to `M` and then deletes the row.
 - If the Delete rows after they have been processed check box is cleared, the Integration Appliance sets the flag to `M` and then `P` but the row is not deleted. In order for a row to be processed again by the Integration Appliance, you must reset the flag column back to `null` before an orchestration job with a Poll Table activity accessing the same source database table is run.
4. Configure the [Delivery Rules](#).

Note: If you select the Exactly once option in the Delivery Rules task, you must create control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.

Note: If you select the Exactly Once option, you must enable persistence. For more information, see [Enabling Persistence](#).
5. Configure the [Retry Options](#).

Map the output of the activity

1. Select the Map Outputs task in the Checklist. The output parameters for the activity are displayed under the row element in the From Activity pane. The output parameters displayed in the From Activity pane correspond to the columns you selected in the Pick Table task. If the Batch option was selected in Delivery Rules, the multiple occurrences symbol displays next to the row element.

Note: During run time, the rows output parameter of the Poll Table activity is not populated with the sequence and flag column values. Only the columns selected in the Pick Table task are returned.
2. Map the required output parameters to variables. See [Creating a map](#) for general instructions on mapping. You are not required to map the output parameters for these activities.

Testing an SSL Database Connection

About this task

After creating an endpoint for a database, you must import the CA certificate for the database into Studio and then test the SSL connection to the database. Perform the following procedure to import the database's CA certificate and then test the SSL connection to the database:

Procedure

1. Open a command window.
2. Navigate to the database server, and locate the certificate file ca-cert stored in the server.
3. Copy this file and then navigate to the workstation where Studio is installed.
4. Using the command window, paste the ca-cert copy in the home directory of Studio: C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x
5. Navigate to the security directory of Studio: C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x\security
6. Run the following command to import the ca-cert file into Studio: `..\jre\bin\keytool.exe -import -v -keystore cacerts -storepass changeit -file ..\castiron_ca_cert.pem -alias alias_name` Where alias is the alias of the database CA certificate.
7. When you are prompted for a yes or no, type yes (Y) and press Enter.
8. Exit the command window.
9. Open the endpoint for the database server.
10. Verify the following login credentials for the database connection: database server, Port, User, and Password.
11. Click Test Connection
12. If the connection is successful, use this endpoint in Studio orchestrations, then use the Verify tab features to evaluate the orchestration.

Overview of Box.com connector

The Box.com connector connects with Box.com cloud storage SaaS platform and enables the communication with Box.com from IBM Cast Iron platform. This allows users to manage their files and folders on Box.com from IBM Cast Iron platform.

Box.com is a cloud platform that helps users to securely store, share, and manage all their company's files. Whether a user needs to secure confidential business information, develop a custom mobile application, or simplify paper-based office processes, Box.com can help users do more with their content.

You can perform the following activities using Box.com connector:

- Outbound activities:
 - Create Folders
 - Update Folders
 - Delete Folders
 - Get Folder Details
 - Copy Folders
 - Create a Shared Link for a Folder
 - Upload Files
 - Download Files
 - Update Files
 - Delete Files
 - Get File Details
 - Copy Files
 - Create a Shared Link for a File
 - Search Files
 - Create Users
 - Update Users
 - Delete Users
 - Get User Details
 - Create Groups
 - Update Groups
 - Delete Groups
 - Get Group Details
 - Add Users to Groups
 - Delete Users from Groups
 - Create Folder Permissions
 - Delete Folder Permissions
 - Create Documents for HTML View
 - Update HTML View Documents
 - Get HTML View Documents
 - Get Document as Extension
 - View Document as HTML
 - View Box.com File as HTML

The Box.com API version currently supported by this connector is 2.0.

[Creating or editing an endpoint for Box.com activity](#)

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to a Box.com. Box.com uses OAuth 2.0 authentication mechanism to authenticate and authorize users to perform operations.

1.

- [Selecting or editing a Box.com endpoint](#)

Parent topic: [Box.com Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Box_com_creating_or_editing_an_endpoin.html

Selecting or editing a Box.com endpoint

To select or edit a Box.com endpoint, perform the following steps:

1. In the **Create Endpoint** or **Edit Endpoint** pane, configure the Box.com endpoint as described in the following table.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

1. Click **Test Connection** to confirm that the connection details are valid and you are able to connect to the Box.com successfully.
2. Click **OK**.

Table: Connection properties

Field Name	Description
OAuth Access Token	OAuth access token generated from Box.com for authentication.
OAuth Refresh Token	OAuth refresh token generated from Box.com while generating OAuth Access token.
Application Client ID	Application client ID of the content API application created in Box.com for OAuth.
Application Client Secret	Application client secret of the content API application created in Box.com for OAuth
Content API URL	URL of Box.com content API with API version. This is prepopulated on the endpoint panel. Change it to specify a different content API URL.
Upload API URL	URL for the Box.com upload API with API version.
View API URL	URL of the Box.com view API with API version. This is prepopulated on the endpoint panel.

	Change it to specify a different view API URL.
View API Key	API key of the view API application created in Box.com.
Box FTP URL	Specifies the FTP host name of Box.com. This is prepopulated on the endpoint panel. Change it to specify a different Box.com FTP host.
User Name	Specifies the username to connect to Box.com. This is same as the Box.com user ID.
Password	Specifies the password of the associated username to connect to Box.com.

Note: To generate the access token, refer to the Box.com documentation relating to "OAuth2 Authentication Support in Box.com REST API".

Mandatory fields: The activity has the following mandatory field:

Name	Type	Required	Description
folderId	String	Yes	This is used to specify the ID of the folder to be updated at Box.com.

Optional fields: The activity has following optional fields:

Name	Type	Required	Description
name	String	No	This is used to specify a new name of the folder.
description	String	No	This is used to specify the description of the folder.

	g		
Parent	String	No	The parent object having parent folder details.
id	String	No	This is used to specify the ID of the parent folder.
shared_link	Object	No	An object representing this item's shared link and associated permissions.
is_password_enabled	Boolean	No	This is used to set the password for shared link. By default, the value of this flag is false.
access	String	No	The level of access required for this shared link. Can be open, company, collaborators, or null to get default share level.
permissions	Object	No	The permissions object.
can_download	Boolean	No	This is used to set whether the shared link should allow download.
can_upload	Boolean	No	This is used to set whether the shared link should allow upload.
can_rename	Boolean	No	This is used to set whether the shared link should allow renaming of folder.
can_delete	Boolean	No	This is used to set whether the shared link should allow should allow deletion of folder.
can_share	Boolean	No	This is used to set whether by using shared link the accessed folder could be shared again.
can_invite_collaborator	Boolean	No	This is used to set whether collaborators can be invited using the shared link.
can_set_share_access	Boolean	No	This is used to set whether share access can be added using the shared link.
folder_upload_email	String	No	This is used to specify the email-to-upload address for this folder.
access	String	No	This is used to specify the level of access for folder. Following value can be set as open or collaborators to set level of access.
sync_state	String	No	This is used to set whether Box Sync clients synchronize this folder.
tags	Object	No	The tags object to include array of string.
element	String	No	This is array of string used to specify tags associated with the folder.

Mapping the inputs of the activity

To map the inputs of the activity, perform the following step:

- Click the **Map Input** link in the **Configure Activity** section displayed under the orchestration.

Mandatory fields: The activity has following mandatory fields:

Name	Type	Required	Description
folderId	String	Yes	The ID of the folder at Box.com for which a shared link is to be created.
shared_link	OBJECT	Yes	An object representing this item's shared link and associated permissions.
access	STRING	Yes	The level of access required for this shared link. Can be open, company, collaborators, or null to get default share level.
permissions	OBJECT	Yes	The permissions object.
can_download	BOOLEAN	Yes	This is used to set whether the shared link should allow download.
can_upload	BOOLEAN	Yes	This is used to set whether the shared link should allow upload.
can_rename	BOOLEAN	Yes	This is used to set whether the shared link should allow renaming of folder.
can_delete	BOOLEAN	Yes	This is used to set whether the shared link should allow should allow deletion of folder.
can_share	BOOLEAN	Yes	This is used to set whether by using shared link the accessed folder can be shared again.
can_invite_collaborator	BOOLEAN	Yes	This is used to set whether collaborators can be invited by using the shared link.
can_set_share_access	BOOLEAN	Yes	This is used to set whether share access can be added by using the shared link.

Optional fields: The activity does not have any optional fields.

Mapping the inputs of the activity

To map the inputs of the activity, perform the following step:

- Click the **Map Input** link in the **Configure Activity** section displayed under the orchestration.

Mandatory fields: The activity has following mandatory fields:

Name	Type	Required	Description
userId	String	Yes	The ID of the user to be updated.

Optional fields: The activity has following optional fields:

Name	Type	Required	Description
name	String	No	Name of the user.
role	String	No	This user's enterprise role. Can be coadmin or user.
language	String	No	The language of this user. Type: ISO 639-1 Language Code .
is_sync_enabled	Boolean	No	Whether or not this user can use Box Sync.
job_title	String	No	The user's job title.
phone	String	No	The user's phone number.
address	String	No	The user's address.

space_amount	Float	No	The user's total available space amount in byte. A value of -1 grants unlimited storage.
can_see_managed_users	Boolean	No	Whether this user can see other enterprise users in its contact list.
status	String	No	Can be "active", "inactive", "cannot_delete_edit", or "cannot_delete_edit_upload".
timezone	String	No	The time zone of this user.
is_exempt_from_device_limits	Boolean	No	Whether to exempt this user from Enterprise device limits.
is_exempt_from_login_verification	Boolean	No	Whether or not this user must use two-factor authentication.
is_password_reset_required	Boolean	No	Whether or not the user is required to reset password.

Mapping the inputs of the activity

To map the inputs of the activity, perform the following step:

- Click the **Map Input** link in the **Configure Activity** section displayed under the orchestration.

Mandatory fields: The activity has following mandatory fields:

Name	Type	Required	Description
upload Type	String	Yes	This has following values: <ul style="list-style-type: none">Select URL_UPLOAD to upload any document to Box.com from any URL. The URL field becomes mandatory if this option is selected.
url	String	No	The publicly accessible URL of the document to be created at Box.com.

Optional fields: The activity has following optional fields:

Name	Type	Required	Description
name	String	No	This is used to specify the name of the document to be created at Box.com.
thumbnails	String	No	Comma-separated list of thumbnail dimensions of the format {width}x{height}. For example, 128Ã—128, 256Ã—256
non-svg	Boolean	No	This Boolean field is used to specify whether non-SVG version of the document is to be created.

Creating, selecting, or editing a Box.com endpoint

To create, select, or edit a Box.com endpoint, perform the following steps:

1. Click the **Pick Endpoint** task from the checklist and select one of the following actions:
 - a. Select an existing endpoint:
 - i. Select **Browse**. The Project Explorer is displayed.
 - ii. Select an existing endpoint and click **OK**. Go to the [Configuring the activity](#) procedure.
 - b. Select an existing endpoint and edit the endpoint:
 - i. Select **Browse**. The Project Explorer is displayed.
 - ii. Select an existing endpoint and click **OK**.
 - iii. Click **Edit**. The **Edit Endpoint** panel is displayed.
 - c. Create a new endpoint:

- Select **New**. The **Create Endpoint** panel is displayed.

1. [Create or edit a Box.com endpoint](#).

Mapping the inputs of the activity

To map the inputs of the activity, perform the following step:

- Click the **Map Input** link in the **Configure Activity** section displayed under the orchestration.

Mandatory fields: The activity has following mandatory fields:

Name	Type	Required	Description
file_id	String	Yes	Box.com unique string identifying the file for which HTML view is to be generated.

Optional fields: The activity has following optional fields:

Name	Type	Required	Description
newDocName	String	No	This should be the new name of the document for which HTML view is to be generated.
duration	String	No	The duration in minutes until the session expires.
expires_at	String	No	The timestamp at which the session should expire.
is_downloadable	Boolean	No	This Boolean field is used to specify whether a button is shown allowing the user to download the original content of the file.
is_text_selectable	Boolean	No	This Boolean field is used to specify whether text in the document is selectable by the end user.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_coupa.html

Creating or editing an endpoint for Coupa activity

Endpoints provide the configuration information that the Studio, the Integration Appliance and the cloud based Cast Iron Live platform use to connect to a Coupa. Coupa uses token based authentication mechanism to authenticate and authorize users to perform operations.

Selecting or editing a Coupa endpoint

To select or edit a Coupa endpoint:

1. In the **Create Endpoint** or **Edit Endpoint** pane, configure the Coupa endpoint as described in the following table.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

1. Click **Test Connection** to confirm that the connection details are valid and you are able to connect to the Coupa successfully.
2. Click **OK**.

Table: Connection properties

Field Name	Description
Host Name	Coupa host name
API Key	API key generated from Coupa

Note: To generate the API key, refer to the Coupa documentation relating to "Coupa API authentication".

Table: Proxy Connection properties

Field Name	Description
Proxy Host	Host name of the proxy server
Proxy Port	Port number needed to connect to the proxy server
Proxy User Name	User name needed to connect to the proxy server
Proxy Password	Password needed to connect to the proxy server

Parent topic: [Coupa Activities](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Coupa_creating_or_editing_an_endpoint.html

Custom Fields support

Coupa supports custom fields. Provision is given in the connector to create, update and retrieve objects having custom fields.

For Create and Update activities, in the MapInputs, each object and its child nodes will have additional nodes for custom fields so that user can provide values for them.

For Query and Retrieve activities, the response object will have additional nodes to identify the custom fields.

The format of custom fields for these activities is as shown below:

```
<customFields>  
  
<customFieldName>dept-id</customFieldName>  
  
<customFieldValue>HR</customFieldValue>  
  
</customFields>
```

Objects Supported by the Coupa Connector

The below objects are supported by Coupa Connector:

X = Operation is supported for the object

Coupa Master Data Objects	Coupa 11			
	Retrieve	Update	Query	
Accounts	X	X	X	X
Addresses	X	X	X	X
Budget Lines	X	X	X	X
Currencies	Â	X	Â	X

Exchange Rates	X	X	Â	X
Catalog Items	X	X	X	X
Supplier Items	X	X	Â	X
Suppliers	X	X	X	X
Users	X	X	X	X
Contracts	X	X	X	X
Departments	X	X	X	X
Remit To Addresses	X	X	X	X
Account Validation Rules	X	X	X	X
Content Groups	X	X	Â	X
Lookup Values	X	X	X	X
Coupa Transactional Data Objects	Coupa 11			
Create	Retrieve	Update	Query	
Approvals*	Â	Â	Â	Â
Expense Reports	X	X	X	X
Inventory Transactions	X	X	Â	X
Invoices	Â	X	X	X
Invoice Payments	Â	Â	X	Â
Purchase Orders	Â	X	X	X
Requisitions	X	X	Â	X
Purchase Order Revisions	Â	X	Â	X
Expenses Lines	Â	X	Â	X

***Note:** Metadata is not retrieved for Approval object, hence the object is not supported in the connector.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Coupa_objects_supported_by_the_coupa.html

Using the Coupa Create activity

Use the Coupa Create activity to create objects in the Coupa instance.

Use this task to create objects in the Coupa instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active orchestration, open the **Activities** tab and expand the **Coupa** folder contents.
2. Drag the **Create** activity icon onto the orchestration. The Coupa Create Object **Checklist** is displayed.
3. In the **Checklist**, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the **Checklist**, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Coupa endpoint.
7. Optional: You can create the endpoint by clicking **New** and specifying the required connection details. Click **OK** to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the **Checklist**, click **Configure**.
10. Click **Browse** to select the object type. The **Browse Coupa** window is displayed.
11. In **Browse Coupa**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
12. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the **Checklist**, click **Retry**. Review the default settings and make the required changes.
14. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Create Objects** activity are displayed as nodes under the request input parameter in the **To Activity** panel.
15. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Coupa Create Objects activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the **cObject** in the **To Activity** pane of **Map Inputs**, and select **Expand Occurrences**.

Using the Coupa Query activity

Use the Coupa Query activity to filter and fetch objects in the Coupa instance.

Use this task to filter and fetch objects in the Coupa instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active orchestration, open the **Activities** tab and expand the **Coupa** folder contents.
2. Drag the **Query** activity icon onto the orchestration. The Coupa Query Object **Checklist** is displayed.
3. In the **Checklist**, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the **Checklist**, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Coupa endpoint.
7. Optional: You can create the endpoint by clicking **New** and specifying the required connection details. Click **OK** to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the **Checklist**, click **Configure**.
10. Click **Browse** to select the object type. The **Browse Coupa** window is displayed.
11. In **Browse Coupa**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
12. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the **Checklist**, click **Retry**. Review the default settings and make the required changes.
14. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Query Objects** activity are displayed as nodes under the request input parameter in the **To Activity** panel.
15. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

Table: Map Inputs parameters

Field Name	Description
limit	The parameter is used to paginate the results. It will limit the number of records retrieved to the specified value. The maximum number of results returned are 50 at a time even if the limit value is given more than 50.
offset	The parameter is used to paginate the results. The records are retrieved starting from the specified offset.
operators	The search criteria. Multiple criteria can be specified by expanding occurrences for operators .

standardFieldName	The standard field name to be used in the criteria. Either of standardFieldName or customFieldName should be specified. Only first level field names should be specified.
customFieldName	The custom field name to be used in the criteria. Either of standardFieldName or customFieldName should be specified. Only first level field names should be specified.
operator	The operator to be applied.
value	The value of the field used in the search

You have configured the Coupa Query Objects activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the **To Activity** pane of **Map Inputs**, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

Using the Coupa Retrieve activity

Use the Coupa Retrieve activity to retrieve objects in the Coupa instance.

Use this task to retrieve all objects based on ID in the Coupa instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active orchestration, open the **Activities** tab and expand the **Coupa** folder contents.
2. Drag the **Retrieve** activity icon onto the orchestration. The Coupa Retrieve Object **Checklist** is displayed.
3. In the **Checklist**, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the **Checklist**, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Coupa endpoint.
7. Optional: You can create the endpoint by clicking **New** and specifying the required connection details. Click **OK** to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the **Checklist**, click **Configure**.
10. Click **Browse** to select the object type. The **Browse Coupa** window is displayed.
11. In **Browse Coupa**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.

12. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the **Checklist**, click **Retry**. Review the default settings and make the required changes.
14. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Retrieve Objects** activity are displayed as nodes under the request input parameter in the **To Activity** panel.
15. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

Table: Map Inputs parameters

Field Name	Description
retrieveAll	If the user wants to fetch all the records of a particular object type, then he should set this parameter to true . Default value is false . The parameter is ignored if value for id is specified.
limit	Applicable only if retrieveAll is true . The parameter is used to paginate the results. It will limit the number of records retrieved to the specified value. The maximum number of results returned are 50 at a time even if the limit value is given more than 50.
offset	Applicable only if retrieveAll is true . The parameter is used to paginate the results. The records are retrieved starting from the specified offset.
id	The object id for which data has to be retrieved. This parameter is given preference over retrieveAll , the value of retrieveAll is ignored if id is specified.
supplier-id	The associated supplier id. Applicable only for RemitToAddress object.

You have configured the Coupa Retrieve Objects activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the **ID** field in the object in the **To Activity** pane of **Map Inputs**, and select **Expand Occurrences**.

Using the Coupa Update activity

Use the Coupa Update activity to update objects in the Coupa instance. Coupa does not support “Delete” operation via the API, so the activity can be used to deactivate objects by setting the status to “inactive”.

Use this task to update objects in the Coupa instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active orchestration, open the **Activities** tab and expand the **Coupa** folder contents.
2. Drag the **Update** activity icon onto the orchestration. The Coupa Update Object **Checklist** is displayed.
3. In the **Checklist**, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the **Checklist**, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Coupa endpoint.
7. Optional: You can create the endpoint by clicking **New** and specifying the required connection details. Click **OK** to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the **Checklist**, click **Configure**.
10. Click **Browse** to select the object type. The **Browse Coupa** window is displayed.
11. In **Browse Coupa**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
12. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the **Checklist**, click **Retry**. Review the default settings and make the required changes.
14. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Update Objects** activity are displayed as nodes under the request input parameter in the **To Activity** panel.
15. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Coupa Update Objects activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the **cObject** in the **To Activity** pane of **Map Inputs**, and select **Expand Occurrences**.

Domino Activities

- [Overview of the Domino connector](#)
- [Creating or editing an endpoint for a Domino activity](#)

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a IBM® Lotus® Domino® server. Lotus Domino server provides services like email server, application server, web server, database server, and directory server. Business data on the server is stored as documents in the Domino databases (.nsf files). Domino connector provides bidirectional connectivity to work with these documents.
- [Creating a Domino document](#)

Use the Create Document activity to create a document in the Domino server.
- [Updating a Domino document](#)

Use the Update Document activity to update a document in the Domino database. Each updated document must be uniquely identifiable by its UniversalID or NotesID.
- [Retrieving a Domino document](#)

Using the Retrieve Activity, you can retrieve a document from a Domino database. Each retrieved document is uniquely identified by its UniversalID or NotesID. The retrieval is done based on the input, that is, either the UniversalID or the NotesID.
- [Querying Domino documents](#)

The Query Document activity is used to query documents from the database in the Lotus® Domino® server that matches the values that are specified in the document fields.
- [Querying views for Domino documents](#)

The Query Views activity is used to query views from the database in the Lotus® Domino® server that matches the values that are specified in the document fields that are present in the view.
- [Deleting a Domino document](#)

Use the Delete Activity to delete a document from the Domino database. Each deleted document must be uniquely identifiable by its UniversalID or NotesID.
- [Getting events from Domino server](#)

The Get Events activity is used to get events from the database in the IBM Domino® server that matches the values that are specified in the input fields of Map Inputs.
- [Getting invitations from Domino server](#)

The Get Invitations activity is used to get invitations from the database in the IBM Domino® server that matches the values that are specified in the input fields of Map Inputs.
- [Getting notices from Domino server](#)

The Get Notices activity is used to get notices from the database in the IBM Domino® server that matches the values that are specified in the input fields of Map Inputs.
- [Processing calendar events in Domino server](#)

The Process Calendar Events activity is used to process an action on an existing calendar event in a database in the IBM Domino® server that matches the values that are specified in the input fields that are present in the Map Inputs.
- [Processing calendar notices in Domino server](#)

The Process Calendar Notices activity is used to process an action on an existing calendar Notice in a database of the IBM Domino® server that matches the values that are specified in the input fields present in Map Inputs.

- [Creating calendar events in Domino server](#)
The Create Calendar Events activity is used to create the calendar events from the database in the IBM Domino® server that matches the values that are specified in the input fields of Map Inputs.
- [Updating calendar events in Domino server](#)
The Update Calendar Events activity is used to update the calendar events from the database in the IBM Domino® server that matches the values that are specified in the input fields of Map Inputs.
- [Deleting calendar events from Domino server](#)
The Delete Calendar Events activity is used to delete calendar events from the database in the IBM Domino® server that matches the values that are specified in the input fields of Map Inputs.
- [Specifying Retry and Delivery Options for Domino activities](#)
Specifying the Retry and Delivery parameters is one of the tasks to configure a Domino activity configuration.
- [Prerequisites to use Domino inbound activities](#)
- [Get Created Documents activity](#)
Use the Get Created Documents activity to get the documents (which are of interest) that were created on the Domino server. The activity polls the event table in the Domino server for new events periodically and process them.
- [Get Updated Documents activity](#)
Use the Get Updated Documents activity to get the documents (which are of interest) that got updated on the Domino server. The activity polls the event table in the Domino server for new events periodically and process them.
- [Get Deleted Documents activity](#)
Use the Get Deleted Documents activity to get the documents (which are of interest) that were deleted on the Domino server. The activity polls the event table in the Domino server for new events periodically and process them.
- [Handling Date/Time and Time zone data types](#)
In the Lotus Domino form, a field of Date/Time type can be configured to represent only a date value, time value, or both date and time values. This configuration is done while creating/editing the form in Domino Designer. So, when a document is created for such a form, the value can be a date, time, or a datetime.
- [Rich text support for Domino connector](#)
The Domino connector supports RichText type in forms. Fields of RichText type can store both text and attachments as part of the document. The connector supports attachments only for the Retrieve and Query Document activities. Text content can be used for the Create, Update, Retrieve, and Query Document activities.
- [Troubleshooting and support](#)
Troubleshooting techniques and self-help information help you identify and solve problems quickly. This topic provides potential solutions for issues you would have with the Domino connector.

Feedback | Notices

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_dominoactivities.html

Overview of the Domino connector

The Domino® connector enables a two-way communication between Cast Iron® and IBM Domino server. The business data can be Domino documents such as a calendar entry, a to-do item, or a note.

You can perform the following activities using the Domino connector:

- Outbound Activities
 - [Create Documents](#)
 - [Update Documents](#)
 - [Delete Documents](#)
 - [Query Documents](#)
 - [Query Views](#)
 - [Retrieve Documents](#)
 - [Get Events](#)
 - [Get Invitations](#)
 - [Get Notices](#)
 - [Process Calendar Events](#)
 - [Process Calendar Notices](#)
 - [Create Calendar Events](#)
 - [Update Calendar Events](#)
 - [Delete Calendar Events](#)
- Inbound/Starter Activities
 - [Get Created Documents](#)
 - [Get Updated Documents](#)
 - [Get Deleted Documents](#)

The Calendar Service is an addition to the family of REST services in the IBM Domino Server, from V9.0.1. Using Calendar Service you can perform create/retrieve/update/delete operations on the Calendar Events, Invitations, and Notices. An event in Domino stands for a Meeting, Recursive Meeting, All Day Event, Appointment, Recursive Appointment, and a Reminder. A Notice can be an Invitation for a Calendar Event or an update information of a Calendar Event.

The Domino connector supports the REST Based APIs of Calendar Service of IBM Domino Server from V7.0.0.1. The activities listed below are added to support this service :

- Create Calendar Events
- Update Calendar Events
- Delete Calendar Events
- Get Events
- Get Invitations
- Get Notices
- Process Calendar Events
- Process Calendar Notices

The versions of IBM Domino supported by the connector depend on the support lifecycle of IBM Domino. You can configure the connector with all the versions of IBM Domino that are currently supported. The IBM Domino versions that are currently supported are 8.0.x, 8.5.x, 9.0, and 9.0.1. The Domino connector cannot be used to connect to a Lotus Notes® client directly. It always connects to the IBM Domino server.

Creating or editing an endpoint for a Domino activity

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a IBM® Lotus® Domino® server. Lotus Domino server provides services like email server, application server, web server, database server, and directory server. Business data on the server is stored as documents in the Domino databases (.nsf files). Domino connector provides bidirectional connectivity to work with these documents.

Selecting or editing a Domino endpoint

1. In the Create Endpoint or Edit Endpoint pane, configure the Domino server as described in the following table. In addition to these fields, the endpoint pane contains Connection pool options and Remote Endpoint Configuration.
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the Domino server successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
Domino Server Configuration	
Host Name	Specifies the host name or IP address of the machine on which Domino server is running.
DIIO Port	Specifies the Domino Internet Inter ORB Protocol (DIIO) port that allows Java™ applets or applications to access Domino data remotely using CORBA. The default value is 63148.
User Name	Specifies the user name to connect to the Domino server.
Password	Specifies the password associated with the user name to connect to the Domino server.
Note: For outbound activities such as Create, Update, Retrieve, Query, and Delete, you can dynamically specify a different Domino server during Map Inputs. The server details in the Map Inputs section holds preference to the regular endpoint declaration.	
Connection Pool options	
Minimum Connections	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
Maximum Connections	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.

Field Name	Description
Maximum Idle Time	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool –no idle time. The default value is 120 minutes.
Maximum Wait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
Reclaim Connections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.
Â	Note: The Connection pool properties need to be configured as per the load (number of concurrent requests) on the endpoint.
Remote Endpoint Configuration	
Endpoint Runs Behind Firewall	Enables the secure connector name property so that secure connector can be used if the Lotus Domino server is running behind a firewall.
Secure Connector Name	Specifies the name of the secure connector that is used to connect to the Lotus Domino server running behind a firewall. For example, if an orchestration containing Domino activity is deployed on to Cast Iron Live (cloud), then the secure connector needs to be configured.

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_creating_an_endpoint_activity.html

Creating a Domino document

Use the Create Document activity to create a document in the Domino® server.

Using the create activity

1. Right-click **Orchestration** in the **Project** pane and click **New Orchestration** to create or open an orchestration. The orchestration pane is displayed.
2. Select the **Activities** tab and expand the **Domino** folder.
3. Drag **Create Document** activity from the **Domino** folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
4. The **Checklist** pane lists the tasks (**Summary, Pick Endpoint, Configure, Map inputs, Map outputs**) that you must complete to configure the outbound activity.
5. Click **Pick Endpoint**, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#)

6. Click **Configure** from the **Checklist**. The **Configure** pane is displayed.
 - o Click **Browse** to select an existing database from the **Browse Domino databases** pane. The **Browse Domino databases** display all the databases for the selected endpoint.
 - o Click **Next** to select an existing form from the **Browse Domino Forms** pane. The **Browse Domino Forms** displays all the forms present in the selected database of the Domino server.

Note: The **Next** button is enabled only after selecting the database name.

Specifying the map inputs for create activity

1. Click **Map Input** from the **Checklist** pane.

The input parameters for the specific Domino activity are displayed under the **To Activity** pane.

Note: You *must* map all the required input parameters of the activity, whose data comes from previous activity.

Note: To populate dynamically added fields of the Domino document, which are not part of the map inputs structure, use the `AdditionalFields` property and provide the field names and field values in `FieldDetails` section.

For Form Types that are same across multiple databases, you can now specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this you must specify the database name in the `databaseName` optional parameter (described in the table given below). If the `databaseName` parameter is populated with a value, the outbound operation will be performed on the database specified in the `databaseName` parameter. If there is no value specified, the database name specified during configuration will be used to perform the outbound operation.

The optional input parameter is described in the following table:

Table 1. Database name optional parameter

Parameter Name	Description
<code>databaseName</code>	Specifies the database name that can be dynamically added in map inputs to enable a single orchestration to perform outbound operations across multiple databases having the same Form Type.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in the endpoint page, add the new optional parameters in `dominoConnectionProperties` of map inputs. The parameters of `dominoConnectionProperties` are described in the following table:

Table 2. Optional connection parameters

Parameters	Description
<code>dominoConnectionProperties</code> parameters	
<code>hostName</code>	Specifies the host name or IP address of the machine on which Domino server is running.
<code>diiopPort</code>	Specifies the Domino Internet Inter ORB Protocol (DIIOP) port that allows Java [®] , [™] applets or applications to access Domino data remotely using CORBA. The default value is 63148.
<code>username</code>	Specifies the user name to connect to the Domino server.

Parameters	Description
password	Specifies the password associated with the user name to connect to the Domino server.
connectionPool parameters	
minimumConnections	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
maximumConnections	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
maxIdleTime	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool –no idle time. The default value is 120 minutes.
maxWait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
reclaimConnections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.

Specifying the map outputs create activity

1. Click **Map output** from the **Checklist** pane.

The output parameters for the Domino activity are displayed under the **From Activity** pane.

The response of the `AdditionalFields` property is also displayed in the From Activity pane.

Some of the common output parameters are defined in the following table.

Parameter Name	Description
UniversalID	A UniversalID of a document is a read/write property that uniquely identifies a document across all replicas of a database. In character format, the UniversalID is a 32-character combination of hexadecimal digits (0-9, A-F). The UniversalID is also known as the uniqueID or UNID. The datatype is string.
NotesID	A NotesID of a document is a read only property and has a hexadecimal value of up to 8 characters, which uniquely identifies a document within a particular database. A note ID represents the location of a document within a specific database file. So the documents that are replicas of one another generally have different note IDs. A note ID does not change, unless the document is deleted.

Form	A form provides the structure for creating and displaying documents, which are the design elements that store data in the database. When you enter the information in a form and save it, the information is saved as a document. When you open the document, the document uses the form as a template to provide the structure for displaying the data. Note: Changing a form (for example, by adding a field) does not change documents previously created with that form until they are modified and saved, either manually or automatically by an agent. Removing a field from a form does not remove the value of that field from previously created documents.
Parent DocumentUNID	A parentdocumentUNID of a document is a read-only property. It is defined as the universal ID of a document's parent, if the document is a response document. If a document does not have a parent, it returns an empty string (""). The datatype is string.

Note: You can map the output parameters of the activity based on requirement.

Summary flag (field flag) behavior

When a document is created for a form containing fields of type Authors, Readers, or Names; and data is set for these fields in the Map Input, the summary flag is set with proper permissions based on the Domino field type. This feature is supported from Domino server version 8.5.3 onwards.

For example:

1. If a Domino field of type Authors is set with a value CN=SYSTEM/O=IBM, the summary flag will be **SUMMARY READ/WRITE-ACCESS NAMES "CN=SYSTEM/O=IBM"**.
2. If a Domino field of type Readers is set with a value CN=SYSTEM/O=IBM, the summary flag will be **SUMMARY READ-ACCESS NAMES "CN=SYSTEM/O=IBM"**.
3. If a Domino field of type Names is set with a value CN=SYSTEM/O=IBM, the summary flag will be **SUMMARY NAMES "CN=SYSTEM/O=IBM"**.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_create_outactivity.html

Updating a Domino document

Use the Update Document activity to update a document in the Domino® database. Each updated document must be uniquely identifiable by its UniversalID or NotesID.

Using the update activity

1. Right-click **Orchestration** in the **Project** pane and click **New Orchestration** to create or open an orchestration. The orchestration pane is displayed.

2. Select the **Activities** tab and expand the **Domino** folder.
3. Drag **Update Activity** from the **Domino** folder onto the orchestration. The graphical representation of the orchestration, along with the Checklist pane is displayed.
4. The **Checklist** pane lists the tasks (**Summary, Pick Endpoint, Configure, Map Inputs, Map Outputs**) that you must complete to configure an outbound activity.
5. Click **Pick Endpoint**, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#)

6. Click **Configure** from the Checklist. The Configure pane is displayed.
 - o Click **Browse** to select an existing database from the Browse Domino databases pane. The Browse Domino databases display all the databases for the selected endpoint.
 - o Click **Next** to select an existing form from the Browse Domino Forms pane. The Browse Domino Forms displays all the forms present in the selected database of the Domino server.

Note: The Next button is enabled only after you select the database name.

Specifying the map inputs for update activity

The input parameters for update activity are either UniversalID or NotesID and all the business data fields (specific to the selected form) must be updated.

1. Click **Map Input** from the **Checklist** pane.

The input parameters for the specific Domino activity are displayed under the **To Activity** pane. The input parameters are defined in the following table.

Parameter Name	Description
UniversalID	A UniversalID of a document is a read/write property that uniquely identifies a document across all replicas of a database. In character format, a UniversalID is a 32-character combination of hexadecimal digits (0-9, A-F). A UniversalID is also known as the unique ID or UNID. The data type is string.
NotesID	A NotesID of a document is a read only property and has a hexadecimal value of up to 8 characters, which uniquely identifies a document within a particular database. A NotesID represents the location of a document within a specific database file. So the documents that are replicas of one another generally have different note IDs. A NotesID does not change, unless the document is deleted.

Note: You *must* map the input parameters of the activity.

Note: To populate dynamically added fields of the Domino document, which are not part of the map inputs structure, use the `AdditionalFields` property and provide the field names and field values in `FieldDetails` section.

For Form Types that are same across multiple databases, you can now specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this, you must specify the database name in the `databaseName` optional parameter (described in Table 1). If the `databaseName` parameter is populated with a value, the outbound operation is performed on the database specified in the `databaseName` parameter. If there is no

value specified, the database name that is specified during configuration is used to perform the outbound operation.

Optional parameters for a Domino activity

The following are the optional parameters that are defined for update activity.

Table 1. Optional parameters

Parameter Name	Description
MarkAsRead	Specifies if the document is to be marked as read during an update operation. It is of type Boolean.
MakeResponse	Specifies if the document is to be made available as the response of the saved document even if another user modifies and saves the document. It is of type Boolean.
ForceSave	Specifies if the document is to be force saved during a conflict of an update operation. It is of type Boolean.
databaseName	<code>databaseName</code> is the name of the database in which the document is updated. If a value is set for this parameter, then the value of the database in the configure panel is overwritten. This parameter is useful when documents with the same structure (Form) must be updated in multiple databases, using the same orchestration.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in the endpoint page, add the new optional parameters in `dominoConnectionProperties` of map inputs. The parameters for `dominoConnectionProperties` are described in the following table:

Table 2. Optional connection parameters

Parameters	Description
<code>dominoConnectionProperties</code> parameters	
<code>hostName</code>	Specifies the host name or IP address of the machine on which Domino server is running.
<code>diiopPort</code>	Specifies the Domino Internet Inter-ORB Protocol (DIIOP) port that allows Java [®] applets or applications to access Domino data remotely using CORBA. The default value is 63148.
<code>username</code>	Specifies the user name to connect to the Domino server.
<code>password</code>	Specifies the password that is associated with the user name to connect to the Domino server.
<code>connectionPool</code> parameters	
<code>minimumConnections</code>	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.

Parameters	Description
maximumConnections	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
maxIdleTime	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool "no idle time. The default value is 120 minutes.
maxWait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
reclaimConnections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.

Specifying the map outputs for a Domino activity

1. Click **Map output** from the **Checklist** pane.

The output parameters for the Domino activity are displayed under the **From Activity** pane.

Note: You can map the output parameters of the activity that is based on your requirement.

Summary flag (field flag) behavior

When a document is updated for a form containing fields of type Authors, Readers, or Names; and data is set for these fields in the Map Input, the summary flag is set with proper permissions based on the Domino field type. This feature is supported from Domino server version 8.5.3 onwards.

For example:

1. If a Domino field of type `Authors` is set with a value `CN=SYSTEM/O=IBM`, the summary flag will be **SUMMARY READ/WRITE-ACCESS NAMES "CN=SYSTEM/O=IBM"**.
2. If a Domino field of type `Readers` is set with a value `CN=SYSTEM/O=IBM`, the summary flag will be **SUMMARY READ-ACCESS NAMES "CN=SYSTEM/O=IBM"**.
3. If a Domino field of type `Names` is set with a value `CN=SYSTEM/O=IBM`, the summary flag will be **SUMMARY NAMES "CN=SYSTEM/O=IBM"**.

Parent topic: [Domino Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

Retrieving a Domino document

Using the Retrieve Activity, you can retrieve a document from a Domino® database. Each retrieved document is uniquely identified by its UniversalID or NotesID. The retrieval is done based on the input, that is, either the UniversalID or the NotesID.

Using the retrieve activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Retrieve Activity from the Domino folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. The Checklist pane lists the tasks(Summary, Pick Endpoint, Configure, Map inputs, Map outputs) that you must perform to complete the configuration of the outbound activity.
5. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

6. Click Configure from the Checklist. The Configure pane is displayed.
 - o Click Browse to select an existing database from the Browse Domino databases pane. The Browse Domino databases display all the databases for the selected endpoint.
 - o Click Next to select an existing form from the Browse Domino Forms pane. The Browse Domino Forms displays all the forms present in the selected database of the Domino server.
Note: The Next button is enabled only after you select the database name.
 - o Fields with canonical names accept fields that may have canonical names such as John Smith/IBM/COUNTRY as values, which are separated by commas. Specify the canonical names in this field if you want to convert the values in these fields to internet mail addresses, such as johnsmith@country.ibm.com. Some of the field name examples are To, From, CC, Chair, Required Attendees, and so on.

Specifying the map inputs for the retrieve activity

The input parameter for Retrieve activity is either UniversalID or NotesID. When both are given, UniversalID is used to retrieve the Domino document.

1. Click Map Input from the Checklist pane.

The input parameters for the specific Domino activity are displayed under the To Activity pane. Some of the common input parameters are defined in the following table.

Parameter Name	Description
Univ	The UniversalID parameter is a read/write property that uniquely identifies a document across

UniversalID	all replicas of a database. In character format, the unique ID parameter is a 32-character combination of hexadecimal digits (0-9, A-F). The UniversalID is also known as the unique ID or UNID. The data type is string.
NotesID	The Notes® ID of a document is a read only property and has a hexadecimal value of up to 8 characters, which uniquely identifies a document within a particular database. The Notes ID represents the location of a document within a specific database file. So the documents that are replicas of one another generally have different Notes IDs. A Notes ID does not change, unless the document is deleted.

Note: You *must* map the input parameters of the activity.

For Form Types that are same across multiple databases, you can now specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this, you must specify the database name in the `databaseName` optional parameter (described in Table 1). If the `databaseName` parameter is populated with a value, the outbound operation is performed on the database specified in the `databaseName` parameter. If there is no value specified, the database name that is specified during configuration is used to perform the outbound operation.

Optional parameters

The optional input parameter is described in the following table:

Table 1. Optional parameters

Parameter name	Description
<code>databaseName</code>	<code>databaseName</code> is the name of the database from which the document is retrieved. If a value is set for this parameter, then the value of the database in the configure panel is overwritten. This parameter is useful when documents with the same structure (Form) must be retrieved from multiple databases, using the same orchestration.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in the endpoint page, add the new optional parameters in `dominoConnectionProperties` of map inputs. The parameters of `dominoConnectionProperties` are described in the following table:

Table 2. Optional connection parameters

Parameters	Description
<code>dominoConnectionProperties</code> parameters	
<code>hostName</code>	Specifies the host name or IP address of the machine on which Domino server is running.
<code>diioPort</code>	Specifies the Domino Internet Inter-ORB Protocol (DIIOP) port that allows Java™ applets or applications to access Domino data remotely using CORBA. The default value is 63148.
<code>username</code>	Specifies the user name to connect to the Domino server.
<code>password</code>	Specifies the password that is associated with the user name to connect to the Domino server.
<code>connectionPool</code> parameters	

Parameters	Description
<code>minimumConnections</code>	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
<code>maximumConnections</code>	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
<code>maxIdleTime</code>	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool "no idle time. The default value is 120 minutes.
<code>maxWait</code>	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
<code>reclaimConnections</code>	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.

Specifying the map outputs for the retrieve activity

1. Click Map output from the Checklist pane.

The output parameters for the Domino activity are displayed under the From Activity pane.

Note: You can map the output parameters of the activity that is based on your requirement.

Note: Dynamically added fields present in the Domino document and not generated in the map input/output structures are handled by the Domino connector. While retrieving documents using this activity, the data for these fields are available in the map outputs section under `AdditionalFields`.

Parent topic: [Domino Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_retrieve_outactivity.html

Querying Domino documents

The Query Document activity is used to query documents from the database in the Lotus® Domino® server that matches the values that are specified in the document fields.

You can specify one or more of the following criteria in the input data that is sent with the outbound request.

- Document business data: When you specify the document business data in the Map Input section, the connector reads all the valid data from the map input. The connector searches the database for documents that match these valid data. All the matching documents that can be represented using the map output schema are returned as a response.
- `ParentDocumentUNID`: When you specify a valid `ParentDocumentUNID` in the Map Input section, the connector queries all the child documents to this parent document. All the matching documents, which can be represented using the map output schema are returned as a response.
- No data set: When you do not provide a data in the map input, the connector queries the documents that can be represented using the map output schema.

You can search for documents based on two types of search methods:

1. **Database Search method:** Given selection criteria for a document, returns all documents in a database that meet the criteria. By default, the activity uses the Database Search method to search for documents. To explicitly set the search to this type, set the value of `searchType` optional parameter to `NORMAL_SEARCH` in the map input section. This method supports the search of documents that are based on the following types of search criteria:
 - a. **Single values:** You can specify a single value in the search criteria. For example, the connector can query documents that are based on the single word, number, or date that is specified in the search field. You can find more information about the search values that can be specified in the Number and Date type fields in the following points.
 - **Numbers:** You can specify a double digit number or an integer value as the search criteria in the Numbers type field. You can use this search function to query documents where a Number type field equals to a certain value. For example, to query documents where employee salary equals to 1234.56, enter the value 1234.56 in the `EmployeeSalary` field.
 - **Date:** You can specify a date as the search criteria in any Date type field. For example, to query documents where birthday equals to 1982/11/22, specify the value 1982/11/22 in the Birthday field.
 - b. **Multiple values:** You can specify multiple values as the search criteria for any Lotus® Domino® field types. This feature can be used to find the documents with the specified values at run time. For example, you can configure the connector to retrieve documents that match the words that are specified in the search criteria.
 - c. **Text search for rich text contents:** You can specify the texts to search documents that have rich text contents at run time. The connector conducts a search by using the texts that are specified in the `RichText` field and all matching documents are retrieved by the connector. The connector supports both single and multiple text content searches for the `RichText` field. You can also provide wildcard suffixes, such as * for searching documents in the `RichText` field.
 - d. **Search using multiple fields:** You can specify search values in more than one field. In this configuration, the activity uses the logical AND operator to group the search strings. For instance, you can specify a single value, multiple values, `RichText`, or `ParentDocumentUNID` in different fields. The activity returns only the search content that matches all the specified criteria.
2. **Database FTSearch/Indexed Search method:** Conducts a full text search of all the documents in a database. When the database is fully indexed, the indexed search method is faster compared to the Database Search method. The method sorts the output data by relevance score. When the collection is sorted by relevance, the highest relevance appears first. To explicitly set the search to this type, set the value of `searchType` optional parameter to `FULL_TEXT_SEARCH` in the map input section.
 - a. **Search using multiple fields:** The indexed search method also supports search using multiple fields. You can specify the search values in more than one field. In this configuration, the connector uses the logical AND operator to group the search strings. For instance, you can specify a single value, multiple values, or `ParentDocumentUNID` in different fields. The connector returns a logical AND operation of all the specified search criteria, returning exact and close matches for string type fields and exact matches for numeric type fields.

Note: The indexed search method does not work for RichText, Attachments, and Date fields.

Using the Query Document activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Query Activity from the Domino folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

5. Click Configure from the Checklist. The Configure pane is displayed.
 - o Click Browse to select an existing database from the **Browse Domino database** pane. The Browse Domino databases display all the databases for the selected endpoint.
 - o Click Next to select an existing form from the **Browse Domino Forms** pane. The Browse Domino Forms displays all the forms present in the selected database of the Domino server.
Note: The Next button is enabled only after you have selected the database name.
 - o Fields with canonical names accept fields that may have canonical names such as John Smith/IBM/COUNTRY as values, which are separated by commas. Specify the canonical names in this field if you want to convert the values in these fields to internet mail addresses, such as johnsmith@country.ibm.com. Some of the field name examples are To, From, CC, Chair, Required Attendees, and so on.
6. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Query Documents activity are displayed as nodes under the request input parameter in the To Activity panel.

For Form Types that are same across multiple databases, you can specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this, you must specify the database name in the `databaseName` optional parameter (described in Table 1). If the `databaseName` parameter is populated with a value, the outbound operation is performed on the database specified in the `databaseName` parameter. If there is no value specified, the database name that is specified during configuration is used to perform the outbound operation.

The optional input parameter is described in the following table:

Table 1. Optional input parameter

Parameter name	Description
<code>databaseName</code>	<code>databaseName</code> is the name of the database from which the document is queried. If a value is set for this parameter, then the value of the database given in the configure panel will be overwritten. This parameter is useful when documents with the same structure (Form) need to be queried from multiple databases, using the same orchestration.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in

the endpoint page, add the new optional parameters in `dominoConnectionProperties` of map inputs. The parameters of `dominoConnectionProperties` are described in the following table:

Table 2. Optional connection parameters

Parameters	Description
<code>dominoConnectionProperties</code> parameters	
<code>hostName</code>	Specifies the host name or IP address of the machine on which Domino server is running.
<code>diiopPort</code>	Specifies the Domino Internet Inter-ORB Protocol (DIIOP) port that allows Java [®] , [™] applets or applications to access Domino data remotely using CORBA. The default value is 63148.
<code>username</code>	Specifies the user name to connect to the Domino server.
<code>connectionPool</code> parameters	
<code>minimumConnections</code>	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
<code>maximumConnections</code>	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
<code>maxIdleTime</code>	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool “no idle time. The default value is 120 minutes.
<code>maxWait</code>	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
<code>reclaimConnections</code>	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.
<code>password</code>	Specifies the password that is associated with the user name to connect to the Domino server.

7. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
8. Select the search type to be used for the activity:

Table 3. Search type

Parameter Name	Description

Parameter Name	Description
searchType	Specifies the search type to be used for this activity. The values are: <ul style="list-style-type: none"> NORMAL_SEARCH: Uses Domino Database Search method. FULL_TEXT_SEARCH: Uses Domino Database FTSearch method. When no value is specified NORMAL_SEARCH is used.

- Select the Map Outputs in the checklist. The XML schemas generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.

Note: Dynamically added fields present in the Domino document and not generated in the map input/output structures are handled by the Domino connector. While retrieving documents using this activity, the data for these fields are available in the map outputs section under `AdditionalFields`.

`queryUsingTimestamp` is the parameter that is used to query documents that are based on time stamps. The `timestamp` property is a recursive property. You can define `groupFields`, `name`, `operator`, and `value` under the `timestamp` property.

The optional output parameters are described in the following table:

Parameter Name	Description										
<code>queryUsingTimestamp</code>	<p>The following are the <code>timestamp</code> properties:</p> <p style="text-align: center;">Table 4. timestamp properties</p> <table border="1"> <thead> <tr> <th>Property</th> <th>Values</th> </tr> </thead> <tbody> <tr> <td><code>groupFields</code></td> <td>You can specify multiple values such as: AND, OR, (,), AND (, OR (,) AND,) OR,) AND (, and) OR (. Note: You can have multiple conditions. <code>groupFields</code> must be used when you have multiple conditions.</td> </tr> <tr> <td><code>name</code></td> <td>Specify one of these values: <code>createdTimestamp</code> or <code>lastModifiedTimestamp</code></td> </tr> <tr> <td><code>operator</code></td> <td>Specify one of these values: <code>GREATER_THAN</code>, <code>GREATER_THAN_OR_EQUAL_TO</code>, <code>EQUAL_TO</code>, <code>LESS_THAN</code>, <code>LESS_THAN_OR_EQUAL_TO</code>, and <code>NOT_EQUAL_TO</code></td> </tr> <tr> <td><code>value</code></td> <td>Specify the date and time values. For example, 26-09-2013 12:05:00 PM EST. Note: If you do not mention the timezone, by default, the timezone of the server is considered.</td> </tr> </tbody> </table> <p>Note:</p> <ul style="list-style-type: none"> Querying documents that are based on the <code>NOT_EQUAL_TO</code> operator (<code>!=</code>) is not supported in Full Text Search. Querying documents using time is not supported in Full Text Search. For example, <code>[_RevisionDate] = 05/06/2013 09:30:00</code>. Querying documents using the <code>EQUAL_TO</code> operator with timestamp does not work with the Normal Search type. For example, <code>@Modified = [05/06/2013 09:14:22]</code>. Querying documents using Full Text Search as the Search Type, you can query documents that are only based on Date; and not DateTime. For example, <code>lastModifiedDateTime >= 05/20/2013 20:00:00</code> is not supported in Full Text Search. 	Property	Values	<code>groupFields</code>	You can specify multiple values such as: AND, OR, (,), AND (, OR (,) AND,) OR,) AND (, and) OR (. Note: You can have multiple conditions. <code>groupFields</code> must be used when you have multiple conditions.	<code>name</code>	Specify one of these values: <code>createdTimestamp</code> or <code>lastModifiedTimestamp</code>	<code>operator</code>	Specify one of these values: <code>GREATER_THAN</code> , <code>GREATER_THAN_OR_EQUAL_TO</code> , <code>EQUAL_TO</code> , <code>LESS_THAN</code> , <code>LESS_THAN_OR_EQUAL_TO</code> , and <code>NOT_EQUAL_TO</code>	<code>value</code>	Specify the date and time values. For example, 26-09-2013 12:05:00 PM EST. Note: If you do not mention the timezone, by default, the timezone of the server is considered.
Property	Values										
<code>groupFields</code>	You can specify multiple values such as: AND, OR, (,), AND (, OR (,) AND,) OR,) AND (, and) OR (. Note: You can have multiple conditions. <code>groupFields</code> must be used when you have multiple conditions.										
<code>name</code>	Specify one of these values: <code>createdTimestamp</code> or <code>lastModifiedTimestamp</code>										
<code>operator</code>	Specify one of these values: <code>GREATER_THAN</code> , <code>GREATER_THAN_OR_EQUAL_TO</code> , <code>EQUAL_TO</code> , <code>LESS_THAN</code> , <code>LESS_THAN_OR_EQUAL_TO</code> , and <code>NOT_EQUAL_TO</code>										
<code>value</code>	Specify the date and time values. For example, 26-09-2013 12:05:00 PM EST. Note: If you do not mention the timezone, by default, the timezone of the server is considered.										

- Create a map between the output parameters and orchestration variables.

You have configured the Domino Query Documents activity.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_query_outactivity.html

Querying views for Domino documents

The Query Views activity is used to query views from the database in the Lotus® Domino® server that matches the values that are specified in the document fields that are present in the view.

Using the Query Document activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Query Views from the Domino® folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

5. Click Configure from the Checklist. The Configure pane is displayed.
Note: The Next button is enabled only after you have selected the database name.
 - Click Browse to select an existing database from the **Browse Domino Database** pane. The Browse Domino databases display all the databases for the selected endpoint.
 - Click Browse to select an existing view from the **Browse Domino Views** pane. The Browse Domino Views display all the views for the selected endpoint and in the selected database.
 - Click Next to select an existing form from the **Browse Domino Forms** pane. The Browse Domino Forms displays all the forms related to the documents in that view.
6. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Query Views activity are displayed as nodes under the request input parameter in the To Activity panel.

For Form Types that are same across multiple databases, you can specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this, you must specify the database name in the `databaseName` optional parameter (described in Table 1). If the `databaseName` parameter is populated with a value, the outbound operation is performed on the database that is specified in the `databaseName` parameter. If there is no value specified, the database name that is specified during configuration is used to perform the outbound operation.

The optional input parameter is described in the following table:

Table 1. Database name optional parameter

Parameter Name	Description
<code>databaseName</code>	Specifies the database name that can be dynamically added in map inputs to enable a single orchestration to perform outbound operations across multiple databases that have the same Form Type.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in the endpoint panel, add the new optional parameters in `dominoConnectionProperties` of map inputs. The parameters for `dominoConnectionProperties` are described in the following table:

Table 2. Optional connection parameters

Parameters	Description
<code>dominoConnectionProperties</code> parameters	
<code>hostName</code>	Specifies the host name or IP address of the machine on which the Domino server is running.
<code>diioPort</code>	Specifies the Domino Internet Inter-ORB Protocol (DIIOP) port that allows Java [®] applets or applications to access Domino data remotely using CORBA. The default value is 63148.
<code>username</code>	Specifies the user name to connect to the Domino server.
<code>password</code>	Specifies the password that is associated with the user name to connect to the Domino server.
<code>connectionPool</code> parameters	
<code>minimumConnections</code>	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
<code>maximumConnections</code>	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
<code>maxIdleTime</code>	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool “no idle time. The default value is 120 minutes.
<code>maxWait</code>	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
<code>reclaimConnections</code>	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.

7. Map the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which

is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

8. Specify the values as described in Table 3:

Table 3. Search type

Parameter Name	Description
KeyValues	Specify the value for which you want to run a search.
ExactMatch	Specify the value as <code>False</code> to return all possible values related to the search term. For an exact match to be returned, specify the value as <code>True</code> .
SearchFormula	Specify a formula for a detailed search as per your requirement.

9. Select the Map Outputs in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
Note: Dynamically added fields present in the Domino document and not generated in the map input/output structures are handled by the Domino connector. While retrieving documents using this activity, the data for these fields are available in the map outputs section under `AdditionalFields`.
10. Create a mapping between the output parameters and orchestration variables.

You have configured the Domino Query Views activity.

Deleting a Domino document

Use the Delete Activity to delete a document from the Domino® database. Each deleted document must be uniquely identifiable by its `UniversalID` or `NotesID`.

Using the delete activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Delete Activity from the Domino folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. The Checklist pane lists the tasks (Summary, Pick Endpoint, Configure, Map inputs, Map outputs) that you must perform to complete the configuration of the outbound activity.
5. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

6. Click Configure from the Checklist. The Configure pane is displayed.

- o Click Browse to select an existing database from the Browse Domino databases pane. The Browse Domino databases display all the databases for the selected endpoint.
- o Click Next to select an existing form from the Browse Domino Forms pane. The Browse Domino Forms displays all the forms present in the selected database of the Domino server.
Note: The Next button is enabled only after you have selected the database name.

Specifying the map inputs for the delete activity

1. Click Map Input from the **Checklist**.

The input parameters for the specific Domino activity are displayed under the To Activity pane. Some of the common input parameters are defined in the following table.

Parameter Name	Description
UniversalID	The UniversalID parameter is a read/write property that uniquely identifies a document across all replicas of a database. In character format, the unique ID parameter is a 32-character combination of hexadecimal digits (0-9, A-F). The UniversalID is also known as the unique ID or UNID. The data type is string.
NotesID	The Notes® ID of a document is a read only property and has a hexadecimal value of up to 8 characters, which uniquely identifies a document within a particular database. The NotesID represents the location of a document within a specific database file. So the documents that are replicas of one another generally have different Notes IDs. A Notes ID does not change, unless the document is deleted.

Note: You must map the input parameters of the activity.

For Form Types that are same across multiple databases, you can now specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this, you must specify the database name in the `databaseName` optional parameter (described in Table 1). If the `databaseName` parameter is populated with a value, the outbound operation is performed on the database specified in the `databaseName` parameter. If there is no value specified, the database name that is specified during configuration is used to perform the outbound operation.

Optional parameters

The optional input parameters are described in the following table:

Table 1.

Input Parameters	Description
forceDelete	This property specifies if the document is to be deleted during a conflict of delete operation. It is of type boolean.

Input Parameters	Description
databaseName	databaseName is the name of the database from which the document is deleted. If a value is set for this parameter, then the value of the database given in the configure panel will be overwritten. This parameter is useful when documents with the same structure (Form) need to be deleted from multiple databases, using the same orchestration.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in the endpoint page, add the new optional parameters in `dominoConnectionProperties` of map inputs. The parameters of `dominoConnectionProperties` are described in the following table:

Table 2. Optional connection parameters

Parameters	Description
<code>dominoConnectionProperties</code> parameters	
<code>hostName</code>	Specifies the host name or IP address of the machine on which Domino server is running.
<code>diiopPort</code>	Specifies the Domino Internet Inter-ORB Protocol (DIIOP) port that allows Java [®] applets or applications to access Domino data remotely using CORBA. The default value is 63148.
<code>username</code>	Specifies the user name to connect to the Domino server.
<code>password</code>	Specifies the password that is associated with the user name to connect to the Domino server.
<code>connectionPool</code> parameters	
<code>minimumConnections</code>	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
<code>maximumConnections</code>	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
<code>maxIdleTime</code>	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool “no idle time. The default value is 120 minutes.
<code>maxWait</code>	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
<code>reclaimConnections</code>	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.

Specifying the map outputs for the delete activity

1. Click Map output from the Checklist.

The output parameters for the Domino activity are displayed under the From Activity pane.

Note: You can map the output parameters of the activity that is based on your requirement.

Getting events from Domino server

The Get Events activity is used to get events from the database in the IBM® Domino® server that matches the values that are specified in the input fields of Map Inputs.

Using the Get Events activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Get Events from the Domino® folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

5. Click Configure from the Checklist. The Configure pane is displayed.
 - o Click the Request Response Format list to select the XML, JSON, or ICAL format.
 - o Click Browse to select an existing database from the **Browse Domino Database** pane. The Browse Domino databases display all the databases for the selected endpoint.
6. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Get Events activity are displayed as nodes under the request input parameter in the To Activity panel.

Table 1. Map Input Parameters

Parameter	Description
since	Retrieves all the events from the timestamp mentioned in this field. For example, 2014-09-17T07:00:00Z
before	Retrieves all the events from the timestamp mentioned in this field. For example, 2014-09-17T07:00:00Z. The <code>before</code> parameter is always used with the <code>since</code> parameter.

Parameter	Description
id	Accepts a event ID as the input and returns the details of that event. For example, 0941088CD074C75065257CA8001AB24C-Lotus_Auto_Generated.
AllEvents	Accepts <code>True</code> values and return all the events in that database.

- Map the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
- Select the Map Outputs in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
- Create a mapping between the output parameters and orchestration variables.

You have configured the Domino Get Events activity.

Processing calendar events in Domino server

The Process Calendar Events activity is used to process an action on an existing calendar event in a database in the IBM Domino® server that matches the values that are specified in the input fields that are present in the Map Inputs.

Using the Process Calendar Events activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Process Calendar Events from the Domino® folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

5. Click Configure from the Checklist. The Configure pane is displayed.
 - o Click the Request Response Format list to select the XML, JSON, or ICAL format.
 - o Click Browse to select an existing database from the **Browse Domino Database** pane. The Browse Domino databases display all the databases for the selected endpoint.
6. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Process Calendar Events activity are displayed as nodes under the request input parameter in the To Activity panel.

The input parameters are described in the following table:

Table 1. Input parameters

Parameter Name	Description
UNID	Indicates the event ID that will be used to process the calendar events.
processAction	Accepts values such as Accept, Tentative, Decline, Counter, Delegate, Delete, and Request-Info. You can select these values from the drop-down list of the ProcessAction field of Map Inputs.

7. Map the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
8. Select the Map Outputs in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
9. Create a mapping between the output parameters and orchestration variables.

8. Map the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
9. Select the Map Outputs in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
10. Create a mapping between the output parameters and orchestration variables.

You have configured the Domino Process Calendar Notices activity.

Creating calendar events in Domino server

The Create Calendar Events activity is used to create the calendar events from the database in the IBMÂ® DominoÂ® server that matches the values that are specified in the input fields of Map Inputs.

Using the Create Calendar Events activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Create Calendar Events from the DominoÂ® folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

5. Click Configure from the Checklist. The Configure pane is displayed.
 - o Click the Event Type list to select one of the following type of event to be created:
 - Meeting
 - Recursive Meeting
 - All Day Event
 - Appointment
 - Recursive Appointment
 - Reminder
 - o Click the Request Response Format list to select the XML, JSON, or ICAL format.
 - o Click Browse to select an existing database from the **Browse Domino Database** pane. The Browse Domino databases display all the databases for the selected endpoint.
6. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Create Calendar Events activity are displayed as nodes under the request input parameter in the To Activity panel.
7. Map the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
8. Select the Map Outputs in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
9. Create a mapping between the output parameters and orchestration variables.

You have configured the Domino Create Calendar Events activity.

Updating calendar events in Domino server

The Update Calendar Events activity is used to update the calendar events from the database in the IBM Domino® server that matches the values that are specified in the input fields of Map Inputs.

Using the Update Calendar Events activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Update Calendar Events from the Domino® folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

5. Click Configure from the Checklist. The Configure pane is displayed.
 - Click the Event Type list to select one of the following event types to be updated:
 - Meeting
 - Recursive Meeting
 - All Day Event
 - Appointment
 - Recursive Appointment
 - Reminder
 - Click the Request Response Format list to select the XML, JSON, or ICAL format.
 - Click Browse to select an existing database from the **Browse Domino Database** pane. The Browse Domino databases display all the databases for the selected endpoint.
6. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Update Calendar Events activity are displayed as nodes under the request input parameter in the To Activity panel.
7. Map the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

8. Select the Map Outputs in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
9. Create a mapping between the output parameters and orchestration variables.

You have configured the Domino Update Calendar Events activity.

Deleting calendar events from Domino server

The Delete Calendar Events activity is used to delete calendar events from the database in the IBM Domino® server that matches the values that are specified in the input fields of Map Inputs.

Using the Delete Calendar Events activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Delete Calendar Events from the Domino® folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

5. Click Configure from the Checklist. The Configure pane is displayed.
 - o Click the Event Type list to select one of the following types:
 - Meeting
 - Recursive Meeting
 - All Day Event
 - Appointment
 - Recursive Appointment
 - Reminder
 - o Click the Request Response Format list to select the XML, JSON, or ICAL format.
 - o Click Browse to select an existing database from the **Browse Domino Database** pane. The Browse Domino databases display all the databases for the selected endpoint.
6. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Delete Calendar Events activity are displayed as nodes under the request input parameter in the To Activity panel.

Table 1. Map Input Parameter

Parameter	Description
-----------	-------------

Parameter	Description
UNID	Indicates the ID of the calendar event that must be deleted from the server.

- Map the orchestration variables and the input parameter of the activity.
 Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
- Select the Map Outputs in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
- Create a mapping between the output parameters and orchestration variables.

You have configured the Domino Delete Calendar Events activity.

Specifying Retry and Delivery Options for Domino activities

Specifying the Retry and Delivery parameters is one of the tasks to configure a Domino® activity configuration.

About this task

This section contains the procedures for configuring the Domino outbound and inbound activities.

Procedure

To specify the retry options for inbound and outbound Domino activities:

- Select the Retry task from the Checklist. The retry pane is displayed.
- Configure the retry options for connecting to a Domino server as described in the following table:

Table 1. Retry options

Retry Fields	Description
--------------	-------------

Retry Fields	Description
Wait __ second(s) between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Domino server.
Try to connect __ times before failing .	<p>Specifies the retry count “ the maximum number of times the Integration Appliance attempts to establish a connection to the Domino server before issuing the following errors:</p> <ul style="list-style-type: none"> o When you set this parameter to "0", Studio does not try to reconnect. o When you set this parameter to a value less than "0", Studio retries the connection indefinitely. <p>If an orchestration that starts with an inbound Domino activity is deployed and the Integration Appliance cannot connect to the specified Domino server, the Integration Appliance logs the connection errors as warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system log, resets the connection error count to zero, and continues to attempt to establish a connection to the Domino server.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

Parent topic: [Domino Activities](#)

Domino inbound activities

Procedure

To specify the delivery rules options for Domino inbound activities:

1. Select the Delivery Rules task from the Checklist. The delivery rules pane is displayed.
2. Configure the delivery rules options to select the activity's behavior as described in the following table:

Table 2. Delivery Rules options

Delivery Rules Fields	Description
Polling Interval	Specifies the time interval to poll event view in Adapter for Lotus® Domino(WALD) inbound event table of the Domino server. (For example, the Get created documents activity polls for create trigger events at the specified time internal.) Time can be selected in the format days, hours, minutes, and seconds.
Fetch size	Specifies how many events the activity must retrieve from the WALD inbound event table of the Domino server in each poll cycle.

Delivery Rules Fields	Description
Delivery Messages	
ATM OST_ ONCE	A non-persistent mode in which a document is either processed once or not processed at all.
ATLE AST_ ONCE	A persistent mode, in which a Domino document is not lost. As a result, there are chances that the orchestration can process the document once or more than once.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_Specifying_Retry_Parameters_for_Domino_Activities.html

Prerequisites to use Domino inbound activities

This section contains the prerequisites for configuring the Domino® inbound activities:

Configuring the Domino server

1. Copy the native library mentioned in the following table from <STUDIO ROOT>/etc/domino/<platform> directory to the Domino servers root directory. The native library is selected based on the platform on which Domino server is running.

Library file	Supported operating systems
waldinbound.dll	Windows 32 bit
waldinbound.dll	Windows 64 bit
libwaldinbound_r.a	AIX® 32 bit
libwaldinbound.so	Redhat 32 bit
libwaldinbound.so	Suse 32 bit
libwaldinbound.so	Solaris 32 bit

2. Search for notes.ini file in the Domino server. Open the file and add an entry at the end of the file.

```
EXTMGR_ADDINS=waldinbound
```

3. Copy the inbound event database (filename : waldinbound.nsf) from the (<STUDIO ROOT>/etc/domino/) to the Domino server's data directory (<DominoRoot>/data).
4. Open the inbound event database (waldinbound.nsf) by using Lotus Notes® and configure the event activity.
5. The following are the steps for configuring WALD inbound event table.
 - o Select the EventTriggerConfigurationView. If there is an entry, edit it. If there is no entry, create a new configuration.
 - o Enter a value for connector ID. This is optional.
 - o Enter the database name and form (both are case sensitive) for which events need to be generated for the field 'Monitored documents'. The same database and form will be selected during discovery of the inbound activity. The syntax is shown below.
 - DatabaseName:formName
 - SampleDatabase.nsf:Employee
 - TestDatabase.nsf:Form1:TestDatabase.nsf:Form2. (For this, events will be generated for both Form1 and Form2.)
6. Select the event type interested.

Note: The selected event type corresponds to the starter activities (Get Created Documents or Get Updated Documents or Get Deleted Documents).
7. Save the configuration (Ctrl + S). Events from the selected databases and forms get triggered and are available in the EventView of the inbound event database.
8. Restart Domino server. Test from Lotus Notes by using sample data and make sure that the events are getting generated for the configuration.
9. Configure the starter activity in Studio. Then create or update or delete a document (based on the configuration chosen in EventTriggerConfigurationView) for the configured Domino databases, which triggers an event. The event is picked by the Domino starter activity and processed.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_activity_implementation_for_inbound_activity.html

Get Created Documents activity

Use the Get Created Documents activity to get the documents (which are of interest) that were created on the Domino® server. The activity polls the event table in the Domino server for new events periodically and process them.

Note: Before you configure and use the get created documents activity, refer to [Prerequisites to use Domino inbound activities](#) on the Domino server.

Adding an inbound Domino activity to the orchestration

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.

3. Drag Get Created Documents activity from the Domino folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
4. The Checklist pane lists the tasks (Summary, Pick Endpoint, Configure, Map outputs) that you must perform to complete the configuration of the inbound activity.

Naming or renaming a Domino activity

1. Click Summary from the Checklist pane. The Summary pane is displayed.
 - o Specify the name of the activity in the Activity Name text box.

Specifying the endpoint for a Domino activity

1. Click Pick Endpoint from the Checklist pane. The Pick Endpoint pane is displayed.
2. Click one of the following options:
 - o Browse... - To select an existing endpoint from the Project Explorer. The Project Explorer shows all the Domino endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint pane. To edit the endpoint properties, click Edit.
 - o New... - To create a new endpoint. The Create Endpoint window is displayed.
 - o Edit... - To edit an existing endpoint. The Edit Endpoint window is displayed.

Note: Any changes that you make to the endpoint, including configuration properties, affects all orchestrations that use that endpoint. The edits are global, not local.

Specifying the database and form for a Domino activity

1. Click Configure from the Checklist pane. The Configure pane is displayed.
 - o Click Browse to select an existing database from the Browse Domino databases pane. The Browse Domino databases display all the databases for the selected endpoint.
 - o Click Next to select an existing Form from the Browse Domino Forms pane. The Browse Domino Forms displays all the forms in the project available for the activity.
Note: The Next button is enabled only after you have selected the database name.
 - o Optional: Specify the names of the Additional Databases from which you would like to poll the documents of the form that is selected in the Form field. The databases must be separated by commas. For example, `Admin.nsf, names.nsf, .` The databases will be polled one after the other. All the databases that are specified in the Additional Database field must have a Form similar to the one configured in the Browse Domino Forms.
 - o Optional: Fields with canonical names accept fields that may have canonical names such as `John Smith/IBM/COUNTRY` as values, which are separated by commas. Specify the canonical names in this field if you want to convert the values in these fields to internet mail addresses, such as `johnsmith@country.ibm.com`. Some of the field name examples are: To, From, CC, Chair, Required Attendees, and so on.

Specifying the map outputs for a Domino activity

1. Click Map output from the Checklist pane.

The output parameters for the Domino activity are displayed under the From Activity pane.

Note: You can map the output parameters of the activity that is based on your requirement.

Note: Dynamically added fields present in the Domino document and not generated in the map input/output structures are handled by the Domino connector. While retrieving documents using this activity, the data for these fields are available in the map outputs section under `AdditionalFields`.

 Last updated: Wednesday, February 17, 2016

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_insert_inbound_activity.html

Get Updated Documents activity

Use the Get Updated Documents activity to get the documents (which are of interest) that got updated on the Domino® server. The activity polls the event table in the Domino server for new events periodically and process them.

Note: Before you configure and use the get updated documents activity, refer to [Prerequisites to use Domino inbound activities](#) on the Domino server.

Adding an inbound Domino activity to the orchestration

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Get Updated Documents activity from the Domino folder onto the orchestration. The graphical representation of the orchestration along with the Checklist pane is displayed.
4. The Checklist pane lists the tasks (Summary, Pick Endpoint, Configure, Map outputs) that you must perform to complete the configuration of the inbound activity.

Naming or renaming a Domino activity

1. Click Summary from the Checklist pane. The Summary pane is displayed.
 - o Specify the name of the activity in the Activity Name text box.

Specifying the endpoint for a Domino activity

1. Click Pick Endpoint from the Checklist pane. The Pick Endpoint pane is displayed.
2. Click one of the following options:
 - o Browse... - To select an existing endpoint from the Project Explorer. The Project Explorer displays all the Domino endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint pane. To edit the endpoint properties, click Edit.
 - o New... - To create a new endpoint. The Create Endpoint window is displayed.
 - o Edit... - To edit an existing endpoint. The Edit Endpoint window is displayed.

Note: Any changes that you make to the endpoint, including configuration properties, affects all orchestrations that use that endpoint. The edits are global, not local.

Specifying the database and form for a Domino activity

1. Click Configure from the Checklist pane. The Configure pane is displayed.

- Click Browse to select an existing database from the Browse Domino databases pane. The Browse Domino databases display all the databases for the selected endpoint.
- Click Next to select an existing Form from the Browse Domino Forms pane. The Browse Domino Forms displays all the forms in the project available for the activity.
Note: The Next button is enabled only after you select the database name.
- Optional: Specify the names of the Additional Databases from which you would like to poll the documents of the form that is selected in the Form field. The databases must be separated by commas. For example, `Admin.nsf, names.nsf,`. The databases will be polled one after the other. All the databases that are specified in the Additional Database field must have a Form similar to the one configured in the Browse Domino Forms.
- Optional: Fields with canonical names accept fields that may have canonical names such as `John Smith/IBM/COUNTRY` as values, which are separated by commas. Specify the canonical names in this field if you want to convert the values in these fields to internet mail addresses, such as `johnsmith@country.ibm.com`. Some of the field name examples are To, From, CC, Chair, Required Attendees, and so on.

Specifying the map outputs for a Domino activity

1. Click Map output from the Checklist pane.

The output parameters for the Domino activity are displayed under the From Activity pane.

Note: You can map the output parameters of the activity that is based on your requirement.

Note: Dynamically added fields present in the Domino document and not generated in the map input/output structures are handled by the Domino connector. While retrieving documents using this activity, the data for these fields are available in the map outputs section under `AdditionalFields`.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_delete_inbound_activity.html

Handling Date/Time and Time zone data types

In the Lotus Domino form, a field of Date/Time type can be configured to represent only a date value, time value, or both date and time values. This configuration is done while creating/editing the form in Domino Designer. So, when a document is created for such a form, the value can be a date, time, or a datetime.

For example, if a form representing a Calendar has the following fields:

Table 1. Example

Fields	Domino Data type
startDate	Date/Time (represents only date)
startTime	Date/Time (represents only time)
endDate	Date/Time (represents only date)
endTime	Date/Time (represents only time)
bothDateAndTime	Date/Time (represents both date and time)
timeZone	Time zone
Subject	Text
Body	Text

If a valid document is created for this form, then:

- `startDate` and `endDate` will only accept a date value
- `startTime` and `endTime` will only accept a time value
- `bothDateAndTime` will only accept date and time
- `timeZone` will only accept a time zone value

From Cast Iron version 6.1.0.9 onwards, Date/Time data type is handled as described in the following points:

1. A Domino field of type Date/Time is represented as `xsd:string` in the map input and map output of the activity.
2. The only supported syntax of the input values for the Date/Time fields in map input are:
 - a. If the field represents only date: `MM/dd/yyyy`. Example : 05/27/2012.
 - b. If the field represents only time (24 hour format): `HH:mm:ss`. Example: 22:15:30.
 - c. If the field represents both date and time (24 hour format): `MM/dd/yyyy HH:mm:ss`. Example: 05/31/2012 23:59:59.
3. The output from the activity also follows the same syntax as the Date/Time fields, in most cases.
4. The preceding syntax is used by the map input and output irrespective of:
 - a. The date and time format of the operating system on which the Domino server is running.
 - b. The date and time format settings configured when creating the form in Domino designer.
5. The Time zone value is also represented as `xsd:string` in the map input and output. The following technote from Lotus Domino gives more information about the syntax: <http://www->

01.ibm.com/support/docview.wss?uid=swg21163045. For more information about Time zone in Lotus Domino, see Lotus Domino documentation.

Note:

1. In the Cast Iron 6.1.0.6 version and the earlier versions, the Domino Date/Time field was generated as `xsd:date`, which was not able to handle all combinations of the input values.
2. Old projects developed using the 6.1.0.6 version or earlier versions that are already running, will work fine with same old behavior, that is, Date/Time represented as `xsd:date`).
3. For all the orchestrations created newly using the 6.1.0.9 version and later versions, Date/Time field will be generated as `xsd:string`.
4. If the old projects require the new behavior, that is, to generate Date/Time as `xsd:string`, then the objects need to be refreshed from the Configure panel of the activity in the Studio 6.1.0.9 version or later versions. Mapping must be validated after this change.

Rich text support for Domino connector

The Domino connector supports RichText type in forms. Fields of RichText type can store both text and attachments as part of the document. The connector supports attachments only for the Retrieve and Query Document activities. Text content can be used for the Create, Update, Retrieve, and Query Document activities.

The following figure describes the structure of the RichText field when a form is discovered and the map input and output are generated.

Troubleshooting and support

Troubleshooting techniques and self-help information help you identify and solve problems quickly. This topic provides potential solutions for issues you would have with the Domino® connector.

New fields added to the calendar object

From Cast Iron® version 6.3.0.2 onwards, you can get the invitee details, date/time, and the room details, in response to retrieving and querying a calendar entry using the Domino connector.

Static subform behavior

In the earlier versions of Domino connector (before v7.0.0.0), the fields present in a subform (statically embedded in the main form) were generated as strings in Map Inputs/Map Outputs, irrespective of the datatypes that are defined for the fields. This issue is fixed in v7.0.0.0 and the data type of the fields are generated correctly.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Dropbox_Connector_creating_or_editing_an_endpoin.html

Selecting or editing a Dropbox endpoint

1. In the Create Endpoint or Edit Endpoint pane, Configure the Dropbox Connection details as described in the following table.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the Dropbox server successfully.

3. Click OK.

Table: Connection properties

Field Name	Description
URL	URL Endpoint to connect and generate Access Token.
Oauth2 Access Token	Access Token as specified by user for OAuth based authentication.
Proxy Host	Proxy host name of the Proxy Server to connect. (Optional)
Proxy Port	Proxy password of the Proxy Server to connect. (Optional)
Proxy Username	Proxy Username of the Proxy Server to connect. (Optional)
Proxy Password	Proxy Password of the Proxy Server to connect. (Optional)

Note: To generate the access token, check Dropbox Create an App from the App console of Dropbox. You could also follow the Dropbox documentation.

Upload File

Name	Type	Required	Description
isChunkedUpload	Boolean	Yes	To be set to true if chunked upload.
chunkdetails->uploadId	Integer	No	If Chunked upload is true then upload id can be given.The unique ID of the in-progress upload on the server. If left blank, the server will create a new upload session.
Chunkdetails	String	No	If Chunked upload is true then offset can be given.If Chunked upload is true then upload id can be given.

offset	integer	
path	string	The full path to the file you want to write to. This parameter should not point to a folder. This is valid only for non chunked upload.
overwrite	boolean	This value, either true (default) or false, determines whether an existing file will be overwritten by this upload. If true, any existing file will be overwritten. If false, the other parameters determine whether a conflict occurs and how that conflict is resolved. This is valid only for non chunked upload.
autorename	boolean	This value, either true (default) or false, determines what happens when there is a conflict. If true, the file being uploaded will be automatically renamed to avoid the conflict. (For example, test.txt might be automatically renamed to test (1).txt.) The new name can be obtained from the returned metadata. If false, the call will fail with a 409 (Conflict) response code. This is valid only for non chunked upload.
locale	string	The metadata returned on successful upload will have its size field translated based on the given locale. This is valid only for non chunked upload.
parentrev	string	If present, this parameter specifies the revision of the file you're editing. If parent_rev matches the latest version of the file on the user's Dropbox, that file will be replaced. Otherwise, a conflict will occur. If you specify a parent_rev and that revision doesn't exist, the file won't save (error 400). You can get the most recent rev by performing GetFileDetails activity. This is valid only for non chunked upload.
textContent	string	If fileType is text Content then data need to be provided here to upload the same content. Need to be provided for both chunked and non chunked upload
binaryContent	binary	If fileType is binaryContent then data need to be provided here to upload the same content. Need to be provided for both chunked and non chunked upload
fileType	string	Specify the fileType to get the data in specified format. Drop down displayed to select either binaryContent or textContent.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Dropbox_Connector_click_on_map_inp_ut_link_in_con1.html

Mapping the outputs of the Activity

Create a map between the dropbox output parameters and the orchestration variables. The expected response is generated on a successful mapping.

Name	Data type	Required	Description
Chunk details upload_id	string	Yes	The unique ID of the in-progress upload on the server. If left blank, the server will create a new upload session.
Chunk details offset	String	No	The byte offset of this chunk, relative to the beginning of the full file. The server will verify that this matches the offset it expects. If it does not, the server will return an error with the expected offset.
Chunk details expires	String	Yes	Expiry time at which the chunked data might expire. This will be a quite a long time for user to commit the chunk data.
revision	integer	No	A deprecated field that semi-uniquely identifies a file. Use rev instead.

	t e g g e r		
bytes	i n t e g g e r	y e s	The file size in bytes.
thumb_b_exists	b o o l e a n	y e s	True if the file is an image that can be converted to a thumbnail via the /thumbnails call.
rev	s t r i n g	y e s	A unique identifier for the current revision of a file. This field is the same rev as elsewhere in the API and can be used to detect changes and avoid conflicts.
modified	s t r i n g	y e s	The last time the file was modified on Dropbox, in the standard date format (not included for the root folder).
mime_type	s t r i n g	y e s	The response type for example "application/pdf"
path	s t r i n g	y e s	Returns the canonical path to the file or folder.
is_dir	b o o l e a n	y e s	Whether the given entry is a folder or not.
size	s t r i	y e s	A human-readable description of the file size (translated by locale).

	n g		
root	s t r i n g	y e s	The root or top-level folder depending on your access level. All paths returned are relative to this root level. Permitted values are either dropbox or app_folder.
client _mti me	s t r i n g	y e s	For files, this is the modification time set by the desktop client when the file was added to Dropbox, in the standard date format. Since this time is not verified (the Dropbox server stores whatever the desktop client sends up), this should only be used for display purposes (such as sorting) and not, for example, to determine if a file has changed or not.
icon	s t r i n g	y e s	The name of the icon used to illustrate the file type in Dropbox's icon library.

Parent topic: [Add the Get File Details Activity in the orchestration:](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Dropbox_Connector_mapping_the_inputs_of_the_acti3.html

Click on Map Input link in Configure Activity section displayed below the orchestration.

Table 1. Get File Details Activity

Name	Type	Required	Description
Path	String	Yes	The path to the file.
file_limit	Integer	No	Default is 10,000 (max is 25,000). When listing a folder, the service won't report listings containing more than the specified amount of files and will instead respond with a 406 (Not Acceptable) status response.
hash	String	No	Each call to /metadata on a folder will return a hash field, generated by hashing all of the metadata contained in that response. On later calls to /metadata, you should provide that value via this parameter so that if nothing has changed, the response will be a 304 (Not Modified) status code instead of the full, potentially very large, folder listing. This parameter is ignored if the specified path is associated with a file or if list=false.
list	Boolean	No	The strings true and false are valid values. true is the default. If true, the folder's metadata will include a contents field with a list of metadata entries for the contents of the folder. If false, the contents field will be omitted. This field has no effect on Get File Details Activity.
include_deleted	Boolean	No	Only applicable when list is set. If this parameter is set to true, then contents will include the metadata of deleted children. Note that the target of the metadata call is always returned even when it has been deleted (with is_deleted set to true) regardless of this flag.
revision	String	No	If you include a particular revision number, then only the metadata for that revision will be returned.

	i n g		
loc ale	S t r i n g	N	The metadata returned will have its size field translated based on the given locale.
incl ude _m edi a_i nfo	b o o l e a n	N	If true, each file will include a photo_info dictionary for photos and a video_info dictionary for videos with additional media info. If the data isn't available yet, the string pending will be returned instead of a dictionary.
incl ude _m em ber shi p	b o o l e a n	n	If true, metadata for a shared folder will include a list of members and a list of groups.

Activity: Get File Copy reference

This activity creates and returns a copy_ref to a file. This reference string can be used to copy that file to another user's Dropbox by passing it in as the from_copy_ref parameter of Copy File activity.

- [Add the Get File Copy reference Activity in the orchestration](#)
- [Click on Map Input link in Configure Activity section displayed below the orchestration.](#)

Click on Map Input link in Configure Activity section displayed below the orchestration.

Get Shared Link Activity

Name	Type	Required	Description
path	String	Yes	Creates and returns a shared link to a file or folder.
locale	string	no	The metadata returned will have its size field translated based on the given locale.
short_url	boolean	No	When true (default), the URL returned will be shortened using the Dropbox URL shortener. If false, the URL will link directly to the file's preview page.

Mapping the outputs of the Activity

Create a map between the Dropbox output parameters and the orchestration variables. The expected response is generated on a successful mapping.

Name	Description	Required
------	-------------	----------

	p e d		
re vi si on	in t e g e r	N o	A deprecated field that semi-uniquely identifies a file. Use rev instead.
by te s	in t e g e r	y e s	The file size in bytes.
th u m b_ ex ist s	b o l e a n	y e s	True if the file is an image that can be converted to a thumbnail via the /thumbnails call.
re v	s t r i n g	y e s	A unique identifier for the current revision of a file. This field is the same rev as elsewhere in the API and can be used to detect changes and avoid conflicts.
m od ifi ed	s t r i n g	y e s	The last time the file was modified on Dropbox, in the standard date format (not included for the root folder).
mi m e_ ty pe	s t r i n g	y e s	The response type for example "application/pdf"
pa th	s t r i n g	y e s	Returns the canonical path to the file or folder.
is_ dir	b o l e a n	y e s	Whether the given entry is a folder or not.
siz e	s t r i n g	y e s	A human-readable description of the file size (translated by locale).

root	string	The root or top-level folder depending on your access level. All paths returned are relative to this root level. Permitted values are either dropbox or app_folder.
client_mtime	string	For files, this is the modification time set by the desktop client when the file was added to Dropbox, in the standard date format. Since this time is not verified (the Dropbox server stores whatever the desktop client sends up), this should only be used for display purposes (such as sorting) and not, for example, to determine if a file has changed or not.
icon	string	The name of the icon used to illustrate the file type in Dropbox's icon library.

Click on Map Input link in Configure Activity section displayed below the orchestration.

Table 1. Get Folder Details Activity

Name	Type	Required	Description
Path	String	Yes	The path to the folder.
file_limit	Integer	No	Default is 10,000 (max is 25,000). When listing a folder, the service won't report listings containing more than the specified amount of files and will instead respond with a 406 (Not Acceptable) status response.

	e g g e r		
has h	S t r i n g	N o	Each call to /metadata on a folder will return a hash field, generated by hashing all of the metadata contained in that response. On later calls to /metadata, you should provide that value via this parameter so that if nothing has changed, the response will be a 304 (Not Modified) status code instead of the full, potentially very large, folder listing. This parameter is ignored if the specified path is associated with a file or if list=false.
list	b o o l e a n	N o	The strings true and false are valid values. true is the default. If true, the folder's metadata will include a contents field with a list of metadata entries for the contents of the folder. If false, the contents field will be omitted.
incl ude _de lete d	B o o l e a n	N o	Only applicable when list is set. If this parameter is set to true, then contents will include the metadata of deleted children. Note that the target of the metadata call is always returned even when it has been deleted (with is_deleted set to true) regardless of this flag.
rev i s i o n n u m b e r	s t r i n g	N o	If you include a particular revision number, then only the metadata for that revision will be returned.
loc ale	S t r i n g	N o	The metadata returned will have its size field translated based on the given locale.
incl ude _m edi a_ i nfo	b o o l e a n	N o	If true, each file will include a photo_info dictionary for photos and a video_info dictionary for videos with additional media info. If the data isn't available yet, the string pending will be returned instead of a dictionary.
incl ude _m em ber shi p	b o o l e a n	n o	If true, metadata for a shared folder will include a list of members and a list of groups.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Dropbox_Connector_click_on_map_input_link_in_con14.html

Mapping the outputs of the Activity

Create a map between the Dropbox output parameters and the orchestration variables. The expected response is generated on a successful mapping.

Name	Data type	Required	Description
has_more	boolean	No	If true, then there are more entries available
cursor	integer	Yes	A string that encodes the latest information that has been returned.
Entries->thumbnail_exists	boolean	Yes	True if the file is an image that can be converted to a thumbnail via the /thumbnails call.
Entries->rev	string	Yes	A unique identifier for the current revision of a file. This field is the same rev as elsewhere in the API and can be used to detect changes and avoid conflicts.
Entries->modified	string	Yes	The last time the file was modified on Dropbox, in the standard date format (not included for the root folder).
Entries->	string	Yes	For files within a shared folder, this field specifies which user last modified this file.

>modifier			
Enteries ->path	string	yes	Returns the canonical path to the file or folder.
Enteries ->is_dir	boolean	yes	Whether the given entry is a folder or not.
Enteries ->size	string	yes	A human-readable description of the file size (translated by locale).
Enteries ->root	string	yes	The root or top-level folder depending on your access level. All paths returned are relative to this root level. Permitted values are either dropbox or app_folder.
Enteries ->read_only	boolean	yes	For shared folders, this field specifies whether the user has read-only access to the folder. For files within a shared folder, this specifies the read-only status of the parent shared folder.
Enteries ->icon	string	yes	The name of the icon used to illustrate the file type in Dropbox's icon library.
Enteries ->bytes	integer	yes	A deprecated field that semi-uniquely identifies a file. Use rev instead.
Entries ->revision	integer	yes	The file size in bytes.
reset	string	yes	If true, clear your local state before processing the delta entries. reset is always true on the initial call to /delta (i.e. when no cursor is passed in). Otherwise, it is true in rare situations, such as after server or account maintenance, or if a user deletes their app folder.

Mapping the outputs of the Activity

Create a map between the Dropbox output parameters and the orchestration variables. The expected response is generated on a successful mapping.

Name	Data type	Required	Description
uid	Integer	No	The user's unique Dropbox ID.
referral_link	integer	yes	The user's referral link.
display_name	string	yes	The user's display name.
locale	string	yes	Locale preference set by the user (e.g. en-us).
email_verified	string	yes	Provided the email id verified or not
Team->Teamid	string	No	The ID of the team the user belongs to.
Team â†’ name	string	No	The name of the team the user belongs to.
quota_info->datastores	integer	No	No. of datastores

quota_info-> quota	string	yes	The user's total quota allocation (bytes). If the user belongs to a team, the team's total quota allocation (bytes).
quota_info-> shared	string	yes	The user's used quota in shared folders (bytes). If the user belongs to a team, this includes all usage contributed to the team's quota outside of the user's own used quota (bytes).
quota_info-> normal	boolean	yes	The user's used quota outside of shared folders (bytes).
ispaired	string	yes	If true, there is a paired account associated with this user.
country	integer	yes	The user's two-letter country code, if available.
Namedetails â†' familiar name	string	yes	The locale-dependent familiar name for the user.
Name details â†' surname	string	yes	The user's surname.
Name details â†' given name	string	yes	The user's given name.
Email	String	yes	Email id of the user

Mapping the outputs of the Activity

Create a map between the Dropbox output parameters and the orchestration variables. The expected response is generated on a successful mapping.

N a m e	D a t a t y p e	R e q u i r e d	Description
re vi si on	in t e g e r	N o	A deprecated field that semi-uniquely identifies a file. Use rev instead.
by te s	in t e g e r	y e s	The file size in bytes.
th u m b_ ex ist s	b o o l e a n	y e s	True if the file is an image that can be converted to a thumbnail via the /thumbnails call.
re v	s t r i n g	y e s	A unique identifier for the current revision of a file. This field is the same rev as elsewhere in the API and can be used to detect changes and avoid conflicts.

	in g		
modified	string	y	The last time the file was modified on Dropbox, in the standard date format (not included for the root folder).
mime_type	string	y	The response type for example "application/pdf"
path	string	y	Returns the canonical path to the file or folder.
is_dir	boolean	y	Whether the given entry is a folder or not.
size	string	y	A human-readable description of the file size (translated by locale).
root	string	y	The root or top-level folder depending on your access level. All paths returned are relative to this root level. Permitted values are either dropbox or app_folder.
client_mtime	string	y	For files, this is the modification time set by the desktop client when the file was added to Dropbox, in the standard date format. Since this time is not verified (the Dropbox server stores whatever the desktop client sends up), this should only be used for display purposes (such as sorting) and not, for example, to determine if a file has changed or not.
icon	string	y	The name of the icon used to illustrate the file type in Dropbox's icon library.

Creating or editing an endpoint for Eloqua Bulk API activity

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to Eloqua platform. Eloqua Bulk API uses OAuth 2.0 authentication mechanism so as to authorize users to perform operations.

Selecting or editing an Eloqua Bulk API endpoint

To select or edit an Eloqua Bulk API endpoint:

1. In the **Create Endpoint** or **Edit Endpoint** pane, configure the Eloqua Bulk API endpoint as described in the following table.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

2. Click **Test Connection** to confirm that the connection details are valid and you are able to connect to the Eloqua Bulk API successfully.

3. Click **OK**.

Table: Connection properties

Field Name	Description
OAuth Access Token	OAuth access token generated from Eloqua Bulk API for authentication.
OAuth Refresh Token	OAuth refresh token generated from Eloqua Bulk API while generating OAuth Access token.
Application Client ID	The Client Identifier issued to the application during registration.
Application Client Secret	The Client Secret issued to the application during registration.
Application Redirect URL	The Redirect URL issued to the application during registration.

Note: To generate the access token, refer to the Oracle Eloqua Bulk API documentation relating to "OAuth2 Authentication Support in Eloqua Bulk REST API".

Using the Eloqua Bulk API Create Import Definition activity

Use the Create Import Definition activity to create an import definition in Eloqua.

Use this task to create an import definition in Eloqua. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Create Import Definition activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Create Import Definition** activity icon onto the orchestration. The Eloqua Bulk API Create Import Definition checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Create Import Definition activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields:

- **name:** Name of the definition. Useful for reusing definitions.
- **identifierFieldName:** Specifies which field to use to match the imported data to existing Eloqua data.
- **fields:** It has following fields :
 - **sourceField:** It would be one of the column names from source data.
 - **EloquaDestinationField:** Eloqua column name to which sourceField data would map.

Optional Fields: The activity has following optional fields:

- **autoDeleteDuration:** Time until the definition is deleted.
- **dataRetentionDuration:** Time until the staged data is deleted.
- **isUpdatingMultipleMatchedRecords:** Specifies whether Eloqua should update multiple records if multiple records match the identifierFieldName.
- **updateRule:** The following rule types are available:
 - **always:** Always update.
 - **ifNewIsNotNull:** Update if the new value is not blank.
 - **ifExistingIsNull:** Update if the existing value is blank.
 - **useFieldRule:** Use the rule defined at the field level.
- **syncActions:** Specifies additional operations to perform during the import. It has following fields :
 - **action:** It specifies what action to perform. The action can be add, remove, or setStatus.
 - **destination:** It specifies where the action should take place. For add or remove actions, this would be the URI of a list or email group. For setStatus, it might the URI of an AppCloud Action or Decision service.
 - **status:** Specifies to what the status should be set for a setStatus action. The following status is available: subscribed, unsubscribed, active, complete, pending, errored, yes, and no.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web

Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Eloqua Bulk API Create Import Definition activity.

Using the Eloqua Bulk API Create Export Definition activity

Use the Create Export Definition activity to create an export definition in Eloqua.

Use this task to create an export definition. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Create Export Definition activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Create Export Definition** activity icon onto the orchestration. The Eloqua Bulk API Create Export Definition checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of Create Export Definition activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields:

- **name:** Name of the definition. Useful for reusing definitions.
- **fields:** It has following fields:
 - **sourceField:** It would be one of the column names from source data.
 - **EloquaDestinationField:** Eloqua column name to which sourceField data would map.

Optional Fields: The activity has following optional fields:

- **autoDeleteDuration:** Time until the definition is deleted.
- **dataRetentionDuration:** Time until the staged data is deleted.
- **maxRecords:** Specifies the maximum number of records to export.
- **Filters:** Specifies query criteria used to filter . Filter use the comparison, logic, and existence operators to filter import data based on Eloqua field values. It has following fields:
 - **Filter:** It allows creating filter statements by using the following options:
 - **elename:** It is used to select the data that you want to export.
 - **operator:** It is used to specify a condition.
 - **value:** Value for filter.
 - **AdditionalFilters:** This is used to add more than one filter.
 - **Operator:** The Eloqua Bulk API also supports complex filters that filter based on multiple criteria using the AND, OR, and NOT operators.
 - **Filter:** Use same parameters as defined in the **Filter** section.
- **syncActions:** It specifies additional operations to perform during the export. It has following fields :
 - **action:** It specifies what action to perform. The action can be add, remove, or setStatus.
 - **destination:** It specifies where the action should take place. For add or remove actions, this would be the URI of a list or email group. For setStatus, it might be the URI of an AppCloud Action or Decision service.
 - **status:** Specifies to what the status should be set for a setStatus action. The following status is available:
 - subscribed
 - unsubscribed
 - active
 - complete
 - pending
 - errored
 - yes
 - no

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

Using the Eloqua Bulk API Get Import Definition activity

Use the Get Import Definition activity to retrieve all import definitions from Eloqua.

Use this task to retrieve all import definitions from Eloqua. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Get Import Definition activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Get Import Definition** activity icon onto the orchestration. The Eloqua Bulk API Get Import Definition checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Get Import Definition activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has the following mandatory field:

- **selectionType:** Following options are available to retrieve Import Definitions:
 - SPECIFIC_ID
 - ALL_IDs

Optional Fields: The activity has following optional fields:

- **id:** The ID of the Import Definition to retrieve.

Note: ID becomes mandatory when you select SPECIFIC_ID in selectionType.

- **limit:** Specifies maximum number of records to return.
- **offset:** Specifies an offset that allows to retrieves the next batch of records.
- **order:** Following options are available to order the :
 - Ascending

- Descending
- **orderBy:** Following options are available to order the :
 - uri
 - id
 - name
 - dataRetentionDuration
 - maxRecords
 - autoDeleteDuration
 - kbUsed
 - createdBy
 - createdAt
 - updatedBy
 - updatedAt
- **Filters:** Specifies query criteria used to filter . Filter uses the comparison, logic, and existence operators to filter import data based on Eloqua field values. It has following fields:
 - **Filter:** It allows creating filter statements by using the following options:
 - **elename:** It is used to select the data that you want to import.
 - **operator:** It is used to specify a condition.
 - **value:** Value for filter.
 - **AdditionalFilters:** This is used to add more than one filter by using the following options:
 - **Operator:** The Eloqua Bulk API also supports complex filters, that filter based on multiple criteria using the AND, OR, and NOT operators.
 - **Filter:** Use same parameters as defined in **Filter** section.
- **Note:** Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

Using the Eloqua Bulk API Push Data for Import activity

Use the Push Data for Import activity to submit the data for existing Import definition into staging area of Eloqua system.

Use this task to submit the data for existing Import definition into staging area of Eloqua system. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Push Data for Import activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Push Data for Import** activity icon onto the orchestration. The Eloqua Bulk API Push Data for Import checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Push Data for Import activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields:

- **id:** The ID of the definition.
- **inputType:** Select type of the data source. Eloqua Bulk API supports two data types for input:
 - JSON
 - CSV

Optional Fields: The activity has the following optional field:

- **ImportData:** The data which is used to import into Eloqua system.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.

Using the Eloqua Bulk API Synchronize Data activity

Use the Synchronize Data activity to trigger synchronization on the import or export operation.

Use this task to trigger synchronization on the import or export operation. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Synchronize Data activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Synchronize Data** activity icon onto the orchestration. The Eloqua Bulk API Synchronize Data checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Synchronize Data activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields:

- **id:** ID of the existing import or export definition.
- **operationType:** Following operation types are available to Sync:
 - Import: It sends data from staging area into Eloqua system.
 - Export: It sends data from Eloqua system into staging area.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

Using the Eloqua Bulk API Get Synchronization Status Details activity

Use the Get Synchronization Status Details activity to retrieve the synchronization logs and error details from Eloqua.

Use this task to retrieve the synchronization status along with logs and rejected record details. Sync log retrieves the logs for the specified sync and rejected logs retrieves raw data about validation failures during the specified sync action. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Get Synchronization Status Details activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Get Synchronization Status Details** activity icon onto the orchestration. Select the activity. The Eloqua Bulk API Get Synchronization Status Details checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of Get Synchronization Status Details activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has the following mandatory field:

- **selectionType:** Following options are available to retrieve status detail of Import/Export definitions.
- SPECIFIC_ID

- ALL_IDs

Optional Fields: The activity has following optional fields:

- **id:** The ID of the Import/Export Definition.

Note: ID becomes mandatory if you select SPECIFIC_ID in selectionType.

- **showlogs:** It is used to retrieve logs. Valid terms are: True, False.
- **showRejectedRecords:** It is used to retrieve rejected records. Valid terms are: True, False.
- **limit:** Specifies maximum number of records to return.
- **offset:** Specifies an offset that allows to retrieves the next batch of records.
- **order:** Following options are used to order the :
 - Ascending
 - Descending

Using the Eloqua Bulk API Get Data for Export Definition activity

Use the Get Data for Export Definition activity to retrieve the data corresponding to a particular export definition in Eloqua.

Use this task to retrieve the data corresponding to a particular export definition. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Get Data for Export Definition activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Get Data for Export Definition** activity icon onto the orchestration. The Eloqua Bulk API Get Data for Export Definition checklist is displayed.
3. In the checklist, click **Summary**.

4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Get Data for Export Definition activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has the following mandatory field:

- **id:** Retrieves the data for the particular definition with the specified ID.

Optional Fields: The activity has following optional fields:

- **dataFormat:** It is used to retrieve the data in selected format. Eloqua Bulk API supports two data formats:
 - JSON: It is used to retrieve data in JSON format.
 - CSV: It is used to retrieve data in CSV format.

Note: In both cases, (JSON/ CSV) exported data is encoded Base64 string.

- **limit:** Specifies maximum number of records to return.
- **offset:** Specifies an offset that allows to retrieves the next batch of records.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Eloqua Bulk API Get Data for Export Definition activity.

Using the Eloqua Bulk API Update Import Definition activity

Use the Update Import Definition activity to update import definition in Eloqua.

Use this task to update import definition in Eloqua. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Update Import Definition activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Update Import Definition** activity icon onto the orchestration. The Eloqua Bulk API Update Import Definition checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Update Import Definition activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields:

- **id:** The ID of the existing import definition.
- **name:** Name of the definition.
- **identifierFieldName:** Specifies which field to use to match the imported data to existing Eloqua data.
- **fields:** It has following fields :
 - **sourceField:** It would be one of the column names from source data.
 - **EloquaDestinationField:** Eloqua column name to which sourceField data would map.

Optional Fields: The activity has following optional fields:

- **autoDeleteDuration:** Time until the definition is deleted.
- **dataRetentionDuration:** Time until the staged data is deleted.
- **isUpdatingMultipleMatchedRecords:** Specifies whether Eloqua should update multiple records if multiple records match the identifierFieldName.
- **updateRule:** The following rule types are available:
 - **always:** Always update.
 - **ifNewIsNotNull:** Update if the new value is not blank.

- **ifExistingIsNull**: Update if the existing value is blank.
- **useFieldRule**: Use the rule defined at the field level.
- **syncActions**: Specifies additional operations to perform during the import. It has following fields:
 - **action**: It specifies what action to perform. The action can be add, remove, or setStatus.
 - **destination**: It specifies where the action should take place. For add or remove actions, this would be the URI of a list or email group. For setStatus, it might be the URI of an AppCloud Action or Decision service.
 - **status**: Specifies to what the status should be set for a setStatus action. The following status is available:
 - subscribed
 - unsubscribed
 - active
 - complete
 - pending
 - errored
 - yes
 - no

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Eloqua Bulk API Update Import Definition activity.

Using the Eloqua Bulk API Update Export Definition activity

Use the Update Export Definition activity to Update export definition in Eloqua.

Use this task to update export definition in Eloqua. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Update Export Definition activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Update Export Definition** activity icon onto the orchestration. The Eloqua Bulk API Update Export Definition checklist is displayed.

3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant **Eloqua Bulk API** endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of Update Export Definition activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields:

- **id:** The ID of the existing export definition.
- **name:** Name of the definition.
- **fields:** It has following fields :
 - **sourceField:** It would be one of the column names from source data.
 - **EloquaDestinationField:** Eloqua column name to which sourceField data would map.

Optional Fields: The activity has following optional fields:

- **autoDeleteDuration:** Time until the definition is deleted.
- **dataRetentionDuration:** Time until the staged data is deleted.
- **maxRecords:** Specifies the maximum number of records to export.
- **Filters:** Specifies query criteria used to filter . Filter use the comparison, logic, and existence operators to filter import data based on Eloqua field values. It has following fields:
 - **Filter:** It used to create filter statements.
 - **elename:** It is used to select the data that you want to export.
 - **operator:** It is used to specify a condition.
 - **value:** Value for filter.
 - **AdditionalFilters:** This is used to add more than one filter.
 - **Operator:** The Eloqua Bulk API also supports complex filters that filter based on multiple criteria using the AND, OR, and NOT operators.
 - **Filter:** Use same parameters as defined in the **Filter** section.
- **syncActions:** It specifies additional operations to perform during the export. It has following fields :
 - **action:** It specifies what action to perform. The action can be add, remove, or setStatus.
 - **destination:** It specifies where the action should take place. For add or remove actions, this would be the URI of a list or email group. For setStatus, it might be the URI of an AppCloud Action or Decision service.
 - **status:** Specifies to what the status should be set for a setStatus action. The following status is available:
 - subscribed
 - unsubscribed
 - active
 - complete

- pending
- errored
- yes
- no

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Eloqua Bulk API Update Export Definition activity.

Creating or editing an endpoint for Eloqua Rest API activity

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to Eloqua platform. Eloqua Rest API uses OAuth 2.0 authentication mechanism so as to authorize users to perform operations.

Selecting or editing an Eloqua Rest API endpoint

To select or edit an Eloqua Rest API endpoint:

1. In the **Create Endpoint** or **Edit Endpoint** pane, configure the Eloqua Rest API endpoint as described in the following table.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

2. Click **Test Connection** to confirm that the connection details are valid and you are able to connect to the Eloqua Rest API successfully.

3. Click **OK**.

Table: Connection properties

Field Name	Description
OAuth Access Token	OAuth access token generated from Eloqua Rest API for authentication.
OAuth Refresh Token	OAuth refresh token generated from Eloqua Rest API while generating OAuth Access token.
Application Client ID	The Client Identifier issued to the application during registration.
Application Client Secret	The Client Secret issued to the application during registration.
Application Redirect URL	The Redirect URL issued to the application during registration.

Note: To generate the access token, refer to the Oracle Eloqua Rest API documentation relating to "OAuth2 Authentication Support in Eloqua Rest API".

Custom Objects/ Custom Fields Support

Eloqua supports most of the special characters in the Name for the Custom Objects or its Fields. However, since the connector uses XML based input/output only those Custom Objects would be supported whose names/fields contain following specific special characters:

- . (Dot)
- - (Hyphen)
- _ (Underscore)
- Space “ ” in case of space it will be replaced by double underscore.

Note:

1. Eloqua Rest Connector supports Custom objects/fields if names begin with a letter (alphabet) and can be followed by alphanumeric characters or followed by specific special characters Dot(.), Hyphen(-), Underscore(-), and Space (). Custom Objects having any other special characters in name/fields would be skipped in the Connector.
2. Eloqua Rest Connector does not support Custom objects if their object/field names contains two consecutive underscore.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Eloq_REST_API_custom_objects__custom_fields_.html

Input XML

In the input XML of the Eloqua REST Retrieve Object, two options provided to the user:

1. **RetrieveAll**

It is a Boolean field. If the user wants to fetch all the records of a particular object type, then he should set this parameter as **true**

1. **ID**

If the user sets the RetrieveAll value as false, then he must specify the ID of the record to be fetched. This ID is passed in the **ID** field.

The user can provide multiple ids to be fetched.

Note : RetrieveAll and ID are not applicable for Custom object retrieve. If the user wants to fetch custom object then he/she should provide value in at least one of the searchURL parameters.

Table: URL parameters for Retrieve

Field Name	Description
depth	The REST API can retrieve entities at three different levels of depth "Complete", "Minimal", and "Partial".
count	Maximum number of entities to return. The value can be any whole number between 1 and 1000.
page	Specifies which page of entities to return, and can be any positive whole number. The Count parameter determines the size (number of results) per page.
orderBy	Specifies the name of the property to order the results by, The orderBy format is ASC DESC.
lastUpdatedAt	Filter the result based on the lastUpdatedAt value
id	Identifier for the entity on which to perform the operation This value is actually part of the base URL, and not a URL parameter.
Search	Specifies the search criteria used to retrieve entities.
viewId	Filter the result based on the viewId value.

You have configured the Eloqua REST Retrieve Objects activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the **ID** field in the object in the **To Activity** pane of **Map Inputs**, and select **Expand Occurrences**.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Eloq_REST_API_using_the_eloqua_rest_api_retr.html

Using the Eloqua Rest API Update activity

Use the Update activity to update an Account, Campaign, Contact, Contact List and Contact Segment in Eloqua.

Use this task to update objects in the Eloqua REST instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua REST** folder contents.
2. Drag the **Update** activity icon onto the orchestration. The Eloqua REST Update Object **Checklist** is displayed.
3. In the **Checklist**, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the **Checklist**, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua REST endpoint.
7. Optional: You can create the endpoint by clicking **New** and specifying the required connection details. Click **OK** to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

9. In the **Checklist**, click **Configure**.
10. Click **Browse** to select the object type. The **Browse Eloqua REST** window is displayed.
11. In **Browse Eloqua REST**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
12. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the **Checklist**, click **Retry**. Review the default settings and make the required changes.
14. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Update Objects** activity are displayed as nodes under the request input parameter in the **To Activity** panel.
15. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Eloqua REST Update Objects activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the eObject in the **To Activity** pane of **Map Inputs**, and select **Expand Occurrences**.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_emailactivities.html

Creating or editing an email endpoint

Studio and the Integration Appliance use the connection information that email endpoints provide to connect to POP3 or SMTP servers.

Note: For some email systems, the POP3 server and the SMTP server can have the same name, for example: mail.acmecompany.com.

Note: *Email connector base library is changed from V7.5 and because of this user might see a difference in the way attachments were retrieved separately using ReadMime and other activities. User has to re verify the values obtained from the headers and use / map them appropriately if they see and difference in the output*

Creating or editing an email endpoint

1. In the Create Endpoint or Edit Endpoint pane, configure the fields as described in the following table.
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. When complete, click Test Connection to confirm that you can connect to the POP3 or SMTP server. The **Get Email** activity connects to a POP3 server while the **Send Email** activity connects to a SMTP server.
3. Click OK.

Table 1.

Field Name	Description
Location	^
Get Email From Server	Get Email activity - The Get Email From Server option is automatically selected for an email endpoint used with the Get Email activity. During run time, the Get Email activity gets email from the specified POP3 server.
Send Email To Server	Send Email activity - The Send Email To Server option is automatically selected for an endpoint used with the Send Email activity. During run time, the Send Email activity sends email to the specified SMTP server.
Host Name	Get Email activity - The Host Name or IP address for the POP3 server. Send Email activity- The Host Name or IP address for the SMTP server.
Port	Specify the port number to access the POP3 or SMTP Server. By default, the port for a POP3 server is 110. ^
Login	^

Field Name	Description
User Name and Password not required	<p>Get Email activity - This is option not available for an endpoint of a Get Email activity. You must specify a User Name and Password for an email endpoint used with the Get Email activity.</p> <p>Send Email activity - Select this option if you want connect to the SMTP server using an anonymous login instead of a username and password. Select this option only if SMTP server the supports anonymous logins (where a user account is not required).</p>
Log In to the Server Using a User Name and Password	<p>Get Email activity - This option is automatically selected for an email endpoint used with the Get Email activity. To connect to the POP3 server using a user account, you must enter values into the User Name and Password fields to specify the account used to connect to the POP3 Server.</p> <p>Send Email activity - Select this option to connect to the SMTP server using a user account. If this option is selected, you must enter values into the User Name and Password fields for the account used to connect to the SMTP Server.</p>
User Name	<p>Get Email activity - Enter the User Name for the account used to connect to the POP3 Server.</p> <p>Send Email activity - Enter the User Name for the account used to connect to the SMTP Server.</p>
Password	<p>Get Email activity - Enter the Password for the account used to connect to the POP3 Server.</p> <p>Send Email activity - Enter the Password for the account used to connect to the SMTP Server.</p>
Security	<p> <input type="checkbox"/> </p>
Normal Email	Specifies that email runs without SSL.
Email over SSL	Specifies that email runs with SSL. For more information, see Testing an SSL email connection .
Implicit or Explicit	Implicit means that SSL is turned as soon as a connection is made. Explicit requires that the client issue a command to the server requesting that SSL be used.
Client Certificate Alias Name	Specifies the client alias used to access the trusted certificate in the keystore. Must be enabled for client authorization by the server. By default, when you select the Client Certificate Alias Name option, Studio provides the following name: Factory Supplied Identity. The alias name you specify in this field should match the value you created when creating the certificate in the keystore.

Field Name	Description
Additional Parameters	<p>Specifies additional parameters for SMTP processing. The following table lists the parameters:</p> <p>smtpNewConnEveryTime Default: false Description: Specifies creation of a new connection everytime. If set to true, does not use a connection pool</p> <p>smtpPoolMinConnections Default: 1 Description: Connection pool option - Minimum Connections</p> <p>smtpPoolMaxConnections Default: 25 Description: Connection pool option - Maximum Connections</p> <p>smtpPoolMaxIdleTime Default: 7200 Description: Connection pool option - Maximum Idle Time in seconds</p> <p>smtpPoolMaxWaitTime Default: 300 Description: Connection pool option - Max Wait Time in seconds</p> <p>smtpPoolReclaimConnections Default: 60 Description: Connection pool option - Reclaim Connections Time in seconds</p>
^	<p>When using Get Email, choose a polling frequency so that the email server does not close the connection between polls (GetMail activity > Delivery Rules). Some email servers will lock the account or not permit log in if there are frequent openings and closings of connections. Read your email providers documentation to ensure that you set the properties correctly for your email server. To enable a connection pool, you must first set <code>smtpNewConnEveryTime</code> to false, and then set the required connection pool properties.</p>
Connection Timeout	^

Field Name	Description
Time out after ___ second(s) when establishing a connection to the endpoint.	<p>Specifies the number of seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For email activities, the amount of time the Integration Appliance attempts to establish a connection to the SMTP or the POP3 server before timing out.</p> <p>A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an endpoint and the time it takes the endpoint to respond.</p> <p>You set the activity timeout in Retry task of the Get Email activity or Send Email activity.</p>

Parent topic: [Email Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
 file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/email_create_edit_endpoint.html

Get Email activity

The **Get Email** activity is a starter activity. When an orchestration that starts with an **Get Email** activity is deployed to the Integration Appliance, the Integration Appliance polls the POP3 server for email message or messages for the specified account at the specified interval.

Note: The Get Email activity requires the POP3 server to support the TOP and UIDL commands. While these are optional in the POP3 protocol, most servers will support these.

The polled POP3 server and email account is defined in the email endpoint associated with the **Get Email** activity.

During run time, the **Get Email** activity polls a POP3 server for incoming email messages of a particular email account, as shown in the following diagram.

Figure 1.

If any email messages are found the following action occurs for each email message: The regular expression defined for the **Subject** field is checked against the subject of the incoming mail message and the regular expression defined for the **From** field is checked against the sender email account of the incoming mail message. If both regular expressions match, an orchestration job is created to process the email, and the mail is marked for deletion on POP3 Server. When the process is completed, the email is deleted from the POP3 server. For more information about regular expression matching, see the [Configuring the activity](#) procedure. Note: Two **Get Email** activities should not poll from the same POP3 server at the same time using the same email account even if the regular expressions specified in the **Configure** task of the activity are different. If two **Get Email** activities are attempting to get email using the same email account, when the first **Get Email** activity process the email from the POP3 server and removes the email from the server, the second **Get Email** activity keeps retrying to retrieve the email from the POP3 server and the following exception may be thrown:

```
Protocol exception: com.jscape.inet.pop.PopException:
Error in TOP 671 0: -ERR The requested message is no
longer available; it may have been deleted.
```

Accessing an email message attachment

To access the attachment of a incoming email message, you must add a **Read MIME** activity in the orchestration after the **Get Email** activity as shown in the preceding figure. In addition, you must map the two output parameters of the **Get Email** activity to variables in the orchestration and then map those variables to the input parameters of the **Read MIME** activity. During run time, the **Read MIME** activity reads the MIME Header and the body of the message and then breaks up the attachments contained in the body of the message and places the result into the parts XML output parameter. For more information, see **Read MIME Activity**.

Adding a Get Email activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the **Activities** tab and expand the Email folder.
3. Drag the **Get Email** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

Creating, selecting, or editing an email endpoint

1. Click Pick Endpoint task from the **Checklist** and choose from one of the following actions:
 - o Select an existing endpoint:
 - a. Select Browse. The Project Explorer is displayed.

- b. Select an existing endpoint and click OK. Complete the [Configuring the activity](#) steps.
 - o Select an existing endpoint and edit the endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK.
 - c. Click Edit. The **Edit Endpoint** pane is displayed.
 - o Create a new endpoint: Select New. The **Create Endpoint** pane is displayed.
2. Create or edit an email endpoint. For more information, see [Creating or editing an email endpoint](#).

Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields in this pane as described in the following table. In this task, you specify the regular expressions used to match against the Subject and From fields of polled email messages. A regular expression must be specified for both of these fields, even if the regular expression is equal to *, which means that all strings match. In order for an incoming mail to be processed, both the Subject and the From strings of the mail must match their respective regular expressions. In each of the regular expression fields, the following wildcards are supported:
 - o * (asterisk) - for zero or more characters
 - o ? (question mark) - for zero or one character

Table 1.

Field	Description
Subject matches	Enter a regular expression that matches the subjects of email messages that start an orchestration job to process the email message. In the regular expression, you can specify a combination of characters and wildcards.
From matches	Enter a regular expression that defines the sender email address of the email messages that start an orchestration job to process the email message. In the regular expression, you can specify a combination of characters and wildcards.

The following table shows some example regular expressions and the result of matching the regular expressions to sample text.

Table 2.

Regular Expression	Sample Text	Result
test	test	matches
test	ttttesttt	matches
test	test	matches
test	ttttesttt	does not match, has to exactly match the regular expression string: test
test	est	does not match, has to exactly match the regular expression string: test
?est	test	matches
?est	best	matches
?est	est	matches

Specifying the delivery rules

1. Select the **Delivery Rules** task from the **Checklist**. The Delivery Rules pane is displayed.
2. Specify the time interval to poll the POP3 server for new email messages:
 - a. Select a time unit from the menu: seconds, minutes, hours, or days.
 - b. Specify the amount of time using one of the following input options:
 - By clicking in the Poll for changes every field and entering a new value.
 - Using the up and down arrows.

For more information, see [Polling interval behavior](#).

Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to a POP3 server. The following table defines the retry options for a connection to an POP3 server:

Table 3.

Field	Description
Retry	^
1) Wait — secon d(s) betwe en each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the POP3 server.
2) Try to conne ct __ times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the POP3 server before issuing an error.</p> <p>If an orchestration that starts with a Get Email activity is deployed and the Integration Appliance cannot connect to the specified POP3 server, the Integration Appliance logs the connections errors as warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system log, resets the connection error count to zero, and continues to attempt to establish a connection to the POP3 server.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as Warnings. The Integration Appliance logs the fourth connection error as an error and resets the connection error count to zero. Therefore, the fifth connection error generates a warning in the system log. The Integration Appliance continues to attempt to establish a connection to the POP3 server.</p>

Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane.
2. In this task, you map the **mailheader** (of type XML) and **body** (of type string) output parameters to variables. You must map the output parameters of the activity in order for the orchestration to be valid. See [Creating a map](#) for general instructions on mapping. The **mailheader** output parameter contains meta information about the email message, for example the email addresses that the message is being sent to and the MIME header of the message itself. The **body** output parameter contains the body of the email message and associated attachments.

CAUTION:

The order of the attachments and the body in the body output depend on the email client that sent the message and the type of message (plain text or HTML).

Note: When using a non-English payload, the **mailheader**, **mimeHeader** and **otherheaders** need to be mapped into the orchestration in the getEmail activity, and mapped from the orchestration back into the sendMail activity.

Parent topic: [Email Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/email_get_activity.html

Send Email activity

An orchestration that contains the **Send Email** activity is acting as an email client during run time.

The **Send Email** activity connects to the SMTP server, and sends a message to the server as shown in the following figure.

Figure 1.

The steps for adding and configuring a **Send Email** activity are described in the following procedures.

Adding a Send Email activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the **Email** folder.
3. Drag the **Send Email** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

Creating, selecting, or editing an email endpoint

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:

- Select an existing endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK. Complete the [Configuring the activity](#) steps.
 - Select an existing endpoint and edit the endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK.
 - c. Click Edit. The Edit Endpoint pane is displayed.
 - Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an email endpoint. For more information, see [Creating or editing an email endpoint](#).

Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields in this pane as described in the following table:

Table 1.

Field	Description
From Address	Specifies the sender address for the email message. You must specify the email address using the standard email format: <code>email@domain.extension</code> . This field is required.
To	Specifies the recipient's addresses for the email message. You must specify the email addresses using the standard email format: <code>email@domain.extension</code> . One or more addresses can be specified. Separate the addresses with commas or semicolons. You must specify at least one address. This field is required.
CC	Specifies the carbon copy's addresses for the email message. You must specify the email addresses using the standard email format: <code>email@domain.extension</code> . One or more addresses can be specified. Separate the addresses with commas or semicolons. This field is optional.
Subject	Specifies the subject of the email message.

Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an SMTP Server. The following table describes the retry options for connecting to an SMTP Server:

Table 2.

Field	Description
Retry	⌘
1) Wait ___ second (s) between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the SMTP Server.

Field	Description
2) Try to connect ___ times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the SMTP Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an Send Email activity and the Integration Appliance cannot connect to the specified SMTP Server, the Integration Appliance logs the connections errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

À

Mapping the input of the activity

1. Select the **Map Inputs** task in the **Checklist**. The input parameters of the activity are displayed in the To Activity pane.
2. In this task, you map variables to the following input parameters of the activity:
 - o The **body** input parameter contains the body of the email message and associated attachments. The **body** input parameter is of type string. You must map a variable or assign a default value to the **body** input parameter.
 - o The optional **mailheader** input parameter contains meta information about the email message, for example the email addresses that the message is being sent to and the **mimeHeader** of the message itself. The **mailheader** input parameter is optional, you do not have to map a variable or assign default values to the **mailheader** input parameter.

If the optional **mailheader** input parameter is not listed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active.

You can optionally override the settings you specified in the **Configure** task of the **Checklist** dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the setting for the From Address field by mapping a variable to the from node of the **mailheader** input parameter. During run time, the value of the variable is the from address in the sent email message.

Table 3.

Nodes of the mailheader Input Parameter	Description	Overrides what settings in the Configuring task? À
from	Specifies the sender address for the email message. You must specify the email address using the standard email format: email@domain.extension.	The from node of the mailheader input parameter overrides the From Address field specified in the Configure task.

Nodes of the mailheader Input Parameter	Description	Overrides what settings in the Configuring task? Å
to	Specifies the recipient addresses for the email message. You must specify the email addresses using the standard email format: email@domain.extension. One or more addresses can be specified. Separate the addresses with commas or semicolons.	The to node of the mailheader input parameter overrides the To field specified in the Configure task.
cc	Specifies the carbon copy addresses for the email message. You must specify the email addresses using the standard email format: email@domain.extension. One or more addresses can be specified. Separate the addresses with commas or semicolons.	The cc node of the mailheader input parameter overrides the CC field specified in the Configure task.
subject	Specifies the subject of the email message.	The subject node of the mailheader input parameter overrides the Subject field specified in the Configure task.
mimeHeader	Specifies the MIME header of the email message.	None.
otherHeaders	Specifies an element that contains a set of MIME headers as name/value pairs not already specified in the mimeHeader node. For example the MIME header: Content-Location is not specified in the MIME header, so the following headerItem node could be equal to the following values: otherheaders/headerItem/name is equal to Content-Location otherHeaders/headerItem/value is equal to the value of the Content-Location MIME header, for example the string: RN-Preamble Multiple MIME headers can be specified, so this is a recurring node.	None.

Note: You can use the **Write MIME** activity to build the contents of the **mimeHeader** node of the optional **mailheader** input parameter. For example, you could add a **Write MIME** activity to the orchestration before the **Send Email** activity and have the **Write MIME** activity populate the contents of the **mimeHeader** XML variable and then pass the **mimeHeader** variable to the **Send Email** activity.

See [Creating a map](#) for more information

Note: When using a non-English payload, the **mailheader**, **mimeHeader** and **otherheaders** need to be mapped into the orchestration in the **getEmail** activity, and mapped from the orchestration back into the **sendMail** activity.

Testing an SSL email connection

After creating an endpoint for an email server, you must import the CA certificate for the email server into Studio and then test the SSL connection to the email server.

About this task

Complete the following procedure to import the email servers CA certificate and then test the SSL connection to the email server:

Procedure

1. Open a command window.
2. Navigate to the email server, and locate the certificate file `ca-cert` stored in the server.
3. Copy this file and then navigate to the workstation where Studio is installed.
4. Using the command window, paste the `ca-cert` copy in the home directory of Studio: `C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x`
5. Browse to the security directory of Studio: `C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x\security`
6. Run the following command to import the `ca-cert` file into Studio: `..\jre\bin\keytool.exe -import -v -keystore cacerts -storepass changeit -file ..\castiron_ca_cert.pem -alias alias_name` Where *alias_name* is the alias of the email servers CA certificate.
7. When you are prompted for a yes or no, enter 'Y'.
8. Exit the command window.
9. Open the endpoint for the email server.
10. Verify the following login credentials for the email connection: Email server, Port, User, and Password.
11. Click Test Connection.
12. If the connection is successful, use this endpoint in Studio orchestrations, then use the Verify tab features to evaluate the orchestration.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_forceBulkAPIactivities.html

Preparing Data for the Force.com Bulk API connector

The Force.com Bulk API connector supports both XML and CSV input data. Following are the details to prepare data for these formats.

Preparing data for XML input

If you are using the XML data as input to the Force.com Bulk API connector, you can either create an XML schema, which can be mapped to the Force.com Bulk API activity or directly map from the previous activity's result to Force.com Bulk API activities.

Force.com Bulk API connector supports CSV input data from connector version 2.2. If you have the CSV data, you can directly map the CSV content to Force.com Bulk API activities. To do so, Force.com Bulk API connector activities expose two new fields, `object` and `data`, in the Map Inputs section. You must map the CSV content to `data` field and provide the selected object name in the `object` field.

Following is the sample for the CSV data, for Account object.

```
Name,BillingStreet,BillingCity,BillingState,BillingCountry  
XYZ,vvnagara,Bangalore,KA,India
```

Note:

1. In the CSV data, the first line must contain comma separated field names of the selected object, and from the second line, the actual data must be populated.
2. The order of the data fields must match that of the header field names.

Creating a Force.com Bulk API endpoint

Force.com Bulk API endpoints contain the connection information that studio and the Integration Appliance use to connect to the Salesforce.com server. You can create multiple endpoints that refer to separate instances.

About this task

Use this task to create or edit an Force.com Bulk API endpoint.

Note:

Any changes you make to the Force.com Bulk API endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

Procedure

1. Drag an activity from the Force.com Bulk API folder in the Activities tab to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
 - a. Browse - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
 - b. New - To create a new endpoint. The Create Endpoint window opens.
 - c. Edit - To edit the existing endpoint. The Edit Endpoint window opens.
4. Complete the fields defined in the following table:

Table 1. Connection Details

Field Name	Description
Connection Details	
User Name	Specifies the user name to connect to the Salesforce.com server.
Password	Specifies the password associated with the user name to connect to the Salesforce.com server.
URI	Specifies the host URI of the Salesforce.com instance

5. When finished, click Test Connection to confirm that you can connect to the Force.com Bulk API system.
6. Click OK.

Specifying the Retry options for Force.com Bulk API activities

Specifying the Retry parameters is one of the tasks to configure an Force.com Bulk API activity.

About this task

Use this task to configure the retry options for configuring Force.com Bulk API activities. The Force.com Bulk API connector uses a single login session for all connections to a Force.com Bulk API endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

Procedure

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry and timeout options for connecting to an Force.com Bulk API instance, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ second(s) between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Force.com Bulk API instance.
Try to connect __ times before failing.	<p>Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the Force.com Bulk API instance before issuing an error and stopping the processing of the current orchestration job.</p> <p>Note: If you deploy an orchestration that contains the Force.com Bulk API activity and the Integration Appliance cannot connect to the specified Force.com Bulk API instance, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>
Activity Timeout	
Timeout after _____ second(s) when the endpoint does not respond to a request.	Specifies the number of seconds the Integration Appliance waits before timing out, when the endpoint does not respond to a request. The default is 300 seconds.

Using the Force.com Bulk API Batch Insert activity

Use the Force.com Bulk API Batch Insert activity to insert or create a large number of objects in Salesforce.com.

About this task

Use this task to insert or create a large number of objects in Salesforce.com. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the Force.com Bulk API folder contents.
2. Drag the Batch Insert activity icon onto the orchestration. The Force.com Bulk API Batch Insert Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Force.com Bulk API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
Note: For more information, see [Creating a Force.com Bulk API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Force.com Bulk API window is displayed.
11. In Browse Force.com Bulk API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Force.com Bulk API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Batch Insert activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

Results

You have configured the Force.com Bulk API Batch Insert activity.

Using the Force.com Bulk API Batch Update activity

Use the Force.com Bulk API Batch Update activity to update a large number of objects in Salesforce.com.

About this task

Use this task to update a large number of objects in Salesforce.com. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the Force.com Bulk API folder contents.
2. Drag the Batch Update activity icon onto the orchestration. The Force.com Bulk API Batch Update Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Force.com Bulk API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
Note: For more information, see [Creating a Force.com Bulk API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Force.com Bulk API window is displayed.
11. In Browse Force.com Bulk API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Force.com Bulk API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Batch Update activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

Results

You have configured the Force.com Bulk API Batch Update activity.

Using the Force.com Bulk API Batch Upsert activity

Use the Force.com Bulk API Batch Upsert activity to update and insert a large number of objects in Salesforce.com.

About this task

Use this task to update and insert a large number of objects in Salesforce.com. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the Force.com Bulk API folder contents.
2. Drag the Batch Upsert activity icon onto the orchestration. The Force.com Bulk API Batch Upsert Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Force.com Bulk API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
Note: For more information, see [Creating a Force.com Bulk API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Force.com Bulk API window is displayed.
11. In Browse Force.com Bulk API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.

12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Force.com Bulk API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Batch Upsert activity are displayed as nodes under the request input parameter in the To Activity panel. Note: The *externalIDFieldName* identifies whether a record must be updated or inserted. If you specify a value for the *externalIDFieldName*, then the record is updated in Salesforce.com. If there is no value set for *externalIDFieldName*, a record is inserted in Salesforce.com.
15. Create a map between the orchestration variables and the input parameter of the activity. Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

Results

You have configured the Force.com Bulk API Batch Upsert activity.

Using the Force.com Bulk API Batch Delete activity

Use the Force.com Bulk API Batch Delete activity to delete a large number of objects in Salesforce.com.

About this task

Use this task to delete a large number of objects in Salesforce.com. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the Force.com Bulk API folder contents.
2. Drag the Batch Delete activity icon onto the orchestration. The Force.com Bulk API Batch Delete Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.

6. Click Browse and use the Project Explorer dialog box to select the relevant Force.com Bulk API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
Note: For more information, see [Creating a Force.com Bulk API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Batch Delete activity are displayed as nodes under the request input parameter in the To Activity panel.
Note: The input data for the delete activity is a list of IDs and the object name. All the objects that match the object name and ID are deleted from Salesforce.com.
10. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

Using the Force.com Bulk API Get Batch Status activity

Use the Force.com Bulk API Get Batch Status activity to get the status of an individual batch or the status of all the batches that are part of the job in Salesforce.com.

About this task

Use this task to get the status of an individual batch or the status of all the batches that are part of the job in Salesforce.com. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the Force.com Bulk API folder contents.

2. Drag the Get Batch Status activity icon onto the orchestration. The Force.com Bulk API Get Batch Status Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Force.com Bulk API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
Note: For more information, see [Creating a Force.com Bulk API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get Batch Status activity are displayed as nodes under the request input parameter in the To Activity panel.
Note: The Bulk API activities return JobInfo, which contains JobId. The job ID can be used to invoke the *getBatchStatus* or *getBatchResult* activities.
10. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

FTP Activities

- [Creating or Editing an FTP endpoint](#)
FTP endpoints provide the connection information that Studio and the Integration Appliance use to connect to FTP Servers.

- [Configuring the FTP endpoint for the Parse Directory Listing Example](#)
To run the Parse Directory Listing Example in your environment, configure the values of the configuration properties used by the FTP Endpoint to point to your FTP Server. In addition, your FTP Server must produce the directory listing in the same format as expected by the Flat File Schema.
- [FTP Poll Directory activity](#)
During run time, the FTP Poll Directory activity connects to FTP Server and polls for the existence of the specified file or files at the specified location. After reading the contents of the file or files and mapping the contents into variable or variables of the orchestration, the **FTP Poll Directory** activity may delete the file or files, move the file or files, or leave the file or files in the directory of the FTP Server.
- [FTP Put File activity](#)
During run time, the **FTP Put File** activity takes data from variables of the orchestration, places the data into a file, and connects to an FTP Server and places the file in the specified directory location.
- [FTP Get File activity](#)
During run time, the **FTP Get File** activity connects to an FTP Server and attempts to get a single file at the specified location. You can configure the **FTP Get File** activity to return the contents of the file into a variable of the orchestration. In addition, you can configure the **FTP Get File** activity to return the timestamp of the file returned by the FTP Server into a variable of the orchestration.
- [FTP Delete File activity](#)
Use the the **FTP Delete File** activity to delete specific files from the specific directories, during run time.
- [FTP List Files activity](#)
During run time, the **FTP List Files** activity connects to an FTP Server and generates a list of files from the specified directory location using the specified regular expression. The **FTP List Files** activity returns the list of files to the orchestration using either the directoryListing or fileListing output parameter.
- [FTP Rename File activity](#)
Use the **FTP Rename File** activity to rename and/or move a file to a different directory, during run time.
- [Parse directory listing example](#)
This example gets a directory listing from and FTP directory using the **FTP List Files** activity, parses the long directory listing using Flat File Scheme, iterates through the list of files, based on the properties of each file.
- [Testing an FTPS server connection](#)
After successfully running a "test connection", you can use Studio verify tools on FTPS orchestrations before publishing a project.

Creating or Editing an FTP endpoint

FTP endpoints provide the connection information that Studio and the Integration Appliance use to connect to FTP Servers.

1. In the Create Endpoint or Edit Endpoint pane, configure the fields as described in the following table.
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project as the edits are global, not local.

2. When you had entered the field values, click Test Connection to confirm that you can connect to the FTP Server.
3. Click OK.

Table 1.

Field Name	Description
Location	Â
Host Name	Specifies the Host Name or IP address for the FTP Server.
Port	Specifies the port number for the specified host name. The default is 21, the standard port for FTP traffic. The default port for SFTP traffic is 22.
Login	Description
Log into the Server as an Anonymous User	This option is only available with the Normal FTP option. Select this option only if the FTP Server allows anonymous logins (where a user account is not required).
Log into the Server with User Name and Password	Select this option to specify a user account to log in into the FTP Server. Enter the user name and password for the account used to connect to the FTP Server.
Security	Description
Normal FTP	Select the Normal FTP option for an unsecured connection.
Secure FTP	Select the Secure FTP option to secure the communication between the Integration Appliance and the FTP Server by sending and receiving the data over SSH. The SSH File Transfer Protocol (SFTP) is a network protocol that provides file transfer over a reliable data stream. Note: Certificate authentication for SFTP is not supported.

Field Name	Description
FTPS	<p>Select the FTPS option to secure the communication between the Integration Appliance and the FTP Server using the SSL protocol. The SSL protocol supports mutual authentication between the Integration Appliance and FTP Server using an authenticated and encrypted connection. Choose one of the following authentication modes:</p> <ul style="list-style-type: none"> • Implicit • Explicit (SSL) - Starts an FTP session and uses SSL security to authenticate an endpoint and encrypts data before transfer. • Explicit (TLS) - Starts an FTP session and uses TLS security to authenticate the endpoint and encrypts data before transfer. <p>Important: Before you can deploy a project using FTPS, you must upload and register a certificate on the Integration Appliance. For more information about uploading and registering a certificate, see the CLI Command Reference.</p>
Client Certificate Alias Name	<p>When the FTPS server is configured to authenticate a client, select this option and specify a client certificate alias name. By default, when you select the Client Certificate Alias Name option, Studio provides the following name: <code>Factory Supplied Identity</code></p> <p>The client certificate alias name that you specify in this field should match the value you specified for the client certificate name using the Cast Iron® command line interface (CLI), when you uploaded or imported the certificate. In the CLI, if you mapped the client certificate name to the default alias name, accept the default name that Studio provides and configure the Connection Timeout for the endpoint.</p>
FTP Mode	<p>Description</p> <p>If your FTP Server supports Active mode transfers, you can configure an FTP endpoint in Studio to use the Active mode to transfer data to and from an FTP Server and the Integration Appliance. By default, FTP endpoints support passive mode transfers.</p> <p>Note: Active mode is not supported for SFTP.</p>
Active FTP	<p>Select this option to enable the Active mode. When you enable the Active mode option, you can specify the external IP and port range for incoming connections. By default, this option is not selected and the FTP endpoint supports passive mode transfers.</p>
External IP	<p>(Optional) Specifies the client IP address from which the FTP Server will respond to connection attempts.</p>
Port Range/Start Port	<p>(Optional) Specifies the lowest port number of the predetermined range assigned to incoming connections. If you enter a start port number, you must also enter the end port number.</p> <p>Important: This number cannot be less than 1024.</p>
Port Range/End Port	<p>(Optional) Specifies the highest port number of the predetermined range assigned to incoming connections. If you enter an end port number, you must also enter the start port number.</p> <p>Important: This number cannot be greater than 65535.</p>
Connection Timeout	<p>Description</p>

Field Name	Description
Time out after ___ second(s) when establishing a connection to the Endpoint.	<p>The number of seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For an FTP activity, the amount of time the Integration Appliance attempts to establish a connection to the FTP Server before timing out. A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an endpoint and the time it takes the endpoint to respond. You set the activity timeout in Retry task of the following FTP activities:</p> <ul style="list-style-type: none"> • FTP Poll Directory activity • FTP Put File activity • FTP Get File activity • FTP Delete File activity • FTP List Files activity • FTP Rename File activity

Note: For some of the fields in the endpoint, you can define configuration properties to supply the values for these fields. The

is displayed when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.

Configuring the FTP endpoint for the Parse Directory Listing Example

To run the Parse Directory Listing Example in your environment, configure the values of the configuration properties used by the FTP Endpoint to point to your FTP Server. In addition, your FTP Server must produce the directory listing in the same format as expected by the Flat File Schema.

About this task

Complete following steps only if you plan on running the Parse Directory Listing Example:

- [To edit and test the FTP configuration properties of the FTTParseDirListingExample in Studio](#)
- [To configure the root directory of the FTP Server](#)
- [To determine if your FTP Server generates the file listing in the same format as the Flat File Schema included in this example](#)
- [To run the FTTParseDirListingExample](#)

To only view and learn more about the example, complete the procedure in the [Parse Directory Listing Example](#) section.

Edit and test the FTP configuration properties of the FTPParseDirListingExample in Studio:Â

Procedure

1. Open **FTPParseDirListingExample**. For instructions see steps 1-2 in [Parse Directory Listing Example](#).
2. From the toolbar menu, select Project > Configuration Properties. The Configuration Properties dialog box is displayed.
3. Edit the values of the properties to reflect your FTP Server.
4. In the Project tab, double-click the FTP Endpoint. The FTP Endpoint tab is displayed.
5. To verify that you entered the correct FTP information, click Test. If Studio connects to your FTP Endpoint, an Information dialog box is displayed with the message that you have successfully connected to the endpoint.
6. In the Project tab, double-click on the **processBids** orchestration. The **processBids** orchestration tab is displayed.

What to do next

Configure the root directory of the FTP Server:

1. Add the additional directories to your FTP Server. Mirror the directory structure and also provided in the FTPServerDirStructure directory. If you accepted the defaults during the installation of Studio, this directory is located in the following location: C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\FTPParseDirListing\FTPServerDirStructure
During run time, the Parse Directory Listing Example expects the root directory of the FTP Server to contain the following directory structure:

```
\input
\processFailed
\processWidgetRUs
\processAcmeInc
\processNewCompany
```

2. Move a copy of the bid*.txt files to the \input directory on your FTP Server. If you accepted the defaults during the installation of Studio, these files provided in the following directory location: C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\FTPParseDirListing\FTPServerDirStructure\input
Before running the example, a copy of the following files must be located in the \input directory of the FTP Server.
 - o bidAcmeInc.txt
 - o bidCrankCo.txt
 - o bidWidgetRUs.txt
 - o bidBudgetManufacture.txt
 - o bidSamAndSons.txt

Determine if your FTP Server generates the file listing in the same format as the Flat File Schema included in this example:

1. Open **FTPParseDirListingExample**. For instructions see steps 1-2 in [Parse Directory Listing Example](#).
2. In the Project tab, double-click the **processBids** orchestration. The **processBids** orchestration tab is displayed.
3. Click the **FTP List Files** activity labeled List Files Full Dir Listing.
4. Click Test.
5. Determine if the format of the directory listing matches the following directory listing:

```

-rw-r--r--  1 551  65 May  3 11:39
bidAcmeInc.txt
-rw-r--r--  1 551  43 May  3 11:39
bidBudgetManufacture.txt
-rw-r--r--  1 551  0 May  3 11:39
bidCrankCo.txt
-rw-r--r--  1 551  73 May  3 11:39
bidSamAndSons.txt
-rw-r--r--  1 551  33 May  3 11:39
bidWidgetRUs.txt

```

If the directory format is different, you can alter the Flat File Schema called **parseDirListing**.

CAUTION:

Changing the nodes of the Flat File Schema may affect other entities in the orchestration. You may need to update the orchestration to reflect these changes.

For more information, see [Flat File Schema Editor Overview](#).

To open the Flat File Schema used in this example, in the Project tab, double-click on the parseDirListing in the Flat File Schema folder. Copy and paste the output of the Test button of the **FTP List Files** activity to a file and then open the file in the Test tab of the Flat File Schema Editor. Change the nodes of the Flat File Schema to reflect the directory listing. The size node is used by the "If size less or equal 0" branch of the **If..Then** activity. Make sure a value is provided for the size node during run time.

Run the FTPParseDirListingExample:

1. From Studio, publish the **FTPParseDirListingExample** project. From the Studio toolbar, select File > Publish Project... .
2. From the Web Management Console (WMC), deploy the **FTPParseDirListingExample** project. For more information, see the WMC Online help or Step 11: Publish and Deploy the Completed Integration Project in the **Developing the BookOrder Project** section of the **Getting Started Guide**.

Feedback | Notices

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring_the_FTP_Endpoint_for_the_Parse_Directory_Listing_Example.html

FTP Poll Directory activity

During run time, the FTP Poll Directory activity connects to FTP Server and polls for the existence of the specified file or files at the specified location. After reading the contents of the file or files and mapping the contents into variable or variables of the orchestration, the **FTP Poll Directory** activity may delete the file or files, move the file or files, or leave the file or files in the directory of the FTP Server.

The FTP Poll Directory activity is a starter activity. When an orchestration that starts with an **FTP Poll Directory** activity is deployed to the Integration Appliance, the Integration Appliance polls for file or files to be added to a specific directory on the FTP Server. When a file or files is shown on the FTP Server, an orchestration job is

started to processes the file or files and the rest of the activities in the orchestration. For more information, see [Polling Interval Behavior](#). For an example of an orchestration using the **FTP Poll Directory** activity, see the **Getting Started Guide**.

Depending on your application requirements, you can process a list of files in an FTP directory using one of the following methods:

- For some cases, you can use only the **FTP Poll Directory** activity to process a set of files found in an FTP directory.
- In other cases, you must use the **FTP List Files** activity in conjunction with the **FTP Get File**, **FTP Put File**, **FTP Delete File**, and **FTP Rename File** activities.

Use the **FTP Poll Directory** activity to process a set of files found in an FTP directory when the following conditions are true:

- **The FTP Poll Directory activity supports the format of the directory listing of your FTP Server.** - The format of directory listings are different for the FTP Servers supported on different operating systems. The **FTP Poll Directory** activity supports many types of FTP Servers but if the directory listing format your FTP Server cannot be parsed by the **FTP Poll Directory** activity, use the **FTP List Files** activity with a Flat File Schema and the **FTP Get File**, **FTP Put File**, **FTP Delete File**, and **FTP Rename File** activities, to provide the same functionality as the **FTP Poll Directory** activity as shown in the Parse Directory Listing Example: [Parse directory listing example](#).
- **After reading each file in the list, each file in the list can be post-processed with the same action.** - For example, while processing a set of files from a FTP directory, if each file in the list can be moved to the same directory, you can use the **FTP Poll Directory** activity to process the set of files. If however, you need to process a different action based on the properties of a file, you must use the **FTP List Files** activity in conjunction with the **FTP Get File**, **FTP Put File**, **FTP Delete File**, and **FTP Rename File** activities. For example, if you must move files to different directories based on the filename, use the **FTP List Files** activity in conjunction with the **FTP Get File**, **FTP Put File**, **FTP Delete File**, and **FTP Rename File** activities as shown in the Parse Directory Listing Example: [Parse directory listing example](#).

Symbolic links

The support for symbolic links by the **FTP Poll Directory** activity during run time is dependent on the following factors: Â

- The types of symbolic links supported by operating system that hosts the FTP Server.
- The types of symbolic links supported by the FTP Server itself.
- The types of symbolic links supported by the **FTP Poll Directory** activity, as listed in the following table:

Table 1.

Symbolic Links to...	Hard Symbolic Links	Soft Symbolic Links	NotesÂ®
Files	Not Supported	Not Supported	The FTP Poll Directory activity does not interpret symbolic links to files as files and therefore symbolic links to files are not processed by the FTP Poll Directory activity during run time.
Directories	Supported	Supported	Â

To determine the specific symbolic link support for a specific FTP Server on a specific operating system, see your operating system and FTP Server documentation.

Persistence

You might want to enable persistence for an orchestration that contains an **FTP Poll Directory** activity. For example, if you disable persistence and have an orchestration job with an **FTP Poll Directory** activity with the Keep in place option selected, during run time if a failure occurs that causes the job to stop, when the orchestration is restarted it processes the file again. The state of the job is lost and Integration Appliance does not know that it has already processed the file. For more information, see [Enabling persistence](#).

Processing subdirectories with the Microsoft FTP Endpoint

For the Microsoft IIS (Internet Information Services) FTP Endpoint, the run time behavior of the **FTP Poll Directory** activity when processing subdirectories and the files in subdirectories depends on the regular expression specified in the File Named field of the Configure task of the activity, as described in the following cases:

- When the regular expression is equal to the string: *, the orchestration job processes the subdirectories in the specified directory.
- When the regular expression is equal to the string: *.* , the orchestration job does not process the subdirectories in the specified directory.
- When the regular expression is blank, the orchestration job does not process the subdirectories in the specified directory

Adding an FTP Poll Directory activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the FTP folder.
3. Drag the **Poll Directory** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

Creating, selecting, or editing an FTP endpoint

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:
 - Select an existing endpoint:
 - a. Select Browse. The Project Explorer is displayed.
CAUTION:
Specifying a new FTP endpoint with a different directory structure than the original FTP endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the "Configure the activity" procedure.
 - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
 - Select an existing endpoint and edit the endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK.
CAUTION:
Specifying a new FTP endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the "Configure the activity" procedure. Click Edit. The Edit Endpoint pane is displayed.
 - Create a new endpoint: Select New. The Create Endpoint pane is displayed.

2. Create or edit an FTP endpoint.

Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields in this pane as described in the following table:

Table 2.

Field	Description
File Name	<p>Specifies a pattern or regular expression that defines the filename or filenames to get from the FTP Server. The processing of the regular expression is done by the FTP Server. For more information, see the FTP Server documentation on regular expressions. Typically, FTP Servers support the following wildcards in their regular expressions:</p> <ul style="list-style-type: none"> ○ * - zero or more characters ○ ? - zero or one character <p>Note: Because the processing of the regular expression is done on the FTP Server, the case sensitivity is determined by FTP Server. If the FTP Server is case sensitive, the file matching done by the FTP Poll Directory activity is also case sensitive.</p>
In Directory	<p>Specifies the directory where the Integration Appliance looks for files on the FTP Server. You can specify a directory using one of the following options:</p> <ul style="list-style-type: none"> ○ Directly enter directory path by clicking in the field and typing in one of the following directory paths: <ul style="list-style-type: none"> ■ Relative directory path, for example: input. (Assumes that FTP home has been configured for the user account that connects to the FTP Server. See "Note" for more information.) ■ Complete directory path, for example on a UNIX machine: /home/user/input. ○ Click Browse... to populate the drop-down list of available directories. Select the appropriate directory from the drop-down list. <p>Note: UNIX: If you specify a relative directory path when connecting to an FTP Server on a UNIX machine, verify that the FTP home directory has been correctly specified in the /etc/passwd file for the user account connecting to the FTP Server.</p>
Test	<p>After a regular expression has been specified in the File Named field and the directory to look for files on the FTP Server has been specified in the In Directory field, click Test to test the regular expression against the set of files in the specified directory on the FTP Server. A dialog box will appear listing any matching files.</p>
Options	<p>Specifies how to read in the contents of the file - either as binary data or encoded text. If the Text option is selected, set the encoding type using one of the following options:</p> <ul style="list-style-type: none"> ○ From the encoded with drop-down list, select one of the default encoding types. ○ Enter your encoding type directly by clicking in the encoded with field and typing in your encoding type. <p>Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see Using the Shift-JIS encoding.</p>

Field	Description
Â	<p>CAUTION:</p> <p>You must specify the Transfer as Text (ASCII) option for FTP activities when retrieving text files and placing text files on an FTP Server for Endpoints that manipulate text data while transferring data from/to the FTP endpoint in ASCII mode. For example, mainframe and DOS FTP Endpoints manipulate ASCII data when passing data in ASCII mode. For example, if your orchestration retrieves ASCII files using the FTP Poll Directory activity and places ASCII files using the FTP Put File activity to a mainframe FTP Server, you must specify the options in the following tasks in Studio:</p> <ul style="list-style-type: none"> ○ In the Configure task of an FTP Poll Directory activity, for the Of Type field select the Text option. ○ In the Delivery Rules task of an FTP Poll Directory activity, for the File Transfer Type field select the Transfer as Text (ASCII) option. ○ In the Configure task of an FTP Put File activity, for the Of Type field select the Text option. ○ In the Delivery Rules task of an FTP Put File activity, for the File Transfer Type field select the Transfer as Text (ASCII) option.
After reading the file	<p>Delete it - Delete the file after the file has been read.</p> <p>Move to directory - Move the file to the specified directory after the file has been read.</p> <p>Specify the directory that the file is moved to during run time, using one of the following options:</p> <ul style="list-style-type: none"> ○ Directly enter a directory path by clicking in the field and typing in one of the following directory paths: <ul style="list-style-type: none"> ▪ Relative directory path, for example: input/. (Assumes that FTP home has been configured for the user account that connects to the FTP Server. See "Note" for more information.) ▪ Complete directory path, for example on a UNIX machine: /home/user/input/. ○ Click Browse... to populate the drop-down list of available directories. Select the appropriate directory from the drop-down list.
Â	<p>Attention: Specify the directory separator after the last listed directory name. For example, to move a file to the processed/acme directory in a relative path, specify the following directory in the Move to directory field: processed/acme/</p> <p>Optional - Specify the format of the file name after it has been renamed. From the Pattern drop-down list, select the desired pattern. To specify the character used to separate the sub-fields in the file name, enter a character in the Pattern Separator field. Specify the run time behavior when a file with the same file name exists:</p> <ul style="list-style-type: none"> ○ Select the Overwrite check box to specify that the existing file should be overwritten if a file with the same name already exists. ○ Clear the Overwrite check box to specify that the existing file should not be overwritten if a file with the same name already exists. <p>Note: The first time the FTP Poll Directory activity polls during run time, if the activity is unable to move the file because the specified move to directory does not exist, a warning is logged (not an error) to the Web Management Console (WMC) and the file stays in place. For all subsequent polls, the activity does not attempt to move the same file and an info level message is logged to the WMC stating that the file has already been processed.</p> <p>Keep in place - Leave the file in the input directory after the file has been read.</p>

Field	Description
Advanced Options	Description
Duplicate List Size	Size of the internal list used by the Integration Appliance to keep track of which files on the FTP Server have been polled or not. The default value is 10000. You should only specify a size larger than the default.

Specifying the delivery rules

1. Select the Delivery Rules task from the **Checklist**. The Delivery Rules pane is displayed.
2. Specify the time interval to poll for the files on the FTP Server:
 - a. Select a time unit from the drop-down menu: seconds, minutes, hours, or days.
 - b. Specify the amount of time by clicking in the Polling Interval field and entering a value or using the up and down arrows.

For more information, see [Polling interval behavior](#).

3. If security is not enabled for the FTP endpoint, the Transfer as Text (ASCII) and Transfer as Binary (BINARY) options are enabled in the Delivery Rules task. If security is enabled for the FTP Endpoint, the file transfer type is always binary.

Select the type of file transfer between the Integration Appliance and the FTP Server from one of the following options:

- o **Transfer as Text (ASCII)** - Only seven bits of each character in the file is transferred from the FTP Server to the Integration Appliance. This option is used for transferring ASCII files such as HTML and text files. **WARNING:** Using this option with binary files can result in a loss of data.
- o **Transfer as Binary (BINARY)** - All eight bits of each byte in the file is transferred from the FTP Server to the Integration Appliance. This option is used for transferring binary files.
Note: Setting the transfer mode in the Delivery Rules task is equivalent to setting the transfer mode via a command line session with an FTP Server using the following commands:
 - `ascii`
 - `binary`

Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an FTP Server. The following table defines the retry options for a connection to an FTP Server:

Table 3.

Field	Description
Retry	^
1) Wait — second(s)) between each retry .	The number of seconds that the Integration Appliance waits before trying to establish a connection to the FTP Server.
2) Try to conn ect — time s befo re failin g.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the FTP Server before issuing an error. If an orchestration that starts with an FTP Poll Directory activity is deployed and the Integration Appliance cannot connect to the specified FTP Server, the Integration Appliance logs the connection errors as warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system log, resets the connection error count to zero, and continues to attempt to establish a connection to the FTP Server.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and resets the connection error count to zero. Therefore, the fifth connection error generates a warning in the system log. The Integration Appliance continues to attempt to establish a connection to the FTP Server.</p>

Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane as listed in the following table:

Table 4.

Output Parameter	Description
filename	Provides the name of the file found on the FTP Server.

Output Parameter	Description
data	Provides the contents of the file.
timestamp	Provides the date and time as a string in the XML Schema dataType format (YYYY-MM-DDhh:mm:ss, where YY is the year, MM is the month, DD is the day, hh is the timezone, mm is the minutes, and ss is the seconds.) Note: If the timestamp output parameter is mapped in the Map Outputs task but the MDTM (return the modification time of a file) functionality is not available or is not enabled for the FTP Server, during run time the orchestration will stop processing due to this error. A warning is generated and the Epoch date (1/1/1970) is returned in the timestamp output parameter.

- You are not required to map the output parameters of the activity. See [Creating a map](#) for general instructions on mapping. ^

Parent topic: [FTP Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ftp_poll_directory_activity.html

FTP Put File activity

During run time, the **FTP Put File** activity takes data from variables of the orchestration, places the data into a file, and connects to an FTP Server and places the file in the specified directory location.

For an example of using the **FTP Put File** activity, see the **Getting Started Guide**.

Transfer interruption

The file transfer done by the **FTP Put File** activity during run time is non-transactional and therefore is not guaranteed. For example, if an **FTP Put File** activity transfers a file from the Integration Appliance to an FTP server and the transfer of the file is interrupted because the Integration Appliance is rebooted, it is not guaranteed that the entire file is transferred.

Symbolic link

The FTP Put File activity supports symbolic links to directories if the symbolic links to directories are supported by the operating system that hosts the FTP Server and the symbolic links to directories are supported by the FTP Server itself. To determine the specific symbolic link support for a specific FTP Server on a specific operating system, see your operating system and FTP Server documentation.

Adding an FTP Put File activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the FTP folder.
3. Drag the **Put File** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

Creating, selecting, or editing an FTP endpoint

1. Click Pick Endpoint task from the **Checklist** and choose one of the following actions:
 - o Select an existing endpoint:
 - a. Select Browse. The Project Explorer is displayed.
Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the To configure the activity procedure.
 - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
 - o Select an existing endpoint and edit the endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK.
Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the "Configure the activity" procedure.
 - c. Click Edit. The Edit Endpoint pane is displayed.
 - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an FTP endpoint: [Creating or Editing an FTP endpoint](#)

Specifying the delivery rules

1. Select the **Delivery Rules** task from the **Checklist**. The Delivery Rules pane is displayed. If security is not enabled for the FTP endpoint, the Transfer as Text (ASCII) and Transfer as Binary (BINARY) options are enabled. If security is enabled for the FTP endpoint, the file transfer type is always binary.
2. Select the type of file transfer between the Integration Appliance and the FTP Server from one of the following options:
 - o **Transfer as Text (ASCII)** - This option is used for transferring files such as HTML, XML, and other text files. Line endings are converted as required and other text file conventions are followed.
CAUTION:
Using this option with binary files can result in a loss of data.
 - o **Transfer as Binary (BINARY)** - This option is used for transferring binary files. Using this option the Integration Appliance transfers data with no conversions.

Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure the fields in this pane as described in the following table:

Table 1.

Field	Description
Save	

Field	Description
File Named	This field is not used for this activity. You specify the name of the output file using the filename input parameter of the Map Input task.
In Directory	<p>Specifies the directory on the FTP server where the Integration Appliance places the file generated in this activity. You can specify a directory using one of the following options:</p> <ul style="list-style-type: none"> ○ Directly enter directory path by clicking in the field and typing in one of the following directory paths: <ul style="list-style-type: none"> ▪ Relative directory path, for example: <code>/output</code>. (Assumes that FTP home has been configured for the user account that connects to the FTP Server. See "Note" for more information.) ▪ Complete directory path, for example on a UNIX machine: <code>/home/user/output</code>. ○ Click Browse... to populate the down-down list of available directories. Select the appropriate directory from the drop-down list. <p>Note: UNIX: If you specify a relative directory path when connecting to an FTP Server on a UNIX machine, verify that the FTP home directory has been correctly specified in the <code>/etc/passwd</code> file for the user account connecting to the FTP Server.</p>
Of Type	<p>Specifies how to read in the contents of the file - either as binary data or encoded text. If the Text option is selected, set the encoding type using one of the following options:</p> <ul style="list-style-type: none"> ○ From the encoded with drop-down list, select one of the default encoding types. ○ Enter your encoding type directly by clicking in the encoded with field and typing in your encoding type. <p>Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see Using the Shift-JIS encoding.</p>
⚠	<p>Attention: You must specify the Transfer as Text (ASCII) option for FTP activities when retrieving text files and placing text files on an FTP Server for Endpoints that manipulate text data while transferring data from/to the FTP Endpoint in ASCII mode. For example, mainframe and DOS FTP Endpoints manipulate ASCII data when passing data in ASCII mode. For example, if your orchestration retrieves ASCII files using the FTP Poll Directory activity and places ASCII files using the FTP Put File activity to a mainframe FTP Server, you must specify the options in the following tasks in Studio:</p> <ul style="list-style-type: none"> ○ In the Configure task of an FTP Poll Directory activity, for the Of Type field select the Text option. ○ In the Delivery Rules task of an FTP Poll Directory activity, for the File Transfer Type field select the Transfer as Text (ASCII) option. ○ In the Configure task of an FTP Put File activity, for the Of Type field select the Text option. ○ In the Delivery Rules task of an FTP Put File activity, for the File Transfer Type field select the Transfer as Text (ASCII) option.

Field	Description
Options - Select one of the following options to define the behavior when a file of the same name already exists in the specified output directory:	
Overwrite Existing File if Duplicate File Name is Found	Specifies if the file already exists, destroys the contents of the original file with new data returned from the activity.
Append to Existing File	Specifies if the file already exists, keeps the original data in the file and appends the new data (returned from the activity) to the end of the file.
Raise Error if File with Duplicate Name is Found	Specifies if the file already exists, keeps the original data in the file, throws an error, and does nothing with the new data returned from the activity. Note: When you select this option, the FTP Put File activity checks if the file exists on the server before uploading the file. In some FTP servers you may not have the permission to check if the file exists before uploading it. This is also referred to as Blind FTP. In such cases, the file is overwritten, even if you have selected the Raise Error if File with Duplicate Name is Found option.

Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an FTP Server. The following table describes the retry options for connecting to an FTP Server:

Table 2.

Field	Description
Retry	
1) Wait ___ second (s) between each retry.	The number of seconds that the Integration Appliance waits before trying to establish a connection to the FTP Server.

Field	Description
2) Try to connect ___ times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the FTP Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an FTP Put File activity and the Integration Appliance cannot connect to the specified FTP Server, the Integration Appliance logs the connections errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors are shown in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

Mapping the input of the activity

1. Select the **Map Inputs** task in the **Checklist**. The Retry pane is displayed. The input parameters of the activity are displayed in the To Activity pane.
2. You are not required to map all the input parameters of the activity. The following parameters are the required:
 - o filename
 - o data

All other parameters are optional. See [Creating a map](#) for general instructions on mapping.

If the input parameter listed in the following table are not displayed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active.

You can optionally override the settings you specified in the **Configure** and **Pick Endpoint** task of the **Checklist** dynamically during run time, using the input parameters defined in the following table.

For example, the directory on the FTP Server where the Integration Appliance places the file generated in this activity, could be set in the **Configure** task to the directory called output. During run time, the directory name: outputXML could be passed into the activity using the directory input parameter. The directory name specified dynamically during run time overrides the original setting specified in the Configure pane. In this example, the file would be placed in the outputXML directory.

Table 3.

Input Parameter Name /Node	Description	Overrides the Setting in Task?

Input Parameter Name /Node	Description	Overrides the Setting in Task?
directory	Specifies the directory on the FTP server where the Integration Appliance places the file generated in this activity.	The directory input parameter overrides the In Directory field of the Configure task.
encoding	Specifies how the outgoing data is written out to the file: <ul style="list-style-type: none"> • If no encoding is required, specify the string: <code>binary</code>. • If encoding is required, specify the encoding type that should be used to encode the outgoing data, for example: <code>UTF-8</code>, <code>US-ASCII</code>, <code>ISO_8859-1</code>, <code>EBCDIC-US</code>, or <code>SHIFT-JIS</code>. 	The encoding input parameter overrides the encoding specified in the Of Type field of the Configure task but if the Binary option is selected in the Of Type field of the Configure task, the encoding specified by the encoding input parameter is ignored.
overwrite	Specifies the behavior when a existing file of the same name already exists in the specified output directory. Specify one of the following values: <ul style="list-style-type: none"> • y - Specifies if the file already exists, destroy the contents of the original file with new data returned from the activity. • a - Specifies if the file already exists, keep the original data in the file and append the new data (returned from the activity) to the end of the file. • n - Specifies if the file already exists, keep the original data in the file and do nothing with the new data returned from the activity. 	The overwrite input parameter overrides the Options field of the Configure task.
connection/timeout	Specifies the connection timeout - the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For the FTP Put File activity, the amount of time the Integration Appliance attempts to establish a connection to the FTP Server before timing out.	The timeout node of the connection input parameter overrides the Connection Timeout -Time out after ___ second(s) when establishing a connection to the Endpoint field of the FTP endpoint.
connection/host	Specifies the Host Name or IP address for the FTP server.	The host node of the connection input parameter overrides the Host Name field of the FTP endpoint.

Input Parameter Name /Node	Description	Overrides the Setting in Task?
connection/port	Specifies the port number for the specified host name. The standard port for FTP traffic is 21. The default port for SFTP traffic is 22.	The port node of the connection input parameter overrides the Port field of the FTP endpoint.
connection/username	Specify a user name for the account used to connect to the FTP Server.	The username node of the connection input parameter overrides the User Name field of the FTP endpoint.
connection/password	Specify a password for the account used to connect to the FTP Server.	The password node of the connection input parameter overrides the Password field of the FTP endpoint.

Parent topic: [FTP Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ftp_put_file_activity.html

FTP Get File activity

During run time, the **FTP Get File** activity connects to an FTP Server and attempts to get a single file at the specified location. You can configure the **FTP Get File** activity to return the contents of the file into a variable of the orchestration. In addition, you can configure the **FTP Get File** activity to return the timestamp of the file returned by the FTP Server into a variable of the orchestration.

The **FTP Get File** activity differs from the **FTP Poll Directory** activity in the following ways:

- The **FTP Get File** activity does not poll for a file or files in the specified directory. Instead the **FTP Get File** activity checks for the file a single time and if the file is not found, it throws an error and the orchestration job continues to processing.
- The **FTP Get File** activity is not a starter activity, so it cannot be the first activity in an orchestration.
- The **FTP Get File** activity does not move or delete files on the FTP server.

Symbolic link

The support for symbolic links by the **FTP Get File** activity during run time is dependant on the following factors: ^

- The types of symbolic links supported by operating system that hosts the FTP Server.
- The types of symbolic links supported by the FTP Server itself.
- The types of symbolic links supported by the **FTP Get File** activity, as listed in the following table:

Table 1.

Symbolic Links to...	Hard Symbolic Links	Soft Symbolic Links	Notes^®
Files	Not Supported	Not Supported	The FTP Get File activity does not interpret symbolic links to files as files and therefore symbolic links to files are not processed by the FTP Get File activity during run time.
Directories	Supported	Supported	^

To determine the specific symbolic link support for a specific FTP Server on a specific operating system, see your operating system and FTP Server documentation.

Adding an FTP Get File activity in the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the FTP folder.
3. Drag the **Get File** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

Creating, selecting, or editing an FTP endpoint

1. Click Pick Endpoint task from the **Checklist** and choose from one of the following actions:
 - o Select an existing endpoint:
 - a. Select Browse. The Project Explorer is displayed.
Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the Configuring the activity procedure.
 - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
 - o Select an existing endpoint and edit the endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK.
Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally

- specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the "Configure the activity" procedure.
 - c. Click Edit. The Edit Endpoint pane is displayed.
 - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an FTP endpoint: [Creating or Editing an FTP endpoint](#)

Specifying the delivery rules

1. Select the **Delivery Rules** task from the **Checklist**. The Delivery Rules pane is displayed. If security is not enabled for the FTP endpoint, the Transfer as Text (ASCII) and Transfer as Binary (BINARY) options are enabled. If security is enabled for the FTP endpoint, the file transfer type is always binary.
 2. Select the type of file transfer between the Integration Appliance and the FTP Server from one of the following options:
 - o **Transfer as Text (ASCII)** - Only seven bits of each character in the file is transferred by the Integration Appliance to the FTP Server. This option is used for transferring ASCII files such as HTML and text files.
CAUTION:
Using this option with binary files can result in a loss of data.
 - o **Transfer as Binary (BINARY)** - All eight bits of each byte in the file is transferred by the Integration Appliance to the FTP Server. This option is used for transferring binary files.
- Note: Setting the transfer mode in the Delivery Rules task is equivalent to setting the transfer mode via a command line session with an FTP Server using the following commands:
- o ascii
 - o binary

Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields in this pane as described in the following table:

Table 2.

Field	Description
Filename	This field is not used for this activity. You specify the name of the output file using the filename input parameter of the Map Input task.
Directory	<p>Specifies the directory on the FTP server where the Integration Appliance places the file generated in this activity. You can specify a directory using one of the following options:</p> <ul style="list-style-type: none"> o Directly enter directory path by clicking in the field and typing in one of the following directory paths: <ul style="list-style-type: none"> ▪ Relative directory path, for example: /output. (Assumes that FTP home has been configured for the user account that connects to the FTP Server. See "Note" for more information.) ▪ Complete directory path, for example on a UNIX machine: /home/user/output. o Click Browse... to populate the down-down list of available directories. Select the appropriate directory from the drop-down list. <p>Note: UNIX: If you specify a relative directory path when connecting to an FTP Server on a UNIX machine, verify that the FTP home directory has been correctly specified in the /etc/passwd file for the user account connecting to the FTP Server.</p>

Field	Description
Of Type	<p>Specifies how to read in the contents of the file - either as binary data or encoded text. If the Text option is selected, set the encoding type using one of the following options:</p> <ul style="list-style-type: none"> From the encoded with drop-down list, select one of the default encoding types. Enter your encoding type directly by clicking in the encoded with field and typing in your encoding type.
Attention	<p>Attention: You must specify the Transfer as Text (ASCII) option for FTP activities when retrieving text files and placing text files on an FTP Server for Endpoints that manipulate text data while transferring data from/to the FTP Endpoint in ASCII mode. For example, mainframe and DOS FTP Endpoints manipulate ASCII data when passing data in ASCII mode.</p> <p>For example, if your orchestration retrieves ASCII files using the FTP Poll Directory activity and places ASCII files using the FTP Put File activity to a mainframe FTP Server, you must specify the options in the following tasks in Studio:</p> <ul style="list-style-type: none"> In the Configure task of an FTP Poll Directory activity, for the Of Type field select the Text option. In the Delivery Rules task of an FTP Poll Directory activity, for the File Transfer Type field select the Transfer as Text (ASCII) option. In the Configure task of an FTP Put File activity, for the Of Type field select the Text option. In the Delivery Rules task of an FTP Put File activity, for the File Transfer Type field select the Transfer as Text (ASCII) option.

Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an FTP Server. The following table defines the retry options for a connection to an FTP Server:

Table 3.

Field	Description
Retry	Attention
1) Wait ___ second (s) between each retry.	The number of seconds that the Integration Appliance waits before trying to establish a connection to the FTP Server.

Field	Description
2) Try to connect ___ times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the FTP Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an FTP Get File activity and the Integration Appliance cannot connect to the specified FTP Server, the Integration Appliance logs the connections errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The input parameters of the activity are displayed in the To Activity pane.
2. The filename parameter is the only parameter you are required to provide an value in the activity. All other parameters are optional. The filename parameter specifies the name of the file to get from the FTP Server. You provide a value for the filename parameter by either by creating a link from the filename input parameter to a variable or by defining a default value for the filename input parameter.

If the optional input parameter listed in the following table are not displayed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active.

You can optionally override the settings you specified in the **Configure** and **Pick Endpoint** task of the **Checklist** dynamically during run time, using the input parameters defined in the following table.

For example, the directory on the FTP Server where the Integration Appliance gets the file, could be set in the **Configure** task to the directory called input. During run time, the directory name: inputXML could be passed into the activity using the directory input parameter. The directory name specified dynamically during run time overrides the original setting specified in the Configure pane. In this example, the Integration Appliance attempts to get the file from the inputXML directory.

Table 4.

Input Parameter Name / Node	Description	Overrides the Setting in Task?

Input Parameter Name /Node	Description	Overrides the Setting in Task?
directory	Specifies the directory on the FTP server where the Integration Appliance places the file generated in this activity.	The directory input parameter overrides the From Directory field of the Configure task.
encoding	Specifies how the outgoing data is written out to the file: <ul style="list-style-type: none"> • If no encoding is required, specify the string: <code>binary</code>. • If encoding is required, specify the encoding type that should be used to encode the outgoing data, for example: <code>UTF-8</code>, <code>US-ASCII</code>, <code>ISO_8859-1</code>, <code>EBCDIC-US</code>, or <code>SHIFT-JIS</code>. 	The encoding input parameter overrides the encoding specified in the Of Type field of the Configure task but if the Binary option is selected in the Of Type field of the Configure task, the encoding specified by the encoding input parameter is ignored.
connection/timeout	Specifies the connection timeout – the number of seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For the FTP Get File activity, the amount of time the Integration Appliance attempts to establish a connection to the FTP Server before timing out.	The timeout node of the connection input parameter overrides the Connection Timeout -Time out after ___ second(s) when establishing a connection to the Endpoint field of the FTP endpoint.
connection/host	Specifies the Host Name or IP address for the FTP server.	The host node of the connection input parameter overrides the Host Name field of the FTP endpoint.
connection/port	Specifies the port number for the specified host name. The standard port for FTP traffic is 21. The default port for SFTP traffic is 22.	The port node of the connection input parameter overrides the Port field of the FTP endpoint.
connection/username	Specify a user name for the account used to connect to the FTP Server.	The username node of the connection input parameter overrides the User Name field of the FTP endpoint.

Input Parameter Name /Node	Description	Overrides the Setting in Task?
connection/password	Specify a password for the account used to connect to the FTP Server.	The password node of the connection input parameter overrides the Password field of the FTP endpoint.

Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane as described in the following table:

Table 5.

Output Parameter Name	Description
data	Contains the contents of the file.
timestamp	Contains the timestamp for the file returned from the FTP Server, typically the creation date or last modified date of the file. Â

2. Map the desired output parameters to variables.

Parse directory listing example

This example gets a directory listing from an FTP directory using the **FTP List Files** activity, parses the long directory listing using Flat File Scheme, iterates through the list of files, based on the properties of each file.

About this task

Based on the properties of each file, one of the following actions occurs:

- Move the file to a new directory using the [FTP Rename File activity](#).
- Rename the file using the [FTP Rename File activity](#).
- Delete the file using the [FTP Delete File activity](#).

To open, view, and learn more about the FTTParseDirListingExample:

Procedure

1. Extract the FTTParseDirListingExample project:
 - a. Find the Default Create Path defined in Studio, the directory that new projects are created in. To view the current Default Create Path, select File > Preferences... from the Studio toolbar menu. The Preferences window is displayed. The current Default Create Path displays at the end of the pane. By default, the Default Create Path is located in the following directory: C:\Documents and Settings*myLogin*\My Documents Where *myLogin* represents your Windows login name.
 - b. Find the FTTParseDirListingExample.zip file that contains the files that make up the FTTParseDirListingExample project. If you accepted the defaults during the installation of Studio, this file is located in the following directory: C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\FTTParseDirListing
 - c. Copy the FTTParseDirListingExample.zip file from the FTTParseDirListing directory to the Default Create Path directory.
 - d. Extract the contents of FTTParseDirListingExample.zip file into the Default Create Path directory.
2. Open the FTTParseDirListingExample project:
 - a. Select File > Open Project... from the Studio toolbar menu. The Open dialog box is displayed.
 - b. Browse for and open the FTTParseDirListingExample directory.
 - c. Click on the FTTParseDirListingExample.sp3 file and click Open. The project is displayed.
3. In the Project tab, double-click the **processBids** orchestration. The **processBids** orchestration tab displays the activities of the orchestration, as shown in the following figure:

4. Click the **Schedule Job** activity. Click the **Configure** task in the **Checklist**. During run time, this activity starts an orchestration job every 5 minutes.
5. Click the **FTP List Files** activity labeled List Files Full Dir Listing. Click the **Configure** task in the **Checklist**. This activity gets a long directory listing of the files in the /input directory on the FTP Server and returns the listing as one string in the dirListing output parameter. In this example, the string returned in the directoryListing output parameter is stored in the fullDirectoryListing string variable.

If the [FTP Endpoint has been configured for the Parse Directory Listing Example](#), click Test in the **Configure** task to get the directory listing. The List Only Files (NLST) check box determines if the directory listing contains just the list of files or a full directory listing. For this example, clear the List Only Files (NLST) check box.

6. Expand the **If...Then** activity. During run time, this activity checks the value of the fullDirectoryListing string variable and if the value is empty, the **If** path is run and the orchestration ends. If the fullDirectoryListing string is not empty, the **Else** path is run and the orchestration parses the directory.

7. Click the **Read Flat File** activity. Click the **Map Inputs** task in the **Checklist**. During run time, the long directory listing created in the **FTP List Files** activity, is passed to the **Read Flat File** activity via the **Data** input parameter.
8. Click the **Map Outputs** task in the **Checklist**. During run time, the **Read Flat File** activity parses the directory string into the repeating node structure displayed in the **Map Outputs** task.
9. Click the **For Each** activity. During run time, the **For Each** activity iterates through the repeating node structure that stores the directory listing. Each iteration is equivalent to a single file and the properties of that file.
10. Click the **Map Variables** activity. During run time, the **Map Variables** activity converts the size of the current file into a decimal number.
11. Click on the **If..Then** activity. During run time, the **If..Then** activity starts the following **If..Then** branches.

Results

- If the size of the file is equal to 0, the [FTP Rename File activity](#) moves the file to the /processFailed directory and renames the file by adding the ERROR prefix to the file name.
- If the file name contains a string representing one of the approved supplies (AcmeInc or WidgetRUs), the [FTP Rename File activity](#) based on the file name, moves the file to the appropriate directory either /processAcmeInc or /processWidgetRUs.
- If the file name contains the string representing the Budget Manufacture supplier, the [FTP Delete File activity](#) removes the file because Budget Manufacture is on the unapproved supplier list.
- If the file is not processed by any of the three previous conditions, the **Else** clause is called and the [FTP Rename File activity](#) moves the file to the /processNewCompany directory.

To run the Parse Directory Listing Example, see the procedures provided in the [Configuring the FTP Endpoint for the Parse Directory Listing Example](#) section.

Testing an FTPS server connection

After successfully running a "test connection", you can use Studio verify tools on FTPS orchestrations before publishing a project.

About this task

If you configure an endpoint that represents an FTPS server, you can use it in a Studio project to create orchestrations. You will not, however, be able to verify the orchestration behavior in Studio until you import a copy of the FTPS certificate into Studio, as detailed in this help topic.

Note: The following procedure refers to a FTPS server named: " <ftps>" in a domain named " <domain.com>".

To test an FTPS Server connection:

Procedure

1. Open a command window.
2. Navigate to the FTPS host, and locate the certificate file ca-cert stored in the FTP server <ftps>, in this directory: /var/www/covalent/servers/<ftps.domain.com>/ssl/caerts/castiron_ca_cert.pem
3. Substitute the actual server and domain name of your FTPS installation.
4. Copy this file and navigate to the Studio workstation.
5. Using the command window, paste the ca-cert copy in the home directory of Studio: C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x
6. Navigate to the security directory of Studio: C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x\security
7. Run the following command to import the ca-cert file into Studio:

```
..\jre\bin\keytool.exe -import -v -keystore cacerts -storepass changeit -file ..\castiron_ca_cert.pem -alias alias_name
```
8. When you are prompted for a yes or no, type yes (Y) and press Enter.
9. Exit the command window.
10. Restart Studio.
11. Open the endpoint for this FTPS server.
12. Verify the following login credentials for the FTPS connection: FTP server, Port, User, and Password.
13. Click Test Connection. If the connection is successful, use this endpoint in Studio orchestrations, then use the Verify tab features to evaluate the orchestration.

HTTP Activities

- [Creating or editing an HTTP endpoint](#)
HTTP endpoints provide the connection information that Studio and the Integration Appliance use to connect to an HTTP server. An HTTP endpoint also specifies the connection information so the Integration Appliance can act as HTTP listener. ^
- [HTTP Receive Request activity](#)
Use the HTTP **Receive Request** activity to configure the Integration Appliance to act as an HTTP listener
- [Decompression with the HTTP Receive Request activity](#)
The **HTTP Receive Request** activity supports decompression with the gzip format only. The **HTTP Receive Request** activity does not support the deflate format or the common UNIX file compression format called compress.

- [HTTP Send Response activity](#)
The HTTP **Send Response** activity sends a reply back to the sender of an HTTP request.
- [Compression/Decompression with the HTTP Send Response activity](#)
During runtime, the **HTTP Send Response** activity sends an HTTP response compliant with the HTTP/HTTPS 1.0 protocol to the HTTP client.
- [HTTP Post Request activity](#)
The HTTP **Post Request** activity sends a **Post Request** to the specified location (the HTTP endpoint) and receives an HTTP response back from that location.
- [HTTP Get Request activity](#)
The HTTP **Get Request** activity sends a **Get Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.
- [HTTP Head Request activity](#)
The HTTP **Head Request** activity sends a **Head Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.
- [HTTP Invoke Request activity](#)
The HTTP **Invoke Request** activity sends a HTTP request to the specified location, the HTTP endpoint, and receives a HTTP response back from that location.
- [HTTP Put Request activity](#)
The HTTP **Put Request** activity sends a **Put Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.
- [HTTP Delete Request activity](#)
The HTTP **Delete Request** activity sends a **Delete Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.
- [Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity](#)
During runtime, the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity sends a HTTP request compliant with the HTTP/HTTPS 1.1 protocol to the HTTP Server.
- [Troubleshooting and support](#)
Troubleshooting techniques and self-help information help you identify and solve problems quickly. Here, you can find potential solutions for issues you would have with the HTTP connector.

Creating or editing an HTTP endpoint

HTTP endpoints provide the connection information that Studio and the Integration Appliance use to connect to an HTTP server. An HTTP endpoint also specifies the connection information so the Integration Appliance can act as HTTP listener. Â

1. In the Create Endpoint or Edit Endpoint pane, configure the fields as described in the following table.
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project as the edits are global, not local.
2. When finished, if available click Test Connection to confirm that you can connect to the HTTP server.
Note: The Test Connection button is only available when configuring an endpoint for the HTTP Post Request activity - when Location is set to the Remote Server option.

3. Click OK.

Table 1.

Field Name	Description
Location	^
Integration Appliance Receives Request	This option specifies that the Integration Appliance is acting as an HTTP listener. For an HTTP endpoint used with the HTTP Receive Request activity, Location is automatically set to the Integration Appliance Receives Request option. ^
Remote Server	This option specifies that the Integration Appliance is sending and receiving requests from a remote HTTP server. For an HTTP endpoint used with the HTTP Post Request activity, Location is automatically set to the Remote Server option.
Host Name	Required for the Remote Server option only - Specify the host name or IP address for the HTTP server that this endpoint connects to.
Port	For the HTTP Receive Request activity - Specify the port number of the Integration Appliance acting as an HTTP listener. For the HTTP Post Request activity - Specify the port number of the remote HTTP server. ^
Login	Description
Log into the Server as an Anonymous User	Available for the Remote Server option only. Select this option to connect to the HTTP server anonymously (where a user account is not required).
Log into the Server with User Name and Password	Available for the Remote Server option only. Select this option to connect to the HTTP server using a user account. Enter the User Name and Password.

Field Name	Description
Authentication	<p>Allows you to select the type of authentication that the Integration Appliance uses when connecting to a remote server. From the list, select one of the following authentication options:</p> <ul style="list-style-type: none"> • Basic - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure. Note: Basic authentication is now made available for HTTP Receive Request activity. • Digest - Encrypts the user name and password you specify before sending the user name and password to the server. This authentication option is more secure than Basic authentication. • NTLM - Requires an instance of NTCredentials to be available for the domain name of the server. This authentication is the most secure authentication option. When you choose the NTLM authentication option, the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server. Note: Do not prefix the user name with the domain. • Kerberos - The Kerberos protocol requires a trusted third party which is referred to as the Kerberos server. The Kerberos server name and realm are configured on the WMC Security:Kerberos panel instead of on the HTTP or Web Services end point.
Realm / Domain	<p>If you select the Basic or Digest authentication option, specify a realm.</p> <p>If you select the NTLM authentication option, specify a domain.</p>
User Name	Available for the Remote Server option only - Specify the User Name for the account used to connect to the HTTP Server.
Password	Available for the Remote Server option only - Specify the Password for the account used to connect to the HTTP Server.
Log into the Server using OAuth 2.0	Description
Grant Type	<p>Cast Iron OAuth2.0 client supports two grants to request an access token. The authorization request can be made directly to the resource owner or through the authorization server.</p> <p>Select one of the following grant types:</p> <ul style="list-style-type: none"> • <code>password</code> - Requires either a combination of Authorization Server URL, Username and password or just the Access Token. If the Access Token is temporary, the authorization server URL, username and password must be provided so as to regenerate the expired access token • <code>authorization_code</code> - Requires an Access Token and/or the combination of Refresh Token and Authorization Server URL in order to refresh temporary access tokens post expiry.
Scope	Specify the scope of the access request using the scope request parameter. The authorization server uses this to inform the client about the scope of the access token issued.
Username	Specify the user name used to log on to the resource server. For resource owner password credential grant, the user name will be used as a part of the access token request.

Field Name	Description
Password	Specify the password used to logon to the resource server. For resource owner password credential grant, the password will be used as a part of the access token request.
Client ID	Specify the client ID issued by the authorization server during registration. Client ID is a unique string containing the registration information provided to the client by the authorization server. The client ID is not a secret; it is exposed to the resource owner and must not be used only for client authentication.
Client Secret	Specify the client secret. The client secret is confidential.
Access Token	Specify the Access Token. Access tokens are credentials representing the authorization issued to the client. Tokens represent specific scopes and the duration of access.
Auth Server URL	Specify the Authorization Server URL. Authorization Server URL is the URL for the authorization server or token endpoint responsible for issuing and refreshing access tokens.
Refresh Token	Specify the refresh token. Refresh tokens are used to obtain access tokens when the current access token has expired.
For more information about OAuth 2.0, see http://tools.ietf.org/html/rfc6749 .	
Security	Description
None	Select the None option if no security is required.
HTTPS	<p>Select the HTTPS option to enable secure HTTP over SSL. Â</p> <ul style="list-style-type: none"> • Available for the Integration Appliance Receives Request option only - When server authentication is required, select the Server Certificate Alias Name check box to specify that the Integration Appliance acting as a server should provide a certificate to the client. If selected, the name of the certificate must be provided. A certificate specified at the endpoint level with this check box takes precedence over certificates specified on the Security > Certificates > Settings > Server SSL over data NIC entry in the WMC. • Available for the Remote Server option only - When client authentication is required, select the Client Certificate Alias Name check box to specify that the Integration Appliance acting as a client should provide a certificate to the HTTP Server. If selected, the name of the certificate must be provided. (For information about how to import a client certificate and private key for use with client authentication, see Importing an end-entity certificate). A certificate specified at the endpoint level with this check box takes precedence over certificates specified on the Security> Certificates > Settings > Client SSL entry in the WMC
Protocol Version	Select the protocol used for secure HTTP over SSL. By default, the protocol version used is SSL_TLSv2.
Connection Pool Options	
Maximum Connections	Specifies the maximum number of HTTP server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.

Field Name	Description
Connection Timeout - The following Connection field is available for the Remote Server option only.	
Time out after ___ seconds when establishing a connection to the Endpoint.	The number of seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the endpoint to respond to the connection request. For an HTTP activity, the amount of time the Integration Appliance attempts to establish a connection to the HTTP Server before timing out. A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an endpoint and the time it takes the endpoint to respond. You set the activity timeout in the Retry task of the HTTP Post Request Activity.
Proxy - The following Proxy fields are available for the Remote Server option only.	
Login	Description
Log into the Server as an Anonymous User	Available for the Remote Server option only. Select this option to connect to the HTTP server anonymously (where a user account is not required).
Log into the Server with User Name and Password	Available for the Remote Server option only. Select this option to connect to the HTTP server using a user account. Enter the User Name and Password.

Field Name	Description
Authentication	<p>Allows you to select the type of authentication that the Integration Appliance uses when connecting to a remote server. From the drop-down list, select one of the following authentication options:</p> <ul style="list-style-type: none"> • Basic - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure. • Digest - Encrypts the user name and password you specify before sending the user name and password to the server. This authentication option is more secure than Basic authentication. • NTLM - Requires an instance of NTCredentials to be available for the domain name of the server. This authentication is the most secure authentication option as the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server. Note: Do not prefix the user name with the domain.
Realm / Domain	If you select the Basic or Digest authentication option, specify a realm. If you select the NTLM authentication option, specify a domain.
User Name	Available for the Remote Server option only - Specify the User Name for the account used to connect to the HTTP Server.
Password	Available for the Remote Server option only - Specify the Password for the account used to connect to the HTTP Server.
Security	Description
None	Select the None option if no security is required.
Connection Timeout - The following Connection field is available for the Remote Server option only.	
Time out after ___ second(s) when establishing a connection to the Endpoint.	Specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For an HTTP activity, the amount of time the Integration Appliance attempts to establish a connection to the HTTP Server before timing out. A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an endpoint and the time it takes the endpoint to respond. You set the activity timeout in Retry task of the HTTP Post Request Activity.

Field Name	Description
Host	Specifies the host name of the proxy server. This field is required.
Port	Specifies the port number to use to connect to the proxy server. This field is required
Username	Specifies the username to use for proxy server authentication. This field is optional if your proxy server does not require authentication
Password	Specifies the password to use for proxy server authentication. This field is optional if your proxy server does not require authentication.

Note: For some of the fields in the endpoint, you can define configuration properties to supply the values for these fields. The

icon is displayed when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.

Parent topic: [HTTP Activities](#)

[Feedback](#) | [Notices](#)

Last updated: Wednesday, February 17, 2016

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_create_edit_endpoint.html

HTTP Receive Request activity

Use the HTTP **Receive Request** activity to configure the Integration Appliance to act as an HTTP listener

The following figure shows the Integration Appliance acting as an HTTP listener.

Figure 1.

The HTTP **Receive Request** activity is a starter activity. When an orchestration that starts with an HTTP **Receive Request** activity is deployed to the Integration Appliance, the Integration Appliance acts as an HTTP listener waiting for HTTP requests. When a HTTP request is received, the following actions occur:

1. An orchestration job is started.
2. The HTTP **Receive Request** activity processes the incoming HTTP request and maps the HTTP request to the output parameters of the activity.
3. The output parameters are mapped to the specified orchestration variables. During design time in the **Map Outputs** task of the **Checklist**, the mapping between the output parameters and the orchestration variables is defined.

4. The remaining activities in the orchestration are processed. (In the graphical representation of the orchestration, the remaining activities are the activities located on the right side of the HTTP **Receive Request** activity).

By default, decompression is enabled for the HTTP **Receive Request** activity. For more information, see [Decompression with the HTTP Receive Request activity](#).

You cannot deploy two HTTP Receive Request activities to the appliance with the same endpoint details, URL and method.

For single HTTP Receive Request activity

If you deploy only one HTTP Receive Request activity for a URL, the orchestration accepts all requests of those URLs starting with that *base URL*. For example, if you deploy `/customer` then it accepts requests for `/customer`, `/customer/21`, `/customer/21/dept`, and so on.

If you deploy an HTTP Receive Request activity for a URL with path parameters, then the orchestration accepts only those requests whose URLs match with the configured URL with values for path parameters. For example, if you deploy `/customer/{custid}` then it accepts requests such as `/customer/10`, `/customer/21`, `/customer/dept`. The following URLs are not accepted: `/customer`, `/customer/21/dept`, and so on.

For multiple HTTP Receive Request activities

If you deploy two HTTP Receive Request activities that are configured with the same base URL, and one with path parameter, then the activities accept requests whose URLs strictly match with the configured URL. For example, if you deploy `/customer` and `/customer/{path parameter}`, and if `/customer` is invoked the request goes to the activity configured with `/customer`. If `/customer/007` is invoked, the request goes to the activity configured with `/customer/{path parameter}`. Also, if you invoke the following URLs: `/customer/dept/1` or `/customer/12/21`, none of the activities accept the requests.

Note: If you deploy two activities, the first one as `/customer/department` and the second one as `/customer/{path parameter}`, and if `/customer/department` is invoked, then the request goes to the activity which was deployed first (`/customer/department`). If `/customer/{path parameter}` is deployed first, then the request goes to `/customer/{path parameter}`.

Note: It is also recommended that you do not deploy the same URL for Web Services and HTTP. *Base URL* - Part of the URL before path parameters. For example - If the configured URL is `/employee/manager/{id}`, then Base URL will be `/employee/manager`.

Adding an HTTP Receive Request activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Receive Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed with the **Summary** task active in the properties pane. The Properties pane is located under the graphical representation of the orchestration in the Workspace.

Creating, selecting, or editing an HTTP endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
 - o Select an existing endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
 - o Select an existing endpoint and edit the endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK.

- c. Click Edit. The Edit Endpoint pane is displayed.
 - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
- 2. Create or edit a HTTP endpoint, see [Creating or editing an HTTP endpoint](#).

Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field	Description
URL Path	<p>Specifies the resource path where the Integration Appliance listens for inbound HTTP requests, for example: /mypath. The string you specify in this field must exclude the string: http://, the hostname, and the port number of the Integration Appliance. The full URL that the Integration Appliance uses to listen for inbound HTTP requests is automatically constructed from the hostname of the Integration Appliance, the port number specified in the HTTP endpoint, and the path specified in this field. For example, if the full URL that the Integration Appliance listens for HTTP requests is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the HTTP Receive Request activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format, url/ {path}? name1=value1&name2=value2. This allows you to map a string value to the "{path}" parameter and to specify query parameter names: <i>name1</i> and <i>name2</i> in this example. If you choose to declare multiple "{path}" parameters, it is recommended that each parameter has a unique name. Parameters with the same name are represented by only one node in the map. The path parameters are displayed under /httpheaders/pathParameters in Map Output. Query parameters are displayed under /httpheaders/queryParameters in Map output.</p> <p>Note: In the URL, any value assigned to a query parameter is not passed to the mapper. The value comes from the server based on the actual incoming request.</p> <p>Note: The path that the Integration Appliance listens for inbound HTTP requests is a resource path string that you specify and does not correspond to actual directory path on the Integration Appliance.</p>
Method	Specifies which HTTP method is accepted by the listening server.
Of Type	Specifies the expected message type of the HTTP request - either Text or Binary.
Requires a Reply	<p>Specifies if a reply should be sent to the sender of the request.</p> <p>Note: If this check box is selected, you must add and configure a HTTP Send Response activity in your orchestration.</p>

Field	Description
Use Compression/Decompression	Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity

Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you may be prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

Specifying Swagger information

1. Select the Swagger task from the **Checklist** to set sample message.
2. Specify the Request sample (JSON) and Response sample (JSON) information. If you do not specify any request sample, the Swagger Output will display with empty sample objects.
3. Click on Generate Swagger button which will display the code in the Swagger Output textbox. You can also click Download Swagger to download and share the file, if required.

Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 2.

Output Parameter	Description
httpheaders	Specifies the header of the HTTP request.
body	Specifies the body of the HTTP request message.

The following table defines the nodes of the optional httpheaders output parameter. Â

Table 3.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path of the incoming request, for example: /myPath.
httpheaders/method	Specifies the type of HTTP request.
httpheaders/host	Specifies the IP address or the host name of the client.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/<configured_header_name>	If you configured at least one request header in Request Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/pathParameters	If you configured path parameters in the URL in the Configure step, each is displayed here. If no path parameter is specified, this node does not display.
httpheaders/queryParameters	If you configured query parameters in the URL in Configure step, each is displayed here. If no query parameter is specified, this node does not display.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

Note: To test your orchestration that starts with the **HTTP Receive Request** activity, you can use the HTTP Post Utility included with the Studio installation, to send HTTP requests to the listening Integration Appliance during run time. You can access the HTTP Post Utility from the start menu, select Programs > IBM > Cast Iron Studio > HTTP Post Utility option. The URL you specify in the URL of the inbound connector field must contain the full URL, for example: http://myAR:myPort/myPath.

Parent topic: [HTTP Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_receive_request_activity.html

Decompression with the HTTP Receive Request activity

The **HTTP Receive Request** activity supports decompression with the gzip format only. The **HTTP Receive Request** activity does not support the deflate format or the common UNIX file compression format called

compress.

The **HTTP Receive Request** activity only supports receiving HTTP requests using HTTP/HTTPS 1.0 protocol.

The decompression runtime behavior of the **HTTP Receive Request** activity when receiving a HTTP request is dependant on the following conditions:

- [The value of the Content-Encoding at the message level](#)
- [The setting of the Use Compression/Decompression check box at the activity level](#)

The affect of these conditions on the decompression runtime behavior of the **HTTP Receive Request** activity are described in the following sections and in the table provided in the [runtime Decompression Behavior](#) section.

Content-Encoding value at the message level

The value of the Content-Encoding HTTP Header Parameter of the HTTP request can determine if the Integration Appliance decompresses the body of the HTTP request that is received from the HTTP Client as shown in the following figure.

The value of the Content-Encoding [^] header is represented by the third column labeled **Content-Encoding Value** in the table provided in the [Run-time Decompression Behavior](#) section.

Setting decompression at the activity level

By default, decompression is turned on at the activity level for the **HTTP Receive Request** activity. You can turn off decompression at the activity level by selecting the Use Compression/Decompression check box. The Use Compression/Decompression check box is available in the **Configure** task of the activity. The second column labeled Use Compression/Decompression Check Box in the table provided in the [runtime Decompression Behavior](#) section, represents the setting of the Use Compression/Decompression check box.

[^]

runtime decompression behavior

The following table describes the decompression runtime behavior when the Integration Appliance receives a HTTP request from the HTTP Client:

Use Compression/Decompression Check Box (Activity Level) 	Content-Encoding Value (Message Level)	Integration Appliance Decompression runtime Behavior
selected	gzip	The Integration Appliance decompresses the body of the request using the gzip format. The value of Content-Encoding is set to gzip in the httpheaders output parameter returned from the activity.
selected	not set	The Integration Appliance sends the body of the  request as is (unchanged). The value of Content-Encoding is not set in the httpheaders output parameter returned from the activity.  
selected	identity	The Integration Appliance does not decompress the body of the request. The value of the Content-Encoding is set to identity in the httpheaders output parameter returned from the activity.
selected	any other string besides gzip or identity	The Integration Appliance sends the 415 (Unsupported Media Type) Response Code.
cleared	value is not significant	The Integration Appliance does not decompress the body of the request and the current value of Content-Encoding in the request is passed as is to the httpheaders output parameter of the activity. For example, if the value of the Content-Encoding is set to gzip but the Use Compression/Decompression check box is cleared, the Integration Appliance does not decompress the body of the request but Content-Encoding is set to gzip in the httpheaders output parameter of the activity.

Note: The Use Compression/Decompression check box will be deprecated in a future release. Use the Content-Encoding HTTP Parameter in the HTTP request to specify how to decompresses the body of the HTTP request.

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/decompression_with_the_http_receive_request_activity.html

HTTP Send Response activity

The HTTP **Send Response** activity sends a reply back to the sender of an HTTP request.

The following figure shows the HTTP **Send Response** activity sending a reply back to the sender of an HTTP request.

Figure 1.

The HTTP **Send Response** activity must be used in conjunction with an HTTP **Receive Request** activity in an orchestration as shown in the preceding figure. If you add a HTTP **Send Response** activity to orchestration, you must select the Requires a Reply check box in the **Configure** task of the HTTP **Receive Request** activity.

By default, compression is not enabled for the HTTP **Send Response** activity. For more information, see [Compression/Decompression with the HTTP Send Response activity](#).

Adding an HTTP Send Response activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Send Response** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed with the **Configure** task active in the properties pane. The properties pane is located beneath the graphical representation of the orchestration.

Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field	Description
To	Specifies the HTTP Receive Request activity associated with this HTTP Send Response activity. During run time, the associated HTTP Receive Request activity receives the request from the client and the HTTP Send Response activity sends the response back to the client. Note: This field is populated only if you select the Requires a Reply check box in the Configure task of the HTTP Receive Request activity.
Of Type	Specifies the message type of the HTTP response - either Text or Binary.
Use Compression/Decompression	Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity .

Specifying the response headers

1. Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is mandatory and at least one variable must be mapped to it. The body input parameter contains the body of the HTTP response message sent back to the client.
2. To view the optional input parameter in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The httpheaders input parameter is displayed.

The following table defines the nodes of the optional httpheaders input parameter:

Table 2.

Nodes of the httpheaders Input Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/method	Specifies the type of HTTP response, for example: POST.
httpheaders/Via	Contains the time taken by each of the activities present between HTTP Receive and HTTP Send Response. For example, <code>FTP Put(uploadfile):50ms;Send Email(postinfo):30ms;</code> . There are two activities, FTP Put and Send Email, that are present between HTTP Receive and HTTP Send Response activities. So, when a job is processed, the Via header response will contain this value. It means that FTP Put activity takes 50 milliseconds and the Send Email activity takes 30 milliseconds, respectively, to complete the activity.

Nodes of the http headers Input Parameter	Description
httpheaders/ configured_header_name	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header name you selected or entered.
httpheaders/ other Headers/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs for the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so this is a recurring node.
httpheaders/ other Headers/headerItem/name	Specifies the name of the HTTP parameter.
httpheaders/ other Headers/headerItem/value	Specifies the value of the HTTP parameter.

3. Create a map between the orchestration variable or variables and the input parameter or parameters. See [Creating a map](#) for general instructions on mapping

Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.

3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

Parent topic: [HTTP Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_send_response_activity.html

Compression/Decompression with the HTTP Send Response activity

During runtime, the **HTTP Send Response** activity sends an HTTP response complaint with the HTTP/HTTPS 1.0 protocol to the HTTP client.

Note: The **HTTP Send Response** activity supports compression with the gzip format only. It does not support the deflate format or the common UNIX file compression format called compress.

The compression runtime behavior of the **HTTP Send Response** activity is dependant on the following conditions:

- [At the message level, the value of the Accept-Encoding header in the original HTTP request](#) received by the **HTTP Receive Request** activity is passed to the **HTTP Send Response** activity to determine if the body of the HTTP response is compressed or not compressed as shown in the following figure.
- [The setting of the Use Compression/Decompression check box at the activity level](#)

The affect of these conditions on the compression runtime behavior of the **HTTP Send Response** activity are described in the following sections and in the table provided in the [runtime Compression Behavior](#) section.

Accept-Encoding value at the message level

During runtime, a **HTTP Receive Request** activity receives a HTTP request from a HTTP client. In the same orchestration, a **HTTP Send Response** activity sends a HTTP response back to the original client. The value of the Accept-Encoding header in the original request received by the **HTTP Receive Request** activity is stored internally on the Integration Appliance. The stored value is passed to the **HTTP Send Response** activity and is used to determine if the body of the response is compressed or not and the encoding type, as shown in the following figure.

If values for the Content-Encoding or Accept-Encoding headers are explicitly set using the optional `httpheaders` input parameter of the **HTTP Send Response** activity, these new values override the default settings of these headers passed-in via the request. For example, if Accept-Encoding is set to `gzip, deflate` in the request but is explicitly set to `identity` in the `httpheaders` input parameter of the **HTTP Send Response** activity, the Integration Appliance does not compress the body of the response.

To explicitly set the Accept-Encoding header, provide the following values in a `headerItem` node in the **Map Inputs** task of the **HTTP Post Request** activity:

- `httpheaders/httpheaders/otherHeaders/headerItem/name` is set to the string: `Accept-Encoding`
- `httpheaders/httpheaders/otherHeaders/headerItem/value` is set to the encoding type, for example the string: `identity`.

Setting Compression/Decompression at the activity level

By default, compression is turned on at the activity level for the **HTTP Send Response** activity. You can turn off compression at the activity level by clearing the Use Compression/Decompression check box. The Use Compression/Decompression check box is available in the **Configure** task of the activity. The second column labeled `HTTP Compression CLI Command` in the following table represents the setting of the Use Compression/Decompression check box.

Runtime compression behavior

The following table describes the compression runtime behavior when the Integration Appliance sends a HTTP response to the HTTP Client:

Use Compression/Decompression Check Box (Activity Level) \hat{A}	Accept-Encoding Value of the HTTP Request (Message Level)	Integration Appliance Compression Runtime Behavior

Use Compression/Decompression Check Box (Activity Level) ^Â	Accept-Encoding Value of the HTTP Request (Message Level)	Integration Appliance Compression Runtime Behavior
selected	gzip or gzip,deflate	The Integration Appliance sends the body of the response compressed in the gzip format and the Content-Encoding header is set to gzip in the response.
selected	identity	The Integration Appliance sends the body of the response uncompressed and the Content-Encoding header is set to identity in the response.
selected	not set, or any other string except gzip or identity	The Integration Appliance sends the body of the response uncompressed and the Content-Encoding header is set to identity in the response.
cleared	value is not significant	The Integration Appliance sends the body of the response as is (unchanged) and the Content-Encoding header is as is in the response. (The value of the Content-Encoding header in the request is passed unchanged to the response.)

Note: The Use Compression/Decompression check box will be deprecated in a future release. Use the Content-Encoding and Accept-Encoding HTTP Parameters in the HTTP request to specify how to decompresses the body of the HTTP request and compress the body of the HTTP response.

Parent topic: [HTTP Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/compression_with_the_http_send_response_activity.html

HTTP Post Request activity

The HTTP **Post Request** activity sends a **Post Request** to the specified location (the HTTP endpoint) and receives an HTTP response back from that location.

Adding an HTTP Post Request activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Post Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

Creating, selecting or editing an HTTP endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:

- o Select an existing endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
 - o Select an existing endpoint and edit the endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK.
 - c. Click Edit. The Edit Endpoint pane is displayed.
 - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint, see [Creating or editing an HTTP endpoint](#).

Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description
URL (Path after Host name)	<p>Specifies the resource path that the Post Request activity sends the request to, for example: /mypath. The string you specify in this field must exclude the string: http://, the host name, and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint, and the path specified in this field. For example, if the full URL that the Post Request activity sends the request to is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the Post Request activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format: url/{path}?name1=value1&name2=value2. This allows you to map a string value to the "{path}" parameter and to specify query parameter names: <i>name1</i> and <i>name2</i> in this example. If you choose to declare multiple "{path}" parameters, each parameter should have a unique name. Parameters with the same name are represented by only one node in the map. The path parameters are displayed under /httpheaders/pathParameters in Map Input. Query parameters are displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper or define a default value.</p>
Where Request Message is Of Type	Specifies the expected message type of the HTTP request - either Text or Binary. Â

Field or Check Box	Description
Where Reply Message is Of Type	Specifies the message type of the HTTP reply - either Text or Binary. Â
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> o Stop Processing the Orchestration Job - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the Post Request activity and the activities after the Post Request activity in the orchestration are not processed and a failed exception is thrown. o Continue Processing and Return the HTTP Error code - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the Post Request activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessage output parameters, respectively.
Use Compression/Decompression	<p>Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity.</p>

Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.

- To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

Specifying the response headers

- Select the **Response Headers** task from the Checklist. The **Response Headers pane** is displayed. A Custom Headers table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle, and a **Standard Headers** table is displayed at the bottom.
- Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.
- To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

Specifying the retry options

- Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
- Configure the retry options for connecting to an HTTP Server. The following table defines the retry options for a connection to an HTTP Server:

Table 2.

Fields	Description
Retry	Â
1) Wait — secon ds betwe en each retry.	The number of seconds that the Integration Appliance waits before trying to establish a connection to the HTTP Server.
2) Try to conne ct — times before failing .	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an HTTP Post Request activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

Fields	Description
Activity Timeout	Â
3) Timeout after _____ seconds when the Endpoint does not respond to a request.	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the Post Request activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in HTTP Endpoint tab. For more information about connection timeouts, see Creating or editing an HTTP endpoint .

Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is mandatory and at least one variable must be mapped to it. The body input parameter contains the body of the HTTP request message sent to the HTTP server.
2. To view the optional input parameters in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The httpheaders and httpConnParameter input parameters display.

The following table defines the nodes of the optional httpheaders input parameter:

Table 3.

Nodes of the httpheaders Input Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one request header in Request Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/path Parameters	If you configured path parameters in the URL in Configure step, each is displayed here. If no path parameter is specified, this node does not display.
httpheaders/query Parameters	If you configured query parameters in the URL in Configure step, each is displayed here. If no query parameter is specified, this node does not display.

Nodes of the httpheaders Input Parameter	Description
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

Note: If the Content-Length header is explicitly set using the httpheaders/otherHeaders/headerItem/name and httpheaders/otherHeaders/headerItem/value, during run time this value is ignored. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional httpConnParameter input parameter. You can optionally override the settings you specified in the **Pick Endpoint** task of the **Checklist** dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the httpConnParameter input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 4.

Nodes of the httpConnParameter Input Parameter	Description	Overrides what settings in the HTTP endpoint?
timeout	Specifies the amount of time in seconds before a timeout occurs.	Â
host	Specifies the host name or IP address of the remote HTTP server. Â	The host node of the httpConnParameter input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server. Â	The port node of the httpConnParameter input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The isSecure node of the httpConnParameter input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The username node of the httpConnParameter input parameter overrides the User Name field in the HTTP endpoint.
password	Specifies the password for the account used to connect to the HTTP Server.	The password node of the httpConnParameter input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and input parameter or parameters. See [Creating a map](#) for general instructions on mapping.

Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 5.

Output Parameter	Description
httpheaders	Specifies the header of the HTTP response.
body	Specifies the body of the HTTP response message.
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time. Â
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the httpheaders output parameter:

Table 6.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies a set of name/value pairs that contain the HTTP parameters of the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so headerItem is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_post_request_activity.html

HTTP Get Request activity

The HTTP **Get Request** activity sends a **Get Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.

Adding an HTTP Get Request activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Get Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

Creating, selecting, or editing an HTTP endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
 - o Select an existing endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
 - o Select an existing endpoint and edit the endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK.
 - c. Click Edit. The Edit Endpoint pane is displayed.
 - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint. See [Creating or editing an HTTP endpoint](#).

Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description
--------------------	-------------

Field or Check Box	Description
URL (Path after Host name)	<p>Specifies the resource path that the Get Request activity sends the request to, for example: /mypath. The string you specify in this field must exclude the string: http://, the hostname, and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint and the path specified in this field. For example, if the full URL that the Get Request activity sends the request to is http://myAR:myPort/myPath, in this field, you only need to specify the string: /myPath. The specified path must be unique for the Get Request activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format: url/{path}?name1=value1&name2=value2. This allows you to map a string value to the "{path}" parameter and to specify query parameter names: <i>name1</i> and <i>name2</i> in this example. If you choose to declare multiple "{path}" parameters, it is recommended that each parameter has a unique name. Parameters with the same name are represented by only one node in the map. The path parameters will be displayed under /httpheaders/pathParameters in Map Input. And query parameters will be displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper, or define a default value.</p>
Where Request Message is Of Type	Specifies the message type of the HTTP response - either Text or Binary.
Where Reply Message is Of Type	Specifies the message type of the HTTP reply - either Text or Binary..

Field or Check Box	Description
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> ○ Stop Processing the Orchestration Job - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the HTTP Get Request activity and the activities after the HTTP Get Request activity in the orchestration are not processed and a failed exception is thrown. ○ Continue Processing and Return the HTTP Error code - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the HTTP Get Request activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessage output parameters, respectively.
Use Compression/Decompression	<p>Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity.</p>

Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Duplicate header names are not allowed (ignoring the case difference) and if duplicated headers appear in the **Custom Headers** table, you are prompted to remove them. The selected HTTP headers are displayed under /httpheaders in Map Input.

Specifying the response headers

1. Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is

- displayed in the middle, and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.
 3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Duplicate header names are not allowed (ignoring the case difference) and if duplicated headers appear in the **Custom Headers** table, you are prompted to remove them. The selected HTTP headers are displayed under /httpheaders in Map Output.

Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options to connect to an HTTP Server. The following table defines the retry options for connecting to an HTTP Server:

Field	Description
Retry	^
1) Wait --- secon ds betwe en each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the HTTP server.
2) Try to conne ct --- times before failing .	Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an HTTP Get Request activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
3) Time out after --- secon ds when the Endpo int does not respo	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the HTTP Get Request activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in HTTP Endpoint tab. For more information about connection timeouts, see, Creating or Editing a Web Services Endpoint .

nd to a reque st.	
----------------------------	--

Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is optional. The body input parameter contains the body of the HTTP response message sent back to the HTTP server.
2. To view the optional input parameter in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The `httpheaders` and **httpConnParameter** input parameters are displayed.

The following table defines the nodes of the optional `httpheaders` input parameter:

Table 2.

Nodes of the <code>httpheaders</code> Input Parameter	Description
<code>httpheaders/uri</code>	Specifies the resource path, for example: <code>/myPath</code> .
<code>httpheaders/<configured_header_name></code>	If you configured at least one request header in the Request Headers step, each is displayed here. <code><configured_header_name></code> is replaced with the actual header names you selected or entered.
<code>httpheaders/pathParameters</code>	If you configured path parameters in the URL in the Configure step, each is displayed here. If no path parameter is specified, this node does not display.
<code>httpheaders/queryParameters</code>	If you configured query parameters in the URL in the Configure step, each is displayed here. If no query parameter is specified, this node does not display.
<code>httpheaders/otherHeaders/headerItem</code>	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP parameters can be specified in the HTTP response, so this is a recurring node.
<code>httpheaders/otherHeaders/headerItem/name</code>	Specifies the name of the HTTP header parameter.
<code>httpheaders/otherHeaders/headerItem/value</code>	Specifies the value of the HTTP parameter.

Note: If the Content-Length header is explicitly set using the `httpheaders/otherHeaders/headerItem/name` and `httpheaders/otherHeaders/headerItem/value`, this value is ignored during run time. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional `httpConnParameter` input parameter. You can optionally override the settings you specified in the Pick Endpoint task of the Checklist dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the `httpConnParameter` input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 3.

Nodes of the httpConnParameter Input Parameter	Description	Overrides what settings in the HTTP endpoint?
timeout	Specifies the amount of time in seconds before a timeout occurs.	^
host	Specifies the host name or IP address of the remote HTTP server.	The host node of the httpConnParameter input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server.	The port node of the httpConnParameter input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The isSecure node of the httpConnParameter input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The username node of the httpConnParameter input parameter overrides the User Name field in the HTTP endpoint.
password	Specifies the password for the account used to connect to the HTTP Server.	The password node of the httpConnParameter input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and the input parameter or parameters. See [Creating a map](#) for general instructions on mapping

Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 4.

Output Parameter	Description
httpheaders	Specifies the header of the HTTP request.
body	Specifies the body of the HTTP request message.
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time.
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the optional httpheaders output parameter. ^

Table 5.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path of the incoming request, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

Parent topic: [HTTP Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_get_request_activity.html

HTTP Head Request activity

The HTTP **Head Request** activity sends a **Head Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.

Adding an HTTP Head Request activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Head Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

Creating, selecting, or editing an HTTP endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
 - Select an existing endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
 - Select an existing endpoint and edit the endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK.
 - c. Click Edit. The Edit Endpoint pane is displayed.
 - Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint. See [Creating or editing an HTTP endpoint](#).

Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description
URL (Path after Host name)	<p>Specifies the resource path that the Head Request activity sends the request to, for example: /mypath. The string you specify in this field must exclude the string: http://, the hostname and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint and the path specified in this field. For example, if the full URL that the Head Request activity sends the request to is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the Head Request activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format: url/{path}?name1=value1&name2=value2. This allows you to map a string value to the "{path}" parameter and to specify query parameter names: <i>name1</i> and <i>name2</i> in this example. If you choose to declare multiple "{path}" parameters, each parameter should have a unique name. Parameters with the same name are represented by only one node in the map. The path parameters are displayed under /httpheaders/pathParameters in Map Input. And query parameters will be displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper, or define a default value.</p>

Field or Check Box	Description
Where Request Message is Of Type	Specifies the expected message type of the HTTP response - either Text or Binary.
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> ○ Stop Processing the Orchestration Job - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the Head Request activity and the activities after the Head Request activity in the orchestration are not processed and a failed exception is thrown. ○ Continue Processing and Return the HTTP Error code - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the Head Request activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessage output parameters, respectively.
Use Compression/Decompression	<p>Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity.</p>

Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.

- To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you may be prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

Specifying the response headers

- Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A Custom Headers table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle, and a **Standard Headers** table is displayed at the bottom.
- Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
- To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

Specifying the retry options

- Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
- Configure the retry options to connect to an HTTP Server. The following table defines the retry options for connecting to an HTTP Server:

Field	Description
Retry	^
1) Wait --- secon ds betwe en each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the HTTP server.
2) Try to conne ct ___ times before failing .	Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an HTTP Head Request activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
3) Time out after ---	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the HTTP Head Request activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection

seconds when the Endpoint does not respond to a request.	timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in HTTP Endpoint tab. For more information about connection timeouts, see, Creating or Editing a Web Services Endpoint .
--	--

Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is optional. The body input parameter contains the body of the HTTP response message sent back to the HTTP server.
2. To view the optional input parameter in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The `httpheaders` and `httpConnParameter` input parameters are displayed.

The following table defines the nodes of the optional `httpheaders` input parameter:

Table 2.

Nodes of the <code>httpheaders</code> Input Parameter	Description
<code>httpheaders/uri</code>	Specifies the resource path, for example: <code>/myPath</code> .
<code>httpheaders/<configured_header_name></code>	If you configured at least one request header in Request Headers step, each one of them will be displayed here. <code><configured_header_name></code> will be replaced with the actual header names you selected or entered.
<code>httpheaders/pathParameters</code>	If you configured path parameters in the URL in the Configure step, each is displayed here. If no path parameter is specified, this node does not display.
<code>httpheaders/queryParameters</code>	If you configured query parameters in the URL in Configure step, each is displayed here. If no query parameter is specified, this node does not display.
<code>httpheaders/otherHeaders/headerItem</code>	Specifies an element that contains a set of HTTP header parameters as name/value pairs for the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so this is a recurring node.
<code>httpheaders/otherHeaders/headerItem/name</code>	Specifies the name of the HTTP parameter.
<code>httpheaders/otherHeaders/headerItem/value</code>	Specifies the value of the HTTP parameter.

Note: If the Content-Length header is explicitly set using the `httpheaders/otherHeaders/headerItem/name` and `httpheaders/otherHeaders/headerItem/value`, during run time this value is ignored. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional `httpConnParameter` input parameter. You can optionally override the settings you specified in the Pick Endpoint task of the Checklist dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the `httpConnParameter` input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 3.

Nodes of the <code>httpConnParameter</code> Input Parameter	Description	Overrides what settings in the HTTP endpoint?
timeout	Specifies the amount of time in seconds before a timeout occurs.	Â
host	Specifies the host name or IP address of the remote HTTP server.	The host node of the <code>httpConnParameter</code> input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server.	The port node of the <code>httpConnParameter</code> input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The <code>isSecure</code> node of the <code>httpConnParameter</code> input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The username node of the <code>httpConnParameter</code> input parameter overrides the User Name field in the HTTP endpoint.
password	Specifies the password for the account used to connect to the HTTP Server.	The password node of the <code>httpConnParameter</code> input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and the input parameter or parameters. See [Creating a map](#) for general instructions on mapping

Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 4.

Output Parameter	Description
httpheaders	Specifies the header of the HTTP request.
body	Specifies the body of the HTTP request message.

Output Parameter	Description
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time.
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the optional httpheaders output parameter. ^Â

Table 5.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path of the incoming request, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name>will be replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

Parent topic: [HTTP Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

HTTP Invoke Request activity

The HTTP **Invoke Request** activity sends a HTTP request to the specified location, the HTTP endpoint, and receives a HTTP response back from that location.

Adding an HTTP Invoke Request activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Invoke Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

Creating, selecting, or editing an HTTP endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
 - o Select an existing endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
 - o Select an existing endpoint and edit the endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK.
 - c. Click Edit. The Edit Endpoint pane is displayed.
 - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint, see [Creating or editing an HTTP endpoint](#).

Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description
--------------------	-------------

Field or Check Box	Description
URL (Path after Host name)	<p>Specifies the resource path that the Invoke Request activity sends the request to, for example: /mypath. The string you specify in this field must exclude the string: http://, the host name, and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint, and the path specified in this field. For example, if the full URL that the Invoke Request activity sends the request to is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the Invoke Request activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format: url/{path}?name1=value1&name2=value2. This allows you to map a string value to the "{path}" parameter and to specify query parameter names: <i>name1</i> and <i>name2</i> in this example. If you choose to declare multiple "{path}" parameters, it is recommended that each parameter has a unique name. Parameters with the same name are represented by only one node in the map. The path parameters are displayed under /httpheaders/pathParameters in Map Input. Query parameters are displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper, or define a default value.</p>
Where Request Message is Of Type	Specifies the expected message type of the HTTP request - either Text or Binary. Â
Where Reply Message is Of Type	Specifies the message type of the HTTP reply - either Text or Binary.

Field or Check Box	Description
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> ○ Stop Processing the Orchestration Job - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the Invoke Request activity and the activities after the Invoke Request activity in the orchestration are not processed and a failed exception is thrown. ○ Continue Processing and Return the HTTP Error code - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the Invoke Request activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessage output parameters, respectively.
Use Compression/Decompression	<p>Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity.</p>

Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

Specifying the response headers

1. Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an HTTP Server. The following table defines the retry options for a connection to an HTTP Server:

Table 2.

Fields	Description
Retry	Â
1) Wait -- secon ds betwe en each retry.	The number of seconds that the Integration Appliance waits before trying to establish a connection to the HTTP Server.
2) Try to conne ct -- times before failing .	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an HTTP Post Request activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>
Activi ty Timeo ut	Â

Fields	Description
3) Time out after ____ secon ds when the Endpo int does not respo nd to a reque st.	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the Invoke Request activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in HTTP Endpoint tab. For more information about connection timeouts, see Creating or editing an HTTP endpoint .

Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is mandatory and at least one variable must be mapped to it. The body input parameter contains the body of the HTTP request message sent to the HTTP server.
2. To view the optional input parameters in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The httpheaders and httpConnParameter input parameters display.

The following table defines the nodes of the optional httpheaders input parameter:

Table 3.

Nodes of the httpheaders Input Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/method	Specifies the type of HTTP request. If no value is mapped, the default method is POST.
httpheaders/<configured_header_name>	If you configured at least one request header in Request Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered
httpheaders/pathParameters	If you configured path parameters in the URL in Configure step, each is displayed here. If no path parameter is specified, this node does not display.
httpheaders/queryParameters	If you configured query parameters in the URL in Configure step, each is displayed here. If no query parameter is specified, this node does not display.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.

Nodes of the httpheaders Input Parameter	Description
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

Note: If the Content-Length header is explicitly set using the httpheaders/otherHeaders/headerItem/name and httpheaders/otherHeaders/headerItem/value, during run time this value is ignored. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional httpConnParameter input parameter. You can optionally override the settings you specified in the **Pick Endpoint** task of the **Checklist** dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the httpConnParameter input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 4.

Nodes of the httpConnParameter Input Parameter	Description	Overrides what settings in the HTTP endpoint?
timeout	Specifies the amount of time in seconds before a timeout occurs.	∅
host	Specifies the host name or IP address of the remote HTTP server. ∅	The host node of the httpConnParameter input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server. ∅	The port node of the httpConnParameter input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The isSecure node of the httpConnParameter input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The username node of the httpConnParameter input parameter overrides the User Name field in the HTTP endpoint.
password	Specifies the password for the account used to connect to the HTTP Server.	The password node of the httpConnParameter input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and input parameter or parameters. See [Creating a map](#) for general instructions on mapping.

Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 5.

Output Parameter	Description
httpheaders	Specifies the header of the HTTP response.
body	Specifies the body of the HTTP response message.
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time. Â
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the httpheaders output parameter:

Table 6.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/method	Specifies the type of HTTP response.
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies a set of name/value pairs that contain the HTTP parameters of the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so headerItem is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

 Last updated: Wednesday, February 17, 2016

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_invoke_request_activity.html

HTTP Put Request activity

The HTTP **Put Request** activity sends a **Put Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.

Adding an HTTP Put Request activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Put Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

Creating, selecting, or editing an HTTP endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
 - o Select an existing endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
 - o Select an existing endpoint and edit the endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK.
 - c. Click Edit. The Edit Endpoint pane is displayed.
 - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint. See [Creating or editing an HTTP endpoint](#).

Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description
--------------------	-------------

Field or Check Box	Description
URL (Path after Host name)	<p>Specifies the resource path that the Put Request activity sends the request to, for example: /mypath. The string you specify in this field must exclude the string: http://, the hostname and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint and the path specified in this field. For example, if the full URL that the Put Request activity sends the request to is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the Put Request activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format, "url/{path}?name1=value1&name2=value2". This allows you to map a string value to the "{path}" parameter and to specify query parameter names: "name1" and "name2" in this example. If you choose to declare multiple "{path}" parameters, it is recommended that each parameter has a unique name. Parameters with the same name are represented by only one node in the map. The path parameters will be displayed under /httpheaders/pathParameters in Map Input. And query parameters will be displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper, or define a default value.</p>
Where Request Message is Of Type	Specifies the message type of the HTTP response - either Text or Binary.
Where Reply Message is Of Type	Specifies the message type of the HTTP reply - either Text or Binary..

Field or Check Box	Description
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> ○ Stop Processing the Orchestration Job - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the Put Request activity and the activities after the Put Request activity in the orchestration are not processed and a failed exception is thrown. ○ Continue Processing and Return the HTTP Error code - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the Put Request activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessage output parameters, respectively.
Use Compression/Decompression	<p>Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity.</p>

Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

Specifying the response headers

1. Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is

- displayed in the middle, and a **Standard Headers** table is displayed at the bottom.
- Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.
 - To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you may be prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

Specifying the retry options

- Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
- Configure the retry options to connect to an HTTP Server. The following table defines the retry options for connecting to an HTTP Server:

Field	Description
Retry	^
1) Wait --- secon ds betwe en each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the HTTP server.
2) Try to conne ct --- times before failing .	Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an HTTP Put Request activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
3) Time out after --- secon ds when the Endpo int does not respo	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the HTTP Put Request activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in HTTP Endpoint tab. For more information about connection timeout, see Creating or Editing a Web Services Endpoint .

nd to a reque st.	
----------------------------	--

Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is mandatory and at least one variable must be mapped to it. The body input parameter contains the body of the HTTP response message sent back to the HTTP server.
2. To view the optional input parameter in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The **httpheaders** and **httpConnParameter** input parameters are displayed.

The following table defines the nodes of the optional httpheaders input parameter:

Table 2.

Nodes of the httpheaders Input Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one request header in Request Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/pathParameters	If you configured path parameters in the URL in Configure step, each is displayed here. If no path parameter is specified, this node does not display.
httpheaders/queryParameters	If you configured query parameters in the URL in Configure step, each one of them will be displayed here. If no query parameter is specified, this node does not display.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs for the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP parameter.

Note: If the Content-Length header is explicitly set using the `httpheaders/otherHeaders/headerItem/name` and `httpheaders/otherHeaders/headerItem/value`, during run time this value is ignored. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional httpConnParameter input parameter. You can optionally override the settings you specified in the Pick Endpoint task of the Checklist dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the httpConnParameter input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 3.

Nodes of the httpConnParameter Input Parameter	Description	Overrides what settings in the HTTP endpoint?
timeout	Specifies the amount of time in seconds before a timeout occurs.	^
host	Specifies the host name or IP address of the remote HTTP server.	The host node of the httpConnParameter input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server.	The port node of the httpConnParameter input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The isSecure node of the httpConnParameter input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The username node of the httpConnParameter input parameter overrides the User Name field in the HTTP endpoint.
password	Specifies the password for the account used to connect to the HTTP Server.	The password node of the httpConnParameter input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and the input parameter or parameters. See [Creating a map](#) for general instructions on mapping

Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 4.

Output Parameter	Description
httpheaders	Specifies the header of the HTTP request.
body	Specifies the body of the HTTP request message.
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time.
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the optional httpheaders output parameter. ^

Table 5.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path of the incoming request, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

Parent topic: [HTTP Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_put_request_activity.html

HTTP Delete Request activity

The HTTP **Delete Request** activity sends a **Delete Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.

Adding an HTTP Delete Request activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Delete Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

Creating, selecting, or editing an HTTP endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
 - Select an existing endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
 - Select an existing endpoint and edit the endpoint:
 - a. Select Browse. The Project Explorer is displayed.
 - b. Select an existing endpoint and click OK.
 - c. Click Edit. The Edit Endpoint pane is displayed.
 - Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint. See [Creating or editing an HTTP endpoint](#).

Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description
URL (Path after Host name)	<p>Specifies the resource path that the Delete Request activity sends the request to, for example: /myPath. The string you specify in this field must exclude the string: http://, the hostname, and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint and the path specified in this field. For example, if the full URL that the Delete Request activity sends the request to is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the Delete Request activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format, "url/{path}?name1=value1&name2=value2". This allows you to map a string value to the "{path}" parameter and to specify query parameter names: <i>name1</i> and <i>name2</i> in this example. If you choose to declare multiple "{path}" parameters, each parameter should have a unique name. Parameters with the same name are represented by only one node in the map. The path parameters are displayed under /httpheaders/pathParameters in Map Input. Query parameters are displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper, or define a default value.</p>

Field or Check Box	Description
Where Request Message is Of Type	Specifies the message type of the HTTP response - either Text or Binary.
Where Reply Message is Of Type	Specifies the message type of the HTTP reply - either Text or Binary.
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> ○ Stop Processing the Orchestration Job - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the Delete Request activity and the activities after the Delete Request activity in the orchestration are not processed and a failed exception is thrown. ○ Continue Processing and Return the HTTP Error code - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the Post Request activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessage output parameters, respectively.
Use Compression/Decompression	<p>Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity</p>

Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

Specifying the response headers

1. Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle, and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The **Retry** pane is displayed.
2. Configure the retry options to connect to an HTTP Server. The following table defines the retry options for connecting to an HTTP Server:

Field	Description
Retry	Â
1) Wait ____ seconds between each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the HTTP server.
2) Try to connect ____ times before	Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an HTTP Delete Request activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops

<p>failing .</p>	<p>processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>
<p>3) Time out after ____ secon ds when the Endpo int does not respo nd to a reque st.</p>	<p>Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the HTTP Delete Request activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in HTTP Endpoint tab. For more information about connection timeouts, see, Creating or Editing a Web Services Endpoint.</p>

Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is optional. The body input parameter contains the body of the HTTP response message sent back to the HTTP server.
2. To view the optional input parameter in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The **httpheaders** and **httpConnParameter** input parameters are displayed.

The following table defines the nodes of the optional httpheaders input parameter:

Table 2.

Nodes of the httpheaders Input Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one request header in Request Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/pathParameters	If you configured path parameters in the URL in Configure step, each is displayed here. If no path parameter is specified, this node does not display.
httpheaders/query Parameters	If you configured query parameters in the URL in Configure step, each one of them will be displayed here. If no query parameter is specified, this node does not display.

Nodes of the httpheaders Input Parameter	Description
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs for the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP parameter.

Note: If the Content-Length header is explicitly set using the `httpheaders/otherHeaders/headerItem/name` and `httpheaders/otherHeaders/headerItem/value`, during run time this value is ignored. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional `httpConnParameter` input parameter. You can optionally override the settings you specified in the Pick Endpoint task of the Checklist dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the `httpConnParameter` input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 3.

Nodes of the httpConnParameter Input Parameter	Description	Overrides what settings in the HTTP endpoint?
timeout	Specifies the amount of time in seconds before a timeout occurs.	∅
host	Specifies the host name or IP address of the remote HTTP server.	The host node of the <code>httpConnParameter</code> input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server.	The port node of the <code>httpConnParameter</code> input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The isSecure node of the <code>httpConnParameter</code> input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The username node of the <code>httpConnParameter</code> input parameter overrides the User Name field in the HTTP endpoint.
password	Specifies the password for the account used to connect to the HTTP Server.	The password node of the <code>httpConnParameter</code> input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and the input parameter or parameters. See [Creating a map](#) for general instructions on mapping

Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 4.

Output Parameter	Description
httpheaders	Specifies the header of the HTTP request.
body	Specifies the body of the HTTP request message.
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time.
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the optional httpheaders output parameter. Å

Table 5.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path of the incoming request, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_delete_request_activity.html

Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity

During runtime, the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity sends a HTTP request compliant with the HTTP/HTTPS 1.1 protocol to the HTTP Server.

Note: The **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity supports compression/decompression with the gzip or the deflate formats. It does not support the common UNIX file compression format called compress.

The compression/decompression runtime behavior of the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity is dependant on the following conditions:

- [If the endpoint supports compression/decompression](#)
- [The values of the Content-Encoding and Accept-Encoding headers at the message level](#)
- [The setting of the Use Compression/Decompression check box at the activity level](#)

The affect of these conditions on the compression/decompression runtime behavior of the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity are described in the following sections and in the tables provided in the [Runtime Compression/Decompression Behavior](#) section.

Endpoint support for compression/decompression

The Integration Appliance determines whether or not the HTTP Endpoint supports compression when the Integration Appliance sends the first HTTP request in the compressed format to the HTTP Endpoint (the HTTP Server), if the HTTP Server returns an error code indicating that HTTP Server does not support compression or does not support the specified Content-Encoding type, the Integration Appliance re-sends the first request in uncompressed format and all subsequent requests to this Endpoint are sent in the uncompressed format. In addition, the HTTP response sent by the HTTP Server is not decompressed when received by Integration Appliance. Â

Endpoint support for compression/decompression is represented by the column labeled **Endpoint Supports Compression?** in the tables provided in the [Runtime Compression/Decompression Behavior](#) section. Â

Content-Encoding and Accept-Encoding values at the message level

The value of the Content-Encoding header in the HTTP request determines if the body of the request is compressed and the type of encoding that is used. For example, if the Content-Encoding is equal to deflate, the Integration Appliance sends the body of the request compressed in the deflate format as shown in the second row of the first table labeled [Compression Behavior When Sending a Request](#) and in the following figure.

The value of the Accept-Encoding header in the request defines the types of encoding that the HTTP client accepts in the response. For example, if the Accept-Encoding is equal to **gzip,deflate** in the request, the HTTP server can send the body of the response compressed in gzip or deflate formats to the Integration Appliance (acting as a client) as shown in the following figure:

Figure 1.

By default, if nothing is mapped to the optional **httpheaders** input parameter in the **Map Inputs** task of the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity, a set of default headers are created. For example, the URL header is automatically set with the value provided in the Configure pane of the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity.

The values for the Accept-Encoding and Content-Encoding headers for the request can be explicitly set using name/value pairs in the optional **httpheaders** input parameter of the **Map Inputs** task in the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity. For example, to set the Content-Encoding to **deflate**, set the following name/value pair in the optional **httpheaders** input parameter:

- **httpheaders/httpheaders/otherHeaders/headerItem/name** is set to the string: Content-Encoding
- **httpheaders/httpheaders/otherHeaders/headerItem/value** is set to the encoding type, for example the string: deflate.

If unsupported values or no values are set for the Accept-Encoding and Content-Encoding headers of the request, default values are provided as shown in the following tables:

- [Compression behavior when sending a request](#)
- [Accept-Encoding Header value passed to the request](#)

The values of the Accept-Encoding and Content-Encoding headers in the request are used by the Integration Appliance and the HTTP server to determine the compression/decompression behavior.

Setting compression/decompression at the activity level

By default, compression/decompression is not used for all HTTP activities. You can select compression or decompression at the activity level by using the Use Compression/Decompression check box that is displayed in the **Configure** task of the activity. The column labeled Use Compression/Decompression Check Box in the table shown in [Runtime Compression/Decompression Behavior](#) represents the setting of the Use Compression/Decompression check box.

Note: The Use Compression/Decompression check box will be deprecated in a future release for the HTTP activities. Use the Content-Encoding and Accept-Encoding HTTP Parameters in the HTTP request to specify how to decompresses the body of the HTTP request and compress the body of the HTTP response.

Runtime compression/decompression behavior

The table provided in the [Compression behavior when sending a request](#) section describes the compression runtime behavior when the Integration Appliance sends a HTTP request to the HTTP server.

The table provided in the [Accept-Encoding Header value passed to the request](#) section describes the value of the Accept-Encoding header passed in the HTTP request.

The table provided in the [Decompression behavior when receiving a response](#) section describes the decompression runtime behavior when the Integration Appliance receives the HTTP response from the HTTP server.

Compression behavior when sending a request

The following table describes the compression runtime behavior when the Integration Appliance sends a HTTP request to the HTTP server.

Use Compression/Decompression Check Box (Activity Level)	Content-Encoding Value in the HTTP Request (Message Level)	Endpoint Supports Compression?	Integration Appliance Compression Runtime Behavior When Sending a Request
selected	gzip, not set, or any other string except deflate or identity	yes	The Integration Appliance sends the body of the request compressed in the gzip format. The Content-Encoding header is set to gzip in the request.
selected	deflate	yes	The Integration Appliance sends the body of the request compressed in the deflate format. The Content-Encoding header is set to deflate in the request.
selected	identity	yes	The Integration Appliance sends the body of the request uncompressed. The Content-Encoding header is set to identity in the request.
selected	value is not significant	no	The Integration Appliance sends the body of the request uncompressed. The Content-Encoding header is set to identity in the request.
cleared	value is not significant	value is not significant	The Integration Appliance sends the body of the request as is (unchanged). The current value of the Content-Encoding header is passed as is in the request.

Â

Accept-Encoding Header value passed to the request

The following table describes the value of the Accept-Encoding header passed in the HTTP request.

Use Compression/Decompression Check Box (Activity Level)	Initial Accept-Encoding Value	Endpoint Supports Compression?	Accept-Encoding Value Passed In the HTTP Request to the Server
selected	gzip	yes	The Accept-Encoding header is set to gzip in the request.
selected	deflate	yes	The Accept-Encoding header is set to deflate in the request.
selected	gzip,deflate	yes	The Accept-Encoding header is set to gzip,deflate in the request.
selected	deflate,gzip	yes	The Accept-Encoding header is set to deflate,gzip in the request.
selected	identity	yes	The Accept-Encoding header is set to identity in the request.
selected	not set, or any other string except deflate, gzip, or identity	yes	The Accept-Encoding header is set to gzip,deflate in the request.
selected	value is not significant	no	The current value of the Accept-Encoding header is passed as is in the request.
cleared	value is not significant	value is not significant	The current value of the Accept-Encoding header is passed as is in the request.

Decompression behavior when receiving a response

The following table describes the decompression runtime behavior when the Integration Appliance receives the HTTP response from the HTTP Server.

Use Compression/Decompression Check Box (Activity Level)	Content-Encoding Value in the HTTP Response (Message Level)	Endpoint Supports Compression?	Integration Appliance Decompression Runtime Behavior When Receiving a Response
selected	gzip	yes	The Integration Appliance decompresses the body of the response using the gzip format.
selected	deflate	yes	The Integration Appliance decompresses the body of the response using the deflate format.
selected	identity	yes	The Integration Appliance does not decompress the body of the response.
selected	value not listed in the Accept-Encoding header	yes	The Integration Appliance logs an error that the response data was received in an unsolicited content encoding type.
selected	value is not significant	no	The Integration Appliance does not decompress the body of the response. The current value of the Content-Encoding header is passed as is in the response.

Use Compression/Decompression Check Box (Activity Level)	Content-Encoding Value in the HTTP Response (Message Level)	Endpoint Supports Compression?	Integration Appliance Decompression Runtime Behavior When Receiving a Response
cleared	value is not significant	value is not significant	The Integration Appliance does not decompress the body of the response. The current value of the Content-Encoding header is passed as is in the response.

Parent topic: [HTTP Activities](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/compression_decompression_with_the_http_invoke_get_post_head_put_delete_request_activity.html

Troubleshooting and support

Troubleshooting techniques and self-help information help you identify and solve problems quickly. Here, you can find potential solutions for issues you would have with the HTTP connector.

Inconsistent behaviour of query parameters

Problem: The behavior of the query parameters passed to the HTTP receiver varies with the input. This inconsistency occurs for HTTP Put, Get, Invoke, Header, and Delete outbound activities. For these activities the URL with query parameters can be set at two places:

- Checklist > Configure panel > URL (Path After Hostname)
- Checklist > Map Inputs panel > To Activity section > httpheaders > uri

However, the query parameters set in the steps mentioned above can be replaced or overwritten in the Map Inputs panel > To Activity section > httpheaders > queryParameters. The behavior of the query parameters passed to the HTTP Receiver varies with the input.

Solution: Consider the following points when setting values:

- If the value of the URL is mapped and the value of the parameters are empty, then the URL is passed as is to the HTTP Receiver.
- If the value of the URL and the value of the parameter in the map are also assigned, then the HTTP Receiver gets the values. The URL with parameter values are appended to the URL.
- If value of the URL is not mapped, the url is build dynamically using the parameter values in the input map.

Example:

Configure panel URI: `/xyz/test?query2=c&query3=c&query5=c&query6=c`

Map Inputs URI: `/xyz/test?query4=u&query3=u`

Map Inputs Query Parameter: query2=m and query3=m

End URL: /xyz/test?query4=u&query3=m&query2=m&query5=&query6=

HTTP connector uses ISO-8859-1 as default character encoding value.

HTTP connector now uses ISO-8859-1 as default character encoding in place of UTF-8.

You can use any one of the following method to change this character encoding value:

- **Method 1:** To resolve the issue, please follow steps below:
 1. Go to the HTTP Send Response activity
 2. Add response header "Content-Type"
 3. In Map Inputs, To Activity body, right click on the body element and click on "Show Optional Parameters"
 4. Expand the (optional)httpheaders, and assign default value below to the "Content-Type" element:

```
text/plain;charset=UTF-8
```

- **Method 2:** Introduced new JVM level configuration property. You can change this to the required value. If you set any value in the HTTP activity, that will take highest priority. Next priority is given to the JVM level property (if available). If nothing is set in either place, then default value "ISO-8859-1" is used for content encoding.

- **Studio**

```
Property name: "ContentEncoding"  
Default value: "ISO-8859-1"
```

Once the Studio is launched, run `jConsole` in bin directory of JDK. In New Connection screen, under Local Process, select the process corresponding to the Studio and click Connect. Under MBeans tab, navigate to `HttpModule > HTTP Loopback > Attributes > ContentEncoding`. Change the default value to the required value.

- **Appliance**

```
Property name: HTTP_CHARACTER_ENCODING  
Default value: ""
```

Setting this attribute on the appliance will require system shell access to enable/disable `jmxport`. In system shell, issue the following command to check if any value is set for the property:

```
ihconfutil lookup /var/sysconf sysconf.db HTTP_CHARACTER_ENCODING
```

User will get output like:

```
ContentEncodingv: []
```

Now, try to set the value true to this property.

```
ihconfutil add /var/sysconf sysconf.db HTTP_CHARACTER_ENCODING <new value>
```

Now verify the value set using:

```
ihconfutil lookup /var/sysconf sysconf.db HTTP_CHARACTER_ENCODING
```

This results in

```
ContentEncodingv: [<new value>]
```

The hierarchy in appliance is

1. Jconsole property
2. Config property
3. Default value

If you want to change the value at runtime without restarting appliance you can use jconsole for appliance, but if you want to set the value and make it permanent, then you have to set in config properties. If nothing is set for both properties default (ISO-8859-1) is used.

Infosphere MDM Activities

- [Overview of InfoSphere MDM and Cast Iron Connector](#)
The InfoSphere® MDM Cast Iron® connector enables cloud integration with on-premises InfoSphere MDM.

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_Infosphere_MDM.html

Overview of InfoSphere MDM and Cast Iron Connector

The InfoSphere® MDM Cast Iron® connector enables cloud integration with on-premises InfoSphere MDM.

Use the InfoSphere MDM Cast Iron connector to expose on-premises MDM business service as REST or web service provider services. Exposing the traditional MDM service for consumption in an enterprise SaaS integration enables reading, writing, searching, and processing notifications from your on-premises MDM.

InfoSphere MDM Cast Iron connector supports use of these MDM editions:

- IBM® InfoSphere Master Data Management Standard Edition 11.4.0
- IBM InfoSphere Master Data Management Advanced Edition 11.4.0

MDM Advanced Edition has many categories of web services, such as Party, Product, Custom Addition, Custom Extension, Custom Inquiry, and Party Maintenance. All of these web services are supported in InfoSphere MDM Cast Iron connector. In MDM standard edition, eSOA web services are supported in InfoSphere MDM Cast Iron connector.

The InfoSphere MDM Cast Iron connector supports both JSON and XML payload. The request to MDM can be either in JSON or XML. In the background at run time, the InfoSphere MDM Cast Iron connector makes a web service call to MDM and when the request is sent as a JSON payload, it is internally converted to XML before performing the web service call. The corresponding response is converted back to JSON before sending the response to the downstream activity.

Creating or editing an endpoint for MDM Connector activity

The InfoSphere® MDM and Cast Iron® Connector endpoint provides information that Cast Iron Studio and the Integration Appliance use to connect to the InfoSphere MDM instance. MDM provides various services that can process create, retrieve, update, and delete operations for your on-premises MDM run time.

About this task

Use this procedure to select or edit an InfoSphere MDM Cast Iron endpoint.

Procedure

1. In the Create Endpoint or Edit Endpoint pane, click Browse to open the Project Explorer.
2. In the Project Explorer pane, select one of the following options for your WSDL file.
 - Select an existing WSDL file that is already uploaded into the project.
 - Select a WSDL file from the file system. Click Add and then browse for the WSDL file. Click Add again.
3. In Endpoint Connection Properties, provide values for these InfoSphere MDM run time connection properties.

Field	Description
-------	-------------

name (Endpoint)	
Host Name	Host name of the MDM run time system
Port	Port value of the WC_defaulthost or WC_defaulthost_secure in the MDM run time; based on http or https.
User Name	MDM server user name
Password	MDM server password
Endpoint URL	Endpoint URL of the Soap request. By default this field contains the correct value. In eSOA, you can change the endpoint URL. If you do change the eSOA endpoint URL, make sure that you update this field.

4. Specify the security options.

When client authentication is required, select Client Certificate Alias Name and specify that the Integration Appliance that is acting as a client must provide a certificate to the HTTP Server. If selected, the name of the certificate must be provided. A certificate that is specified at the activity level with this check box takes precedence over a certificate that is specified in Security > Certificates > Settings > Client SSL in the WMC.

Note: This version of InfoSphere MDM connector supports SSL_TLSv2 protocol version.

5. Provide values for these properties. Click Advanced Properties.

Field name (Advanced Properties)	Description
Connection Pool Options	Specify the maximum number of connections. This value is the maximum number of connections that the Integration Appliance can open in the connection pool. Specifying 0 means that the number of connections is unlimited. By default, the Integration Appliance can have 25 connections open.
Connection Timeout	Specify the amount of time, in seconds, before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. For a web services activity, enter the amount of time that the Integration Appliance attempts to establish a connection to the web service before timing out. A connection timeout is different from an activity timeout. An activity timeout occurs after the connection to the Endpoint is established. An activity timeout specifies the amount of time, in seconds, before a timeout occurs between the activity that starts a request on an Endpoint and the time it takes the Endpoint to respond. Set the activity timeout in Retry task of the web services Invoke Service Activity.
XML Schema	Determines the number of child levels that Cast Iron Studio allocates and displays for each XML schema (including WSDLs) in the opened project. For the details of each of the properties, see Other Preferences .

Updating modified MDM model or WSDL

When working with multiple versions of InfoSphere[®] MDM, there is a chance that the MDM model and WSDL will be modified.

About this task

In such scenarios, you can attempt to update the existing WSDL with the new WSDL. For details, see [Updating a Changed WSDL](#).

Adding an activity

Use this procedure to add an Invoke MDM Service activity in the orchestration.

Procedure

1. Create or open an orchestration to view. A graphical representation of the orchestration displays.
2. Select the Activities tab and expand the InfoSphere MDM folder.
3. Drag the Invoke MDM Service activity onto the orchestration.
4. Select the activity to display the checklist.

Parent topic: [Starting an MDM service activity](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MDM_addingactivity.html

Creating an endpoint

Use this procedure to create, select, or edit an InfoSphere® MDM endpoint.

Procedure

1. Click Pick Endpoint task from the checklist and choose from one of the following actions:
 - o Select an existing endpoint.
 - a. Select Browse.
 - b. On the Project Explorer, select an existing endpoint and click OK. Continue with [Configuring the activity](#)
 - o Select an existing endpoint and edit the endpoint.
 - a. Select Browse.
 - b. On the Project Explorer, select an existing endpoint and click OK.
 - c. Click Edit and make your changes in the Edit Endpoint pane.
 - o Create a new endpoint.
 - a. Select New.

- b. Add information in the Create Endpoint pane.
2. Continue with [Creating or editing an endpoint for MDM Connector activity](#).

Parent topic: [Starting an MDM service activity](#)

[Feedback](#) | [Notices](#)

Configuring the activity

Use this procedure to configure the Invoke MDM Service activity.

Procedure

1. Select the Configure task from the checklist.
2. In the Configure pane, select a single MDM Service to start.
3. Select the Payload Type to specify what the input and output to the MDM service is. Options are XML or JSON String. If JSON string is selected, the Show JSON Schema option is enabled. Click Show JSON Schema to open the JSON Converter dialog. Input the XML request and convert it to a JSON string.

Specifying retry options

Use this procedure to specify retry options for the Invoke MDM Service activity.

Procedure

1. Select Retry task from the checklist.
2. On the Retry pane, configure the retry options for connecting to an MDM Service. Retry options are described in this table.

Field	Description
Retry	Specifies the number of times that the Integration Appliance tries to run the service when it fails.

Wait ____ second(s) between each retry	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the MDM Service.
Try to connect ____ times before failing	<p>Specifies the retry count, which is the maximum number of times the Integration Appliance attempts to establish a connection to the MDM Service before recording an error. When the count is reached, processing of the current orchestration job is stopped.</p> <p>If you deploy an orchestration that contains an Invoke MDM Service activity and the Integration Appliance cannot connect to the specified MDM Service, the Integration Appliance logs the connection errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, the retry count is set to 3. The first, second, and third connection errors are shown in the system log as warnings. The Integration Appliance logs the fourth connection as an error and stops processing the current orchestration job.</p>
Time out after ____ seconds when the Endpoint does not respond to a request	<p>Specifies the amount of time (in seconds) before a timeout occurs between the activity making a request on an endpoint and the time it takes the endpoint to respond. For the Invoke MDM Service activity, the timeout is the amount of time that the Integration Appliance waits for a response from the MDM Service after attempting to start the service before the Integration Appliance issues a timeout error.</p> <p>An activity timeout is different from a connection timeout in that an activity timeout occurs after the connection to the endpoint is established. A connection timeout specifies the amount of time, in seconds, before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request.</p> <p>Set the connection timeout in the Web Services Endpoint tab. For more information about connection timeouts, see Creating or editing an endpoint for MDM Connector activity.</p>

Mapping activity input

Use this procedure to map input to the Invoke MDM Service activity.

About this task

The body input parameter that is listed in the To Activity pane of Map Input task for the selected operation can be either XML or JSON string based on the selected Payload Type.

Optional parameters are called `ibmMDMConnectionProperties` in the To Activity pane of the Map Inputs pane. To view the optional input parameters, select Map > Show Optional Parameters from the toolbar menu. You can also right-click in the To Activity pane and select Show Optional Parameters. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, clicking a node in the Map Inputs pane makes this option active.

You can override the setting of the Endpoint Connection Properties in the InfoSphere MDM Endpoint pane by setting the values for `ibmMDMConnectionProperties`. Typically, this value is overridden when the connection properties are dynamically passed from the upstream activity.

Troubleshooting and support

Use this information to help identify and correct issues with the InfoSphere® MDM and Cast Iron® Connector.

Studio hangs while working on MDM-AE WSDL

Problem:

While working on the party WSDL (InfoSphere MDM Advanced Edition), Cast Iron Studio hangs when you select the operation.

Cause:

The MDM WSDL is large and is recursive in nature. Thus, the studio runs out of memory and hangs while attempting to load operations in the WSDL.

Solution:

Make sure that the XML Schema Resolver properties are set to tuned values while working with the WSDL. Start with reasonably low value and then increase the property value based on project requirements. Typically, values for the XML Schema Resolver properties can be set as follows.

- Number of child node levels allocated in the memory for the schema=6
- Number of recursive node levels=4
- Number of child node levels that are initially expanded when the schema displayed graphically=3
- Number of child node levels allocated in the memory for the substituted types of schema=7

Also, make sure that the studio heap size is set to 1024 MB for 32-bit systems or 2048 MB for 64-bit systems.

Insightly Activities

- [Overview of Insightly connector](#)
- [Creating or editing an endpoint for Insightly activity](#)

Endpoints provide the configuration information that the Studio and the Integration Appliance used to connect to Insightly platform. Insightly uses Basic API Key based authentication mechanism so as to authorize users to perform operations.
- [Using the Insightly Create Objects Activity](#)

Use the Create Objects activity to create contact and organisation in Insightly.
- [Using the Insightly Update Objects Activity](#)

Use the Update Objects activity to update contact and organisation in Insightly.
- [Using the Insightly Retrieve Objects Activity](#)

Use the Retrieve Objects activity to fetch the details of a Contact and Organisation from Insightly.
- [Using the Insightly Delete Objects Activity](#)

Use the Delete Objects activity to delete contact and organisation in Insightly.
- [Specifying the Retry options for Insightly REST API activities](#)

Specifying the Retry parameters is one of the tasks to configure an Insightly activity. The Insightly REST API connector uses a single login session for all connections to an Insightly REST API endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails. The retrial exceptions include 503 and 504 for this error codes.

 Last updated: Wednesday, February 17, 2016

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_Inightlyactivities.html

Overview of Insightly connector

Insightly is a great tool to help small businesses deal with the vital task of managing leads, contacts, organizations, partners, vendors and suppliers. It has prebuild Integration with Box, Drop Box, One Drive, Google Drive, Intuit QuickBooks and Xero.

Insightly is a cloud based CRM.

Key Features of Insightly are as below:

- Lead Management
- Contact Management
- Calendaring and Events
- Linking (Direct Relationships Between Contacts, Organizations, Opportunities, Projects)
- Mass Email and Email Templates

The connector connects with Insightly platform and enables the communication with Insightly from IBM Cast Iron platform and allows getting data into and sending data out. The connector uses the REST APIs provided by Insightly platform, which allows users to interact with the Insightly objects like Contacts, Organisations etc. It enables users to Create, Update, Retrieve and Delete various types of records available in the application system.

You can perform the following activities using the Insightly connector:

- Create Objects
- Retrieve Objects
- Update Objects
- Delete Objects

Parent topic: [Insightly Activities](#)

 Last updated: Wednesday, February 17, 2016

Creating or editing an endpoint for Insightly activity

Endpoints provide the configuration information that the Studio and the Integration Appliance used to connect to Insightly platform. Insightly uses Basic API Key based authentication mechanism so as to authorize users to perform operations.

Selecting or editing an Insightly endpoint

1. In the Create Endpoint or Edit Endpoint pane, configure the Insightly endpoint as described in the following table.
 Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the Insightly successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
Host Name	Host Name for Insightly instance.
API Key	Authentication API Key for accessing Insightly instance.
Following parameters are required in endpoint test connection screen to make connection via Proxy	
Host Name	Host Name of Proxy Network
Port	Port Number of the Proxy Network.
User Name	Specifies the user name for accessing service via proxy network.
Password	Specifies the password for accessing service via proxy network.

Objects Supported by the Insightly Connector

Insightly connector supports the Insightly objects: Contacts and Organisation. Also, the connector supports the Create, Update, Delete and Retrieve operation for these objects.

Table 2. Operations supported by the Insightly objects

Insightly Objects	Create	Update	Delete	Retrieve
Contacts	Yes	Yes	Yes	Yes
Organisation	Yes	Yes	Yes	Yes

Note: The latest Insightly API version supported is v2.1.

Custom Fields support

Insightly supports custom fields. Provision is given in the connector to create, update and retrieve objects having custom fields.

For Create and Update activities, in the Map Inputs, each object and its child nodes will have additional nodes for custom fields so that user can provide values for them.

For Retrieve activity, the response object will have additional nodes to identify the custom fields.

The format of custom fields for these activities is as shown below:

```
<customFields>
<customFieldName>secondemailid</customFieldName>
<customFieldValue>test.test@gmail.com</customFieldValue>
</customFields>
```

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Insightly_creating_an_endpoint_activit.html

Using the Insightly Create Objects Activity

Use the Create Objects activity to create contact and organisation in Insightly.

About this task

Use this task to create objects in Insightly. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created Insightly endpoint to the orchestration and select Create Objects activity. The Create Objects activity will be added to the orchestration. Select the activity. Insightly Create Objects Checklist is displayed.
3. In the Checklist, click Configure.
4. Click Browse to select the object type. The Browse Insightly window is displayed.
5. In Browse Insightly, you can select the object type from the object type list. Click OK.
6. In the Checklist, click Retry. Review the default settings and make the required changes.
Note: For more information, see [Specifying Retry options for Insightly REST API activities](#).
7. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
8. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
9. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
10. Create a map between the output parameters and orchestration variables.

Results

You have configured the Insightly Create Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type are supported.

Using the Insightly Update Objects Activity

Use the Update Objects activity to update contact and organisation in Insightly.

About this task

Use this task to update objects in Insightly instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created Insightly endpoint to the orchestration and select Update Objects activity. The Update Objects activity will be added to the orchestration. Select the activity. Insightly Update Objects Checklist is displayed.
3. In the Checklist, click Configure.
4. Click Browse to select the object type. The Browse Insightly window is displayed.
5. In Browse Insightly, you can select the object type from the object type list. Click OK.
6. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Update Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
7. In the Checklist, click Retry. Review the default settings and make the required changes.
Note: For more information, see [Specifying Retry options for Insightly REST API activities](#).
8. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
9. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
10. Create a map between the output parameters and orchestration variables.

Results

You have configured the Insightly Update Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type are supported.

Using the Insightly Retrieve Objects Activity

Use the Retrieve Objects activity to fetch the details of a Contact and Organisation from Insightly.

About this task

Use this task to retrieve all objects based on ID in the Insightly instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created Insightly endpoint to the orchestration and select Retrieve Objects activity. The Retrieve Objects activity will be added to the orchestration. Select the activity. The Insightly Retrieve Objects Checklist is displayed.
3. In the Checklist, click Configure.
4. Click Browse to select the object type. The Browse Insightly window is displayed.
5. In Browse Insightly, you can select the object type from the object type list. Click OK.
6. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
7. In the Checklist, click Retry. Review the default settings and make the required changes.
Note: For more information, see [Specifying Retry options for Insightly REST API activities](#).
8. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
9. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
10. Create a map between the output parameters and orchestration variables.

Results

You have configured the Insightly Retrieve Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type are supported.

Specifying the Retry options for Insightly REST API activities

Specifying the Retry parameters is one of the tasks to configure an Insightly activity. The Insightly REST API connector uses a single login session for all connections to an Insightly REST API endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails. The retrieval exceptions include 503 and 504 for this error codes.

About this task

This section contains the procedure for configuring the retry options for Insightly API activities.

Procedure

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry options and timeout options for connecting to an Insightly instance, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait ___ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Insightly instance.

Retry Fields	Description
Retry __ times before failing.	<p>Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the Insightly instance before issuing an error and stopping the processing of the current orchestration job.</p> <p>Note: If you deploy an orchestration that contains the Insightly REST API activity and the Integration Appliance cannot connect to the specified Insightly instance, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>
Stop processing rest of the records of the batch if failure detected even after the configured no. of retries.	<p>Specifies that if a batch of records is sent as input to an orchestration, and if failure is detected in between, then the remaining records should be processed or not.</p> <p>For example, if the retry count is set to 3 and a batch of 5 records is sent as input to the orchestration. If, after processing the 1st record of batch, the Integration Appliance cannot connect to the specified Insightly instance even after configured number of retries i.e. 3 retry attempts, then the processing of the remaining 4 records will not be done and execution will be terminated if this option is selected.</p> <p>For the similar settings, if this option is not selected, then the remaining 4 records would be attempted to be processed.</p>

Overview of the JD Edwards (JDE) connector

The JD Edwards (JDE) connector provides the ability for the appliance to interact with the JD Edwards EnterpriseOne server and perform certain business functions, without the need for special coding. The connector works with the JD Edwards EnterpriseOne server by sending requests to it and by monitoring and responding to events that occur in the JD Edwards EnterpriseOne server.

You can complete the following activities using the JDE connector:

- [Invoke Business Function](#)
- [Poll Real-Time Events](#)

The JDE connector supports the following versions of JDE Tools: 8.97, 8.98, and 9.1 (for Invoke Business Function). The connector is compatible with any version of JD Edwards EnterpriseOne that works with the supported versions of EnterpriseOne Tools.

The JDE connector requires JDE library files to connect to the JDE server. For more information, see [Installing JAR files to connect to the JDE server](#) and [Importing JDE Libraries](#).

Creating or editing an endpoint for a JDE activity

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a JD Edwards EnterpriseOne transaction server (JDE server). Â

1. In the Create Endpoint or Edit Endpoint pane, configure the JDE server as described in the following table. The endpoint pane contains Connection Information, Connection Pool Options and Remote Endpoint Configuration.
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the JDE server successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
Connection Information	
Environment	Specifies the JD Edwards EnterpriseOne environment name.
Role	Specifies the name of the role that is associated with the user name used to access the JD Edwards EnterpriseOne environment.
User Name	Specifies the user name to connect to the JDE server.
Password	Specifies the password associated with the user name to connect to the JDE server.
Connection Pool options	
Minimum Connections	Specifies the lowest number of JDE server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
Maximum Connections	Specifies the maximum number of JDE server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
Maximum Idle Time	Specifies the amount of time in minutes that a JDE server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool "no idle time". The default value is 120 minutes.
Maximum Wait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
Reclaim Connections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.
Note: The Connection pool properties need to be configured as per the load (number of concurrent requests) on the endpoint.	
Remote Endpoint Configuration	

Field Name	Description
Endpoint Runs Behind Firewall	Enables the secure connector name property so that secure connector can be used if the JDE server is running behind a firewall.
Secure Connector Name	Specifies the name of the secure connector that is used to connect to the JDE server running behind a firewall. For example, if an orchestration containing JDE activity is deployed on to Cast Iron Live (cloud), then the secure connector needs to be configured.

Importing JDE Libraries

You must import JDE instance-specific libraries on both Studio and the Integration Appliance before you can configure JDE endpoints, build orchestrations that use the JDE Connector, and deploy projects using the JDE Connector.

About this task

For information about installing the required library files on the Integration Appliance using the Web Management Console (WMC), see the WMC Online Help

Procedure

To get copies of the required JDE provider modules:

1. Log on to the instance of your JDE system.
2. Import the following JDE files to the workstation where Studio is installed:
 - ApplicationAPIs_JAR.jar
 - ApplicationLogic_JAR.jar
 - Base_JAR.jar
 - BizLogicContainer_JAR.jar
 - BizLogicContainerClient_JAR.jar
 - BusinessLogicServices_JAR.jar
 - castor.jar
 - classes12.zip
 - commons-httpclient-3.0.jar
 - Connector.jar
 - EventProcessor_EJB.jar
 - EventProcessor_JAR.jar
 - Generator_JAR.jar
 - JdbjBase_JAR.jar
 - JdbjInterfaces_JAR.jar

- JdeNet_JAR.jar
- jmxremote.jar
- jmxremote_optional.jar
- jmxri.jar
- log4j.jar
- ManagementAgent_JAR.jar
- Metadata.jar
- MetadataInterface.jar
- ojdbc14.jar
- PMApi_JAR.jar
- Spec_JAR.jar
- System_JAR.jar
- SystemInterfaces_JAR.jar
- xalan.jar
- xerces.jar
- xmlparserv2.jar
- jdelog.properties
- tnsnames.ora
- jdbj.ini
- jdeinterop.ini

Note: You also need to add database driver JAR files. These JAR files depend on the JD Edwards Enterprise One server version and the database used. For more information about the required JAR list, contact the Oracle Support team.

3. After retrieving the required files, use the Add Providers dialog box to [install the JDE files](#) into Studio.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JDEnew_Importing_JDE_Libraries.html

Installing JAR files to connect to the JDE server

You must copy the JDE JAR files on the same workstation as your Cast Iron Studio installation before you can connect to a JD Edwards EnterpriseOne transaction server (JDE server).

Before you begin

- The JAR files can be obtained from the JDE system administrator.
- The JAR files must be on the same computer as the studio installation.
- The JAR files must be from the same version as the JDE server you connect to.

For more information about importing the JAR files, see [Importing JDE Libraries](#).

About this task

Procedure

1. Open studio and select Tools > Install Module Providers.
2. When the Add Provider(s) dialog box is displayed, click the plus (+) button under JDE. A field and a Browse button appears.
3. Click Browse, and use the browse dialog box to locate and select the JAR files.
4. Click Open to import the selected files.
5. When the JAR files are listed in the Add Provider(s) dialog box, click OK.

Results

A prompt is displayed to restart studio and activate the changes.

What to do next

You can now create JDE endpoints and orchestrations.

Parent topic: [JDE Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JDEnewinstalling_jarfiles.html

Using the JDE Invoke Business Function activity

Use the JDE Invoke Business Function activity to call a specific JDE business function. You can map the resulting output from this activity to an orchestration.

Before you begin

Ensure that you have:

- Imported the JDE library files required to connect to the JDE server. For more information, see [Installing JAR files to connect to the JDE server](#).
- Valid connection details to connect to the JDE server.

About this task

Use this task to call a specific JDE business function from the JDE server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the JDE folder.
2. Drag the Invoke Business Function activity icon onto the orchestration. The JDE Invoke Business Function Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.

5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant JDE endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
Note: For more information, see [Creating or editing an endpoint for a JDE activity](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. In the JDE Business Function panel, click Browse to browse for business function names.
11. In Browse JDE Business Functions dialog, select one or more business functions from the `Business Function List`, and add it to the Selected Business Functions pane.
12. The Business Function Container field gets populated based on the first business function selected and click OK. You can also type the desired business function container name.

The selected business functions are displayed in the Configure panel.

13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery Options for JDE Activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Invoke Business Function activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

Results

You have configured the JDE Invoke Business Function activity.

Using the JDE Poll Real-Time Events activity

Use the JDE Poll Real-Time Events activity to poll real-time events from JD Edwards EnterpriseOne transaction server. A real-time event is a business transaction that provides information from the JD Edwards EnterpriseOne server that can be used to interoperate with a vendor system. Real-time events can be

generated wherever business functions run, such as HTML, WIN32, and enterprise servers. Real-time events are useful for producing notifications in real-time.

Before you begin

Ensure that you have:

- Imported the JDE library files required to connect to the JDE server. For more information, see [Installing JAR files to connect to the JDE server](#).
- Valid connection details to connect to the JDE server.

About this task

Use this task to poll real-time events from JD Edwards EnterpriseOne transaction server.

Procedure

1. In an active orchestration, open the Activities tab and expand the JDE folder.
2. Drag the Poll Real-Time Events activity icon onto the orchestration. The JDE Poll Real-Time Events Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant JDE endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
Note: For more information, see [Creating or editing an endpoint for a JDE activity](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. In the JDE Real-Time Events panel, click Browse to browse for real-time events. The Browse JDE Real-Time Events dialog is displayed.
11. In Browse JDE Real-Time Events dialog, select a real-time event from the list and click OK. The selected real-time event is displayed in the Configure panel.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery Options for JDE Activities](#).
13. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
14. Create a map between the output parameters and orchestration variables.

Results

You have configured the JDE Poll Real-Time Events activity.

Specifying Retry and Delivery Options for JDE Activities

Specifying the Retry and Delivery parameters is one of the tasks to configure a JDE activity configuration.

About this task

This section contains the procedure for configuring the retry options for JDE outbound and inbound activities.

Procedure

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry options for connecting to a JD Edwards EnterpriseOne transaction server as described in the following table.

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the JD Edwards EnterpriseOne transaction server.
Try to connect __ times before failing.	Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the JDE server before issuing an error and stopping the processing of the current orchestration job. Note: If you deploy an orchestration that contains the inbound or outbound JDE activity and the Integration Appliance cannot connect to the specified JDE server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.

Parent topic: [JDE Activities](#)

Specifying the delivery rules options for JDE inbound activities

About this task

This section contains the procedure for configuring the delivery rule options for JDE inbound activities.

Procedure

1. Select the Delivery Rules task from the Checklist. The delivery rules pane is displayed.
2. Configure the delivery rules options to select the activity's behavior as described in the following table.

Table 2. Delivery rules

Delivery Rules Fields	Description
Poll for changes every _____ days/hours/minutes/seconds	Specifies the time interval to poll for real-time events in the JD Edwards EnterpriseOne transaction server. Time can be selected in the format days, hours, minutes, or seconds.
Fetch _____ rows per poll	Specifies how many real-time events the activity should retrieve from the JD Edwards EnterpriseOne transaction server in each poll cycle.
Delivery Messages	
ATMOST_ONCE	A non-persistent mode in which a JDE real-time event is either delivered once or not delivered at all.
Wait time on JDE transaction server _____ seconds	Specifies the time interval that the connector waits to get an event from the JD Edwards EnterpriseOne transaction server.

JIRA Activities

- [Overview of JIRA connector](#)
- [Creating or editing an endpoint for JIRA activity](#)
Endpoints provide the configuration information that the Studio and the Integration Appliance used to connect to JIRA platform. JIRA connector supports only Basic authentication mechanism so as to authorize users to perform operations. JIRA connector also supports HTTPS connection.
- [Using the JIRA Create Objects Activity](#)
Use the Create Objects activity to create an Attachment, Component, Filter, Issue, IssueComment, IssueLink, IssueLinkType, IssueWorkLog, IssueVote, Version, ProjectRole and Watchers in JIRA.
- [Using the JIRA Update Objects Activity](#)
Use the Update Objects activity to update Filter, Issue, IssueComment, IssueLinkType, IssueWorkLog and Version in JIRA.
- [Using the JIRA Retrieve All Objects Activity](#)
Use the Retrieve All Objects activity to fetch the details of IssueComments, IssueLinkTypes, IssueTypes, IssueVotes, IssueWorkLogs, Priorities, Resolutions, Watchers and Statuses from JIRA.

- [Using the JIRA Delete Objects Activity](#)
Use the Delete Objects activity to delete an Attachment, Component, Filter, Issue, IssueComment, IssueLink, IssueLinkType, IssueWorkLog, Version, Votes and Watchers in JIRA.
- [Using the JIRA Retrieve Objects Activity](#)
Use the Retrieve Objects activity to fetch the details of an Attachment, Component, Filter, IssueLink, IssueLinkType, IssueType, IssueVote, IssueWorkLog, Version, ProjectRole, Watchers, Group, Priority, Project, Resolution, User and Status from JIRA.
- [Using the JIRA Search Objects Activity](#)
Use the Search Objects activity to fetch the records which matches search string for Issue, User, UsersOverMultiProject, AssignableUser and UsersWithPermissions from JIRA.
- [Specifying the Retry options for JIRA REST API activities](#)
Specifying the Retry parameters is one of the tasks to configure a JIRA activity. The JIRA REST API connector uses a single login session for all connections to an JIRA REST API endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails. The retrieable exceptions include 503 and 504 for this error codes.

<file:///dcs/markdown/workspace/Transform/out.html>

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_JIRAactivities.html

Overview of JIRA connector

JIRA is a proprietary issue tracking product, developed by Atlassian, commonly used for bug tracking, issue tracking, and project management functions. JIRA is the tracker for teams planning and building great products. JIRA captures and organizes issue, assign work and follow team activity. Customizable reporting allows monitoring the progress of issues with detailed graphs and charts.

JIRA support both on premise and cloud environments.

JIRA connector interacts with restful Web Service API™s, which allow you to access bi-directional data-level integration.

You can perform the following activities using the JIRA connector:

- Outbound activities:
 - Create Objects
 - Retrieve Objects
 - Update Objects
 - Delete Objects
 - Retrieve All Objects
 - Search Objects

The JIRA version currently supported by this connector is 6.4.7 (on premise)

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JIRA_Overview.html

Creating or editing an endpoint for JIRA activity

Endpoints provide the configuration information that the Studio and the Integration Appliance used to connect to JIRA platform. JIRA connector supports only Basic authentication mechanism so as to authorize users to perform operations. JIRA connector also supports HTTPS connection.

Selecting or editing an JIRA endpoint

1. In the Create Endpoint or Edit Endpoint pane, configure the JIRA endpoint as described in the following table.
 Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the JIRA successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
Host Name	Host Name for JIRA instance (on-premise or cloud).
Port Number	Port for JIRA instance User Name Authentication user name for accessing JIRA instance.
Password	Authentication password for accessing JIRA instance.
Following parameters are required in endpoint test connection screen to make connection via Proxy:	
Host Name	Host Name of Proxy Network
Port	Port Number of the Proxy Network.
User Name	User name for accessing service via proxy network.
Password	Password for accessing service via proxy network.
Following parameters are required in endpoint test connection screen to make HTTPS connection:	
HTTPS	Checkbox to indicate whether HTTPS to be used
Certificate	HTTPS certificate
SSL Protocol Version	Protocol version for certificate.
Following parameters are required in endpoint test connection screen to make settings for Connection Timeout:	

Field Name	Description
Timeout after..... seconds when establishing a connection to the endpoint	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. The default is 300 seconds.

In addition with the above parameters, there is also a provision for Secure Connector configuration to connect the Endpoint with JIRA on-premise instance.

Objects Supported by the JIRA Connector

JIRA connector supports the JIRA objects as detailed in the table below:

Table 2. Operations supported by the JIRA objects

JIRA Objects	Create	Update	Delete	Retrieve All	Retrieve	Search
Attachment	Yes		Yes		Yes	
Component			Yes		Yes	
Filter	Yes	Yes	Yes		Yes	
Issue	Yes	Yes	Yes		Yes	Yes
IssueComment	Yes	Yes	Yes	Yes	Yes	
IssueLink	Yes		Yes		Yes	
IssueLinkType	Yes	Yes	Yes	Yes	Yes	
IssueWorkLog	Yes	Yes	Yes	Yes	Yes	
IssueVote	Yes			Yes		
Version	Yes	Yes	Yes		Yes	
ProjectRole	Yes				Yes	
Votes			Yes			
Watchers	Yes		Yes	Yes		
Group					Yes	
IssueType				Yes	Yes	
Priority				Yes	Yes	
Project					Yes	
Resolution				Yes	Yes	
Status				Yes	Yes	
User					Yes	Yes
UserOverMultiProject						Yes
AssignableUser						Yes
UsersWithPermissions						Yes

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JIRA_creating_an_endpoint_activity.html

Using the JIRA Create Objects Activity

Use the Create Objects activity to create an Attachment, Component, Filter, Issue, IssueComment, IssueLink, IssueLinkType, IssueWorkLog, IssueVote, Version, ProjectRole and Watchers in JIRA.

About this task

Use this task to create objects in the JIRA. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the JIRA folder contents.
2. Drag the Create Objects activity icon onto the orchestration. Select the activity. The JIRA Create Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant JIRA endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse JIRA window is displayed.
11. In Browse JIRA, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.
Note: For more information, see [Specifying the Retry options for JIRA REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.

16. Create a map between the output parameters and orchestration variables.

Results

You have configured the JIRA Create Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Object Name (For example: Attachment) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

Using the JIRA Update Objects Activity

Use the Update Objects activity to update Filter, Issue, IssueComment, IssueLinkType, IssueWorkLog and Version in JIRA.

About this task

Use this task to update objects in the JIRA instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the JIRA folder contents.
2. Drag the Update Objects activity icon onto the orchestration. Select the activity. The JIRA Update Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant JIRA endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse JIRA window is displayed.
11. In Browse JIRA, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.

Note: For more information, see [Specifying the Retry options for JIRA REST API activities](#).

13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

Results

You have configured the JIRA Update Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Object Name (For example: Filter) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

Using the JIRA Retrieve All Objects Activity

Use the Retrieve All Objects activity to fetch the details of IssueComments, IssueLinkTypes, IssueTypes, IssueVotes, IssueWorkLogs, Priorities, Resolutions, Watchers and Statuses from JIRA.

About this task

Use this task to retrieve all object details in the JIRA instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the JIRA folder contents.
2. Drag the Retrieve All Objects activity icon onto the orchestration. Select the activity. The JIRA Retrieve All Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant JIRA endpoint.

7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse JIRA window is displayed.
11. In Browse JIRA, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.
Note: For more information, see [Specifying the Retry options for JIRA REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

Results

You have configured the JIRA Retrieve All Objects activity.

Using the JIRA Delete Objects Activity

Use the Delete Objects activity to delete an Attachment, Component, Filter, Issue, IssueComment, IssueLink, IssueLinkType, IssueWorkLog, Version, Votes and Watchers in JIRA.

About this task

Use this task to Delete objects in the JIRA instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the JIRA folder contents.

2. Drag the Delete Objects activity icon onto the orchestration. Select the activity. The JIRA Delete Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant JIRA endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse JIRA window is displayed.
11. In Browse JIRA, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.
Note: For more information, see [Specifying the Retry options for JIRA REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

Results

You have configured the JIRA Delete Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Object Name (For example: Filter) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

Using the JIRA Retrieve Objects Activity

Use the Retrieve Objects activity to fetch the details of an Attachment, Component, Filter, IssueLink, IssueLinkType, IssueType, IssueVote, IssueWorkLog, Version, ProjectRole, Watchers, Group, Priority, Project,

About this task

Use this task to retrieve objects based on ID in the JIRA instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the JIRA folder contents.
2. Drag the Retrieve Objects activity icon onto the orchestration. Select the activity. The JIRA Retrieve Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant JIRA endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse JIRA window is displayed.
11. In Browse JIRA, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.
Note: For more information, see [Specifying the Retry options for JIRA REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

Results

You have configured the JIRA Retrieve Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Object Name (For example: Attachment) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

Parent topic: [JIRA Activities](#)

Using the JIRA Search Objects Activity

Use the Search Objects activity to fetch the records which matches search string for Issue, User, UsersOverMultiProject, AssignableUser and UsersWithPermissions from JIRA.

About this task

Use this task to Search objects in the JIRA instance by setting query parameters. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the JIRA folder contents.
2. Drag the Search Objects activity icon onto the orchestration. Select the activity. The JIRA Search Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant JIRA endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse JIRA window is displayed.
11. In Browse JIRA, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.
Note: For more information, see [Specifying the Retry options for JIRA REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables. **Query Parameter**

Below are the query parameters of the Search objects:

Table 1. Common Query parameters for all the Search Objects

Field Name	Description
startAt	The index of the first record to return (0-based)
maxResults	The maximum number of users to return (defaults to 50). The maximum allowed value is 1000. If you specify a value that is higher than this number, your search results will be truncated.

Table 2. Query parameters for Issue Objects

Field Name	Description
validateQuery	This parameter is used to validate the JQL query
responseFields	The list of fields to return for each issue. By default, all navigable fields are returned.
criteria	field, operator, value and logicalOperator is defined in criteria. Multiple criteria can be specified by expanding occurrences for the criteria node.
field	The standard field name to be used in the criteria should be specified.
operator	The operator to be applied. (For Ex: The valid operators are =, !=, <, >, <=, >=, ~, !~, IN, NOT IN, IS and IS NOT)
value	The value of the field used in the search
logicalOperator	The logical operator to be applied (For Ex: Valid logical operators are AND, OR and NOT)
orderBy	field and order is defined in orderBy. Multiple orderBy can be specified by expanding occurrences for the orderBy node
field	The standard field name to be used to display the fields in order
order	The order are ASC and DESC

Table 3. Common Query parameters for User Objects

Field Name	Description
includeActive	The parameter is used to include the active users
includeInactive	The parameter is used to include the inactive users

Table 4. Common Query parameters for UserWithPermission Objects

Field Name	Description
permissions	comma separated list of permissions for project or issue returned users must have

Note: Enumeration is not supported by connector so user has to enter the data in query parameters.

Results

You have configured the JIRA Search Objects activity.

Specifying the Retry options for JIRA REST API activities

Specifying the Retry parameters is one of the tasks to configure a JIRA activity. The JIRA REST API connector uses a single login session for all connections to an JIRA REST API endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails. The retrieable exceptions include 503 and 504 for this error codes.

About this task

This section contains the procedure for configuring the Retry options for JIRA REST API activities.

Procedure

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry options and timeout options for connecting to an JIRA instance, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait ___ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the JIRA instance.
Retry ___ times before failing.	Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the JIRA instance before issuing an error and stopping the processing of the current orchestration job. Note: If you deploy an orchestration that contains the JIRA REST API activity and the Integration Appliance cannot connect to the specified JIRA instance, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.

Retry Fields	Description
Stop processing rest of the records of the batch if failure detected even after the configured no. of retries.	<p>Specifies that if a batch of records is sent as input to an orchestration, and if failure is detected in between, then the remaining records should be processed or not.</p> <p>For example, if the retry count is set to 3 and a batch of 5 records is sent as input to the orchestration. If, after processing the 1st record of batch, the Integration Appliance cannot connect to the specified JIRA instance even after configured number of retries i.e. 3 retry attempts, then the processing of the remaining 4 records will not be done and execution will be terminated if this option is selected.</p> <p>For the similar settings, if this option is not selected, then the remaining 4 records would be attempted to be processed.</p>

JMS Activities

- [Creating or editing a JMS endpoint](#)
JMS endpoints provide information that Studio and the Integration Appliance use to connect to a JMS instance.
- [Specifying delivery rules and retry parameters for JMS activities](#)
The JMS Connector uses a single login session for all connections to a JMS endpoint. If a session expires, the connector automatically establishes a new session. The JMS Connector does not count the initial attempt to reacquiring the session as a retry attempt. The JMS Connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.
- [Get Message activity](#)
You can use the Get Message activity to get a message from the queue. If there is no message present the activity can time out.
- [Poll Message activity](#)
The Poll Message activity is a starter activity that polls the configured queue for the message. This activity supports the ATLEAST ONCE and EXACTLY ONCE delivery semantics. The Poll Message Activity supports batching, if the batching option is selected.
- [Publish Message activity](#)
The Publish Message activity is an executable activity that allows you to publish data on the configured topic. This activity supports the ATLEAST ONCE and ATMOST ONCE delivery semantics.
- [Send Message activity](#)
The Send Message activity is an executable activity that sends message to the configured queue. The Send Message activity supports the AT LEAST and AT MOST ONCE delivery semantics. Request-reply use cases can use the Poll Message and Send Message activity; there is no separate activity for reply.

- [Subscribe Message activity](#)
The Subscribe Message activity is a starter activity that allows you to subscribe to a JMS topic. This activity supports the ATLEAST ONCE and EXACTLY ONCE delivery semantics.
- [Creating a JMS endpoint to a WebLogic server](#)
You can define a JMS endpoint to an existing WebLogic server, by completing the following steps in IBM Cast Iron Studio.

Creating or editing a JMS endpoint

JMS endpoints provide information that Studio and the Integration Appliance use to connect to a JMS instance.

About this task

Any changes you make to the endpoint, including configuration properties, affects all orchestrations that use that endpoint as the edits are global, not local.

Procedure

1. Drag an activity from the JMS folder of the Activities tab onto the orchestration.
2. The Summary panel is displayed along with a Checklist, which outlines what you must do to configure the activity.
3. Click Pick Endpoint from the Checklist. The Pick Endpoint panel opens.
4. Click one of the following options:
 - Browse - To select an existing endpoint from the Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel. To edit the endpoint properties, click Edit.
 - New - To create a new endpoint. The Create Endpoint window opens.
 - Edit - To edit the existing endpoint. The Edit Endpoint window opens.

Note: Editing an endpoint affects all orchestrations that use that endpoint in the project as the edits are global, not local.
5. In the Create Endpoint window, specify connection parameters or select a configuration property by clicking the icon to the right of the fields. Required fields are denoted by the following icon 

Connection Parameter Fields	Description
JNDI Initial Factory	Specifies the context factory class Studio retrieves from JNDI. Studio uses the class to lookup JMS connection factory and JMS destinations (Queue or Topic).
Provider URL	Specifies the URL of the JMS server.
Provider Package	An optional parameter, where you can specify a provider package name.

Factory Name	Use your own connection factory or use one of the default factories that comes preconfigured with the endpoint system: JBOSS, ActiveMQ, or WebLogic.
--------------	--

- o Specify Provider login information, which includes user name and password.
- o Specify Connection Pool Options.

Connection Pool Options	Description
Minimum Connections	Specifies the minimum number of connections that Studio uses to connect to a JMS instance. By default, there is a minimum of 1 connection.
Maximum Connections	Specifies the maximum number of connections that Studio uses to connect to a JMS instance. By default, there is a maximum of 25 connections.
Maximum Idle Time	By default, maximum idle time is 120 minutes.
Maximum Wait	By default, maximum wait time is 300 seconds.

6. Specify properties for the JNDI Provider, so you can set implementation specific JNDI initial context properties for tasks such as authentication.
 - a. Click  to add a field in the JNDI Provider table. A new row is displayed in the table.
 - b. Enter a property name and value.
7. Specify properties for the Connection Factory, so you can set implementation specific connection properties.
 - a. Click  to add a field in the Connection Factory table. A new row is displayed in the table.
 - b. Enter a property name and value.
8. Click Test Connection to confirm that the parameters you specified so that the project can access a JMS instance.

Note: When you configure an endpoint using configuration properties, verify that the configuration properties have valid values. If the configuration property value is invalid or does not exist, the connection test fails.

Specifying delivery rules parameters for JMS activities

Specifying the Delivery Rules parameters is one of the tasks you must complete to configure a JMS activity.

About this task

For more information about the configuration tasks in the Checklist, see the help topic for the specific JMS activity.

Procedure

1. In the Checklist, select Delivery Rules. The Delivery Rules panel opens.
2. For the Poll Message activity only, specify the polling interval. By default, the activity polls for changes every second.
3. Select Batch objects to process the job as a batch.
4. Select one of the following delivery options.

Note: The delivery options available depend on the JMS activity. Not all delivery options are available for every JMS activity.

Delivery Option	Description
ATLEAST_ONCE	A persistent mode, in which the JMS Provider insures that a message is not lost. As a result, there are chances that the client can receive multiple copies of a single message.Â
ALMOST_ONCE	In this non-persistent mode, a message may be lost, but JMS does not deliver multiple copies of a message. Â

EXACTLY_ONCE	In this persistent mode, JMS delivers a message once and only once.
--------------	---

Specifying retry parameters for JMS activities

Specifying the Retry parameters is one of the tasks you must complete to configure a JMS activity.

About this task

For more information about the configuration tasks in the Checklist, see the help topic for the specific JMS activity.

Procedure

1. In the Checklist, select Retry. The Retry panel opens.
2. Configure the retry options for connecting to a JMS instance. The following table describes the retry options for connecting to a JMS instance:

Retry Fields	Description
Wait __ second(s) between each retry.	The number of seconds that the Integration Appliance waits before trying to establish a connection to the JMS instance. By default, this parameter is set to 30 seconds
Try to connect __ times before failing.	Specifies the retry count, the maximum number of times that the Integration Appliance attempts to establish a connection to the JMS instance before issuing an error and stopping the processing of the current orchestration job. By default this parameter is set to 5 attempts.

3. For the Get Message activity, specify a value for the Activity Timeout parameter.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS_Get_To_Specify_Retry_Parameters.html

Get Message activity

You can use the Get Message activity to get a message from the queue. If there is no message present the activity can time out.

About this task

The Get Message Activity supports batching, if the batching option is selected. When the batching option is selected, if there is more than one message in the queue, the activity processes all the messages at once, instead of processing them one at a time.

Important: This orchestration must already have a JMS endpoint representing the data source. Otherwise, input and output mapping is disabled.

- [Adding a JMS activity to an orchestration](#)
- [Changing the Activity Name](#)
- [Picking a JMS endpoint](#)
- [Configuring the Get Message activity](#)
- [Mapping the Inputs](#)

Inputs represent data that is transmitted from the orchestration (variables) to the JMS endpoint (parameters).

- [Mapping the Outputs](#)

Outputs represent data that is transmitted from the JMS activity (parameters) to the orchestration (variables).

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS_Get_Picking_JMS_Endpoint.html

Configuring the Get Message activity

Procedure

1. In the Checklist, click Configure.
2. In the Queue field, specify the provider-specific name of the queue to be polled.
3. Open the Message Data menu and choose the format the message takes, whether Bytes or Text.
4. In the Message Selector field, enter the text of a message header.

Using the JMS message selector a client can specify, by submitting the text of a message header, those messages it is interested in. Only messages whose headers and properties match the selector are delivered. Message selectors cannot reference message body values. The message selector string must follow JMS selector syntax.

5. In the Checklist, click Delivery Rules.
6. Click the Batch Objects checkbox to activate the option, which enables the activity to batch-process multiple messages.
7. Open the Deliver menu and choose either option: ATLEAST_ONCE or ATMOST_ONCE
8. In the Checklist, click Retry.
9. Review the default settings and make any needed changes.

Mapping the Inputs

Inputs represent data that is transmitted from the orchestration (variables) to the JMS endpoint (parameters).

Before you begin

If required, you can create a custom mapping variable in Source or Destination column by following the steps in [Creating variables](#).

Procedure

1. In the Checklist, click Map Inputs. A set of options is displayed, and the To Activity list shows the JMS variables.
2. Click Select Inputs.

The Select Inputs dialog box lists all the variables.

3. Choose a variable, then click OK.
4. To link the activities, click and drag a variable from the From Orchestration list onto a parameter listed in the To Activity list.

If the link is viable, a line is displayed, linking the two.

5. Repeat this procedure to link other orchestration variables to JMS parameters.
6. To test the input links, click the Test button.

The Input Test Files table lists all linked variables/parameters.

7. In the Location column, click the small blue button.
8. Use the Browse dialog box to select an input test file.
9. Click Run Test. Test results are displayed in the columns underneath.

Tip: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#).

Mapping the Outputs

Outputs represent data that is transmitted from the JMS activity (parameters) to the orchestration (variables).

Before you begin

If required, you can create a custom mapping variable in the Source or Destination column by following the steps in [Creating variables](#)

Procedure

1. In the Checklist, click Map Outputs.
2. Review the parameters listed in the From Activity list.
3. If you want to create new orchestration variables that match the output parameters of the current activity, select a parameter and then click Copy.
4. In the Copy Parameters dialog box, choose one or more parameters, then click OK to add them to the To Orchestration list. The data type, schema, or schema fragment of the selected output parameter is applied to the new variable.
5. Click Select Inputs.

The Select Inputs dialog box lists all the variables associated with the other endpoint.

6. Choose one or more variables, then click OK to add them to this list.
7. Drag a parameter from the From Activity list onto a variable listed in the To Orchestration list.

If the link is viable, a line is displayed, linking the two.

8. Repeat this procedure to link other parameters and variables.
9. To test the output links, click the Test button. A variable is listed in an Input Test Files table.
10. In the Location column, click the small blue button.
11. Use the Browse dialog box to select an input test file.
12. Click Run Test. Test results are displayed in the columns underneath.

Tip: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#).

Poll Message activity

The Poll Message activity is a starter activity that polls the configured queue for the message. This activity supports the ATLEAST ONCE and EXACTLY ONCE delivery semantics. The Poll Message Activity supports batching, if the batching option is selected.

About this task

The EXACTLY ONCE delivery semantic is handled through the message acknowledgement. Since the JMS provider must never deliver a copy of an acknowledged message, the Poll Message activity leverages the provider for the EXACTLY_ONCE delivery semantic. When the batching option is selected, if there is more than one message in the queue, the activity processes all the messages at once, instead of processing them one at a time.

Important: This orchestration must have a JMS endpoint representing the data source, otherwise, output mapping is disabled.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS_Poll_Picking_JMS_Endpoint.html

Configuring the Poll Message activity

Procedure

1. In the Checklist, click Configure.
2. In the Queue field, specify the provider-specific name of the queue to be polled.
3. Open the Message Data menu and choose the format the message takes, whether Byte or Text.
4. In the Message Selector field, enter the text of a message header.

Using a JMS message selector a client can specify, by submitting the text of a message header, those messages it is interested in. Only messages whose headers and properties match the selector are delivered. Message selectors cannot reference message body values. The message selector string must follow JMS selector syntax.

5. In the Checklist, click Delivery Rules.
6. In the Poll for changes field, select the preferred interval number.
7. Click the Batch Objects checkbox to activate the option, which enables the activity to batch-process multiple messages.
8. Open the Deliver menu and choose either option: ATLEAST_ONCE, ATMOST_ONCE, or EXACTLY_ONCE
9. In the Checklist, click Retry.
10. Review the default settings and make any needed changes.

For more information, see [Specifying retry parameters for JMS activities](#)

Mapping the Outputs

Outputs represent data that is transmitted from the JMS activity (parameters) to the orchestration (variables).

Before you begin

If required, you can create a custom mapping variable in the Source or Destination column by following the steps in [Creating variables](#)

Procedure

1. In the Checklist, click Map Outputs.
2. Review the parameters listed in the From Activity list.
3. If you want to create new orchestration variables that match the output parameters of the current activity, select a parameter and then click Copy.
4. In the Copy Parameters dialog box, choose one or more parameters, then click OK to add them to the To Orchestration list. The data type, schema, or schema fragment of the selected output parameter is applied to the new variable.
5. Click Select Inputs.

The Select Inputs dialog box lists all the variables associated with the other endpoint.

6. Choose one or more variables, then click OK to add them to this list.
7. Drag a parameter from the From Activity list onto a variable listed in the To Orchestration list.

If the link is viable, a line is displayed, linking the two.

8. Repeat this procedure to link other parameters and variables.
9. To test the output links, click the Test button. A variable is listed in an Input Test Files table.
10. In the Location column, click the small blue button.
11. Use the Browse dialog box to select an input test file.
12. Click Run Test. Test results are displayed in the columns underneath.
Tip: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#).

Creating a JMS endpoint to a WebLogic server

You can define a JMS endpoint to an existing WebLogic server, by completing the following steps in IBM Cast Iron Studio.

Before you begin

Install the following JAR files in IBM Cast Iron Studio and the Integration Appliance run time:

- wlclient.jar
- wljmsclient.jar

Procedure

1. In Studio, drag an activity from the JMS folder of the Activities tab onto the orchestration.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel opens.
3. To create an endpoint, click New. The Create Endpoint window opens.
4. In the Create Endpoint window, specify the following connection parameters.

Connection parameter fields	Description
JNDI Initial Factory	Specify the context factory class that Studio retrieves from JNDI: <code>weblogic.jndi.WLInitialContextFactory</code> This JNDI factory class is configured during the JMS WebLogic server installation
Provider URL	Specify the URL of the JMS server in the following format: <code>t3://:7001</code> Where 7001 is the default port.
Provider Package	Optionally, you can specify a provider package name.
Factory Name	Use one of the supplied default factories that is configured with the WebLogic endpoint system: <code>weblogic.examples.jms.QueueConnectionFactory</code>

-
- To validate the parameters you specified, click Test Connection.
Note: When you configure an endpoint by using configuration properties, verify that the configuration properties have valid values. If the configuration property value is invalid or does not exist, the connection test fails.
 - In the Checklist, click Configure.
 - In the Topic field, select the following topic from the Preconfigured or custom Topic/Queues list:

```
weblogic.examples.jms.exampleQueue
```

This topic is preconfigured to use a JMS WebLogic server.

- Open the Message Data menu and choose the format the message takes, whether Bytes or Text.
- In the Message Selector field, you can enter the text of a message header.
By submitting the text of a message header in a JMS message selector, a client can specify the messages it is interested in. Only messages with headers and properties that match the selector are delivered. Message selectors cannot reference message body values. The message selector string must comply with the JMS selector syntax.
Note: Message selector can be blank
- In the Client ID field, specify the unique client identifier assigned to this JMS connection.
- In the Checklist, click Delivery Rules.
- Open the Deliver menu and choose the option: ATMOST_ONCE
- In the Checklist, click Retry.
- If there are any problems, review the default settings and make the required changes.

Overview of the Lightweight Directory Access Protocol (LDAP) connector

The LDAP connector enables a two-way communication between Cast Iron® and LDAP Servers . LDAP Server comprises of LDAP entries such as a user, systems, network, services etc. allowing sharing of information over internet. LDAP connector provides bidirectional connectivity to work with LDAP Entries present in LDAP Server.

You can perform the following activities using the LDAP connector:

Outbound Activities :

1. Create Entry
2. Retrieve Entry
3. Search Entry
4. Delete Entry

Creating or Editing Endpoint for LDAP

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a LDAP server.

Selecting or editing a LDAP endpoint :

1. In the Create Endpoint or Edit Endpoint pane, configure the LDAP server as described in the following table.
 - a. In addition to these fields, the endpoint pane contains Connection pool options and Remote Endpoint Configuration.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

2 .Click Test Connection to confirm that the connection details are valid and you are able to connect to the LDAP server successfully.

3 .Click OK.

LDAP Network Parameters	Description
Host	Specifies the host name or IP address of the machine on which LDAP server is running
Port	Specifies the LDAP Sever port. The default value is 389.
Protocol version	LDAP Protocol version, LDAP Connector supports only Protocol v3
Base Dn	Point from where connector (LDAP browser) display LDAP tree (Directory Information Tree)
Connection Pool options	Description
Minimum Connections	Specifies the lowest number of LADP server connections that the Integration Appliance keeps open in the

	connection pool. Entering 0 (zero) is supported. The default value is 5
Maximum Connections	Specifies the maximum number of LDAP server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25
Maximum Idle Time	Specifies the amount of time in minutes that a LDAP server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool "no idle time. The default value is 120 minutes
Maximum Wait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds
Reclaim Connections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minutes
Remote Endpoint Configuratons	Description
Endpoint Runs Behind Firewall	SEnables the secure connector name property so that secure connector can be used if the LDAP server is running behind a firewall
Secure Connector Name	Specifies the maximum number of LDAP server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25

Creating LDAP Entry

Use create activity to create entry or entries on LDAP Server. A LDAP Entry consist of set of attributes which defines the Entry.

Using the create activity:

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the LDAP folder
3. Drag Create Entry activity from the LDAP folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed
4. Drag Create Entry activity from the LDAP folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed
 - a. Click on Pick Endpoint to select a LDAP endpoint to work with
 - b. Click Configure from the Checklist. The Configure pane is displayed. Complete the following steps to configure Create Entry activity
 - i. Click Browse button to select an Base Dn from the Browse DIT pane. The Browse LDAP Entry panel displays all the entries from the selected LDAP server. **Note** : if you have configured the Base-Dn property in the endpoint panel then Browse LDAP Entry displays children of Base-Dn alone or else it displays all the entries from the root of the LDAP directory
 - ii. Click Browse button to select an Object class(es) from the Browse LDAP Object Class pane. The Browse LDAP Object Class panel displays all the Object Classes on the selected LDAP Server. LDAP object class(es) defines the attributes of an Entry. An Entry object can have superset of attributes from 2 or more object classes. Select all the object classes which will collectively represent all attributes of the Entry you are going to create

Specifying the map inputs for create activity

Click Map Input from the Checklist pane. The input parameters for the specific LDAP activity are displayed under the To Activity pane.

Note: Whole request object is an array type which allow users to create multiple entries using same request. and use the additionalAttributes section and provide the Attribute names, its type and attribute values

Table 1. Map Input Optional Parameter

Parameter Name	Description
baseDn	Point under which new entry to be created
RDN	Relative Distinguished Names(RDN). RDN of an object is the part of the name that is an attribute of the object itself (the part of the object name that identifies this object as unique from its siblings at its current level in the naming hierarchy)

Parameter Name	Description
objectClasses	To specify additional object classes and its attribute(s) which are not part of the map inputs structure during runtime, use ObjectClasses element to provide the Object class name(s). The element objectClasses is an array type so that you can specify multiple values
entryAttributes	LDAP Entry Attributes type provides structured content type to create an Entry in the LDAP server. The Entry Attributes element type is created from the set of attributes derived using Object Class(es) specified in the configure panel
additionalAttributes	Additional Attributes type can be used when user wants to specify additional set attributes and their values outside the selected object classes during runtime. The element additionalAttributes is an array type so that user can specify multiple additional attributes. The element additionalAttributes is a complex type element through which user can specify attribute name, its type and values (values itself an array type allowing user to specify set of values for the given attribute)

Specifying the map outputs create activity

Click Map output from the Checklist pane. The output parameters for the LDAP Create activity are displayed under the From Activity pane. Some of the common output parameters are defined in the following table

Table 2. Create Activity common output parameters

Parameter Name	Description
baseDn	Return Base Dn if successful
RDN	Return RDN if successful
resultCode	LDAP Result code
resultMessage	LDAP Result Message

Note : We can create multiple Entries using create entry activity

Parent topic: [LDAP Connector Activities](#)

Delete LDAP Entry

Use the Delete Activity to delete LDAP entries from the configured LDAP Sever.

Using the create activity:

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the LDAP folder
3. Drag Create Entry activity from the LDAP folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed

The Checklist pane lists the tasks (Summary, Pick Endpoint, Configure, Map inputs, Map outputs) that you must complete to configure the outbound activity

- a. Click on Pick Endpoint to select a LDAP endpoint to work with
- b. Click Configure from the Checklist. The Configure pane is displayed. Complete the following steps to configure Create Entry activity
 - i. Click Browse button to select an Base Dn from the Browse DIT pane. The Browse LDAP Entry panel displays all the entries from the selected LDAP server. **Note** : if you have configured the Base-Dn property in the endpoint panel then Browse LDAP Entry displays children of Base-Dn alone or else it displays all the entries from the root of the LDAP directory
 - ii. Click Browse button to select an Object class(es) from the Browse LDAP Object Class pane. The Browse LDAP Object Class panel displays all the Object Classes on the selected LDAP Server. LDAP object class(es) defines the attributes of an Entry. An Entry object can have superset of attributes from 2 or more object classes. Select all the object classes which will collectively represent all attributes of the Entry you are going to create

Specifying the map inputs for create activity

Click Map Input from the Checklist pane. The input parameters for the specific LDAP activity are displayed under the To Activity pane.

Note: Whole request object is an array type which allow users to create multiple entries using same request. and use the additionalAttributes section and provide the Attribute names, its type and attribute values

Table 1. Map Input Optional Parameter

Parameter Name	Description
baseDn	Point under which new entry to be created

Parameter Name	Description
RDN	Relative Distinguished Names(RDN). RDN of an object is the part of the name that is an attribute of the object itself (the part of the object name that identifies this object as unique from its siblings at its current level in the naming hierarchy)

Specifying the map outputs create activity

Click Map output from the Checklist pane. The output parameters for the LDAP Create activity are displayed under the From Activity pane. Some of the common output parameters are defined in the following table

Table 2. Delete Activity common output parameters

Parameter Name	Description
baseDn	Return Base Dn if successful
RDN	Return RDN if successful
resultCode	LDAP Result code
resultMessage	LDAP Result Message

Note : We can delete multiple Entries using create entry activity

Retrieve LDAP Entry

Using the Retrieve Activity, you can retrieve an entry from a LDAP Server. The retrieved entry is uniquely identified by its Dn

Using the Search Entry activity:

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the LDAP folder
3. Drag Create Entry activity from the LDAP folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed

The Checklist pane lists the tasks (Summary, Pick Endpoint, Configure, Map inputs, Map outputs) that you must complete to configure the outbound activity

- a. Click on Pick Endpoint to select a LDAP endpoint to work with

- b. Click Configure from the Checklist. The Configure pane is displayed. Complete the following steps to configure Create Entry activity
- i. Click Browse button to select an Base Dn from the Browse DIT pane. The Browse LDAP Entry panel displays all the entries from the selected LDAP server. **Note** : if you have configured the Base-Dn property in the endpoint panel then Browse LDAP Entry displays children of Base-Dn alone or else it displays all the entries from the root of the LDAP directory
 - ii. Click Browse button to select an Object class(es) from the Browse LDAP Object Class pane. The Browse LDAP Object Class panel displays all the Object Classes on the selected LDAP Server. LDAP object class(es) defines the attributes of an Entry. An Entry object can have superset of attributes from 2 or more object classes. Select all the object classes which will collectively represent all attributes of the Entry you are going to create

Specifying the map inputs for create activity

Click Map Input from the Checklist pane. The input parameters for the specific LDAP activity are displayed under the To Activity pane.

Table 1. Map Input Optional Parameter

Parameter Name	Description
baseDn	Starting point of LDAP search
RDN	The Entry to be searched, input must be name value pair

Specifying the map outputs create activity

Click Map output from the Checklist pane. The output parameters for the LDAP Create activity are displayed under the From Activity pane. Some of the common output parameters are defined in the following table

Table 2. Retrieve Activity common output parameters

Parameter Name	Description
baseDn	The container Dn under which entry represented by RDN is created
RDN	Relative Distinguished Names(RDN). RDN of an object is the part of the name that is an attribute of the object itself (the part of the object name that identifies this object as unique from its siblings at its current level in the naming hierarchy)
objectClasses	field contains structured content containing all attributes of the object classes selected in configure panel

Parameter Name	Description
entryAttributes	field contains structured content containing all attributes of the object classes selected in configure panel
additionalAttributes	additionalAttributes field contains additional set attributes of the entry which cannot be represented by selected object classes (entryAttributes). Means, if the entry contains an attribute or set of attributes which are not in the entryAttribute field then those attribute(s) will be added to additionalAttributes. The field additionalAttributes is a complex type field which can contain attribute name, its type and values. (The value field is an array in turn to support multiple value for an attribute)

Note : We can delete multiple Entries using create entry activity

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/LDAP_connector_retrieve_entry.html

Retrieve LDAP Entry

Search activity is used to search entries in LDAP Server that matches the values that are specified in the search criteria. You can specify or configure the following search criteria in the configuration panel or input data that is sent with the outbound request.

1. Search Scope :

The Scope is the starting point of an LDAP search and the depth from the base DN to which the search should occur. There are three options (values) that can be assigned to the SCOPE parameter:

- a. **Only Object** : This value is used to indicate searching only the entry at the base DN, resulting in only that entry being returned (keeping in mind that it also has to meet the search filter criteria!!!)
- b. **Immediate Child** : This value is used to indicate searching all entries one level under the base DN - but not including the base DN and not including any entries under that one level under the base

DN

c. **Complete Sub tree** : This value is used to indicate searching of all entries at all levels under and including the specified base DN.

2. **Search filter** : Search filters select the entries to be returned for a search operation. They are most commonly used with the ldap search command-line utility and you can place multiple search filters.

Using the Search Entry activity:

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the LDAP folder
3. Drag Create Entry activity from the LDAP folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed

The Checklist pane lists the tasks (Summary, Pick Endpoint, Configure, Map inputs, Map outputs) that you must complete to configure the outbound activity

- a. Click on Pick Endpoint to select a LDAP endpoint to work with
- b. Click Configure from the Checklist. The Configure pane is displayed. Complete the following steps to configure Create Entry activity
 - i. Click Browse button to select an Base Dn from the Browse DIT pane. The Browse LDAP Entry panel displays all the entries from the selected LDAP server. **Note** : if you have configured the Base-Dn property in the endpoint panel then Browse LDAP Entry displays children of Base-Dn alone or else it displays all the entries from the root of the LDAP directory
 - ii. Click Browse button to select an Object class(es) from the Browse LDAP Object Class pane. The Browse LDAP Object Class panel displays all the Object Classes on the selected LDAP Server. LDAP object class(es) defines the attributes of an Entry. An Entry object can have superset of attributes from 2 or more object classes. Select all the object classes which will collectively represent all attributes of the Entry you are going to create

Specifying the map inputs for create activity

Click Map Input from the Checklist pane. The input parameters for the specific LDAP activity are displayed under the To Activity pane.

Table 1. Map Input Optional Parameter

Parameter Name	Description
baseDn	Starting point of LDAP search
RDN	Relative DN
Search Scope	The Scope is the starting point of an LDAP search and the depth from the base DN to which the search should occur
Search Filter	Search filters select the entries to be returned for a search operation.

Note : Value provided in map will take highest priority

Specifying the map outputs create activity

Click Map output from the Checklist pane. The output parameters for the LDAP Create activity are displayed under the From Activity pane. Some of the common output parameters are defined in the following table

Table 2. Retrieve Activity common output parameters

Parameter Name	Description
baseDn	The container Dn under which entry represented by RDN is created
RDN	Relative Distinguished Names(RDN). RDN of an object is the part of the name that is an attribute of the object itself (the part of the object name that identifies this object as unique from its siblings at its current level in the naming hierarchy)
objectClasses	Lists all object classes of the search entry
entryAttributes	field contains structured content containing all attributes of the object classes selected in configure panel
additionalAttributes	additionalAttributes field contains additional set attributes of the entry which cannot be represented by selected object classes (entryAttributes). Means, if the entry contains an attribute or set of attributes which are not in the entryAttribute field then those attribute(s) will be added to additionalAttributes. The field additionalAttributes is a complex type field which can contain attribute name, its type and values. (The value field is an array in turn to support multiple value for an attribute)

Services Provided

Microsoft Dynamics AX is a multi-language, multi-currency enterprise resource planning (ERP) business solution with comprehensive global business management features for financial, human resources, and operations management as well as additional industry capabilities for retailers, professional service industries, financial service businesses, manufacturers, and public sector organizations..

Following is the overview of the services provided from MS Dynamics AX end.

- Financial Management
- Manufacturing
- Sales and Marketing
- Project Accounting
- Supply Chain Management
- Human Resource Management
- Service Management
- Business Intelligence and Reporting
- Compliance Management
- Collaborative Workspace
- Mobility

Microsoft AX customer base comprises of Large Enterprise and Mid-size business owners

Authentication supported

The IBM Cast Iron connector for AX 2012 will support NTLM version 1.0 as the authentication type.

In NTLM authentication, users are authenticated against their windows credentials.

While creating an Endpoint for the Cast Iron for MS AX connector, user should provide an already Configured windows authentication to authenticate against the server.

Creation and Deployment of new port on IIS

- Open MS AX Dynamics 2012 application console.
- Go to DAT
- Go to setup in left below panel
- Click on inbound port and new port.
- Give name to port
- Select HTTP from dropdown at right panel
- Click on Configure-> bindings->basic->security->instead of windows , ntlm.
- Select the WSDL.
- Click Service operation button
- Check the service class name from the operation list given in requirement document.
- Select all the operations prefix by service class name
- Move these operation to left side of panel by clicking < button
- Click on close button and activate the port.

Creating a MS Dynamics AX Endpoint in Cast Iron

MS Dynamics AX 2012 Endpoint contains the information that the connector requires connect to the MS AX 2012 service.

Note: Any changes you make to the MS Dynamics AX Endpoint affects all the orchestrations that use that Endpoint, as the edits are global, not local.

1. In the Cast Iron project tab, right click the Endpoints option and select Create Endpoint
2. Select the MS Dynamics AX option from the drop down. The Endpoint connection panel will be displayed.
3. Fill in the following connection parameters in the Connection Details panel

Field Name	Description
Host Name	Specifies the machine name hosting the AX 2012 service
Port Number	Specifies the PORT no at which the WSDL is available
Application Pool	Specifies the IIS configuration name on the machine hosting MS AX 2012 server
Port Name	Specifies the name of the port created on the AX instance for configuring the WSDL.

1. Click on the Download WSDL. The WSDL is downloaded.
2. Provide the parameters in the Authentication section and save the Endpoint.

Field Name	Description
Domain	Specifies the domain in which the MS AX 2012 server is Configured
Username	Specifies the username used to connect to the MS AX 2012 service
Password	Specifies the password used to connect to the MS AX 2012 service

The saved Endpoint will be visible under the Endpoints section.

- 1.

Parent topic: [MS Dynamics AX Activities](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MS_Dyn_AX_creating_a_ms_dynamics_ax_endp.html

Using the MS Dynamics AX Invoke service Activity

This section covers the steps to use the MS AX 2012 Endpoint created in the above step.

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS AX 2012 Endpoint to the orchestration and select Invoke Service.
3. The Invoke service Activity is added to the orchestration. Double click the Activity.
4. Click the Configure option in the checklist menu.
5. The respective operations are populated in the WSDL operations section.
6. Click any one operation from the WSDL operation section.
7. Click the Map inputs. The XML schemas generated for that operation are displayed.
8. Create a map between the orchestration variables and the input parameter of the Activity

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the Activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the Activity is displayed as nodes under the response output parameter in the From Activity panel.

The MS AX 2012 connector Invoke Service Activity is Configured.

Similar process has to be executed for Verifying the different WSDL operations for the selected service.

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MS_Dyn_AX_using_the_ms_dynamics_ax_invok.html

Connector Operations

A service operation is a named set of functionality that is offered by a service. For example, the service operation that creates a new sales order is named SalesSalesOrderService.create. A service can expose multiple service operations. The service operations that a service exposes can include custom service operations. The following table describes some of the common service operations for document services.

Following operations would be performed by MS Dynamics AX 2012 R3 connector:

Op er ati on	Description
Cre ate	<p>This operation creates a record for a new item in the database. For example, for the sales order service, this operation creates a new sales order. Usually, this operation responds with an entity key that contains the ID of the new item. The new record that is created uses the field values from the record in the message.</p> <p>An integration port can be Configured to replace existing documents when this service operation is called.</p>
De let e	This operation deletes a record in the database. Only records in child tables can be deleted
Fin d	This operation searches for the specified database record.
Fin dK ey s	This operation retrieves a list of entity keys that correspond to the specified search criteria. For example, a request can contain a query for customers whose last name starts with the letter T. The response to this query contains a list of key fields and values that you can use to query again for additional data. For example, you can use the key fields to update each customer record in the list that you retrieved.
Re ad	This operation retrieves the specified records from the database. The records that must be read are specified by using entity keys. The response contains the data for the records that are returned.
Up da te	This operation updates a record in the database. Only the fields for whom the values are provided in the message are updated. Values for all other database fields remain unchanged.
get Ke ys	This operation retrieves the keys for documents based on a document filter
get Ch an ge dK ey s	This operation retrieves the keys for documents based on a document filter and a date that is passed in.

Advance shipping notice

An advance ship notice or advance shipping notice (ASN) is a notification of pending deliveries, similar to a packing list. It is usually sent in an electronic format and is a common EDI document.

ASN enables external systems to receive information about shipments. The ASN document is a delivery confirmation and is used to notify a customer about an expected delivery. The ASN is typically generated based on information that is available when a shipment has left the warehouse, and it can be triggered when you post a packing slip in Microsoft Dynamics AX.

1. Create a new port for [Advanced Shipping Notice](#)™ service on IIS.
2. Add new [MS Dynamics AX](#)™ Endpoint in Cast Iron studio.
3. Download the [Advance shipping notice](#)™ WSDL.
4. Click and drag the Endpoint created to the orchestration.
5. Select the [Invoke](#)™ service.
6. Click on the service and then click [Configure](#)™.
7. Select a service from the list of services.
8. Provide values for the parameters in the Map inputs page.
9. Right click on the service and select the [Verify Activity](#)™ option.
10. Results will be displayed in the Verify tab.

Fixed Asset

Fixed assets are items of value, such as buildings, vehicles, land, and equipment, which are owned by an individual or corporation. You can set up and enter acquisition information for fixed asset records, and then manage fixed assets by depreciating them and setting a capitalization threshold to determine depreciation. You can calculate adjustments to the **fixed assets**, and also dispose of them.

Vendor Group

The Vendor portal is a website where you, as an approved vendor for an organization, can interact with your customer. In the Vendor portal, you can maintain your vendor profile information and process transactions with the customer organization. The tasks that an employee in your organization can complete in the Vendor portal are determined by the user role that is assigned to the employee. User roles are assigned when users are granted access to the website. This service enables synchronization of vendor groups with external systems.

Exchange Rate

Exchange Rate service enables you to send your exchange rates to another subsidiary. Different sets of Exchange rates could be segregated into different Exchange Rate types. So, different exchange rate types could be used for different purpose.

Exchange rate types are a grouping that allows different exchange rates for two currencies. These exchange rates are used to convert the transactions like purchase, Sell, etc.

1. Create a new port for "Exchange Rates" service on IIS.
2. Add new "MS Dynamics AX" Endpoint in Cast Iron studio.
3. Download the "Exchange Rate" WSDL.
4. Click and drag the Endpoint created to the orchestration.
5. Select the "Invoke" service.
6. Click on the service and then click "Configure".
7. Select a service from the list of services.
8. Provide values for the parameters in the Map inputs page.
9. Right click on the service and select the "Verify Activity" option.
10. Results will be displayed in the Verify tab.

Sales invoice

A sales invoice for a sales order is an invoice that is attached to a sales order. It contains a header and one or more lines for items or services. The sales invoice finishes the sales order, packing slip, and sales invoice cycle. This service sends an invoice to a customer. The invoice is based on the sales order data of the customer.

Vendor payment

Prepayments are a common business practice, with organizations issuing prepayments to vendors for goods or services before those goods or services are fulfilled. To minimize risk, you can track prepayments by defining the prepayment on a purchase order. Vendors can also create a prepayment invoice that is associated with a purchase order. This service makes it easier for organizations to complete, manage and track prepayments to vendors.

Services Provided

Microsoft Dynamics GP is a multi-language, multi-currency enterprise resource planning (ERP) business solution with comprehensive global business management features for financial, human resources, and operations management as well as additional industry capabilities for retailers, professional Service industries, financial Service businesses, manufacturers, and public sector organizations.

Following is the overview of the Services provided from MS Dynamics GP end.

- Financial Management
- Manufacturing
- Sales and Marketing
- Project Accounting
- Supply Chain Management
- Human Resource Management
- Service Management
- Business Intelligence and Reporting
- Compliance Management
- Collaborative Workspace
- Mobility

Microsoft GP customer base comprises of Large Enterprise and Mid size business owners

Microsoft Dynamics 2013 Object Categories

The number of objects available is quite large and hence they are divided into three categories. Following are the objects that represent the categories.

- Business Document Objects: These are the objects that represent business documents in Microsoft Dynamics GP. Those are:
 - Customer
 - Vendor
 - CreditLimit
 - Account
 - SalesInvoice
 - Applicant
- Base Objects: This object serves as the basis for each specific type of object. Those are
 - Business Objects
 - Key
 - Criteria
 - Restriction
- Helper Objects: Some objects are included simply to help you work with the Dynamics GP Service. They perform actions such as controlling how the Service is called, or dealing with errors that occur during processing. Those are
 - Context
 - Policy
 - ExceptionInformation
 - ValidationItem

Authentication supported

The IBM Cast Iron connector for GP 2013 will support NTLM version 1.0 as the authentication type.

In NTLM authentication, users are authenticated against their windows credentials.

Pre-requisites:

While creating an Endpoint for the Cast Iron for MS GP connector, user should provide an already Configured windows authentication to authenticate against the GP server.

Creating a GP Endpoint in Cast Iron

MS Dynamics GP 2013 Endpoint contains the information the connector requires to connect to the MS GP 2013 Service.

Any changes you make to the MS Dynamics GP Endpoint, affects all the orchestrations that use that Endpoint, as the edits are global, not local.

1. In the Cast Iron project tab, right click the Endpoints option and select Create Endpoint
2. Select the MS Dynamics GP option from the drop down. The Endpoint connection panel will be displayed.
3. Fill in the following connection parameters in the Connection Details panel.
4. Connection Details

Field Name	Description
Host Name	Specifies the machine name hosting the GP 2013 Service
Port Number	Specifies the port at which the GP Service is available
URI	Specifies the base URI for the GP WSDL. BY default, it is for the legacy webService. For custom web Service, the user will have to modify it accordingly.

1. Click on Download WSDL button. The WSDL is downloaded.
2. Provide the parameters in the Authentication section and save the Endpoint.

Field Name	Description
Domain	Specifies the domain in which the MS GP 2013 Service is Configured
Username	Specifies the username used to connect to the MS GP 2013 Service
Password	Specifies the password used to connect to the MS GP 2013 Service

The saved Endpoint will be visible under the Endpoints section.

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MS_Dyn_GP_creating_a_gp_endpoint_in_cast.html

Using the MS Dynamics GP Invoke Service Activity

This section covers the steps to use the MS GP 2013 Endpoint created in the above step.

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS GP Endpoint to the orchestration and select Invoke Service.
3. The Invoke Service Activity is added to the orchestration. Double click the Activity.
4. Click the Configure option in the checklist menu.
5. From the WSDL Operations drop down, select any operation.
6. The operation is selected and respective operation for all objects are populated in the WSDL operations section.
7. Click any one operation from the WSDL operation section.
8. Click the Map inputs. The XML schemas generated for that operation are displayed.
9. Create a map between the orchestration variables and the input parameter of the Activity

Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the Activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the Activity is displayed as nodes under the response output parameter in the From Activity panel.

The MS GP 2013 connector Invoke Service Activity is Configured.

Similar process has to be executed for Verifying the different WSDL operations for the selected standard operations.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MS_Dyn_GP_using_the_ms_dynamics_gp_invok.html

Connector Operations

Following operations would be performed by Microsoft Dynamics GP 2013 connector:

Operation	Description
Create	This method adds new data to Dynamics GP and use objects to specify the type of data being created and the values to be saved.
GetByKey	When objects are retrieved individually, user must specify the unique key value for the object you want to retrieve. The "GetByKey" methods in the Dynamics GP Service are used to retrieve individual objects
GetList	When objects are returned as a list, you will supply a set of criteria that indicate which objects you want to retrieve. The Dynamics GP Service has criteria objects that you will use to specify criteria. The "GetList" methods in the Dynamics GP Service are used to retrieve lists of objects.
Update	The "Update" methods are used to change the values of an existing object's properties. The object is used as a parameter for this operation.
Delete	The "Delete" methods are used to delete the object based on key values provided.
Void	The "Void" methods are used to void the object but does not delete the object.

Applicant

Identify top applicants and help maintain a fair hiring process with customized interview forms and templates for acknowledgement, offer, and rejection letters. Successful candidate information that imports into employee records with a single step, eliminating the need to reenter the information.

1. Add new "MS Dynamics GP" Endpoint in Cast Iron studio.
2. Click and drag the Endpoint created to the orchestration.
3. Select the "Invoke" Service.
4. Click on the Service and then click "Configure".
5. Click on any standard operation listed in the drop-down list.
6. Select the required operation thereafter.
7. Provide values for the parameters in the Map inputs page.
8. Right click on the Service and select the "Verify Activity" option.
9. Results will be displayed in the Verify tab.

Services Provided

Microsoft Dynamics NAV 2013 supports all typical enterprise resource planning (ERP) activities. Most ERP functionality in Microsoft Dynamics NAV 2013 relates to the business tasks that users perform in different company departments, such as the Finance, Sales, and Warehouse departments.

The departments supported by Microsoft Dynamics NAV 2013 are:

- Finance
- Business Intelligence
- Marketing
- Sales
- Design and Engineering
 - Operations and Planning
- Purchasing
- Receiving

- Warehouse activities
- Production
- Shipping
- Service
- Resource Planning
- Jobs
- Human Resources

Microsoft Dynamics NAV 2013 Objects

Following are the standard application objects for Microsoft Dynamics NAV 2013. These are available in the Object Designer.

Tables	You use tables to store data. For example, a business application may contain a customer table that stores information about each customer, such as, name, address, telephone number, and contact person.
Reports	You use reports to present data. You use filters and sorting to select the data that you want to present in a report
XML repo	You use XMLports to import and export data in .xml, .txt, or .csv format

rts	
Codeunits	A codeunit contains user-defined functions that are written in C/AL code. You can use the functions in a codeunit from the other objects in your application.
MenuSuites	A MenuSuite object contains the set of menus that are displayed in the NAV 2013 navigation pane.
Pages	Pages display data from the database and allow users to enter new data into the database
Queries	A query specifies a set of data from the database.

Out of these mail objects, three are exposed in form of web Services - pages, codeunits and queries. Note: The MS Dynamics NAV 2013 connector will support Pages and Codeunits as webServices types.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MS_Dyn_Nav_microsoft_dynamics_nav_2013_ob.html

Authentication supported

The IBM Cast Iron connector for NAV 2013 will support NTLM version 1.0 as the authentication type.

In NTLM authentication, users are authenticated against their windows credentials.

Pre-requisites:

While creating an Endpoint for the Cast Iron for MS NAV connector, user should provide an already Configured windows authentication to authenticate against the NAV Service.

How to: Create a New Company

To use RapidStart Services for Microsoft Dynamics NAV, you first create a new company for which you want to perform a Microsoft Dynamics NAV implementation. When you create a new company, the standard Microsoft Dynamics NAV tables and pages are created, but there is no data in them.

In addition, you can apply specific setup data to your company after you initialize it. The information is provided in a configuration package, a .rapidstart file, which delivers content in a compressed format.

Use the following procedure to create a new company, and use the BASICCONFIG package as part of the process.

file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MS_Dyn_Nav_how_to__create_a_new_company.html

To create a new company

1. In the Microsoft Dynamics NAV Development Environment, create a new company. On the **File** menu, choose **Company**, and then choose **New**.
2. Name the new company and then choose the **OK** button.
3. Switch to the Microsoft Dynamics NAV Windows client and initialize the company you have just created.

You can now import the configuration package that you exported from CRONUS. After you create a new company, some tables are automatically filled in, even if no company template is applied.

Creating a NAV Endpoint in Cast Iron

MS Dynamics NV 2013 Endpoint contains the information the connector requires to connect to the MS NAV 2013 Service.

Any changes you make to the MS Dynamics NAV Endpoint affects all the orchestrations that use that Endpoint, as the edits are global, not local.

1. In the Cast Iron project tab, right click the Endpoints option and select Create Endpoint
2. Select the MS Dynamics NAV option from the drop down. The Endpoint connection panel will be displayed.
3. Fill in the following connection parameters in the Connection Details panel

Field Name	Description
Host Name	Specifies the machine name hosting the NAV 2013 Service.
Port Number	Specifies the PORT no at which the WSDL is available
Application Pool	Specifies the IIS configuration name on the machine hosting NAV 2013 Service.
Company Name	Specifies the BD name in which the standard NAV pages and tables are stored.

1. Provide the parameters in the Authentication section and save the Endpoint.

Field Name	Description
Domain	Specifies the domain in which the MS NAV 2013 Service is Configured
Username	Specifies the username used to connect to the MS NAV 2013 Service
Password	Specifies the password used to connect to the MS NAV 2013 Service

The saved Endpoint will be visible under the Endpoints section.

Refresh button Functionality

1. Delete/add some WSDLs.
2. Right click the Orchestrations section and select new orchestration.
3. Drag the newly created MS NAV Endpoint to the orchestration and select Invoke Service.
4. The Invoke Service Activity is added to the orchestration. Double click the Activity.
5. Click the Configure option in the checklist menu.
6. Click on the "Refresh" button.
7. The list of Services gets updated accordingly.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MS_Dyn_Nav_update_wsdli.html

Using the MS Dynamics NAV Invoke Service Activity

This section covers the steps to use the MS NAV 2013 Endpoint created in the above step.

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS NAV Endpoint to the orchestration and select Invoke Service.
3. The Invoke Service Activity is added to the orchestration. Double click the Activity.
4. Click the Configure option in the checklist menu.
5. From the Select Service drop down, select any Service.
6. The Service is selected and their respective operations are populated in the WSDL operations section.
7. Click any one operation from the WSDL operation section.
8. Click the Map inputs. The XML schemas generated for that operation are displayed.
9. Create a map between the orchestration variables and the input parameter of the Activity.

Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the Activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the Activity is displayed as nodes under the response output parameter in the From Activity panel.

The MS NAV 2013 connector Invoke Service Activity is Configured.

Similar process has to be executed for Verifying the different WSDL operations for the selected Service.

Connector Operations

Following operations would be performed by Microsoft Dynamics NAV 2013 connector

Operation	Description
Create	This operation creates a single record. For example, for the currency, this operation creates a new currency. The supplied record object is overwritten with the version that is created by the page.
Create Multiple	This operation creates a set of records. The supplied record object is overwritten with the version that is created by page.

Read	This operation reads a single record.
ReadMultiple	This operation reads a filtered set of records. This operation returns an array of entities. The ReadMultiple operation allows the consumer of a Web Service to specify the number of records to be returned at one time. This can reduce load on the server.
Update	This operation updates a single record. The updated record is passed as a reference and is updated with the latest version.
UpdateMultiple	This operation updates a set of records. The updated array of records is passed as a reference and is updated with the latest version.
IsUpdated	This operation checks if an object has been updated since the key was obtained. This operation returns true if the object has been updated by any user; otherwise, false . Concurrency management will prevent a record being changed if it has been subsequently updated. This check will proactively prevent that failure.
DeletePart	This operation deletes records on a subpage of the current page. This operation is exposed only by pages that have subpages, which are pages that have parts of type page

User Setup

Microsoft Dynamics NAV has a security program to ensure that only the correct people have access to the companies in the program. With user IDs and passwords, you can control who can enter the program. You can improve this security by using roles to restrict an individual user's permissions—for example, to read information create new information, or modify existing information.

1. Create a new company for "User Setup" Service.
2. Add new "MS Dynamics NAV" Endpoint in Cast Iron studio.
3. Enter valid values in the Test Connection screen and click 'Test Connection'.
4. Click and drag the Endpoint created to the orchestration.
5. Select the "invoke" Service.
6. Click on the Service and then click "Configure".
7. Select a Service from the list of Services.
8. Select WSDL operation from the list.
9. Provide values for the parameters in the Map inputs page.
10. Right click on the Service and select the "Verify Activity" option.
11. Results will be displayed in the Verify tab.

Location List

This Service specifies information about your locations, such as example, warehouses, and distribution centers. You can keep track of items in different locations using the Location table. Each location has a name as well as a code representing the name. You use the table to assign a code to a location name. You can then enter the code in location code fields elsewhere in the program, for example, on purchase or sales document lines. This will then record the transactions for the location when you post.

1. Create a new company for "Location List" Service.
2. Add new "MS Dynamics NAV" Endpoint in Cast Iron studio.
3. Enter valid values in the Test Connection screen and click 'Test Connection'.
4. Click and drag the Endpoint created to the orchestration.
5. Select the "invoke" Service.
6. Click on the Service and then click "Configure".
7. Select a Service from the list of Services.
8. Select WSDL operation from the list.
9. Provide values for the parameters in the Map inputs page.

Printer Selections

Specifies the printer to you use when you print invoices, credit memos, and so on. You use the Printer Selection table to control this. In this table you can assign certain printers to certain users and/or reports so that the Invoice report, for example, is always printed on printer X. You can also specify that only user Y will always print credit memos on printer X, for example.

1. Create a new company for *Printer Selections* Service.
2. Add new *MS Dynamics NAV* Endpoint in Cast Iron studio.
3. Enter valid values in the Test Connection screen and click 'Test Connection'.
4. Click and drag the Endpoint created to the orchestration.
5. Select the *invoke* Service.

6. Click on the Service and then click "Configure".
7. Select a Service from the list of Services.
8. Select WSDL operation from the list.
9. Provide values for the parameters in the Map inputs page.
10. Right click on the Service and select the "Verify Activity" option.
11. Results will be displayed in the Verify tab.

Creating or editing an endpoint for MS Office 365 activity

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to a MS Office 365 server. MS Office 365 uses OAuth 2.0 authentication mechanism to authenticate and authorize users to perform operations.

Selecting or editing a MS Office 365 endpoint

To select or edit a MS Office 365 endpoint:

1. In the **Create Endpoint** or **Edit Endpoint** pane, configure the MS Office 365 endpoint as described in the following table.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

2. Click **Test Connection** to confirm that the connection details are valid and you are able to connect to the MS Office 365 successfully.

3. Click **OK**.

Table: Connection properties

Field Name	Description
OAuth Access Token	OAuth access token generated from Azure AD
OAuth Refresh Token	OAuth refresh token generated from Azure AD while generating OAuth Access token
Application Client ID	Application client ID generated from the server where the application is hosted
Application Client Secret	Application client secret generated from the server where the application is hosted

Note: To generate the access token, refer to the MS Office 365 documentation relating to "OAuth2 Authentication Support in MS Office 365 REST API".

 Last updated: Wednesday, February 17, 2016

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MS_Off_365_creating_or_editing_an_endpoint.html

Using the MS Office 365 Send Mails activity

Use the Send Mails activity to send a mail to recipients in MS Office 365.

Use this task to send a mail to recipients in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Send Mails activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Send Mails** activity icon onto the orchestration. The MS Office 365 Send Mails checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Send Mails activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has the following mandatory field:

- **InputType:** This has following two values:
 - Select **ON_THE_FLY** to send a mail without getting saved in **Drafts** folder.
 - Select **DRAFT** to send the mail and save it in **Drafts** folder.

Optional Fields: The activity has following optional fields:

- **SaveToSentItems:** Set it True if the sent mail has to be saved in the **Sent Items** folder.
- **message_id:** ID of the mail.
- **Message** parameter having following fields:
 - Subject of the draft mail
 - **Body** parameter having following fields:
 - **Content:** Add contents of the text as per the content type in base-64 format.
 - **Content Type:** Having text and HTML values.
 - **Importance** parameter having following fields in which user can set the importance level:

- Low
- Normal
- High
- **ToRecipients** parameter having **EmailAddress** field which has following fields:
 - **Address:** email address of recipients in **To** field.
 - **Name:** name of the recipient.
- **CcRecipients** parameter having **EmailAddress** field which has following fields:
 - **Address:** email address of recipients in **Cc** field.
 - **Name:** name of the recipient.
- **BccRecipients** parameter having **EmailAddress** field which has following fields:
 - **Address:** email address of recipients in **Bcc** field.
 - **Name:** name of the recipient.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Send Mails activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

Using the MS Office 365 Get Mails activity

Use the Get Mails activity to retrieve all the mails or a single mail along with their attachments if required in MS Office 365.

Use this task to retrieve all the mails or a single mail along with their attachments if required from the default folder which is inbox or the specific folder ID provided in MS Office 365 instance. The call to this activity is a synchronous call, where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Get Mails activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.

2. Drag the **Get Mails** activity icon onto the orchestration. The MS Office 365 Get Mails checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Get Mails activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields:

- **InputType:** This has following two values:
 - Select **ALL_MESSAGES** to fetch all the messages
 - Select **BY_MESSAGE_ID** to fetch specific message

Optional Fields: The activity has following optional fields:

- **folder_id:** This is used to set the ID of the specific folder to fetch the messages from MS Office 365.
- **message_id:** ID of the specific message to be fetched.
- **include_attachments:** Set it True if attachments are also required to be fetched along with the messages.
- **Customize:** This is used to set the Odata query parameters in following fields:
 - **Top**
 - **Skip**
 - **FilterRequests**
 - **SelectProperties**
 - **Orderby**

Note:

- Refer [“ODATA Query Parameters”](#)™ document for filtering, sorting, and paging parameters.
- Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Get Mails activity.

Note: User can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

Using the MS Office 365 Respond Mail activity

Use the Respond Mail activity to reply to a sender of mail or forward a mail to recipients in MS Office 365. The mail gets saved in **Sent Items** folder.

Use this task to reply to a sender of mail or forward a mail to recipients in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Respond Mail activity:

1. In an active orchestration, open the **Activities** tab and expand the MS Office 365 folder contents.
2. Drag the **Respond Mail** activity icon onto the orchestration. The MS Office 365 Respond Mail checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Respond Mail activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields:

- **InputType:** This has following three values:
- Select **REPLY** to reply to a mail.
- Select **REPLYALL** to reply to all the recipients of a mail.
- Select **FORWARD** to forward the mail to specified recipients.
- **message_id:** ID of the message for which reply has to be sent or to be forwarded.
- **Comment:** Comment to be included along with reply or when forwarded.

Optional Fields: The activity has following optional fields:

- **ToRecipients** parameter having **EmailAddress** field which has following fields:
- **Address:** email address of recipients in **To** field.
- **Name:** name of the recipient.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Respond Mail activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

Using the MS Office 365 Update Mails activityUse the Update Mails activity to change writable properties on a draft or existing message in MS Office 365. Only the properties that you specify are changed.

Use this task to change writable properties on a draft or existing message in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Update Mails activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Update Mails** activity icon onto the orchestration. The MS Office 365 Update Mails checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Update Mails activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has the following mandatory field:

- **message_id:** ID of the message which has to be updated.

Optional Fields: The activity has the following optional field:

- **mail:** Specify properties of the mail which is to be updated.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Update Mails activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

Using the MS Office 365 Create Draft Mails activity

Use the Create Draft Mails activity to create draft mails in MS Office 365.

Use this task to create draft mails in the MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Create Draft Mails activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Create Draft Mails** activity icon onto the orchestration. The MS Office 365 Create Draft Mails checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Create Draft Mails activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields:

- **InputType:** This has following four values:
 - Select **NEW** to create new draft mail.
 - Select **REPLY** to save the reply mail as draft.
 - Select **REPLYALL** to save the reply to all mail as draft.
 - Select **FORWARD** to save the forwarded mail as draft.

Optional Fields: The activity has following optional fields:

- **folder ID:** The ID of the folder where draft mail is saved.
- **message_id:** ID of the mail.
- **message** parameter having following fields:
 - Subject of the draft mail
- **Body** parameter having following fields:
 - **Content:** Add contents of the text as per the content type in base-64 format.
 - **Content Type:** Having text and HTML values.
- **Importance** parameter having following fields in which user can set the importance level:
 - Low
 - Normal
 - High
- **ToRecipients** parameter having **EmailAddress** field which has following fields:
 - **Address:** email address of recipients in **To** field.
 - **Name:** name of the recipient.
- **CcRecipients** parameter having **EmailAddress** field which has following fields:
 - **Address:** email address of recipients in **Cc** field.
 - **Name:** name of the recipient.
- **BccRecipients** parameter having **EmailAddress** field which has following fields:
 - **Address:** email address of recipients in **Bcc** field.
 - **Name:** name of the recipient.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Create Draft Mails activity.

Note: User can also add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

Using the MS Office 365 Delete Contacts activity

Use the Delete Contacts activity to delete a contact in MS Office 365. Deleted contents might not be recoverable.

Use this task to delete a contact in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Delete Contacts activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Delete Contacts** activity icon onto the orchestration. The MS Office 365 Delete Contacts checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant **MS Office 365** endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Delete Contacts activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields:

- **contactId:** ID of the contact to be deleted.

Optional Fields: The activity does not have any optional fields.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Delete Contacts activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

Using the MS Office 365 Get Contact Folders activity

Use the Get Contact Folders activity to retrieve all the contact folders or a specific contact folder in MS Office 365.

Use this task to retrieve all the contact folders or a specific contact folder in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Get Contact Folders activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Get Contact Folders** activity icon onto the orchestration. The MS Office 365 Get Contact Folders checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Get Contact Folders activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields:

- **InputType:** This has following two values:
 - Select **ALL_CONTACT_FOLDERS** to fetch all the contact folders.
 - Select **SINGLE_CONTACT_FOLDER** to fetch specific contact folder.

Optional Fields: The activity has following optional fields:

- **contact_folder_id:** This is used to set the ID of the specific contact folder to fetch the details from MS Office 365.
- **Customize:** This is used to set the Odata query parameters in following fields:
 - **Top**
 - **Skip**
 - **FilterRequests**
 - **SelectProperties**
 - **Orderby**

Note:

- Refer to [“~ ODATA Query Parameters”™](#) document for filtering, sorting, and paging parameters.
- Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Get Contact Folders activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

2. Drag the **Delete Calendar Groups** activity icon onto the orchestration. The MS Office 365 Delete Calendar Groups checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Delete Calendar Groups activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory field:

- **calendar_group_id:** This is used to set the ID of the calendar group to be deleted from MS Office 365.

Optional fields: The activity does not have any optional fields.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Delete Calendar Groups activity.

Note: User can also add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

Using the MS Office 365 Create Events activity

Use the Create Events activity to create events in MS Office 365.

Use this task to create events in the MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Create Events activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Create Events** activity icon onto the orchestration. The MS Office 365 Create Events checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.

7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Create Events activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields:

- **Calendar_id:** This is used to set the ID of the calendar where event is added.

Optional Fields: The activity has following optional fields:

- **event** parameter having following fields:
- **Subject:** This is used to set the subject of the event.
- **Body** parameter having following fields:
- **Content:** Add contents of the text as per the content type in base-64 format.
- **Content Type:** Having text and HTML values.
- **Importance** parameter having following fields in which user can set the importance level:
- Low
- Normal
- High
- **Attendees** parameter having **EmailAddress** and **Type** fields which have the following fields:

EmailAddress has following fields:

- **Address:** email address of attendees.
- **Name:** name of the attendees.

Type has Required, Optional, and Resource values which are set for attendees.

- **Start:** start time of the event.
- **End:** end time of the event.
- **Attachments:** User can add multiple attachments for single events.
- **Categories:** User can categorize the event as Blue, Green, Orange, Purple, Red, and Yellow category
- **Location** parameter having the following field:
- **DisplayName:** location of the event.
- **IsAllDay:** This is the Boolean field which is used to generate event all day if value is True. If value is False, the event is not generated all day.
- **IsOrganizer:** This is the Boolean field which accepts True or False value. If event is generated by organizer, this field has True value else the value is False.
- **Organizer** parameter having the following field:
- **EmailAddress:** email address of organizer.
- **Recurrence** parameter having **Pattern** field in which user can define the event generation pattern.
- **ResponseRequested:** This is a Boolean parameter which accepts True or False value. If value is True, a response is requested from attendees and if value is False, no response is received.
- **Type:** User can generate an event as per the type selected.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Create Events activity.

Note: User can also add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

Using the MS Office 365 Update Events activity

Use the Update Events activity to update events in MS Office 365.

Use this task to update events in the MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Update Events activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Update Events** activity icon onto the orchestration. The MS Office 365 Update Events checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Update Events activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory field:

- **event_id:** This is used to set the ID of the event to update the record at MS Office 365.

Optional Fields: The activity has following optional fields:

- **event** parameter having following fields:
- **Subject:** This is used to set the subject of the event.

- **Body** parameter having following fields:
- **Content:** Add contents of the text as per the content type in base-64 format.
- **Content Type:** Having text and HTML values.
- **Importance** parameter having following fields in which user can set the importance level:
 - Low
 - Normal
 - High
- **Attendees** parameter having **EmailAddress** and **Type** fields which have following fields:

EmailAddress has following fields:

- **Address:** email address of attendees.
- **Name:** name of the attendees.

Type has Required, Optional, and Resource values which are set for attendees.

- **Start:** start time of the event.
- **End:** end time of the event.
- **Attachments:** User can add multiple attachments for single events.
- **Categories:** User can categorize the event as Blue, Green, Orange, Purple, Red, and Yellow category.
- **Location** parameter having following field:
- **DisplayName:** location of the event.
- **IsAllDay:** This is the Boolean field which is used to generate event all day if value is True. If value is False, the event is not generated all day.
- **IsCancelled:** This is the Boolean field which is used to cancel generated event when value is True. If value is False, then event is not cancelled.
- **IsOrganizer:** This is the Boolean field which accepts True or False value. If event is generated by organizer, this field has True value else the value is False.
- **Organizer** parameter having following field:
- **EmailAddress:** email address of organizer.
- **Recurrence** parameter having **Pattern** field in which user can define the event generation pattern.
- **ResponseRequested:** This is a Boolean parameter which accepts True or False value. If value is True, a response is requested from attendees and if value is False, no response is received.
- **Type:** User can able to generate event as per the type selected.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Update Events activity.

Note: User can also add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

Using the MS Office 365 Get Events activity

Use the Get Events activity to retrieve different types of events along with their attachments if required from calendar in MS Office 365.

Use this task to retrieve all events within a specific time range from default calendar or a calendar_id provided. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Get Events activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Get Events** activity icon onto the orchestration. The MS Office 365 Get Events checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Get Events activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields:

- **InputType:** This has following four values:
- Select **ALL_EVENTS_WITHIN_SPECIFIED_TIME** to fetch all the events within specific time range.
- Select **All_RECURRINGEVENTS_FOR_CALENDAR_ID** to fetch all recurring events from default primary calendar or from the calendar id provided.
- Select **SINGLE_EVENTOCCURRENCES_WITHIN_SPECIFIED_TIME** to fetch specific event occurrence within specified time range.
- Select **SINGLE_EVENT** to fetch specific event.

Optional Fields: The activity has following optional fields:

- **calendarid:** This is used to set the ID of the specific calendar to fetch the details from MS Office 365.
- **startDateTime:** Starting date and time of the time range is specified in this parameter.
- **endDateTime:** End date and time of the time range is specified in this parameter.
- **event_id:** ID of the specific event to be fetched.
- **include_attachments:** Specify True if attachments are required to be fetched along with events, otherwise False.
- **Customize:** This is used to set the Odata query parameters in following fields:
- **Top**

- **Skip**
- **FilterRequests**
- **SelectProperties**
- **Orderby**

Note:

- Refer to the "ODATA Query Parameters" document for filtering, sorting, and paging parameters.
 - Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
 2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Get Events activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

Using the MS Office 365 Delete Events activity

Use the Delete Events activity to delete an event in MS Office 365. Deleted contents might not be recoverable.

Use this task to delete an event in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Delete Events activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Delete Events** activity icon onto the orchestration. The MS Office 365 Delete Events checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Delete Events activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields:

- **eventId:** ID of the event to be deleted.

Optional Fields: The activity does not have any optional fields.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Delete Events activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

Creating or editing an endpoint for MS Office 365 OneDrive activity

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a MS Office 365 OneDrive server. MS Office 365 OneDrive uses OAuth 2.0 authentication mechanism to authenticate and authorize users to perform operations.

Selecting or editing a MS Office 365 OneDrive endpoint

To select or edit a MS Office 365 OneDrive endpoint:

1. In the **Create Endpoint** or **Edit Endpoint** pane, configure the MS Office 365 endpoint as described in the following table.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

2. Click **Test Connection** to confirm that the connection details are valid and you are able to connect to the MS Office 365 OneDrive successfully.

3. Click **OK**.

Table: Connection properties

Field Name	Description
Base URL	Host name or tenant of the server that serves as the REST endpoint
OAuth Access Token	OAuth access token generated from MS Office 365 OneDrive for authentication
OAuth Refresh Token	OAuth refresh token generated from MS Office 365 OneDrive while generating OAuth Access token
Application Client ID	Application client ID generated from the server where the application is hosted
Application Client Secret	Application client secret generated from the server where the application is hosted

Note: To generate the access token, refer to the MS Office 365 API documentation relating to [OAuth2 Authentication Support in MS Office 365 REST API](#).

Using the MS Office 365 OneDrive Create Folders Activity

Use the Create Folders activity to create folders in MS Office 365 OneDrive.

Use this task to create folders in MS Office 365 OneDrive instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active Orchestration, open the Activities tab and expand the MS Office 365 OneDrive folder contents.
2. Drag the **Create Folders** activity icon onto the orchestration. The MS Office 365 OneDrive Create Folders **Checklist** is displayed.
3. In the **Checklist**, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the **Checklist**, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 OneDrive endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. Additional configuration is not required for this activity
9. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Create Folders** activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields

- requestType: Value determines whether files are to be uploaded by providing the parent id or by providing path of the location.
- parent_id: The id of the folder where new folder is to be created. Mandatory when requestType is BY_ID
- path: Location where the new folder has to be created. Mandatory when requestType is BY_PATH.
- folder_name: Name of the folder to be created.

Optional Fields: The activity has following optional fields

- support_x_http_method “ True or False. Whether to support X-HTTP-Method

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 OneDrive Create Folders activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

Using the MS Office 365 OneDrive Upload Files Activity

Use the Upload Files activity to upload files in MS Office 365 OneDrive.

Use this task to upload files in MS Office 365 OneDrive instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active Orchestration, open the Activities tab and expand the MS Office 365 OneDrive folder contents.
2. Drag the **Upload Files** activity icon onto the orchestration. The MS Office 365 OneDrive Upload Files **Checklist** is displayed.
3. In the **Checklist**, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the **Checklist**, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 OneDrive endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. Additional configuration is not required for this activity
9. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Upload Files** activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields

- parent_id: The id of the folder where new file has to be uploaded. Mandatory when requestType is BY_ID
- path: Location where the new folder has to be created. Mandatory when requestType is BY_PATH.
- file_name: Name of the file to be uploaded.
- file_content: Content of the file which is uploaded in either binary format or text format.
- requestType: Value determines whether files are to be uploaded by providing the parent id or by providing path of the location.
- contentType: Value determines whether content of the file to be uploaded is TEXT or BINARY.

Optional Fields: The activity has following optional fields

- nameConflict “ Can be either “overwrite” or “abort”
- support_x_http_method “ True or False. Whether to support X-HTTP-Method

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. 7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. Additional configuration is not required for this activity
9. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Download Files** activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields

- file_id: The id of the file to be downloaded. Mandatory when requestType is BY_ID.
- path: Location of the file which is to be downloaded. Mandatory when requestType is BY_PATH.
- requestType: Value determines whether files to be downloaded by providing the parent id or by providing path of the location.

Optional Fields: The activity has following mandatory fields

- etag_if_none_match “ The Etag value to be provided in the request of HTTP header.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 OneDrive Download Files activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

Using the MS Office 365 One Drive Get Properties Activity

Use the Get Properties activity to fetch properties of a file, folder or drive in MS Office 365 One Drive.

Use this task to get properties of resource in MS Office 365 One Drive instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active Orchestration, open the Activities tab and expand the MS Office 365 One Drive folder contents.
2. Drag the **Get Properties** activity icon onto the orchestration. The MS Office 365 One Drive Get Properties **Checklist** is displayed.
3. In the **Checklist**, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the **Checklist**, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 One Drive endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. Additional configuration is not required for this activity
9. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Get Properties** activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields

- requestType: This value determines if the resource has to be fetched by BY_ID or by BY_PATH.
- inputType: This value specifies which resource's metadata has to be fetched out of FILE, FOLDER, DRIVE.
- folder_id " The folder properties to be fetched. Mandatory in case requestType is BY_ID
- file_id " The file properties to be fetched. Mandatory in case of requestType is BY_ID
- path - Location of the file which is to be downloaded. Mandatory when requestType is BY_PATH

Optional Fields: The activity has following mandatory fields

- expand " A comma-separated list of relationships to expand and include in the response
- select - A comma-separated list of properties to include in the response
- etag_if_none_match " The Etag value to be send as HTTP header

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 One Drive Get Properties activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of

the same type is supported.

Using the MS Office 365 One Drive Update Properties Activity

Use the Update Properties activity to update properties of a file, folder or drive in MS Office 365 One Drive.

Use this task to update properties in MS Office 365 One Drive instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active Orchestration, open the Activities tab and expand the MS Office 365 One Drive folder contents.
2. Drag the **Update Properties** activity icon onto the orchestration. The MS Office 365 One Drive Update Properties **Checklist** is displayed.
3. In the **Checklist**, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the **Checklist**, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 One Drive endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. Additional configuration is not required for this activity
9. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Update Properties** activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: The activity has following mandatory fields

- requestType: This value determines if the resource has to be updated BY_ID or BY_PATH
- inputType: This value specifies which resource's metadata has to be updated out of FILE or FOLDER.
- folder_id " The folder properties to be fetched. Mandatory in case requestType is BY_ID
- file_id " The file properties to be fetched. Mandatory in case of requestType is BY_ID
- path - Location of the file which is to be downloaded. Mandatory when requestType is BY_PATH
- etag_if_match " The Etag value to be sent in request as HTTP header
- new_name " The new name to be given either to file or folder
- destination_folder_id " The destination folder id is required when you want to move either files or folder from one location to another
- destination_folder_path - The destination folder path is required when you want to move either files or folder from one location to another

Optional Fields: The activity has following mandatory fields

- support_x_http_method “ True or False. Whether to support X-HTTP-Method

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

Use the Download File activity to view the file properties as well as its content in MS SharePoint.
- [Using the MS SharePoint Create Folder Activity](#)

Use the Create Folder activity to create new folder in MS SharePoint.
- [Using the MS SharePoint Update Folder Activity](#)

Use the Update Folder activity to modify folder properties in MS SharePoint.
- [Using the MS SharePoint Delete Folder Activity](#)

Use the Delete Folder activity to delete folder from MS SharePoint.
- [Using the MS SharePoint Retrieve Folder Activity](#)

Use the Retrieve Folder activity to view the folder properties of an existing folder in MS SharePoint.
- [Using the MS SharePoint Retrieve User Activity](#)

Use the Retrieve User activity to view the User details from MS SharePoint.
- [Specifying the Retry options for MS SharePoint REST API activities](#)

Specifying the Retry parameters is one of the tasks to configure a MS SharePoint activity. The MS SharePoint REST API connector uses a single login session for all connections to an MS SharePoint REST API endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_MSSharepointactivities.html

Overview of MS SharePoint connector

SharePoint is a web application platform in the Microsoft Office server suite. SharePoint combines various functions which are traditionally separate applications: intranet, extranet, content management, document management, personal cloud, enterprise social networking, enterprise search, business intelligence, workflow

management, web content management, and an enterprise application store. SharePoint is basically a secure place to store, organize, share, collaborate and access information.

SharePoint supports both on premise and cloud environments.

You can perform the following activities using the MS SharePoint connector:

- Upload File
- Update File
- Delete File
- Download File
- Create Folder
- Update Folder
- Delete Folder
- Retrieve Folder
- Retrieve User

Creating or editing an endpoint for MS SharePoint activity

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to MS SharePoint platform. MS SharePoint uses both Basic and OAuth 2.0 authentication mechanism so as to authorize users to perform operations.

Selecting or editing an MS SharePoint endpoint

1. In the Create Endpoint or Edit Endpoint pane, configure the MS SharePoint endpoint as described in the following table.
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the MS SharePoint successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Required	Description
Deployment	Mandatory	Deployment drop down will have two values as On Cloud and On Premise
Host name	Mandatory	Host Name for SharePoint On Cloud or On Premise based on the value selected for Deployment field.
Port	Optional	Use default port 80 or 443 if no value is specified.

Field Name	Required	Description
Sub Site	Optional	Use it while constructing URL if specified.
SharePoint On Premise Details		Section to hold authentication details needed for SharePoint On Premise. Will be enabled only when user selects On Premise from Deployment dropdown.
SharePoint On Cloud Details		Section to hold authentication details needed for SharePoint On Cloud. Will be enabled only when user selects On Cloud from Deployment dropdown.
OAuth Access Token	Mandatory field under SharePoint On Cloud section.	Specifies the OAuth access token generated from MS SharePoint for authentication.
OAuth Refresh Token	Mandatory field under SharePoint On Cloud section.	Specifies the OAuth refresh token generated from MS SharePoint while generating OAuth Access token.
Application Client ID	Mandatory field under SharePoint On Cloud section.	Specifies the Application client ID of the content API application created in MS SharePoint for OAuth.
Application Client Secret	Mandatory field under SharePoint On Cloud section.	Specifies the Application client secret of the content API application created in MS SharePoint for OAuth.
Authentication Type	Mandatory field under On Premise section.	Its default value is BASIC.
User Name	Mandatory field under On Premise section.	Specifies the username to connect to MS SharePoint. This is same as the MS SharePoint user ID.
Password	Mandatory field under On Premise section.	Specifies the password of the associated username to connect to MS SharePoint.
Following parameters are required in endpoint test connection screen to make connection via Proxy		
Host Name		Host Name of Proxy Network
Port		Port Number of the Proxy Network.
User Name		Specifies the user name for accessing service via proxy network.
Password		Specifies the password for accessing service via proxy network.

Note: To generate the access token, refer to the MS SharePoint documentation relating to "OAuth 2.0 Authentication".

In addition with the above parameters, there is also a provision for Secure Connector configuration to connect the Endpoint with MS SharePoint On-Premise instance.

Parent topic: [MS SharePoint Activities](#)

Using the MS SharePoint Upload File Activity

Use the Upload File activity to upload new files in MS SharePoint.

About this task

Use this task to upload new files at a given file path in MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Upload File activity. The Upload File activity will be added to the orchestration. Double click the activity. The MS SharePoint Upload File Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: Parent Folder, File name, and File Content (It should be provided in Base 64 encoded format for uploading any type of file).

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

Results

You have configured the MS SharePoint Upload File activity.

Note:

You can upload multiple files at one go, using this activity since the input variable is unbounded.

Using the MS SharePoint Update File Activity

Use the Update File activity to update an existing file's content in MS SharePoint.

About this task

Use this task to modify an existing file's content in MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Update File activity. The Update File activity will be added to the orchestration. Double click the activity. The MS SharePoint Update File Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: File path, and File Content (It should be provided in Base 64 encoded format for Updateing any type of file).

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

Results

You have configured the MS SharePoint Update File activity.

Note:

You can Update multiple files at one go, using this activity since the input variable is unbounded.

Using the MS SharePoint Delete File Activity

Use the Delete File activity to delete a file from MS SharePoint.

About this task

Use this task to delete a file permanently from MS SharePoint instance or move it to the Recycle Bin. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Delete File activity. The Delete File activity will be added to the orchestration. Double click the activity. MS SharePoint Delete File Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: File Path, and Delete Type.

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

Results

You have configured the MS SharePoint Delete File activity.

Note:

You can delete multiple files at one go, using this activity since the input variable is unbounded.

Using the MS SharePoint Create Folder Activity

Use the Create Folder activity to create new folder in MS SharePoint.

About this task

Use this task to add new folders in MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Create Folder activity. The Create Folder activity will be added to the orchestration. Double click the activity. The MS SharePoint Create Folder Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: Server Relative Url, and Folder name.

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

Results

You have configured the MS SharePoint Create Folder activity.

Note:

You can create multiple folders at one go, using this activity since the input variable is unbounded.

Using the MS SharePoint Update Folder Activity

Use the Update Folder activity to modify folder properties in MS SharePoint.

About this task

Use this task to update folder properties like WelcomePage in MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Update Folder activity. The Update Folder activity will be added to the orchestration. Double click the activity. The MS SharePoint Update Folder Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: Server Relative Url, and WelcomePage

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

Results

You have configured the MS SharePoint Update Folder activity.

Note:

You can update properties of multiple folders at one go using this activity since the input variable is unbounded.

Using the MS SharePoint Delete Folder Activity

Use the Delete Folder activity to delete folder from MS SharePoint.

About this task

Use this task to remove a folder permanently from MS SharePoint instance or move it to the Recycle Bin. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Delete Folder activity. The Delete Folder activity will be added to the orchestration. Double click the activity. The MS SharePoint Delete Folder Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: Server Relative Url, and Delete Type

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

Results

You have configured the MS SharePoint Delete Folder activity.

Note:

You can delete multiple folders at one go using this activity since the input variable is unbounded.

Using the MS SharePoint Retrieve Folder Activity

Use the Retrieve Folder activity to view the folder properties of an existing folder in MS SharePoint.

About this task

Use this task to fetch folder properties from MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Retrieve Folder activity. The Retrieve Folder activity will be added to the orchestration. Double click the activity. The MS SharePoint Retrieve Folder Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: Show Children, and Server Relative Url

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

Results

You have configured the MS SharePoint Retrieve Folder activity.

Note:

You can retrieve the details of multiple folders at one go using this activity since the input variable is unbounded.

Using the MS SharePoint Retrieve User Activity

Use the Retrieve User activity to view the User details from MS SharePoint.

About this task

Use this task to fetch user details from MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Retrieve User activity. The Retrieve User activity will be added to the orchestration. Double click the activity. The MS SharePoint Retrieve Folder Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: Retrieve Type, User Id (If value Retrieve Type is given as ID), and Login name (If value Retrieve Type is given as LOGINNAME)

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

Results

You have configured the MS SharePoint Retrieve User activity.

Note:

You can retrieve the details of multiple users at one go using this activity since the input variable is unbounded.

Specifying the Retry options for MS SharePoint REST API activities

Specifying the Retry parameters is one of the tasks to configure a MS SharePoint activity. The MS SharePoint REST API connector uses a single login session for all connections to an MS SharePoint REST API endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

About this task

This section contains the procedure for configuring the Retry options for MS SharePoint API activities.

Procedure

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry and timeout options for connecting to an MS SharePoint instance, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the MS SharePoint instance.
Retry __ times before failing.	Specifies the retry count “” the maximum number of times the Integration Appliance attempts to establish a connection to the MS SharePoint instance before issuing an error and stopping the processing of the current orchestration job. Note: If you deploy an orchestration that contains the MS SharePoint REST API activity and the Integration Appliance cannot connect to the specified MS SharePoint instance, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.

Retry Fields	Description
Stop processing rest of the records of the batch if failure detected even after the configured no. of retries.	<p>Specifies that if a batch of records is sent as input to an orchestration, and if failure is detected in between, then the remaining records should be processed or not.</p> <p>For example, if the retry count is set to 3 and a batch of 5 records is sent as input to the orchestration. If, after processing the 1st record of batch, the Integration Appliance cannot connect to the specified MS SharePoint instance even after configured number of retries i.e. 3 retry attempts, then the processing of the remaining 4 records will not be done and execution will be terminated if this option is selected.</p> <p>For the similar settings, if this option is not selected, then the remaining 4 records would be attempted to be processed.</p>

Creating and editing the MSDynamics CRM endpoint

MSDynamics CRM endpoints contain the connection information that Studio and the Integration Appliance use to connect to the MSDynamics CRM server. You can create multiple endpoints that refer to separate instances.

About this task

Use this task to create or edit a MSDynamics CRM endpoint. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Note:

Any changes you make to the MSDynamics CRM endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

To create and edit a MSDynamics CRM endpoint, complete the following steps:

Procedure

1. Drag an activity from the MSDynamics CRM folder under the Activities tab, to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
 - a. **Browse** - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
 - b. **New** - To create a new endpoint. The Create Endpoint window opens.
 - c. **Edit** - To edit the existing endpoint. The Edit Endpoint window opens.
4. In the Create Endpoint window, complete the fields defined in the following table:

Table 1. Connection details

Field Name	Description
Login Details	
User Name	Specifies the user name to connect to the MSDynamics online CRM server.
Password	Specifies the password associated with the user name to connect to the MSDynamics online CRM server.
Service Details	
Organization Unique Name	Specifies the name provided by the MSDynamics Online CRM for the organization. You can locate the organization unique name under the developer resources in the MSDynamics CRM online portal.

Field Name	Description
Discovery Service	Specifies the discovery service URL provided by MSDynamics Online CRM. Currently, the value is defaulted for the Asia/Pacific geography. You can locate this URL under the developer resources in the MSDynamics CRM online portal.
Organization Service	Specifies the organization service URL provided by MSDynamics Online CRM. When you click the discover organization button, the organization service URL will be populated automatically using the discovery service and organization unique name values. Else, you can edit it manually. You can also locate the organization service under the developer resources in the MSDynamics CRM online portal.
Authentication Details	
Claims Based	This is the only authentication mechanism supported.
Connection Timeout	
Timeout after _____ seconds when establishing connection to the endpoint	Specifies the number of seconds before a time-out occurs between the activity making a request on an endpoint and the time it takes the endpoint to respond. By default this parameter is set to 300 seconds.
Proxy connection details	
Connect via a Proxy Server	Select this check box to enable the fields to connect through a proxy server.
Authentication	Indicates the type of authentication that the Integration Appliance uses when connecting to a proxy server. From the list, select one of the following authentication options: <ul style="list-style-type: none"> ○ Basic - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure. ○ NTLM - Requires an instance of NTcredentials to be available for the domain name of the server. This authentication is the most secure authentication option. When you choose the NTLM authentication option, the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time that a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server.
Realm/Domain	If you select the Basic authentication option, specify a realm. If you select the NTLM authentication option, specify a domain.
Host Name	Specify the host name of the proxy server.
Port	Specify the port number that is required to connect to the proxy server.
User Name	Specify the user name that is required to connect to the proxy server.
Password	Specify the password that is required to connect to the proxy server.

5. When finished, click Test Connection to confirm that you can connect to the MSDynamics CRM system.
6. Click OK.

Results

You have created or edited a MSDynamics CRM endpoint.

Using the MSDynamics CRM Create activity

Use the MSDynamics CRM Create activity to create entities such as Account, Contact, Lead, Opportunity, Product, Quote, Invoice, Order, Records, and so on, in the MSDynamics CRM server.

About this task

Use this task to create entities in the MSDynamics CRM server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MSDynamics CRM Create activity, complete the following steps:

Procedure

1. In an active orchestration, open the Activities tab and expand the MSDynamics CRM folder contents.
2. Drag the Create activity icon onto the orchestration. The MSDynamics CRM Create Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MSDynamics CRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
Note: For more information, see [Creating and editing the MSDynamics CRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the entity type. The Browse MSDynamics CRM entities window is displayed.
11. In Browse MSDynamics CRM entities window, you can either filter the entity type by searching for the entity, or select the entity type from the entity type list. Click Finish.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for MSDynamics CRM activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected entity of the Create activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which

is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

Results

You have configured the MSDynamics CRM Create activity.

Using the MSDynamics CRM Retrieve activity

Use the MSDynamics CRM Retrieve activity to retrieve entities from the MSDynamics CRM server.

About this task

Use this task to retrieve entities in the MSDynamics CRM server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MSDynamics CRM Retrieve activity, complete the following steps:

Procedure

1. In an active orchestration, open the Activities tab and expand the MSDynamics CRM folder contents.
2. Drag the Retrieve activity icon onto the orchestration. The MSDynamics CRM Retrieve Checklist is displayed.
3. In the Checklist, click Summary.

4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MSDynamics CRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
Note: For more information, see [Creating and editing the MSDynamics CRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the entity type. The Browse MSDynamics CRM entities window is displayed.
11. In Browse MSDynamics CRM entities window, you can either filter the entity type by searching for the entity, or select the entity type from the entity type list. Click Finish.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for MSDynamics CRM activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

Results

You have configured the MSDynamics CRM Retrieve activity.

Specifying retry parameters for MSDynamics CRM activities

Specifying the retry parameters is one of the tasks you must complete to configure a MSDynamics CRM activity.

About this task

The MSDynamics CRM connector connects to the MSDynamics CRM server to execute the activities. If a connection is lost or timed out, the connector automatically establishes a new connection based on the parameters described in Table 1. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

For more information about the configuration tasks in the Checklist, see the help topic for the specific MSDynamics CRM activity.

To specify the retry parameters, complete the following steps:

Procedure

1. In the Checklist, select Retry. The Retry panel is displayed.
2. Configure the retry options for connecting to the MSDynamics CRM server.

The following table describes the retry options for connecting to the MSDynamics CRM server:

Table 1. Retry options

Retry Fields	Description
Wait __ second(s) between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the MSDynamics CRM server. By default, this parameter is set to 30 seconds.
Try to connect __ times before failing.	Specifies the maximum number of times that the Integration Appliance attempts to establish a connection to the MSDynamics CRM server before issuing an error and stopping the processing of the current orchestration job. By default this parameter is set to 5 attempts.
Activity Timeout	
Time out after __ second(s) when the endpoint does not respond to a request.	Specifies the number of seconds the Integration Appliance waits before timing out, when the endpoint does not respond to a request. The default is 300 seconds.

Results

You have configured the retry parameters for MSDynamics CRM activities.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_MQactivities.html

Creating or editing a MQ Activity endpoint

MQ activities handle flat file, XML, or raw messages to or from an MQ queue. The MQ system handles routing of messages through the network of queues. All three of the MQ activities, MQ Get Message, MQ Poll Queue, and MQ Put Message use the same endpoint creation dialog box.

Before you begin

For MQ activities to be fully functional, ensure that the Queue Manager, Channel Name, and other queue names are configured correctly. For more information on MQ configuration, see [WebSphere MQ Help](#).

Procedure

1. Drag an MQ connection activity from the Activities tab onto the orchestration.

The Summary panel is displayed along with a Checklist which outlines what you must do to configure the activity.

2. Click Endpoint from the Checklist and select one of the following options:
 - Browse to add an endpoint from the endpoint repository. Once added, you can click Edit to edit it.
Note: Editing an endpoint affects all orchestrations that use it. The edits are global, not local.
 - New to create a new endpoint.
 - Edit to edit the existing endpoint.

The Create Endpoint panel is displayed.

3. Fill in the fields defined in the following table.
4. Click OK when finished.

Table 1. Queue Manager Details

Field	Description
Location	^
Host Name	Specifies the host name for the MQ Queue Manager.
Port	Specifies the port number to connect to the Queue Manager. Defaults to 1414, the default for Queue Managers.
Queue Manager	Specifies the name of the Queue Manager to connect to. The name can have a maximum length of 48 characters.
Channel Name	Specifies the channel name to use to connect to the Queue Manager. The name can have a maximum length of 20 characters.
Login	
User Name	User name for the account used to connect to the Queue Manager. The name has a maximum length of 12 characters. This account must be defined in the mqm group in MQ
^	Note: For some of the fields in the endpoint, you can define configuration properties to supply the values for these fields. ^ The  icon is displayed when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.
Connection Pool Options	(Default values are provided for the connection pool options, but can be changed.)
Minimum Connections	Specifies the number of connections in the connection pool that the Integration Appliance always keeps open. Specifying 0 is supported.
Maximum Connections	Specifies the maximum number of connections that the Integration Appliance has open in the connection pool. If you change the default value, the value must be greater than or equal to the value specified for Minimum Connections. Valid values are 1 - 50. If you enter a value greater than 50, the value is reset to 50.
Maximum Idle Time	Specifies the amount of time that a connection can be open and idle before being closed by the Integration Appliance. Specifying 0 means that the connections are closed when they are returned to the pool "no idle time."

Installing JAR files to connect to the MQ system

To connect to the MQ system from Studio, you must have the MQ connector-specific JAR files on the same workstation as your Studio installation. These files must be present in Studio to enable configuration of the endpoints and orchestrations.

About this task

The two JAR files to be installed for WebSphere MQ version 5.x and 6.x are:

- connector.jar
- com.ibm.mq.jar

Procedure

1. Open Studio, select Tools > Install Module Providers.
2. When the Add Provider(s) dialog box is displayed, click the plus (+) button under MQ Connector. A field and a Browse button is displayed.
3. Click Browse, and use the browse dialog box to locate and select both the JAR files.
4. Click Open to import the contents of the JAR files.
5. When the JAR files are listed in the Add Providers dialog box, click OK.

Results

A prompt is displayed to restart Cast Iron Studio and activate the changes.

Note: You must manually restart Studio after it shuts down to apply the changes.

What to do next

You can now create MQ connector endpoints and orchestrations.

<file:///dcs/markdown/workspace/Transform/out.html>

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ_installing_jarfiles.html

Defining and loading an XML schema for a MQRFH2 header

To include additional metadata or parameters in an MQ message, you must define an MQRFH2 header that defines the your parameters. Typically, these parameters are specific to an application but do not occur in the

data of the message itself.

About this task

Each parameter, which MQ calls a folder, is passed as an XML fragment along with other MQRFH2 header data. Each parameter can have its own unique XML structure.

Because the Integration Appliance works with XML messages, each of these parameter fragments must be extracted from the MQRFH2 header. The fragments are consolidated into one fragment and passed as the MQRFH2 parameter to the Integration Appliance.

To make these parameters accessible, both Studio and the Integration Appliance need access to an XML Schema that defines the structures of all the parameters. Complete the following procedure to create that XML Schema and load it into the project.

Procedure

1. Create an XML Schema that defines the parameters of your MQRFH2 header using an XML Schema editor or text editor. For an example XML Schema, see [MQRFH2 XML data and schema examples](#). Your XML Schema must be customized for your application's parameters.
Create the XML Schema according to the following guidelines:
 - Define the consolidated structure as a single `NameValueData` element.
 - List all the parameters, in the order they occur in the MQRFH2 header, as elements inside `NameValueData` element.
 - Parameter names must be unique.
 - Parameter, group, and property names must be valid XML names. See the XML specification or MQ documentation for more information.
 - Each parameter must be wrapped in a single element. MQ documentation refers to this parameter element as a folder.
 - Parameters may contain properties, groups, or both.
 - Groups and properties may repeat.
 - Groups can nest inside other groups.
 - Properties must be defined as type `MQRFHQPropertyType`.
2. Add this XML Schema to the project. See [Uploading Files into a Project](#) for more information.
3. The XML Schema is now available in the Browse for Schema Type Element dialog box. In the Configure pane of the MQ activities, this dialog box appears when you click the Schema Fragment for MQRFH2 Header check box and then click [...]. In the Browse For Schema Type Element dialog box find the XML Schema that defines the header, select `NameValueData` element in that XML Schema, and click OK.

MQ Get Message activity

Use the MQ Get Message activity retrieves messages from an MQ queue during run time.

Note: You must have [created an endpoint for the MQ activity](#) before configuring the activity. The Configure task has three sections:

- [Queue and Message details](#) - where you specify properties for queue and message details.
- [Delivery rules](#) - where you specify how you want messages delivered.
- [Retry options](#) - where you specify how long to wait between retries and the number of time to retry before failing.

After completing the Configure tasks, [Mapping inputs](#) and [Mapping outputs](#) of the activity.

Note: The maximum message size is 100 MBytes.

Queue and Message details

Specify the Queue and Message details for the fields in the following table. Required fields are marked with an asterisk.

Field	Description
Queue Name *	Specifies the name of the MQ queue where Integration Appliance attempts to retrieve the message from.
Timeout	<p>The number of seconds before a timeout occurs between the MQ Get Message activity requesting to retrieve a message from the queue and the time it takes for the message to be returned. If this timeout period expires and no message is returned from the queue, the Integration Appliance waits the specified retry time before attempting to retrieve a message again. For a detail explanation of the timeouts and retry options, see Timeout and Retry options.</p> <p>To specify the number of seconds that the Integration Appliance should wait before issuing a timeout, select the After option and enter the number seconds in the Seconds field. By default the Never option is selected, this option specifies the Integration Appliance waits indefinitely to retrieve a message from the queue "there is no timeout period.</p>
Payload Data Type	Specifies the datatype of the message payload, either binary or string.
Schema Fragment for MQRFH2 Header	<p>Specifies if an MQRFH2 header is included in the message. If the message includes a MQRFH2 header, select this check box and click [...]. In the Browse For Schema Type Element dialog box to find the XML Schema that defines the header, select the NameValueData element in that XML Schema, and click OK. The schema fragment is the NameValueData element and all its child elements.</p> <p>Note: The XML Schema that defines the header must first be created and loaded into the project before you can select it. For more information see Defining and loading an XML schema for a MQRFH2 header.</p>

Delivery rules

Field	Description
Deliver Messages	<p>The options available here depend on whether the Unique ID's checkbox is selected. If selected, all three options are available. If not, only At Least Once is displayed.</p> <ul style="list-style-type: none"> • At least once - Specifies that the message is delivered at least once but can be delivered more than once. Connection or Integration Appliance failures can result in messages being

	<p>retrieved and processed more than once. This delivery option is typically used when the receiving system can detect or tolerate duplicate messages</p> <ul style="list-style-type: none"> • At most once - Specifies the message is delivered only once or not at all. Connection or Integration Appliance failures can result in messages being missed. This delivery option is typically used when the receiving system cannot tolerate duplicate messages but can tolerate lost messages. • Exactly once - Specifies the message is delivered once and only once. Connection or Integration Appliance failures do not affect delivery with this option. The Integration Appliance uses MQ message IDs to ensure that every message is retrieved and processed exactly once. <p>Note: If you select the Exactly Once option, you must enable persistence. For more information, see Enabling Persistence.</p>
Where messages have Unique ID's	Specifies if the messages on the queue have unique IDs.

Retry options

Configure the retry options for getting a message from the MQ queue as described in the following table:

Retry Options	Description
1) Wait ___ seconds between each retry.	The number of seconds that the Integration Appliance waits before attempting to retrieve a message from the queue. To learn more about how this option relates to the Timeout field in the Configure pane or the timeout input parameter, see Timeout and Retry options .
2) Try to connect ___ times before failing.	<p>Specifies the maximum number of times the Integration Appliance attempts to retrieve a message from the queue before issuing an error and stops the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an MQ Get Message activity and the Integration Appliance cannot connect to the specified MQ Server or cannot get a message from the queue, the Integration Appliance logs the errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third errors appear in the system log as warnings. The Integration Appliance logs the fourth error as an error and stops processing the current orchestration job.</p> <p>To learn more about how this option relates to the Timeout field in the Configure pane or the timeout input parameter, see Timeout and Retry Options.</p>

Mapping inputs

1. Select the Map Inputs task in the Checklist. The Retry panel opens.

The input parameters of the activity are displayed in the To Activity panel.

2. All the input parameters of the MQ Get Message activity are optional. If the input parameter listed in the following table are not displayed in the To Activity pane of the Map Inputs panel, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity panel and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs panel to activate this option.

You can constrain the type of message returned by the MQ Get Message activity by mapping any combination of the following nodes of the mqmdheader optional input parameter:

- o mqmdheader/MsgId
- o mqmdheader/CorreId
- o mqmdheader/GroupId
- o mqmdheader/MsgSeqNumber

During run time, the activity iterates sequentially through the messages in the queue. If nothing is mapped to these nodes, nothing is constrained so the first message in the queue is returned by the MQ Get Message activity and next activity in the orchestration is processed.

If any of these nodes are mapped, during run time the MQ Get Message activity iterates through each message in the queue until it finds the first message that matches the run time values of all the mapped nodes. The first matching message is returned by the MQ Get Message activity and next activity in the orchestration is processed.

For example in the Map Inputs task, mqmdheader/MsgId is mapped to the string called msgId and a default value of largeOrders is specified for the mqmdheader/GroupId as shown in the following figure:

During run time, the MQ Get Message activity returns the first message in the queue that satisfies both of the following conditions:

- The run time value specified of the string variable called msgId is equal message ID of the message in the queue.
- The group ID of the message equals largeOrders.

You can optionally override the settings you specified for the Queue Name and the Timeout in the Configure task of the Checklist dynamically during run time, using the input parameters defined in the following table.

For example, the MQ queue name can be set in the Configure task to poqueue. During run time, the MQ queue name: newqueue could be passed into the activity using the queueName input parameter. The queue name specified dynamically during run time overrides the original setting specified in the Configure panel. In this example, the Integration Appliance looks at the MQ queue named newqueue for messages.

Optional Input Parameters that Override the Settings in the Configure Task

Input Parameter Name/Node	Description	Overrides the Setting in Task?
timeout	<p>Specifies the amount of time that the Integration Appliance waits after requesting to retrieve a message from the queue before retrying.</p> <p>Specify a negative number to specify no timeout period “” the Integration Appliance waits indefinitely to retrieve a message from the queue. Specifying a negative number is equal to specifying the Never option in the Configure task.</p>	The timeout input parameter overrides the Timeout field of the Configure task.
queue name	Specifies the name of the MQ queue where the Integration Appliance looks for messages.	The queueName input parameter overrides the encoding specified in the Queue Name field of the Configure task.

See [Creating a Map](#) for general instructions on mapping.

Mapping outputs

You are not required to map the output parameters for this activity. See [Creating a Map](#) for general instructions on mapping.

Timeout and Retry options

The timeout specified in the Timeout field in the Configure task or the timeout input parameter specifies the number of seconds before a timeout occurs between the MQ Get Message activity requesting to retrieve a message from the queue and the time it takes for the message to be returned. If this timeout period expires and no message is returned from the queue, the Integration Appliance waits the amount of time specified in the 1) Wait ___ second(s) between each retry option before attempting to retrieve a message, again. The Integration Appliance keeps attempting to get the message up to the specified retry count. The retry count is specified with the 2) Try to connect ___ times before failing. The 1) Wait ___ second(s) between each retry and 2) Try to connect ___ times before failing options are specified in the [Retry options](#) task.

For example, a MQ Get Message activity is configured with the following options:

- The Timeout field in the Configure task is set to 10 seconds and the optional timeout input parameter is not mapped and no default value is defined.
- The 1) Wait ___ second(s) between each retry option is set to 15 seconds.
- The 2) Try to connect ___ times before failing option is set to 2.

During run time, if the MQ Get Message activity is continuously unable to retrieve a message from the queue, as shown in the following figure:

Time Line

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ_Get_Message_Activity.html

MQ Put Message activity

Use the MQ Put Message activity sends a message to the specified queue during run time.

Note: You must have [created an endpoint for the MQ activity](#) before configuring the activity.

The Configure task has three sections:

- [Queue and Message details](#) - where you specify properties for queue and message details.
- [Delivery rules](#) - where you specify how you want messages delivered.
- [Retry options](#) - where you specify how long to wait between retries and the number of time to retry before failing.

After completing the Configure tasks, and [Mapping inputs](#) for the activity.

Note: The maximum message size is 100 MBytes.

Queue and Message details

Specify the Queue and Message details using the fields in the following table. Required fields are marked with an asterisk.

Field	Description
Queue Name *	Specifies the name of the queue where the messages are put.
Payload Data Type	Specifies the datatype of the message payload, either binary or string.
Message Type	<p>Datagram - Select if the message should be sent and no reply is needed.</p> <p>Request - Select if the message should have a reply. Be sure to set the Reply to Queue property for request messages.</p> <p>Response - Select if the message is a reply to a previous request.</p>
Reply to Queue	Specifies the queue the reply should be sent to for request messages.
Reply to Queue Manager	Specifies the name of the Queue Manager that the queue (specified in the Reply to Queue field) belongs to.
Persistent	<ul style="list-style-type: none"> • True - Messages are restored to queues if the Queue Manager crashes. • False - Messages may be lost from the queue if the Queue Manager crashes. • Default - Messages use the persistence setting for the queue (this is the default).
Priority	<p>Specifies the priority of the message. By default, the message priority defaults to the default priority for the queue. If the queue uses priorities to order messages and this message should have a specific priority set, select Specify and enter the priority. Priorities can range from 1 (lowest) up to 9 (highest).</p> <p>Note: The priority should not exceed the maximum priority number set for the MQ queue. Check with your MQ system administrator for this information.</p>
Message Expiration	<p>The number of seconds that messages are kept in the queue before expiring. Defaults to Never, which ensures that the message is delivered and waits on the queue until it is retrieved, no matter how long that may take.</p> <p>If messages for this queue should expire and be discarded after some period of time, select Specify and enter the maximum number of Seconds that the message should be kept in the queue.</p>
Schema Fragment for MQRFH2 Header	<p>Specifies if an MQRFH2 header is included in the message. If the message is an XML message and includes a MQRFH2 header, select this check box and click [...]. In the Browse For Schema Type Element dialog box find the XML Schema that defines the header, select the NameValueData element in that XML Schema, and click OK. The schema fragment is the NameValueData element and all its child elements.</p> <p>Note: The XML Schema that defines the header must first be created and loaded into the project before you can select it. For more information see Defining and loading an XML schema for a MQRFH2 header.</p>

Delivery rules

Field	Description
Deliver Messages	<p>The options available here are:</p> <ul style="list-style-type: none">• At least once - Specifies that the message is delivered at least once but can be delivered more than once. Connection or Integration Appliance failures can result in messages being retrieved and processed more than once. This delivery option is typically used when the receiving system can detect or tolerate duplicate messages.• At most once - Specifies the message is delivered only once or not at all. Connection or Integration Appliance failures can result in messages being missed. This delivery option is typically used when the receiving system cannot tolerate duplicate messages but can tolerate lost messages.

Retry options

Configure the retry options for connecting to a MQ Server. The following table describes the retry options for connecting to a MQ Server:

Retry Options	Description
1) Wait ___ seconds between each retry.	The number of seconds that the Integration Appliance waits before attempting to contact the Queue manager to send a message to MQ Server, again.
2) Try to connect ___ times before failing.	<p>Specifies the maximum number of times the Integration Appliance attempts to contact the Queue manager to send a message to the MQ Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an MQ Put Message activity and the Integration Appliance cannot connect to the Queue manager of the specified MQ Server, the Integration Appliance logs the errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth error as an error and stops processing the current orchestration job.</p>

Mapping inputs

You are required to map input parameters for this activity. The following parameter is required and must be mapped in order for the configuration to be complete. All other parameters are optional. See [Creating a Map](#) for more information.

Required Input Parameters:

payload

To view the optional input parameters in the To Activity panel of the Map Inputs panel, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity panel and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs panel to activate this option.

Parent topic: [MQ Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ_Put_Message_Activity.html

MQ Poll Queue activity

Use the MQ Poll Queue activity periodically checks the MQ Queue for messages based on a specified retry interval during runtime.

Note: You must have [created an endpoint for the MQ activity](#) before configuring the activity. The Configure task has three sections:

- [Queue and Message details](#) - where you specify properties for queue and message details.
- [Delivery Rules](#) - where you specify how you want messages delivered.
- [Retry options](#) - where you specify how long to wait between retries and the number of time to retry before failing.

After completing the Configure tasks, [Mapping outputs](#) for the activity.

Note: The maximum message size is 100 MBytes.

Queue and Message details

Specify Queue and Message details for the fields in the following table. Required fields are marked with an asterisk.

Field	Description
Queue Name *	Specifies the name of the queue which is polled for messages.
Payload Data Type	Specifies the datatype of the message payload, either binary or string.
Schema Fragment for MQRFH2 Header	Specifies if an MQRFH2 header is included in the message. If the message is an XML message and includes a MQRFH2 header, select this check box and click [...]. In the Browse For Schema Type Element dialog box find the XML Schema that defines the header, select the NameValueData element in that XML Schema, and click OK. The schema fragment is the NameValueData element and all its child elements.

Note: The XML Schema that defines the header must first be created and loaded into the project before you can select it. For more information see [Defining and loading an XML schema for a MQRFH2 header](#).

Delivery Rules

Field	Description
Poll for changes	Specifies how often the Integration Appliance should poll the queue for changes. For more information, see Polling Interval Behavior .
Where messages have Unique ID's	Specifies if the messages on the queue have unique IDs.
Deliver Messages	<p>The options available here depend on whether the Unique ID's checkbox is selected. If selected, all three options are available. If not, only At Least Once is displayed.</p> <ul style="list-style-type: none"> • At least once - Specifies that the message is delivered at least once but can be delivered more than once. Connection or Integration Appliance failures can result in messages being retrieved and processed more than once. This delivery option is typically used when the receiving system can detect or tolerate duplicate messages. • At most once - Specifies the message is delivered only once or not at all. Connection or Integration Appliance failures can result in messages being missed. This delivery option is typically used when the receiving system cannot tolerate duplicate messages but can tolerate lost messages. • Exactly once - Specifies the message is delivered once and only once. Connection or Integration Appliance failures do not affect delivery with this option. The Integration Appliance uses MQ message IDs to ensure that every message is retrieved and processed exactly once. <p>Note: If you select the Exactly Once option, you must enable persistence. For more information, see Enabling Persistence.</p>

Retry options

Configure the retry options of the MQ Poll Queue activity, as defined in the following table:

Retry Options	Description
1) Wait ___ second(s) between each retry.	The number of seconds that the Integration Appliance waits before attempting to retrieve messages from MQ Server, again.
2) Try to	Specifies the maximum number of times the Integration Appliance attempts to retrieve messages from the MQ Server before failing.

connect ___ times before failing.	<p>If an orchestration that starts with an MQ Poll Queue activity is deployed and the Integration Appliance cannot connect to the specified MQ server or cannot retrieve messages from queue, the Integration Appliance logs the errors as warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system log, resets the current retry count to zero, and continues to attempt to establish a connection to the MQ server.</p> <p>For example, you set the retry count to 3. The first, second, and third errors appear in the system log as warnings. The Integration Appliance logs the fourth error as an error and resets the current retry count to zero. Therefore, the fifth connection error generates a warning in the system log. The Integration Appliance continues to attempt to retrieve messages from the queue.</p>
-----------------------------------	---

Mapping outputs

You are not required to map output parameters for this activity. However, if you do map any of these parameters, note the following points:

Parameters:

- payload and mqmdheader parameters are obtained from the message that is received from the queue.
- rfh2header is obtained if the schema for the RFH2 Header is specified in the Configure task.

  & & & & <parameterC>
    & & & & & & & & <groupNew>
      & & & & & & & & & & & & & & & & & & & <property5>01/15/2004</property5>
    & & & & & & & & </groupNew>
  & & & & & & & & <property1>value</property1>
  & & & & </parameterC>
</NameValueData>

```

Example XML Schema that defines MQRFH2 parameters

The following example XML Schema defines the three parameters displayed in [Example XML data that contains MQRFH2 parameters](#). The type for all of the property elements: MQRFH2PropertyType, provides the datatype attribute shown on property2 in the preceding example. The MQRFH2PropertyType type also ensures that the elements can contain values.

The repetition for property4 in groupDtl is handled with the minOccurs and maxOccurs attributes. You can also set maxOccurs to unbounded to allow an unlimited number of repetitions.

An Example XML Schema that defines MQRFH2 Parameters:

```

<xsd:schema elementFormDefault="qualified"
  & & xmlns:xsd="http://www.w3.org/2001/XMLSchema"

```

```

& & xmlns:rfh="http://www.approuter.com/samples/MQ"
& & targetNamespace="http://www.approuter.com/samples/MQ">
& & <xsd:complexType name="MQRFH2PropertyType">
& & & <xsd:simpleContent>
& & & & <xsd:extension base="xsd:string">
& & & & & <xsd:attribute name="dt" type="xsd:string" use="optional"/>
& & & & & </xsd:extension>
& & & & </xsd:simpleContent>
& & </xsd:complexType>
& & <xsd:element name="NameValueData">
& & & & <xsd:complexType>
& & & & & <xsd:sequence>
& & & & & & <xsd:element name="parameterA">
& & & & & & & <xsd:complexType>
& & & & & & & & <xsd:sequence>
& & & & & & & & & <xsd:element name="property1" type="rfh:MQRFH2PropertyType"/>
& & & & & & & & & <xsd:element name="property2" type="rfh:MQRFH2PropertyType"/>
& & & & & & & & & </xsd:sequence>
& & & & & & & & </xsd:complexType>
& & & & & & & </xsd:element>
& & & & & & & <xsd:element name="parameterB">
& & & & & & & & <xsd:complexType>
& & & & & & & & <xsd:sequence>

```

Parent topic: [MQ Activities](#)

 Last updated: Wednesday, February 17, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ_MQRFH2_Schema_Fragment_Examples.html

NetSuite Activities

- [Creating or editing a NetSuite endpoint](#)
Endpoints provide the NetSuite connection information that Studio and the Integration Appliance use to connect with NetSuite.
- [Add Records activity](#)
Use the Add Records activity to add one or more new records to NetSuite. Each added record must be uniquely identifiable by its name, type, and hierarchy. If two or more records have the same identifiers, a SOAP fault is posted. The records to be added must be of the same record type.
- [Attach Records activity](#)
The Attach Records activity can be used to define a relationship between two records. For example, a Contact record can be associated with a Vendor record. A Contact record can be associated with all entity records except for other Contact records and Group records.
- [Delete Records activity](#)
The Delete Records activity can delete one or more records from NetSuite. Each deleted record must be uniquely identifiable by its name, type, and hierarchy. If two or more records have the same identifiers, a SOAP fault is posted. The records to be deleted must be of the same record type.
- [Detach Records activity](#)
The detach records activity can be used to remove a relationship between two records. For example, a Contact record associated with a Vendor record can be removed. The Detach Records activity can also detach files, such as Word or PDF files, from a NetSuite record.
- [Get Records activity](#)
The Get Records activity retrieves one or more records based on the records unique IDs. If any of the IDs are invalid, valid IDs are processed and a warning for invalid IDs is sent in the response.
- [Initialize Record activity](#)
Use the Initialize Record activity to populate a transaction record with input from another related record. For example, you can populate a Sales Order record with input from the related Estimate record before submitting the Sales Order record to NetSuite.
- [Search Records activity](#)
The Search Records activity searches for a specific record type based on search criteria that you specify.
- [Update Records activity](#)
The Update Records activity can update one or more records. Only fields that are populated are updated in NetSuite. For fields that are not populated, the previous value in NetSuite is maintained. If a field is populated with an empty string, the value of the field in NetSuite is replaced with an empty string.
- [Upsert Records Activity](#)
The Upsert Records activity can update a record if the record already exists in the database, or to insert the record if it does not. Only fields that are populated are updated in NetSuite. For fields that are not populated, the previous value in NetSuite is maintained. If a field is populated with an empty string, the value of the field in NetSuite is replaced with an empty string.
- [Troubleshooting and support](#)
Troubleshooting techniques and self-help information help you identify and solve problems quickly. This topic provides potential solutions for issues you would have with the NetSuite connector.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_netsuiteactivities.html

Creating or editing a NetSuite endpoint

Endpoints provide the NetSuite connection information that Studio and the Integration Appliance use to connect with NetSuite.

Procedure

1. Select an activity from the NetSuite folder of the Activities tab.
2. Drag the activity onto the orchestration.

The Summary panel is displayed along with a Checklist that lists the tasks that must be performed to configure the activity.

3. Click the Endpoint task from the Checklist and choose one of the following options:
 - o Browse - To select an existing endpoint from the project.
 - o New - To create a new endpoint.
 - o Edit - To edit an existing endpoint.
Note: Edits are global, not local. Editing an endpoint affects all orchestrations that use that endpoint in the Project.
4. When the NetSuite endpoint screen is displayed, complete, or edit, the information in the following fields:
 - o NetSuite Customer Login - Users are limited to two sessions for each username/password. One session is through the browser and the other session is through Web Services. Attempting a second login through the browser with the same username and password results in the first session terminating. The same scenario applies to attempts to establish two concurrent Web Services sessions. For multiple concurrent Web Services connections, obtain a Web Services Plus license.

Field	Description
Email Address	E-mail address used to login to NetSuite
Password	Password for E-mail address
Account Number	Account number associated with E-mail address

- o Login Options - Choose either Login normally or Login in to the specified URL and specified version.

If you purchased the Web Services Concurrent License, click Web Services Plus License.

- o Connection Pool Options - Leave the default values or change the values for the Connection Pool Options:

Field	Description
Minimum	The default is 1.

Connections	
Maximum Connections	The default is 1. If Web Services Plus License (Concurrent Web Services User preference) is selected, the default is 5.
Maximum Idle Time	The maximum number of minutes, the session can remain idle before ending the session. The default is 120 minutes. NetSuite enforces a 120 minute maximum.
Maximum Wait	Maximum Wait The maximum number of seconds to wait for the session to start. The default is 300 seconds.

- o Connection Timeout - Use the up and down arrows to select the number of seconds, that you want to wait to establish a connection to the endpoint before ending the attempt.
- o Proxy - To use a proxy server to connect with NetSuite, select Connect via a Proxy Server.

For Authentication, click the arrow and choose the mode, either Basic or NTLM.

For Realm, if you choose Basic authentication, you can specify a realm. If you do not specify a realm, the endpoint authenticates to 'any realm'.

Complete the following fields:

Field	Description
Host Name	The name of the proxy server or the IP address of the proxy server.
Port	The port number used by the proxy server to connect with NetSuite.
User Name	The ID used to login to the proxy server.
Password	The password for User Name.

- o Update - Use the Update WSDL to_2011_1 button to upgrade the NetSuite WSDL. The button is inactive if WSDL_2011_1 is already present. After clicking the button, you will be presented with a list of project entities that will be affected by this update. At that point, you can decline to update to WSDL_2011_1 or proceed with the update.

Click Test Connection to verify that a connection can be established.

Using the Add Records activity

To use the Add Records activity complete the following steps.

Procedure

1. In the Activities tab, expand the NetSuite directory and locate the Add Records activity.
2. Add the Add Records activity to your orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. In the Checklist, click Pick Endpoint.
4. Select one of the following options:
 - Browse - to select a NetSuite endpoint from the Project Explorer.
 - New - to create a new NetSuite endpoint using the Create Endpoint dialog.

For instructions on creating a NetSuite endpoint, see [Creating or editing a NetSuite endpoint](#).

- Edit - to edit an existing NetSuite endpoint using the Edit Endpoint dialog.
For instructions on editing a NetSuite endpoint, see [Creating or editing a NetSuite endpoint](#).
Note: Edits are global, not local. Editing an endpoint affects all orchestrations that use that endpoint in the project.
5. In the Checklist, click Configure.
6. Click Browse to display the Browse NetSuite dialog.
7. In the Browse NetSuite dialog, click Show Record Types and select one of the following options:
 - All “ to view all record types.
 - Only Custom “ to view only custom records.
 - Only Standard “ to view only standard NetSuite record types.

Note: To use custom records, you must enter the internal ID in the recType/internalId node.
8. To view custom fields in standard records, select the Generate custom fields for standard record types checkbox.

This option does not apply to custom record types. The state of the checkbox is saved.

9. In the Browse NetSuite dialog, select a record type by completing one of the following tasks:
 - o Enter the first few letters of a record type in the Search for a Record Type field, select the record type in the Record Type scroll list and then click Select.
 - o Scroll through the Record Type scroll list until you find the required record type, click the record type, and then click Select.
10. To refresh the maps in NetSuite, in the Configure pane, click Refresh after the record type is set.
11. In the Checklist, click Retry.
12. In the Retry section:
 - o Set the number of seconds, between each retry to connect with NetSuite. The default is 30 seconds.
 - o Set the number of times you want to retry before failing. The default is 5 times.In the Activity Timeout section:
 - o Set the Activity Timeout, the number of seconds, to wait when the endpoint does not respond to a request. The default is 300 seconds.
13. Mapping inputs. See [Mapping the inputs for the Add Records activity](#) for more information.
14. Mapping outputs. See [Mapping the outputs for the Add Records activity](#) for more information.

Mapping the inputs for the Add Records activity

Up can map the Add records task inputs

About this task

To map the inputs for the add records activity, complete the following steps.

Procedure

1. In the Checklist, click the Map Inputs task.
2. Click Select Inputs... and select the input variables for the map.

For instructions on how to create variables, see [Creating Variables](#).

3. Map the elements in the From Orchestration pane to the NetSuite elements in the To Activity pane.

The elements in the To Activity pane are determined by the NetSuite record type you selected in the Configure task. For mapping instructions, see [Creating a Map](#).

Attach Records activity

The Attach Records activity can be used to define a relationship between two records. For example, a Contact record can be associated with a Vendor record. A Contact record can be associated with all entity records except for other Contact records and Group records.

About this task

The Attach Records activity can also attach files, such as Word or PDF files, to a NetSuite record. Any file that is in the NetSuite file cabinet can be attached to any record except for custom records.

The following list describes the nodes for the Attach Records activity in the Checklist > Map Inputs > To Activity panel:

- {RecordRef} attachTo - this node specifies the record to which the attachment is attached.
 - @type “ In the Define Default Value, select the type of record.
 - @externalId “ Either externalId or internalId must be specified for the RecordRef.

- @internalID “ Either externalId or internalId must be specified for the RecordRef.
- contact “ This node specifies the record to associate with or the file to attach to the attachTo record.
 - @internalID “ Either externalId or internalId must be specified for the RecordRef.
 - @externalId “ Either externalId or internalId must be specified for the RecordRef.
 - @type “ In the Define Default Value, select the type of record.
 - name “ Enter the name of the contact or the file name.
- contactRole “ This node specifies the role in the user defined Contact List located in the NetSuite UI at List > Relationships > Contacts.
 - exists “ a Boolean used to indicate whether the Contacts List exists or not.
 - @internalID “ Either externalId or internalId must be specified for the role.
 - @externalId “ Either externalId or internalId must be specified for the role.
 - name “ The title of the role such as Primary Contact.

Using the Get Records activity

To use the Get Records activity complete the following steps.

Procedure

1. In the Activities tab, expand the NetSuite directory and locate the Get Records activity.
2. Add the Get Records activity to your orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. In the Checklist, click Pick Endpoint.
4. Select one of the following options:
 - Browse - to select a NetSuite endpoint from the Project Explorer.
 - New - to create a new NetSuite endpoint using the Create Endpoint dialog.

For instructions on creating a NetSuite endpoint, see [Creating or editing a NetSuite endpoint](#).

- Edit - to edit an existing NetSuite endpoint using the Edit Endpoint dialog.
For instructions on editing a NetSuite endpoint, see [Creating or editing a NetSuite endpoint](#).
Note: Edits are global, not local. Editing an endpoint affects all orchestrations that use that endpoint in the project.
5. In the Checklist, click Configure.
6. Click Browse to display the Browse NetSuite dialog.
7. In the Browse NetSuite dialog, click Show Record Types and select one of the following:
 - All “ to view all record types.

- o Only Custom “ to view only custom records.
- o Only Standard “ to view only standard NetSuite record types.

Note: To use custom records, you must enter the internal ID in the recType/internalId node.

8. To view custom fields in standard records, select the Generate custom fields for standard record types checkbox.

This option does not apply to custom record types. The state of the checkbox is saved.

9. In the Browse NetSuite dialog, choose a record type by performing one of the following tasks:
 - o Enter the first few letters of a record type in the Search for a Record Type field, select the record type in the Record Type scroll list and then click Select.
 - o Scroll through the Record Type scroll list until you find the record type you want, click the record type, and then click Select.
 10. To refresh the maps in NetSuite, after the record type is set in the Configure panel, click Refresh.
 11. In the Checklist, click Retry.
 12. In the Retry section:
 - o Set the number of seconds, between each retry to connect with NetSuite. The default is 30 seconds.
 - o Set the number of times you want to retry before failing. The default is 5 times.
- In the Activity Timeout section:
- o Set the Activity Timeout, in seconds, you want to wait when the endpoint does not respond to a request. The default is 300 seconds.
13. Map inputs. See [Mapping the inputs for the Get Records activity](#) for more information.
 14. Map outputs. See [Mapping the outputs for the Get Records activity](#) for more information.

Initialize Record activity

Use the Initialize Record activity to populate a transaction record with input from another related record. For example, you can populate a Sales Order record with input from the related Estimate record before submitting the Sales Order record to NetSuite.

About this task

The following table lists the transaction records with the related record types that can be used to populate the transaction records.

Transaction Record Type	Related Initialization Record
Customer Refund	Cash Sale
Customer Refund	Return Authorization
Cash Sale	Customer
Cash Sale	Estimate

Transaction Record Type	Related Initialization Record
Cash Sale	Opportunity
Cash Sale	Sales Order
Credit Memo	Customer
Credit Memo	Invoice
Credit Memo	Return Authorization
Customer Payment	Customer
Customer Payment	Invoice
Estimate	Opportunity
Invoice	Customer
Invoice	Estimate
Invoice	Opportunity
Invoice	Sales Order
Item Fulfillment	Sales Order
Item Receipt	Return Authorization
Item Receipt	Purchase Order
Return Authorization	Cash Sale
Return Authorization	Invoice
Return Authorization	Sales Order
Sales Order	Estimate
Sales Order	Opportunity
Vendor Bill	Purchase Order

Search Records activity

The Search Records activity searches for a specific record type based on search criteria that you specify.

About this task

You specify search criteria by expanding an element node and then specifying the operator and search value. For example, for a record type having an account number node:

1. Expand the accountNumber node.
2. Click operator and then right-click operator.
3. Select Define Default Value.
4. In the Default Value field, click the arrow and select an operator from the list.
5. Click OK.
6. Click searchValue.
7. Select Define Default Value.
8. In the Default Value field, enter the account number.
9. Click OK.

The Search Records activity supports searching on fields with a null value using the operator noneOf. This search returns all records for which the field does not have a null value.

To retrieve values from lists, use the Get Records activity as the Search Records activity does not support lists.

You define the search criteria during the Map Inputs task in the To Activity panel.

Troubleshooting and support

Troubleshooting techniques and self-help information help you identify and solve problems quickly. This topic provides potential solutions for issues you would have with the NetSuite connector.

Points to note when upgrading to NetSuite 2013_2 with WebSphere Cast Iron NetSuite Connector

In NetSuite 2013_1 and earlier versions, every custom field in NetSuite was identified with an `internalId` (unique) attribute.

NetSuite has made the following changes in version 2013_2 and later versions:

- `scriptId` is the new `internalId`
- a new `internalId` attribute has been introduced

These changes affect all orchestrations that use the Cast Iron NetSuite connector, with the internal ID for custom fields being populated. If you upgrade the connector endpoints to version 2013_2 or a later version, these orchestration will stop working because the `internalId` attribute would still point to the old value.

Symptom

Orchestrations using the Cast Iron NetSuite connector stop working if you upgrade the connector endpoints to version 2013_2 or later versions of NetSuite.

Solution:

1. Open each project using the NetSuite connector in IBM WebSphere Cast Iron Studio 7001.

2. Go to each NetSuite endpoint, click the 'Update Wsdl to 2014_1' button and follow the steps to update the WSDL attached to the project.
3. For each activity in every orchestration using NetSuite connector, go to the Configure Tab of the activity and press the refresh button to update the NetSuite object with the latest schema.
4. Go to Map Input and Map Output section to ensure that the right value is populated for the internal ID field for the object and/or its child objects.
5. Thoroughly test the orchestrations in the project in development environment, before moving into production.
6. Repeat these steps for every project using NetSuite connector.

Creating or editing an Oracle CRM On Demand endpoint

Oracle CRM On Demand endpoints contain the connection information that studio and the Integration Appliance use to connect to the Oracle CRM On Demand Server. You can create multiple endpoints that refer to separate instances.

About this task

Use this task to create or edit an Oracle CRM On Demand endpoint.

Note:

Any changes you make to the Oracle CRM On Demand endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

Procedure

1. Drag an activity from the Oracle CRM On Demand folder under the Activities tab to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
 - a. Browse - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
 - b. New - To create a new endpoint. The Create Endpoint window opens.
 - c. Edit - To edit the existing endpoint. The Edit Endpoint window opens.
4. Complete the fields defined in the following table:

Table 1. Connection Details

Field Name	Description
Connection Details	
OracleCRM HostName	Specifies the host name of the Oracle CRM On Demand instance.
User Name	Specifies the user name to connect to the OracleCRM On Demand server.
Password	Specifies the password associated with the user name to connect to the OracleCRM On Demand server.

5. When finished, click Test Connection to confirm that you can connect to the Oracle CRM On Demand system.
6. Click OK.

Specifying the Retry options for Oracle CRM On Demand activities

Specifying the Retry parameters is one of the tasks to configure an Oracle CRM On Demand activity.

About this task

Use this task to configure the retry options for the Oracle CRM On Demand activities. The Oracle CRM On Demand connector uses a single login session for all connections to an Oracle CRM On Demand endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

Procedure

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry and timeout options for connecting to an Oracle CRM On Demand instance, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Oracle CRM On Demand instance.
Try to connect __ times before failing.	Specifies the retry count “ the maximum number of times the Integration Appliance attempts to establish a connection to the Oracle CRM On Demand instance before issuing an error and stopping the processing of the current orchestration job. Note: If you deploy an orchestration that contains the Oracle CRM On Demand activity and the Integration Appliance cannot connect to the specified Oracle CRM On Demand instance, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
Activity Timeout	

Retry Fields	Description
Timeout after ----- seconds when the endpoint does not respond to a request.	Specifies the number of seconds the Integration Appliance waits before timing out, when the endpoint does not respond to a request. The default is 300 seconds.

Using the Oracle CRM On Demand Insert Object activity

Use the Oracle CRM On Demand Insert Object activity to insert or create objects in the Oracle CRM On Demand instance.

About this task

Use this task to insert or create objects in the Oracle CRM On Demand instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the Oracle CRM On Demand folder contents.
2. Drag the Insert Object activity icon onto the orchestration. The Oracle CRM On Demand Insert Object Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle CRM On Demand endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.

Note: For more information, see [Creating or editing an Oracle CRM On Demand endpoint](#).

8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse OracleCRMOD window is displayed.
11. In Browse OracleCRMOD, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Oracle CRM On Demand activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Insert Object activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

Results

You have configured the Oracle CRM On Demand Insert Object activity.

Using the Oracle CRM On Demand Update Object activity

Use the Oracle CRM On Demand Update Object activity to update objects in the Oracle CRM On Demand instance, with new values.

About this task

Use this task to update objects in the Oracle CRM On Demand instance, with new values. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the Oracle CRM On Demand folder contents.
2. Drag the Update Object activity icon onto the orchestration. The Oracle CRM On Demand Update Object Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle CRM On Demand endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
Note: For more information, see [Creating or editing an Oracle CRM On Demand endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse OracleCRMOD window is displayed.
11. In Browse OracleCRMOD, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Oracle CRM On Demand activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Update Object activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

Results

You have configured the Oracle CRM On Demand Update Object activity.

Using the Oracle CRM On Demand Query Object activity

Use the Oracle CRM On Demand Query Object activity to query objects in the Oracle CRM instance.

About this task

Use this task to query objects in the Oracle CRM On Demand instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the Oracle CRM On Demand folder contents.
2. Drag the Query Object activity icon onto the orchestration. The Oracle CRM On Demand Query Object Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle CRM On Demand endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
Note: For more information, see [Creating or editing an Oracle CRM On Demand endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse OracleCRMOD window is displayed.
11. In Browse OracleCRMOD, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Oracle CRM On Demand activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Query Object activity are displayed as nodes under the request input parameter in the To Activity panel.

Perform the following steps to type the query strings in the SearchSpec of the To Activity pane:

- a. Right-click a SearchSpec and select the Define Default Value option.
- b. Specify the Default Value in the Define Default Value window. For example, to query for contact objects whose given name begins with *Jo*, then type the query string as "[ContactFirstName] = 'Jo*'" . To query for contact objects whose given name is *John*, type "[ContactFirstName] = 'John'" . To query for contact objects whose name is *Jane Doe*, type the query string as "([ContactFirstName] = 'Jane') AND ([ContactLastName] = 'Doe')".
- c. Click OK.

Note: To get the value of the object name field, you must specify a blank value in the Name field of the Map Inputs section.

15. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which

is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

Results

You have configured the Oracle CRM On Demand Query Object activity.

Overview of the Oracle E-Business Suite connector

With the Oracle E-Business Suite connector, you can interact and exchange information with Oracle E-Business Suite. By using the connector, you can send requests to the underlying Oracle database, without special coding.

You can perform the following activities by using the Oracle E-Business Suite connector:

- Outbound Activities
 - [Create Objects](#)
 - [Update Objects](#)
 - [Delete Objects](#)
 - [Retrieve Objects](#)
- Inbound Activities
 - [Get Created Objects](#)
 - [Get Updated Objects](#)
 - [Get Deleted Objects](#)

The versions of Oracle E-Business Suite application that is supported by the connector are 11.5,12.0, and 12.1.

Installing JAR files to connect to Oracle E-Business Suite

You must copy the Oracle JDBC driver JAR file on the same workstation as your Cast Iron Studio installation before you can connect to the Oracle E-Business Suite application.

Before you begin

- The JAR files can be obtained from the Oracle system administrator.
- The JAR files must be on the same computer as the studio installation.
- The JAR files must be from the same version as the Oracle E-Business Suite application you connect to.

Note: The Oracle E-Business Suite connector uses the Oracle thin driver to connect and work with the database.

About this task

Procedure

1. Open studio and select Tools > Install Module Providers.
2. When the Add Provider(s) dialog box is displayed, click the plus (+) button under Oracle E-Business Suite. A field and a Browse button appears.
3. Click Browse, and use the browse dialog box to locate and select the JAR file.
4. Click Open to import the selected file.
5. When the JAR file is listed in the Add Provider(s) dialog box, click OK.

Results

A prompt is displayed to restart studio and activate the changes.

What to do next

You can now create Oracle E-Business Suite endpoints and orchestrations.

Creating or editing an endpoint for an Oracle E-Business Suite activity

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to an Oracle database.

Selecting or editing an Oracle E-Business Suite endpoint

1. In the Create Endpoint or Edit Endpoint pane, configure the Oracle database as described in the following table. In addition to these fields, the endpoint pane contains Connection pool options and Remote Endpoint Configuration.
 Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the Oracle database successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
Oracle E-Business Suite connector - Connection Information	
Interface	Specifies the interface used to communicate with Oracle E-Business Suite. Currently, only database is supported, which uses JDBC API to communicate with Oracle E-Business Suite.
Host Name	Specifies the host name or IP address of the machine on which the Oracle database is running.
Port Number	Specifies the Oracle Internet port that allows Java [®] , [®] applets or applications to access the database.
System ID	Specifies the system ID (SID) to connect to the Oracle database.
User Name	Specifies the user name to connect to the Oracle database.
Password	Specifies the password associated with the user name to connect to the Oracle database.
Additional Properties	Specifies the additional properties to be set when connecting to the database using the JDBC driver.
Connection Pool options	
Minimum Connections	Specifies the lowest number of Oracle database connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
Maximum Connections	Specifies the maximum number of Oracle database connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
Maximum Idle Time	Specifies the amount of time in minutes that a Oracle database connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool "no idle time". The default value is 120 minutes.
Maximum Wait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.

Field Name	Description
Reclaim Connections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minutes.
Note: The Connection pool properties need to be configured as per the load (number of concurrent requests) on the endpoint.	
Remote Endpoint Configuration	
Endpoint Runs Behind Firewall	Enables the secure connector name property so that secure connector can be used if the Oracle database is installed behind a firewall.
Secure Connector Name	Specifies the name of the secure connector that is used to connect to the Oracle database is installed behind a firewall.

Using the Oracle E-Business Suite Create Objects activity

Use the Create Objects activity to create rows in database tables corresponding to the business object in the request. You can create rows to flat tables/views that have a primary key defined.

About this task

Use this task to create objects in the Oracle E-Business Suite application. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the Oracle E-Business Suite folder contents.
 2. Drag the **Create Objects** activity from the Oracle E-Business Suite folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
 3. In the Checklist, click Summary.
 4. Review the contents of the Activity Name field, and make the required changes.
 5. In the Checklist, click Pick Endpoint.
 6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle E-Business Suite endpoint.
 7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
- Note: For more information, see [Creating or editing an endpoint for an Oracle E-Business Suite activity](#).

8. To make the required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the Oracle table/view name in the Oracle Table/View field.
11. In Browse Oracle Database Tables/Views dialog:
 - o Select a user schema from the Filter by user schema drop-down list.
 - o Select either `Tables` or `Views` from Database object type.
 - o Use Filter tables/views by name to filter the tables/views during selection.
 - o Select a table/view.
12. Click OK.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery options for Oracle E-Business Suite activities](#).
14. Select Map Inputs in the Checklist. The XML schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel. Create a map between the output parameters and orchestration variables.

Results

You have configured the Oracle E-Business Suite Create Objects activity.

Using the Oracle E-Business Suite Update Objects activity

Use the Update Objects activity to update rows in the database tables corresponding to the business object in the request. You can update rows of flat tables that have a primary key defined.

About this task

Use this task to update objects in the Oracle E-Business Suite application. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the Oracle E-Business Suite folder contents.
2. Drag the **Update Objects** activity from the Oracle E-Business Suite folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle E-Business Suite endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
Note: For more information, see [Creating or editing an endpoint for an Oracle E-Business Suite activity](#).
8. To make the required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the Oracle table/view name in the Oracle Table/View field.
11. In Browse Oracle Database Tables/Views dialog:
 - o Select a user schema from the Filter by user schema drop-down list.
 - o Select either `Tables` or `Views` from Database object type.
 - o Use Filter tables/views by name to filter the tables/views during selection.
 - o Select a table/view.
12. Select a table and click OK.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery options for Oracle E-Business Suite activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Update Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel. Create a map between the output parameters and orchestration variables.

Results

You have configured the Oracle E-Business Suite Update Objects activity.

Using the Oracle E-Business Suite Delete Objects activity

Use the Delete Objects activity to delete rows from the Oracle table. You can delete rows from flat tables/views that have a primary key defined.

About this task

Use this task to delete rows from the Oracle E-Business Suite application. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the Oracle E-Business Suite folder contents.
2. Drag the **Delete Objects** activity from the Oracle E-Business Suite folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle E-Business Suite endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
Note: For more information, see [Creating or editing an endpoint for an Oracle E-Business Suite activity](#).
8. To make the required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the Oracle table/view name in the Oracle Table/View field.
11. In Browse Oracle Database Tables/Views dialog:
 - o Select a user schema from the Filter by user schema drop-down list.
 - o Select either `Tables` or `Views` from Database object type.
 - o Use Filter tables/views by name to filter the tables/views during selection.
 - o Select a table/view.
12. Click OK.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery options for Oracle E-Business Suite activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Delete Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel. Create a map between the output parameters and orchestration variables.

Using the Oracle E-Business Suite Retrieve Objects activity

Use the Retrieve Objects activity to retrieve rows from the Oracle table. You can retrieve rows from flat tables/views that have a primary key defined.

About this task

Use this task to retrieve objects in the Oracle E-Business Suite application. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the Oracle E-Business Suite folder contents.
2. Drag the **Retrieve Objects** activity from the Oracle E-Business Suite folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle E-Business Suite endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
Note: For more information, see [Creating or editing an endpoint for an Oracle E-Business Suite activity](#).
8. To make the required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the Oracle table/view name in the Oracle Table/View field.
11. In Browse Oracle Database Tables/Views dialog:
 - o Select a user schema from the Filter by user schema drop-down list.
 - o Select either `Tables` or `Views` from Database object type.
 - o Use Filter tables/views by name to filter the tables/views during selection.
 - o Select a table/view.
12. Click OK.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery options for Oracle E-Business Suite activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity

- panel.
15. Create a map between the orchestration variables and the input parameter of the activity.
 Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
 16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel. Create a map between the output parameters and orchestration variables.

Specifying Retry and Delivery options for Oracle E-Business Suite activities

Specifying the Retry and Delivery parameters is one of the tasks to configure a Oracle E-Business Suite activity configuration.

About this task

This section contains the procedures for configuring the Oracle E-Business Suite activities.

Procedure

To specify the retry options for Oracle E-Business Suite activities:

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry options for connecting to a Oracle E-Business Suite server as described in the following table:

Table 1. Retry options

Retry Fields	Description

Retry Fields	Description
Wait ___ second(s) between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Oracle E-Business Suite application.
Try to connect ___ times before failing.	<p>Specifies the retry count “the maximum number of times the Integration Appliance attempts to establish a connection to the Oracle E-Business Suite application before issuing the following errors:</p> <ul style="list-style-type: none"> o When you set this parameter to 0, Studio does not try to reconnect. o When you set this parameter to a value less than 0, Studio retries the connection indefinitely. <p>If an orchestration that starts with an outbound Oracle E-Business Suite activity is deployed and the Integration Appliance cannot connect to the specified Oracle E-Business Suite application, the Integration Appliance logs the connection errors as warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system log, resets the connection error count to zero, and continues to attempt to establish a connection to the Oracle E-Business Suite application.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

Specifying the delivery rules options for Oracle E-Business Suite inbound activities

About this task

This section contains the procedure for configuring the delivery rule options for Oracle E-Business Suite inbound activities.

Procedure

1. Select the Delivery Rules task from the Checklist. The delivery rules pane is displayed.
2. Configure the delivery rules options to select the activity's behavior as described in the following table.

Table 2. Delivery rules

Delivery Rules Fields	Description
Poll for changes every _____ days/hours/minute s/seconds	Specifies the time interval to poll for objects in the Oracle database. (For example, the Get created object activity polls for create objects at the specified time interval.) Time can be selected in the format days, hours, minutes, or seconds.

Delivery Rules Fields	Description
Fetch _____ rows per poll	Specifies how many objects or components the activity should retrieve from the Oracle database in each poll cycle.
Delivery Messages	Â
ATMOST_ONCE	A non-persistent mode in which a row from the Oracle table is either delivered once or not delivered at all.
ATLEAST_ONCE	A persistent mode, in which a row from the Oracle table is not lost. As a result, there are chances that the orchestration can receive events once or more than once.

Prerequisites for starter activities in Oracle E-Business Suite

This section contains the prerequisites to configure the Oracle E-Business Suite inbound activities.

You must create an event store and triggers in Oracle database as a prerequisite for using the starter activities.

The event store is a table that holds events that represent data changes until the polling connector can process them. The connector uses the event store to keep track of event entities. Each time a database record is created, updated, or deleted, the connector updates the status of the event in the event store. The Event Store Name field can be found in the Configure panel of the Get Created, Get Deleted, and Get Updated activities.

You can set triggers on user tables as needed to populate the event store. For Oracle database, set up triggers on user tables so that changes to the user tables can automatically generate events that is stored in the event store.

Creating the event store and triggers in Oracle E-Business Suite

To create an "Event Store" and "Triggers" in Oracle database, perform the following:

1. Create a new table. For example, if the event store name is configured as `IBM_CI_EVENTS`, use the script available in `<STUDIO_ROOT>/etc/oracleebbs/scripts/IBM_CI_EVENTS.SQL`. The structure of the event table is described as follows:

Note: It is recommended that a separate event table is created and used for every configured table/view.

Table 1. Event table structure

Column name	Type	Description

Column name	Type	Description
event_id	Number	The unique event ID, which is a primary key for the table. This can have the same value as the object_key.
object_key	String	A string that contains the primary key of the record that is retrieved. This column cannot be null.
object_name	String	Each business object refers to a table or view. The name of the business object is constructed with the schema name and table name. This column cannot be null.
object_function	String	The operation corresponding to the event (Delete, Create, and Update). This column cannot be null.
event_priority	Number	Identifies the event priority. This value must be a positive integer. This column cannot be null.
event_time	Timestamp	Date and time when event was generated. The format is mm/dd/yyyy hh:mm:ss.
event_status	Â	The event status is initially set to a value for a new event and updated by the adapter as it processes the event. The status can have one of the following values: <ul style="list-style-type: none"> o 0: Identifies a new event. o 1: Identifies an event that has been delivered to an export. o -1: An error occurred while processing the event. This column cannot be null.
event_comment	Â	Any comment associated with the event.
event_message	Â	this is optional. This field can be blank.
xid	Â	this is optional. This field can be blank.
connector_ID	Â	The unique identifier for the connector instance that receives a specific event.

2. To create Triggers for your table, refer to the sample <STUDIO ROOT>/etc/oracleebs/scripts/sample_trigger.sql. The trigger is used to populate the event store when a row is created, updated. or deleted.

Here is a sample of an insert trigger called event_create which populates the event store IBM_CI_EVENTS when a row is added to the selected table.

```

create or replace
TRIGGER SCOTT.event_create
after insert on SCOTT.CUSTOMER for each row
begin
insert into "SCOTT"."IBM_CI_EVENTS"
(
event_id
, object_key
,object_name

```

```

        ,object_function
        ,event_priority
        ,event_status
    )
values
    (
        event_sequence.nextval
        ,:new.PKEY
        ,'ScottCustomer'
        ,'Create'
        ,0
        ,0
    );
end;

```

Table 2. Trigger description

Column name	Values
event_id	For a unique event_id, a sequence called event_sequence is used. Or else, you can provide a unique event ID for every row that is inserted.
object_key	This contains the primary key of the record.
object_name	The object name is constructed with the schema name and table name. For example, if the table CUSTOMER is present in Scott's schema, then the value of this property will be ScottCustomer.
object_function	The value of object_function will be Create/Update/Delete depending on whether it is an insert/update/delete trigger.
event_priority	The value of event_priority must be 0 or a positive integer.
event_status	The value of event_status must be 0, so that it is considered as a new event.

Using the Oracle E-Business Suite Get Created Objects activity

Use the Get Created Objects activity to get the values of rows that have been newly created in the database tables/views corresponding to the business object in the request.

About this task

Use this task to get created objects from the Oracle E-Business Suite application. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Procedure

1. In an active orchestration, open the Activities tab and expand the Oracle E-Business Suite folder contents.
2. Drag the **Get Created Objects** activity from the Oracle E-Business Suite folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle E-Business Suite endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
Note: For more information, see [Creating or editing an endpoint for an Oracle E-Business Suite activity](#).
8. To make the required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Specify the Event Store name configured in the Oracle database. The activity polls this Event Store for new events.
11. Browse for the Oracle tables/views name in the Oracle Table/View field.
12. In Browse Oracle Database Tables/Views dialog:
 - o Select a user schema from the Filter by user schema drop-down list.
 - o Select either `Tables` or `Views` from Database object type.
 - o Use Filter tables/views by name to filter the tables/views during selection.
 - o Select a table/view.
13. Click OK.
14. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery options for Oracle E-Business Suite activities](#).
15. Select Map Inputs in the Checklist. The XML schemas generated from the selected object of the Get Created Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
16. Create a map between the orchestration variables and the input parameter of the activity.
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel. Create a map between the output parameters and orchestration variables.

Results

You have configured the Oracle E-Business Suite Get Created Objects activity.

PeopleSoft activities

- [Overview of the PeopleSoft connector](#)
- [Creating or editing an endpoint for a PeopleSoft activity](#)
Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a PeopleSoft server. 
- [Installing JAR files to connect to the PeopleSoft server](#)
You must copy two JAR files on the same workstation as your Cast Iron Studio installation before you can connect to a PeopleSoft server.
- [Using the PeopleSoft Create Component Interface activity](#)
Use the PeopleSoft Create Component Interface activity to create new component interfaces on the PeopleSoft server. The newly created component contains data that represent a business entity.
- [Using the PeopleSoft Update Component Interface activity](#)
Use the PeopleSoft Update Component Interface activity to update component interfaces on the PeopleSoft server. This activity updates the corresponding PeopleSoft component with the incoming business object.
- [Using the PeopleSoft Delete Component Interface activity](#)
Use the PeopleSoft Delete Component Interface activity to delete component interfaces from the PeopleSoft server. This activity deletes the PeopleSoft components and its children. Because the connector supports only logical deletes, the components are marked as deleted, but not removed.
- [Using the PeopleSoft Get Component Interface activity](#)
Use the PeopleSoft Get Component Interface activity to retrieve component interfaces from the PeopleSoft server. With this activity you can access the PeopleSoft component and retrieve values from the PeopleSoft server.

- [Using the PeopleSoft Find Component Interface activity](#)
Use the PeopleSoft Find Component Interface activity to retrieve all the component interfaces from the PeopleSoft server. This activity behaves like the PeopleSoft Get Component Interface activity, except that it retrieves multiple instances of the same PeopleSoft component that match the input criteria.
- [Creating events table and compiling PeopleSoft JAR files](#)
The first of the two required JAR files, which will be named `PSFTCI.jar`, must be manually built and compiled.
- [Using the PeopleSoft Get Created Component Interface activity](#)
Use the Get Created Component Interface activity to poll for created objects in the PeopleSoft server.
- [Using the PeopleSoft Get Updated Component Interface activity](#)
Use the Get Updated Component Interface activity to poll for updated events in the PeopleSoft server.
- [Using the PeopleSoft Get Deleted Component Interface activity](#)
Use the Get Deleted Component Interface activity to poll for deleted events in the PeopleSoft server.
- [Specifying retry and Delivery Options for PeopleSoft Activities](#)
Specifying the Retry and Delivery parameters is one of the tasks to configure a PeopleSoft activity configuration.

Overview of the PeopleSoft connector

The PeopleSoft connector enables you to create integrated processes that exchange information with PeopleSoft Enterprise through a standard interface. This interface shields the client application from analyzing lower-level details about implementation of the application or data structures used on the PeopleSoft Enterprise server.

You can perform the following activities using the PeopleSoft connector:

- Outbound Activities
 - [Create Component Interface](#)
 - [Update Component Interface](#)
 - [Delete Component Interface](#)
 - [Get Component Interface](#)
 - [Find Component Interface](#)
- Inbound/Starter Activities
 - [Get Created Component Interface](#)

 - [Get Deleted Component Interface](#)

The PeopleSoft connector supports the following versions of the PeopleTools: 8.22, 8.40 - 8.49, 8.50, and 8.51.

Note: The connector is compatible with any version of PeopleSoft Applications that works with the version of PeopleTools supported by the adapter.

The PeopleSoft connector requires PeopleSoft JAR files to connect to the PeopleSoft server. For more information, see [Installing JAR files to connect to the PeopleSoft server](#) and [Creating events table and compiling PeopleSoft JAR files](#).

Creating or editing an endpoint for a PeopleSoft activity

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a PeopleSoft server. Â

Selecting or editing a PeopleSoft endpoint

1. In the Create Endpoint or Edit Endpoint pane, configure the PeopleSoft server as described in the following table. In addition to these fields, the endpoint pane contains Connection pool options and Remote Endpoint Configuration.
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the PeopleSoft server successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
PeopleSoft Server Configuration	
Host Name	Specifies the host name or IP address of the machine on which PeopleSoft server is running.
Port	Specifies the PeopleSoft Internet port that allows Java [®] , [™] applets or applications to access PeopleSoft data.
User Name	Specifies the user name to connect to the PeopleSoft server.
Password	Specifies the password associated with the user name to connect to the PeopleSoft server.
Language Code	Specifies the language code to connect to the PeopleSoft server. There are 22 language codes listed. The default code is ENG.
Connection Pool options	
Minimum Connections	Specifies the lowest number of PeopleSoft server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.

Field Name	Description
Maximum Connections	Specifies the maximum number of PeopleSoft server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
Maximum Idle Time	Specifies the amount of time in minutes that a PeopleSoft server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool "no idle time. The default value is 120 minutes.
Maximum Wait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
Reclaim Connections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.
Note: The Connection pool properties need to be configured as per the load (number of concurrent requests) on the endpoint.	
Remote Endpoint Configuration	
Endpoint Runs Behind Firewall	Enables the secure connector name property so that secure connector can be used if the PeopleSoft server is running behind a firewall.
Secure Connector Name	Specifies the name of the secure connector that is used to connect to the PeopleSoft server running behind a firewall. For example, if an orchestration containing PeopleSoft activity is deployed on to Cast Iron Live (cloud), then the secure connector needs to be configured.

Installing JAR files to connect to the PeopleSoft server

You must copy two JAR files on the same workstation as your Cast Iron Studio installation before you can connect to a PeopleSoft server.

Before you begin

- The JAR files can be obtained from the PeopleSoft system administrator.
- The JAR files must be on the same computer as the studio installation.
- The JAR files must be from the same version as the PeopleSoft server you connect to.

For more information about creating event tables and compiling PeopleSoft JAR files, see [Creating events table and compiling PeopleSoft JAR files](#).

About this task
