## Applicant

Identify top applicants and help maintain a fair hiring process with customized interview forms and templates for acknowledgement, offer, and rejection letters. Successful candidate information that imports into employee records with a single step, eliminating the need to reenter the information.

1. Add new "MS Dynamics GP" Endpoint in Cast Iron studio.
2. Click and drag the Endpoint created to the orchestration.
3. Select the "Invoke" Service.
4. Click on the Service and then click "Configure".
5. Click on any standard operation listed in the drop-down list.
6. Select the required operation thereafter.
7. Provide values for the parameters in the Map inputs page.
8. Right click on the Service and select the "Verify Activity" option.
9. Results will be displayed in the Verify tab.

## Services Provided

---

Microsoft Dynamics NAV 2013 supports all typical enterprise resource planning (ERP) activities. Most ERP functionality in Microsoft Dynamics NAV 2013 relates to the business tasks that users perform in different company departments, such as the Finance, Sales, and Warehouse departments.

The departments supported by Microsoft Dynamics NAV 2013 are:

- Finance
- Business Intelligence
- Marketing
- Sales
- Design and Engineering
  - Operations and Planning
- Purchasing
- Receiving
- Warehouse activities
- Production
- Shipping
- Service
- Resource Planning

- Jobs
- Human Resources

## Microsoft Dynamics NAV 2013 Objects

---

Following are the standard application objects for Microsoft Dynamics NAV 2013. These are available in the Object Designer.

Tables	Tables You use tables to store data. For example, a business application may contain a customer table that stores information about each customer, such as, name, address, telephone number, and contact person.
Reports	You use reports to present data. You use filters and sorting to select the data that you want to present in a report
XMLports	You use XMLports to import and export data in .xml, .txt, or .csv format
Codeunits	A codeunit contains user-defined functions that are written in C/AL code. You can use the functions in a codeunit from the other objects in your application.
Menu Suites	A MenuSuite object contains the set of menus that are displayed in the Navigation pane.
Pages	Pages display data from the database and allow users to enter new data into the database
Queries	A query specifies a set of data from the database.

Out of these nine objects, three are exposed in form of web Services - pages, codeunits and queries.

Note: The MS Dynamics NAV 2013 connector will support Pages and Codeunits as webServices types.

## Authentication supported

---

The IBM Cast Iron connector for NAV 2013 will support NTLM version 1.0 as the authentication type.

In NTLM authentication, users are authenticated against their windows credentials.

Pre-requisites:

While creating an Endpoint for the Cast Iron for MS NAV connector, user should provide an already Configured windows authentication to authenticate against the NAV Service.

## How to: Create a New Company

---

To use RapidStart Services for Microsoft Dynamics NAV, you first create a new company for which you want to perform a Microsoft Dynamics NAV implementation. When you create a new company, the standard Microsoft Dynamics NAV tables and pages are created, but there is no data in them.

In addition, you can apply specific setup data to your company after you initialize it. The information is provided in a configuration package, a .rapidstart file, which delivers content in a compressed format.

Use the following procedure to create a new company, and use the BASICCONFIG package as part of the process.

**Parent topic:** [Services Provided](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MS\\_Dyn\\_Nav\\_how\\_to\\_\\_create\\_a\\_new\\_company.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MS_Dyn_Nav_how_to__create_a_new_company.html)

## To create a new company

---

1. In the Microsoft Dynamics NAV Development Environment, create a new company. On the **File** menu, choose **Company**, and then choose **New**.

2. Name the new company and then choose the **OK** button.

3. Switch to the Microsoft Dynamics NAV Windows client and initialize the company you have just created.

You can now import the configuration package that you exported from CRONUS. After you create a new company, some tables are automatically filled in, even if no company template is applied.

## Creating a NAV Endpoint in Cast Iron

---

MS Dynamics NV 2013 Endpoint contains the information the connector requires to connect to the MS NAV 2013 Service.

Any changes you make to the MS Dynamics NAV Endpoint affects all the orchestrations that use that Endpoint, as the edits are global, not local.

1. In the Cast Iron project tab, right click the Endpoints option and select Create Endpoint
2. Select the MS Dynamics NAV option from the drop down. The Endpoint connection panel will be displayed.
3. Fill in the following connection parameters in the Connection Details panel

Field Name	Description
Host Name	Specifies the machine name hosting the NAV 2013 Service.
Port Number	Specifies the PORT no at which the WSDL is available
Application Pool	Specifies the IIS configuration name on the machine hosting NAV 2013 Service.
Company Name	Specifies the BD name in which the standard NAV pages and tables are stored.

1. Provide the parameters in the Authentication section and save the Endpoint.

Field Name	Description
Domain	Specifies the domain in which the MS NAV 2013 Service is Configured
Username	Specifies the username used to connect to the MS NAV 2013 Service
Password	Specifies the password used to connect to the MS NAV 2013 Service

The saved Endpoint will be visible under the Endpoints section.

## Using the MS Dynamics NAV Invoke Service Activity

---

This section covers the steps to use the MS NAV 2013 Endpoint created in the above step.

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS NAV Endpoint to the orchestration and select Invoke Service.
3. The Invoke Service Activity is added to the orchestration. Double click the Activity.
4. Click the Configure option in the checklist menu.
5. From the Select Service drop down, select any Service.
6. The Service is selected and their respective operations are populated in the WSDL operations section.
7. Click any one operation from the WSDL operation section.
8. Click the Map inputs. The XML schemas generated for that operation are displayed.
9. Create a map between the orchestration variables and the input parameter of the Activity.

Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the Activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the Activity is displayed as nodes under the response output parameter in the From Activity panel.

The MS NAV 2013 connector Invoke Service Activity is Configured.

Similar process has to be executed for Verifying the different WSDL operations for the selected Service.

## Connector Operations

---

Following operations would be performed by Microsoft Dynamics NAV 2013 connector

Operation	Description
Create	This operation creates a single record. For example, for the currency, this operation creates a new currency. The supplied record object is overwritten with the version that is created by the page.
CreateMultiple	This operation creates a set of records. The supplied record object is overwritten with the version that is created by page.
Read	This operation reads a single record.
ReadMultiple	This operation reads a filtered set of records. This operation returns an array of entities. The ReadMultiple operation allows the consumer of a Web Service to specify the number of records to be returned at one time. This can reduce load on the server.
Update	This operation updates a single record. The updated record is passed as a reference and is updated with the latest version.
UpdateMultiple	This operation updates a set of records. The updated array of records is passed as a reference and is updated with the latest version.
IsUpdated	This operation checks if an object has been updated since the key was obtained. This operation returns <b>true</b> if the object has been updated by any user; otherwise, <b>false</b> . Concurrency management will prevent a record being changed if it has been subsequently updated. This check will proactively prevent that failure.
Delete<part>	This operation deletes records on a subpage of the current page. This operation is exposed only by pages that have subpages, which are pages that have parts of type page

## Finance Charge Terms

Defines the conditions for finance charge calculations. You must set up a code representing each finance charge calculation. Then you can enter this code in the Fin. Charge Terms Code field on customer cards. Afterward, when you calculate finance charges on open entries, the program will use the information represented by the code. You can also register finance charge terms codes on vendor cards.

1. Create a new company for “Finance Charge Terms” Service.
  2. Add new “MS Dynamics NAV” Endpoint in Cast Iron studio.
  3. Enter valid values in the Test Connection screen and click ‘Test Connection’.
  4. Click and drag the Endpoint created to the orchestration.
  5. Select the “invoke” Service.
  6. Click on the Service and then click “Configure”.
  7. Select a Service from the list of Services.
  8. Select WSDL operation from the list.
  9. Provide values for the parameters in the Map inputs page.
  10. Right click on the Service and select the “Verify Activity” option.
  11. Results will be displayed in the Verify tab.

## Languages

---

Specifies if you have customers or vendors in other countries/regions and you want to print item names or descriptions in the appropriate language. This is possible if you set up language codes in the Language table.

1. Create a new company for "Languages" Service.
2. Add new "MS Dynamics NAV" Endpoint in Cast Iron studio.
3. Enter valid values in the Test Connection screen and click 'Test Connection'.
4. Click and drag the Endpoint created to the orchestration.
5. Select the "invoke" Service.
6. Click on the Service and then click "Configure".
7. Select a Service from the list of Services.
8. Select WSDL operation from the list.
9. Provide values for the parameters in the Map inputs page.

## Payment methods

---

Assigns a code to each payment method. You can set up an unlimited number of payment methods. After you have set up the methods you can enter one of the codes in the Payment Method Code field on each of the customer and vendor cards.

1. Create a new company for "Payment methods" Service.
2. Add new "MS Dynamics NAV" Endpoint in Cast Iron studio.
3. Enter valid values in the Test Connection screen and click 'Test Connection'.
4. Click and drag the Endpoint created to the orchestration.

## Rounding Method

---

This Service specifies the rounding rules to be used if you use Microsoft Dynamics NAV to adjust or suggest item prices or standard cost changes.

1. Create a new company for "Rounding Methods" Service.
2. Add new "MS Dynamics NAV" Endpoint in Cast Iron studio.

3. Enter valid values in the Test Connection screen and click 'Test Connection'.
4. Click and drag the Endpoint created to the orchestration.
5. Select the 'invoke' Service.
6. Click on the Service and then click 'Configure'.

## User Setup

---

Microsoft Dynamics NAV has a security program to ensure that only the correct people have access to the companies in the program. With user IDs and passwords, you can control who can enter the program. You can improve this security by using roles to restrict an individual user's permissions—for example, to read information, create new information, or modify existing information.

1. Create a new company for "User Setup" Service.
2. Add new "MS Dynamics NAV" Endpoint in Cast Iron studio.
3. Enter valid values in the Test Connection screen and click 'Test Connection'.
4. Click and drag the Endpoint created to the orchestration.
5. Select the "invoke" Service.
6. Click on the Service and then click "Configure".
7. Select a Service from the list of Services.
8. Select WSDL operation from the list.
9. Provide values for the parameters in the Map inputs page.
10. Right click on the Service and select the "Verify Activity" option.
11. Results will be displayed in the Verify tab.

## Location List

---

This Service specifies information about your locations, such as example, warehouses, and distribution centers. You can keep track of items in different locations using the Location table. Each location has a name as well as a code representing the name. You use the table to assign a code to a location name. You can then enter the code in location code fields elsewhere in the program, for example, on purchase or sales document lines. This will then record the transactions for the location when you post.

1. Create a new company for "Location List" Service.
2. Add new "MS Dynamics NAV" Endpoint in Cast Iron studio.
3. Enter valid values in the Test Connection screen and click 'Test Connection'.
4. Click and drag the Endpoint created to the orchestration.
5. Select the "Invoke" Service.
6. Click on the Service and then click "Configure".
7. Select a Service from the list of Services.
8. Select WSDL operation from the list.
9. Provide values for the parameters in the Map inputs page.
10. Right click on the Service and select the "Verify Activity" option.
11. Results will be displayed in the Verify tab.

## Printer Selections

---

Specifies the printer to you use when you print invoices, credit memos, and so on. You use the Printer Selection table to control this. In this table you can assign certain printers to certain users and/or reports so that the Invoice report, for example, is always printed on printer X. You can also specify that only user Y will always print credit memos on printer X, for example.

1. Create a new company for "Printer Selections" Service.
2. Add new "MS Dynamics NAV" Endpoint in Cast Iron studio.
3. Enter valid values in the Test Connection screen and click 'Test Connection'.
4. Click and drag the Endpoint created to the orchestration.
5. Select the "invoke" Service.
6. Click on the Service and then click "Configure".
7. Select a Service from the list of Services.
8. Select WSDL operation from the list.
9. Provide values for the parameters in the Map inputs page.

## Creating or editing an endpoint for MS Office 365 activity

---

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to a MS Office 365 server. MS Office 365 uses OAuth 2.0 authentication mechanism to authenticate and authorize users to perform operations.

Selecting or editing a MS Office 365 endpoint

To select or edit a MS Office 365 endpoint:

1. In the **Create Endpoint** or **Edit Endpoint** pane, configure the MS Office 365 endpoint as described in the following table.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

2. Click **Test Connection** to confirm that the connection details are valid and you are able to connect to the MS Office 365 successfully.

3. Click **OK**.

*Table: Connection properties*

Field Name	Description
OAuth Access Token	OAuth access token generated from Azure AD
OAuth Refresh Token	OAuth refresh token generated from Azure AD while generating OAuth Access token
Application Client ID	Application client ID generated from the server where the application is hosted
Application Client Secret	Application client secret generated from the server where the application is hosted

**Note:** To generate the access token, refer to the MS Office 365 documentation relating to "OAuth2 Authentication Support in MS Office 365 REST API".

## Using the MS Office 365 Send Mails activity

---

Use the Send Mails activity to send a mail to recipients in MS Office 365.

Use this task to send a mail to recipients in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Send Mails activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Send Mails** activity icon onto the orchestration. The MS Office 365 Send Mails checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.

5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Send Mails activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has the following mandatory field:

- **InputType:** This has following two values:
  - Select **ON\_THE\_FLY** to send a mail without getting saved in **Drafts** folder.
  - Select **DRAFT** to send the mail and save it in **Drafts** folder.

**Optional Fields:** The activity has following optional fields:

- **SaveToSentItems:** Set it True if the sent mail has to be saved in the **Sent Items** folder.
- **message\_id:** ID of the mail.
- **Message** parameter having following fields:
  - Subject of the draft mail
- **Body** parameter having following fields:
  - **Content:** Add contents of the text as per the content type in base-64 format.
  - **Content Type:** Having text and HTML values.
- **Importance** parameter having following fields in which user can set the importance level:
  - Low
  - Normal
  - High
- **ToRecipients** parameter having **EmailAddress** field which has following fields:
  - **Address:** email address of recipients in **To** field.
  - **Name:** name of the recipient.
- **CcRecipients** parameter having **EmailAddress** field which has following fields:
  - **Address:** email address of recipients in **Cc** field.
  - **Name:** name of the recipient.
- **BccRecipients** parameter having **EmailAddress** field which has following fields:
  - **Address:** email address of recipients in **Bcc** field.
  - **Name:** name of the recipient.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Send Mails activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

# Using the MS Office 365 Get Mails activity

---

Use the Get Mails activity to retrieve all the mails or a single mail along with their attachments if required in MS Office 365.

Use this task to retrieve all the mails or a single mail along with their attachments if required from the default folder which is inbox or the specific folder ID provided in MS Office 365 instance. The call to this activity is a synchronous call, where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Get Mails activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Get Mails** activity icon onto the orchestration. The MS Office 365 Get Mails checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Get Mails activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **InputType:** This has following two values:
  - Select **ALL\_MESSAGES** to fetch all the messages
  - Select **BY\_MESSAGE\_ID** to fetch specific message

**Optional Fields:** The activity has following optional fields:

- **folder\_id:** This is used to set the ID of the specific folder to fetch the messages from MS Office 365.
- **message\_id:** ID of the specific message to be fetched.
- **include\_attachments:** Set it True if attachments are also required to be fetched along with the messages.
- **Customize:** This is used to set the Odata query parameters in following fields:
  - **Top**
  - **Skip**
  - **FilterRequests**
  - **SelectProperties**
  - **Orderby**

Note:

- Refer â€˜ODATA Query Parametersâ€™ document for filtering, sorting, and paging parameters.
- Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Get Mails activity.

Note: User can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Using the MS Office 365 Delete Mails activity

---

Use the Delete Mails activity to delete a mail in MS Office 365. Deleted Contents might not be recoverable.

Use this task to delete a mail in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Delete Mails activity:

1. In an active orchestration, open the Activities tab and expand the MS Office 365 folder contents.
2. Drag the Delete Mails activity icon onto the orchestration. The MS Office 365 Delete Mails checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select Map Inputs in the checklist. The XML schemas generated from the selected object of the Delete Mails activity are displayed as nodes under the request input parameter in the To Activity panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following the mandatory field:

- message\_Id: ID of the message to be deleted.

**Optional Fields:** The activity does not have any optional fields.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select Map Outputs in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Delete Mails activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type are supported.

## Using the MS Office 365 Move Mails activity

---

Use the Move Mails activity to move a mail to another folder or copy a mail to another folder in MS Office 365.

Use this task to move a mail to another folder or copy a mail to another folder in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Move Mails activity:

1. In an active orchestration, open the Activities tab and expand the MS Office 365 folder contents.
2. Drag the Move Mails activity icon onto the orchestration. The MS Office 365 Move Mails checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select Map Inputs in the checklist. The XML schemas generated from the selected object of the Move Mails activity are displayed as nodes under the request input parameter in the To Activity panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- InputType: This has following two values:
  - Select MOVE to move the mail to destination.
  - Select COPY to save a copy of the mail in the destination.

**Optional Fields:** The activity has following optional fields:

- message\_Id: The ID of the message which has to be moved or copied.
- destination\_id: Destination folder ID where the folder to be moved or copied has to be placed.

Note: Values must be provided at run time for any mandatory element of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select Map Outputs in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Move Mails activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type are supported.

## Using the MS Office 365 Respond Mail activity

---

Use the Respond Mail activity to reply to a sender of mail or forward a mail to recipients in MS Office 365. The mail gets saved in **Sent Items** folder.

Use this task to reply to a sender of mail or forward a mail to recipients in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Respond Mail activity:

1. In an active orchestration, open the **Activities** tab and expand the MS Office 365 folder contents.
2. Drag the **Respond Mail** activity icon onto the orchestration. The MS Office 365 Respond Mail checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Respond Mail activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **InputType:** This has following three values:
  - Select **REPLY** to reply to a mail.
  - Select **REPLYALL** to reply to all the recipients of a mail.
  - Select **FORWARD** to forward the mail to specified recipients.
- **message\_id:** ID of the message for which reply has to be sent or to be forwarded.
- **Comment:** Comment to be included along with reply or when forwarded.

**Optional Fields:** The activity has following optional fields:

- **ToRecipients** parameter having **EmailAddress** field which has following fields:
  - **Address:** email address of recipients in **To** field.
  - **Name:** name of the recipient.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Respond Mail activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Using the MS Office 365 Update Mails activity

Use the Update Mails activity to change writable properties on a draft or existing message in MS Office 365. Only the properties that you specify are changed.

Use this task to change writable properties on a draft or existing message in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Update Mails activity:

1. In an active orchestration, open the Activities tab and expand the MS Office 365 folder contents.

2. Drag the Update Mails activity icon onto the orchestration. The MS Office 365 Update Mails checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the Project Explorer dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Update Mails activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has the following mandatory field:

- **message\_id**: ID of the message which has to be updated.

**Optional Fields:** The activity has the following optional field:

- **mail**: Specify properties of the mail which is to be updated.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Update Mails activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of **Map Inputs**, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Using the MS Office 365 Create Draft Mails activity

Use the Create Draft Mails activity to create draft mails in MS Office 365.

Use this task to create draft mails in the MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Create Draft Mails activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Create Draft Mails** activity icon onto the orchestration. The MS Office 365 Create Draft Mails checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Create Draft Mails activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **InputType:** This has following four values:
  - Select **NEW** to create new draft mail.
  - Select **REPLY** to save the reply mail as draft.
  - Select **REPLYALL** to save the reply to all mail as draft.
  - Select **FORWARD** to save the forwarded mail as draft.

**Optional Fields:** The activity has following optional fields:

- **folder ID:** The ID of the folder where draft mail is saved.
- **message\_id:** ID of the mail.
- **message** parameter having following fields:
  - Subject of the draft mail
  - **Body** parameter having following fields:
  - **Content:** Add contents of the text as per the content type in base-64 format.
  - **Content Type:** Having text and HTML values.
- **Importance** parameter having following fields in which user can set the importance level:
  - Low
  - Normal
  - High
- **ToRecipients** parameter having **EmailAddress** field which has following fields:
  - **Address:** email address of recipients in **To** field.
  - **Name:** name of the recipient.
- **CcRecipients** parameter having **EmailAddress** field which has following fields:
  - **Address:** email address of recipients in **Cc** field.
  - **Name:** name of the recipient.
- **BccRecipients** parameter having **EmailAddress** field which has following fields:
  - **Address:** email address of recipients in **Bcc** field.
  - **Name:** name of the recipient.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Create Draft Mails activity.

Note: User can also add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Using the MS Office 365 Get Folders activity

Use the Get Folders activity to retrieve all the folders or a specific folder in MS Office 365.

Use this task to retrieve all the folders or a specific folder in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Get Folders activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Get Folders** activity icon onto the orchestration. The MS Office 365 Get Folders checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Get Folders activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has the following mandatory field:

- **InputType:** This has following two values:
  - Select **ALL\_FOLDERS** to fetch all the folders.
  - Select **BY\_FOLDER\_ID** to fetch specific folder.

**Optional Fields:** The activity has following optional fields:

- **folder\_id:** This is used to set the ID of the specific folder whose details are to be fetched from MS Office 365.
- **Customize:** This is used to set the Odata query parameters in following fields:
  - **Top**
  - **Skip**
  - **FilterRequests**
  - **SelectProperties**
  - **Orderby**

Note:

- Refer [â€˜ODATA Query Parametersâ€™](#) document for filtering, sorting, and paging parameters.
- Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. ## Using the MS Office 365 Update Folders activity

---

Use the Update Folders activity to update folders in MS Office 365.

Use this task to update folders in the MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Update Folders activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Update Folders** activity icon onto the orchestration. The MS Office 365 Update Folders checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.

7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Update Folders activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has the following mandatory field:

- **folder\_id:** This is used to set the ID of the folder to update the record at MS Office 365.

**Optional Fields:** The activity has following optional fields:

- **DisplayName:** This is used to update the display name of the folder.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Update Folders activity.

Note: User can also add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Using the MS Office 365 Delete Folders activity

---

Use the Delete Folders activity to delete a folder in MS Office 365. Deleted contents might not be recoverable.

Use this task to delete a folder in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Delete Folders activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Delete Folders** activity icon onto the orchestration. The MS Office 365 Delete Folders checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Delete Folders activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has the following mandatory field:

- **folderId:** ID of the folder to be deleted.

**Optional Fields:** The activity does not have any optional fields.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Delete Folders activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Using the MS Office 365 Move Folders activity

Use the Move Folders activity to move a folder and its contents to another folder or copy a folder and its contents to another folder in MS Office 365.

Use this task to move a folder and its contents to another folder or copy a folder and its contents to another folder in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Move Folders activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Move Folders** activity icon onto the orchestration. The MS Office 365 Move Folders checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Move Folders activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **InputType:** This has following two values:
  - Select **MOVE** to move the folder to destination.
  - Select **COPY** to save a copy of the folder in the destination.
- **folder\_Id:** The ID of the folder which has to be moved or copied.
- **destination\_id:** ID of the destination folder where moved or copied folder has to be placed.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory

element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Move Folders activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Using the MS Office 365 Create Contacts activity

---

Use the Create Contacts activity to add a contact to the root **Contacts** folder or to the contacts endpoint of another contact folder in MS Office 365.

Use this task to add a contact to the root **Contacts** folder or to the contacts endpoint of another contact folder in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Create Contacts activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Create Contacts** activity icon onto the orchestration. The MS Office 365 Create Contacts checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Create Contacts activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **contact\_folder\_id:** ID of the contactfolder under which contact is to be created.

**Optional Fields:** The activity has following optional fields:

- **contact:** Specify properties of the contact which is to be added in created contact.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Create Contacts activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Using the MS Office 365 Update Contacts activity

---

Use the Update Contacts activity to change a contact's properties in MS Office 365.

Use this task to change a contact's properties in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Update Contacts activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Update Contacts** activity icon onto the orchestration. The MS Office 365 Update Contacts checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Update Contacts activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **contact\_id:** ID of the contact which has to be updated.

**Optional Fields:** The activity has following optional fields:

- **contact:** Specify properties of the contact which is to be updated in contact.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Update Contacts activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Using the MS Office 365 Get Contacts activity

---

Use the Get Contacts activity to retrieve all the contacts from a default folder, contact folder provided, or a specific contact in MS Office 365.

Use this task to retrieve all the contacts from a default folder, contact folder provided, or a specific contact in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Get Contacts activity:

1. In an active orchestration, open the **Activities** tab and expand the MS Office 365 folder contents.
2. Drag the **Get Contacts** activity icon onto the orchestration. The MS Office 365 Get Contacts checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Get Contacts activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **InputType:** This has following two values:
- Select **ALL\_CONTACTS** to fetch all the contacts.
- Select **SINGLE\_CONTACT** to fetch specific contact.

**Optional Fields:** The activity has following optional fields:

- **contact\_folder\_id:** This is used to set the ID of the specific contact folder to fetch the details from MS Office 365.
- **contact\_id:** ID of the specific contact to be fetched.
- **Customize:** This is used to set the Odata query parameters in following fields:
  - **Top**
  - **Skip**
  - **FilterRequests**
  - **SelectProperties**
  - **Orderby**

Note:

- Refer ~ODATA Query Parameters™ document for filtering, sorting, and paging parameters.
- Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Get Contacts activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Using the MS Office 365 Delete Contacts activity

---

Use the Delete Contacts activity to delete a contact in MS Office 365. Deleted contents might not be recoverable.

Use this task to delete a contact in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Delete Contacts activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Delete Contacts** activity icon onto the orchestration. The MS Office 365 Delete Contacts checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant **MS Office 365** endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Delete Contacts activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **contactId:** ID of the contact to be deleted.

**Optional Fields:** The activity does not have any optional fields.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Delete Contacts activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Using the MS Office 365 Get Calendars activity

---

Use the Get Calendars activity to retrieve all the calendars, calendars from a specific group, or a specific calendar in MS Office 365.

Use this task to retrieve all the calendars, calendars from a specific group, or a specific calendar in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Get Calendars activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Get Calendars** activity icon onto the orchestration. The MS Office 365 Get Calendars checklist is displayed.
3. In the checklist, click **Summary**.

4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Get Calendars activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has the following mandatory field:

- **InputType:** This has following two values:
  - Select **ALL\_CALENDARS** to fetch all the calendars.
  - Select **SINGLE\_CALENDAR** to fetch a specific calendar.

**Optional Fields:** The activity has following optional fields:

- **calendar\_group\_id:** This is used to set the ID of the specific calendar group to fetch the details from MS Office 365.
- **calendar\_id:** ID of the calendar to be fetched.
- **Customize:** This is used to set the Odata query parameters in following fields:
  - **Top**
  - **Skip**
  - **FilterRequests**
  - **SelectProperties**
  - **Orderby**

Note:

- Refer “ODATA Query Parameters” document for filtering, sorting, and paging parameters.
- Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Get Calendars activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Using the MS Office 365 Delete Calendars activity

Use the Delete Calendars activity to delete calendars in MS Office 365.

Use this task to delete calendars in the MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Delete Calendars activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Delete Calendars** activity icon onto the orchestration. The MS Office 365 Delete Calendars checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Delete Calendars activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has the following mandatory field:

- **calendar\_id:** This is used to set the ID of the calendar to be deleted from MS Office 365.

**Optional fields:** The activity does not have any optional fields.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Delete Calendars activity.

Note: User can also add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Using the MS Office 365 Create Calendar Groups activity

Use the Create Calendar Groups activity to create a Calendar Group in MS Office 365.

Use this task to create a Calendar Group in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Create Calendar Groups activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Create Calendar Groups** activity icon onto the orchestration. The MS Office 365 Create Calendar Groups checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Create Calendar Groups activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **Name:** Name of the calendar group which is to be created.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Create Calendar Groups activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Using the MS Office 365 Update Calendar Groups activity

Use the Update Calendar Groups activity to update calendar groups in MS Office 365.

Use this task to update calendar groups in the MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Update Calendar Groups activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Update Calendar Groups** activity icon onto the orchestration. The MS Office 365 Update Calendar Groups checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Update Calendar Groups activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has the following mandatory field:

- **calendar\_group\_id:** This is used to set the ID of the specific calendar group to update the record at MS Office 365.

**Optional Fields:** The activity has following optional fields:

- **name:** This is used to set a new name or update the existing name of the calendar group.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.

## Using the MS Office 365 Create Events activity

---

Use the Create Events activity to create events in MS Office 365.

Use this task to create events in the MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Create Events activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Create Events** activity icon onto the orchestration. The MS Office 365 Create Events checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Create Events activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **Calendar\_id:** This is used to set the ID of the calendar where event is added.

**Optional Fields:** The activity has following optional fields:

- **event** parameter having following fields:
- **Subject:** This is used to set the subject of the event.
- **Body** parameter having following fields:
  - **Content:** Add contents of the text as per the content type in base-64 format.
  - **Content Type:** Having text and HTML values.
- **Importance** parameter having following fields in which user can set the importance level:
  - Low
  - Normal
  - High
- **Attendees** parameter having **EmailAddress** and **Type** fields which have the following fields:

**EmailAddress** has following fields:

- **Address:** email address of attendees.
- **Name:** name of the attendees.

**Type** has Required, Optional, and Resource values which are set for attendees.

- **Start:** start time of the event.
- **End:** end time of the event.
- **Attachments:** User can add multiple attachments for single events.
- **Categories:** User can categorize the event as Blue, Green, Orange, Purple, Red, and Yellow category
- **Location** parameter having the following field:
- **DisplayName:** location of the event.
- **IsAllDay:** This is the Boolean field which is used to generate event all day if value is True. If value is False, the event is not generated all day.
- **IsOrganizer:** This is the Boolean field which accepts True or False value. If event is generated by organizer, this field has True value else the value is False.
- **Organizer** parameter having the following field:
- **EmailAddress:** email address of organizer.
- **Recurrence** parameter having **Pattern** field in which user can define the event generation pattern.
- **ResponseRequested:** This is a Boolean parameter which accepts True or False value. If value is True, a response is requested from attendees and if value is False, no response is received.
- **Type:** User can generate an event as per the type selected.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Create Events activity.

Note: User can also add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Using the MS Office 365 Update Events activity

Use the Update Events activity to update events in MS Office 365.

Use this task to update events in the MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Update Events activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Update Events** activity icon onto the orchestration. The MS Office 365 Update Events checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Update Events activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory field:

- **event\_id:** This is used to set the ID of the event to update the record at MS Office 365.

**Optional Fields:** The activity has following optional fields:

- **event** parameter having following fields:
- **Subject:** This is used to set the subject of the event.
- **Body** parameter having following fields:
  - **Content:** Add contents of the text as per the content type in base-64 format.
  - **Content Type:** Having text and HTML values.
- **Importance** parameter having following fields in which user can set the importance level:
  - Low
  - Normal
  - High
- **Attendees** parameter having **EmailAddress** and **Type** fields which have following fields:

**EmailAddress** has following fields:

- **Address:** email address of attendees.
- **Name:** name of the attendees.

**Type** has Required, Optional, and Resource values which are set for attendees.

- **Start:** start time of the event.
- **End:** end time of the event.
- **Attachments:** User can add multiple attachments for single events.
- **Categories:** User can categorize the event as Blue, Green, Orange, Purple, Red, and Yellow category.
- **Location** parameter having following field:
- **DisplayName:** location of the event.
- **IsAllDay:** This is the Boolean field which is used to generate event all day if value is True. If value is False, the event is not generated all day.
- **IsCancelled:** This is the Boolean field which is used to cancel generated event when value is True. If value is False, then event is not cancelled.
- **IsOrganizer:** This is the Boolean field which accepts True or False value. If event is generated by organizer, this field has True value else the value is False.
- **Organizer** parameter having following field:
- **EmailAddress:** email address of organizer.
- **Recurrence** parameter having **Pattern** field in which user can define the event generation pattern.
- **ResponseRequested:** This is a Boolean parameter which accepts True or False value. If value is True, a response is requested from attendees and if value is False, no response is received.
- **Type:** User can able to generate event as per the type selected.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Update Events activity.

Note: User can also add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Using the MS Office 365 Get Events activity

---

Use the Get Events activity to retrieve different types of events along with their attachments if required from calendar in MS Office 365.

Use this task to retrieve all events within a specific time range from default calendar or a calendar\_id provided. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Get Events activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Get Events** activity icon onto the orchestration. The MS Office 365 Get Events checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Get Events activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **InputType:** This has following four values:
  - Select **ALL\_EVENTS\_WITHIN\_SPECIFIED\_TIME** to fetch all the events within specific time range.
  - Select **ALL\_RECURRINGEVENTS\_FOR\_CALENDAR\_ID** to fetch all recurring events from default primary calendar or from the calendar id provided.
  - Select **SINGLE\_EVENTOCCURRENCES\_WITHIN\_SPECIFIED\_TIME** to fetch specific event occurrence within specified time range.
  - Select **SINGLE\_EVENT** to fetch specific event.

**Optional Fields:** The activity has following optional fields:

- **calendarid:** This is used to set the ID of the specific calendar to fetch the details from MS Office 365.
- **startDateTime:** Starting date and time of the time range is specified in this parameter.
- **endDateTime:** End date and time of the time range is specified in this parameter.
- **event\_id:** ID of the specific event to be fetched.
- **include\_attachments:** Specify True if attachments are required to be fetched along with events, otherwise False.
- **Customize:** This is used to set the Odata query parameters in following fields:
  - **Top**
  - **Skip**
  - **FilterRequests**
  - **SelectProperties**
  - **orderby**

Note:

- Refer [â€˜ODATA Query Parametersâ€™](#) document for filtering, sorting, and paging parameters.
- Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Get Events activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Using the MS Office 365 Delete Events activity

---

Use the Delete Events activity to delete an event in MS Office 365. Deleted contents might not be recoverable.

Use this task to delete an event in MS Office 365 instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MS Office 365 Delete Events activity:

1. In an active orchestration, open the **Activities** tab and expand the **MS Office 365** folder contents.
2. Drag the **Delete Events** activity icon onto the orchestration. The MS Office 365 Delete Events checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant MS Office 365 endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Delete Events activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **eventId:** ID of the event to be deleted.

**Optional Fields:** The activity does not have any optional fields.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 Delete Events activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right-click the object in the **To Activity** pane of Map Inputs, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

## Creating or editing an endpoint for MS Office 365 OneDrive activity

---

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a MS Office 365 OneDrive server. MS Office 365 OneDrive uses OAuth 2.0 authentication mechanism to authenticate and authorize users to perform operations.

### Selecting or editing a MS Office 365 OneDrive endpoint

To select or edit a MS Office 365 OneDrive endpoint:

1. In the Create Endpoint or Edit Endpoint pane, configure the MS Office 365 endpoint as described in the following table.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the MS Office 365 OneDrive successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
Base URL	Host name or tenant of the server that serves as the REST endpoint
OAuth Access Token	OAuth access token generated from MS Office 365 OneDrive for authentication
OAuth Refresh Token	OAuth refresh token generated from MS Office 365 OneDrive while generating OAuth Access token
Application Client ID	Application client ID generated from the server where the application is hosted
Application Client Secret	Application client secret generated from the server where the application is hosted

Note: To generate the access token, refer to the MS Office 365 API documentation relating to [â€œOAuth2 Authentication Support in MS Office 365 REST APIâ€](#).

## Using the MS Office 365 OneDrive Create Folders Activity

---

Use the Create Folders activity to create folders in MS Office 365 OneDrive.

Use this task to create folders in MS Office 365 OneDrive instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active Orchestration, open the Activities tab and expand the MS Office 365 OneDrive folder contents.
2. Drag the Create Folders activity icon onto the orchestration. The MS Office 365 OneDrive Create Folders Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MS Office 365 OneDrive endpoint.
7. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. Additional configuration is not required for this activity
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Folders activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields

- requestType: Value determines whether files are to be uploaded by providing the parent id or by providing path of the location.
- parent\_id: The id of the folder where new folder is to be created. Mandatory when requestType is BY\_ID
- path: Location where the new folder has to be created. Mandatory when requestType is BY\_PATH.
- folder\_name: Name of the folder to be created.

**Optional Fields:** The activity has following optional fields

- support\_x\_http\_method – True or False. Whether to support X-HTTP-Method

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 OneDrive Create Folders activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

## Using the MS Office 365 OneDrive Upload Files Activity

---

Use the Upload Files activity to upload files in MS Office 365 OneDrive.

Use this task to upload files in MS Office 365 OneDrive instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active Orchestration, open the Activities tab and expand the MS Office 365 OneDrive folder contents.
2. Drag the Upload Files activity icon onto the orchestration. The MS Office 365 OneDrive Upload Files Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MS Office 365 OneDrive endpoint.
7. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. Additional configuration is not required for this activity
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Upload Files activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields

- parent\_id: The id of the folder where new file has to be uploaded. Mandatory when requestType is BY\_ID.
- path: Location where the new folder has to be created. Mandatory when requestType is BY\_PATH.
- file\_name: Name of the file to be uploaded.
- file\_content: Content of the file which is uploaded in either binary format or text format.
- requestType: Value determines whether files are to be uploaded by providing the parent id or by providing path of the location.
- contentType: Value determines whether content of the file to be uploaded is TEXT or BINARY.

**Optional Fields:** The activity has following optional fields

- nameConflict – Can be either “overwrite” or “abort”
- support\_x\_http\_method – True or False. Whether to support X-HTTP-Method

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 OneDrive Upload Files activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

## Using the MS Office 365 OneDrive List Folder Contents Activity

---

Use the List Folder Contents activity to retrieve all the content present in a folder in MS Office 365 OneDrive.

Use this task to list content of a folder in MS Office 365 OneDrive instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active Orchestration, open the Activities tab and expand the MS Office 365 OneDrive folder contents.

2. Drag the List Folder Contents activity icon onto the orchestration. The MS Office 365 OneDrive List Folder Contents Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MS Office 365 OneDrive endpoint.
7. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. Additional configuration is not required for this activity
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the List Folder Contents activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields

- requestType: Value determines whether folder whose contents are to be retrieved by providing the parent id or by providing path of the location.
- file\_id: The id of the folder whose contents are to be fetched. Mandatory when requestType is BY\_ID.
- path: Location of the folder whose contents are to be retrieved. Mandatory when requestType is BY\_PATH.

**Optional Fields:** The activity has following optional fields

- filter – Filtering based on the name parameter
- orderby – Order by name parameter
- select - List of the properties that should be included for each item in the response
- skipToken – Paging token
- top – Determines the maximum of records to return
- etag\_if\_none\_match – The Etag value to be provided in the HTTP header.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 OneDrive List Folder Contents activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

## Using the MS Office 365 One Drive Get Properties Activity

Use the Get Properties activity to fetch properties of a file, folder or drive in MS Office 365 One Drive.

Use this task to get properties of resource in MS Office 365 One Drive instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active Orchestration, open the Activities tab and expand the MS Office 365 One Drive folder contents.
2. Drag the Get Properties activity icon onto the orchestration. The MS Office 365 One Drive Get Properties Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MS Office 365 One Drive endpoint.
7. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. Additional configuration is not required for this activity
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get Properties activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- requestType: This value determines if the resource has to be fetched by BY\_ID or by BY\_PATH.
- inputType: This value specifies which resource's metadata has to be fetched out of FILE, FOLDER, DRIVE.
- folder\_id – The folder properties to be fetched. Mandatory in case requestType is BY\_ID
- file\_id – The file properties to be fetched. Mandatory in case of requestType is BY\_ID
- path - Location of the file which is to be downloaded. Mandatory when requestType is BY\_PATH

**Optional Fields:** The activity has following mandatory fields

- expand – A comma-separated list of relationships to expand and include in the response
- select - A comma-separated list of properties to include in the response
- etag\_if\_none\_match – The Etag value to be send as HTTP header

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 One Drive Get Properties activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

## Using the MS Office 365 One Drive Update Properties Activity

---

Use the Update Properties activity to update properties of a file, folder or drive in MS Office 365 One Drive.

Use this task to update properties in MS Office 365 One Drive instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active Orchestration, open the Activities tab and expand the MS Office 365 One Drive folder contents.
2. Drag the Update Properties activity icon onto the orchestration. The MS Office 365 One Drive Update Properties Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MS Office 365 One Drive endpoint.
7. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. Additional configuration is not required for this activity
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Update Properties activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields

- requestType: This value determines if the resource has to be updated BY\_ID or BY\_PATH
- inputType: This value specifies which resource's metadata has to be updated out of FILE or FOLDER.
- folder\_id – The folder properties to be fetched. Mandatory in case requestType is BY\_ID

- file\_id – The file properties to be fetched. Mandatory in case of requestType is BY\_ID
- path - Location of the file which is to be downloaded. Mandatory when requestType is BY\_PATH
- etag\_if\_match – The Etag value to be sent in request as HTTP header
- new\_name – The new name to be given either to file or folder
- destination\_folder\_id – The destination folder id is required when you want to move either files or folder from one location to another
- destination\_folder\_path - The destination folder path is required when you want to move either files or folder from one location to another

**Optional Fields:** The activity has following mandatory fields:

- support\_x\_http\_method – True or False. Whether to support X-HTTP-Method

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 One Drive Update Properties activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

## Using the MS Office 365 One Drive Copy Files or Folders Activity

Use the Copy Files or Folders activity to copy files or folders to destination folder in MS Office 365 One Drive.

Use this task to copy files or folders to destination folder in MS Office 365 One Drive instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active Orchestration, open the Activities tab and expand the MS Office 365 One Drive folder contents.
2. Drag the Copy Files or Folders activity icon onto the orchestration. The MS Office 365 One Drive Copy Files or Folders Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MS Office 365 One Drive endpoint.
7. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. Additional configuration is not required for this activity
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Copy Files or Folders activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields

- requestType: This value determines if the resource has to be located for copying by id or by path.
- inputType: This value specifies which resource's metadata has to be copied out of file or folder.
- folder\_id – The folder properties to be fetched. Mandatory in case requestType is BY\_ID
- file\_id – The file properties to be fetched. Mandatory in case of requestType is BY\_ID

- path - Location of the file which is to be downloaded. Mandatory when requestType is BY\_PATH
- new\_name – The new name to be given either to file or folder
- destination\_folder\_id – The destination folder id is required when you want to move either files or folder from one location to another
- destination\_folder\_path - The destination folder path is required when you want to move either files or folder from one location to another

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 One Drive Copy Files or Folders activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

## Using the MS Office 365 One Drive Delete Files or Folders Activity

Use the Delete Files or Folders activity to delete files or folders in MS Office 365 One Drive.

Use this task to delete files or folders in MS Office 365 One Drive instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active Orchestration, open the Activities tab and expand the MS Office 365 One Drive folder contents.
2. Drag the Delete Files or Folders activity icon onto the orchestration. The MS Office 365 One Drive Delete Files or Folders Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MS Office 365 One Drive endpoint.
7. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. Additional configuration is not required for this activity
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Delete Files or Folders activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields

- requestType: This value determines if the resource has to be located for deleting by id or by path.
- inputType: This value specifies which resource's metadata has to be deleted out of file or folder.
- folder\_id – The folder properties to be fetched. Mandatory in case requestType is BY\_ID
- file\_id – The file properties to be fetched. Mandatory in case of requestType is BY\_ID
- path - Location of the file which is to be downloaded. Mandatory when requestType is BY\_PATH
- etag\_if\_match – The Etag value to be sent in request as HTTP header

**Optional Fields:** The activity has following mandatory fields

- support\_x\_http\_method – True or False. Whether to support X-HTTP-Method

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
2. Create a map between the output parameters and orchestration variables.

User has configured the MS Office 365 One Drive Delete Files or Folders activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

Use the Update List Items activity to update list item properties for existing lists in MS SharePoint.
- [Using the MS SharePoint Retrieve List Items Activity](#)  
Use the Retrieve List Items activity to retrieve list item properties for existing lists from MS SharePoint.
- [Using the MS SharePoint Delete List Items Activity](#)  
Use the Delete List Items activity to delete list items of existing lists in MS SharePoint.
- [Using the MS SharePoint Create Attachments Activity](#)  
Use the Create Attachments activity to create attachments for list items of existing lists in MS SharePoint.
- [Using the MS SharePoint Update Attachments Activity](#)  
Use the Update Attachments activity to update the contents of list items attachments for existing lists in MS SharePoint.
- [Using the MS SharePoint Retrieve Attachments Activity](#)  
Use the Retrieve Attachments activity to retrieve details of all attachments of a list item for existing lists in MS SharePoint.
- [Using the MS SharePoint Retrieve Attachment Content Activity](#)  
Use the Retrieve Attachment Contents activity to retrieve contents of the attachments of a List item for existing lists in MS SharePoint.
- [Using the MS SharePoint Delete Attachments Activity](#)  
Use the Delete Attachments activity to delete attachments of list item for existing lists in MS SharePoint.
- [Specifying the Retry options for MS SharePoint REST API activities](#)  
Specifying the Retry parameters is one of the tasks to configure a MS SharePoint activity. The MS SharePoint REST API connector uses a single login session for all connections to an MS SharePoint REST API endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_MSSharepointactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_MSSharepointactivities.html)

## Overview of MS SharePoint connector

SharePoint is a web application platform in the Microsoft Office server suite. SharePoint combines various functions which are traditionally separate applications: intranet, extranet, content management, document management, personal cloud, enterprise social networking, enterprise search, business intelligence, workflow management, web content management, and an enterprise application store. SharePoint is basically a secure place to store, organize, share, collaborate and access information.

SharePoint supports both on premise and cloud environments.

You can perform the following activities using MS SharePoint connector:

- Upload Files
- Download Files
- Update Files
- Delete Files
- Search Files
- Share Files
- Create Folders
- Retrieve Folders
- Update Folders
- Delete Folders
- Create Lists
- Retrieve Lists
- Update Lists
- Delete Lists
- Create List Items
- Retrieve List Items

- Update List Items
- Delete List Items
- Create Attachments
- Retrieve Attachments
- Retrieve Attachment Contents
- Update Attachments
- Delete Attachments
- Retrieve Users

## Creating or editing an endpoint for MS SharePoint activity

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to MS SharePoint platform. MS SharePoint uses both Basic and OAuth 2.0 authentication mechanism so as to authorize users to perform operations.

### Selecting or editing an MS SharePoint endpoint

To select or edit a MS SharePoint endpoint:

1. In the Create Endpoint or Edit Endpoint pane, configure the MS SharePoint endpoint as described in the following table.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the MS SharePoint successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Required	Description
Deployment	Mandatory	Deployment drop down will have two values as On Cloud and On Premise
Host name	Mandatory	Host Name for SharePoint On Cloud or On Premise based on the value selected for Deployment field.
Port	Optional	Use default port 80 or 443 if no value is specified.
Sub Site	Optional	Use it while constructing URL if specified.
SharePoint On Premise Details		Section to hold authentication details needed for SharePoint On Premise. Will be enabled only when user selects On Premise from Deployment dropdown.
SharePoint On Cloud Details		Section to hold authentication details needed for SharePoint On Cloud. Will be enabled only when user selects On Cloud from Deployment dropdown.
OAuth Access Token	Mandatory field under SharePoint On Cloud section.	Specifies the OAuth access token generated from MS SharePoint for authentication.
OAuth Refresh Token	Mandatory field under SharePoint On Cloud section.	Specifies the OAuth refresh token generated from MS SharePoint while generating OAuth Access token.
Application Client ID	Mandatory field under SharePoint On Cloud section.	Specifies the Application client ID of the content API application created in MS SharePoint for OAuth.

Field Name	Required	Description
Application Client Secret	Mandatory field under SharePoint On Cloud section.	Specifies the Application client secret of the content API application created in MS SharePoint for OAuth.
Authentication Type		Two types of Authentication mechanisms are supported which are BASIC and NTLM. Its default value is BASIC.
User Name	Mandatory field under On Premise section.	Specifies the username to connect to MS SharePoint. This is same as the MS SharePoint user ID.
Password	Mandatory field under On Premise section.	Specifies the password of the associated username to connect to MS SharePoint.
Domain		If NTLM is selected as Authentication type, Domain needs to be mentioned.
Following parameters are required in endpoint test connection screen to make HTTPS Connection		
HTTPS		Checkbox to indicate whether HTTPS to be used
Following parameters are required in endpoint test connection screen to make connection via Proxy		
Authentication		Two types of Authentication mechanisms are supported which are BASIC and NTLM. Its default value is BASIC.
Host Name		Host Name of Proxy Network
Port		Port Number of the Proxy Network.
User Name		Specifies the user name for accessing service via proxy network.
Password		Specifies the password for accessing service via proxy network.
Domain		If NTLM is selected as Authentication type, Domain needs to be mentioned.

Note: To generate the access token, refer to the MS SharePoint documentation relating to "OAuth 2.0 Authentication".

In addition with the above parameters, there is also a provision for Secure Connector configuration to connect the Endpoint with MS SharePoint On-Premise instance.

In the Map Input section of each activity, relevant fields of endpoint panel are available to override at runtime. User can provide data to various groups of parameters like Proxy Details, Connection Details or Authentication Details to override. Providing only partial field data in a selected group is not allowed to override.

## Using the MS SharePoint Upload Files Activity

Use the Upload File activity to upload new files in MS SharePoint.

### About this task

Use this task to upload new files at a given file path in MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Upload Files activity. The Upload Files activity will be added to the orchestration. Double click the activity. The MS SharePoint Upload Files Checklist is displayed.

3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.  
**Mandatory Fields:**
  - o Parent Folder (Folder name where the file needs to be uploaded)
  - o File Name
  - o File Content (It should be provided in Base 64 encoded format for uploading any type of file)

Sample input request:

```
<UploadFileRequestDetails xmlns="">
<parentFolder>/Shared Documents</parentFolder>
<fileName>details.txt</fileName>
<fileContent>a2h1c2hidSBraGF0dWphDQpNb2R1bGUgbGVhZA0KUGVyc21zdGVudCBTeXN0ZW1z</fileContent>
</UploadFileRequestDetails>
```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MS SharePoint Upload Files activity.

Note:

You can upload multiple files at one go, using this activity since the input variable is unbounded.

## Using the MS SharePoint Update Files Activity

---

Use the Update Files activity to update an existing file's content in MS SharePoint.

### About this task

---

Use this task to modify an existing file's content in MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Update Files activity. The Update Files activity will be added to the orchestration. Double click the activity. The MS SharePoint Update Files Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:**

- o File path
- o File Content (It should be provided in Base 64 encoded format for updating any type of file)

**Sample Input request:**

```
<UpdateFileRequestDetails xmlns="">
<filePath>/Shared Documents/ details.txt </filePath>
<fileContent>a2h1c2hidSBraGF0dWphDQpNb2R1bGUgbGVhZA0KUGVyc21zdGVudCBTeXN0ZW1z</fileContent>
</UpdateFileRequestDetails>
```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

## Results

## Using the MS SharePoint Delete Files Activity

---

Use the Delete Files activity to delete a file from MS SharePoint.

### About this task

---

Use this task to delete a file permanently from MS SharePoint instance or move it to the Recycle Bin. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Delete Files activity. The Delete Files activity will be added to the orchestration. Double click the activity. The MS SharePoint Delete Files Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:**

- o File Path
- o Delete Type (Allowed values are Recycle Bin or Permanent)

**Sample input request:**

```
<DeleteFileRequestDetails xmlns="">
<deleteType>Recycle Bin</deleteType>
```

```
<filePath>/Shared Documents/k1.txt</filePath>
</DeleteFileRequestDetails>
```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MS SharePoint Delete Files activity.

Note:

You can delete multiple files at one go, using this activity since the input variable is unbounded.

## Using the MS SharePoint Download Files Activity

---

Use the Download Files activity to view the file properties as well as its content in MS SharePoint.

### About this task

---

Use this task to view existing file properties and its content from MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Download Files activity. The Download Files activity will be added to the orchestration. Double click the activity. The MS SharePoint Download File Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields: File path

Sample Input Request

```
<DownloadFileRequestDetails xmlns="">
<filePath>/Shared Documents/file1.txt</filePath>
</DownloadFileRequestDetails>
```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. ## Using the MS SharePoint Create Folder Activity

---

Use the Create Folder activity to create new folder in MS SharePoint.

### About this task

---

Use this task to add new folders in MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Create Folder activity. The Create Folder activity will be added to the orchestration. Double click the activity. The MS SharePoint Create Folder Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.  
Mandatory Fields:
  - Server Relative Url (It is the path where folder needs to be created. Its format is /Site\_Name/Subsite\_Name (sub site needs to be mentioned if folder needs to be created at sub site))
  - Folder name

#### Sample Input Request

```
<CreateFolderRequestDetails xmlns="">
<serverRelativeUrl>/Shared Documents</serverRelativeUrl>
<folderName>Folder 1</folderName>
</CreateFolderRequestDetails>
```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

## Results

## Using the MS SharePoint Retrieve Folder Activity

---

Use the Retrieve Folder activity to view the folder properties of an existing folder in MS SharePoint.

### About this task

---

Use this task to fetch folder properties from MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Retrieve Folder activity. The Retrieve Folder activity will be added to the orchestration. Double click the activity. The MS SharePoint Retrieve Folder Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields:

- o Server Relative Url: (It is the path where folder is present. Its format: /Site\_Name/Subsite\_Name/Folder\_Name/ (sub site needs to be mentioned if folder is present in sub site))
- o Show Children: (Boolean field, if provided its value as TRUE, details of files and folders present inside the given serverRelativeUrl will be shown, if provided as FALSE details of the files and folders won't be shown)

Sample Input Request

```
<RetrieveFolderRequestDetails xmlns="">
<showChildren>true</showChildren>
<serverRelativeUrl>/Shared Documents/Folder1</serverRelativeUrl>
</RetrieveFolderRequestDetails>
```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the MS SharePoint Retrieve Folder activity.

Note:

You can retrieve the details of multiple folders at one go using this activity since the input variable is unbounded.

**Limitation:**

Filter option in retrieve folders activity is not working for On Premise. This is the known API behaviour.

## Using the MS SharePoint Update Folder Activity

---

Use the Update Folder activity to modify folder properties in MS SharePoint.

### About this task

---

Use this task to update folder properties like WelcomePage in MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Update Folder activity. The Update Folder activity will be added to the orchestration. Double click the activity. The MS SharePoint Update Folder Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields:

- Server Relative Url: (It is the path where folder is present. Its format: /Site\_Name/Subsite\_Name/Folder\_Name/ (sub site needs to be mentioned if folder is present in sub site))
- WelcomePage: (A property which can be updated)

Sample Input Request

```
<UpdateFolderRequestDetails xmlns="">
<serverRelativeUrl>/Shared Documents/FolderD1</serverRelativeUrl>
<welcomePage>Welcome to SharePoint!!!</welcomePage>
</UpdateFolderRequestDetails>
```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the MS SharePoint Update Folder activity.

Note:

You can update properties of multiple folders at one go using this activity since the input variable is unbounded.

## Using the MS SharePoint Delete Folders Activity

---

Use the Delete Folders activity to delete folder from MS SharePoint.

### About this task

---

Use this task to remove a folder permanently from MS SharePoint instance or move it to the Recycle Bin. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Delete Folders activity. The Delete Folders activity will be added to the orchestration. Double click the activity. The MS SharePoint Delete Folder Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.  
*Note:* For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.  
**Mandatory Fields:**
  - o Server Relative Url (It is the path where folder is present. Its format: /Site\_Name/Subsite\_Name/Folder\_Name/ (sub site needs to be mentioned if folder is present in sub site))
  - o Delete Type (Allowed values are Recycle Bin or Permanent)

#### Sample Input Request

```
<DeleteFolderRequestDetails xmlns="">
<deleteType>Permanent</deleteType>
<serverRelativeUrl>/Shared Documents/Folder1</serverRelativeUrl>
</DeleteFolderRequestDetails>
```

*Note:* Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the MS SharePoint Delete Folders activity.

*Note:*

You can delete multiple folders at one go using this activity since the input variable is unbounded.

#### **Limitation:**

Delete Folder returns a success message even if a folder name which is not present in Shared Documents is given in Delete folder request. This is the API behaviour.

**Parent topic:** [MS SharePoint Activities](#)

## Using the MS SharePoint Retrieve User Activity

---

Use the Retrieve User activity to view the User details from MS SharePoint.

### About this task

---

Use this task to fetch user details from MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Retrieve User activity. The Retrieve User activity will be added to the orchestration. Double click the activity. The MS SharePoint Retrieve User Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

#### Mandatory Fields:

- o Retrieve Type (Valid values are ALL\_USERS, ID and LOGINNAME)
- o User Id (Required if Retrieve Type is given as ID)
- o Login name (Required if Retrieve Type is given as LOGINNAME)

#### Sample Input Request

```
<?xml version="1.0" encoding="UTF-8"?>
<RetrieveUser xmlns="http://www.IBM.com/xmlns/prod/websphere/j2ca/Sharepoint/retrieveuser">

*****Retrieve Type as ALL USEERS *****
<RetrieveUserRequestDetails xmlns="">
<retrieveType>ALL_USERS</retrieveType>
<loginName></loginName>
</RetrieveUserRequestDetails>

*****Valid ID*****
<RetrieveUserRequestDetails xmlns="">
<retrieveType>ID</retrieveType>
<userId>12</userId>
<loginName></loginName>
</RetrieveUserRequestDetails>

*****Valid LOGINNAME*****
<RetrieveUserRequestDetails xmlns="">
<retrieveType>LOGINNAME</retrieveType>
<loginName><:0(.s|true)</loginName>
</RetrieveUserRequestDetails>
</RetrieveUser>
```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the MS SharePoint Retrieve User activity.

Note:

You can retrieve the details of multiple users at one go using this activity since the input variable is unbounded.

## Using the MS SharePoint Share Files Activity

---

Use the Share Files activity to share an existing file in MS SharePoint.

### About this task

---

Use this task to share file with internal or external users in MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Share Files activity. The Share Files activity will be added to the orchestration. Double click the activity. MS SharePoint Share Files Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields:

- resourceAddress (the full URL to the document you want to share)
- additiveMode
- UserRoleAssignments
  - Role (The Role property represents which permission you are assigning. 1 = View, 2 = Edit, 3 = Owner, 0 = None)
  - userId (The UserId property can be the name of the user or a role.)

Note:

**AdditiveMode:** A flag indicating whether the permission setting uses the additive or strict mode. If this value is "true", the permission setting uses the additive mode, which means that the specified permission will be added to the user's current list of permissions if it is not there already, and if this value is "false", the permission setting uses the strict mode, which means that the specified permission will replace the user's current permissions. This parameter is useful when you want to stop sharing a document with a person or group. In this case you would set AdditiveMode to false using the Role = 0.

Sample input request:

```
<ShareFile xmlns="http://www.IBM.com/xmlns/prod/websphere/j2ca/Sharepoint/sharefile">
  <ShareFileRequestDetails xmlns="">
    <resourceAddress>/shared documents/file1.txt</resourceAddress>
    <UserRoleAssignments>
      <Role>1</Role>
      <UserId>khushbu_khatuja@persistent.com</UserId>
    </UserRoleAssignments>
    <validateExistingPermissions>true</validateExistingPermissions>
    <additiveMode>true</additiveMode>
    <sendServerManagedNotification>true</sendServerManagedNotification>
    <customMessage>hello</customMessage>
    <includeAnonymousLinksInNotification>true</includeAnonymousLinksInNotification>
  </ShareFileRequestDetails>
</ShareFile>
```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MS SharePoint Share Files activity.

Note:

You can share multiple files at one go using this activity since the input variable is unbounded.

## Using the MS SharePoint Search Files Activity

---

Use the Search Files activity to search files in MS SharePoint.

### About this task

---

Use this task to search files in MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Search Files activity. The Search Files activity will be added to the orchestration. Double click the activity. MS SharePoint Search Files Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields:

- queryText (text consisting of the filename user wants to search)
- fileExtension (extension of the file user wants to search)

Sample input request:

```
<Search xmlns="http://www.IBM.com/xmlns/prod/websphere/j2ca/Sharepoint/search">
  <SearchRequestDetails xmlns="">
    <querytext>test</querytext>
    <fileExtension>txt</fileExtension>
  </SearchRequestDetails>
</Search>
```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MS SharePoint Search Files activity.

Note:

You can search multiple files at one go using this activity since the input variable is unbounded

**Limitation:**

Search Files Activity is not giving desired results for On Premise. It is working fine for On Cloud. This is the known API behaviour for SharePoint On Premise setup.

**Parent topic:** [MS SharePoint Activities](#)

## Using the MS SharePoint Create Lists Activity

---

Use the Create Lists activity to create lists in MS SharePoint.

### About this task

---

Use this task to Create Lists in MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Create Lists activity. The Create Lists activity will be added to the orchestration. Double click the activity. The MS SharePoint Create Lists Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields:

- o BaseTemplate - Base Template is a Squarespace starter template with minimal markup and styles, and is intended to be used as a starting point for your next project. Gets the list definition type on which the list is based. The [hyperlink](#) specifies the different list server templates.
- o Title

Sample Input Request

```
<?xml version="1.0" encoding="UTF-8"?>
<CreateLists xmlns="http://www.IBM.com/xmlns/prod/websphere/j2ca/Sharepoint/createlists">
<CreateListsRequestDetails xmlns="">
<BaseTemplate>100</BaseTemplate>
<Title>BaseTemp100</Title>
</CreateListsRequestDetails>
</CreateLists>
```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MS SharePoint Create Lists activity.

Note:

You can create multiple lists at one go using this activity since the input variable is unbounded.

### Limitation:

Lists with more than 256 characters are getting created on Server even though it shows message as “unknown error” in the response. This is a known API behaviour.

## Using the MS SharePoint Update Lists Activity

---

Use the Update Lists activity to update lists in MS SharePoint.

### About this task

---

Use this task to update list properties like Title in MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Update Lists activity. The Update Lists activity will be added to the orchestration. Double click the activity. The MS SharePoint Update Lists Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

#### Mandatory Fields:

- o updateBy (Valid values are LIST\_ID and LIST\_TITLE)
- o listId (Required if updateBy is given as LIST\_ID)
- o listTitle (Required if updateBy is given as LIST\_TITLE)
- o NewTitle

#### Sample Input Request

```
<?xml version="1.0" encoding="UTF-8"?>
<UpdateList xmlns="http://www.IBM.com/xmlns/prod/websphere/j2ca/Sharepoint/updatelist">

<!-- 1. updateBy value as LIST_TITLE -->

<UpdateListRequestDetails xmlns="">
<updateBy>LIST_TITLE</updateBy>
<listTitle>List100</listTitle>
<NewTitle>UpdatedTitle</NewTitle>
</UpdateListRequestDetails>

<!-- updateBy value as LIST_ID -->
<UpdateListRequestDetails xmlns="">
<updateBy>LIST_ID</updateBy>
```

```

<listId>087176c2-a1b9-4c97-b7fd-17787d6797de</listId>
<NewTitle>Test Title Updated</NewTitle>
</UpdateListRequestDetails>
</UpdateList>

```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

## Results

## Using the MS SharePoint Retrieve Lists Activity

---

Use the Retrieve Lists activity to retrieve list properties from MS SharePoint.

### About this task

---

Use this task to retrieve list properties from MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Retrieve Lists activity. The Retrieve Lists activity will be added to the orchestration. Double click the activity. The MS SharePoint Retrieve Lists Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.

Mandatory Fields:

- retrieveType (Valid values are ALL and SPECIFIC)
- retrieveListBy (Valid values are LIST\_ID and LIST\_TITLE)
- listId (Required if retrieveType is given as SPECIFIC and retrieveListBy as LIST\_ID)
- listTitle (Required if retrieveType is given as SPECIFIC and retrieveListBy as LIST\_TITLE)

Sample Input Request

```

<?xml version="1.0" encoding="UTF-8"?>
<RetrieveList xmlns="http://www.IBM.com/xmlns/prod/websphere/j2ca/Sharepoint/retrievelist">
<!--1. retrieveType value as ALL-->

<RetrieveListRequestDetails xmlns="">
<retrieveType>ALL</retrieveType>

```

```

</RetrieveListRequestDetails>

<!--2. retrieveType value as SPECIFIC and retrieveListBy as LIST_TITLE-->
<RetrieveListRequestDetails xmlns="">
    <retrieveType>SPECIFIC</retrieveType>
    <retrieveListBy>LIST_TITLE</retrieveListBy>
    <listTitle>List103</listTitle>
</RetrieveListRequestDetails>

<!--3. retrieveType value as SPECIFIC and retrieveListBy as LIST_ID-->
<RetrieveListRequestDetails xmlns="">
    <retrieveType>SPECIFIC</retrieveType>
    <retrieveListBy>LIST_ID</retrieveListBy>
    <listId>efb347bd-2b4f-4859-b67c-80c7e60ed8fa</listId>
</RetrieveListRequestDetails>
</RetrieveList>

```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MS SharePoint Retrieve Lists activity.

Note:

You can retrieve properties of multiple lists at one go using this activity since the input variable is unbounded.

**Limitation:**

ExpandChildren option in retrieve Lists activity is not working for SharePoint On-Premise. This is the known API behaviour for SharePoint On-Premise.

## Using the MS SharePoint Delete Lists Activity

---

Use the Delete Lists activity to delete lists in MS SharePoint.

### About this task

---

Use this task to delete lists in MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Delete Lists activity. The Delete Lists activity will be added to the orchestration. Double click the activity. The MS SharePoint Delete Lists Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.

Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).

4. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
5. Create a map between the orchestration variables and the input parameter of the activity.  
Mandatory Fields:
  - o deleteType (Allowed values are Permanent or Recycle Bin)
  - o deleteBy (Valid values are LIST\_ID and LIST\_TITLE)
  - o listId (If deleteBy is given as LIST\_ID)
  - o listTitle (If deleteBy is given as LIST\_TITLE)

#### Sample Input Request

```
<?xml version="1.0" encoding="UTF-8"?>
<DeleteList xmlns="http://www.IBM.com/xmlns/prod/websphere/j2ca/Sharepoint/deletelist">

<!-- 1. deleteType value as Permanent , deleteBy as LIST_TITLE -->
<DeleteListRequestDetails xmlns="">
  <deleteType>Permanent</deleteType>
  <deleteBy>LIST_TITLE</deleteBy>
  <listTitle>Test List2</listTitle>
</DeleteListRequestDetails>

<!-- 2. deleteType value as Recycle Bin , deleteBy as LIST_ID-->
<DeleteListRequestDetails xmlns="">
  <deleteType> Recycle Bin</deleteType>
  <deleteBy>LIST_ID</deleteBy>
  <listId>087176c2-a1b9-4c97-b7fd-17787d6797de</listId>
</DeleteListRequestDetails>
</DeleteList>
```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

6. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
7. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MS SharePoint Delete Lists activity.

Note:

You can delete multiple lists at one go using this activity since the input variable is unbounded.

## Using the MS SharePoint Create List Items Activity

---

Use the Create List Items activity to create Items for existing lists in MS SharePoint.

### About this task

---

Use this task to create items for existing lists in MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Create List Items activity. The Create List Items activity will be added to the orchestration. Double click the activity. The MS SharePoint Create List Items Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. In the Checklist, click Configure. Click Browse. The List Selection Dialogue is displayed with Lists of only supported base templates which includes base template id as 100, 105 and 120. Select a List and Click OK.
5. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
6. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:**

- o Title

**Sample Input Request**

```
<?xml version="1.0" encoding="UTF-8"?>
<CreateListItems
  xmlns="http://www.IBM.com/xmlns/prod/websphere/j2ca/Sharepoint/createlistitems">
  <CreateListItemsRequestDetails xmlns="">
    <Title>B100_SampleTitle</Title>
  </CreateListItemsRequestDetails>
</CreateListItems>
```

**Note:** Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

7. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
8. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MS SharePoint Create List Items activity.

**Note:**

- You can create multiple list items at one go using this activity since the input variable is unbounded.
- “Multiple choice fields” support is available to create the new list item with choice elements.

## Using the MS SharePoint Update List Items Activity

---

Use the Update List Items activity to update list item properties for existing lists in MS SharePoint.

### About this task

---

Use this task to Update List Item properties like Title for existing lists in MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.

2. Drag the newly created MS SharePoint endpoint to the orchestration and select Update List Items activity. The Update List Items activity will be added to the orchestration. Double click the activity. The MS SharePoint Update List Items Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. In the Checklist, click Configure. Click Browse. The List Selection Dialogue is displayed with Lists of only supported base templates which includes base template id as 100, 105 and 120. Select a List and Click OK.
5. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
6. Create a map between the orchestration variables and the input parameter of the activity.  
**Mandatory Fields:**
  - o Title
  - o itemId (ID of the item which needs to update)

#### Sample Input Request

```
<?xml version="1.0" encoding="UTF-8"?>
<UpdateListItems
  xmlns="http://www.IBM.com/xmlns/prod/websphere/j2ca/Sharepoint/updatelistitems">
  <UpdateListItemsRequestDetails xmlns="">
    <Title>UpdatedTitle</Title>
    <itemId>1</itemId>
  </UpdateListItemsRequestDetails>
</UpdateListItems>
```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

7. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
8. Create a map between the output parameters and orchestration variables.

---

## Results

You have configured the MS SharePoint Update List Items activity.

Note:

- You can update properties of multiple list items at one go using this activity since the input variable is unbounded.
- “Multiple choice fields” support is available to update the existing list item with the choice elements.

## Using the MS SharePoint Retrieve List Items Activity

Use the Retrieve List Items activity to retrieve list item properties for existing lists from MS SharePoint.

---

### About this task

Use this task to retrieve the Item properties for existing lists from MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

---

### Procedure

1. Right click the Orchestrations section and select new orchestration.

2. Drag the newly created MS SharePoint endpoint to the orchestration and select Retrieve List Items activity. The Retrieve List Items activity will be added to the orchestration. Double click the activity. The MS SharePoint Retrieve List Items Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. In the Checklist, click Configure. Click Browse. The List Selection Dialogue is displayed with Lists of only supported base templates which includes base template id as 100, 105 and 120. Select a List and Click OK.
5. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
6. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:**

- retrieveType (Allowed values are SPECIFIC or ALL)
- itemId (Required if retrieveType is given as SPECIFIC)

**Sample Input Request**

```
<?xml version="1.0" encoding="UTF-8"?>
<RetrieveListItems
  xmlns="http://www.IBM.com/xmlns/prod/websphere/j2ca/Sharepoint/retrievelistitems">

  <!-- 1. retrieveType value as ALL -->
  <RetrieveListItemsRequestDetails xmlns="">
    <retrieveType>ALL</retrieveType>
  </RetrieveListItemsRequestDetails>

  <!-- 2. retrieveType value as SPECIFIC and valid value for itemId-->
  <RetrieveListItemsRequestDetails xmlns="">
    <retrieveType>SPECIFIC</retrieveType>
    <itemId>1</itemId>
  </RetrieveListItemsRequestDetails>
</RetrieveListItems>
```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

7. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
8. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MS SharePoint Retrieve List Items activity.

Note:

- You can retrieve properties of multiple list Items at one go using this activity since the input variable is unbounded.
- You can fetch the choice element data if it is available for the list item. Also you can use the “Multiple choice fields” in the filter parameters.

## Using the MS SharePoint Delete List Items Activity

---

Use the Delete List Items activity to delete list items of existing lists in MS SharePoint.

### About this task

---

Use this task to Delete List items of existing lists in MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS SharePoint endpoint to the orchestration and select Delete List Items activity. The Delete List Items activity will be added to the orchestration. Double click the activity. The MS SharePoint Delete List Items Checklist is displayed.
3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
4. In the Checklist, click Configure. Click Browse. The List Selection Dialogue is displayed with Lists of only supported base templates which includes base template id as 100, 105 and 120. Select a List and Click OK.
5. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
6. Create a map between the orchestration variables and the input parameter of the activity.

### Mandatory Fields:

- o itemId (Id of the item to delete)
- o ETag (gives the version of an item)

### Sample Input Request

```
<?xml version="1.0" encoding="UTF-8"?>
<DeleteListItems
  xmlns="http://www.IBM.com/xmlns/prod/websphere/j2ca/Sharepoint/deletelistitems">
  <DeleteListItemsRequestDetails xmlns="">
    <itemId>4</itemId>
    <ETag>24</ETag>
  </DeleteListItemsRequestDetails>
</DeleteListItems>
```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

7. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
8. Create a map between the output parameters and orchestration variables.

## Results

## Using the MS SharePoint Delete Attachments Activity

---

Use the Delete Attachments activity to delete attachments of list item for existing lists in MS SharePoint.

### About this task

---

Use this task to delete attachments of list item for existing lists in MS SharePoint instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.

2. Drag the newly created MS SharePoint endpoint to the orchestration and select Delete Attachments activity. The Delete Attachments activity will be added to the orchestration. Double click the activity. The MS SharePoint Delete Attachments Checklist is displayed.
  3. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MS SharePoint REST API activities](#).
  4. In the Checklist, click Configure. Click Browse. The List Selection Dialogue is displayed with Lists of only supported base templates which includes base template id as 100, 105 and 120. Select a List and Click OK.
  5. Select the Map Inputs in the Checklist. The XML Schemas generated from that operation are displayed as nodes under the request input parameter in the To Activity panel.
  6. Create a map between the orchestration variables and the input parameter of the activity.
- Mandatory Fields:**
- o itemId (Id of the item for which user wants to delete an attachment)
  - o filename (name of the file attached to the item)

#### Sample Input Request

```
<?xml version="1.0" encoding="UTF-8"?>
<DeleteAttachments
  xmlns="http://www.IBM.com/xmlns/prod/websphere/j2ca/Sharepoint/deleteattachments">
  <DeleteAttachmentsRequestDetails xmlns="">
    <itemId>4</itemId>
    <fileName>test123.txt</fileName>
  </DeleteAttachmentsRequestDetails>
</DeleteAttachments>
```

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

7. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
8. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MS SharePoint Delete Attachments activity.

Note:

You can delete multiple attachments at one go using this activity since the input variable is unbounded.

#### Limitation for Custom Fields for a List:

Even though SharePoint supports custom fields starting with a digit or having space in field names, Cast Iron Studio will fail to support them. This holds true for CRUD activities for List Items and Attachments activities.

Note:

If there is a change in schema (for example the list is changed from Configure section) the default values set for previous lists are retained for the fields in Map Inputs. It is advisable to do the mapping again in this case whenever the list is changed.

Note regarding Expand occurrences functionality:

There is a discrepancy in populating the Map Input section of the CRUD activities when user selects the Expand Occurrences option for a recurring node. The details of the same are mentioned in the below link:

<https://developer.ibm.com/answers/questions/251002/reselecting-the-same-objectfor-which-expand-occure.html#answer-251011>.

## Specifying the Retry options for MS SharePoint REST API activities

---

Specifying the Retry parameters is one of the tasks to configure a MS SharePoint activity. The MS SharePoint REST API connector uses a single login session for all connections to an MS SharePoint REST API endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

### About this task

---

This section contains the procedure for configuring the Retry options for MS SharePoint API activities.

### Procedure

---

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry and timeout options for connecting to an MS SharePoint instance, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the MS SharePoint instance.
Retry __ times before failing.	Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the MS SharePoint instance before issuing an error and stopping the processing of the current orchestration job. Note: If you deploy an orchestration that contains the MS SharePoint REST API activity and the Integration Appliance cannot connect to the specified MS SharePoint instance, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
Stop processing rest of the records of the batch if failure detected even after the configured no. of retries.	Specifies that if a batch of records is sent as input to an orchestration, and if failure is detected in between, then the remaining records should be processed or not. For example, if the retry count is set to 3 and a batch of 5 records is sent as input to the orchestration. If, after processing the 1st record of batch, the Integration Appliance cannot connect to the specified MS SharePoint instance even after configured number of retries i.e. 3 retry attempts, then the processing of the remaining 4 records will not be done and execution will be terminated if this option is selected. For the similar settings, if this option is not selected, then the remaining 4 records would be attempted to be processed.

## Creating and editing the MSDynamics CRM endpoint

MSDynamics CRM endpoints contain the connection information that Studio and the Integration Appliance use to connect to the MSDynamics CRM server. You can create multiple endpoints that refer to separate instances.

### About this task

Use this task to create or edit a MSDynamics CRM endpoint. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Note:

Any changes you make to the MSDynamics CRM endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

To create and edit a MSDynamics CRM endpoint, complete the following steps:

### Procedure

1. Drag an activity from the MSDynamics CRM folder under the Activities tab, to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. **Browse** - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
  - b. **New** - To create a new endpoint. The Create Endpoint window opens.
  - c. **Edit** - To edit the existing endpoint. The Edit Endpoint window opens.
4. In the Create Endpoint window, complete the fields defined in the following table:

Table 1. Connection details

Field Name	Description
<b>Login Details</b>	
User Name	Specifies the user name to connect to the MSDynamics online CRM server.
Password	Specifies the password associated with the user name to connect to the MSDynamics online CRM server.

Field Name	Description
<b>Service Details</b>	
Organization Unique Name	Specifies the name provided by MSDynamics Online CRM for the organization. You can locate the organization unique name under the developer resources in the MSDynamics CRM online portal.
Discovery Service	Specifies the discovery service URL provided by MSDynamics Online CRM. Currently, the value is defaulted for the Asia/Pacific geography. You can locate this URL under the developer resources in the MSDynamics CRM online portal.
Organization Service	Specifies the organization service URL provided by MSDynamics Online CRM. When you click the discover organization button, the organization service URL will be populated automatically using the discovery service and organization unique name values. Else, you can edit it manually. You can also locate the organization service under the developer resources in the MSDynamics CRM online portal.
<b>Authentication Details</b>	
Claims Based	This is the only authentication mechanism supported.
<b>Connection Timeout</b>	
Timeout after _____ seconds when establishing connection to the endpoint	Specifies the number of seconds before a time-out occurs between the activity making a request on an endpoint and the time it takes the endpoint to respond. By default this parameter is set to 300 seconds.
<b>Proxy connection details</b>	
Connect via a Proxy Server	Select this check box to enable the fields to connect through a proxy server.
Authentication	Indicates the type of authentication that the Integration Appliance uses when connecting to a proxy server. From the list, select one of the following authentication options: <ul style="list-style-type: none"> <li>o <b>Basic</b> - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure.</li> <li>o <b>NTLM</b> - Requires an instance of NTCredentials to be available for the domain name of the server. This authentication is the most secure authentication option. When you choose the NTLM authentication option, the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time that a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server.</li> </ul>
Realm/Domain	If you select the <b>Basic</b> authentication option, specify a realm. If you select the <b>NTLM</b> authentication option, specify a domain.
Host Name	Specify the host name of the proxy server.
Port	Specify the port number that is required to connect to the proxy server.
User Name	Specify the user name that is required to connect to the proxy server.
Password	Specify the password that is required to connect to the proxy server.

5. When finished, click Test Connection to confirm that you can connect to the MSDynamics CRM system.

6. Click OK.

## Results

You have created or edited a MSDynamics CRM endpoint.

# Using the MSDynamics CRM Create activity

---

Use the MSDynamics CRM Create activity to create entities such as Account, Contact, Lead, Opportunity, Product, Quote, Invoice, Order, Records, and so on, in the MSDynamics CRM server.

## About this task

---

Use this task to create entities in the MSDynamics CRM server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MSDynamics CRM Create activity, complete the following steps:

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the MSDynamics CRM folder contents.
2. Drag the Create activity icon onto the orchestration. The MSDynamics CRM Create Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MSDynamics CRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing the MSDynamics CRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the entity type. The Browse MSDynamics CRM entities window is displayed.
11. In Browse MSDynamics CRM entities window, you can either filter the entity type by searching for the entity, or select the entity type from the entity type list. Click Finish.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for MSDynamics CRM activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected entity of the Create activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MSDynamics CRM Create activity.

**Parent topic:** [MS Dynamics CRM Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MSDynamics\\_Create\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MSDynamics_Create_Activity.html)

# Using the MSDynamics CRM Update activity

---

Use the MSDynamics CRM Update activity to update entities such as Account, Contact, Lead, Opportunity, Product, Quote, Invoice, Order, Records, and so on in the MSDynamics CRM server.

## About this task

---

Use this task to update entities in the MSDynamics CRM server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MSDynamics CRM Update activity, complete the following steps:

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the MSDynamics CRM folder contents.
2. Drag the Update activity icon onto the orchestration. The MSDynamics CRM Update Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MSDynamics CRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing the MSDynamics CRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the entity type. The Browse MSDynamics CRM entities window is displayed.
11. In Browse MSDynamics CRM entities window, you can either filter the entity type by searching for the entity, or select the entity type from the entity type list. Click Finish.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for MSDynamics CRM activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Update Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MSDynamics CRM Update activity.

## Using the MSDynamics CRM Delete activity

---

Use the MSDynamics CRM Delete activity to delete entities such as Account, Contact, Lead, Opportunity, Product, Quote, Invoice, Order, Records, and so on from the MSDynamics CRM server.

## About this task

---

Use this task to delete entities from the MSDynamics CRM server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MSDynamics CRM Delete activity, complete the following steps:

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the MSDynamics CRM folder contents.
2. Drag the Delete activity icon onto the orchestration. The MSDynamics CRM Delete Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MSDynamics CRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing the MSDynamics CRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the entity type. The Browse MSDynamics CRM entities window is displayed.
11. In Browse MSDynamics CRM entities window, you can either filter the entity type by searching for the entity, or select the entity type from the entity type list. Click Finish.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for MSDynamics CRM activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Delete activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

## Results

## Using the MSDynamics CRM Retrieve activity

---

Use the MSDynamics CRM Retrieve activity to retrieve entities from the MSDynamics CRM server.

### About this task

---

Use this task to retrieve entities in the MSDynamics CRM server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the MSDynamics CRM Retrieve activity, complete the following steps:

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the MSDynamics CRM folder contents.
2. Drag the Retrieve activity icon onto the orchestration. The MSDynamics CRM Retrieve Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.

5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MSDynamics CRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing the MSDynamics CRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the entity type. The Browse MSDynamics CRM entities window is displayed.
11. In Browse MSDynamics CRM entities window, you can either filter the entity type by searching for the entity, or select the entity type from the entity type list. Click Finish.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for MSDynamics CRM activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

## Specifying retry parameters for MSDynamics CRM activities

---

Specifying the retry parameters is one of the tasks you must complete to configure a MSDynamics CRM activity.

### About this task

---

The MSDynamics CRM connector connects to the MSDynamics CRM server to execute the activities. If a connection is lost or timed out, the connector automatically establishes a new connection based on the parameters described in Table 1. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

For more information about the configuration tasks in the Checklist, see the help topic for the specific MSDynamics CRM activity.

To specify the retry parameters, complete the following steps:

### Procedure

---

1. In the Checklist, select Retry. The Retry panel is displayed.

2. Configure the retry options for connecting to the MSDynamics CRM server.

The following table describes the retry options for connecting to the MSDynamics CRM server:

Table 1. Retry options

Retry Fields	Description
--------------	-------------

Retry Fields	Description
Wait __ second(s) between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the MSDynamics CRM server. By default, this parameter is set to 30 seconds.
Try to connect __ times before failing.	Specifies the maximum number of times that the Integration Appliance attempts to establish a connection to the MSDynamics CRM server before issuing an error and stopping the processing of the current orchestration job. By default this parameter is set to 5 attempts.
<b>Activity Timeout</b>	
Time out after __ second(s) when the endpoint does not respond to a request.	Specifies the number of seconds the Integration Appliance waits before timing out, when the endpoint does not respond to a request. The default is 300 seconds.

## Results

---

You have configured the retry parameters for MSDynamics CRM activities.

**Parent topic:** [MS Dynamics CRM Activities](#)

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MSDynamics\\_Specifying\\_Retry\\_Parameters.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MSDynamics_Specifying_Retry_Parameters.html)

## MQ Activities

---

- [Creating or editing a MQ Activity endpoint](#)

MQ activities handle flat file, XML, or raw messages to or from an MQ queue. The MQ system handles routing of messages through the network of queues. All three of the MQ activities, MQ Get Message, MQ Poll Queue, and MQ Put Message use the same endpoint creation dialog box.

- [Installing JAR files to connect to the MQ system](#)

To connect to the MQ system from Studio, you must have the MQ connector-specific JAR files on the same workstation as your Studio installation. These files must be present in Studio to enable configuration of the endpoints and orchestrations.

- [Defining and loading an XML schema for a MQRFH2 header](#)

To include additional metadata or parameters in an MQ message, you must define an MQRFH2 header that defines the your parameters. Typically, these parameters are specific to an application but do not occur in the data of the message itself.

- [MQ Get Message activity](#)

Use the MQ Get Message activity retrieves messages from an MQ queue during run time.

- [MQ Put Message activity](#)

Use the MQ Put Message activity sends a message to the specified queue during run time.

- [MQ Poll Queue activity](#)

Use the MQ Poll Queue activity periodically checks the MQ Queue for messages based on a specified retry interval during runtime.

- [MQRFH2 XML data and schema examples](#)

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_MQactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_MQactivities.html)

## Creating or editing a MQ Activity endpoint

---

MQ activities handle flat file, XML, or raw messages to or from an MQ queue. The MQ system handles routing of messages through the network of queues. All three of the MQ activities, MQ Get Message, MQ Poll Queue, and MQ Put Message use the same endpoint creation dialog box.

## Before you begin

For MQ activities to be fully functional, ensure that the Queue Manager, Channel Name, and other queue names are configured correctly. For more information on MQ configuration, see WebSphere MQ Help.

## Procedure

1. Drag an MQ connection activity from the Activities tab onto the orchestration.

The Summary panel is displayed along with a Checklist which outlines what you must do to configure the activity.

2. Click Endpoint from the Checklist and select one of the following options:

- o Browse to add an endpoint from the endpoint repository. Once added, you can click Edit to edit it.  
Note: Editing an endpoint affects all orchestrations that use it. The edits are global, not local.
- o New to create a new endpoint.
- o Edit to edit the existing endpoint.

The Create Endpoint panel is displayed.

3. Fill in the fields defined in the following table.

4. Click OK when finished.

Table 1. Queue Manager Details

Field	Description
Location	Â
Host Name	Specifies the host name for the MQ Queue Manager.
Port	Specifies the port number to connect to the Queue Manager. Defaults to 1414, the default for Queue Managers.
Queue Manager	Specifies the name of the Queue Manager to connect to. The name can have a maximum length of 48 characters.
Channel Name	Specifies the channel name to use to connect to the Queue Manager. The name can have a maximum length of 20 characters.
Login	
User Name	User name for the account used to connect to the Queue Manager. The name has a maximum length of 12 characters. This account must be defined in the mqm group in MQ
Â	Note: For some of the fields in the endpoint, you can <a href="#">define configuration properties</a> to supply the values for these fields. Â The  icon is displayed when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.
Connection Pool Options	(Default values are provided for the connection pool options, but can be changed.)
Minimum Connections	Specifies the number of connections in the connection pool that the Integration Appliance always keeps open. Specifying 0 is supported.
Maximum Connections	Specifies the maximum number of connections that the Integration Appliance has open in the connection pool. If you change the default value, the value must be greater than or equal to the value specified for Minimum Connections. Valid values are 1 - 50. If you enter a value greater than 50, the value is reset to 50.

Field	Description
Maximum Idle Time	Specifies the amount of time that a connection can be open and idle before being closed by the Integration Appliance. Specifying 0 means that the connections are closed when they are returned to the pool —no idle time.

## Installing JAR files to connect to the MQ system

To connect to the MQ system from Studio, you must have the MQ connector-specific JAR files on the same workstation as your Studio installation. These files must be present in Studio to enable configuration of the endpoints and orchestrations.

### About this task

The two JAR files to be installed for WebSphere MQ version 5.x and 6.x are:

- connector.jar
- com.ibm.mq.jar

### Procedure

1. Open Studio, select Tools > Install Module Providers.
2. When the Add Provider(s) dialog box is displayed, click the plus (+) button under MQ Connector. A field and a Browse button is displayed.
3. Click Browse, and use the browse dialog box to locate and select both the JAR files.
4. Click Open to import the contents of the JAR files.
5. When the JAR files are listed in the Add Providers dialog box, click OK.

### Results

A prompt is displayed to restart Cast Iron Studio and activate the changes.

Note: You must manually restart Studio after it shuts down to apply the changes.

### What to do next

You can now create MQ connector endpoints and orchestrations.

## Defining and loading an XML schema for a MQRFH2 header

To include additional metadata or parameters in an MQ message, you must define an MQRFH2 header that defines the your parameters. Typically, these parameters are specific to an application but do not occur in the data of the message itself.

## About this task

---

Each parameter, which MQ calls a folder, is passed as an XML fragment along with other MQRFH2 header data. Each parameter can have its own unique XML structure.

Because the Integration Appliance works with XML messages, each of these parameter fragments must be extracted from the MQRFH2 header. The fragments are consolidated into one fragment and passed as the MQRFH2 parameter to the Integration Appliance.

To make these parameters accessible, both Studio and the Integration Appliance need access to an XML Schema that defines the structures of all the parameters. Complete the following procedure to create that XML Schema and load it into the project.

## Procedure

---

1. Create an XML Schema that defines the parameters of your MQRFH2 header using an XML Schema editor or text editor. For an example XML Schema, see [MQRFH2 XML data and schema examples](#). Your XML Schema must be customized for your application's parameters.  
Create the XML Schema according to the following guidelines:
  - o Define the consolidated structure as a single `NameValueData` element.
  - o List all the parameters, in the order they occur in the MQRFH2 header, as elements inside `NameValueData` element.
  - o Parameter names must be unique.
  - o Parameter, group, and property names must be valid XML names. See the XML specification or MQ documentation for more information.
  - o Each parameter must be wrapped in a single element. MQ documentation refers to this parameter element as a folder.
  - o Parameters may contain properties, groups, or both.
  - o Groups and properties may repeat.
  - o Groups can nest inside other groups.
  - o Properties must be defined as type `MQRFHQPropertyType`.
2. Add this XML Schema to the project. See [Uploading Files into a Project](#) for more information.
3. The XML Schema is now available in the Browse for Schema Type Element dialog box. In the Configure pane of the MQ activities, this dialog box appears when you click the Schema Fragment for MQRFH2 Header check box and then click [...]. In the Browse For Schema Type Element dialog box find the XML Schema that defines the header, select `NameValueData` element in that XML Schema, and click OK.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ\\_Define\\_and\\_Load\\_a\\_Schema\\_Fragment\\_for\\_the\\_MQRFH2\\_Header.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ_Define_and_Load_a_Schema_Fragment_for_the_MQRFH2_Header.html)

## MQ Get Message activity

---

Use the MQ Get Message activity retrieves messages from an MQ queue during run time.

Note: You must have [created an endpoint for the MQ activity](#) before configuring the activity.

The Configure task has three sections:

- [Queue and Message details](#) - where you specify properties for queue and message details.
- [Delivery rules](#) - where you specify how you want messages delivered.
- [Retry options](#) - where you specify how long to wait between retries and the number of time to retry before failing.

After completing the Configure tasks, [Mapping inputs](#) and [Mapping outputs](#) of the activity.

Note: The maximum message size is 100 MBytes.

## Queue and Message details

Specify the Queue and Message details for the fields in the following table. Required fields are marked with an asterisk.

Field	Description
Queue Name *	Specifies the name of the MQ queue where Integration Appliance attempts to retrieve the message from.
Timeout	<p>The number of seconds before a timeout occurs between the MQ Get Message activity requesting to retrieve a message from the queue and the time it takes for the message to be returned. If this timeout period expires and no message is returned from the queue, the Integration Appliance waits the specified retry time before attempting to retrieve a message again. For a detail explanation of the timeouts and retry options, see <a href="#">Timeout and Retry options</a>.</p> <p>To specify the number of seconds that the Integration Appliance should wait before issuing a timeout, select the After option and enter the number seconds in the Seconds field. By default the Never option is selected, this option specifies the Integration Appliance waits indefinitely to retrieve a message from the queue – there is no timeout period.</p>
Payload Data Type	Specifies the datatype of the message payload, either binary or string.
Schema Fragment for MQRFH2 Header	<p>Specifies if an MQRFH2 header is included in the message. If the message includes a MQRFH2 header, select this check box and click [...]. In the Browse For Schema Type Element dialog box to find the XML Schema that defines the header, select the NameValueData element in that XML Schema, and click OK. The schema fragment is the NameValueData element and all its child elements.</p> <p>Note: The XML Schema that defines the header must first be created and loaded into the project before you can select it. For more information see <a href="#">Defining and loading an XML schema for a MQRFH2 header</a>.</p>

## Delivery rules

Field	Description
Deliver Messages	<p>The options available here depend on whether the Unique ID's checkbox is selected. If selected, all three options are available. If not, only At Least Once is displayed.</p> <ul style="list-style-type: none"> <li>At least once - Specifies that the message is delivered at least once but can be delivered more than once. Connection or Integration Appliance failures can result in messages being retrieved and processed more than once. This delivery option is typically used when the receiving system can detect or tolerate duplicate messages.</li> <li>At most once - Specifies the message is delivered only once or not at all. Connection or Integration Appliance failures can result in messages being missed. This delivery option is typically used when the receiving system cannot tolerate duplicate messages but can tolerate lost messages.</li> <li>Exactly once - Specifies the message is delivered once and only once. Connection or Integration Appliance failures do not affect delivery with this option. The Integration Appliance uses MQ message IDs to ensure that every message is retrieved and processed exactly once.</li> </ul> <p>Note: If you select the Exactly Once option, you must enable persistence. For more information, see <a href="#">Enabling Persistence</a>.</p>
Where messages have Unique ID's	Specifies if the messages on the queue have unique IDs.

## Retry options

Configure the retry options for getting a message from the MQ queue as described in the following table:

Retry Options	Description
1) Wait --- seconds between	The number of seconds that the Integration Appliance waits before attempting to retrieve a message from the queue. To learn more about how this option relates to the Timeout field in the Configure pane or the timeout input parameter, see <a href="#">Timeout and Retry options</a> .

each retry.	
2) Try to connect --- times before failing.	<p>Specifies the maximum number of times the Integration Appliance attempts to retrieve a message from the queue before issuing an error and stops the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an MQ Get Message activity and the Integration Appliance cannot connect to the specified MQ Server or cannot get a message from the queue, the Integration Appliance logs the errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third errors appear in the system log as warnings. The Integration Appliance logs the fourth error as an error and stops processing the current orchestration job.</p> <p>To learn more about how this option relates to the Timeout field in the Configure pane or the timeout input parameter, see <a href="#">Timeout and Retry Options</a>.</p>

## Mapping inputs

---

1. Select the Map Inputs task in the Checklist. The Retry panel opens.

The input parameters of the activity are displayed in the To Activity panel.

2. All the input parameters of the MQ Get Message activity are optional. If the input parameter listed in the following table are not displayed in the To Activity pane of the Map Inputs panel, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity panel and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs panel to activate this option.

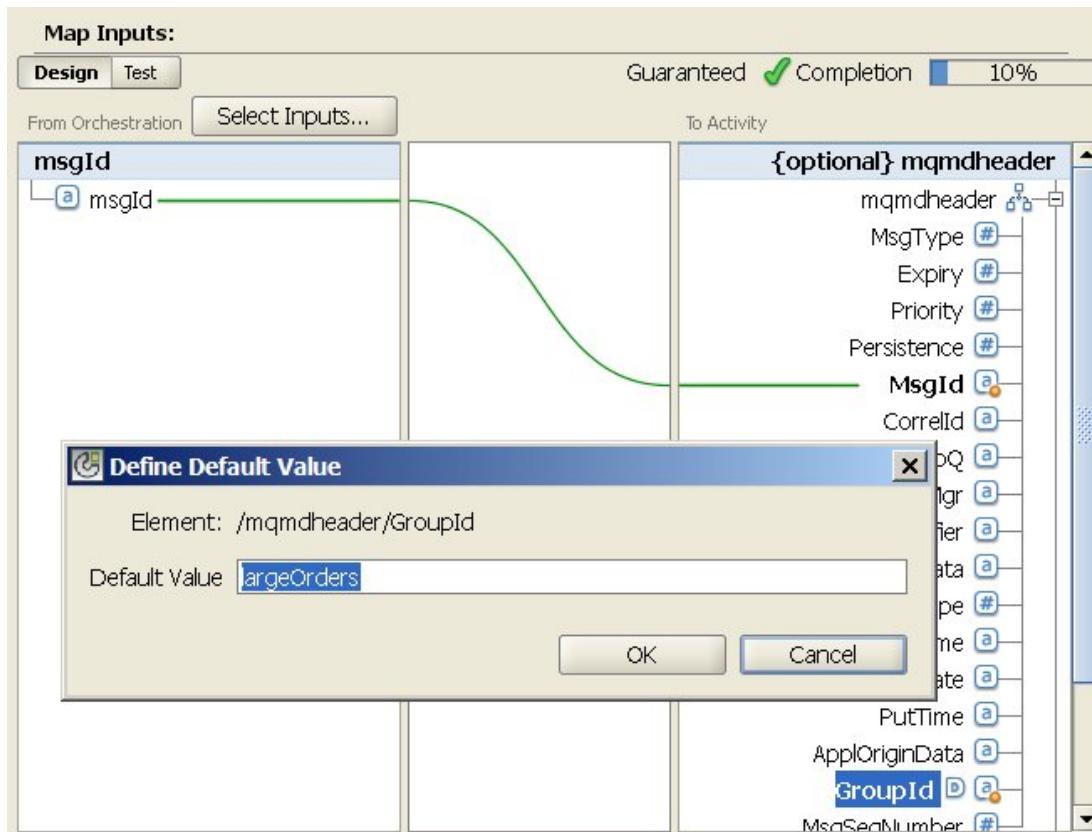

You can constrain the type of message returned by the MQ Get Message activity by mapping any combination of the following nodes of the mqmdheader optional input parameter:

- o mqmdheader/MsgId
- o mqmdheader/CorrelId
- o mqmdheader/GroupId
- o mqmdheader/MsgSeqNumber

During run time, the activity iterates sequentially through the messages in the queue. If nothing is mapped to these nodes, nothing is constrained so the first message in the queue is returned by the MQ Get Message activity and next activity in the orchestration is processed.

If any of these nodes are mapped, during run time the MQ Get Message activity iterates through each message in the queue until it finds the first message that matches the run time values of all the mapped nodes. The first matching message is returned by the MQ Get Message activity and next activity in the orchestration is processed.

For example in the Map Inputs task, mqmdheader/MsgId is mapped to the string called msgId and a default value of largeOrders is specified for the mqmdheader/GroupId as shown in the following figure:

During run time, the MQ Get Message activity returns the first message in the queue that satisfies both of the following conditions:

- The run time value specified of the string variable called `msgId` is equal message ID of the message in the queue.
- The group ID of the message equals `largeOrders`.

You can optionally override the settings you specified for the Queue Name and the Timeout in the Configure task of the Checklist dynamically during run time, using the input parameters defined in the following table.

For example, the MQ queue name can be set in the Configure task to `poqueue`. During run time, the MQ queue name: `newqueue` could be passed into the activity using the `queuename` input parameter. The queue name specified dynamically during run time overrides the original setting specified in the Configure panel. In this example, the Integration Appliance looks at the MQ queue named `newqueue` for messages.

Optional Input Parameters that Override the Settings in the Configure Task

<b>Input Parameter Name/Node</b>	<b>Description</b>	<b>Overrides the Setting in Task?</b>
<code>timeout</code>	Specifies the amount of time that the Integration Appliance waits after requesting to retrieve a message from the queue before retrying.  Specify a negative number to specify no timeout period – the Integration Appliance waits indefinitely to retrieve a message from the queue.  Specifying a negative number is equal to specifying the Never option in the Configure task.	The <code>timeout</code> input parameter overrides the <code>Timeout</code> field of the Configure task.
<code>queuename</code>	Specifies the name of the MQ queue where the Integration Appliance looks for messages.	The <code>queuename</code> input parameter overrides the <code>encoding</code> specified in the <code>Queue Name</code> field of the Configure task.

See [Creating a Map](#) for general instructions on mapping.

## Mapping outputs

You are not required to map the output parameters for this activity. See [Creating a Map](#) for general instructions on mapping.

## Timeout and Retry options

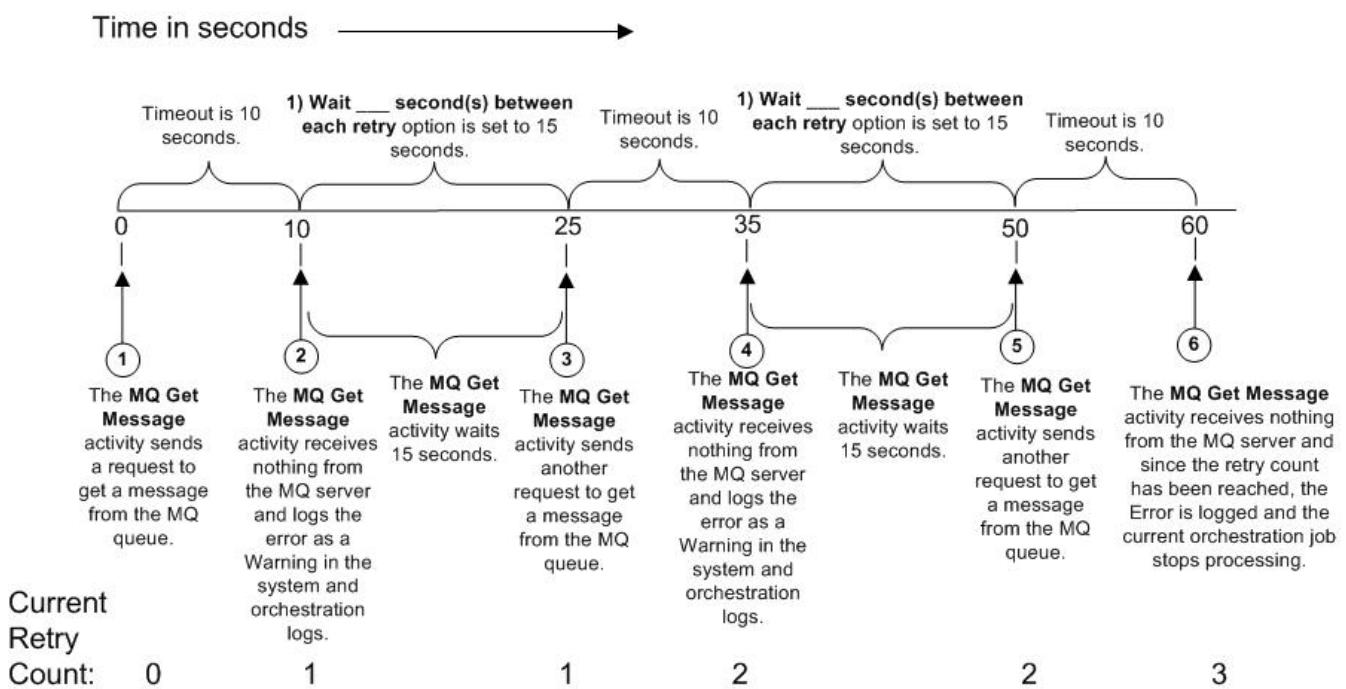

The timeout specified in the Timeout field in the Configure task or the timeout input parameter specifies the number of seconds before a timeout occurs between the MQ Get Message activity requesting to retrieve a message from the queue and the time it takes for the message to be returned. If this timeout period expires and no message is returned from the queue, the Integration Appliance waits the amount of time specified in the 1) Wait \_\_\_\_ second(s) between each retry option before attempting to retrieve a message, again. The Integration Appliance keeps attempting to get the message up to the specified retry count. The retry count is specified with the 2) Try to connect \_\_\_\_ times before failing. The 1) Wait \_\_\_\_ second(s) between each retry and 2) Try to connect \_\_\_\_ times before failing options are specified in the [Retry options](#) task.

For example, a MQ Get Message activity is configured with the following options:

- The Timeout field in the Configure task is set to 10 seconds and the optional timeout input parameter is not mapped and no default value is defined.
  - The 1) Wait \_\_\_ second(s) between each retry option is set to 15 seconds.
  - The 2) Try to connect \_\_\_ times before failing option is set to 2.

During run time, if the MQ Get Message activity is continuously unable to retrieve a message from the queue, as shown in the following figure:

## Time Line

[Feedback](#) | [Notices](#)

Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ\\_Get\\_Message\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ_Get_Message_Activity.html)

## MQ Put Message activity

Use the MO Put Message activity sends a message to the specified queue during run time.

Note: You must have [created an endpoint for the MO activity](#) before configuring the activity.

The Configure task has three sections:

- [Queue and Message details](#) - where you specify properties for queue and message details.
- [Delivery rules](#) - where you specify how you want messages delivered.
- [Retry options](#) - where you specify how long to wait between retries and the number of time to retry before failing.

After completing the Configure tasks, and [Mapping inputs](#) for the activity.

Note: The maximum message size is 100 MBytes.

## Queue and Message details

Specify the Queue and Message details using the fields in the following table. Required fields are marked with an asterisk.

Field	Description
Queue Name *	Specifies the name of the queue where the messages are put.
Payload Data Type	Specifies the datatype of the message payload, either binary or string.
Message Type	Datagram - Select if the message should be sent and no reply is needed. Request - Select if the message should have a reply. Be sure to set the Reply to Queue property for request messages. Response - Select if the message is a reply to a previous request.
Reply to Queue	Specifies the queue the reply should be sent to for request messages.
Reply to Queue Manager	Specifies the name of the Queue Manager that the queue (specified in the Reply to Queue field) belongs to.
Persistent	<ul style="list-style-type: none"><li>• True - Messages are restored to queues if the Queue Manager crashes.</li><li>• False - Messages may be lost from the queue if the Queue Manager crashes.</li><li>• Default - Messages use the persistence setting for the queue (this is the default).</li></ul>
Priority	Specifies the priority of the message. By default, the message priority defaults to the default priority for the queue. If the queue uses priorities to order messages and this message should have a specific priority set, select Specify and enter the priority. Priorities can range from 1 (lowest) up to 9 (highest). Note: The priority should not exceed the maximum priority number set for the MQ queue. Check with your MQ system administrator for this information.
Message Expiration	The number of seconds that messages are kept in the queue before expiring. Defaults to Never, which ensures that the message is delivered and waits on the queue until it is retrieved, no matter how long that may take.  If messages for this queue should expire and be discarded after some period of time, select Specify and enter the maximum number of Seconds that the message should be kept in the queue.
Schema Fragment for MQRFH2 Header	Specifies if an MQRFH2 header is included in the message. If the message is an XML message and includes a MQRFH2 header, select this check box and click [...]. In the Browse For Schema Type Element dialog box find the XML Schema that defines the header, select the NameValueData element in that XML Schema, and click OK. The schema fragment is the NameValueData element and all its child elements. Note: The XML Schema that defines the header must first be created and loaded into the project before you can select it. For more information see <a href="#">Defining and loading an XML schema for a MQRFH2 header</a> .

## Delivery rules

Field	Description
Delivery Messages	The options available here are: <ul style="list-style-type: none"><li>• At least once - Specifies that the message is delivered at least once but can be delivered more than once. Connection or Integration Appliance failures can result in messages being retrieved and processed more than once. This delivery option is typically used when the receiving system can detect or tolerate duplicate messages.</li><li>• At most once - Specifies the message is delivered only once or not at all. Connection or Integration Appliance failures can result in messages being missed. This delivery option is typically used when the receiving system cannot tolerate</li></ul>

duplicate messages but can tolerate lost messages.

## Retry options

Configure the retry options for connecting to a MQ Server. The following table describes the retry options for connecting to a MQ Server:

Retry Options	Description
1) Wait --- second(s) between each retry.	The number of seconds that the Integration Appliance waits before attempting to contact the Queue manager to send a message to MQ Server, again.
2) Try to connect --- times before failing.	Specifies the maximum number of times the Integration Appliance attempts to contact the Queue manager to send a message to the MQ Server before issuing an error and stopping the processing of the current orchestration job.  If you deploy an orchestration that contains an MQ Put Message activity and the Integration Appliance cannot connect to the Queue manager of the specified MQ Server, the Integration Appliance logs the errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and stops processing the current orchestration job.  For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth error as an error and stops processing the current orchestration job.

## Mapping inputs

You are required to map input parameters for this activity. The following parameter is required and must be mapped in order for the configuration to be complete. All other parameters are optional. See [Creating a Map](#) for more information.

Required Input Parameters:  
payload

To view the optional input parameters in the To Activity panel of the Map Inputs panel, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity panel and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs panel to activate this option.

**Parent topic:** [MQ Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ\\_Put\\_Message\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ_Put_Message_Activity.html)

## MQ Poll Queue activity

Use the MQ Poll Queue activity periodically checks the MQ Queue for messages based on a specified retry interval during runtime.

Note: You must have [created an endpoint for the MQ activity](#) before configuring the activity.

The Configure task has three sections:

- [Queue and Message details](#) - where you specify properties for queue and message details.
- [Delivery rules](#) - where you specify how you want messages delivered.
- [Retry options](#) - where you specify how long to wait between retries and the number of time to retry before failing.

After completing the Configure tasks, [Mapping outputs](#) for the activity.

Note: The maximum message size is 100 MBytes.

## Queue and Message details

Specify Queue and Message details for the fields in the following table. Required fields are marked with an asterisk.

Field	Description
Queue Name *	Specifies the name of the queue which is polled for messages.
Payload Data Type	Specifies the datatype of the message payload, either binary or string.
Schema Fragment for MQRFH2 Header	Specifies if an MQRFH2 header is included in the message. If the message is an XML message and includes a MQRFH2 header, select this check box and click [...]. In the Browse For Schema Type Element dialog box find the XML Schema that defines the header, select the <code>NameValueData</code> element in that XML Schema, and click OK. The schema fragment is the <code>NameValueData</code> element and all its child elements. Note: The XML Schema that defines the header must first be created and loaded into the project before you can select it. For more information see <a href="#">Defining and loading an XML schema for a MQRFH2 header</a> .

## Delivery rules

Field	Description
Poll for changes	Specifies how often the Integration Appliance should poll the queue for changes. For more information, see <a href="#">Polling Interval Behavior</a> .
Where messages have Unique ID's	Specifies if the messages on the queue have unique IDs.
Deliver Messages	The options available here depend on whether the Unique ID's checkbox is selected. If selected, all three options are available. If not, only At Least Once is displayed. <ul style="list-style-type: none"><li>• At least once - Specifies that the message is delivered at least once but can be delivered more than once. Connection or Integration Appliance failures can result in messages being retrieved and processed more than once. This delivery option is typically used when the receiving system can detect or tolerate duplicate messages.</li><li>• At most once - Specifies the message is delivered only once or not at all. Connection or Integration Appliance failures can result in messages being missed. This delivery option is typically used when the receiving system cannot tolerate duplicate messages but can tolerate lost messages.</li><li>• Exactly once - Specifies the message is delivered once and only once. Connection or Integration Appliance failures do not affect delivery with this option. The Integration Appliance uses MQ message IDs to ensure that every message is retrieved and processed exactly once. Note: If you select the Exactly Once option, you must enable persistence. For more information, see <a href="#">Enabling Persistence</a>.</li></ul>

## Retry options

Configure the retry options of the MQ Poll Queue activity, as defined in the following table:

Retry Options	Description
1) Wait --- second(s) between each retry.	The number of seconds that the Integration Appliance waits before attempting to retrieve messages from MQ Server, again.
2) Try to	Specifies the maximum number of times the Integration Appliance attempts to retrieve messages from the MQ Server

<p>connect — times before failing.</p>	<p>before failing.</p> <p>If an orchestration that starts with an MQ Poll Queue activity is deployed and the Integration Appliance cannot connect to the specified MQ server or cannot retrieve messages from queue, the Integration Appliance logs the errors as warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system log, resets the current retry count to zero, and continues to attempt to establish a connection to the MQ server.</p> <p>For example, you set the retry count to 3. The first, second, and third errors appear in the system log as warnings. The Integration Appliance logs the fourth error as an error and resets the current retry count to zero. Therefore, the fifth connection error generates a warning in the system log. The Integration Appliance continues to attempt to retrieve messages from the queue.</p>
--	--

## Mapping outputs

You are not required to map output parameters for this activity. However, if you do map any of these parameters, note the following points:

Parameters:

- payload and mqmdheader parameters are obtained from the message that is received from the queue.
- rfh2header is obtained if the schema for the RFH2 Header is specified in the Configure task.

**Parent topic:** [MQ Activities](#)

[Feedback](#) | [Notices](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ\\_Poll\\_Message\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ_Poll_Message_Activity.html)

## MQRFH2 XML data and schema examples

This section contains the following examples:

- [Example XML data that contains MQRFH2 parameters](#)
- [Example XML Schema that defines MQRFH2 parameters](#)

### Example XML data that contains MQRFH2 parameters

Note the following characteristics about the example XML data:

- ParameterA contains only properties.
- ParameterB contains groups with properties.
- ParameterC contains both a group and a property.
- Property4 repeats several times within groupDtl.

Example XML Data that Contains MQRFH2 Parameters:

```
<?xml version="1.0" encoding="UTF-8"?>
<NameValuePairData>
  <parameterA>
    <property1>value</property1>
    <property2 datatype="nt">345</property2>
  </parameterA>
  <parameterB>
```

```

<groupHeader>
<property3>true</property3>
</groupHeader>
<groupDtl>
<property4>ANR</property4>
<property4>BYC</property4>
<property4>ENN</property4>
</groupDtl>
</parameterB>
<parameterC>
<groupNew>
<property5>01/15/2004</property5>
</groupNew>
<property1>value</property1>
</parameterC>
</NameValuePairData>

```

## **Example XML Schema that defines MQRFH2 parameters**

---

The following example XML Schema defines the three parameters displayed in [Example XML data that contains MQRFH2 parameters](#). The type for all of the property elements: MQRFH2PropertyType, provides the datatype attribute shown on property2 in the preceding example. The MQRFH2PropertyType type also ensures that the elements can contain values.

The repetition for property4 in groupDtl is handled with the minOccurs and maxOccurs attributes. You can also set maxOccurs to unbounded to allow an unlimited number of repetitions.

An Example XML Schema that defines MQRFH2 Parameters:

```

<xsd:schema elementFormDefault="qualified">
  < xmlns:xsd="http://www.w3.org/2001/XMLSchema"
    xmlns:rfh="http://www.approuter.com/samples/MQ"
    targetNamespace="http://www.approuter.com/samples/MQ">
    <xsd:complexType name="MQRFH2PropertyType">
      <xsd:simpleContent>
        <xsd:extension base="xsd:string">
          <xsd:attribute name="dt" type="xsd:string" use="optional"/>
        </xsd:extension>
      </xsd:simpleContent>
    </xsd:complexType>
    <xsd:element name="NameValuePairData">
      <xsd:complexType>
        <xsd:sequence>

```

```
<xsd:element name="parameterA">
<xsd:complexType>
<xsd:sequence>
<xsd:element name="property1" type="rfh:MQRFH2PropertyType"/>
<xsd:element name="property2" type="rfh:MQRFH2PropertyType"/>
</xsd:sequence>
</xsd:complexType>
</xsd:element>

<xsd:element name="parameterB">
<xsd:complexType>
<xsd:sequence>
<xsd:element name="groupHeader">
<xsd:complexType>
<xsd:sequence>
<xsd:element name="property3" type="rfh:MQRFH2PropertyType"/>
</xsd:sequence>
</xsd:complexType>
</xsd:element>

<xsd:element name="groupDtl">
<xsd:complexType>
<xsd:sequence>
<xsd:element name="property4" type="rfh:MQRFH2PropertyType" minOccurs="1"
maxOccurs="5"/>
</xsd:sequence>
</xsd:complexType>
</xsd:element>

<xsd:element name="parameterC">
<xsd:complexType>
<xsd:sequence>
<xsd:element name="groupNew">
<xsd:complexType>
<xsd:sequence>
<xsd:element name="property5" type="rfh:MQRFH2PropertyType"/>
</xsd:sequence>
```

```

</xsd:complexType>
</xsd:element>
<xsd:element name="property1" type="rfh:MQRFH2PropertyType"/>
</xsd:sequence>
</xsd:complexType>
</xsd:element>
</xsd:sequence>
</xsd:complexType>
</xsd:element>
</xsd:schema>

```

**Parent topic:** [MQ Activities](#)

#### [Feedback | Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ\\_MQRFH2\\_Schema\\_Fragment\\_Examples.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ_MQRFH2_Schema_Fragment_Examples.html)

## NetSuite Activities

- [Creating or editing a NetSuite endpoint](#)  
Endpoints provide the NetSuite connection information that Studio and the Integration Appliance use to connect with NetSuite.
- [Add Records activity](#)  
Use the Add Records activity to add one or more new records to NetSuite. Each added record must be uniquely identifiable by its name, type, and hierarchy. If two or more records have the same identifiers, a SOAP fault is posted. The records to be added must be of the same record type.
- [Attach Records activity](#)  
The Attach Records activity can be used to define a relationship between two records. For example, a Contact record can be associated with a Vendor record. A Contact record can be associated with all entity records except for other Contact records and Group records.
- [Delete Records activity](#)  
The Delete Records activity can delete one or more records from NetSuite. Each deleted record must be uniquely identifiable by its name, type, and hierarchy. If two or more records have the same identifiers, a SOAP fault is posted. The records to be deleted must be of the same record type.
- [Detach Records activity](#)  
The detach records activity can be used to remove a relationship between two records. For example, a Contact record associated with a Vendor record can be removed. The Detach Records activity can also detach files, such as Word or PDF files, from a NetSuite record.
- [Get Records activity](#)  
The Get Records activity retrieves one or more records based on the records unique IDs. If any of the IDs are invalid, valid IDs are processed and a warning for invalid IDs is sent in the response.
- [Initialize Record activity](#)  
Use the Initialize Record activity to populate a transaction record with input from another related record. For example, you can populate a Sales Order record with input from the related Estimate record before submitting the Sales Order record to NetSuite.
- [Search Records activity](#)  
The Search Records activity searches for a specific record type based on search criteria that you specify.
- [Update Records activity](#)  
The Update Records activity can update one or more records. Only fields that are populated are updated in NetSuite. For fields

that are not populated, the previous value in NetSuite is maintained. If a field is populated with an empty string, the value of the field in NetSuite is replaced with an empty string.

- [Upsert Records Activity](#)

The Upsert Records activity can update a record if the record already exists in the database, or to insert the record if it does not. Only fields that are populated are updated in NetSuite. For fields that are not populated, the previous value in NetSuite is maintained. If a field is populated with an empty string, the value of the field in NetSuite is replaced with an empty string.

- [Troubleshooting and support](#)

Troubleshooting techniques and self-help information help you identify and solve problems quickly. This topic provides potential solutions for issues you would have with the NetSuite connector.

## Creating or editing a NetSuite endpoint

---

Endpoints provide the NetSuite connection information that Studio and the Integration Appliance use to connect with NetSuite.

### Procedure

---

1. Select an activity from the NetSuite folder of the Activities tab.
2. Drag the activity onto the orchestration.

The Summary panel is displayed along with a Checklist that lists the tasks that must be performed to configure the activity.

3. Click the Endpoint task from the Checklist and choose one of the following options:
  - Browse - To select an existing endpoint from the project.
  - New - To create a new endpoint.
  - Edit - To edit an existing endpoint.

Note: Edits are global, not local. Editing an endpoint affects all orchestrations that use that endpoint in the Project.

4. When the NetSuite endpoint screen is displayed, complete, or edit, the information in the following fields:
  - NetSuite Customer Login - Users are limited to two sessions for each username/password. One session is through the browser and the other session is through Web Services. Attempting a second login through the browser with the same username and password results in the first session terminating. The same scenario applies to attempts to establish two concurrent Web Services sessions. For multiple concurrent Web Services connections, obtain a Web Services Plus license.

Field	Description
Email Address	E-mail address used to login to NetSuite
Password	Password for E-mail address
Account Number	Account number associated with E-mail address

- Login Options - Choose either Login normally or Login in to the specified URL and specified version.

If you purchased the Web Services Concurrent License, click Web Services Plus License.

- Connection Pool Options - Leave the default values or change the values for the Connection Pool Options:

Field	Description
Minimum Connections	The default is 1.
Maximum Connections	The default is 1. If Web Services Plus License (Concurrent Web Services User preference) is selected, the default is 5.
Maximum Idle Time	The maximum number of minutes, the session can remain idle before ending the session. The default is 120 minutes. NetSuite enforces a 120 minute maximum.

Maximum Wait	Maximum Wait The maximum number of seconds to wait for the session to start. The default is 300 seconds.
--------------	--

- Connection Timeout - Use the up and down arrows to select the number of seconds, that you want to wait to establish a connection to the endpoint before ending the attempt.
- Proxy - To use a proxy server to connect with NetSuite, select Connect via a Proxy Server.

For Authentication, click the arrow and choose the mode, either Basic or NTLM.

For Realm, if you choose Basic authentication, you can specify a realm. If you do not specify a realm, the endpoint authenticates to 'any realm'.

Complete the following fields:

Field	Description
Host Name	The name of the proxy server or the IP address of the proxy server.
Port	The port number used by the proxy server to connect with NetSuite.
User Name	The ID used to login to the proxy server.
Password	The password for User Name.

- Update - Use the Update WSDL to\_2011\_1 button to upgrade the NetSuite WSDL. The button is inactive if WSDL\_2011\_1 is already present. After clicking the button, you will be presented with a list of project entities that will be affected by this update. At that point, you can decline to update to WSDL\_2011\_1 or proceed with the update.

Click Test Connection to verify that a connection can be established.

# Using the Add Records activity

---

To use the Add Records activity complete the following steps.

## Procedure

---

1. In the Activities tab, expand the NetSuite directory and locate the Add Records activity.
2. Add the Add Records activity to your orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. In the Checklist, click Pick Endpoint.
4. Select one of the following options:
  - Browse - to select a NetSuite endpoint from the Project Explorer.
  - New - to create a new NetSuite endpoint using the Create Endpoint dialog.  
For instructions on creating a NetSuite endpoint, see [Creating or editing a NetSuite endpoint](#).
  - Edit - to edit an existing NetSuite endpoint using the Edit Endpoint dialog.  
For instructions on editing a NetSuite endpoint, see [Creating or editing a NetSuite endpoint](#).  
Note: Edits are global, not local. Editing an endpoint affects all orchestrations that use that endpoint in the project.
5. In the Checklist, click Configure.
6. Click Browse to display the Browse NetSuite dialog.
7. In the Browse NetSuite dialog, click Show Record Types and select one of the following options:
  - All – to view all record types.
  - Only Custom – to view only custom records.
  - Only Standard – to view only standard NetSuite record types.

Note: To use custom records, you must enter the internal ID in the recType/internalId node.
8. To view custom fields in standard records, select the Generate custom fields for standard record types checkbox.  

This option does not apply to custom record types. The state of the checkbox is saved.
9. In the Browse NetSuite dialog, select a record type by completing one of the following tasks:
  - Enter the first few letters of a record type in the Search for a Record Type field, select the record type in the Record Type scroll list and then click Select.
  - Scroll through the Record Type scroll list until you find the required record type, click the record type, and then click Select.
10. To refresh the maps in NetSuite, in the Configure pane, click Refresh after the record type is set.
11. In the Checklist, click Retry.
12. In the Retry section:
  - Set the number of seconds, between each retry to connect with NetSuite. The default is 30 seconds.
  - Set the number of times you want to retry before failing. The default is 5 times.

In the Activity Timeout section:

  - Set the Activity Timeout, the number of seconds, to wait when the endpoint does not respond to a request. The default is 300 seconds.
13. Mapping inputs. See [Mapping the inputs for the Add Records activity](#) for more information.
14. Mapping outputs. See [Mapping the outputs for the Add Records activity](#) for more information.

## Attach Records activity

---

The Attach Records activity can be used to define a relationship between two records. For example, a Contact record can be associated with a Vendor record. A Contact record can be associated with all entity records except for other Contact records and Group records.

## About this task

---

The Attach Records activity can also attach files, such as Word or PDF files, to a NetSuite record. Any file that is in the NetSuite file cabinet can be attached to any record except for custom records.

The following list describes the nodes for the Attach Records activity in the Checklist > Map Inputs > To Activity panel:

- {RecordRef} attachTo - this node specifies the record to which the attachment is attached.
  - @type – In the Define Default Value, select the type of record.
  - @externalId – Either externalId or internalId must be specified for the RecordRef.
  - @internalID – Either externalId or internalId must be specified for the RecordRef.
- contact – This node specifies the record to associate with or the file to attach to the attachTo record.
  - @internalID – Either externalId or internalId must be specified for the RecordRef.
  - @externalId – Either externalId or internalId must be specified for the RecordRef.
  - @type – In the Define Default Value, select the type of record.
  - name – Enter the name of the contact or the file name.
- contactRole – This node specifies the role in the user defined Contact List located in the NetSuite UI at List > Relationships > Contacts.
  - exists – a Boolean used to indicate whether the Contacts List exists or not.
  - @internalID – Either externalId or internalId must be specified for the role.
  - @externalId – Either externalId or internalId must be specified for the role.
  - name – The title of the role such as Primary Contact.
- [Using the Attach Records activity](#)

## Using the Attach Records activity

---

To use the Attach Records activity, complete the following steps:

### Procedure

---

1. In the Activities tab, expand the NetSuite directory and locate the Attach Records activity.
2. Add the Attach Records activity to your orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. In the Checklist, click Pick Endpoint.
4. Select one of the following options:
  - Browse - to select a NetSuite endpoint from the Project Explorer.
  - New - to create a new NetSuite endpoint using the Create Endpoint dialog.

For instructions on creating a NetSuite endpoint, see [Creating or editing a NetSuite endpoint](#).

- Edit - to edit an existing NetSuite endpoint using the Edit Endpoint dialog.

For instructions on editing a NetSuite endpoint, see [Creating or editing a NetSuite endpoint](#).

Note: Edits are global, not local. Editing an endpoint affects all orchestrations that use that endpoint in the project.

5. In the Checklist, click Configure.
6. Click Configure to open the Attach Reference Activity Wizard.
7. Click Browse.
8. Select the record you want to attach and click Attach.

9. Click Next.
10. Select the record to which you want to attach the attachment record and click Select.
11. Click Finish.
12. In the Checklist, click Retry.
13. In the Retry section:
  - o Set number of seconds, between each retry to connect with NetSuite. The default is 30 seconds.
  - o Set the number of times you want to retry before failing. The default is 5 times.
- In the Activity Timeout section:
  - o Set the Activity Timeout, in seconds, you want to wait when the endpoint does not respond to a request. The default is 300 seconds.

## Mapping the outputs for the Detach Records activity

---

To map the outputs for the detach records activity, complete the following steps.

### Procedure

---

1. In the Checklist, click the Map Outputs task.
2. Click Copy.
3. Select detachListResponse and click Create to copy the detachListResponse from the Activity panel to the Orchestration panel.

**Parent topic:** [Detach Records activity](#)

## Get Records activity

---

The Get Records activity retrieves one or more records based on the records unique IDs. If any of the IDs are invalid, valid IDs are processed and a warning for invalid IDs is sent in the response.

- [Using the Get Records activity](#)  
To use the Get Records activity complete the following steps.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/netsuite\\_Get\\_Records\\_Activity\\_ov.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/netsuite_Get_Records_Activity_ov.html)

## Using the Get Records activity

---

To use the Get Records activity complete the following steps.

## Procedure

---

1. In the Activities tab, expand the NetSuite directory and locate the Get Records activity.
2. Add the Get Records activity to your orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. In the Checklist, click Pick Endpoint.
  4. Select one of the following options:
    - o Browse - to select a NetSuite endpoint from the Project Explorer.
    - o New - to create a new NetSuite endpoint using the Create Endpoint dialog.  
  
For instructions on creating a NetSuite endpoint, see [Creating or editing a NetSuite endpoint](#).
- For instructions on editing a NetSuite endpoint, see [Creating or editing a NetSuite endpoint](#).  
Note: Edits are global, not local. Editing an endpoint affects all orchestrations that use that endpoint in the project.
5. In the Checklist, click Configure.
  6. Click Browse to display the Browse NetSuite dialog.
  7. In the Browse NetSuite dialog, click Show Record Types and select one of the following:
    - o All – to view all record types.
    - o Only Custom – to view only custom records.
    - o Only Standard – to view only standard NetSuite record types.
- Note: To use custom records, you must enter the internal ID in the recType/internalId node.
8. To view custom fields in standard records, select the Generate custom fields for standard record types checkbox.

This option does not apply to custom record types. The state of the checkbox is saved.

9. In the Browse NetSuite dialog, choose a record type by performing one of the following tasks:
    - o Enter the first few letters of a record type in the Search for a Record Type field, select the record type in the Record Type scroll list and then click Select.
    - o Scroll through the Record Type scroll list until you find the record type you want, click the record type, and then click Select.
  10. To refresh the maps in NetSuite, after the record type is set in the Configure panel, click Refresh.
  11. In the Checklist, click Retry.
  12. In the Retry section:
    - o Set the number of seconds, between each retry to connect with NetSuite. The default is 30 seconds.
    - o Set the number of times you want to retry before failing. The default is 5 times.
- In the Activity Timeout section:
- o Set the Activity Timeout, in seconds, you want to wait when the endpoint does not respond to a request. The default is 300 seconds.
13. Map inputs. See [Mapping the inputs for the Get Records activity](#) for more information.
  14. Map outputs. See [Mapping the outputs for the Get Records activity](#) for more information.

**Parent topic:** [Get Records activity](#)

## Initialize Record activity

---

Use the Initialize Record activity to populate a transaction record with input from another related record. For example, you can populate a Sales Order record with input from the related Estimate record before submitting the Sales Order record to NetSuite.

### About this task

---

The following table lists the transaction records with the related record types that can be used to populate the transaction records.

Transaction Record Type	Related Initialization Record
Customer Refund	Cash Sale
Customer Refund	Return Authorization
Cash Sale	Customer
Cash Sale	Estimate
Cash Sale	Opportunity
Cash Sale	Sales Order

<b>Transaction Record Type</b>	<b>Related Initialization Record</b>
Credit Memo	Customer
Credit Memo	Invoice
Credit Memo	Return Authorization
Customer Payment	Customer
Customer Payment	Invoice
Estimate	Opportunity
Invoice	Customer
Invoice	Estimate
Invoice	Opportunity
Invoice	Sales Order
Item Fulfillment	Sales Order
Item Receipt	Return Authorization
Item Receipt	Purchase Order
Return Authorization	Cash Sale
Return Authorization	Invoice
Return Authorization	Sales Order
Sales Order	Estimate
Sales Order	Opportunity
Vendor Bill	Purchase Order

## Search Records activity

---

The Search Records activity searches for a specific record type based on search criteria that you specify.

### About this task

---

You specify search criteria by expanding an element node and then specifying the operator and search value. For example, for a record type having an account number node:

1. Expand the accountNumber node.
2. Click operator and then right-click operator.
3. Select Define Default Value.
4. In the Default Value field, click the arrow and select an operator from the list.
5. Click OK.
6. Click searchValue.
7. Select Define Default Value.
8. In the Default Value field, enter the account number.
9. Click OK.

The Search Records activity supports searching on fields with a null value using the operator noneOf. This search returns all records for which the field does not have a null value.

To retrieve values from lists, use the Get Records activity as the Search Records activity does not support lists.

You define the search criteria during the Map Inputs task in the To Activity panel.

- [Using the Search Records activity](#)

    - Only Custom – to view only custom records.
    - Only Standard – to view only standard NetSuite record types.
- Note: To use custom records, you must enter the internal ID in the recType/internalId node.
8. To view custom fields in standard records, select the Generate custom fields for standard record types checkbox.
- This option does not apply to custom record types. The state of the checkbox is saved.
9. In the Browse NetSuite dialog, choose a record type by performing one of the following tasks:

- Enter the first few letters of a record type in the Search for a Record Type field, select the record type in the Record Type scroll list and then click Select.
  - Scroll through the Record Type scroll list until you find the record type you want, click the record type, and then click Select.
10. To refresh the maps in NetSuite, after the record type is set in the Configure panel, click Refresh.
11. In the Checklist, click Retry.
12. In the Retry section:
- Set the number of seconds, between each retry to connect with NetSuite. The default is 30 seconds.
  - Set the number of times you want to retry before failing. The default is 5 times.
- In the Activity Timeout section:
- Set the Activity Timeout, in seconds, you want to wait when the endpoint does not respond to a request. The default is 300 seconds.
13. Map inputs. See [Mapping the inputs for the Upsert Records activity](#) for more information.
14. Map outputs. See [Mapping the outputs for the Upsert Records activity](#) for more information.

**Parent topic:** [Upsert Records Activity](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/netsuite\\_Upsert\\_Records\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/netsuite_Upsert_Records_Activity.html)

## Mapping the inputs for the Upsert Records activity

---

To map the inputs for the update records activity, complete the following steps.

### Procedure

---

1. In the Checklist, click the Map Inputs task.
  2. Click Select Inputs... and select the input variables for the map.
- For instructions on how to create variables, see [Creating Variables](#).

3. Map the elements in the From Orchestration panel to the NetSuite elements in the To Activity panel.

The elements in the To Activity panel are determined by the NetSuite record type you selected in the Configure task. For mapping instructions, see [Creating a Map](#).

## Mapping the outputs for the Upsert Records activity

---

To map the outputs for the update records activity, complete the following steps.

### Procedure

---

1. In the Checklist, click the Map Outputs task.
2. Click Copy.

3. Select either or both upsertListResponse or headers\_x and click Create to copy your choices from the Activity panel to the Orchestration panel.

## Troubleshooting and support

---

Troubleshooting techniques and self-help information help you identify and solve problems quickly. This topic provides potential solutions for issues you would have with the NetSuite connector.

### Points to note when upgrading to NetSuite 2013\_2 with WebSphere Cast Iron NetSuite Connector

---

In NetSuite 2013\_1 and earlier versions, every custom field in NetSuite was identified with an `internalId` (unique) attribute.

NetSuite has made the following changes in version 2013\_2 and later versions:

- `scriptId` is the new `internalId`
- a new `internalId` attribute has been introduced

These changes affect all orchestrations that use the Cast Iron NetSuite connector, with the internal ID for custom fields being populated. If you upgrade the connector endpoints to version 2013\_2 or a later version, these orchestration will stop working because the `internalId` attribute would still point to the old value.

#### Symptom

Orchestrations using the Cast Iron NetSuite connector stop working if you upgrade the connector endpoints to version 2013\_2 or later versions of NetSuite.

#### Solution:

1. Open each project using the NetSuite connector in IBM WebSphere Cast Iron Studio 7001.
2. Go to each NetSuite endpoint, click the 'Update Wsdl to 2014\_1' button and follow the steps to update the WSDL attached to the project.
3. For each activity in every orchestration using NetSuite connector, go to the Configure Tab of the activity and press the refresh button to update the NetSuite object with the latest schema.
4. Go to Map Input and Map Output section to ensure that the right value is populated for the internal ID field for the object and\or its child objects.
5. Thoroughly test the orchestrations in the project in development environment, before moving into production.
6. Repeat these steps for every project using NetSuite connector.

## Oracle CRM On Demand Activities

---

The following activities require the C0020-IBM: Connector for Oracle CRM On Demand.

- [Creating or editing an Oracle CRM On Demand endpoint](#)  
Oracle CRM On Demand endpoints contain the connection information that studio and the Integration Appliance use to connect to the Oracle CRM On Demand Server. You can create multiple endpoints that refer to separate instances.
- [Specifying the Retry options for Oracle CRM On Demand activities](#)  
Specifying the Retry parameters is one of the tasks to configure an Oracle CRM On Demand activity.
- [Using the Oracle CRM On Demand Insert Object activity](#)  
Use the Oracle CRM On Demand Insert Object activity to insert or create objects in the Oracle CRM On Demand instance.
- [Using the Oracle CRM On Demand Update Object activity](#)  
Use the Oracle CRM On Demand Update Object activity to update objects in the Oracle CRM On Demand instance, with new values.
- [Using the Oracle CRM On Demand Query Object activity](#)  
Use the Oracle CRM On Demand Query Object activity to query objects in the Oracle CRM instance.
- [Using the Oracle CRM On Demand Delete Object activity](#)  
Use the Oracle CRM On Demand Delete Object activity to delete objects from the Oracle CRM On Demand instance.

---

#### [Feedback | Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_oracleCRMactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_oracleCRMactivities.html)

## [Creating or editing an Oracle CRM On Demand endpoint](#)

---

Oracle CRM On Demand endpoints contain the connection information that studio and the Integration Appliance use to connect to the Oracle CRM On Demand Server. You can create multiple endpoints that refer to separate instances.

### [About this task](#)

---

Use this task to create or edit an Oracle CRM On Demand endpoint.

Note:

Any changes you make to the Oracle CRM On Demand endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

### [Procedure](#)

---

1. Drag an activity from the Oracle CRM On Demand folder under the Activities tab to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. Browse - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
  - b. New - To create a new endpoint. The Create Endpoint window opens.
  - c. Edit - To edit the existing endpoint. The Edit Endpoint window opens.
4. Complete the fields defined in the following table:

Table 1. Connection Details

Field Name	Description
Connection Details	
OracleCRM HostName	Specifies the host name of the Oracle CRM On Demand instance.
User Name	Specifies the user name to connect to the OracleCRM On Demand server.
Password	Specifies the password associated with the user name to connect to the OracleCRM On Demand server.

5. When finished, click Test Connection to confirm that you can connect to the Oracle CRM On Demand system.

6. Click OK.

## Specifying the Retry options for Oracle CRM On Demand activities

---

Specifying the Retry parameters is one of the tasks to configure an Oracle CRM On Demand activity.

### About this task

---

Use this task to configure the retry options for the Oracle CRM On Demand activities. The Oracle CRM On Demand connector uses a single login session for all connections to an Oracle CRM On Demand endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

### Procedure

---

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry and timeout options for connecting to an Oracle CRM On Demand instance, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Oracle CRM On Demand instance.
Try to connect __ times before failing.	Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the Oracle CRM On Demand instance before issuing an error and stopping the processing of the current orchestration job. Note: If you deploy an orchestration that contains the Oracle CRM On Demand activity and the Integration Appliance cannot connect to the specified Oracle CRM On Demand instance, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
Activity Timeout	
Timeout after ____ seconds when the endpoint does not respond to a request.	Specifies the number of seconds the Integration Appliance waits before timing out, when the endpoint does not respond to a request. The default is 300 seconds.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Oracle\\_Specifying\\_Retry\\_Parameters\\_for\\_Oracle\\_Activities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Oracle_Specifying_Retry_Parameters_for_Oracle_Activities.html)

## Using the Oracle CRM On Demand Insert Object activity

---

Use the Oracle CRM On Demand Insert Object activity to insert or create objects in the Oracle CRM On Demand instance.

### About this task

---

Use this task to insert or create objects in the Oracle CRM On Demand instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Oracle CRM On Demand folder contents.
2. Drag the Insert Object activity icon onto the orchestration. The Oracle CRM On Demand Insert Object Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle CRM On Demand endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an Oracle CRM On Demand endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse OracleCRMOD window is displayed.
11. In Browse OracleCRMOD, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Oracle CRM On Demand activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Insert Object activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the Oracle CRM On Demand Insert Object activity.

## Using the Oracle CRM On Demand Update Object activity

---

Use the Oracle CRM On Demand Update Object activity to update objects in the Oracle CRM On Demand instance, with new values.

### About this task

---

Use this task to update objects in the Oracle CRM On Demand instance, with new values. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Oracle CRM On Demand folder contents.
2. Drag the Update Object activity icon onto the orchestration. The Oracle CRM On Demand Update Object Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle CRM On Demand endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
*Note:* For more information, see [Creating or editing an Oracle CRM On Demand endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse OracleCRMOD window is displayed.
11. In Browse OracleCRMOD, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Oracle CRM On Demand activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Update Object activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
*Note:* Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the Oracle CRM On Demand Update Object activity.

# Using the Oracle CRM On Demand Query Object activity

---

Use the Oracle CRM On Demand Query Object activity to query objects in the Oracle CRM instance.

## About this task

---

Use this task to query objects in the Oracle CRM On Demand instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Oracle CRM On Demand folder contents.
2. Drag the Query Object activity icon onto the orchestration. The Oracle CRM On Demand Query Object Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle CRM On Demand endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an Oracle CRM On Demand endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse OracleCRMOD window is displayed.
11. In Browse OracleCRMOD, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Oracle CRM On Demand activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Query Object activity are displayed as nodes under the request input parameter in the To Activity panel.

Perform the following steps to type the query strings in the SearchSpec of the To Activity pane:

- a. Right-click a SearchSpec and select the Define Default Value option.
  - b. Specify the Default Value in the Define Default Value window. For example, to query for contact objects whose given name begins with Jo, then type the query string as "[ContactFirstName] = â€"Joâ€™â€". To query for contact objects whose given name is John, type "[ContactFirstName] = â€Johnâ€™â€". To query for contact objects whose name is Jane Doe, type the query string as "([ContactFirstName] = â€Janeâ€™â€) AND ([ContactLastName] = â€Doeâ€™â€)".
  - c. Click OK.  
Note: To get the value of the object name field, you must specify a blank value in the Name field of the Map Inputs section.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
  16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
  17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Oracle CRM On Demand Query Object activity.

**Parent topic:** [Oracle CRM On Demand Activities](#)

---

## Using the Oracle CRM On Demand Delete Object activity

---

Use the Oracle CRM On Demand Delete Object activity to delete objects from the Oracle CRM On Demand instance.

### About this task

---

Use this task to delete objects from the Oracle CRM On Demand instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Oracle CRM On Demand folder contents.
2. Drag the Delete Object activity icon onto the orchestration. The Oracle CRM On Demand Delete Object Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle CRM On Demand endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an Oracle CRM On Demand endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse OracleCRMOD window is displayed.
11. In Browse OracleCRMOD, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Oracle CRM On Demand activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Delete Object activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

### Results

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_oracleebsactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_oracleebsactivities.html)

## Overview of the Oracle E-Business Suite connector

With the Oracle E-Business Suite connector, you can interact and exchange information with Oracle E-Business Suite. By using the connector, you can send requests to the underlying Oracle database, without special coding.

You can perform the following activities by using the Oracle E-Business Suite connector:

- Outbound Activities
  - [Create Objects](#)
  - [Update Objects](#)
  - [Delete Objects](#)
  - [Retrieve Objects](#)
- Inbound Activities
  - [Get Created Objects](#)
  - [Get Updated Objects](#)
  - [Get Deleted Objects](#)

The versions of Oracle E-Business Suite application that is supported by the connector are 11.5,12.0, and 12.1.

## Installing JAR files to connect to Oracle E-Business Suite

---

You must copy the Oracle JDBC driver JAR file on the same workstation as your Cast Iron Studio installation before you can connect to the Oracle E-Business Suite application.

### Before you begin

---

- The JAR files can be obtained from the Oracle system administrator.
- The JAR files must be on the same computer as the studio installation.
- The JAR files must be from the same version as the Oracle E-Business Suite application you connect to.

Note: The Oracle E-Business Suite connector uses the Oracle thin driver to connect and work with the database.

### About this task

---

#### Procedure

---

1. Open studio and select Tools > Install Module Providers.
2. When the Add Provider(s) dialog box is displayed, click the plus (+) button under Oracle E-Business Suite. A field and a Browse button appears.
3. Click Browse, and use the browse dialog box to locate and select the JAR file.
4. Click Open to import the selected file.
5. When the JAR file is listed in the Add Provider(s) dialog box, click OK.

#### Results

---

A prompt is displayed to restart studio and activate the changes.

### What to do next

---

You can now create Oracle E-Business Suite endpoints and orchestrations.

**Parent topic:** [Oracle E-Business Suite Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/OracleEBS\\_installing\\_jarfiles.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/OracleEBS_installing_jarfiles.html)

## Creating or editing an endpoint for an Oracle E-Business Suite activity

---

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to an Oracle database. Â

### Selecting or editing an Oracle E-Business Suite endpoint

---

1. In the Create Endpoint or Edit Endpoint pane, configure the Oracle database as described in the following table. In addition to these fields, the endpoint pane contains Connection pool options and Remote Endpoint Configuration.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the Oracle database successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
<b>Oracle E-Business Suite connector - Connection Information</b>	
Interface	Specifies the interface used to communicate with Oracle E-Business Suite. Currently, only database is supported, which uses JDBC API to communicate with Oracle E-Business Suite.
Host Name	Specifies the host name or IP address of the machine on which the Oracle database is running.
Port Number	Specifies the Oracle Internet port that allows Javaâ„¢ applets or applications to access the database.
System ID	Specifies the system ID (SID) to connect to the Oracle database.
User Name	Specifies the user name to connect to the Oracle database.
Password	Specifies the password associated with the user name to connect to the Oracle database.
Additional Properties	Specifies the additional properties to be set when connecting to the database using the JDBC driver.
<b>Connection Pool options</b>	
Minimum Connections	Specifies the lowest number of Oracle database connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
Maximum Connections	Specifies the maximum number of Oracle database connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
Maximum Idle Time	Specifies the amount of time in minutes that a Oracle database connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool â€”no idle time. The default value is 120 minutes.
Maximum Wait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
Reclaim Connections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minutes.
Note: The Connection pool properties need to be configured as per the load (number of concurrent requests) on the endpoint.	
<b>Remote Endpoint Configuration</b>	
Endpoint Runs Behind Firewall	Enables the secure connector name property so that secure connector can be used if the Oracle database is installed behind a firewall.
Secure Connector Name	Specifies the name of the secure connector that is used to connect to the Oracle database is installed behind a firewall.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/OracleEBS\\_creating\\_an\\_endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/OracleEBS_creating_an_endpoint.html)

## Using the Oracle E-Business Suite Create Objects activity

---

Use the Create Objects activity to create rows in database tables corresponding to the business object in the request. You can create rows to flat tables/views that have a primary key defined.

## About this task

---

Use this task to create objects in the Oracle E-Business Suite application. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Oracle E-Business Suite folder contents.
2. Drag the **Create Objects** activity from the Oracle E-Business Suite folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle E-Business Suite endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for an Oracle E-Business Suite activity](#).
8. To make the required changes to the selected endpoint configuration, click Edit to access the options in a separate window.  
Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the Oracle table/view name in the Oracle Table/View field.
11. In Browse Oracle Database Tables/Views dialog:
  - o Select a user schema from the Filter by user schema drop-down list.
  - o Select either Tables or Views from Database object type.
  - o Use Filter tables/views by name to filter the tables/views during selection.
  - o Select a table/view.
12. Click OK.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery options for Oracle E-Business Suite activities](#).
14. Select Map Inputs in the Checklist. The XML schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Oracle E-Business Suite Create Objects activity.

## Using the Oracle E-Business Suite Update Objects activity

---

Use the Update Objects activity to update rows in the database tables corresponding to the business object in the request. You can update rows of flat tables that have a primary key defined.

## About this task

---

Use this task to update objects in the Oracle E-Business Suite application. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Oracle E-Business Suite folder contents.
2. Drag the **Update Objects** activity from the Oracle E-Business Suite folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle E-Business Suite endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for an Oracle E-Business Suite activity](#).
8. To make the required changes to the selected endpoint configuration, click Edit to access the options in a separate window.  
Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the Oracle table/view name in the Oracle Table/View field.
11. In Browse Oracle Database Tables/Views dialog:
  - Select a user schema from the Filter by user schema drop-down list.
  - Select either Tables or Views from Database object type.
  - Use Filter tables/views by name to filter the tables/views during selection.
  - Select a table/view.
12. Select a table and click OK.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery options for Oracle E-Business Suite activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Update Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel. Create a map between the output parameters and orchestration variables.

## Results

## [Specifying Retry and Delivery options for Oracle E-Business Suite activities](#)

---

Specifying the Retry and Delivery parameters is one of the tasks to configure a Oracle E-Business Suite activity configuration.

### About this task

---

This section contains the procedures for configuring the Oracle E-Business Suite activities.

## Procedure

---

To specify the retry options for Oracle E-Business Suite activities:

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry options for connecting to a Oracle E-Business Suite server as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait $\text{---}$ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Oracle E-Business Suite application.
Try to connect $\text{---}$ times before failing.	<p>Specifies the retry count — the maximum number of times the Integration Appliance attempts to establish a connection to the Oracle E-Business Suite application before issuing the following errors:</p> <ul style="list-style-type: none"> <li>o When you set this parameter to 0, Studio does not try to reconnect.</li> <li>o When you set this parameter to a value less than 0, Studio retries the connection indefinitely.</li> </ul> <p>If an orchestration that starts with an outbound Oracle E-Business Suite activity is deployed and the Integration Appliance cannot connect to the specified Oracle E-Business Suite application, the Integration Appliance logs the connection errors as warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system log, resets the connection error count to zero, and continues to attempt to establish a connection to the Oracle E-Business Suite application.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

## Specifying the delivery rules options for Oracle E-Business Suite inbound activities

---

### About this task

This section contains the procedure for configuring the delivery rule options for Oracle E-Business Suite inbound activities.

### Procedure

1. Select the Delivery Rules task from the Checklist. The delivery rules pane is displayed.
2. Configure the delivery rules options to select the activity's behavior as described in the following table.

Table 2. Delivery rules

Delivery Rules Fields	Description
Poll for changes every $\text{-----}$ days/hours/minutes/seconds	Specifies the time interval to poll for objects in the Oracle database. (For example, the Get created object activity polls for create objects at the specified time internal.) Time can be selected in the format days, hours, minutes, or seconds.
Fetch $\text{-----}$ rows per poll	Specifies how many objects or components the activity should retrieve from the Oracle database in each poll cycle.
<b>Delivery Messages</b>	Â
ATMOST_ONCE	A non-persistent mode in which a row from the Oracle table is either delivered once or not delivered at all.
ATLEAST_ONCE	A persistent mode, in which a row from the Oracle table is not lost. As a result, there are chances that the orchestration can receive events once or more than once.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/OracleEBS\\_specifying\\_retry\\_parameters.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/OracleEBS_specifying_retry_parameters.html)

## Prerequisites for starter activities in Oracle E-Business Suite

---

This section contains the prerequisites to configure the Oracle E-Business Suite inbound activities.

You must create an event store and triggers in Oracle database as a prerequisite for using the starter activities.

The event store is a table that holds events that represent data changes until the polling connector can process them. The connector uses the event store to keep track of event entities. Each time a database record is created, updated, or deleted, the connector updates the status of the event in the event store. The Event Store Name field can be found in the Configure panel of the Get Created, Get Deleted, and Get Updated activities.

You can set triggers on user tables as needed to populate the event store. For Oracle database, set up triggers on user tables so that changes to the user tables can automatically generate events that are stored in the event store.

### Creating the event store and triggers in Oracle E-Business Suite

---

To create an "Event Store" and "Triggers" in Oracle database, perform the following:

1. Create a new table. For example, if the event store name is configured as IBM\_CI\_EVENTS, use the script available in <STUDIO ROOT>/etc/oracleebs/scripts/IBM\_CI\_EVENTS.SQL. The structure of the event table is described as follows:

Note: It is recommended that a separate event table is created and used for every configured table/view.

Table 1. Event table structure

Column name	Type	Description
event_id	Number	The unique event ID, which is a primary key for the table. This can have the same value as the object_key.
object_key	String	A string that contains the primary key of the record that is retrieved.  This column cannot be null.
object_name	String	Each business object refers to a table or view. The name of the business object is constructed with the schema name and table name.  This column cannot be null.
object_function	String	The operation corresponding to the event (Delete, Create, and Update).  This column cannot be null  .
event_priority	Number	Identifies the event priority. This value must be a positive integer.  This column cannot be null.
event_time	Timestamp	Date and time when event was generated. The format is mm/dd/yyyy hh:mm:ss.
event_status	Â	The event status is initially set to a value for a new event and updated by the adapter as it processes the event. The status can have one of the following values: <ul style="list-style-type: none"><li>o 0: Identifies a new event.</li><li>o 1: Identifies an event that has been delivered to an export.</li><li>o -1: An error occurred while processing the event.</li></ul> This column cannot be null.
event_comment	Â	Any comment associated with the event.
event_message	Â	this is optional. This field can be blank.
xid	Â	this is optional. This field can be blank.

Column name	Type	Description
connector_ID	Â	The unique identifier for the connector instance that receives a specific event.

2. To create Triggers for your table, refer to the sample <STUDIO\_ROOT>/etc/oracleebs/scripts/sample\_trigger.sql. The trigger is used to populate the event store when a row is created, updated, or deleted.

Here is a sample of an insert trigger called event\_create which populates the event store IBM\_CI\_EVENTS when a row is added to the selected table.

```
create or replace
TRIGGER SCOTT.event_create
    after insert on SCOTT.CUSTOMER for each row
begin
    insert into "SCOTT"."IBM_CI_EVENTS"
    (
        event_id
        , object_key
        ,object_name
        ,object_function
        ,event_priority
        ,event_status
    )
    values
    (
        event_sequence.nextval
        ,:new.PKEY
        ,'ScottCustomer'
        ,'Create'
        ,0
        ,0
    );
end;
```

Table 2. Trigger description

Column name	Values
event_id	For a unique event_id, a sequence called event_sequence is used. Or else, you can provide a unique event ID for every row that is inserted.
object_key	This contains the primary key of the record.
object_name	The object name is constructed with the schema name and table name. For example, if the table CUSTOMER is present in Scott's schema, then the value of this property will be ScottCustomer.
object_function	The value of object_function will be Create/Update/Delete depending on whether it is an insert/update/delete trigger.
event_priority	The value of event_priority must be 0 or a positive integer.
event_status	The value of event_status must be 0, so that it is considered as a new event.

## Using the Oracle E-Business Suite Get Created Objects activity

Use the Get Created Objects activity to get the values of rows that have been newly created in the database tables/views corresponding to the business object in the request.

### About this task

Use this task to get created objects from the Oracle E-Business Suite application. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Oracle E-Business Suite folder contents.
2. Drag the **Get Created Objects** activity from the Oracle E-Business Suite folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle E-Business Suite endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for an Oracle E-Business Suite activity](#).
8. To make the required changes to the selected endpoint configuration, click Edit to access the options in a separate window.  
Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Specify the Event Store name configured in the Oracle database. The activity polls this Event Store for new events.
11. Browse for the Oracle tables/views name in the Oracle Table/View field.
12. In Browse Oracle Database Tables/Views dialog:
  - o Select a user schema from the Filter by user schema drop-down list.
  - o Select either Tables or Views from Database object type.
  - o Use Filter tables/views by name to filter the tables/views during selection.
  - o Select a table/view.
13. Click OK.
14. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery options for Oracle E-Business Suite activities](#).
15. Select Map Inputs in the Checklist. The XML schemas generated from the selected object of the Get Created Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
16. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Oracle E-Business Suite Get Created Objects activity.

## Using the Oracle E-Business Suite Get Updated Objects activity

---

Use the Get Updated Objects activity to get the rows that have been updated in the database tables corresponding to the business object in the request.

## About this task

---

Use this task to get the updated objects in the Oracle E-Business Suite application. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Oracle E-Business Suite folder contents.
2. Drag the **Get Updated Objects** activity from the Oracle E-Business Suite folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle E-Business Suite endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for an Oracle E-Business Suite activity](#).
8. To make the required changes to the selected endpoint configuration, click Edit to access the options in a separate window.  
Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Specify the Event Store name configured in the Oracle database. The activity polls this Event Store for new events.
11. Browse for the Oracle table/view name in the Oracle Table/View field.
12. In Browse Oracle Database Tables/Views dialog:
  - o Select a user schema from the Filter by user schema drop-down list.
  - o Select either Tables or Views from Database object type.
  - o Use Filter tables/views by name to filter the tables/views during selection.
  - o Select a table/view.
13. Click OK.
14. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery options for Oracle E-Business Suite activities](#).
15. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get Updated Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
16. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Oracle E-Business Suite Get Updated Objects activity.

**Parent topic:** [Oracle E-Business Suite Activities](#)

## Using the Oracle E-Business Suite Get Deleted Objects activity

---

Use the Get Deleted Objects activity to get the deleted records from the Oracle table.

### About this task

---

Use this task to get deleted records from the Oracle E-Business Suite application. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Oracle E-Business Suite folder contents.
2. Drag the **Get Deleted Objects** activity from the Oracle E-Business Suite folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle E-Business Suite endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for an Oracle E-Business Suite activity](#).
8. To make the required changes to the selected endpoint configuration, click Edit to access the options in a separate window.  
Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Specify the Event Store name configured in the Oracle database. The activity polls this Event Store for new events.
11. Browse for the Oracle table/view name in the Oracle Table/View field.
12. In Browse Oracle Database Tables/Views dialog:
  - o Select a user schema from the Filter by user schema drop-down list.
  - o Select either Tables or Views from Database object type.
  - o Use Filter tables/views by name to filter the tables/views during selection.
  - o Select a table/view.
13. Click OK.
14. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery options for Oracle E-Business Suite activities](#).
15. Create a map between the orchestration variables and the input parameter of the activity.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Oracle E-Business Suite Get Deleted Objects activity.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_peoplesoftactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_peoplesoftactivities.html)

## Overview of the PeopleSoft connector

---

The PeopleSoft connector enables you to create integrated processes that exchange information with PeopleSoft Enterprise through a standard interface. This interface shields the client application from analyzing lower-level details about implementation of the application or data structures used on the PeopleSoft Enterprise server.

You can perform the following activities using the PeopleSoft connector:

- Outbound Activities
  - [Create Component Interface](#)
  - [Update Component Interface](#)
  - [Delete Component Interface](#)
  - [Get Component Interface](#)
  - [Find Component Interface](#)
- Inbound/Starter Activities
  - [Get Created Component Interface](#)
  - [Get Updated Component Interface](#)
  - [Get Deleted Component Interface](#)

The PeopleSoft connector supports the following versions of the PeopleTools: 8.22, 8.40 - 8.49, 8.50, and 8.51.

Note: The connector is compatible with any version of PeopleSoft Applications that works with the version of PeopleTools supported by the adapter.

The PeopleSoft connector requires PeopleSoft JAR files to connect to the PeopleSoft server. For more information, see [Installing JAR files to connect to the PeopleSoft server](#) and [Creating events table and compiling PeopleSoft JAR files](#).

## Creating or editing an endpoint for a PeopleSoft activity

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a PeopleSoft server.

### Selecting or editing a PeopleSoft endpoint

1. In the Create Endpoint or Edit Endpoint pane, configure the PeopleSoft server as described in the following table. In addition to these fields, the endpoint pane contains Connection pool options and Remote Endpoint Configuration.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the PeopleSoft server successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
<b>PeopleSoft Server Configuration</b>	
Host Name	Specifies the host name or IP address of the machine on which PeopleSoft server is running.
Port	Specifies the PeopleSoft Internet port that allows Javaâ„¢ applets or applications to access PeopleSoft data.
User Name	Specifies the user name to connect to the PeopleSoft server.
Password	Specifies the password associated with the user name to connect to the PeopleSoft server.
Language Code	Specifies the language code to connect to the PeopleSoft server. There are 22 language codes listed. The default code is ENG.
<b>Connection Pool options</b>	
Minimum Connections	Specifies the lowest number of PeopleSoft server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
Maximum Connections	Specifies the maximum number of PeopleSoft server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
Maximum Idle Time	Specifies the amount of time in minutes that a PeopleSoft server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool â€œno idle time. The default value is 120 minutes.
Maximum Wait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
Reclaim Connections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.
Note: The Connection pool properties need to be configured as per the load (number of concurrent requests) on the endpoint.	
<b>Remote Endpoint Configuration</b>	
Endpoint Runs Behind Firewall	Enables the secure connector name property so that secure connector can be used if the PeopleSoft server is running behind a firewall.
Secure Connector Name	Specifies the name of the secure connector that is used to connect to the PeopleSoft server running behind a firewall. For example, if an orchestration containing PeopleSoft activity is deployed on to Cast Iron Live (cloud), then the secure connector needs to be configured.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PeopleSoft\\_creating\\_an\\_endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PeopleSoft_creating_an_endpoint.html)

## Installing JAR files to connect to the PeopleSoft server

---

You must copy two JAR files on the same workstation as your Cast Iron Studio installation before you can connect to a PeopleSoft server.

### Before you begin

---

- The JAR files can be obtained from the PeopleSoft system administrator.
- The JAR files must be on the same computer as the studio installation.
- The JAR files must be from the same version as the PeopleSoft server you connect to.

For more information about creating event tables and compiling PeopleSoft JAR files, see [Creating events table and compiling PeopleSoft JAR files](#).

### About this task

---

The files to be installed are:

- PSFTCI.jar
- psjoi.jar

### Procedure

---

1. Open studio and select Tools > Install Module Providers.
2. When the Add Provider(s) dialog box is displayed, click the plus (+) button under PeopleSoft Connector. A field and a Browse button appears.
3. Click Browse, and use the browse dialog box to locate and select the JAR files.
4. Click Open to import the selected files.
5. When the JAR files are listed in the Add Provider(s) dialog box, click OK.

### Results

---

A prompt is displayed to restart studio and activate the changes.

### What to do next

---

You can now create PeopleSoft endpoints and orchestrations.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PeopleSoft\\_installing\\_jarfiles.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PeopleSoft_installing_jarfiles.html)

## Using the PeopleSoft Create Component Interface activity

---

Use the PeopleSoft Create Component Interface activity to create new component interfaces on the PeopleSoft server. The newly created component contains data that represent a business entity.

## Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the PeopleSoft server. For more information, see [Installing JAR files to connect to the PeopleSoft server](#).
- Valid connection details to connect to the PeopleSoft server.

## About this task

---

Use this task to create component interfaces on the PeopleSoft server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the PeopleSoft folder contents.
2. Drag the Create Component Interface activity icon onto the orchestration. The PeopleSoft Create Component Interface Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant PeopleSoft endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for a PeopleSoft activity](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the component interface name in the Component Interface field. Component interface name is populated with a default value, which represents the PeopleSoft interface. Browse for the component interface name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this component interface.
11. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry and Delivery Options for PeopleSoft Activities](#).
12. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Component Interface activity are displayed as nodes under the request input parameter in the To Activity panel.  
Note: The PeopleSoft connector generates a single input schema for all the objects used by the activities. There may be some fields that are redundant and not applicable for this activity.
13. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
14. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
15. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the PeopleSoft Create Component Interface activity.

## Using the PeopleSoft Update Component Interface activity

---

Use the PeopleSoft Update Component Interface activity to update component interfaces on the PeopleSoft server. This activity updates the corresponding PeopleSoft component with the incoming business object.

## Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the PeopleSoft server. For more information, see [Installing JAR files to connect to the PeopleSoft server](#).
- Valid connection details to connect to the PeopleSoft server.

## About this task

---

Use this task to update component interfaces on the PeopleSoft server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the PeopleSoft folder contents.
2. Drag the Update Component Interface activity icon onto the orchestration. The PeopleSoft Update Component Interface Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant PeopleSoft endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for a PeopleSoft activity](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the component interface name in the Component Interface field. Component interface name is populated with a default value, which represents the PeopleSoft interface.
  - a. In the Browse component interface window, browse for the component interface name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this component interface.
  - b. Click Next. The Preserve child relationship window is displayed.
  - c. Select the child business objects from the populated list, and click Finish to complete configure.
11. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry and Delivery Options for PeopleSoft Activities](#).
12. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Update Component Interface activity are displayed as nodes under the request input parameter in the To Activity panel.
13. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
14. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
15. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the PeopleSoft Update Component Interface activity.

## Using the PeopleSoft Delete Component Interface activity

---

Use the PeopleSoft Delete Component Interface activity to delete component interfaces from the PeopleSoft server. This activity deletes the PeopleSoft components and its children. Because the connector supports only logical deletes, the components are marked as deleted, but not removed.

### Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the PeopleSoft server. For more information, see [Installing JAR files to connect to the PeopleSoft server](#).
- Valid connection details to connect to the PeopleSoft server.

### About this task

---

Use this task to delete component interface from the PeopleSoft server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the PeopleSoft folder contents.
2. Drag the Delete Component Interface activity icon onto the orchestration. The PeopleSoft Delete Component Interface Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant PeopleSoft endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for a PeopleSoft activity](#).
8. To make required changes to the selected endpoint configuration, click Edit and access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the component interface name in the Component Interface field. Component interface name is populated with a default value, which represents the PeopleSoft interface.
  - a. In the Browse component interface window, browse for the component interface name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this component interface.
  - b. Click Next. The Logical delete window is displayed.
  - c. Select a field from the Field name for logical delete drop-down list.
  - d. Specify the value of the deleted object in the Value to indicate deleted object field, and click Finish to complete configure.
11. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry and Delivery Options for PeopleSoft Activities](#).
12. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Delete Component Interface activity are displayed as nodes under the request input parameter in the To Activity panel.
13. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
14. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
15. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the PeopleSoft Delete Component Interface activity.

**Parent topic:** [PeopleSoft activities](#)

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PeopleSoft\\_delete\\_component.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PeopleSoft_delete_component.html)

## Using the PeopleSoft Get Component Interface activity

---

Use the PeopleSoft Get Component Interface activity to retrieve component interfaces from the PeopleSoft server. With this activity you can access the PeopleSoft component and retrieve values from the PeopleSoft server.

### Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the PeopleSoft server. For more information, see [Installing JAR files to connect to the PeopleSoft server](#).
- Valid connection details to connect to the PeopleSoft server.

### About this task

---

Use this task to retrieve component interfaces from the PeopleSoft server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the PeopleSoft folder contents.
2. Drag the Get Component Interface activity icon onto the orchestration. The PeopleSoft Get Component Interface Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant PeopleSoft endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for a PeopleSoft activity](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the component interface name in the Component Interface text box. Component interface name is populated with a default value, which represents the PeopleSoft interface. Browse for the component interface name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this component interface.
11. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry and Delivery Options for PeopleSoft Activities](#).
12. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get Component Interface activity are displayed as nodes under the request input parameter in the To Activity panel.  
Note: The PeopleSoft connector generates a single input schema for all the objects used by the activities. There may be some fields that are redundant and not applicable for this activity. You must set the GETKEYS field for this activity. For Wbi\_Customer\_Ci component interface, you must specify the value for the customerid field.
13. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
14. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
15. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the PeopleSoft Get Component Interface activity.

## Using the PeopleSoft Find Component Interface activity

---

Use the PeopleSoft Find Component Interface activity to retrieve all the component interfaces from the PeopleSoft server. This activity behaves like the PeopleSoft Get Component Interface activity, except that it retrieves multiple instances of the same PeopleSoft component that match the input criteria.

### Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the PeopleSoft server. For more information, see [Installing JAR files to connect to the PeopleSoft server](#).
- Valid connection details to connect to the PeopleSoft server.

### About this task

---

Use this task to find component interfaces in the PeopleSoft server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the PeopleSoft folder contents.
2. Drag the Find Component Interface activity icon onto the orchestration. The PeopleSoft Find Component Interface Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant PeopleSoft endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for a PeopleSoft activity](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the component interface name in the Component Interface text box. Component interface name is populated with a default value, which represents the PeopleSoft interface. Browse for the component interface name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this component interface.
11. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry and Delivery Options for PeopleSoft Activities](#).
12. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Find Component Interface activity are displayed as nodes under the request input parameter in the To Activity panel. The PeopleSoft connector generates a single input schema for all the objects used by the activities. There may be some fields that are redundant and not applicable for this activity. You must set the FINDKEYS field for this activity. For the `Wbi_Customer_Ci` component interface, you must specify either the `customerid` field or the `customerfirstname` field value, or both.
13. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a

mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

14. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
15. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the PeopleSoft Find Component Interface activity.

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PeopleSoft\\_find\\_component.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PeopleSoft_find_component.html)

## Creating events table and compiling PeopleSoft JAR files

---

The first of the two required JAR files, which will be named `PSFTCI.jar`, must be manually built and compiled.

PeopleSoft connector polls the PeopleSoft Enterprise server at specified intervals for events. When the connector detects an event, it converts the event data into a business object and sends it to the client application. To use this scenario, you must create a custom event project in PeopleSoft Enterprise server.

### Event store

---

The event store is a table that holds events that represent data changes until the polling connector can process them. The connector uses the event store to keep track of event entities. To use inbound processing, you must use PeopleTools Application Designer to create a custom project for event notification. The custom project creates the event store the connector needs for inbound processing. Each time a business object is created, updated, or deleted, the PeopleCode function used in the project and then added to the component interface inserts a new record in the event store, with the appropriate object name, keys, and status value.

During inbound processing, the connector polls the events from the event store at configured poll intervals. In each poll call, a configured number of events are processed by the connector. The order of event processing is based on the ascending order of priority and the ascending order of the event time stamp. The events with the Ready for poll (0) status are picked up for polling in each poll cycle. The connector uses the object name and object key to retrieve the corresponding business object. As events are retrieved from the event store and processed, the status of the event changes to reflect its state, as shown in the following table.

Table 1. Event status values

Status short name	Description	Event Table Value
Error processing event	An error occurred during event processing.	-1
Ready for poll	The event is ready to be picked up.	0
Success	The event has been delivered to the event manager.	1
Deleted	The event has been processed successfully and is removed from the event store.	4

### I. To create the events table

---

Ensure that the following steps are met for configuring and compiling the PeopleSoft JAR files.

- Creating Events Table
- Add the trigger to WBI\_CUSTOMER\_COMP component
- Create the Java API for Component Interface

1. Copy `WBI_CUST_PROJ` project located at <Cast Iron Installation directory>\etc\peoplesoft\scripts to a temp directory (`C:\Projects`) on the machine where the PeopleTools runs.
2. Log on to the PeopleSoft application designer, and select Tools > Copy Project > From File.

3. Browse to C:\Projects directory. From the Select Project from the List Below, double-click WBI\_CUST\_PROJ.
4. In the Copy From File dialog, click Copy. Wait for the operation to complete.
5. Select WBI\_CUST\_PROJ in the left panel, and then select Build > Project from the main menu.
6. In the Build panel, select the following check boxes:
  - Create Tables
  - Create Views
  - Create Trigger
  - Run and build script
7. Click Build, to begin to build the project.
8. Click Close, to exit the Build Progress dialog.
9. In the Build Log view of the application designer, check the log messages to confirm that three records were processed correctly.
10. Select File > Save All to save the changes.
11. To configure the user security for the Component Interfaces, log onto PeopleSoft Web Client with the URL:  
<http://localhost/psp/ps/?cmd=login>.
12. Go to PeopleTools > Security > Permissions & Roles > Permission Lists.
13. Specify PTPT1200 in the edit box of begins with and click Search.
14. Go to the Component Interfaces tab, click + to add the Component Interface WBI\_CUSTOMER\_COMP\_INTERFACE.
15. Click Edit of WBI\_CUSTOMER\_COMP\_INTERFACE.
16. Select Full Access for all methods and click OK.
17. Go back to the Component Interfaces tab, click + to add the Component Interface IBM\_EVENT\_CI.
18. Click Edit of IBM\_EVENT\_CI.
19. Select Full Access for all methods and click OK.
20. Go back to the Component Interfaces tab and press Save button to save the changes.

## II. To add triggers

---

1. In PeopleSoft application designer, open WBI\_CUST\_PROJ project.
  2. In the left panel, right-click on WBI\_CUSTOMER\_COMP and select View PeopleCode.
  3. In the PeopleCode edit window, select SavePostChange in the right panel.
  4. Type the following PeopleCode in the edit window.
- ```
Declare Function IBMPublishEvent PeopleCode IBM_FETCH_ID.IBM_NEXT_EVENT_ID FieldFormula;
Component string &BONAME1; Component string &KEYLIST1;
&BONAME1 = "WbiCustomerCompInterface";
&KEYLIST1 = "WBI_CUSTOMER.WBI_CUSTOMER_ID"; /* Check if Component Changed before calling
function*/ If ComponentChanged() And %UserId <> "C" Then /* Publish this event to the IBM
WebSphere IBM_EVENT_TBL for polling */ IBMPublishEvent(&BONAME1; &KEYLIST1); End-If;
```
5. Select File > Save All to save the changes.
  6. To ensure the trigger that was created in the steps above can work well, you need to do some initialization work. Connect to the database that PeopleTools uses, and run the following SQL statement:
- ```
$ insert into PS_IBM_FETCH_ID values(1000);
$ commit;
```

## III. To create the Java API for Component Interface

---

The Component Interface API provides access to all the objects and PeopleCode methods. You can manually generate these API using the application designer, and then compile them to a PSFTCI.jar file.

1. In PeopleSoft application designer, open IBM\_EVENT\_CI Component Interface.
2. Select Build > PeopleSoft API from the main menu.
3. In the Build PeopleSoft API Bindings dialog, make sure only the Build check box under Java Classes is selected. Set the Target Directory for storing the generated Java files.  
 In the Select API to Build list, select the following items:
  - CompIntfc.CompIntfcPropertyInfo
  - CompIntfc.CompIntfcPropertyInfoCollection
  - All beginning with CompIntfc.IBM\_EVENT\_CI
  - All beginning with CompIntfc.WBI\_CUSTOMER\_COMP\_INTERFACE
4. Click OK. Check the target directory to make sure the Java files are generated correctly.
5. Copy the generated Java files to C:\Temp directory, then copy psjoa.jar file from <PeopleTools\_HOME>\web\psjoa to C:\Temp directory.
6. Enter directory as C:\Temp and run the following commands to build the Java files.

```
$ javac -classpath .\psjobj.jar PeopleSoft\Generated\CompIntfc\*.java  
$ jar -cvf PSFTCI.jar PeopleSoft\Generated\CompIntfc\*.class
```

These two JAR files `psjobj.jar` and `PSFTCI.jar` would be used by PeopleSoft connector to access the PeopleSoft Enterprise application.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Peoplesoft\\_compiling\\_jars.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Peoplesoft_compiling_jars.html)

## Using the PeopleSoft Get Created Component Interface activity

---

Use the Get Created Component Interface activity to poll for created objects in the PeopleSoft server.

### Before you begin

---

Ensure that you have:

- Installed the necessary vendor software JAR files.
- The valid connection details to connect to the PeopleSoft server.
- Configured the *EventStore* business objects and triggers to generate events. For more information, see [Creating events table and compiling PeopleSoft JAR files](#).

### About this task

---

Use this task to poll for events created on the PeopleSoft server.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the PeopleSoft folder contents.
2. Drag the Get Created Component Interface activity icon onto the orchestration. The PeopleSoft Get Created Component Interface Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant PeopleSoft endpoint.
7. You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for a PeopleSoft activity](#).
8. To make any required changes to the selected endpoint configuration, click Edit to access the options in a separate window.  
Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Specify the Event Store Name configured in the PeopleSoft server. The activity polls this event store for new events. The Event Store Name field is populated with a default value, specify the event store name configured in PeopleSoft server if it is not same as the default value.
11. Specify the component interface name in the Component Interface field, or browse for the required component interface.
12. In the Checklist, click Retry. Review the default settings and make the required changes. Similarly, configure the **Delivery Rules** panel. For more information, see [Specifying retry and Delivery Options for PeopleSoft Activities](#).

The activity polls the event store at configured interval for create events and fetches the actual object for that event. This object is sent to the orchestration. After processing, the event is marked as archived in the event store.

13. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
14. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the PeopleSoft Get Created Component Interface activity.

**Parent topic:** [PeopleSoft activities](#)

## Specifying retry and Delivery Options for PeopleSoft Activities

---

Specifying the Retry and Delivery parameters is one of the tasks to configure a PeopleSoft activity configuration.

### About this task

---

This section contains the procedure for configuring the retry options for PeopleSoft outbound and inbound activities.

### Procedure

---

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry options for connecting to a PeopleSoft server as described in the following table.

Table 1. Retry options

Retry Fields	Description
Wait -- seconds between each retry .	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the PeopleSoft server.
Try to connect -- times before failing.	Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the PeopleSoft server before issuing an error and stopping the processing of the current orchestration job.  Note: If you deploy an orchestration that contains the inbound or outbound PeopleSoft activity and the Integration Appliance cannot connect to the specified PeopleSoft server, the Integration Appliance logs the connection errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.

**Parent topic:** [PeopleSoft activities](#)

## Specifying the delivery rules options for PeopleSoft inbound activities

---

### About this task

This section contains the procedure for configuring the delivery rule options for PeopleSoft inbound activities.

### Procedure

1. Select the Delivery Rules task from the Checklist. The delivery rules pane is displayed.

2. Configure the delivery rules options to select the activity's behavior as described in the following table.

Table 2. Delivery rules

Delivery Rules Fields	Description
Poll for changes every _____ days/hours/minutes/seconds	Specifies the time interval to poll for objects in the PeopleSoft server. (For example, the Get Component Interfaces activity polls for Create Component Interfaces activity at the specified time internal.) Time can be selected in the format days, hours, minutes, or seconds.
Fetch _____ rows per poll	Specifies how many objects or components the activity should retrieve from the PeopleSoft server in each poll cycle.
Delivery Messages	
ATMOST_ONCE	A non-persistent mode in which a PeopleSoft component interfaces is either delivered once or not delivered at all.

## Services Provided

---

The QuickBooks Intuit platform provides rich web services and API support via Intuit Partner Platform, which allows creating, retrieving, editing and integrating objects.

The Cast Iron connector for QuickBooks shall use these API functions, which allows users to interact with the platform and shall enable users to create, retrieve and modify various types of objects available on the platform.

Popular Services

- Credit card processing
- Download Center
- QuickBooks Store

#### Business Services

- Payment Processing
- Training services
- Payroll
- Field Service Management
- Custom Programming / reporting / interface

#### QuickBooks Extras

- Field Service Management
- e-commerce Web store Integration
- Cloud server hosting
- Antivirus

The depth and flexibility of QuickBooks™ integration is as follows:

- Has access to all objects in the Intuit platform such as Bill, Vendor and Purchase etc.
- Is completely flexible, letting user customize any business process for how leads are updated, handed to sales, or clawed back
- Is compatible with any CRM system user select
- Allows marketing and sales each to manage their own unique data model, but define exactly which fields are to be synchronized
- Is set up with one click, out of the box, for any new client, but can grow to accommodate any business process.

## Creating or editing an endpoint for Intuit QuickBooks activity

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to an Intuit QuickBooks. QuickBooks uses token based authentication mechanism to authenticate and authorize users to perform operations.

The QuickBooks REST APIs are authenticated using OAuth 1.0 Required connection parameters.

To generate the OAuth token, the first step is to create an app on the QuickBooks portal and connect to that created App. Check the link for more details:

<https://developer.intuit.com/v2/ui#/app/startcreate>

Note: The default access token duration is 120 seconds but if the customer keeps it blank then the value taken is 180 days.

1. Next is, the customer has to explicitly authorize the App through the option available on the portal after which the customer is provided with Consumer Key and Consumer Secret.

Note: Consumer key and Consumer Secret will remain same. Access Token and Access Secret Token expires after the specified duration is elapsed

Table 1. Connection properties

Property Name	Label on Test Connection screen
OAuthConsumerKey	OAuth Consumer Key
OAuthConsumerSecret	OAuth Consumer Secret
OAuthAccessToken	OAuth Access Token

OauthTokenSecret	OAuth Token Secret
HostName	Host Name
CompanyId	Company Id

- Regeneration of Access Token
- Required connection Headers

**Parent topic:** [QuickBooks Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/QuickBooks\\_creating\\_or\\_editing\\_an\\_endpoin.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/QuickBooks_creating_or_editing_an_endpoin.html)

## Regeneration of Access Token

Note: Please note that the generation and regeneration of OAuth token is user's responsibility and the IBM Cast Iron Connector for QuickBooks doesn't handle this.

Before the token expires, your app can obtain a new token to provide uninterrupted service by calling the [Reconnect API](#).

The following conditions must be met in order to renew the OAuth access token:

- The renewal must be made within 30 days of token expiry. Note that when your app received the token during the OAuth grant, the expiry date was calculated (180 days).
- The current token must still be active.

The auto-renewal strategy helps to track the expiry as follows:

- Keep track of when the token expires (180 days after you get it).
- Wait 151 days (this is now within 30 days of token expiration), call the "Reconnect API" to get a new token.
- Start over with #1 after getting new token.

**Parent topic:** [Creating or editing an endpoint for Intuit QuickBooks activity](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/QuickBooks\\_regeneration\\_of\\_access\\_token.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/QuickBooks_regeneration_of_access_token.html)

## Required connection Headers

Following connection headers are required in each API request.

1. **Authorization:** Each API request must include an Authorization header.

Provide "OAuth" followed by space and OAuth 1.0 token entered by user as its value.

For example: The header will look like as below in case of OAuth 1.0 authentication.

*Authorization: 2YotnFZFEjr1zCsicMWpAA*

Connector generates this authorization header based on OAuth parameter values provided by user in endpoint configuration.

**Note:** Connector will not generate OAuth 1.0 token. User will have to generate it directly from QuickBooks portal and provide it to the connector for authentication.

1. **Content-Type:** Each API request must include Content-Type header. The value of the header depends upon the format of request body.

If request body has data in XML format, then provide Application/xml as its value.

For example: The header will look like as below in case of xml.

*Content-Type: Application/xml*

## QuickBooks Supported Objects

---

Following are the supported objects in the IBM Cast Iron Connector for QuickBooks

Following QuickBooks objects will be supported by QuickBooks connector.

Objects are classified into 3 entities:

### Transaction Entities

- Bill
- BillPayment
- CreditMemo
- Estimate
- Invoice
- JournalEntry
- Payment
- Purchase
- PurchaseOrder
- RefundReceipt
- SalesReceipt
- TimeActivity
- VendorCredit

### Name List Entities

- Account
- Budget
- Class
- Customer
- Department
- Employee
- Item
- PaymentMethod
- TaxAgency
- TaxCode
- TaxRate
- TaxService
- Term
- Vendor

### Supporting Entities

- Attachable
- CompanyInfo
- Preferences

Operations supported by QuickBooks objects

1. Create
2. Delete
3. Update
4. Retrieve
5. Query

Due to Cast Iron platform limitation, the XSD `choice` element is not handled appropriately.

So, for all the operation supported by the IBM Cast Iron Connector for QuickBooks, wherever the input schema displays a `choice` XSD element, the user should provide only one of the values. If there are multiple values provided, the connector returns appropriate error message.

## Using the QuickBooks Create activity

---

Use the QuickBooks Create activity to create objects in the QuickBooks instance.

Use this task to create objects in the QuickBooks instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active orchestration, open the **Activities** tab and expand the QuickBooks folder contents.
2. Drag the **Create** activity icon onto the orchestration. The QuickBooks Create Object **Checklist** is displayed.
3. In the **Checklist**, click **Pick Endpoint**.
4. Click **Browse** and use the **Project Explorer** dialog box to select the relevant QuickBooks endpoint.
5. In the **Checklist**, click **Configure**.
6. Click **Browse** to select the object type. The **Browse** QuickBooks window is displayed.
7. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Create Objects** activity are displayed as nodes under the request input parameter in the **To Activity** panel.
8. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the QuickBooks Create Objects activity.

## Using the QuickBooks Delete activity

---

Use the QuickBooks Delete activity to delete objects in the QuickBooks instance.

Use this task to delete objects in the QuickBooks instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active orchestration, open the **Activities** tab and expand the QuickBooks folder contents.
2. Drag the **Delete** activity icon onto the orchestration. The QuickBooks Delete Object **Checklist** is displayed.
3. In the **Checklist**, click **Pick Endpoint**.
4. Click **Browse** and use the **Project Explorer** dialog box to select the relevant QuickBooks endpoint.
5. In the **Checklist**, click **Configure**.
6. Click **Browse** to select the object type. The **Browse** QuickBooks window is displayed.
7. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Delete Objects** activity are displayed as nodes under the request input parameter in the **To Activity** panel.
8. Delete a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Delete a map between the output parameters and orchestration variables.

You have configured the QuickBooks Delete Objects activity.

## Using the QuickBooks Update activity

---

Use the QuickBooks Update activity to update objects in the QuickBooks instance.

Use this task to update objects in the QuickBooks instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active orchestration, open the **Activities** tab and expand the QuickBooks folder contents.
2. Drag the **Update** activity icon onto the orchestration. The QuickBooks Update Object **Checklist** is displayed.
3. In the **Checklist**, click **Pick Endpoint**.
4. Click **Browse** and use the **Project Explorer** dialog box to select the relevant QuickBooks endpoint.
5. In the **Checklist**, click **Configure**.
6. Click **Browse** to select the object type. The **Browse** QuickBooks window is displayed.
7. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Update Objects** activity are displayed as nodes under the request input parameter in the **To Activity** panel.
8. Update a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory

element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Update a map between the output parameters and orchestration variables.

You have configured the QuickBooks Update Objects activity.

## Using the QuickBooks Query activity

---

Use the QuickBooks Query activity to Query objects in the QuickBooks instance.

Use this task to Query objects in the QuickBooks instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active orchestration, open the **Activities** tab and expand the QuickBooks folder contents.
2. Drag the **Query** activity icon onto the orchestration. The QuickBooks Query Object **Checklist** is displayed.
3. In the **Checklist**, click **Pick Endpoint**.
4. Click **Browse** and use the **Project Explorer** dialog box to select the relevant QuickBooks endpoint.
5. In the **Checklist**, click **Configure**.
6. Click **Browse** to select the object type. The **Browse** QuickBooks window is displayed.
7. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Query Objects** activity are displayed as nodes under the request input parameter in the **To Activity** panel.

Query supports 2 types of input methods. They are: 1) Query string 2) Filters.

- Query String: User must provide a Query string as per the QuickBooks query format and accordingly the response would be generated.
- Filters: Adding filters help to generate a response based on the values provided in the fields which are `~Fieldname~`, `~Operator~` and `~Value~`.
  - For specific filter operator like `In`, user must provide only comma separated values as a part of input string.

Query also supports pagination. (I.e. limit and offset) Pagination is applicable only for `Filter` method.

**Note:** If user doesn't provide any specific values either in Query String or in Filters, then by default all the values present in the table gets displayed.

1. Query a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Query a map between the output parameters and orchestration variables.

You have configured the QuickBooks Query Objects activity.

## Using the QuickBooks Retrieve activity

---

Use the QuickBooks Retrieve activity to retrieve objects in the QuickBooks instance.

Use this task to retrieve objects in the QuickBooks instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active orchestration, open the **Activities** tab and expand the QuickBooks folder contents.
2. Drag the **Retrieve** activity icon onto the orchestration. The QuickBooks Retrieve Object **Checklist** is displayed.
3. In the **Checklist**, click **Pick Endpoint**.
4. Click **Browse** and use the **Project Explorer** dialog box to select the relevant QuickBooks endpoint.
5. In the **Checklist**, click **Configure**.
6. Click **Browse** to select the object type. The **Browse** QuickBooks window is displayed.
7. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Retrieve Objects** activity are displayed as nodes under the request input parameter in the **To Activity** panel.

Retrieve supports 2 types of input methods. They are: 1) RetrieveAll 2) RetrieveById

- **RetrieveAll** : If the value for parameter `retrievalAll` is set to `true`, then it retrieves the complete data for that object.
- **RetrieveById**: If user provides value for Id, then it retrieves the data for that object based on that ID.

RetrieveAll supports pagination (i.e. `limit` and `offset`). If user provides values for both the methods, then RetrieveById takes preference.

1. Retrieve a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Retrieve a map between the output parameters and orchestration variables.

You have configured the QuickBooks Retrieve Objects activity.

## Overview of the RightNow SOAP API connector

---

The RightNow SOAP API connector enables a two-way communication between Cast Iron and the RightNow server. This connector uses the RightNow SOAP APIs.

You can perform the following activities using the RightNow SOAP API connector:

- [Create Objects](#)
- [Get Objects](#)
- [Query Objects](#)
- [Update Objects](#)
- [Destroy Objects](#)

The versions of RightNow supported by the connector depend on the support life cycle of RightNow. The SOAP API version of RightNow currently supported is v1\_2.

## Creating and editing a RightNow SOAP API endpoint

---

RightNow SOAP API endpoints contain the connection information that Studio and the Integration Appliance use to connect to the RightNow CRM instance. You can create multiple endpoints that refer to separate instances.

## About this task

---

Use this task to create or edit a RightNow SOAP API endpoint. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Note:

Any changes you make to the RightNow SOAP API endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

To create and edit a RightNow SOAP API endpoint, complete the following steps:

## Procedure

---

1. Drag an activity from the RightNow SOAP API folder under the Activities tab, to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. **Browse** - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
  - b. **New** - To create a new endpoint. The Create Endpoint window opens.
  - c. **Edit** - To edit the existing endpoint. The Edit Endpoint window opens.
4. In the Create Endpoint window, complete the fields defined in the following table:

Table 1. Connection details

Field Name	Description
<b>Connection Details</b>	
URL	Specifies the URL of the RightNow instance.
User Name	Specifies the user name to connect to the RightNow instance.
Password	Specifies the password associated with the user name to connect to the RightNow instance.
<b>Proxy Connection Details</b>	
Proxy Host	Specifies the host name of the proxy server.
Proxy Port	Specifies the port number needed to connect to the proxy server.
Proxy User Name	Specifies the user name needed to connect to the proxy server.
Proxy Password	Specifies the password needed to connect to the proxy server.

5. When finished, click Test Connection to confirm that you can connect to the RightNow system.
6. Click OK.

## Results

---

You have created or edited a RightNow SOAP API endpoint.

## Using the RightNow SOAP API Create Objects activity

---

Use the RightNow SOAP API Create Objects activity to create objects such as Account, Answer, Contact, Incident, Meta Answer, Opportunity, Organization, Purchased Product, Sales Product, Task and so on, in the RightNow server.

## About this task

---

Use this task to create objects in the RightNow server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the RightNow SOAP API Create Objects activity, complete the following steps:

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the RightNow SOAP API folder contents.
2. Drag the Create Objects activity icon onto the orchestration. The RightNow SOAP API Create Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant RightNow SOAP API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a RightNow SOAP API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse RightNow SOAP API window is displayed.
11. In Browse RightNow SOAP API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for RightNow SOAP API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for an element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the RightNow SOAP API Create Objects activity.

## Using the RightNow SOAP API Destroy Objects activity

---

Use the RightNow SOAP API Destroy Objects activity to delete objects such as Account, Answer, Contact, Incident, Meta Answer, Opportunity, Organization, Purchased Product, Sales Product, Task and so on, from the RightNow server. If you delete the primary object, all the corresponding sub objects related to the primary object will also be deleted.

## About this task

---

Use this task to delete objects in the RightNow server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the RightNow SOAP API Destroy Objects activity, complete the following steps:

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the RightNow SOAP API folder contents.
2. Drag the Destroy Objects activity icon onto the orchestration. The RightNow SOAP API Destroy Objects activity checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant RightNow SOAP API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a RightNow SOAP API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse RightNow SOAP API window is displayed.
11. In Browse RightNow SOAP API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for RightNow SOAP API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Destroy Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the RightNow SOAP API Destroy Objects activity.

**Parent topic:** [RightNow SOAP API Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/RightNowSOAPAPI\\_destroy\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/RightNowSOAPAPI_destroy_activity.html)

## Using the RightNow SOAP API Query Objects activity

---

Use the RightNow SOAP API Query Objects activity to query objects such as Account, Address, AnalyticsReport, Answer, Contact, Country, Email, Organization and so on, from the RightNow server. The query string that you specify for this operation must adhere to the RightNow Object Query Language (ROQL) standard. In order to retrieve sub objects, we need to populate default values for the sub objects.

### About this task

---

Use this task to query objects from the RightNow server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the RightNow SOAP API Query Objects activity, complete the following steps:

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the RightNow SOAP API folder contents.
2. Drag the Query Objects activity icon onto the orchestration. The RightNow SOAP API Query Objects activityChecklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant RightNow SOAP API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a RightNow SOAP API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse RightNow SOAP API window is displayed.
11. In Browse RightNow SOAP API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for RightNow SOAP API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Query Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the RightNow SOAP API Query Objects activity.

**Parent topic:** [RightNow SOAP API Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/RightNowSOAPAPI\\_queryobject\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/RightNowSOAPAPI_queryobject_activity.html)

## Specifying retry parameters for RightNow SOAP API activities

---

Specifying the retry parameters is one of the tasks you must complete to configure a RightNow activity.

### About this task

---

The RightNow SOAP API connects to the RightNow server to execute the activities. If a connection is lost or timed out, the connector automatically establishes a new connection based on the parameters described in Table 1. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

For more information about the configuration tasks in the Checklist, see the help topic for the specific RightNow SOAP API activity.

To specify the retry parameters, complete the following steps:

## Procedure

---

1. In the Checklist, select Retry. The Retry panel is displayed.
2. Configure the retry options for connecting to a RightNow application.

The following table describes the retry options for connecting to a RightNow application:

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the RightNow application. By default, this parameter is set to 30 seconds.
Try to connect __ times before failing.	Specifies the maximum number of times that the Integration Appliance attempts to establish a connection to the RightNow application before issuing an error and stopping the processing of the current orchestration job. By default this parameter is set to 5 attempts.
Activity Timeout	
Time out after __ seconds when the endpoint does not respond to a request.	Specifies the number of seconds the Integration Appliance waits before timing out, when the endpoint does not respond to a request. The default is 300 seconds.

## Results

---

You have configured the retry parameters for the RightNow SOAP API activities.

**Parent topic:** [RightNow SOAP API Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/RightNowSOAPAPI\\_Specifying\\_Retry\\_Parameters\\_for\\_Activities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/RightNowSOAPAPI_Specifying_Retry_Parameters_for_Activities.html)

## Salesforce.com activities

---

- [Creating or editing a Salesforce.com endpoint](#)

Salesforce.com endpoints provide information that Studio and the Integration Appliance use to connect to a Salesforce.com instance.

- [Configuring Salesforce.com activities](#)

Selecting fields from the Salesforce.com object to map is one of the tasks you must complete to configure a Salesforce.com activity. For more information about the configuration tasks in the Checklist, see the help topic for the specific Salesforce.com activity.

- [Migrating Salesforce.com projects](#)

- [Setting Salesforce.com configuration properties](#)

Any changes you make to configuration properties affects all orchestrations that use that endpoint. The edits are global, not local.

- [Specifying the Retry and Time Out parameters for Salesforce.com activities](#)

Specifying the Retry and Time Out parameters is one of the tasks you must complete to configure a Salesforce.com activity. The Salesforce.com Connector uses an HTTP 1.1 persistent connection over SSL to make all connections to the Salesforce.com server. The Salesforce.com connector compresses all data for requests and responses using the gzip format.

- [Understanding and setting polling preferences for the Salesforce.com connector](#)

- [Convert Lead activity](#)

Use this activity to convert leads into accounts, contacts, or opportunities in Salesforce.com. While the Salesforce.com API limits the number of objects that it can convert in a single call to 100 objects, the Cast Iron® Salesforce.com connector does not have such a limit. You can use the **Convert Lead** activity to convert an unlimited number of objects.

- [Set password activity](#)

Use this activity to change the password of a user or SelfServiceUser to a value that you specify.

- [Reset password activity](#)

Use this activity to reset the password of the user to a system-generated value.

- [Send email activity](#)  
Use this activity to send single or multiple emails. The emails include all standard email attributes such as the email address, subject line, and carbon copies.
- [Create Objects activity](#)  
Use this activity to create one or more Salesforce.com objects. In the Activities tab, open the Salesforce.com directory to find the Create Objects activity.
- [Delete Objects activity](#)  
Use this activity to delete one or more objects in Salesforce.com. While the Salesforce.com API limits the number of objects that it can delete in a single call to 200 objects, the Cast Iron Salesforce.com connector does not have such a limit. You can use the **Delete Objects** activity to delete an unlimited number of objects.
- [Get Deleted Objects](#)  
This activity retrieves the list of individual objects that have been deleted within the specified time-span for the specified object.
- [Get Updated Objects](#)
- [Get User Information activity](#)  
Use this activity to get user information from the Salesforce.com server. In the Activities tab, open the Salesforce.com directory to find the Get User Information activity.
- [Get Server Timestamp activity](#)  
Use this activity to get the current time from the Salesforce.com server. In the Activities tab, open the Salesforce.com directory to find the Get Server Timestamp activity.
- [Merge Objects Activity](#)  
Use this activity to merge Salesforce.com objects into a single record.
- [Poll Deleted Objects activity](#)  
This activity polls the Salesforce.com Server for objects that have been recently deleted and returns IDs to the Integration Appliance.
- [Poll Updated Objects activity](#)  
This activity polls the Salesforce.com Server for objects that have been recently created or updated and returns all the object fields that you selected in the configuration panel to the Integration Appliance. In Studio, configure the polling interval for the activity.
- [Query Objects activity](#)  
Use the SForce Object Query Language (SOQL) to run a query on one or more Salesforce.com object types from this activity and return a results set. The Query Objects activity automatically runs a query or queryAll call, followed by continuous queryMore calls for all children and objects returned from Salesforce.com.
- [Configuring the Query Objects activity](#)  
You must create a SForce Object Search Language (SOSL) query to configure the **Search Objects** activity. The following sections discuss the steps to configure the **Search Objects** activity, create an SOSL query, and provide SOSL syntax rules for IBM® Cast Iron.
- [Retrieve Objects activity](#)  
Use this activity to retrieve one or more Salesforce.com objects of a specified type. While the Salesforce.com API limits the number of objects that it can retrieve in a single call to 2,000 objects, the Cast Iron Salesforce.com connector does not have such a limit. You can use the **Retrieve Objects** activity to retrieve an unlimited number of objects.
- [Search Objects activity](#)
- [Undelete Objects activity](#)
- [Configuring the Search Objects activity](#)  
You must create an SForce Object Search Language (SOSL) query to configure the **Search Objects** activity.
- [Update Objects activity](#)  
Use this activity to update existing objects in Salesforce.com.
- [Upsert Objects activity](#)  
Use this activity to update existing objects or create new objects in Salesforce.com.

---

#### [Feedback | Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_salesforceactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_salesforceactivities.html)

## [Creating or editing a Salesforce.com endpoint](#)

---

## About this task

---

Any changes you make to the endpoint, including configuration properties, affects all orchestrations that use that endpoint as the edits are global, not local.

## Procedure

---

1. Drag an activity from the Salesforce.com folder of the Activities tab onto the orchestration.

The Summary panel is displayed along with a Checklist which lists the tasks that you must perform to configure the activity.

2. Click Pick Endpoint task from the Checklist. The Pick Endpoint panel opens.

3. Click one of the following options:

- o Browse...: To select an existing endpoint from the Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel. To edit the endpoint properties, click Edit. Go to step 5.
- o New: To create a new endpoint. The Create Endpoint window opens. Go to step 5.
- o Edit: To edit an existing endpoint. The Edit Endpoint window opens. Go to step 5.

Note: Editing an endpoint affects all orchestrations that use that endpoint in the project as the edits are global, not local.

4. In the endpoint window, specify a user name and a password to access a Salesforce.com instance.

- a. Type a user name or click the icon to the right of the User Name field to select the sfdc\_login configuration property.
- b. Type a password or click the icon to the right of the Password field to select the sfdc\_password configuration property.

5. Choose a login option:

Login Options	Description
Login normally	By default, Login is selected. At run time, the Integration Appliance accesses a production instance of Salesforce.com.
Login to Salesforce.com Sandbox	At run time, the Integration Appliance accesses a copy of the production system. You can run tests in the Sandbox without affecting production data.
Login to specified Partner WSDL Login URL	At run time, the Integration Appliance accesses the URL you specify in the Login URL field.
Login URL	Only required when you choose the Login to specified Partner WSDL Login URL option.

6. Specify the Connection Timeout parameter. By default, the Integration Appliance times out if it is unable to connect to the Salesforce.com endpoint after 300 seconds.

7. To connect through a proxy server, complete the fields described in the following table:

Option	Description
Field name	Description
Connect via a Proxy Server	Select this check box to enable the fields to connect through a proxy server.
Authentication	Allows you to select the type of authentication that the Integration Appliance uses when connecting to a proxy server. From the list, select one of the following authentication options: <ul style="list-style-type: none"> <li>o Basic - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure.</li> <li>o NTLM - Requires an instance of NTCredentials to be available for the domain name of the server. This authentication is the most secure authentication option. When you choose the NTLM authentication option, the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server.</li> </ul>

Option	Description
Real m/D omain	If you select the <b>Basic</b> authentication option, specify a realm. If you select the <b>NTLM</b> authentication option, specify a domain.
Host Name	Specify the host name of the proxy server.
Port	Specify the port number needed to connect to the proxy server.
User Name	Specify the user name needed to connect to the proxy server.
Password	Specify the password needed to connect to the proxy server.

8. Click Test Connection to confirm that the parameters you specified allow the project to access a Salesforce.com instance.

Note: When you configure a Salesforce.com endpoint to use configuration properties, verify that the configuration properties have valid values. If the configuration property value is invalid or does not exist, the connection test fails.

**Parent topic:** [Salesforce.com activities](#)

## Configuring Salesforce.com activities

Selecting fields from the Salesforce.com object to map is one of the tasks you must complete to configure a Salesforce.com activity. For more information about the configuration tasks in the Checklist, see the help topic for the specific Salesforce.com activity.

### About this task

For some of the fields in the endpoint, you can [create configuration properties](#) to supply the values for these fields. An icon is displayed when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.

### Procedure

1. In the Checklist, select Configure. The Configure panel opens.
2. Click Browse... to select a Salesforce.com object type. The Choose a Salesforce.com Object window shows all the Salesforce.com objects that are associated with the Studio activity.
3. Select an object type from the list.  
Note: Custom object types end with a double underscore c ( \_\_c ). For example: *CustomerPriority\_\_c*

Enter a character or string in the Search for an Object Type field and Studio filters the object types and only shows the object types that match the filter criteria. (Optional) Click the refresh icon to retrieve the latest Salesforce.com object types.

4. Click OK.

All the fields associated with the object type you selected are displayed.

5. In the Object Field Preferences section, select the fields to map.

By default, all fields are selected. You can choose to clear any field that you do not want to show in the map. A global checkbox allows you to select and clear all fields at once.

Note: The Id field is required for many activities. For these activities, the Id field is disabled and you cannot clear this field.

**Parent topic:** [Salesforce.com activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring\\_SalesforceCom\\_Activities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring_SalesforceCom_Activities.html)

## Migrating Salesforce.com projects

---

### About this task

In Studio version 3.6.2, the Salesforce.com connector version 3.0 is built-in and does not require additional installation as the previous version required.

Salesforce.com Connector Version	Studio Version	Installation Type
3.0X	3.6.2 and higher	built-in (no additional installation)
2.0X	3.5 and higher	add-on (separate installation)
1.0X	3.5 and higher	add-on (separate installation)

Studio does not automatically migrate projects containing Salesforce.com connector version 1.x or Salesforce.com connector version 2.x. However, the latest version of Studio can support any manually migrated projects that contain orchestrations using add-on versions of the connector. Therefore, it is possible to use both the built-in and add-on versions of the Salesforce.com connector in the same orchestration.

Â

## Setting Salesforce.com configuration properties

---

Any changes you make to configuration properties affects all orchestrations that use that endpoint. The edits are global, not local.

### Procedure

1. Select Project > Configuration Properties. The Configuration Properties window opens.
2. Click the Value field for the sfdc\_password property and type a valid password.
3. Click the Value field for the sfdc\_login property and type a valid Salesforce.com login.
4. Click OK.

## Specifying the Retry and Time Out parameters for Salesforce.com activities

---

Specifying the Retry and Time Out parameters is one of the tasks you must complete to configure a Salesforce.com activity. The Salesforce.com Connector uses an HTTP 1.1 persistent connection over SSL to make all connections to the Salesforce.com server. The Salesforce.com connector compresses all data for requests and responses using the gzip format.

### About this task

---

The Salesforce.com connector uses a single login session for all connections to a Salesforce.com endpoint. If a session expires, the connector automatically establishes a new session. The Salesforce.com connector does not count the initial attempt to reacquire the session as a retry attempt. The Salesforce.com connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

For more information about the configuration tasks in the **Checklist**, see the help topic for the specific Salesforce.com activity.

### Procedure

---

1. In the Checklist, select Retry. The Retry panel open.
2. Configure the retry options for connecting to a Salesforce.com instance.

The following table describes the retry options for connecting to a Salesforce.com instance:

Retry Fields	Description
Wait __ second(s) between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Salesforce.com instance.  By default, this parameter is set to 30 seconds.
Try to connect __ times before failing. Â	Specifies the maximum number of times that the Integration Appliance attempts to establish a connection to the Salesforce.com instance before issuing an error and stopping the processing of the current orchestration job.  By default this parameter is set to 5 attempts.
Activity Timeout Field	Description
Time out after __ seconds when the Endpoint does not respond to a request.	Specifies the number of seconds before a time out occurs between the activity making a request on an endpoint and the time it takes the endpoint to respond.  By default this parameter is set to 300 seconds.

**Parent topic:** [Salesforce.com activities](#)

# Understanding and setting polling preferences for the Salesforce.com connector

---

## About this task

---

The Salesforce.com connector contains two activities that poll the Salesforce.com server for changes:

- **Poll Deleted Objects** activity
- **Poll Updated Objects** activity

These activities have the following startup behavior:

- For an orchestration that has never been deployed, the baseline time stamp is established when the activity is activated for the first time. The activity uses the baseline time stamp as the start time to poll for changes after the poll interval elapses. After the poll completes, the activity stores the last poll time.
- For a previously deployed orchestration, the activity uses the last poll time and the current time to poll for changes after the poll interval elapses.
- Salesforce.com requires at least 60 seconds between each poll. If less than 60 seconds have transpired, then the activity ignores the current polling interval until the next polling interval elapses.

## Procedure

---

1. In the Checklist, select Polling.

The Polling Preferences panel opens.

2. Set the polling preferences for the following parameters:

Polling Preference	Description
Poll for changes every <i>	Specifies the polling interval for which the Integration Appliance polls the Salesforce.com Server for objects that have been created or updated since the last poll.  Where <i> is the polling interval. The interval can be specified in minutes, hours, or days  By default, the Integration Appliance polls the Salesforce.com Server every 5 minutes.
Batch up to <n> objects per orchestration	Specifies the maximum number of object records per orchestration job, during a polling interval. By default, the Integration Appliance processes 1 record per orchestration job. Use this preference to tune the performance of the Integration Appliance.  Where <n> is the number of objects in a batch.

## Convert Lead activity

---

Use this activity to convert leads into accounts, contacts, or opportunities in Salesforce.com. While the Salesforce.com API limits the number of objects that it can convert in a single call to 100 objects, the Cast Iron® Salesforce.com connector does not have such a limit. You can use the **Convert Lead** activity to convert an unlimited number of objects.

## Procedure

---

1. In the Activities tab, open the Salesforce.com directory to find the Convert Lead activity.

2. Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or Editing a Salesforce.com Endpoint](#).

4. Specify the Retry and Time out parameters for the activity.

5. Map the input of the activity.

6. Map the output of the activity.

- [Map the input of the Convert Lead activity](#)
- [Map the output of the Convert Lead activity](#)

**Parent topic:** [Salesforce.com activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Convert\\_Lead\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Convert_Lead_Activity.html)

## Map the input of the Convert Lead activity

---

### Procedure

1. In the Checklist, select Map Inputs.

The convertLead element displays in the To Activity pane. The parameters displayed correspond to the structure of the input to the Salesforce.com convertLead operation.

2. (Optional) Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:

- CallOptions
- connection
- sessionInfo

3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

## Set password activity

---

Use this activity to change the password of a user or SelfServiceUser to a value that you specify.

Note: You must have the administrative permission to change the password for the users.

### To use the Set Password activity:

1. In the Activities tab, open the Salesforce.com directory to find the Set Password activity.
2. Drag the Set Password activity onto the orchestration.

The Summary and Checklist for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

Note: No additional configuration is required for this activity in the Configure section.

4. Specify the Retry and Activity Timeout parameters for the activity.
5. Map the inputs of the activity.
6. Map the outputs of the activity.

### To map the input of the Set Password activity:

1. In the Checklist, select Map Inputs.

The userId and password parameters are displayed in the To Activity pane.

2. (Optional) Right-click the default node and choose Show Optional Parameters, to display these optional input parameters for this activity:
  - o CallOptions
  - o connection
  - o sessionInfo

3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

## To map the output of the Set Password activity:

---

1. In the Checklist, select Map Outputs.

The sessionInfo element is displayed in the From Activity pane.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

## Reset password activity

---

Use this activity to reset the password of the user to a system-generated value.

Note: You must have the administrative permission to reset the password for the users.

## To use the Reset Password activity:

---

1. In the Activities tab, open the Salesforce.com directory to find the Reset Password activity.
2. Drag the Reset Password activity onto the orchestration.

The Summary and Checklist for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

Note: No additional configuration is required for this activity in the Configure section.

4. Specify the Retry and Activity Timeout parameters for the activity.
5. Map the inputs of the activity.
6. Map the outputs of the activity.

## To map the input of the Reset Password activity:

---

1. In the Checklist, select Map Inputs.

The userId parameter is displayed in the To Activity pane.

2. (Optional) Right-click the default node and choose Show Optional Parameters, to display these optional input parameters for this activity:
  - o CallOptions
  - o EmailHeader
  - o connection
  - o sessionInfo

3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

## To map the output of the Reset Password activity:

---

1. In the Checklist, select Map Outputs.

The password and sessionInfo elements are displayed in the From Activity pane.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

## Send email activity

---

Use this activity to send single or multiple emails. The emails include all standard email attributes such as the email address, subject line, and carbon copies.

### To use the email activity:

---

1. In the Activities tab, open the Salesforce.com directory to find the Send Email activity.
2. Drag the Send Email activity onto the orchestration.

The Summary and Checklist for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

4. In the Configure section, select the Send Mass Emails check box if you want to send multiple emails.
5. Specify the Retry and Activity Timeout parameters for the activity.
6. Map the inputs of the activity.
7. Map the outputs of the activity.

### To map the input of the Send Email activity:

---

1. In the Checklist, select Map Inputs.

The emails parameter is displayed in the To Activity pane.

2. (Optional) Right-click the default node and choose Show Optional Parameters, to display these optional input parameters for this activity:
  - o connection
  - o sessionInfo

3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

## To map the output of the Send Email activity:

---

1. In the Checklist, select Map Outputs.

The results and sessionInfo elements are displayed in the From Activity pane.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

## Create Objects activity

---

Use this activity to create one or more Salesforce.com objects. In the Activities tab, open the Salesforce.com directory to find the Create Objects activity.

### Procedure

---

1. Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

2. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

3. Configure the activity, by choosing a Salesforce.com object type and object field preferences.

4. Specify the Retry and Time out parameters for the activity.

5. Map the input of the activity.

6. Map the output of the activity.

## Map the input of the Create Objects activity

---

### Procedure

---

1. In the Checklist, select Map Inputs.

The Objects element is displayed in the To Activity panel. The parameters displayed correspond to the structure of the input to the Salesforce.com Objects operation.

2. (Optional) Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:

- o AssignmentRuleHeader
- o MruHeader
- o EmailHeader
- o CallOptions
- o connection
- o sessionInfo

3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

*Optional* and *nillable* field elements have the following behavior:

- o The Integration Appliance does not update an optional field, when the Salesforce.com server does not provide a value for the field.
  - o If you set the xsi:nil attribute to true on a nillable field, the Integration Appliance sets the field to null during an update.
- Note: Setting a field to an empty string does not set a field to null.

**Parent topic:** [Create Objects activity](#)

## Get Updated Objects

---

### Procedure

1. In the Activities tab, open the Salesforce.com directory to find the Get Updated Objects activity.
2. Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

4. Configure the activity, by choosing a Salesforce.com object type and object field preferences.

You can only select object types and fields that the Integration Appliance can update. The input map contains the object type with elements that correspond to the fields you select during this configuration step.

Note: The Integration Appliance cannot create auto-number fields.

5. Specify the Retry and Time out parameters for the activity.

6. Map the input of the activity.

The input map consists of an object's input parameter. This parameter consists of a single root element that has a single repeating element, named after the object type you selected, containing all the fields you selected in the Object Field Preferences table.

7. Map the output of the activity.

## Merge Objects Activity

---

Use this activity to merge Salesforce.com objects into a single record.

### About this task

You can merge two or more of the following Salesforce.com objects into a single record:

- Account
- Contact
- Leads

After the activity merges the objects, it deletes the pre-merge records and re-parents any duplicates.

While the Salesforce.com API limits the number of requests that it can merge in a single call to 200, the Cast Iron® Salesforce.com connector does not have such a limit. You can use the **Merge Objects** activity to process an unlimited number of merge requests.

### Procedure

1. In the Activities tab, open the Salesforce.com directory to find the Merge Objects activity.
2. Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

4. Configure the activity, by choosing a Salesforce.com object type and object field preferences.

You can only select Account, Contact, and Lead object types and fields that the Appliance can update. Fields such as auto-number fields might not be available to select.

5. Specify the Retry and Time out parameters for the activity.
6. Map the input of the activity.
7. Map the output of the activity.

## Map the input of the Merge Objects activity

---

### Procedure

1. In the Checklist, select Map Inputs.

The Merge element is displayed in the To Activity panel.

2. (Optional) Right-click the default node and choose Show Optional Parameters, to display these optional input parameters for this activity:
  - AssignmentRuleHeader
  - MruHeader
  - EmailHeader
  - CallOptions
  - connection
  - sessionInfo
3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

*Optional* and *nillable* field elements have the following behavior:

- The Integration Appliance does not update an optional field, when the Salesforce.com server does not provide a value for the field.
- If you set the xsi:nil attribute to true on a nillable field, the Integration Appliance sets the field to null during an update.  
Note: Setting a field to an empty string does not set a field to null.

# Poll Deleted Objects activity

---

This activity polls the Salesforce.com Server for objects that have been recently deleted and returns IDs to the Integration Appliance.

## Procedure

---

1. In the Activities tab, open the Salesforce.com directory to find the Poll Deleted Objects activity.
2. Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

4. Configure the activity by choosing a Salesforce.com object type and object field preferences.
5. Specify the Polling preferences for the activity.
6. Specify the Retry and Time out parameters for the activity.
7. Map the output of the activity.

- [Map the output of the Poll Deleted Object activity](#)

**Parent topic:** [Salesforce.com activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Poll\\_Deleted\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Poll_Deleted_Objects_Activity.html)

# Map the output of the Poll Deleted Object activity

---

## Procedure

---

1. In the Checklist, select Map Outputs.

The objects element is displayed in the From Activity panel.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

The output map can have *nillable* field elements have the following behavior:

- o If the field being retrieved is null, the Integration Appliance sets the xsi:nil attribute to true in the result.
- o If the input ID is not valid or does not represent the object type you specified, then for the entire object element the Integration Appliance sets xsi:nil to true for that element's position in the result set.

**Parent topic:** [Poll Deleted Objects activity](#)

## Poll Updated Objects activity

---

This activity polls the Salesforce.com Server for objects that have been recently created or updated and returns all the object fields that you selected in the configuration panel to the Integration Appliance. In Studio, configure the polling interval for the activity.

## Procedure

---

1. In the Activities tab, open the Salesforce.com directory to find the Poll Updated Objects activity.
2. Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

4. Configure the activity by choosing a Salesforce.com object type and object field preferences.
5. Specify the Polling preferences for the activity.
6. Specify the Retry and Time out parameters for the activity.
7. Map the output of the activity.

- [Map the output of the Poll Updated Object activity](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Poll\\_Updated\\_Objects\\_Activity\\_Mapoutput.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Poll_Updated_Objects_Activity_Mapoutput.html)

# Query Objects activity

---

Use the Sforce Object Query Language (SOQL) to run a query on one or more Salesforce.com object types from this activity and return a results set. The Query Objects activity automatically runs a query or queryAll call, followed by continuous queryMore calls for all children and objects returned from Salesforce.com.

Note: Running the Query Objects activity can result in a cursor being opened by Salesforce.com to track the query results. If the activity reaches the cursor limit that Salesforce.com allots to each user or if the cursor expires, the Integration Appliance tries the activity again.

## Using the Query Objects activity

---

1. In the Activities tab, open the Salesforce.com directory to find the Query Objects activity.
2. Add the activity to your orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

4. Configure the activity, by specifying a query and setting query options.
5. Specify the Retry and Time out parameters for the activity.
6. Map the input of the activity.
7. Map the output of the activity.

## Map the input of the Query Objects activity

---

1. In the Checklist, select Map Inputs.

The parameters element is displayed in the To Activity panel. The parameters element has a child element for each parameter you specified in the SOQL query. The context for the parameter in the query determines the parameter type. If you did not specify any parameters, then no child elements are displayed under the parameters element.

2. Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - o MruHeader
  - o CallOptions
  - o connection
  - o sessionInfo
3. Click Select Inputs... and select the input variable or variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variable or variables.

For mapping instructions, see [Creating a Map](#).

## Map the output of the Query Objects activity

---

1. In the Checklist, select Map Outputs.

The objects element is displayed in the From Activity panel. The result parameter has a single element named objects with a single repeating element named after the driving object of the query. The driving object is the first object named in the FROM clause of the query. For example, in the following SOQL statement Account is the driving object:

Select Name from Account, Account.Contacts

The driving object has child elements that correspond to the fields or relationships listed in the SELECT clause of a query.

Â The schema is defined as follows:

- o For fields, the field type matches the SOAP type of the field. The field type is nillable if the SOAP type is nillable.
- o For relationships for parent elements, the element name is the name of the parent. If there is no parent when the activity runs the query, then the element is absent. The fields or relationships of the parent is displayed immediately underneath the relationship element.
- o For relationships for child elements, the element name is the name of the child. The relationship element has a single repeating element named after the object type of the child object. The fields and relationship of the child is displayed underneath the object type element. If there are no children when the activity runs the query, then the element is absent.
- o If you did not select any fields or relationships, but instead request the count() in the SELECT clause, the entire object type element is replaced with an element named count of type unsignedInt.

Â

2. Click Select Outputs... and select the output variable or variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variable or variables.

For mapping instructions, see [Creating a Map](#).

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Query\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Query_Objects_Activity.html)

## Configuring the Query Objects activity

---

You must create a SForce Object Search Language (SOSL) query to configure the **Search Objects** activity. The following sections discuss the steps to configure the **Search Objects** activity, create an SOSL query, and provide SOSL syntax rules for IBMÂ® Cast IronÂ®.

### Procedure

---

1. In the Checklist, select Configure.

The Specify Query window opens.

2. Create an SOSL query in the Specify Query window.

3. (Optional) You can specify dynamic parameters in the search clause of the SOSL statement. You can then map these parameters dynamically as the input parameters for the activity, which allows the activity to dynamically control the query based upon the input to the orchestration. Use a (\$) dollar sign to denote a parameter and follow it with the parameter name.

4. Click the Validate icon to validate the query.

If the query is invalid, the Validation Feedback icon displays in the lower left corner of the Specify Query window. For invalid queries:

- a. Click the Validation Feedback icon in the lower left corner of the Specify Query window for a list of validation errors.

- b. Use the Refresh icon to refresh meta data and revalidate the SOSL statement.

5. In the Checklist, select Query to configure specific query options.

The Query Options pane opens.

6. Select Include deleted items in query (execute a queryAll operation), to query for deleted records in addition to existing records. If you do not select this option, the Integration Appliance only queries existing records.

7. Specify a Query batch size between 200-2,000 queries to help tune the performance of the Integration Appliance.

The option determines the batch size to use in the QueryOptions SOAP header for all query calls and does not affect the number of results returned by the activity. By default, this option is set to 500 queries.

**Parent topic:** [Salesforce.com activities](#)

## Creating SOSL Queries

---

When creating a SOQL query, you can use dynamic parameters in the WHERE clause of the SOQL statement. Studio can then dynamically map these parameters as the input parameters for the activity. This allows for dynamic control of the query based upon input to the orchestration.

### About this task

The SForce Object Query Language does not define a syntax for parameterized queries; however, Cast Iron does enforce some proprietary SOQL syntax rules. You can use parameters in either simple expressions or set expressions.

SOSL Syntax Rules for Cast Iron

- Use a (\$) dollar sign to denote a parameter. After the (\$) dollar sign, specify a string of alphanumeric characters. The first character must be a letter [a-zA-Z], optionally followed by one or more letters [a-zA-Z], digits [0-9], or ( \_) underscores.

Note: Parameter names are case-sensitive; therefore, the parameters \$a and \$A are considered to be different parameters.

The following table contains examples of valid and invalid parameter declarations:

Parameter	Valid or Invalid
\$AnAccount	valid
\$a123_456	valid
\$123a	invalid
\$_id	invalid

- You must declare parameters on the right-hand side of an expression in a WHERE clause.
- Parameters can appear more than once in a given SOQL statement. However, even though the parameter appears more than once in the SOQL statement, it only appears once in the input parameter map. The activity substitutes the same value for all locations where the parameter is used at runtime.

Note: When you use the same parameter name and there is a type mismatch, an error occurs. For example, the following SOQL generates an error because \$param is used as both a string and date type:

```
SELECT Name from Account where Name like $param and createdDate > $param
```

- The type of the field in which a parameter is being compared determines the type of the parameter and whether the parameter is being used in a simple expression, a set expression, or part of a set expression.

Type of Expr	Description

essi on	
Simple Expressions	<p>For example: Select ID from Account where Name = \$NameParam</p> <p>The SoapType of the field on the left-hand side of the expression determines the parameter type. If the field type is nullable and the operator is (=) or (!=), then the parameter is nullable. Setting xsi:nil=true on the parameter sets the parameter value to null when it is substituted. If the parameter's type requires it to be enclosed in (‘) single quotes, then the parameter's value is enclosed in single quotes during substitution and its contents are escaped automatically.</p> <p>For SOQL, the (\) backslash and (‘) single-quote will be escaped.</p>
Set Expressions	<p>For example: Select ID From Account where ID in \$idList</p> <p>The parameter's type is a repeating sequence of the SoapType of the field on the left-hand side of the expression. The parameter is not nullable and has minOccurs=1, maxOccurs=unbounded on the element.</p> <p>The sequence is expanded at runtime to be a proper set value, for example:</p> <p>Select Id From Account where Id in (‘value1’,‘value2’)</p>
Part of a Set Expression	<p>Parameters inside a set list are treated like a simple expression parameter type, for example: SELECT Name from Account where BillingState IN (‘California’, \$state2)</p> <p>In this example, the \$state2 parameter type is the SoapType of the Account BillingState field and is not a repeating element. The parameter is not nullable.</p>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring\\_the\\_Query\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring_the_Query_Objects_Activity.html)

## Retrieve Objects activity

Use this activity to retrieve one or more Salesforce.com objects of a specified type. While the Salesforce.com API limits the number of objects that it can retrieve in a single call to 2,000 objects, the Cast Iron® Salesforce.com connector does not have such a limit. You can use the **Retrieve Objects** activity to retrieve an unlimited number of objects.

### Using the Retrieve Objects activity

1. In the Activities tab, open the Salesforce.com directory to find the Retrieve Objects activity.
2. Add the activity to your orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

4. Configure the activity, by choosing a Salesforce.com object type and object field preferences.

Only object types that the Integration Appliance is able to retrieve via the Salesforce.com API display.

5. Specify the Retry and Time out parameters for the activity.
6. Map the input of the activity.
7. Map the output of the activity.

### Map the input of the Retrieve Objects activity

1. In the Checklist, select Map Inputs.

The `ids` element is displayed in the To Activity pane. The element contains the collection of IDs that the Integration Appliance retrieves from Salesforce.com

2. (Optional) Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:

- `MruHeaderUser`
- `CallOptions`
- `connection`
- `sessionInfo`

3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

*Optional* and *nillable* field elements have the following behavior:

- If the field being retrieved is null, the Integration Appliance sets the `xsi:nil` attribute to `true` in the result.
- If the input ID is not valid or does not represent the object type you specified, then for the entire object element the Integration Appliance sets `xsi:nil` to `true` for that element's position in the result set.

## Map the output of the Retrieve Objects activity

---

1. In the Checklist, select Map Outputs.

The `objects` element is displayed in the From Activity panel. The element contains all fields that you selected in the field preferences table, during the configuration steps.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

**Parent topic:** [Salesforce.com activities](#)

## Search Objects activity

---

### About this task

---

Use the Sforce Object Search Language (SOSL) to run a search query on one or more Salesforce.com object types from this activity and return a results set.

Note: You can only search objects that are configured as searchable or eSearchable. You cannot search attachment objects.

Using the Search Objects activity:

### Procedure

---

1. In the Activities tab, open the Salesforce.com directory to find the **Search Objects** activity.
2. Add the activity to an orchestration. The **Checklist** and **Summary** for the activity is displayed beneath the orchestration.

## Results

---

1. Select a Salesforce.com endpoint. For instructions on creating or editing a Salesforce.com endpoint, see [Creating or Editing a Salesforce.com Endpoint](#).
2. [Configure](#) the activity, by specifying a search query and setting search query options.
3. [Specify](#) the Retry and Time out parameters for the activity.
4. Map the input of the activity.
5. Map the output of the activity.

### Map the input of the Search Objects activity:

1. In the **Checklist**, select Map Inputs. The **parameters** element is displayed in the To Activity panel. The parameter element has a child element for each parameter you specified in the SOSL query. The context for the parameter in the query determines the parameter type. If you did not specify any parameters, then no child elements are displayed under the parameters element.
2. Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - o CallOptions
  - o connection
  - o sessionInfo
3. Click Select Inputs... and select the input variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
4. As appropriate, map the input parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

### Map the output of the Search Objects activity:

1. In the **Checklist**, select Map Outputs. The **objects** element is displayed in the From Activity panel.
2. Click Select Outputs... and select the output variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
3. As appropriate, map the output parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

## Undelete Objects activity

---

### About this task

---

Use this activity to restore one or more objects that you deleted in Salesforce.com.

To use the Undelete Objects activity complete the following steps:

### Procedure

---

1. In the Activities tab, open the Salesforce.com directory to find the **Undelete Objects** activity. Add the activity to an orchestration. The **Checklist** and **Summary** for the activity are displayed beneath the orchestration.
2. Select a Salesforce.com endpoint. For instructions on creating or editing a Salesforce.com endpoint, see [Creating or Editing a Salesforce.com Endpoint](#).
3. [Specify](#) the Retry and Time out parameters for the activity.
4. Map the input of the activity.
5. Map the output of the activity.

## Results

---

### Map the input of the Undelete Objects activity

1. In the **Checklist**, select Map Inputs. The **ids** element is displayed in the To Activity panel.

2. Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - o CallOptions
  - o connection
3. Click Select Inputs... and select the input variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
4. As appropriate, map the input parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

#### Map the output of the Undelete Objects activity

1. In the **Checklist**, select Map Outputs. The **results** element is displayed in the From Activity panel.
2. Click Select Outputs... and select the output variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
3. As appropriate, map the output parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

## Configuring the Search Objects activity

You must create an SForce Object Search Language (SOSL) query to configure the **Search Objects** activity.

### About this task

The following sections discuss the steps to configure the **Search Objects** activity, create an SOSL query, and provide SOSL syntax rules for IBM® Cast Iron®.

To configure the Search Objects activity complete the following steps:

### Procedure

1. In the Checklist, select Configure. The Specify Query window opens.
2. [Create](#) an SOSL query in the Specify Query window.
3. Optional: You can specify dynamic parameters in the search clause of the SOSL statement. You can then map these parameters dynamically as the input parameters for the activity, which allows the activity to dynamically control the query based upon the input to the orchestration. Use a (\$) dollar sign to denote a parameter and follow it with the parameter name.
4. Click the Validate icon , to validate the query. If the query is invalid, the Validation Feedback icon  shows in the lower left corner of the Specify Query window. For invalid queries:
  - o Click the Validation Feedback icon in the lower left corner of the Specify Query window for a list of validation errors.
  - o Use the Refresh icon  to refresh meta data and revalidate the SOSL statement.

**Parent topic:** [Salesforce.com activities](#)

## Creating SOSL queries

### About this task

When creating a SForce Object Search Language (SOSL) query, you can use dynamic parameters in the WHERE clause of the SOSL statement. Studio can then dynamically map these parameters as the input parameters for the activity. This allows for dynamic control of the query based upon input to the orchestration.

The SForce Object Search Language does not define a syntax for parameterized queries; however, IBM Cast Iron does enforce a few proprietary SOSL syntax rules. You can use parameters in either simple expressions or set expressions.

### SOSL syntax rules for IBM Cast Iron

## About this task

- Use a (\$) dollar sign to denote a parameter. After the (\$) dollar sign, specify a string of alphanumeric characters. The first character must be a letter [a-zA-Z], optionally followed by one or more letters [a-zA-Z], digits [0-9], or ( \_) underscores.  
Note: Parameter names are case-sensitive; therefore, the parameters \$a and \$A are considered to be different parameters.

The following table contains examples of valid and invalid parameter declarations:

Parameter	Valid or Invalid
\$AnAccount	valid
\$a123_456	valid
\$123a	invalid
\$_id	invalid

- You must declare parameters in the Search Query portion of the SOSL statement. Curly braces ( { } ) demarcate the Search Query portion of the SOSL statement.  
Important: Do not use double-quotes ( " " ) to enclose parameters. If you enclose parameters in double-quotes, the activity treats the parameter as a string search literal.
- The parameter type is always xsd:string. During substitution, the activity escapes any parameter that you declare using a reserved character. Reserved characters include the following characters:

Reserved Characters	Description
&	ampersand
*	asterisk
\	back slash
[ ]	box brackets
:	colon
,	comma
{ }	curly braces
"	double quote
!	exclamation mark
-	minus sign
+	plus sign
'	single quote
~	tilda
^	up arrow
	vertical bar

- Parameters can appear more than once in a given SOQL statement. However, even though the parameter appears more than once in the SOQL statement, it only appears once in the input parameter map. The activity substitutes the same value for all locations where the parameter is used at runtime.

---

### [Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring\\_the\\_Search\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring_the_Search_Objects_Activity.html)

## Update Objects activity

---

Use this activity to update existing objects in Salesforce.com.

## About this task

---

While the Salesforce.com API limits the number of objects that it can update in a single call to 200 objects, the Cast Iron® Salesforce.com Connector does not have such a limit. You can use the Update Objects activity to update an unlimited number of objects. ▶

Using the Update Objects activity.

## Procedure

---

1. In the Activities tab, open the Salesforce.com directory to find the **Update Objects** activity.
2. Add the activity to an orchestration. The **Checklist** and **Summary** for the activity are displayed beneath the orchestration.
3. Select a Salesforce.com endpoint. For instructions on creating or editing a Salesforce.com endpoint, see [Creating or Editing a Salesforce.com Endpoint](#).
4. **Configure** the activity by choosing a Salesforce.com object type and object field preferences. You can only select object types and fields that the Integration Appliance can update. The input map contains the object type with elements that correspond to the fields you select during this configuration step.  
Note: The Integration Appliance cannot create auto-number fields.
5. **Specify** the **Retry** and **Time out** parameters for the activity.
6. Map the input of the activity. The input map consists of an object's input parameter. This parameter consists of a single root element that has a single repeating element, named after the object type you selected, containing all the fields you selected in the Object Field Preferences table.
7. Map the output of the activity.

## Results

---

### Map the input of the Update Objects activity

1. In the **Checklist**, select Map Inputs. The **objects** element is displayed in the To Activity pane.
2. Right-click the default node and choose Show Optional Parameters to show the optional input parameters for this activity:
  - o AssignmentRuleHeader
  - o MruHeader
  - o EmailHeader
  - o CallOptions
  - o connection
  - o sessionInfo
3. Click **Select Inputs...** and select the input variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
4. As appropriate, map the input parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

Optional and nillable field elements have the following behavior:

- The Integration Appliance does not update an optional field, when the Salesforce.com server does not provide a value for the field.
- If you set the xsi:nil attribute to true on a nillable field, the Integration Appliance sets the field to null during an update.  
Note: Setting a field to an empty string does not set a field to null.

### Map the output of the Update Objects activity

1. In the **Checklist**, select Map Outputs. The **saveResults** element is displayed in the From Activity panel.
2. Click **Select Outputs...** and select the output variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
3. As appropriate, map the output parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

**Parent topic:** [Salesforce.com activities](#)

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Update\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Update_Objects_Activity.html)

# Upsert Objects activity

---

Use this activity to update existing objects or create new objects in Salesforce.com.

## About this task

---

The activity uses an external ID, usually a foreign key, to determine whether to update an existing object or create a new object in Salesforce.com.

While the Salesforce.com API limits the number of objects that it can create in a single upsert call to 200 objects, the Cast Iron® Salesforce.com connector does not have such a limit. You can use the **Upsert Objects** activity to create an unlimited number of objects.

To use the **Upsert Objects** activity:

## Procedure

---

1. In the Activities tab, open the Salesforce.com directory to find the **Upsert Objects** activity.
2. Add the activity to an orchestration. The **Checklist** and **Summary** for the activity are displayed beneath the orchestration.
3. Select a Salesforce.com endpoint. For instructions on creating or editing a Salesforce.com endpoint, see [Creating or Editing a Salesforce.com Endpoint](#).
4. **Configure** the activity, by choosing a Salesforce.com object type and object field preferences.  
Note: You can only choose object types that the Integration Appliance can update or create and contain at least one External ID field. When you select the object type, Studio displays the external IDs defined on the object type in the External ID field of the Configure pane. You cannot edit the IDs listed in the External ID list. The external ID that you select becomes a required field, you cannot clear this field from the Object Field Preferences table. If only one external ID is available, Studio automatically selects this field in the Object Field Preferences table.
5. **Specify** the **Retry** and **Time out** parameters for the activity.
6. Map the input of the activity.
7. Map the output of the activity.

## Results

---

### Map the input of the Upsert Objects activity

1. In the **Checklist**, select Map Inputs. The **objects** element is displayed in the To Activity panel.
2. Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - o AssignmentRuleHeader
  - o MruHeader
  - o EmailHeader
  - o CallOptions
  - o connection
  - o sessionInfo
3. Click Select Inputs... and select the input variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
4. As appropriate, map the input parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

This activity supports the following optional input parameters:

- AssignmentRuleHeader
- EmailHeader
- MruHeader

Optional and nillable field elements have the following behavior:

- The Integration Appliance does not update an optional field, when the Salesforce.com server does not provide a value for the field.
- If you set the xsi:nil attribute to true on a nillable field, the Integration Appliance sets the field to null during an update.  
Note: Setting a field to an empty string does not set a field to null.

### Map the output of the Upsert Objects activity

1. In the **Checklist**, select Map Outputs. The **upsertResults** element is displayed in the From Activity panel.

2. Click Select Outputs... and select the output variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
3. As appropriate, map the output parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

## Overview of Sage CRM Connector

---

Sage CRM is a customer relationship management application, which is available in both on premise and cloud based deployments. The software helps businesses improve customer relationships by organising and automating communications and activities across all customer-facing departments including sales, marketing and customer service. Integration with MailChimp is a popular and widely used integration scenario with Sage CRM.

Key Features of Sage CRM are as below:

- Targeted Marketing
- Accelerated sales
- Email Marketing
- Social CRM

- Mobile CRM

The IBM Cast Iron Connector for Sage CRM supports only cloud deployments. It enables an interface to connect to the Sage CRM through the SData 2.0 ReST-based API offered by Sage. The connector enables fetching data from the CRM and saving / updating data into the CRM for integration. All the objects (except Mobile Views object), including custom objects are supported by the connector. It enables users to Create, Update, Retrieve, Delete and Query (SData supported queries) records / objects available in the application.

You can perform the following activities using the Sage CRM connector:

- Create Objects
- Update Objects
- Delete Objects
- Query Objects
- Retrieve Objects
- Retrieve All Objects

The Sage CRM version currently supported by this connector is 2016 R1 Professional Edition, and API version is SData 2.0.

## Creating or editing an endpoint for Sage CRM activity

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to Sage CRM. Sage CRM uses Basic HTTP authentication mechanism to authorize users to perform operations.

### Selecting or editing a Sage CRM endpoint

1. In the Create Endpoint or Edit Endpoint pane, configure the Sage CRM endpoint as described in the following table.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to Sage CRM successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
Deployment Type	Type of deployment used for the Sage CRM instance. Currently only option supported is "Cloud".
Host Name	Host Name for Sage CRM instance. Since this is applicable for on premise version, it is currently disabled.
Username	User name used to identify the authorized user.
Password	Password to authorize the user.

Following parameters are required in endpoint test connection screen to make connection via Proxy:

Field Name	Description
Authentication Type	Authentication Type to be used for connecting to the Proxy Network. It will have values as Basic and NTLM.
Domain	Domain of Proxy Network (enabled only if user selects Authentication type as NTLM)
Host name	Host Name of Proxy Network

<b>Field Name</b>	<b>Description</b>
Port	Port Number of Proxy Network
User Name	User Name for accessing service via proxy network
Password	Password for accessing service via proxy network

Note:

In the Map Input section of each activity, relevant fields of endpoint panel are available to override at runtime. User can provide data to various groups of parameters like Proxy Details, Connection Details or Authentication Details to override. Providing only partial field data in a selected group is not allowed to override.

## Objects Supported by the Sage CRM Connector

---

Following standard objects are supported by the Sage CRM Connector:

<b>Sage CRM Objects</b>	<b>Create</b>	<b>Update</b>	<b>Delete</b>	<b>Query</b>	<b>Retrieve</b>	<b>Retrieve All</b>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SageCRM\\_creating\\_an\\_endpoint\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SageCRM_creating_an_endpoint_activity.html)

## Using the Sage CRM Create Objects Activity

Use the Create Objects activity to create one or more objects in Sage CRM.

## About this task

---

Use this task to create one or more objects in the Sage CRM. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created Sage CRM endpoint to the orchestration and select Create Objects activity.
3. The Create Objects activity will be added to the orchestration. Select the activity. The Sage CRM Create Objects Checklist is displayed.
4. In the checklist, click Configure.
5. Click Browse to select the object type. The Browse Sage CRM window is displayed.
6. In Browse Sage CRM, you can select the object type from the object type list. Click OK.
7. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Sage CRM REST API activities](#).
8. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
9. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
10. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
11. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Sage CRM Create Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Object tag in the To Activity pane of Map Inputs, and select Expand Occurrences.

Objects which have references with other custom or standard objects, with relationship types as "association" and not read only will be shown in the map inputs. In such cases, it is possible to create / update the configured custom object along with the referenced object.

## Using the Sage CRM Retrieve Objects Activity

---

Use the Retrieve Objects activity to fetch details of objects identified by specified id from Sage CRM.

## About this task

---

Use this task to retrieve objects based on ID in the Sage CRM instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. Right click the Orchestrations section and select new orchestration.

2. Drag the newly created Sage CRM endpoint to the orchestration and select Retrieve Objects activity.
3. The Retrieve Objects activity will be added to the orchestration. Select the activity. The Sage CRM Retrieve Objects Checklist is displayed.
4. In the checklist, click Configure.
5. Click Browse to select the object type. The Browse Sage CRM window is displayed.
6. In Browse Sage CRM, you can select the object type from the object type list. Click OK.
7. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
8. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Sage CRM REST API activities](#).
9. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
10. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
11. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Sage CRM Retrieve Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the key tag in the object in the To Activity pane of Map Inputs, and select Expand Occurrences.

## Using the Sage CRM Delete Objects Activity

---

Use the Delete Objects activity to delete one or more objects in Sage CRM.

### About this task

---

Use this task to delete one or more objects in the Sage CRM instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created Sage CRM endpoint to the orchestration and select Delete Objects activity.
3. The Delete Objects activity will be added to the orchestration. Select the activity. The Sage CRM Delete Objects Checklist is displayed.
4. In the checklist, click Configure.
5. Click Browse to select the object type. The Browse Sage CRM window is displayed.
6. In Browse Sage CRM, you can select the object type from the object type list. Click OK.
7. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Delete Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
8. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Sage CRM REST API activities](#).
9. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
10. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
11. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Sage CRM Delete Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the key tag in the object in the To Activity pane of Map Inputs, and select Expand Occurrences.

## Using the Sage CRM Retrieve All Objects Activity

---

Use the Retrieve All Objects activity to fetch details of a specified object type from Sage CRM.

### About this task

---

Use this task to retrieve all object details of a specified object type in the Sage CRM instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created Sage CRM endpoint to the orchestration and select Retrieve All Objects activity.
3. The Retrieve All Objects activity will be added to the orchestration. Select the activity. The Sage CRM Retrieve All Objects Checklist is displayed.
4. In the checklist, click Configure.
5. Click Browse to select the object type. The Browse Sage CRM window is displayed.
6. In Browse Sage CRM, you can select the object type from the object type list. Click OK.
7. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve All Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
8. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Sage CRM REST API activities](#).
9. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
10. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
11. Create a map between the output parameters and orchestration variables.

#### Query Parameter:

Table 1. Supported Query parameters for the Retrieve All Objects

Field Name	Description
startIndex	Start index of the record from which the result of the API call should start
Count	Count of number of objects to be displayed in the response.

Atleast one of the above query parameters should have a value mapped / default value for the activity to execute successfully.

## Results

---

You have configured the Sage CRM Retrieve All Objects activity.

Note:

This activity works on fetching multiple records of a specified type. As such, the input response would be single, which is applicable to a single retrieve all API call to fetch multiple objects.

**Parent topic:** [Sage CRM Activities](#)

## Using the Sage CRM Query Objects Activity

---

Use the Query Objects activity to execute SData query on a specified object type from Sage CRM.

### About this task

---

Use this task to execute an SData query on a specified object type in the Sage CRM instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created Sage CRM endpoint to the orchestration and select Query Objects activity.
3. The Query Objects activity will be added to the orchestration. Select the activity. The Sage CRM Query Objects Checklist is displayed.
4. In the checklist, click Configure.
5. Input the valid query parameters with a ? as a placeholder for the value. To configure multiple query parameters, separate each query parameter with a &. Some query examples:

```
select=?&where=?  
startIndex=?&count=?  
orderBy=?  
select=?&where=?orderBy=?  
    where=Lead_UpdatedDate lt @2016-01-10@
```

*Note that the query string should not begin with a ?.*

6. Click Browse to select the object type. The Browse Sage CRM window is displayed.
7. In Browse Sage CRM, you can select the object type from the object type list. Click OK.
8. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Query Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
9. In the Checklist, click Retry. Review the default settings and make the required changes.  
*Note: For more information, see [Specifying the Retry options for Sage CRM REST API activities](#).*
10. Create a map between the orchestration variables and the input parameter of the activity.  
*Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.*
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

**Query Parameter:**

Table 1. Common Query parameters for the Query Objects

Field Name	Description
------------	-------------

Field Name	Description
startIndex	Start index of the record from which the result of the API call should start
count	Count of number of objects to be displayed in the response.
where	Specifies a filtering criteria. Only the resources that match the criteria specified in the where parameter are returned.
orderBy	Specifies an ordering criteria. The collection is sorted by ascending or descending order of the attribute names specified in this parameter.
select	Selects the properties that will be returned in the payload. This parameter allows a client to request that a specific list of properties be returned in the payload. It gives precise control over the breadth and depth of information returned.

Atleast one of the above query parameters should have a value mapped / default value for the activity to execute successfully.

## Results

---

You have configured the Sage CRM Query Objects activity.

Note:

This activity works on fetching multiple records of a specified type. As such, the input response would be single, which is applicable to a single retrieve all API call to fetch multiple objects.

**Parent topic:** [Sage CRM Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SageCRM\\_query\\_objects\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SageCRM_query_objects_activity.html)

## Specifying the Retry options for Sage CRM REST API activities

---

Specifying the Retry parameters is one of the tasks to configure Sage CRM activity. The Sage CRM connector automatically retries to connect to Sage CRM instance while executing any connector activity for the specified number of times in case it receives 503 Service unavailable or 504 Gateway timeout status code.

### About this task

---

This section contains the procedure for configuring the Retry options for Sage CRM API activities.

### Procedure

---

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry and timeout options for connecting to an Sage CRM instance, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Sage CRM instance.

Retry Fields	Description
Retry __ times before failing.	<p>Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the Sage CRM instance before issuing an error and stopping the processing of the current orchestration job.</p> <p>Note: If you deploy an orchestration that contains the Sage CRM REST API activity and the Integration Appliance cannot connect to the specified Sage CRM instance, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>
Stop processing rest of the records of the batch if failure detected even after the configured no. of retries.	<p>Specifies that if a batch of records is sent as input to an orchestration, and if failure is detected in between, then the remaining records should be processed or not.</p> <p>For example, if the retry count is set to 3 and a batch of 5 records is sent as input to the orchestration. If, after processing the 1st record of batch, the Integration Appliance cannot connect to the specified Sage CRM instance even after configured number of retries i.e. 3 retry attempts, then the processing of the remaining 4 records will not be done and execution will be terminated if this option is selected.</p> <p>For the similar settings, if this option is not selected, then the remaining 4 records would be attempted to be processed.</p>

## Overview of the Salesforce Analytics connector

---

The IBM Salesforce Analytics Connector is an add-on developed with the Cast Iron Connector development kit (CDK).

This connector :

1. provides essential functionality for integration with Salesforce Analytics
2. provides a consistent look and feel like the other Cast Iron endpoints and activities
3. provides integration with Analytics Cloud with minimal API knowledge requirement
4. provides an optional ability to convert XML to CSV data for integration with Salesforce Analytics
5. provides an ability to split data into chunks of 10,000 rows

**Parent topic:** [Salesforce Analytics activities](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Salesforce\\_analytics\\_connector\\_overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Salesforce_analytics_connector_overview.html)

## How to Install the Salesforce Analytics Connector

---

1. Open Cast Iron Studio 7.0.0.2
2. Select 'Solutions' â†' **'Plugin Connectors'** and login with your credentials
3. If the older version of the connector is installed, uninstall the same, by following the steps listed below
  - a. In the **'Plugin Connectors'** window, select the **'Installed'** Tab
  - b. Select **'C0024-IBM\_Connector\_for\_Salesforce\_Analytics'**
  - c. Click on **'Uninstall'**
  - d. Restart Studio
  - e. Using Windows Explorer, browse through C:\Users\<currentuser>\castiron\connector-repository
  - f. Confirm that the folder **'C0024-IBM\_Connector\_for\_Salesforce\_Analytics-1\_0'** does not exist under C:\Users\<currentuser>\.castiron\connector-repository. If it exists, delete the same
4. In the Cast Iron Studio, Select 'Solutions' â†' **'Plugin Connectors'** and login with your credentials
5. Under **'Available'** Tab, select **'C0024-IBM\_Connector\_for\_Salesforce\_Analytics'**
6. Click on **'Install'**
  7. 1) The message **'Finished installing selected connectors'** would be displayed.
  8. Restart Studio. **This completes the installation process successfully**
9. **Note :** If you open an old project using the older version of the project, it would ask you to 'Update' the project first

**Parent topic:** [Salesforce Analytics activities](#)

# Use case with CSV format data

---

Steps for the integration process for simple csv format is described below

## Procedure

---

1. Use the Salesforce tools or manually create the metadata JSON file for the data to be loaded onto Analytics Cloud
2. Load the JSON file into the Cast Iron project as a default value in a string variable
3. Use the appropriate Cast Iron activity (HTTP, FTP, etc) to receive the CSV data
4. Use the 'Create Dataset' activity to map 'EdgeMartAlias' and 'Operation'. Specify 'Format' to be 'CSV'. Base-64 encode the JSON and map to 'MetadataJson'
5. Use the 'Load Data' activity to map the 'InsightsExternalDataId' and 'PartNumber' (optional) Base-64 encode the CSV and map to 'DataFile'. Specify 'DataFormat' to be 'CSV'
6. Use the 'Update Dataset' activity to set the 'Status' of the dataset to 'Process'
7. Use the 'Retrieve Dataset' activity and poll Analytics Cloud for the status of the data load

**Parent topic:** [Salesforce Analytics activities](#)

---

[Feedback](#) | [Notices](#)

# Use case with XML format data

---

Steps for the integration process for XML data format is described below

## Procedure

---

1. Use the Salesforce tools or manually create the metadata JSON file for the data to be loaded onto Analytics Cloud
2. Load the JSON file into the Cast Iron project as a default value in a string variable
3. Use the appropriate Cast Iron activity (HTTP, FTP, etc) to receive the XML data
4. 1. Use the 'Create Dataset' activity to map the 'EdgeMartAlias' and 'Operation'. Specify 'Format' to be 'CSV'. Base-64 encode the JSON and map to MetadataJson
5. 1. Serialize the XML data using the 'Write XML' activity. Refer [Example 1: How to Configure the Write XML Activity for XML Data](#) on how to configure this activity to serialize the XML correctly
6. Use the 'Load Data' activity to map the 'InsightsExternalDataId' and 'PartNumber' (optional). Base-64 encode the XML and map to 'DataFile'. Specify 'DataFormat' to be 'XML'. This will configure the connector to internally convert the XML to CSV and invoke the SFDC Analytics API with the CSV
7. Use the 'Update Dataset' activity to set the processing status Refer the topic " How to configure the Write XML Activity for XML Data "
8. Use the 'Retrieve Dataset' activity to poll Analytics Cloud for the status of the data load

# Create Dataset Activity

---

This activity creates a dataset with a name ( EdgeMartAlias ) and the metadata for the object

## Procedure

---

1. The mandatory fields are:
  - a. ' EdgemartAlias ': Specify the dataset name. It must be unique across the organization
  - b. 'Format': Specify 'CSV' which is the only format accepted at the moment
  - c. 'Operation': Set to 'Overwrite'
2. Optional fields are:
  - a. 'Action ': Defaults to None
3. If the operation is successful, will return an 'Id' value for the dataset. This value must be maintained throughout the orchestration, to associate the file data to the dataset

**Parent topic:** [Salesforce Analytics activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Salesforce\\_analytics\\_connector\\_CreateDataSet\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Salesforce_analytics_connector_CreateDataSet_Activity.html)

## Load Data Activity

---

This activity loads the file data to the dataset. The data can be passed in bulk or split in accordance with the Salesforce API limitation, where each chunk must contain less than 10,000 rows

## Procedure

---

Note:

### Salesforce Analytics API Limits:

The number of rows in a single data load, cannot be more than 10,000. If the ' DataFile ' of the 'Load Data' Activity has more than 10,000 rows and no ' PartNumber ' is specified, the connector will take care of splitting it into chunks of 10,000 rows and then invoke the Salesforce Analytics API with PartNumber starting at 1

A few other limits are listed below. It is the responsibility of the integration developer to ensure that the data adheres to the latest limits specified by the Salesforce Analytics documentation

- a. Maximum file size per external data upload
- b. Maximum number of characters in a field
- c. Maximum number of fields in a record
- d. Data or data chunks are less than 10-MB

The mandatory fields are:

- a. ' InsightsExternalDataId ': Specify the Id value of the dataset received from Create Dataset activity
- b. ' DataFile ': Map the file data encoded using the Base64 Encode function. File data can be in CSV or XML format
- c. ' DataFormat ': Specify if the ' DataFile ' is in XML or CSV format. ('XML' or 'CSV' are the accepted values). This field is used internally by the connector to understand the format of ' DataFile '

### Result:

If the ' DataFormat ' is XML, the connector would try to convert the ' DataFile ' from XML to CSV.

If the ' DataFormat ' is 'CSV', no conversion will happen.

**Parent topic:** [Salesforce Analytics activities](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Salesforce\\_analytics\\_connector\\_LoadData\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Salesforce_analytics_connector_LoadData_Activity.html)

## Load Data Activity - Continued

---

### About this task

1. The optional field is PartNumber.
  - a. If no value is specified, the connector checks if the DataFile has more than 10,000 rows. If the ' DataFile ' has more than 10,000 rows, the connector would internally split the data in to chunks of 10,000 and upload the data to Salesforce Analytics with PartNumber starting at 1.
  - b. If value is specified, the connector would not do any splitting and just upload the data to Salesforce Analytics with the specified ' PartNumber '.
  - c. ' DataFormat ': Specify if the ' DataFile ' is in XML or CSV format. ('XML' or 'CSV' are the accepted values). This field is used internally by the connector to understand the format of ' DataFile '.
2. Refer the topic [Example 1: How to Configure the Write XML Activity for XML Data](#) to see how the 'Write XML' activity should be configured to serialize the XML data in the orchestration

Note: If the `success` field has the value `true`, the operation is successful. If `false`, it has failed.

PartNumber	DataFormat	Connector Behavior
Specified	XML	The connector will convert DataFile into CSV, but will not split the CSV. Special characters like comma, double quotes, new line will be escaped during conversion. It will upload the CSV to Salesforce Analytics
Specified	CSV	The connector will not do any conversion or splitting. It will upload the CSV as-is to Salesforce Analytics. It is responsibility of integration developer to escape the special characters in the CSV as specified in the Salesforce Analytics documentation
Not Specified	XML	The connector will try to convert DataFile into CSV and also, split the CSV into chunks of 10,000 rows. Special characters like comma, double quotes, new line will be escaped during conversion. It will upload the data chunks to Salesforce Analytics with PartNumber starting with 1
Not Specified	CSV	The connector will not do any conversion, but will split the DataFile into chunks of 10,000 rows and upload the chunks to Salesforce Analytics with PartNumber starting with 1. Please note that the connector uses newline character as the line separator for splitting the CSV. To use this configuration, the CSV data should not contain any newline character as part of field value. It is responsibility of integration developer to escape the special characters in the CSV as specified in the Salesforce Analytics documentation

## Update Dataset Activity

---

Use the 'Update Dataset' activity to indicate that the data file has been completely uploaded, and can be processed by the Analytics Cloud engine

## Procedure

---

The mandatory fields are :

- a. **'Id'**: Specify the Id value received from Create Dataset activity
- b. **'Action'**: Set the value to "Process"

## Results

---

If the "success" field has the value "true", the operation is successful. If "false", it has failed

**Parent topic:** [Salesforce Analytics activities](#)

---

## Retrieve Dataset Activity

---

Use the 'Retrieve Dataset' activity to check the status of the data file processing. This activity will retrieve the Dataset of the Id specified in input

## Procedure

---

The mandatory fields is :

- a. **'Id'**: Specify the Id value received from Create Dataset activity

## Results

---

The response contains the information about the dataset. The Status field in the response will contain the current processing state

1. "Completed" indicates the data has been successfully loaded into Analytics Cloud
2. "Errored" indicates there was a problem. Use the Job view in the Analytics Cloud UI to identify the cause of the error
3. "In Progress" indicates that the Analytics Cloud engine is still processing the data

Note:

There are other status values too (Check out the Salesforce Analytics Documentation for details). However, these are the most important ones from an integration perspective

## Example 1: How to Configure the Write XML Activity for XML Data

### Procedure

In the 'Load Data Activity', if the 'DataFile' field is in XML format and 'DataFormat' field has the value "XML":

- a. Map the XML or its fragment, needed to the 'Write XML' Activity, to serialize it
- b. Refer the examples below for the structure of an XML or an XML fragment – these are for illustrative purposes only and the XML element names, can be different, based on the usecase

**Parent topic:** [Salesforce Analytics activities](#)

[Feedback](#) | [Notices](#)

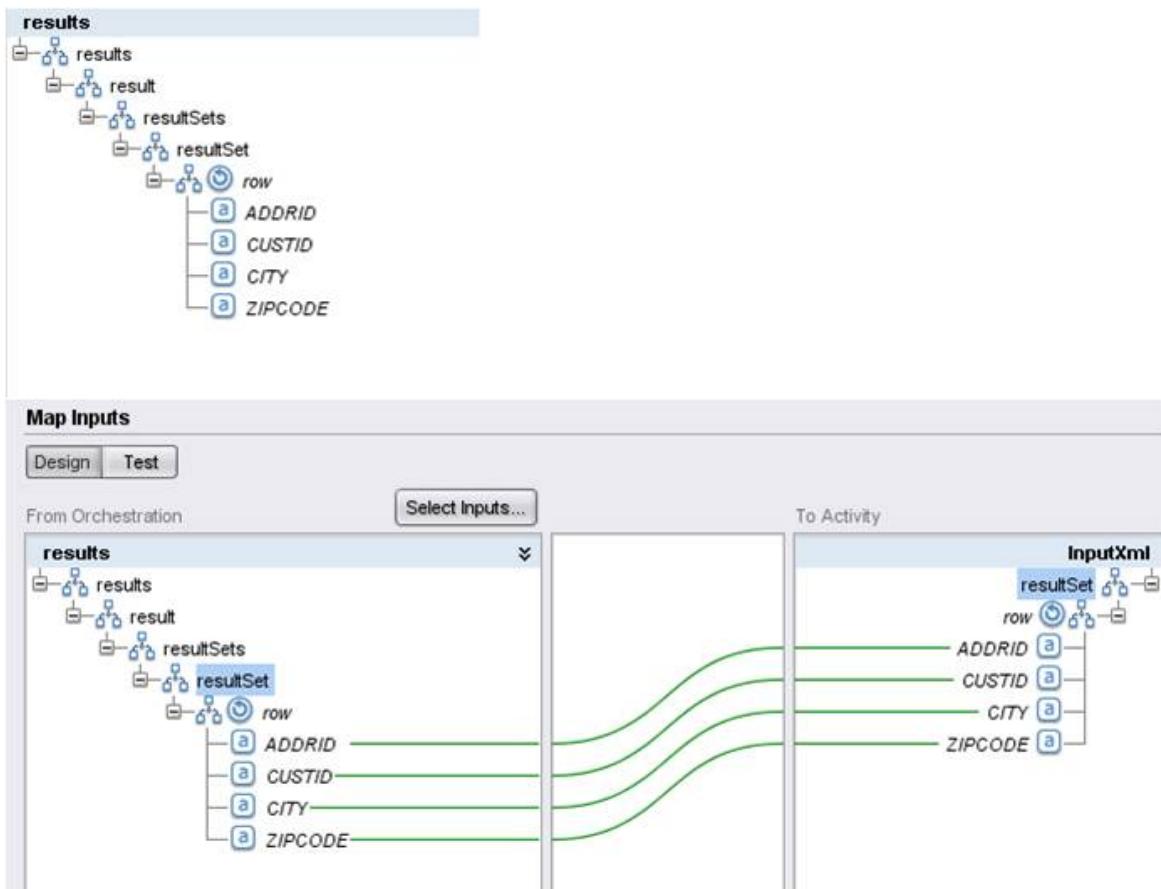

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Salesforce\\_analytics\\_connector\\_writexml.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Salesforce_analytics_connector_writexml.html)

## Example 1: Continued

### Procedure

1. If the XML or the XML fragment, looks as in Figure 1, configure the Map Inputs of 'Write XML' as in Figure 2, while serializing it
2. When the serialized XML is sent to the 'Load Data' Activity, it will produce a CSV internally and send it to the Salesforce Analytics. For example:
  - o **ADDRID,CUSTID,CITY,ZIPCODE**
  - o **id41931,bangalore,560000,41931**
  - o **id41932,bangalore,560000,41932**
  - o **id41933,bangalore,560000,41933**

 Last updated: Wednesday, 15 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_sapactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_sapactivities.html)

## Overview of the SAP connector

---

The SAP connector enables a two-way communication between Cast Iron and the SAP instance. The connector supports Business Application Programming Interface (BAPI), Remote Function Call (RFC), and Intermediate Document (IDOC) interfaces.

You can perform the following activities using the SAP connector:

- Outbound Activities

- [Invoke BAPI](#)
- [Invoke RFC](#)
- [Send IDOC](#)

- Inbound/Starter Activities

- [Receive IDOC](#)

The SAP connector supports SAP Java Connector (JCo) libraries to work with SAP via IDOC, RFC and BAPI interfaces.

The SAP connector requires the SAP JCo libraries to connect to the SAP instance. The connector supports JCo version 3.0.x or later versions. For more information, see [Downloading and installing the SAP Jar Files and DLLs](#).

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP\\_Overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP_Overview.html)

## Creating or editing a SAP endpoint

---

Endpoints provide the SAP connection information that Studio and the Integration Appliance use to connect to the SAP system.

### Procedure

---

1. Drag an activity from the SAP folder of the Activities tab onto the orchestration.

The Summary pane is displayed along with a Checklist which outlines what you must do to configure the activity.

2. Click Endpoint task from the Checklist and click on one of the following options:
  - Browse â€”To select an existing endpoint from the Project Explorer. Once a SAP endpoint has been added, you can click Edit to edit it.  
Note: Editing an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
  - New â€”To create a new endpoint. The Create Endpoint window is displayed.
  - Edit â€”To edit the existing endpoint. The Edit Endpoint window is displayed.
3. Complete the fields defined in the tables below.
4. When finished, click Test Connection to confirm that you can connect to the SAP System.
5. Click OK.

**Table 1. SAP Options**

Field	Description
<b>Location</b>	
Host Name	Specifies the IP Address or the machine name that contains the SAP system.
System Number	Specifies the number that identifies the specific instance of the SAP system that Studio should connect to. Your SAP administrator must supply this information.
<b>Client Information</b>	
SAP Client	Specifies a number that identifies Studio and the Integration Appliance as a client for the SAP system. Your SAP administrator must supply this information.
Language	Specifies the message language option for SAP. For example, EN is the ISO code for English.
<b>SAP Login Details</b>	
Username/Password based authentication	Specifies the user name and password of the user account of the SAP connector on the SAP system.
User name	Specifies the user name to use when connecting to the SAP system.
Password	Specifies the password to the user name when connecting to the SAP system.
SSO Token based authentication	Specifies that this option needs to be selected if the SSO Token is to be specified to log on to the SAP system.
SSO Token	Specifies the single sign-on (SSO) token.
Secure Network Connection (SNC)	Indicates that this check box must be selected for SNC. Note: When the SNC check box is selected, the Username/Password based authentication is cleared. To use this option, you must select it again.
Secure Network Connection (SNC) name	Specifies the distinguished name of the SNC connection.
Secure Network Connection (SNC) partner	Specifies the distinguished name of the SNC partner.
Secure Network Connection (SNC) security level	Specifies the level of security of SNC.
X509 Certificate	Specifies the X509 certificate to be used as the logon ticket. This field is optional only if Username/Password based authentication is used with SNC.
For more information about configuring SSO and SNC, see <a href="#">Configuring Single Sign-on (SSO) and Secure Network Communications (SNC) for SAP connector</a>	
<b>Connection Pool Options</b>	
Maximum Connections	Specifies the additional SAP connections, up to the specified amount, that the Integration Appliance opens based on the message load.
Maximum Idle Time	Specifies the number of minutes that a SAP connection can be open and idle before being closed by the Integration Appliance.

Field	Description
<b>Inbound Gateway</b>	
Enable inbound gateway	Select this check box if this endpoint is used by a Receive IDOC activity and Receive RFC activity.
Host	Specifies the hostname of the SAP gateway.
Server Instances	Specifies the maximum number of Servers that can be registered with the same programID within an SAP instance.
Program ID	Specifies the ID of the registered Server. This ID is assigned when the RFC destination port is configured. SAP Program IDs cannot start with the exclamation (!) character. Note: For SAP systems, the Program ID name is case sensitive. For example, the Program ID name: Aaa is not equivalent to the Program ID name: aaa.
Service	Specifies the name of the SAP gateway service.
Retry Interval	Specifies the number of seconds that the Integration Appliance should wait before trying to re-establish a connection to the gateway of the SAP system.
<b>Remote Endpoint Configuration</b>	Â
Endpoint Runs Behind Firewall	Enables the secure connector name property so that secure connector can be used if the SAP application is running behind a firewall.
Secure Connector Name	Specifies the name of the secure connector that is used to connect to the SAP application running behind a firewall. For example, if an orchestration containing an SAP activity is deployed on to Cast Iron Live (cloud), then the secure connector needs to be configured.

Note: For some of the fields in the endpoint, you can [define configuration properties](#) to supply the values for these fields. The  icon is displayed when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.

**Parent topic:** [SAP activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP\\_Creating\\_or\\_Editing\\_a\\_SAP\\_Endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP_Creating_or_Editing_a_SAP_Endpoint.html)

## Downloading and installing the SAP Jar Files and DLLs

To connect to an SAP system from studio, you must install SAP DLLs and jar files onto your Windows development machine. You must have the SAP login credentials to enter the SAP Support Portal and download the files.

### About this task

To download and install the SAP jar files and DLLs:

1. Contact SAP Technical Support to obtain the compressed files for the following SAP Components:

- o **SAP JCo - based on the platform on which studio is running.**
- o **SAP Java IDoc Class Library**

Note: Latest version of JCo jar available: 3.0.14, IDoc version 3.0.12.

2. Uncompress the SAP JCo compressed file:

- o Double-click the sapjidoc30P\_x-1000xxxx.zip file.
- o Use the decompression tool to extract the contents of the compressed file to a temporary directory. This compressed file contains another compressed file sapjco3- NTintel-3.0.x.zip. Extract this compressed file to a temporary directory, for example: C:\temp\sapjco3-NTintel-3.0.x. This directory contains the required libraries sapjco3.jar and sapjco3.dll.

3. Uncompress the SAP IDoc JCo compressed file:
  - o Double-click the sapjidoc30P\_x-1000xxxx.zip file.
  - o Use the decompression tool to extract the contents of the compressed file to a temporary directory, for example, C:\temp\sapjidoc30P\_x-1000xxxx. This directory contains the required library sapidoc3.jar.

Note: If you are using Cast Iron Studio version 6.4 or earlier versions, you must download and install the 32 bit SAP libraries. For Cast Iron version 7.0 onwards, you must download and install the 64 bit SAP libraries.

## Procedure

---

1. Open studio, select Tools > Install Module Providers.
2. When the Add Providers dialog box is displayed, click the plus (+) button beneath SAP Connector.

A text entry field and a Browse button is displayed.
3. Click Browse, and use the browse dialog box to locate and select the sapjco3.jar file.
4. Click Open to import the jar file contents.
5. Click the next available plus (+) button to add the sapidoc3.jar and sapjco3.dll files.
6. When the jar file is listed in the Add Providers dialog box, click OK.

## Results

---

A prompt is displayed to restart studio and activate the changes.

## What to do next

---

You can now create SAP endpoints and orchestrations.

**Parent topic:** [SAP activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Downloading\\_and\\_Installing\\_the\\_SAP\\_Jar\\_File\\_and\\_DLLs.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Downloading_and_Installing_the_SAP_Jar_File_and_DLLs.html)

# Configuring Single Sign-on (SSO) and Secure Network Communications (SNC) for SAP connector

---

## Before you begin

---

In Cast Iron version 6.3.0.2 and later versions, you can connect to SAP through the SAP connector in the following ways:

- By providing user name and password
- By providing an SSO ticket (for Invoke RFC, Invoke BAPI, and Send IDOC activities only).

Note: Enable the SAP server for SSO. The SAP SSO ticket can be obtained by logging into the SAP system using a web browser and fetching the value of session cookie named MYSAPSSO2.
- Using the SNC feature, by providing the SNC name, the SNC partner name, and one of the following:
  - o X509 certificate
  - o X509 certificate, username (user of the certificate), and a dummy password
  - o User name and password

Note: Enable the SAP server for SNC.

## Procedure

---

For SNC:

1. Add SECUDIR as a system variable and set it to the PATH: WHERE SECUDIR = <PATH OF EXTRACTED SAP CRYPTO lib file>.
2. Add the system credentials to the .pse file: sapgenpse seclogin -p <PSE LOCATION>.pse -o <SYSTEM USERNAME>.
3. In Cast Iron Studio, go to Tools > Install Module Providers and upload sapcrypto.dll file of the respective version of studio (32 bit/64 bit) to the SAP connector.
4. In the endpoint page, complete the following:
  - a. Specify the distinguished name for client PSE (created while generating client PSE) in the SNC name field.
  - b. Specify the distinguished name for client PSE (created while generating client PSE) in the SNC partner field.
  - c. Specify the level of security in SNC security level. Security level support is provided by Cryptographic Library and all security levels may not be supported by a particular library file. Select the required option from the drop-down list.
  - d. Optional: Specify the X509 certificate to be used as the log on ticket, if required. Remove the extra lines such that the certificate is in a single line.
  - e. Complete the rest of the fields and click Test Connection.

**Parent topic:** [SAP activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP\\_configuring\\_SNC.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP_configuring_SNC.html)

## SAP Invoke BAPI activity

---

Use the SAP Invoke BAPI activity to call a Business Object Method (BAPI), that is remotely enabled at the specified SAP Endpoint, during run time.

Note: To connect to the SAP System from Studio, you must download and install the SAP Jar files and DLLs onto your Windows development machine. For more information, see [Downloading and installing the SAP Jar Files and DLLs](#).

### Adding a SAP Invoke BAPI activity in the orchestration

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the SAP folder.
3. Drag the SAP Invoke BAPI activity onto the orchestration.
4. Select the activity. The Checklist is displayed.

### Creating, selecting, or editing a SAP endpoint

---

1. Click Pick Endpoint task from the Checklist and select one of the following actions:
  - Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Go to the Configuring the activity procedure.
  - Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - Create a new endpoint: Select New. The Create Endpoint panel is displayed.
2. [Create or Edit a SAP endpoint](#).

### Configuring the activity

---

1. Select the Configure task from the Checklist. The Configure panel is displayed.
2. In the Object Name field click Browse.... The BAPI List dialog box is displayed.
3. Search for a Business Object. Click a Business Object in the list and enter the starting characters of the Business Object name.
4. Expand the Business Object to view the associated BAPI methods.
5. Select a Business Object and Method and click OK.
6. Select one of the following Transaction Options:

- o Do Nothing (Transaction handled by BAPI directly) - During run time, the Integration Appliance calling the BAPI does no transaction processing. If a transaction is associated with the BAPI, the BAPI must completely handle the transaction
- o Commit transaction after completion - During run time, the Integration Appliance calls the BAPI and waits for a return message from the SAP System. The return code of the message returned from the SAP System determines if the Integration Appliance sends another message requesting that the SAP System to commit or rollback the transaction:
  - If the return code passed back from the BAPI indicates success, the Integration Appliance sends another message requesting that the SAP System commit the transaction and immediately starts processing the next activity in the orchestration.
  - If the return code passed back from the BAPI indicates failure, the Integration Appliance sends a rollback request to the SAP System and immediately starts processing the next activity in the orchestration.
- o Commit transaction and wait upon completion - During run time, the Integration Appliance invokes the BAPI and waits for a return message from the SAP System. The return code of the message returned from the SAP System determines if the Integration Appliance sends another message requesting that the SAP System to commit or rollback the transaction:
  - If the return code passed back from the BAPI indicates success, the Integration Appliance sends another message requesting that the SAP System commit the transaction. The orchestration waits until the SAP System sends a second message indicating that the transaction has been committed before processing the next activity in the orchestration.
  - If the return code passed back from the BAPI indicates failure, the Integration Appliance sends a rollback request to the SAP System. The orchestration waits until the SAP System sends a second message indicating that the rollback of the transaction has occurred before processing the next activity in the orchestration.

## Specifying the retry options

---

1. Select the Retry task from the Checklist. The Retry panel is displayed.
2. Configure the retry options for connecting to an SAP System. The following table describes the retry options for connecting to an SAP System:

Retry options	Description
1) Wait --- seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the SAP System.
2) Try to connect --- times before failing.	Specifies the maximum number of times the Integration Appliance attempts to establish a connection to the SAP System before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an SAP Invoke BAPI activity and the Integration Appliance cannot connect to the specified SAP System, the Integration Appliance logs the connections errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.

## Mapping the inputs of the activity

---

- Select the Map Inputs task in the Checklist. The XML Schemas generated from the input parameters of the BAPI are displayed as nodes under the request input parameter in the To Activity panel. In addition if the BAPI contains tables, the XML Schemas representing the tables of the BAPI , are displayed as nodes under the request input parameter in the To Activity panel.

The SAP connector also supports dynamic endpoint connection to a different SAP system. During run time, add optional parameters in `sapConnectionProperties` of map inputs, if you want to dynamically connect to an SAP system other than the one configured in the endpoint panel, if you want to connect to the same SAP system with a different user name and password other than the fields used in the endpoint panel, or if you want a different SSO token other than the one added in the endpoint panel. The parameters of `sapConnectionProperties` are described in the following table:

Table 1. Connection properties

Optional parameter	Description
sapConnectionProperties parameters	
hostName	Specifies the IP Address or the machine name that contains the SAP system.
systemNumber	Specifies the number that identifies the specific instance of the SAP system that Studio should connect to. Your SAP administrator must supply this information.
client	Specifies a number that identifies Studio and the Integration Appliance as a client for the SAP system. Your SAP administrator must supply this information.
language	Specifies the message language option for SAP. For example, EN is the ISO code for English.
basicAuthentication parameters	
username	Specifies the user name to use when connecting to the SAP system.
password	Specifies the password to the user name when connecting to the SAP system.
ssoAuthentication parameters	
ssotoken	Specifies the single sign-on (SSO) token.
sncAuthentication parameters	
sncmode	Specifies if the Secure Network Connections (SNC) mode is enabled.
sncname	Specifies the distinguished name of the SNC connection.
partner	Specifies the distinguished name of the SNC partner.
qop	Specifies the level of security of SNC.
X509 Certificate	Specifies the X509 certificate to be used as the logon ticket. This field is optional only if Username/Password based authentication is used with SNC.
connectionPool parameters	
maximumConnections	Specifies the additional SAP connections, up to the specified amount, which the Integration Appliance opens based on the message load.
maxIdleTime	Specifies the number of minutes that a SAP connection can be open and idle before being closed by the Integration Appliance.

- Create a map between orchestration variables and the BAPI input parameters and tables. See [Creating a map](#) for general instructions on mapping.

Values must be provided at run time for any mandatory elements of the BAPI input parameters or tables. A value can be provided by specifying a default value for element or by linking the element with input node. During run time if no value is provided for a mandatory element, the activity throws an exception during run time which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional element of the BAPI input parameters or tables, no exception is thrown during run time.

## Mapping the outputs of the activity

- Select the Map Outputs task in the Checklist. The XML Schema generated from return types of the BAPI display as nodes under the response output parameter in the From Activity panel. In addition, if the BAPI contains tables, the XML Schemas representing the tables are displayed as nodes under the response node in the From Activity.
- Create a map between the BAPI output parameters and tables and orchestration variables. See [Creating a map](#) for general instructions on mapping.

## Note about deploying a SAP orchestration

---

Before you can deploy an orchestration with SAP activities using the WMC, the Integration Appliance must first be able to establish a connection to the SAP System. If the Integration Appliance is unable to establish the connection to the SAP System, the orchestration is not deployed.

**Parent topic:** [SAP activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP\\_Invoke\\_BAPI\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP_Invoke_BAPI_Activity.html)

## SAP Invoke RFC activity

---

Use the SAP Invoke RFC activity to call a Remote Function Call (RFC), that is remotely enabled at the specified SAP endpoint, during run time.

Note: To connect to the SAP System from Studio, you must download and install the SAP Jar files and DLLs onto your Window's development machine. For more information, see [Downloading and installing the SAP Jar Files and DLLs](#).

### Adding a SAP Invoke RFC activity to the orchestration

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the SAP folder.
3. Drag the SAP Invoke RFC activity onto the orchestration.
4. Select the activity. The Checklist is displayed.

### Creating, selecting, or editing a SAP endpoint

---

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Go to the Configuring the activity procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint panel is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint panel is displayed.
2. [Create or Edit a SAP endpoint](#).

### Configuring the activity

---

1. Select the Configure task from the Checklist. The Configure panel is displayed.
2. In the RFC Name field, click Browse.... The RFC List dialog box is displayed.
3. In the RFC Search Function field, enter a combination of characters and the \* wildcard character to find the desired RFC name as shown in the following examples:
  - o AB\* â€“ Finds all the RFC whose names begin with the AB prefix.
  - o AB\*TRANSACTION â€“ Finds all the RFC whose begin with the AB prefix and end with the string: TRANSACTION.

The SAP system is interrogated and the RFC names that match the wildcard expression are listed in the Matching SAP Functions table.

4. From the Matching SAP Functions table, select one of the SAP Functions and click OK.

### Specifying the retry options

---

1. Select the Retry task from the Checklist. The Retry panel is displayed.

2. Configure the retry options for connecting to an SAP System. The following table describes the retry options for connecting to an SAP System:

Retry options	Description
1) Wait --- seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the SAP System.
2) Try to connect --- times before failing.	Specifies the maximum number of times the Integration Appliance attempts to establish a connection to the SAP System before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an SAP Invoke RFC activity and the Integration Appliance cannot connect to the specified SAP System, the Integration Appliance logs the connection errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.

## Mapping the inputs of the activity

- Select the Map Inputs task in the Checklist. The XML Schemas generated from the input parameters of the RFC are displayed as nodes under the request input parameter in the To Activity pane. In addition if the RFC contains tables, the XML Schemas representing the tables of the RFC, are displayed as nodes under the request input parameter in the To Activity panel.
- Create a map between orchestration variables and the RFC input parameters and tables. See [Creating a map](#) for general instructions on mapping.

Values must be provided at run time for any mandatory elements of the RFC input parameters or tables. A value can be provided by specifying a default value for the element or by linking the element with input node. During run time if no value is provided for a mandatory element, the activity throws an exception during run time which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional element of the RFC input parameters or tables, no exception is thrown during run time.

### Transaction Options:

- In the Map Inputs of the activity, right click the To Activity section and select Show Optional Parameters. A variable `transactionOptions` appears in the map input. This property is available from Cast Iron Studio version 6.1.0.12 only.
- Select one of the following values:  
Note: If you do not set any value for the `transactionOptions` property, the `COMMIT_HANDLED_BY_RFC` value will be used.

Table 1.

Value	Description
<code>COMMIT_HANDLED_BY_RFC</code>	The commit of RFC is taken care by the RFC itself. The connector does not do any explicit commit calls.

Value	Description
COMMIT_TRANS ACTION_AFTER_COMPLETION	<p>During run time, the SAP connector calls the RFC and waits for a return message from the SAP System. The return code of the message returned by the SAP system determines if the SAP connector sends another call requesting the SAP system to commit or rollback the transaction:</p> <ul style="list-style-type: none"> <li>◦ If the return code passed from the RFC indicates success, the SAP connector makes another call requesting the SAP system to commit the transaction, and immediately starts processing the next activity in the orchestration.</li> <li>◦ If the return code passed from the RFC indicates failure, the SAP connector makes a rollback request to the SAP system, and immediately starts processing the next activity in the orchestration.</li> </ul>
COMMIT_TRANS ACTION_AND_WAIT_UPON_COMPLETION	<p>During run time, the SAP connector invokes the RFC and waits for a return message from the SAP system. The return code of the message returned by the SAP system determines if the SAP connector sends another message requesting the SAP system to commit or rollback the transaction:</p> <ul style="list-style-type: none"> <li>◦ If the return code passed back from the RFC indicates success, the SAP connector makes another call requesting the SAP system to commit the transaction. The orchestration waits until the SAP System sends a second message indicating that the transaction has been committed before processing the next activity in the orchestration.</li> <li>◦ If the return code passed back from the RFC indicates failure, the SAP connector makes a rollback request to the SAP system. The orchestration waits until the SAP system sends a second message indicating that the rollback of the transaction has occurred before processing the next activity in the orchestration.</li> </ul>

3. After the transaction operations are selected, fill in the input data for RFC.

The SAP connector also supports dynamic endpoint connection to a different SAP system. During run time, add optional parameters in `sapConnectionProperties` of map inputs, if you want to dynamically connect to an SAP system other than the one configured in the endpoint panel, if you want to connect to the same SAP system with a different user name and password other than the fields used in the endpoint panel, or if you want a different SSO token other than the one added in the endpoint panel. The parameters of `sapConnectionProperties` are described in the following table:

Table 2. Connection properties

Optional parameter	Description
sapConnectionProperties parameters	
hostName	Specifies the IP Address or the machine name that contains the SAP system.
systemNumber	Specifies the number that identifies the specific instance of the SAP system that Studio should connect to. Your SAP administrator must supply this information.
client	Specifies a number that identifies Studio and the Integration Appliance as a client for the SAP system. Your SAP administrator must supply this information.
language	Specifies the message language option for SAP. For example, EN is the ISO code for English.
basicAuthentication parameters	
username	Specifies the user name to use when connecting to the SAP system.
password	Specifies the password to the user name when connecting to the SAP system.
ssoAuthentication parameters	
ssotoken	Specifies the single sign-on (SSO) token.
sncAuthentication parameters	
sncmode	Specifies if the Secure Network Connections (SNC) mode is enabled.
sncname	Specifies the distinguished name of the SNC connection.
partner	Specifies the distinguished name of the SNC partner.
qop	Specifies the level of security of SNC.
X509 Certificate	Specifies the X509 certificate to be used as the logon ticket. This field is optional only if Username/Password based authentication is used with SNC.
connectionPool parameters	
maximumConnections	Specifies the additional SAP connections, up to the specified amount, which the Integration Appliance opens based on the message load.

Optional parameter	Description
maxIdleTime	Specifies the number of minutes that a SAP connection can be open and idle before being closed by the Integration Appliance.

## Mapping the outputs of the activity

---

1. Select the Map Outputs task in the Checklist. The XML Schema generated from return types of the RFC are displayed as nodes under the request output parameter in the From Activity panel. In addition, if the RFC contains tables, the XML Schemas representing the tables are displayed as nodes under the request node in the From Activity.
2. Create a map between the RFC output parameters and tables and orchestration variables. See [Creating a map](#) for general instructions on mapping.

## Note about Deploying a SAP Orchestration

---

Before you can deploy an orchestration with SAP activities using the WMC, the Integration Appliance must first be able to establish a connection to the SAP System. If the Integration Appliance is unable to establish the connection to the SAP System, the orchestration is not deployed.

**Parent topic:** [SAP activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP\\_Invoke\\_RFC\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP_Invoke_RFC_Activity.html)

## SAP Receive IDOC activity

---

Use the SAP Receive IDOC activity to act as a server and listen on the configured SAP endpoint, during run time. The activity receives an IDOC from the specified SAP endpoint and converts it to XML data. The SAP Receive IDOC activity is a starter activity.

If you receive your SAP data directly from the SAP system using an RFC port, you must use the SAP Receive IDOC activity. If you receive your SAP data as a file through a SAP File Port to the SAP system, you must use the Project > Import > SAP IDOC Schema toolbar menu option during design time to generate a Flat File Schema for your IDOC metadata and use the Read Flat File activity to read the SAP data. For more information, see [Generating a Flat File Schema from an IDOC](#).

For the SAP Receive IDOC activity only, you must specify an inbound gateway connection parameters. For more information, see [Creating or editing a SAP endpoint](#).

In order to connect to the SAP System from Studio, you must download and install the SAP Jar files and DLLs on your Windows development machine. For more information, see [Downloading and installing the SAP Jar Files and DLLs](#).

Note: An orchestration that contains an SAP Receive IDOC activity must have persistence enabled. For more information, see [Enabling persistence](#).

## Adding a SAP Receive IDOC activity in the orchestration

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the SAP folder.
3. Drag the Receive IDOC activity onto the orchestration.
4. Select the activity. The Checklist is displayed.

## Creating, selecting, or editing a SAP endpoint

---

1. Click Pick Endpoint task from the Checklist and select one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.

- b. Select an existing endpoint and click OK. Go to the Configuring the activity procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint panel is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint panel is displayed.
2. [Create or Edit a SAP endpoint](#).

## Configuring the activity

---

1. Select the Configure task from the Checklist. The Configure panel is displayed.
2. Click Browse....
3. Select an IDOC row and click OK. The Message Type, IDOC Type, and IDOC Extended Type in the Configure task are populated.

## Mapping the outputs of the activity

---

1. Select the Map Outputs task in the Checklist.

The output parameter of the activity is displayed in the From Activity panel. The XML Schema generated from the selected IDOC Type and IDOC Extended Type becomes the output parameter of the activity.

2. Create a map between the IDOC XML Schema and orchestration variables. See [Creating a map](#) for general instructions on mapping.

## Note about Deploying a SAP Orchestration

---

Before you can deploy an orchestration with SAP activities using the Web Management Console, the Integration Appliance must first be able to establish a connection to the SAP System. If the Integration Appliance is unable to establish the connection to the SAP System, the orchestration is not deployed.

**Parent topic:** [SAP activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP\\_Receive\\_IDOC\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP_Receive_IDOC_Activity.html)

## SAP Send IDOC activity

---

Use the SAP Send IDOC activity to send an IDOC to the specified SAP endpoint, during run time.

If you send your SAP data directly to the SAP system using an RFC port, you must use the SAP Send IDOC activity. If you send your SAP data as a file through a SAP File Port to the SAP system, you must use the Project > Import > SAP IDOC Schema toolbar menu option during design time to generate a Flat File Schema for your IDOC metadata and use the Write Flat File activity to write the SAP data. For more information, see [Generating a Flat File Schema from an IDOC](#).

To connect to the SAP System from Studio, you must download and install the SAP Jar files and DLLs on your Window's development machine. For more information, see [Downloading and installing the SAP Jar Files and DLLs](#).

During run time, if the SAP Send IDOC activity processes two instances of an IDOC, where both instances have the same IDOC number, the SAP Send IDOC activity appends the data segment of the second instance to the first instance.

Note: An orchestration that contains a SAP Send IDOC activity must have persistence enabled. For more information, see [Enabling persistence](#).

The steps for adding and configuring a SAP Send IDOC activity to an orchestration are described in the following procedures:

- [Adding a SAP Send IDOC activity to the orchestration](#)
- [Creating, selecting, or editing a SAP endpoint](#)
- [Configuring the activity](#)

- Specifying the retry options
- Mapping the inputs of the activity

## Adding a SAP Send IDOC activity to the orchestration

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the SAP folder.
3. Drag the Send IDOC activity onto the orchestration.
4. Select the activity. The Checklist is displayed.

## Creating, selecting, or editing a SAP endpoint

---

1. Click Pick Endpoint task from the Checklist and select one of the following actions:
  - Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Go to the [Configuring the activity](#) procedure.
  - Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint panel is displayed.
  - Create a new endpoint: Select New. The Create Endpoint panel is displayed.
2. [Create or Edit a SAP endpoint](#).

## Configuring the activity

---

1. Select the Configure task from the Checklist. The Configure panel is displayed.
2. Click Browse....
3. Select an IDOC row and click OK. The Message Type, IDOC Type, and IDOC Extended Type in the Configure task are populated.

## Specifying the retry options

---

1. Select the Retry task from the Checklist. The Retry panel is displayed.
2. Configure the retry options for connecting to an SAP System. The following table describes the retry options for connecting to an SAP System:

Retry options	Description
1) Wait --- seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the SAP System.
2) Try to connect --- times	Specifies the maximum number of times the Integration Appliance attempts to establish a connection to the SAP System before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an SAP Send IDOC activity and the Integration Appliance cannot connect to the specified SAP System, the Integration Appliance logs the connection errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.

## Mapping the inputs of the activity

1. Select the Map Inputs task in the Checklist. The input parameter of the activity are displayed in the To Activity panel. The XML Schema generated from selected IDOC Type and IDOC Extended Type becomes the input parameter of the activity.
2. Right-click the To Activity section and select Show Optional Parameters.

The SAP connector also supports dynamic endpoint connection to a different SAP system. During run time, add optional parameters in `sapConnectionProperties` of map inputs, if you want to dynamically connect to an SAP system other than the one configured in the endpoint panel, if you want to connect to the same SAP system with a different user name and password other than the fields used in the endpoint panel, or if you want a different SSO token other than the one added in the endpoint panel. The parameters of `sapConnectionProperties` are described in the following table:

Table 1. Connection properties

Optional parameter	Description
sapConnectionProperties parameters	
hostName	Specifies the IP Address or the machine name that contains the SAP system.
systemNumber	Specifies the number that identifies the specific instance of the SAP system that Studio should connect to. Your SAP administrator must supply this information.
client	Specifies a number that identifies Studio and the Integration Appliance as a client for the SAP system. Your SAP administrator must supply this information.
language	Specifies the message language option for SAP. For example, EN is the ISO code for English.
basicAuthentication parameters	
username	Specifies the user name to use when connecting to the SAP system.
password	Specifies the password to the user name when connecting to the SAP system.
ssoAuthentication parameters	
ssotoken	Specifies the single sign-on (SSO) token.
sncAuthentication parameters	
sncmode	Specifies if the Secure Network Connections (SNC) mode is enabled.
sncname	Specifies the distinguished name of the SNC connection.
partner	Specifies the distinguished name of the SNC partner.
qop	Specifies the level of security of SNC.
X509 Certificate	Specifies the X509 certificate to be used as the logon ticket. This field is optional only if Username/Password based authentication is used with SNC.
connectionPool parameters	
maximumConnections	Specifies the additional SAP connections, up to the specified amount, which the Integration Appliance opens based on the message load.
maxIdleTime	Specifies the number of minutes that a SAP connection can be open and idle before being closed by the Integration Appliance.

3. Create a map between orchestration variables and the IDOC input parameters and tables. See [Creating a map](#) for general instructions on mapping.

## Note about Deploying a SAP Orchestration

Before you can deploy an orchestration with SAP activities using the Web Management Console, the Integration Appliance must first be able to establish a connection to the SAP System. If the Integration Appliance is unable to establish the connection to the SAP System, the orchestration is not deployed.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP\\_Send\\_IDOC\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP_Send_IDOC_Activity.html)

## SAP Receive RFC activity

---

Use the SAP Receive RFC activity to act as a server and listen on the configured SAP endpoint, during run time. The activity receives RFC from the specified SAP endpoint and converts it to XML data. The SAP Receive RFC activity is a starter activity. This activity can be configured in both synchronous and asynchronous mode.

For the SAP Receive RFC activity, you must specify the inbound gateway connection parameters. The Receive RFC activity accepts requests only from the configured Program ID in the endpoint. For more information see [Creating or editing a SAP endpoint](#).

To connect to the SAP system from Studio, you must download and install the SAP Jar files and DLLs on your Window's development machine. For more information, see [Downloading and installing the SAP Jar Files and DLLs](#).

Note: An orchestration that contains an SAP Receive RFC activity must have persistence enabled to run in asynchronous mode. For more information, see [Enabling persistence](#).

### Adding a SAP Receive RFC activity to the orchestration

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the SAP folder.
3. Drag the Receive RFC activity onto the orchestration.
4. Select the activity. The Checklist is displayed.

### Creating, selecting, or editing a SAP endpoint

---

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Go to the Configuring the activity procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint panel is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint panel is displayed.
2. [Create or Edit a SAP endpoint](#).

### Configuring the activity

---

1. Select the Configure task from the Checklist. The Configure panel is displayed.
2. In the RFC Name field, click Browse.... The RFC List dialog box is displayed.
3. In the RFC Search Pattern field, enter a combination of characters and the \* wildcard character to find the desired RFC name as shown in the following examples:
  - o AB\* Finds all the RFC names that begin with the AB prefix.
  - o AB\*TRANSACTION Finds all the RFC names that begin with the AB prefix and end with the string: TRANSACTION.

The SAP system is interrogated and the RFC names that match the wildcard expression are listed in the Matching SAP Functions table.

4. In the Options panel, you can either select the Synchronous mode check box or clear it. The processing can be handled either synchronously or asynchronously. By default, the Receive RFC activity is configured to the asynchronous mode.
  - o **Synchronous mode** - Both SAP and Cast Iron (the SAP Receive RFC activity) must be available during processing. SAP sends an RFC request to Cast Iron and waits for a response from the Receive RFC activity.
  - o **Asynchronous mode** - The SAP Receive RFC activity need not be available when SAP invokes the function call. SAP sends an RFC request to Cast Iron and does not wait for a response from the Receive RFC activity.

- From the Matching SAP Functions table, select one of the SAP Functions and click OK.

## Mapping the outputs of the activity

---

- Select the Map Outputs task in the Checklist. The output parameter of the activity is displayed in the From Activity panel. The XML Schema generated from the selected RFC becomes the output parameter of the activity.
- Create a map between the RFC output parameters and tables and orchestration variables. See [Creating a map](#) for general instructions on mapping.

## Note about Deploying a SAP Orchestration

---

Before you can deploy an orchestration with SAP activities using the WMC, the Integration Appliance must first be able to establish a connection to the SAP System. If the Integration Appliance is unable to establish the connection to the SAP System, the orchestration is not deployed.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP\\_Receive\\_RFC\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP_Receive_RFC_Activity.html)

## SAP Send RFC Response activity

---

The SAP **Send RFC Response** activity sends a reply back to the sender (SAP) of the SAP Receive RFC request.

The **Send RFC Response** activity must be used in conjunction with a **Receive RFC** activity in an orchestration. If you add a **Send RFC Response** activity to orchestration, you must select the Synchronous mode check box in the **Configure** task of the **Receive RFC** activity.

## Adding a Send RFC Response activity to the orchestration

---

- Create or open an orchestration. A graphical representation of the orchestration is displayed.
- Select the Activities tab and expand the SAP folder.
- Drag the **Send RFC Response** activity onto the orchestration.
- Select the activity. The **Checklist** is displayed with the **Configure** task active in the properties pane. The properties pane is located below the graphical representation of the orchestration.

## Configuring the activity

---

- Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
- Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field	Description
To	Specifies the SAP Receive RFC activity associated with this Send RFC Response activity. During run time, the associated Receive RFC activity receives the request from SAP, processes the request, and sends the output to Send RFC Response. The Send RFC Response activity sends the response back to SAP. Note: This field gets populated only if you select the Synchronous mode check box in the <b>Configure</b> task of the SAP <b>Receive RFC</b> activity.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP\\_Send\\_Response\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP_Send_Response_Activity.html)

## Troubleshooting and support

Troubleshooting techniques and self-help information help you identify and solve problems quickly. This topic provides potential solutions for issues you would have with the SAP connector.

## Getting EDI\_DC40 IDOC control record structure with WebSphere Cast Iron SAP Connector

**EDI\_DC40** is a standard SAP structure used to store IDoc Control Record for Interface to External System information. With the SAP connector using non-Unicode SAP server as endpoint in WebSphere Cast Iron Studio version 7002 for the Receive IDoc and Send IDoc activities, supports Control record name as **EDI\_DC40**.

Customer who are getting the EDI\_DC as their standard structure name, are requested to use the latest version of 7501/7510 Studio and reconfigure the object in their orchestration and map it accordingly.

### **Older behavior:**

With the Old Behavior for non-Unicode machine the control record name was EDI\_DC instead of EDI\_DC40.

```
-ALEREQ01
|_SAPTransactorID
|_qRECQueueName
|_IDOC
|_@Begin
|_EDI_DC
    |_Segment
        |_TABNAM
        |_MANDT
æ|æ|æ|
æ|æ|æ|
```

## New behavior:

With the new behavior for both Unicode and non-Unicode SAP server, the control record name will be EDI\_DC40.

```
-ALEREQ01
|_SAPTransactorID
|_qRECQueueName
|_IDOC
|_@Begin
|_EDI_DC40
    |_Segment
    |_TABNAM
    |_MANDT
â€¢â€¢â€¢
â€¢â€¢â€¢
```

## Dependency JCo Jar files - Version Specific Information

Install and use the latest patch level of the SAP Java Connector 3.0. Latest version of JCo jar available: 3.0.14, IDoc version 3.0.12.

You need to have these 3 files: sapico3.jar, sapico3.dll (for Windows) or sapico3.so (for Appliance), and sapidoc3.jar.

For downloading SAP JCo jar (2 files), follow these steps with specific to version:

- Download latest the SAP Java Connector 3.0.14 from the SAP Service Marketplace at <http://service.sap.com/connectors>. You will find the download package with the latest patch level for various platform by navigating to SAP Java Connector > Tools & Services > Download SAP JCo Release 3.0. An installation guide is included in the download archive.
    - For Studio 32 bit Version, download the JCo jar zip file under Microsoft Windows and Windows Server > 32bit for 32 bit version of WebSphere Cast Iron Studio.

- For Studio 64 bit Version, download the JCo jar zip file under Microsoft Windows and Windows Server > 64bit x86 for 64 bit version of WebSphere Cast Iron Studio.
- For WebSphere Cast Iron Appliance, download the JCo jar zip file under Linux (for Intel compatible processors)> 64bit x86 for Appliance.

For downloading SAP IDoc jar (1 file), follow these steps with specific to version:

- Download latest the SAP Java Connector 3.0.14 from the SAP Service Marketplace at <http://service.sap.com/connectors>. You will find the download package with the latest patch level for various platform by navigating to SAP Java Connector > Tools & Services > SAP Java IDoc Class Library.
  - For all platforms, SAP Java IDoc Class Library 3.0.12 zip file will contain the SAP IDoc jar file.

## **Exception thrown when trying to browse for IDoc/BAPI/RFC of an orchestration (new/existing) for 6.1.0.15 studio projects in later studio versions**

---

### **Problem:**

Null point exception is thrown when a 6.1.0.15 studio project is opened in any other later versions of studio and when a browse for IDoc/BAPI/RFC is done in a new or an existing orchestrations.

Error shown in studio error.log file:

```
WARNING: Unable to find entry: ./configuration-wizard -- err msg: Unable to locate entry
./configuration-wizard java.util.concurrent.ExecutionException:
java.lang.NullPointerException at
java.util.concurrent.FutureTask.report(FutureTask.java:134) at
java.util.concurrent.FutureTask.get(FutureTask.java:200) at
com.approuter.studio.gui.FutureBusyView$1.run(FutureBusyView.java:72) at
java.util.concurrent.ThreadPoolExecutor.runWorker(ThreadPoolExecutor.java:1157) at
java.util.concurrent.ThreadPoolExecutor$Worker.run(ThreadPoolExecutor.java:627) at
java.lang.Thread.run(Thread.java:798) Caused by: java.lang.NullPointerException at
com.approuter.studio.connectors.sap.WSSapConnection.<init>(WSSapConnection.java:88) at

com.approuter.studio.connectors.sap.endpoint.SapEndpointProjectNode$3.call(SapEndpointProjectNode.java
:345)
at

com.approuter.studio.connectors.sap.endpoint.SapEndpointProjectNode$3.call(SapEndpointProjectNode.java
:342)
at java.util.concurrent.FutureTask.run(FutureTask.java:274)
```

### **Cause:**

Enhanced authentication mechanisms in higher versions of Cast Iron Studio.

### **Solution:**

After opening the project in later version of Studio, navigate to any of the respective Endpoints displayed on the right side of the project tab and come back to the Configure tab of the orchestration.

Now you are enabled with browsing for the IDoc/BAPI/RFC for that orchestration.

## **Supported formats of the date and time field values**

---

The following table describes the supported formats of the date and time field values for all activities of the SAP connector:

Table 1. Formats for Date and Time field values

Field	Input parameter (non-starter activities)	Output parameter (starter and non-starter activities)
Date	yyyy-mm-dd or yyyyMMdd	yyyyMMdd
Time	hh:mm:ss or hhmmss	hhmmss

The supported formats for the input and output parameters of the date and time field values in the SAP connector version 6.0.x and earlier versions are: yyyy-mm-dd and hh:mm:ss, respectively.

## Exception thrown when you deploy orchestrations with Receive RFC and Receive IDOC activities using the same SAP RFC Program ID

**Problem:** When you deploy orchestrations with Receive RFC and Receive IDOC activities with the same SAP RFC Program ID, the following exception is thrown:

```
java.lang.RuntimeException: An attempt to start a JCoIDocServer failed. There might be an existing JCoServer with the same server configuration, else try restarting your server
at
com.ibm.j2ca.sap.inbound.SapJCoServerBuilder.verifyServerConfiguration(SapJCoServerBuilder.java:403)
at com.ibm.j2ca.sap.inbound.SapJCoServerBuilder.createServer(SapJCoServerBuilder.java:96)
at
com.ibm.j2ca.sap.inbound.SAPEventListenerManager.buildEventListener(SAPEventListenerManager.java:149)
at
com.ibm.j2ca.sap.inbound.SAPEventListenerManager.startEventListeners(SAPEventListenerManager.java:132)
at com.ibm.j2ca.sap.inbound.EndpointManager.addEndpoint(EndpointManager.java:68)
at com.ibm.j2ca.sap.SAPResourceAdapter.endpointActivation(SAPResourceAdapter.java:266)
at com.approuter.module.sap.activity.ReceiveIDOCActivity.activate(ReceiveIDOCActivity.java:222)
at com.approuter.maestro.activities.BaseModule.activate(BaseModule.java:296)
at com.approuter.maestro.vm.Program.start(Program.java:796)
at com.approuter.maestro.vm.Kernel.startOrchestration(Kernel.java:704)
at com.approuter.maestro.management.Loader$1.run(Loader.java:461)
at java.lang.Thread.run(Thread.java:736)
```

**Cause:** SAP JCo allows only one instance of JCoServer with a given set of server configuration to run within a Java virtual machine (JVM); another JCoServer with same server configuration cannot run in the same JVM. JCo throws an error indicating that the server cannot be restarted. The Receive IDOC activity and Receive RFC activity do not support the same SAP Program ID used during orchestration.

**Solution:** Ensure that you deploy orchestrations having Receive RFC and Receive IDOC activities using different SAP Program IDs, and create separate end points for IDOC/RFC.

## Recommended configurations to avoid 'Maximum number of 202 conversations exceeded' error

When working with the SAP connector, the following are the recommended configurations to be done if the 'Maximum number of 202 conversations exceeded' error is displayed:

### Error:

```
LOCATION    CPIC (TCP/IP) on local host with Unicode
ERROR       max no of 202 conversations exceeded
TIME        <Day> <Date> <Time> <Year>
RELEASE     720
COMPONENT   CPIC (TCP/IP) with Unicode
```

The following recommendations depend on the load and the number of parallel requests:

1. Reduce the timeout value in the endpoint configuration so that the unused connections are terminated automatically.
2. Configure Cast Iron runtime and SAP gateway to support more RFC connections.
  - a. Set the environment value `CPIC_MAX_CONV` to >100 on Cast Iron runtime. Update `maestro.sh` to set the environment variable. The steps are described in Schedule A.
  - b. Increase the profile value `gw/max_conn` and `gw/max_sys` on the SAP gateway to support many parallel connections. Also, if you run into memory bottlenecks increase the values of `gw/max_overflow_size` and `gw/max_shm_req`.
  - c. Set maximum connections value in SAP endpoint to a realistic value. Depending on the load and parallel requests, appliance either generates or receives.
  - d. Set the number of Server Instance value in SAP endpoint to 10.
3. Sample Values:

```
SAP-Gateway
gw/max_conn=2000, gw/max_sys=1200
gw/max_overflow_size =40000000, gw/max_shm_req = 200 (this is to adjust the memory allocation)
CPIC_MAX_CONV=5000
```

### Schedule A:

1. Log on into the appliance shell (contact IBM support to get appliance shell key in order to log on to the system shell).
2. Go to the `/usr/ironhide/bin` folder. Take a back up of `maestro.sh` (`copy maestro.sh to maestro.sh.old`).

3. Edit `maestro.sh`.

```
move to line
# Version of java currently in use.
if [ -z $JAVA_HOME ]; then
    JAVA_HOME=/usr/java/default
fi
JAVA="${JAVA_HOME}/bin/java"
```

4. Add the following line:

```
## maximum SAP conversations allowed
export CPIC_MAX_CONV=500
```

5. Save and exit.

6. Exit system shell and run the command `system restart` in order to restart the appliance runtime.

## Upgrading JRE from 32 bit to 64 bit

---

**Problem:** If you have an SAP project running on an earlier version of the appliance, when you upgrade the appliance to version 7.0 or later, the SAP projects will not start and the following errors occur:

- Examples of errors thrown in WMC:

```
Start of Orchestration config-
url://SAP_BAPI/1.0/Default/Orchestrations/Orchestration failed:
java.lang.ExceptionInInitializerError: Error
getting the version of the native layer:
java.lang.UnsatisfiedLinkError: sapjco3
(/usr/ironhide/lib/thirdparty/libsapjco3.so:
wrong ELF class: ELFCLASS32).
```

```
Required SAP JCO library is not found.
Install version 3.x SAP JCO library (.dll or .so based on platform)
```

- Examples of exceptions recorded in the `maestro.out` log:

```

```

**Cause:**

In the earlier versions of Cast Iron appliance (version 6.4 and earlier versions), 32 bit SAP JCo libraries were used. From Cast Iron appliance version 7.0 onwards, you must use the 64 bit SAP JCo libraries.

**Solution:**

You need to delete the 32 bit SAP JCo libraries, sapjco3.jar and libsapjco3.so, and load the 64 bit SAP JCo libraries.

Upgrading SAP JCo libraries:

In case of any issue after applying 64 bit JCo libraries, contact IBM Technical Support for further assistance.

## Exception thrown when SAP server Host name is not correct

## Overview of SAP C4C Core Connector

---

The SAP C4C Core Connector enables a connection between Cast Iron and SAP C4C instance. You can perform the following activities using the SAP C4C Core connector:

- Manage
- Query
- Invoke Service (for custom services)

SAP C4C also provides analytics service in REST implementation. There will be a different connector developed to consume the RESTful services and extend the SAP C4C analytics service to end user. This will out of scope for SAP C4C Core services connector.

## Creating and editing a SAP C4C Core Endpoint

Endpoints provide the SAP C4C connection information that Studio and the Integration Appliance use to connect with SAP C4C instance. You can create multiple endpoints that refer to separate instances.

Use this task to create or edit SAP C4C Core endpoint.

Any changes you make to SAP C4C Core endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

1. Drag an activity from **SAP C4C Core** folder in the **Activities** tab to the Orchestration window. The **Summary** panel is displayed.
2. Click **Pick Endpoint** from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  1. **Browse** - To select an existing endpoint from **Project Explorer**. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the **Pick Endpoint** panel.
  2. **New** - To create a new endpoint. The **Create Endpoint** window opens.
  3. **Edit** - To edit the existing endpoint. The **Edit Endpoint** window opens.
1. Complete the fields defined in the following table:

*Table 1. Connection Details*

Field Name	Description
SAP C4C Core	
Host Name	Specifies the host name of your SAP C4C Endpoint.
Authentication	
Authentication	The authentication dropdown will have only one value as Basic.
User Name	Specifies the authentication user name used for accessing the SAP C4C instance
Password	Specifies the authentication password used for accessing the SAP C4C instance
Security	
Client Certificate Alias Name	Specifies the name of the certificate saved in the local keystore. In case this is checked, then the Basic Authentication is disabled and certificate authentication will take precedence. If certificates are imported in keystore then user will be prompted to check the certificate alias name and specify a valid value for the same.
Protocol Version	The default value is SSL_TLSv2. The another value is TLSv1.2
Connection Timeout	
Timeout after..... seconds when establishing a connection to the endpoint	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. The default is 300 seconds.
Proxy	
Connect via a Proxy Server	Allows you to enable the proxy connection details.
Authentication	Specifies the Authentication method used to connect to the proxy server. It supports following modes: <ul style="list-style-type: none"> <li>• <b>Basic</b> - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure</li> </ul> Do not prefix the user name with the domain
Host Name	Specifies the host name of the proxy server.

Port	Specifies the port number needed to connect to the proxy server.
User Name	Specifies the user name needed to connect to the proxy server.
Password	Specifies the password needed to connect to the proxy server.

1. When finished, click **Test Connection** to confirm that you can connect to SAP C4C instance.
2. Click **OK**.

## Using the Query Activity

Query Activity allows you to browse and query standard business objects available in SAP C4C instance using standard services.

Use this task to browse and execute query operations in SAP C4C Core services.

To configure Query SAP C4C Core activity, complete the following steps:

1. In an active orchestration, open the **Activities** tab and expand the **SAP C4C Core** folder contents.
2. Drag the **Query** activity icon onto the orchestration. The Query Activity Checklist is displayed.
3. In the **Checklist**, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the **Checklist**, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant SAP C4C Core endpoint.

**Optional:** You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration. For more information, see [Creating and editing a SAP C4C Core endpoint](#)

1. In the **Checklist**, click **Configure**.
2. In the **Configure** section, click on the **Browse** button and select one of the **Query scenarios** from the list displayed and click on the **Finish** button.

**Optional:** You can refresh the list of scenarios populated here by clicking on Refresh button displayed in the pop-up. If there is any change in the list of scenarios, it will be reflected here.

1. Select any of the **WSDL Operations** displayed for the selected **Query Scenario** (if more than one Operation is displayed). If only one WSDL operation is displayed, select that particular operation.

**Optional:** You can **refresh** list of Operations displayed by clicking on **Refresh** button (present beside **Browse** option). If any modifications are found in the WSDL operations, request/ response schemas, the same will get updated accordingly.

1. In the **Checklist**, click **Retry**. Review the default settings and make the required changes. For more information, see specifying the retry options for SAP C4C Core activity.
2. Click **Map Inputs** from the **Checklist**. The XML Schemas generated from the selected operation of the Query activity are displayed as nodes under the request input parameter in the **To Activity** panel.

The user name and password in the map inputs are populated based on the details provided in the endpoint screen.

1. Create a map between the orchestration variables and the input parameter of the activity.

Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Query activity.

## Using the Manage Activity

---

Manage Activity allows you to create and update standard business objects available in SAP C4C instance using standard services.

Use this task to execute create and update operations in SAP C4C Core services.

To configure Manage SAP C4C Core activity, complete the following steps:

1. In an active orchestration, open the **Activities** tab and expand the **SAP C4C Core** folder contents.
2. Drag the **Manage** activity icon onto the orchestration. The Manage Activity Checklist is displayed.
3. In the **Checklist**, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the **Checklist**, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant SAP C4C Core endpoint.

**Optional:** You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.

For more information, see Creating and editing a SAP C4C Core endpoint

1. In the **Checklist**, click **Configure**.
2. In the **Configure** section, click on the **Browse** button and select one of the **Manage scenarios** from the list displayed and click on the **Finish** button.

**Optional:** You can refresh the list of scenarios populated here by clicking on Refresh button displayed in the pop-up. If there is any change in the list of scenarios, it will be reflected here.

1. Select any of the **WSDL Operations** displayed for the selected **Manage Scenario** (if more than one Operation is displayed). If only one WSDL operation is displayed, select that particular operation.

**Optional:** You can refresh list of Operations displayed by clicking on **Refresh** button (present beside **Browse** option). If any modifications are found in the WSDL operations, request/ response schemas, the same will get updated accordingly.

1. In the **Checklist**, click **Retry**. Review the default settings and make the required changes. For more information, see specifying the retry options for SAP C4C Core activity.
2. Click **Map Inputs** from the **Checklist**. The XML Schemas generated from the selected operation of the Manage activity are displayed as nodes under the request input parameter in the **To Activity** panel.

The user name and password in the map inputs are populated based on the details provided in the endpoint screen.

1. Create a map between the orchestration variables and the input parameter of the activity.

Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.

2. Create a map between the output parameters and orchestration variables.

You have configured the Manage activity.

## Using the Invoke Service Activity

---

Invoke Service Activity allows you to execute custom invoke operations on standard business objects available in SAP C4C instance.

Use this task to execute custom invoke operations in SAP C4C Core services.

To configure Invoke Service SAP C4C Core activity, complete the following steps:

1. In an active orchestration, open the **Activities** tab and expand the **SAP C4C Core** folder contents.
2. Drag the **Invoke Service** activity icon onto the orchestration. The **Invoke Service** Activity Checklist is displayed.
3. In the **Checklist**, click **Summary**.
4. Review the contents of the **Activity** Name field, and make the required changes.
5. In the **Checklist**, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant SAP C4C Core endpoint.

**Optional:** You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.

For more information, see [Creating and editing a SAP C4C Core endpoint](#)

1. In the **Checklist**, click **Configure**.
2. In the **Configure** section, there are following two options as below:
  - a. **Browse**: Click on the **Browse** button and select the appropriate WSDL file from the local file system.
  - b. **Add URL**: Click on **Add URL** button and in the pop-up displayed enter WSDL File Name and the WSDL URL (the path to select the WSDL) and click on **Finish** button. Please note that this feature will be used if the WSDL is hosted on a remote server. Do not provide the web service location URL in this field.
3. Select any of the **WSDL Operations** displayed for the selected **Service** (if more than one Operation is displayed). If only one WSDL operation is displayed, select that particular operation.

**Optional:** You can **refresh** list of Operations displayed by clicking on **Refresh** button (present beside **Browse** option). If any modifications are found in the WSDL operations, request/ response schemas, the same will get updated accordingly.

The Refresh option for invoke service activity is for the updating the WSDL Operations for service selected by Add URL option only.

1. In the **Checklist**, click **Retry**. Review the default settings and make the required changes. For more information, see specifying the retry options for SAP C4C Core activity.
2. Click **Map Inputs** from the **Checklist**. The XML Schemas generated from the selected operation of the Invoke Service are displayed as nodes under the request input parameter in the **To Activity** panel.

The user name and password in the map inputs are populated based on the details provided in the endpoint screen.

1. Create a map between the orchestration variables and the input parameter of the activity.

Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.

2. Create a map between the output parameters and orchestration variables.

You have configured the Invoke Service activity.

## Specifying the retry options for SAP C4C Core activities

---

Specify the retry options for the **SAP C4C Core** activity.

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to the SAP C4C application. The following table describes the retry options for connecting to the SAP C4C application:

Field	Description
Retry	
1) Wait ___ second(s) between each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the SAP C4C application.
2) Try to connect ___ times before failing.	Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the SAP C4C application before issuing an error and stopping the processing of the current orchestration job.  If you deploy an orchestration that contains a Query activity and the Integration Appliance cannot connect to the specified the SAP C4C service, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and the stops processing the current orchestration job.  For example, the retry count is set to 5. The first, second, third, fourth, and fifth, connection errors are shown in the system log as Warnings. The Integration Appliance logs the sixth connection error as an Error and stops processing the current orchestration job.
Activity Timeout	
3) Time out after ___ seconds when the Endpoint does not respond to a request.	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the SAP C4C activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the SAP C4C application after attempting to start the SAP C4C service, before the Integration Appliance issues a timeout error.  An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the Endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. Set the connection timeout in SAP C4C Core Endpoint tab.  For more information about connection timeouts, see <a href="#">Creating and editing a SAP C4C Core endpoint</a> .

## X.509 Certificate Authentication for SAP C4C Connector â€“ Points to remember

---

Following behavior is seen in your Cast Iron Orchestration when you import a SAP C4C PKCS#12 key pair file in the key store:

1. The certificate imported always takes precedence over basic authentication, and once the key pair file is imported, all the orchestration requests will be authenticated through the certificate authentication.
2. If the imported key pair file is invalid due to the reasons specified above, the test connection and the orchestrations would fail with 401 un-authorized access error. Replacing the invalid file with a newly generated file is a corrective action to be taken in such a scenario.
3. In order to make a communication arrangement with SSL certificate authentication exclusively, it is recommended not to configure any user id and password for the same communication arrangement.

## ServiceMax activities

---

- [Creating or editing a ServiceMax endpoint](#)  
ServiceMax endpoints provide information that Studio and the Integration Appliance use to connect to a ServiceMax instance.
- [Configuring ServiceMax activities](#)  
Selecting fields from the ServiceMax object to map is one of the tasks you must complete to configure a ServiceMax activity. For more information about the configuration tasks in the Checklist, see the help topic for the specific ServiceMax activity.
- [Setting ServiceMax configuration properties](#)  
Any changes you make to configuration properties affects all orchestrations that use that endpoint. The edits are global, not local.
- [Specifying the Retry and Time Out parameters for ServiceMax activities](#)  
Specifying the Retry and Time Out parameters is one of the tasks you must complete to configure a ServiceMax activity. The ServiceMax Connector uses an HTTP 1.1 persistent connection over SSL to make all connections to the ServiceMax server. The ServiceMax connector compresses all data for requests and responses using the gzip format.
- [Understanding and setting polling preferences for the ServiceMax connector](#)
- [Poll Updated Objects activity](#)  
This activity polls the ServiceMax Server for objects that have been recently created or updated and returns all the object fields that you selected in the configuration panel to the Integration Appliance. In Studio, configure the polling interval for the activity.
- [Get Updated Objects](#)
- [Poll Deleted Objects activity](#)  
This activity polls the ServiceMax Server for objects that have been recently deleted and returns IDs to the Integration Appliance.
- [Get Deleted Objects](#)  
This activity retrieves the list of individual objects that have been deleted within the specified time-span for the specified object.
- [Create Objects activity](#)  
Use this activity to create one or more ServiceMax objects. In the Activities tab, open the ServiceMax directory to find the Create Objects activity.
- [Update Objects activity](#)  
Use this activity to update existing objects in ServiceMax.

- [Upsert Objects activity](#)  
Use this activity to update existing objects or create new objects in ServiceMax.
- [Delete Objects activity](#)  
Use this activity to delete one or more objects in ServiceMax. While the Salesforce.com API limits the number of objects that it can delete in a single call to 200 objects, the Cast Iron® ServiceMax connector does not have such a limit. You can use the **Delete Objects** activity to delete an unlimited number of objects.
- [Undelete Objects activity](#)
- [Retrieve Objects activity](#)  
Use this activity to retrieve one or more ServiceMax objects of a specified type. While the Salesforce.com API limits the number of objects that it can retrieve in a single call to 2,000 objects, the Cast Iron ServiceMax connector does not have such a limit. You can use the **Retrieve Objects** activity to retrieve an unlimited number of objects.
- [Query Objects activity](#)  
Use the Sforce Object Query Language (SOQL) to run a query on one or more Salesforce.com object types from this activity and return a results set. The Query Objects activity automatically runs a query or queryAll call, followed by continuous queryMore calls for all children and objects returned from Salesforce.com.
- [Configuring the Query Objects activity](#)  
You must create a Sforce Object Search Language (SOSL) query to configure the **Search Objects** activity. The following sections discuss the steps to configure the **Search Objects** activity, create an SOSL query, and provide SOSL syntax rules for IBM® Cast Iron.
- [Search Objects activity](#)
- [Configuring the Search Objects activity](#)  
You must create an Sforce Object Search Language (SOSL) query to configure the **Search Objects** activity.
- [Convert Lead activity](#)  
Use this activity to convert leads into accounts, contacts, or opportunities in ServiceMax. While the Salesforce.com API limits the number of objects that it can convert in a single call to 100 objects, the Cast Iron ServiceMax connector does not have such a limit. You can use the **Convert Lead** activity to convert an unlimited number of objects.
- [Merge Objects Activity](#)  
Use this activity to merge ServiceMax objects into a single record.
- [Get User Information activity](#)  
Use this activity to get user information from the ServiceMax server. In the Activities tab, open the ServiceMax directory to find the Get User Information activity.
- [Get Server Timestamp activity](#)  
Use this activity to get the current time from the ServiceMax server. In the Activities tab, open the ServiceMax directory to find the Get Server Timestamp activity.
- [Send email activity](#)  
Use this activity to send single or multiple emails. The emails include all standard email attributes such as the email address, subject line, and carbon copies.
- [Set password activity](#)  
Use this activity to change the password of a user or `SelfServiceUser` to a value that you specify.
- [Reset password activity](#)  
Use this activity to reset the password of the user to a system-generated value.

#### Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_servicemaxactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_servicemaxactivities.html)

## Creating or editing a ServiceMax endpoint

---

ServiceMax endpoints provide information that Studio and the Integration Appliance use to connect to a ServiceMax instance.

### About this task

---

Any changes that you make to the endpoint, including configuration properties, affects all orchestrations that use that endpoint as the edits are global, not local.

### Procedure

---

1. Drag an activity from the ServiceMax folder of the Activities tab onto the orchestration.

The Summary panel is displayed along with a Checklist, which lists the tasks that you must perform to configure the activity.

2. Click Pick Endpoint task from the Checklist. The Pick Endpoint panel opens.

3. Click one of the following options:

- o Browse...: To select an existing endpoint from the Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel. To edit the endpoint properties, click Edit. Go to step 5
- o New: To create a new endpoint. The Create Endpoint window opens. Go to step 5
- o Edit: To edit an existing endpoint. The Edit Endpoint window opens. Go to step 5

Note: Editing an endpoint affects all orchestrations that use that endpoint in the project as the edits are global, not local.

4. In the endpoint window, specify a user name and a password to access a ServiceMax instance.

- a. Type a user name or click the icon to the right of the User Name field to select the configuration property.
- b. Type a password or click the icon to the right of the Password field to select the configuration property.

5. Choose a login option:

Login Options	Description
Login normally	By default, Login is selected. At run time, the Integration Appliance accesses a production instance of ServiceMax.
Login to ServiceMax sandbox	At run time, the Integration Appliance accesses a copy of the production system. You can run tests in the sandbox without affecting production data.
Login to specified Partner WSDL Login URL	At run time, the Integration Appliance accesses the URL you specify in the Login URL field.
Login URL	Only required when you choose the Login to specified Partner WSDL Login URL option.

6. Specify the Connection Timeout parameter. By default, the Integration Appliance times out if it is unable to connect to the ServiceMax endpoint after 300 seconds.

7. To connect through a proxy server, complete the fields that are described in the following table:

Option	Description
Connect via a Proxy Server	Select this check box to enable the fields to connect through a proxy server.
Authentication	Indicates the type of authentication that the Integration Appliance uses when connecting to a proxy server. From the list, select one of the following authentication options: <ul style="list-style-type: none"><li>o <b>Basic</b> - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure.</li><li>o <b>NTLM</b> - Requires an instance of NTCredentials to be available for the domain name of the server. This authentication is the most secure authentication option. When you choose the NTLM authentication option, the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time that a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server.</li></ul>
Realm/Domain	If you select the <b>Basic</b> authentication option, specify a realm. If you select the <b>NTLM</b> authentication option, specify a domain.
Host name	Specify the host name of the proxy server.
Port	Specify the port number that is required to connect to the proxy server.
User name	Specify the user name that is required to connect to the proxy server.

Option	Description
<b>Password</b>	Specify the password that is required to connect to the proxy server.

8. Click Test Connection to confirm that the parameters you specified allow the project to access a ServiceMax instance.

Note: When you configure a ServiceMax endpoint to use configuration properties, verify that the configuration properties have valid values. If the configuration property value is invalid or does not exist, the connection test fails.

**Parent topic:** [ServiceMax activities](#)

## Configuring ServiceMax activities

---

Selecting fields from the ServiceMax object to map is one of the tasks you must complete to configure a ServiceMax activity. For more information about the configuration tasks in the Checklist, see the help topic for the specific ServiceMax activity.

### About this task

---

For some of the fields in the endpoint, you can [create configuration properties](#) to supply the values for these fields. An icon is displayed when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.

### Procedure

---

1. In the Checklist, select Configure. The Configure panel opens.
2. Click Browse... to select a ServiceMax object type. The Choose a ServiceMax Object window shows all the ServiceMax objects that are associated with the Studio activity.
3. Select an object type from the list.  
Note: Custom object types end with a double underscore c ( \_\_c ). For example: *CustomerPriority\_\_c*

Enter a character or string in the Search for an Object Type field and Studio filters the object types and only shows the object types that match the filter criteria. (Optional) Click the refresh icon to retrieve the latest ServiceMax object types.

4. Click OK.

All the fields that are associated with the object type you selected are displayed.

5. In the Object Field Preferences section, select the fields to map.

By default, all fields are selected. You can choose to clear any field that you do not want to show in the map. A global check box allows you to select and clear all fields at once.

Note: The Id field is required for many activities. For these activities, the Id field is disabled and you cannot clear this field.

## Setting ServiceMax configuration properties

---

Any changes you make to configuration properties affects all orchestrations that use that endpoint. The edits are global, not local.

### Procedure

---

1. Select Project > Configuration Properties. The Configuration Properties window opens.
2. Click the Value field for the servicemax\_password property and type a valid password.
3. Click the Value field for the servicemax\_login property and type a valid ServiceMax login.
4. Click OK.

**Parent topic:** [ServiceMax activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax\\_Setting\\_Configuration\\_Properties.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax_Setting_Configuration_Properties.html)

## Specifying the Retry and Time Out parameters for ServiceMax activities

---

Specifying the Retry and Time Out parameters is one of the tasks you must complete to configure a ServiceMax activity. The ServiceMax Connector uses an HTTP 1.1 persistent connection over SSL to make all connections to the ServiceMax server. The ServiceMax connector compresses all data for requests and responses using the gzip format.

### About this task

---

The ServiceMax connector uses a single login session for all connections to a ServiceMax endpoint. If a session expires, the connector automatically establishes a new session. The ServiceMax connector does not count the initial attempt to reacquire the session as a retry attempt. The ServiceMax connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

For more information about the configuration tasks in the **Checklist**, see the help topic for the specific ServiceMax activity.

### Procedure

---

1. In the Checklist, select Retry. The Retry panel opens.
2. Configure the retry options for connecting to a ServiceMax instance.

The following table describes the retry options for connecting to a ServiceMax instance:

Retry fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the ServiceMax instance.  By default, this parameter is set to 30 seconds.
Try to connect __ times before failing. Â	Specifies the maximum number of times that the Integration Appliance attempts to establish a connection to the ServiceMax instance before issuing an error and stopping the processing of the current orchestration job.  By default this parameter is set to 5 attempts.
Activity Timeout field	Description

Retry fields	Description
Time out after __ seconds when the Endpoint does not respond to a request.	<p>Specifies the number of seconds before a time-out occurs between the activity making a request on an endpoint and the time it takes the endpoint to respond.</p> <p>By default this parameter is set to 300 seconds.</p>

## Understanding and setting polling preferences for the ServiceMax connector

### About this task

The ServiceMax connector contains two activities that poll the ServiceMax server for changes:

- **Poll Deleted Objects** activity
- **Poll Updated Objects** activity

These activities have the following startup behavior:

- For an orchestration that has never been deployed, the baseline time stamp is established when the activity is activated for the first time. The activity uses the baseline time stamp as the start time to poll for changes after the poll interval elapses. After the poll completes, the activity stores the last poll time.
- For a previously deployed orchestration, the activity uses the last poll time and the current time to poll for changes after the poll interval elapses.
- ServiceMax requires at least 60 seconds between each poll. If less than 60 seconds have transpired, then the activity ignores the current polling interval until the next polling interval elapses.

### Procedure

1. In the Checklist, select Polling.

The Polling Preferences panel opens.

2. Set the polling preferences for the following parameters:

Polling Preference	Description
Poll for changes every <i>Where <i> is the polling interval. The interval can be specified in minutes, hours, or days</i>	<p>Specifies the polling interval for which the Integration Appliance polls the ServiceMax Server for objects that have been created or updated since the last poll.</p> <p>By default, the Integration Appliance polls the ServiceMax Server every 5 minutes.</p>
Batch up to <n> objects per orchestration Where <n> is the number of objects in a batch.	<p>Specifies the maximum number of object records per orchestration job, during a polling interval. By default, the Integration Appliance processes one record per orchestration job. Use this preference to tune the performance of the Integration Appliance.</p>

**Parent topic:** [ServiceMax activities](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax\\_Understanding\\_and\\_Setting\\_Polling\\_Preferences.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax_Understanding_and_Setting_Polling_Preferences.html)

## Poll Updated Objects activity

---

This activity polls the ServiceMax Server for objects that have been recently created or updated and returns all the object fields that you selected in the configuration panel to the Integration Appliance. In Studio, configure the polling interval for the activity.

### Procedure

---

1. In the Activities tab, open the ServiceMax directory to find the Poll Updated Objects activity.
2. Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a ServiceMax endpoint.

For instructions on creating or editing a ServiceMax endpoint, see [Creating or editing a ServiceMax endpoint](#).

4. Configure the activity by choosing a ServiceMax object type and object field preferences.
5. Specify the Polling preferences for the activity.
6. Specify the Retry and Time out parameters for the activity.

### What to do next

---

Map the output of the Poll Updated Objects activity.

**Parent topic:** [ServiceMax activities](#)

## Mapping the output of the Poll Updated Object activity

---

### Procedure

1. In the Checklist, select Map Outputs.

The objects element is displayed in the From Activity panel.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

The output map can have *nillable* field elements have the following behavior:

- o If the field that is being retrieved is null, the Integration Appliance sets the xsi:nil attribute to true in the result.

## Get Updated Objects

---

### Procedure

1. In the Activities tab, open the ServiceMax directory to find the Get Updated Objects activity.
2. Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a ServiceMax endpoint.

For instructions on creating or editing a ServiceMax endpoint, see [Creating or editing a ServiceMax endpoint](#).

4. Configure the activity, by choosing a ServiceMax object type and object field preferences.  
You can only select object types and fields that the Integration Appliance can update. The input map contains the object type with elements that correspond to the fields you select during this configuration step.  
Note: The Integration Appliance cannot create auto-number fields.
5. Specify the Retry and Time out parameters for the activity.
6. Map the input of the activity.

The input map consists of an object's input parameter. This parameter consists of a single root element that has a single repeating element, named after the object type you selected, containing all the fields you selected in the Object Field Preferences table.

### What to do next

---

Map the input of the Get Updated Objects.

**Parent topic:** [ServiceMax activities](#)

## Mapping the input of the Get Updated Objects activity

---

### Procedure

1. In the Checklist, select Map Inputs.

The startDateTime element is displayed in the To Activity panel.

2. Optional: Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - o endDateTime
  - o CallOptions
  - o connection
  - o sessionInfo
3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

*Optional* and *nillable* field elements have the following behavior:

- o The Integration Appliance does not update an optional field, when the ServiceMax server does not provide a value for the field.
- o If you set the xsi:nil attribute to true on a nillable field, the Integration Appliance sets the field to null during an update.  
Note: Setting a field to an empty string does not set a field to null.

### What to do next

Map the output of the Get Updated Object activity.

## Mapping the output of the Get Updated Object activity

---

### Procedure

1. In the Checklist, select Map Outputs.

The saveResults element is displayed in the From Activity panel.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

---

Map the inputs of the Create Objects activity.

**Parent topic:** [ServiceMax activities](#)

## [Mapping the input of the Create Objects activity](#)

---

## Procedure

1. In the Checklist, select Map Inputs.

The Objects element is displayed in the To Activity panel. The parameters that are displayed correspond to the structure of the input to the ServiceMax objects operation.

2. Optional: Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:

- AssignmentRuleHeader
- MruHeader
- EmailHeader
- CallOptions
- connection
- sessionInfo

3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

*Optional* and *nillable* field elements have the following behavior:

- o The Integration Appliance does not update an optional field, when the ServiceMax server does not provide a value for the field.
- o If you set the `xsi:nil` attribute to `true` on a *nillable* field, the Integration Appliance sets the field to null during an update.

Note: Setting a field to an empty string does not set a field to null.

## What to do next

Map the output of the Create Objects activity.

### Mapping the output of the Create Object activity

#### Procedure

1. In the Checklist, select Map Outputs.

The `saveResults` element is displayed in the From Activity panel. The parameters that are displayed correspond to the `saveResults` structure, which is returned by the create activity.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

---

#### Feedback | Notices

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax\\_Create\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax_Create_Objects_Activity.html)

## Update Objects activity

---

Use this activity to update existing objects in ServiceMax.

### About this task

---

While the Salesforce.com API limits the number of objects that it can update in a single call to 200 objects, the Cast Iron® ServiceMax connector does not have such a limit. You can use the Update Objects activity to update an unlimited number of objects.

Using the Update Objects activity.

#### Procedure

---

1. In the Activities tab, open the ServiceMax directory to find the **Update Objects** activity.

2. Add the activity to an orchestration. The **Checklist** and **Summary** for the activity are displayed beneath the orchestration.

3. Select a ServiceMax endpoint. For instructions on creating or editing a ServiceMax endpoint, see [Creating or editing a ServiceMax endpoint](#).

4. **Configure** the activity by choosing a ServiceMax object type and object field preferences. You can only select object types and fields that the Integration Appliance can update. The input map contains the object type with elements that correspond to the fields you select during this configuration step.  
Note: The Integration Appliance cannot create auto-number fields.
5. **Specify** the **Retry** and **Time out** parameters for the activity.
6. Map the input of the activity. The input map consists of an object's input parameter. This parameter consists of a single root element that has a single repeating element, which is named after the object type you selected, containing all the fields you selected in the Object Field Preferences table.
7. Map the output of the activity.

## Results

---

### Map the input of the Update Objects activity

1. In the **Checklist**, select Map Inputs. The **objects** element is displayed in the To Activity pane.
2. Right-click the default node and choose Show Optional Parameters to show the optional input parameters for this activity:
  - o AssignmentRuleHeader
  - o MruHeader
  - o EmailHeader
  - o CallOptions
  - o connection
  - o sessionInfo
3. Click Select Inputs... and select the input variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
4. As appropriate, map the input parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

Optional and nillable field elements have the following behavior:

- The Integration Appliance does not update an optional field, when the ServiceMax server does not provide a value for the field.
- If you set the `xsi:nil` attribute to true on a nillable field, the Integration Appliance sets the field to null during an update.

Note: Setting a field to an empty string does not set a field to null.

### Map the output of the Update Objects activity

1. In the **Checklist**, select Map Outputs. The **saveResults** element is displayed in the From Activity panel.
2. Click **Select Outputs...** and select the output variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
3. As appropriate, map the output parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

**Parent topic:** [ServiceMax activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax\\_Update\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax_Update_Objects_Activity.html)

## Upsert Objects activity

---

Use this activity to update existing objects or create new objects in ServiceMax.

### About this task

The activity uses an external ID, usually a foreign key, to determine whether to update an existing object or create a new object in ServiceMax.

While the Salesforce.com API limits the number of objects that it can create in a single upsert call to 200 objects, the Cast Iron® ServiceMax connector does not have such a limit. You can use the **Upsert Objects** activity to create an unlimited number of objects.

To use the **Upsert Objects** activity:

## Procedure

---

1. In the Activities tab, open the ServiceMax directory to find the **Upsert Objects** activity.
2. Add the activity to an orchestration. The **Checklist** and **Summary** for the activity are displayed beneath the orchestration.
3. Select a ServiceMax endpoint. For instructions on creating or editing a ServiceMax endpoint, see [Creating or editing a ServiceMax endpoint](#).
4. **Configure** the activity, by choosing a ServiceMax object type and object field preferences.  
Note: You can only choose object types that the Integration Appliance can update or create and contain at least one External ID field. When you select the object type, Studio displays the external IDs defined on the object type in the External ID field of the Configure pane. You cannot edit the IDs listed in the External ID list. The external ID that you select becomes a required field, you cannot clear this field from the Object Field Preferences table. If only one external ID is available, Studio automatically selects this field in the Object Field Preferences table.
5. **Specify** the **Retry** and **Time out** parameters for the activity.
6. Map the input of the activity.
7. Map the output of the activity.

## Results

---

### Map the input of the Upsert Objects activity

1. In the **Checklist**, select Map Inputs. The **objects** element is displayed in the To Activity panel.
2. Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - o AssignmentRuleHeader
  - o MruHeader
  - o EmailHeader
  - o CallOptions
  - o connection
  - o sessionInfo
3. Click Select Inputs... and select the input variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
4. As appropriate, map the input parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

This activity supports the following optional input parameters:

- AssignmentRuleHeader
- EmailHeader
- MruHeader

Optional and nullable field elements have the following behavior:

- The Integration Appliance does not update an optional field, when the ServiceMax server does not provide a value for the field.
- If you set the `xsi:nil` attribute to true on a nullable field, the Integration Appliance sets the field to null during an update.  
Note: Setting a field to an empty string does not set a field to null.

### Map the output of the Upsert Objects activity

1. In the **Checklist**, select Map Outputs. The **upsertResults** element is displayed in the From Activity panel.
2. Click Select Outputs... and select the output variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
3. As appropriate, map the output parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

## Undelete Objects activity

---

### About this task

---

Use this activity to restore one or more objects that you deleted in ServiceMax.

To use the Undelete Objects activity complete the following steps:

### Procedure

---

1. In the Activities tab, open the ServiceMax directory to find the **Undelete Objects** activity. Add the activity to an orchestration. The **Checklist** and **Summary** for the activity are displayed beneath the orchestration.
2. Select a ServiceMax endpoint. For instructions on creating or editing a ServiceMax, see [Creating or editing a ServiceMax endpoint](#).
3. [Specify](#)the Retry and Time out parameters for the activity.
4. Map the input of the activity.
5. Map the output of the activity.

### Results

---

#### Map the input of the Undelete Objects activity

1. In the **Checklist**, select Map Inputs. The **ids** element is displayed in the To Activity panel.
2. Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - o CallOptions
  - o connection
3. Click Select Inputs... and select the input variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
4. As appropriate, map the input parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

#### Map the output of the Undelete Objects activity

1. In the **Checklist**, select Map Outputs. The **results** element is displayed in the From Activity panel.
2. Click Select Outputs... and select the output variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
3. As appropriate, map the output parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

**Parent topic:** [ServiceMax activities](#)

---

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax\\_Undelete\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax_Undelete_Objects_Activity.html)

## Retrieve Objects activity

---

Use this activity to retrieve one or more ServiceMax objects of a specified type. While the Salesforce.com API limits the number of objects that it can retrieve in a single call to 2,000 objects, the Cast Iron® ServiceMax connector does not have such a limit. You can use the **Retrieve Objects** activity to retrieve an unlimited number of objects.

## Using the Retrieve Objects activity

---

1. In the Activities tab, open the ServiceMax directory to find the Retrieve Objects activity.
2. Add the activity to your orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a ServiceMax endpoint.

For instructions on creating or editing a ServiceMax endpoint, see [Creating or editing a ServiceMax endpoint](#).

4. Configure the activity, by choosing a ServiceMax object type and object field preferences.

Only object types that the Integration Appliance is able to retrieve through the Salesforce.com API display.

5. Specify the Retry and Time out parameters for the activity.

## Mapping the input of the Retrieve Objects activity

---

1. In the Checklist, select Map Inputs.

The ids element is displayed in the To Activity pane. The element contains the collection of IDs that the Integration Appliance retrieves from ServiceMax.

2. (Optional) Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - MruHeaderUser
  - CallOptions
  - connection
  - sessionInfo

3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

*Optional* and *nillable* field elements have the following behavior:

- If the field being retrieved is null, the Integration Appliance sets the `xsi:nil` attribute to `true` in the result.
- If the input ID is not valid or does not represent the object type that you specified, then for the entire object element the Integration Appliance sets `xsi:nil` to `true` for that element's position in the result set.

## Mapping the output of the Retrieve Objects activity

---

1. In the Checklist, select Map Outputs.

The objects element is displayed in the From Activity panel. The element contains all fields that you selected in the field preferences table, during the configuration steps.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

**Parent topic:** [ServiceMax activities](#)

---

[Feedback](#) | [Notices](#)

## Query Objects activity

---

Use the Sforce Object Query Language (SOQL) to run a query on one or more Salesforce.com object types from this activity and return a results set. The Query Objects activity automatically runs a query or queryAll call, followed by continuous queryMore calls for all children and objects returned from Salesforce.com.

Note: Running the Query Objects activity can result in a cursor being opened by Salesforce.com to track the query results. If the activity reaches the cursor limit that Salesforce.com allots to each user or if the cursor expires, the Integration Appliance tries the activity again.

### Using the Query Objects activity

---

1. In the Activities tab, open the Salesforce.com directory to find the Query Objects activity.
2. Add the activity to your orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

4. Configure the activity, by specifying a query and setting query options.
5. Specify the Retry and Time out parameters for the activity.
6. Map the input of the activity.
7. Map the output of the activity.

### Map the input of the Query Objects activity

---

1. In the Checklist, select Map Inputs.

The parameters element is displayed in the To Activity panel. The parameters element has a child element for each parameter you specified in the SOQL query. The context for the parameter in the query determines the parameter type. If you did not specify any parameters, then no child elements are displayed under the parameters element.

2. Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - o MruHeader
  - o CallOptions
  - o connection
  - o sessionInfo
3. Click Select Inputs... and select the input variable or variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variable or variables.

For mapping instructions, see [Creating a Map](#).

### Map the output of the Query Objects activity

---

1. In the Checklist, select Map Outputs.

The objects element is displayed in the From Activity panel. The result parameter has a single element named objects with a single repeating element named after the driving object of the query. The driving object is the first object named in the FROM clause of the query. For example, in the following SOQL statement Account is the driving object:

Select Name from Account, Account.Contacts

The driving object has child elements that correspond to the fields or relationships listed in the SELECT clause of a query.

Â The schema is defined as follows:

- o For fields, the field type matches the SOAP type of the field. The field type is nullable if the SOAP type is nullable.
- o For relationships for parent elements, the element name is the name of the parent. If there is no parent when the activity runs the query, then the element is absent. The fields or relationships of the parent is displayed immediately

- underneath the relationship element.
- o For relationships for child elements, the element name is the name of the child. The relationship element has a single repeating element named after the object type of the child object. The fields and relationship of the child is displayed underneath the object type element. If there are no children when the activity runs the query, then the element is absent.
  - o If you did not select any fields or relationships, but instead request the count() in the SELECT clause, the entire object type element is replaced with an element named count of type unsignedInt.

Â

2. Click Select Outputs... and select the output variable or variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variable or variables.

For mapping instructions, see [Creating a Map](#).

 Last updated: Wednesday, 15 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Query\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Query_Objects_Activity.html)

## Configuring the Query Objects activity

You must create a Sforce Object Search Language (SOSL) query to configure the **Search Objects** activity. The following sections discuss the steps to configure the **Search Objects** activity, create an SOSL query, and provide SOSL syntax rules for IBM® Cast Iron®.

### Procedure

1. In the Checklist, select Configure.

The Specify Query window opens.

2. Create an SOSL query in the Specify Query window.

3. Optional: You can specify dynamic parameters in the search clause of the SOSL statement. You can then map these parameters dynamically as the input parameters for the activity, which allows the activity to dynamically control the query that is based on the input to the orchestration. Use a (\$) dollar sign to denote a parameter and follow it with the parameter name.

4. Click the Validate icon  , to validate the query.

If the query is invalid, the Validation Feedback icon  displays in the lower left corner of the Specify Query window. For invalid queries:

a. Click the Validation Feedback icon in the lower left corner of the Specify Query window for a list of validation errors.

b. Use the Refresh icon  To refresh metadata and revalidate the SOSL statement.

5. In the Checklist, select Query to configure specific query options.

The Query Options pane opens.

6. Select Include deleted items in query (execute a queryAll operation), to query for deleted records in addition to existing records. If you do not select this option, the Integration Appliance only queries existing records.

7. Specify a Query batch size between 200-2000 queries to help tune the performance of the Integration Appliance.

The option determines the batch size to use in the QueryOptions SOAP header for all query calls and does not affect the number of results that are returned by the activity. By default, this option is set to 500 queries.

**Parent topic:** [ServiceMax activities](#)

## Creating SOSL Queries

When creating a SOQL query, you can use dynamic parameters in the WHERE clause of the SOQL statement. Studio can then dynamically map these parameters as the input parameters for the activity. This allows for dynamic control of the query that is based on input to the orchestration.

## About this task

The SForce Object Query Language does not define a syntax for parameterized queries; however, Cast Iron does enforce some proprietary SOQL syntax rules. You can use parameters in either simple expressions or set expressions.

### SOSL Syntax Rules for Cast Iron

- Use a (\$) dollar sign to denote a parameter. After the (\$) dollar sign, specify a string of alphanumeric characters. The first character must be a letter [a-zA-Z], optionally followed by one or more letters [a-zA-Z], digits [0-9], or ( \_) underscores.

Note: Parameter names are case-sensitive; therefore, the parameters \$a and \$A are considered to be different parameters.

The following table contains examples of valid and invalid parameter declarations:

Parameter	Valid or Invalid
\$AnAccount	valid
\$a123_456	valid
\$123a	invalid
\$_id	invalid

- You must declare parameters on the right side of an expression in a WHERE clause.

- Parameters can appear more than once in a given SOQL statement. However, even though the parameter appears more than once in the SOQL statement, it only appears once in the input parameter map. The activity substitutes the same value for all locations where the parameter is used at run time.

Note: When you use the same parameter name and there is a type mismatch, an error occurs. For example, the following SOQL generates an error because \$param is used as both a string and date type:

```
SELECT Name from Account where Name like $param and createdDate > $param
```

- The type of the field in which a parameter is being compared determines the type of the parameter and whether the parameter is being used in a simple expression, a set expression, or part of a set expression.

Type of Expression	Description
Simple Expressions	<p>For example: Select ID from Account where Name = \$NameParam</p> <p>The SoapType of the field on the left side of the expression determines the parameter type. If the field type is nullable and the operator is (=) or (!=), then the parameter is nullable. Setting xsi:nil=true on the parameter sets the parameter value to null when it is substituted. If the parameter's type requires it to be enclosed in (‘) single quotation marks, then the parameter's value is enclosed in single quotation marks during substitution and its contents are escaped automatically.</p> <p>For SOQL, the (\) backslash and (‘) single quotation mark is escaped.</p>
Set Expressions	<p>For example: Select ID From Account where ID in \$idList</p> <p>The parameter's type is a repeating sequence of the SoapType of the field on the left side of the expression. The parameter is not nullable and has minOccurs=1, maxOccurs=unbounded on the element.</p> <p>The sequence is expanded at run time to be a proper set value, for example:</p> <p>Select Id From Account where Id in (‘value1’,‘value2’)</p>
Part of a Set Expression	<p>Parameters inside a set list are treated like a simple expression parameter type, for example: SELECT Name from Account where BillingState IN (‘California’, \$state2)</p> <p>In this example, the \$state2 parameter type is the SoapType of the Account BillingState field and is not a repeating element. The parameter is not nullable.</p>

## Search Objects activity

---

### About this task

Use the Sforce Object Search Language (SOSL) to run a search query on one or more ServiceMax object types from this activity and return a results set.

Note: You can only search objects that are configured as searchable or eSearchable. You cannot search attachment objects.

Using the Search Objects activity:

### Procedure

---

1. In the Activities tab, open the ServiceMax directory to find the **Search Objects** activity.
2. Add the activity to an orchestration. The **Checklist** and **Summary** for the activity is displayed beneath the orchestration.

### Results

---

1. Select a ServiceMax endpoint. For instructions on creating or editing a ServiceMax endpoint, see [Creating or editing a ServiceMax endpoint](#).
2. [Configure](#) the activity, by specifying a search query and setting search query options.
3. [Specify](#) the Retry and Time out parameters for the activity.
4. Map the input of the activity.
5. Map the output of the activity.

#### Mapping the input of the Search Objects activity:

1. In the **Checklist**, select Map Inputs. The parameters element is displayed in the To Activity panel. The parameter element has a child element for each parameter you specified in the SOSL query. The context for the parameter in the query determines the parameter type. If you did not specify any parameters, then no child elements are displayed under the parameters element.
2. Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - o CallOptions
  - o connection
  - o sessionInfo
3. Click Select Inputs... and select the input variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
4. As appropriate, map the input parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

#### Mapping the output of the Search Objects activity:

1. In the **Checklist**, select Map Outputs. The **objects** element is displayed in the From Activity panel.
2. Click Select Outputs... and select the output variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
3. As appropriate, map the output parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

**Parent topic:** [ServiceMax activities](#)

## Configuring the Search Objects activity

---

**Parent topic:** ServiceMax activities

## Creating SOSL queries

---

### About this task

When creating a Sforce Object Search Language (SOSL) query, you can use dynamic parameters in the WHERE clause of the SOSL statement. Studio can then dynamically map these parameters as the input parameters for the activity. This allows for dynamic control of the query that is based on input to the orchestration.

The Sforce Object Search Language does not define a syntax for parameterized queries; however, IBM Cast Iron does enforce a few proprietary SOSL syntax rules. You can use parameters in either simple expressions or set expressions.

### SOSL syntax rules for IBM Cast Iron

### About this task

- Use a (\$) dollar sign to denote a parameter. After the (\$) dollar sign, specify a string of alphanumeric characters. The first character must be a letter [a-zA-Z], optionally followed by one or more letters [a-zA-Z], digits [0-9], or ( \_) underscores.  
Note: Parameter names are case-sensitive; therefore, the parameters \$a and \$A are considered to be different parameters.

The following table contains examples of valid and invalid parameter declarations:

Parameter	Valid or Invalid
\$AnAccount	valid
\$a123_456	valid
\$123a	invalid
\$_id	invalid

- You must declare parameters in the Search Query portion of the SOSL statement. Curly braces ({} ) demarcate the Search Query portion of the SOSL statement.

Important: Do not use double quotation marks (" ") to enclose parameters. If you enclose parameters in double quotation marks, the activity treats the parameter as a string search literal.

- The parameter type is always xsd:string. During substitution, the activity escapes any parameter that you declare using a reserved character. Reserved characters include the following characters:

Reserved Characters	Description
&	ampersand
*	asterisk
\	back slash
[ ]	box brackets
:	colon
,	comma
{ }	curly braces
"	Double quotation mark
!	exclamation mark
-	minus sign
+	plus sign
'	Single quotation mark
~	tilde
^	up arrow
	vertical bar

- Parameters can appear more than once in a given SOQL statement. However, even though the parameter appears more than once in the SOQL statement, it only appears once in the input parameter map. The activity substitutes the same value for all locations where the parameter is used at run time.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax\\_Configuring\\_the\\_Search\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax_Configuring_the_Search_Objects_Activity.html)

## Convert Lead activity

Use this activity to convert leads into accounts, contacts, or opportunities in ServiceMax. While the Salesforce.com API limits the number of objects that it can convert in a single call to 100 objects, the Cast Iron® ServiceMax connector does not have such a limit. You can use the **Convert Lead** activity to convert an unlimited number of objects.

### Procedure

- In the Activities tab, open the ServiceMax directory to find the Convert Lead activity.
- Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

- Select a ServiceMax endpoint.

For instructions on creating or editing a ServiceMax endpoint, see [Creating or editing a ServiceMax endpoint](#).

- Specify the Retry and Time out parameters for the activity.

### What to do next

Map the inputs of the Convert Lead activity.

**Parent topic:** [ServiceMax activities](#)

## Mapping the input of the Convert Lead activity

---

### Procedure

1. In the Checklist, select Map Inputs.

The `convertLead` element displays in the To Activity pane. The parameters that are displayed correspond to the structure of the input to the ServiceMax `convertLead` operation.

2. Optional: Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:

- `CallOptions`
- `connection`
- `sessionInfo`

3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

### What to do next

Map the output of the Convert Lead activity.

## Mapping the output of the Convert Lead activity

### Procedure

1. In the Checklist, select Map Outputs.

The `convertLeadResponse` element is displayed in the From Activity panel. The parameters that are displayed correspond to the `convertLeadResponse` structure, which is returned by the `convertLead` operation.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax\\_Convert\\_Lead\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax_Convert_Lead_Activity.html)

## Merge Objects Activity

---

Use this activity to merge ServiceMax objects into a single record.

### About this task

---

You can merge two or more of the following ServiceMax objects into a single record:

- Account
- Contact
- Leads

After the activity merges the objects, it deletes the pre-merge records and reparents any duplicates.

While the Salesforce.com API limits the number of requests that it can merge in a single call to 200, the Cast Iron® ServiceMax connector does not have such a limit. You can use the **Merge Objects** activity to process an unlimited number of merge requests.

## Procedure

---

1. In the Activities tab, open the ServiceMax directory to find the Merge Objects activity.
2. Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a ServiceMax endpoint.

For instructions on creating or editing a ServiceMax endpoint, see [Creating or editing a ServiceMax endpoint](#).

4. Configure the activity, by choosing a ServiceMax object type and object field preferences.

You can only select Account, Contact, and Lead object types and fields that the Appliance can update. Fields such as auto-number fields might not be available to select.

5. Specify the Retry and Time out parameters for the activity.

## What to do next

---

Map the input of the Merge Objects activity.

**Parent topic:** [ServiceMax activities](#)

## Mapping the input of the Merge Objects activity

---

### Procedure

1. In the Checklist, select Map Inputs.

The Merge element is displayed in the To Activity panel.

2. Optional: Right-click the default node and choose Show Optional Parameters, to display these optional input parameters for this activity:
  - o AssignmentRuleHeader
  - o MruHeader
  - o EmailHeader
  - o CallOptions
  - o connection
  - o sessionInfo

3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

*Optional* and *nillable* field elements have the following behavior:

- o The Integration Appliance does not update an optional field, when the ServiceMax server does not provide a value for the field.
- o If you set the `xsi:nil` attribute to `true` on a *nillable* field, the Integration Appliance sets the field to null during an update.

Note: Setting a field to an empty string does not set a field to null.

## Mapping the output of the Merge Object activity

---

### Procedure

1. In the Checklist, select Map Outputs.

The results element is displayed in the From Activity panel. The parameters that are displayed correspond to the structure of the ServiceMax `MergeResults` schema.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

---

## Send email activity

---

Use this activity to send single or multiple emails. The emails include all standard email attributes such as the email address, subject line, and carbon copies.

### Using the email activity

---

1. In the Activities tab, open the ServiceMax directory to find the Send Email activity.
2. Drag the Send Email activity onto the orchestration.

The Summary and Checklist for the activity are displayed beneath the orchestration.

### 3. Select a ServiceMax endpoint.

For instructions on creating or editing a ServiceMax endpoint, see [Creating or editing a ServiceMax endpoint](#).

4. In the Configure section, select the Send Mass Emails check box if you want to send multiple emails.
5. Specify the Retry and Activity Timeout parameters for the activity.
6. Map the inputs of the activity.
7. Map the outputs of the activity.

## Mapping the input of the Send Email activity

---

### 1. In the Checklist, select Map Inputs.

The emails parameter is displayed in the To Activity pane.

2. Right-click the default node and choose Show Optional Parameters, to display these optional input parameters for this activity:
  - connection
  - sessionInfo
3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

## Mapping the output of the Send Email activity

---

### 1. In the Checklist, select Map Outputs.

The results and sessionInfo elements are displayed in the From Activity pane.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

 Last updated: Monday, 6 March 2017  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_Service\\_Now.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_Service_Now.html)

## Overview of ServiceNow Connector

---

ServiceNow is a platform-as-a-service (PaaS) provider of IT service management (ITSM) software. ServiceNow also automates and standardizes common business processes. The platform contains a number of modular applications that can vary by instance and user.

The ServiceNow platform is based on service-oriented architecture (SOA), in which all data objects can use web services to access bi-directional data-level integration.

You can perform the following activities using ServiceNow connector:

- Outbound Activities:
  - Create
  - Retrieve
  - Update
  - Delete

Note: For ServiceNow integration one need to have Admin role.

**Parent topic:** [Service Now Activities](#)

## Creating or editing an endpoint for ServiceNow activity

---

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to ServiceNow platform. ServiceNow uses both Basic and OAuth 2.0 authentication mechanism so as to authorize users to perform operations.

### Selecting or editing ServiceNow endpoint

To select or edit an ServiceNow endpoint:

1. In the **Create Endpoint** or **Edit Endpoint** pane, configure the ServiceNow endpoint as described in the following table.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

2. Click **Test Connection** to confirm that the connection details are valid and you are able to connect to the ServiceNow successfully.
3. Click **OK**.

*Table: Connection properties*

Field Name	Description
Host Name	Host Name for ServiceNow API, e.g. <vender-name>.service-now.com
User Name	ServiceNow User Name used for basic authentication, required only if Select For OAuth Authentication is unchecked.
Password	ServiceNow Password used for basic authentication, required only if Select For OAuth Authentication is unchecked.
Select For OAuth Authentication	Check Box. Decides the authentication mechanism used by the user. Should be checked if OAuth 2.0 authentication is used, else unchecked for basic authentication.
OAuth Access Token	OAuth Access Token for ServiceNow API, required only if Select For OAuth Authentication is checked.
OAuth Refresh Token	OAuth Refresh Token for ServiceNow API, required only if Select For OAuth Authentication is checked.
Application Client Id	Application Client Id for ServiceNow account, required only if Select For OAuth Authentication is checked.
Application Client Secret	Application Client Secret for ServiceNow account, required only if Select For OAuth Authentication is checked.

Note: To generate the access token, refer to the ServiceNow documentation relating to "OAuth Authentication".

#### Tables Supported by the ServiceNow Connector

All standard and custom tables are supported by ServiceNow Connector.

**Parent topic:** [Service Now Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Monday, 6 March 2017  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Service\\_Now\\_creating\\_or\\_editing\\_an\\_endpoin.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Service_Now_creating_or_editing_an_endpoin.html)

## Using the ServiceNow Session Management

JSessionID field can be used to execute the records in a single session.

### About this task

Session Management is applicable for runtime operations only. If JSessionID value is null or expired, the Connector re-generates it implicitly, uses it in the execution of the activity and returns it in the response. This JSessionID can be used in other activities by providing the same value in the other activity. If the JSessionID is idle for 5 min it expires and user can provide the value as null and connector re-generates it.

### Procedure

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created ServiceNow endpoint to the orchestration and select any activity.
3. Double click the activity added to the orchestration.
4. In the Checklist, click Configure.
5. Click Browse and use the Project Explorer dialog box to select the relevant ServiceNow table.
6. Click the Map Inputs in the Checklist. The XML Schemas generated for the selected activity are displayed.
7. Create a map between the orchestration variables and the input parameter of the activity.
8. To reuse the session, provide valid session information in JSessionID Field. If the value is not available the connector re-generates it and returns.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node.
9. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
10. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the ServiceNow activity. If Session ID present in JSessionID is valid then the same should be displayed in Map Outputs as JSessionID. This value can be stored in a Variable and can be used in execution of further operations. If the JSessionID field value is invalid or expired then new session ID gets created which is then implicitly used in the execution of an activity. This new value is then displayed in Map Outputs as JSessionID.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

## Using the ServiceNow Create Activity

---

Use the Create activity to create records for standard and custom tables in ServiceNow.

### About this task

---

Use this task to add records to the table in ServiceNow instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created ServiceNow endpoint to the orchestration and select Create activity. The Create activity will be added to the orchestration. Double click the activity.
3. In the Checklist, click Configure.
4. Click Browse and use the Project Explorer dialog box to select the relevant ServiceNow table.
5. Select the Map Inputs in the Checklist. The XML Schemas generated for that operation are displayed.
6. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node.
7. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
8. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the ServiceNow Create Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

**Parent topic:** [Service Now Activities](#)

---

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Service\\_Now\\_using\\_the\\_servicenow\\_create\\_ac.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Service_Now_using_the_servicenow_create_ac.html)

## Using the ServiceNow Retrieve Activity

---

Use the Retrieve activity to get records from standard and custom tables in ServiceNow.

### About this task

---

Use this task to get records from the table in ServiceNow instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created ServiceNow endpoint to the orchestration and select Retrieve activity. The Retrieve activity will be added to the orchestration. Double click the activity.
3. In the Checklist, click Configure.
4. Click Browse and use the Project Explorer dialog box to select the relevant ServiceNow table.
5. Select the Map Inputs in the Checklist. The XML Schemas generated for that operation are displayed.
6. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory fields:**

- `is_all_records`: to fetch all the records.
- `sys_id`: to fetch specific record when `is_all_records` is false.

**Customize:** To customize the response `query_object` is used. Below are `query_object` fields:

- `sysparm_display_value`: Data retrieval operation for reference and choice fields. Set this parameter to one of these values,
  - **true**: Returns display values for all of the fields.
  - **false**: Returns actual values from the database. If a value is not specified, this parameter defaults to **false**.
  - **all**: Returns both actual and display values.
- `sysparm_exclude_reference_link`: Additional information provided for reference fields, such as the URI to the reference resource, is suppressed.
- `sysparm_fields`: Comma-separated field names to return in the response.
- `sysparm_limit`: Limit to be applied on pagination. The default is 10000.
- `sysparm_query`: An encoded query.
- `sysparm_view`: UI view to determine fields returned in the response.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

7. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
8. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the ServiceNow Retrieve activity.

Note:

You can add more than one `sys_id` fields as input to this activity. To add more than one `sys_id` fields as input, right click the `sys_id` field in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

## Using the ServiceNow Update Activity

---

Use the Update activity to get records from standard and custom tables in ServiceNow.

### About this task

---

Use this task to get records from the table in ServiceNow instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created ServiceNow endpoint to the orchestration and select Update activity. The Update activity will be added to the orchestration. Double click the activity.
3. In the Checklist, click Configure.
4. Click Browse and use the Project Explorer dialog box to select the relevant ServiceNow table.
5. Select the Map Inputs in the Checklist. The XML Schemas generated for that operation are displayed.
6. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory fields:**

- o sys\_id: to update records.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

7. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
8. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the ServiceNow Update activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

## Using the ServiceNow Delete Activity

---

Use the Delete activity to remove records from standard and custom tables in ServiceNow.

### About this task

---

Use this task to remove records from the table in ServiceNow instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created ServiceNow endpoint to the orchestration and select Delete activity. The Delete activity will be added to the orchestration. Double click the activity.
3. In the Checklist, click Configure.
4. Click Browse and use the Project Explorer dialog box to select the relevant ServiceNow table.
5. Select the Map Inputs in the Checklist. The XML Schemas generated for that operation are displayed.
6. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory fields:**

- o sys\_id: to delete records.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

7. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
8. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the ServiceNow Delete activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

**Parent topic:** [Service Now Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_siebelactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_siebelactivities.html)

## Overview of the Siebel connector

---

The Siebel connector enables a two-way communication between Cast Iron and the Siebel business applications server. The connector supports Business Object/Business Component (BO/BC), Integration Objects (IO), and Business Service (BS) interfaces.

You can perform the following activities using the Siebel connector:

- Outbound Activities
  - [Create Objects](#) (uses BO/BC or IO)
  - [Update Objects](#) (uses BO/BC or IO)
  - [Delete Objects](#) (uses BO/BC or IO)
  - [Query Objects](#) (uses BO/BC or IO)
  - [Execute Business Service](#) (uses BS)
- Inbound/Starter Activities
  - [Get Created Objects](#) (uses BO/BC or IO)
  - [Get Updated Objects](#) (uses BO/BC or IO)
  - [Get Deleted Objects](#) (uses BO/BC or IO)

The Siebel connector supports the following versions of the Siebel server: 7.0.5, 7.5.x, 7.7.x, 7.8.x, 8.0, 8.1, and 8.1.1.

The Siebel connector requires Siebel JAR files to connect to the Siebel server. For more information, see [Installing JAR files to connect to the Siebel server](#).

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel\\_Overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel_Overview.html)

## Installing JAR files to connect to the Siebel server

---

You must copy two JAR files on the same workstation as your Cast Iron Studio installation before you can connect to a Siebel server. Also, you can copy the `Siebel.properties` file, which is optional, to configure the connection timeout, transaction timeout, and the Siebel properties.

## Before you begin

---

- The JAR files can be obtained from the Siebel system administrator.
- The JAR files must be on the same computer as the studio installation.
- The JAR files must be from the same version as the Siebel server you connect to.
- The `Siebel.properties` file must have properties for that particular version of the Siebel server.

## About this task

---

The files to be installed are:

- `Siebel.jar`
- A language specific JAR file. For example, the English language JAR file is named `SiebelJI_enu.jar`
- `Siebel.properties` - This is an optional file. For more information about the `Siebel.properties` file, see [Siebel properties file](#).

## Procedure

---

1. Open studio and select Tools > Install Module Providers.
2. When the Add Provider(s) dialog box is displayed, click the plus (+) button under Siebel Connector. A field and a Browse button appears.
3. Click Browse, and use the browse dialog box to locate and select the JAR files and the properties file (optional).
4. Click Open to import the contents of the selected files.
5. When the two JAR files and the properties file (optional) are listed in the Add Provider(s) dialog box, click OK.

## Results

---

A prompt is displayed to restart studio and activate the changes.

## What to do next

---

You can now create Siebel endpoints and orchestrations.

**Parent topic:** [Siebel activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel\\_installing\\_jarfiles.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel_installing_jarfiles.html)

## Creating or editing a Siebel endpoint

---

Siebel endpoints contain the connection information that Studio and the Integration Appliance use to connect to a Siebel Business Applications Server. You can create multiple endpoints that refer to separate instances.

## About this task

---

Use this task to create or edit a Siebel endpoint.

Note: Any changes you make to the Siebel endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

## Procedure

---

1. Drag an activity from the Siebel folder under the Activities tab to the Orchestration window. The Summary panel is displayed.

2. Click Pick Endpoint under Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. Browse - To select an existing endpoint from Project Explorer. The Project Explorer window shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
  - b. New - To create a new endpoint. The Create Endpoint window opens.  
Note: In Version 6.1.0.1, select the first Siebel entry in the list. For more information, see the technote <http://www-01.ibm.com/support/docview.wss?uid=swg21516320>.
  - c. Edit - To edit the existing endpoint. The Edit Endpoint window opens.
4. Complete the fields defined in the following table:

Table 1. Connection properties

Field Name	Description
Connection information	
Connection URL	<p>Specifies the connection URL to connect to the Siebel server. The connection URLs for all versions of Siebel follow this format:</p> <pre>siebel[.transport][.encryption] [.compression]://host[:port]/EnterpriseServer/AppObjMgr</pre> <p>The default port number is 2320. For Siebel version 7.5x and earlier versions, the port number (2320) and the server name are specified.</p> <p>For Siebel version 7.8, the port and the server name are not specified.</p> <p>If you do not select the default port, you can specify another port number (for example, 2321).</p> <p>The following are the examples of connection URIs for different versions of the Siebel server:</p> <ul style="list-style-type: none"> <li>○ For Siebel 7.5: <code>siebel://&lt;IP_address&gt;:2320/siebel/SSEObjMgr_ENU/sebldev1</code></li> <li>○ For Siebel 7.8: <code>siebel://&lt;IP_address&gt;:/Sieb78/SSEObjMgr_enu</code></li> <li>○ For Siebel 8: <code>siebel://&lt;IP_address&gt;:2321/SBA_80/SSEObjMgr_enu</code></li> </ul>
Language Code	Specifies the language code to log on to the Siebel server. If the system locale is English, the value for this property is ENU (English).
User Name	Specifies the user name to connect to the Siebel server.
Password	Specifies the password associated with the user name to connect to the Siebel server.
Code page	<p>Specifies the character encoding (code page) of the Siebel Server. The character encoding (code page) of the Siebel Server and the character encoding of the Siebel client (machine on which Siebel connector is used) must be the same. This allows the Siebel client and the Siebel Server to communicate correctly. Change the character encoding of the Siebel client if it is different from that of the Siebel server.</p> <p>The Siebel Javaâ„¢ Data Bean supports a limited list of code page settings. If the current code page setting of your run time is not supported, the connector may not be able to connect to the Siebel server. For more details refer to the Siebel Java Data Bean documentation.</p>
Load Balancing	
Use Resonate for load balancing on Siebel server	Specifies the option (select the check box) if the Siebel system uses resonate for load balancing. The connector takes advantage of the load balancing feature to connect to the Siebel Business Applications server efficiently.
Connection pool options	
Minimum Connections	Specifies the minimum number of connections available in the connection pool. The activity uses the connections to connect to a Siebel server. The default value is 5.
Maximum Connections	Specifies the maximum number of connections available in the connection pool. The activity uses the connections to connect to a Siebel server. The default value is 25.
Maximum Idle Time	Specifies the amount of time in minutes an open connection can be idle before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool - no idle time. The default value is 120 minutes.

Field Name	Description
Maximum Wait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
Reclaim Connections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections, as specified in the Minimum Connections parameter, is reached. By default, the connector reclaims connections at five minutes interval.
Â	Note: The Connection pool properties need to be configured as per the load (number of concurrent requests) on the endpoint.
Remote endpoint configuration	
Endpoint Runs Behind Firewall	Enables the secure connector name property so that secure connector can be used if the Siebel Business Applications server is running behind a firewall.
Secure Connector Name	Specifies the name of the secure connector that is used to connect to the Siebel Business Applications server running behind a firewall. For example, if an orchestration containing Siebel activity is deployed on to Cast Iron® Live (cloud), then the secure connector needs to be configured.

5. When finished, click Test Connection to confirm that you can connect to the Siebel system.

6. Click OK.

## Using the Siebel Create Objects activity

Use the Siebel Create Objects activity to work with either Siebel Business Objects, Business Components, or Siebel Integration Objects.

### Before you begin

Ensure that you have:

- Installed the JAR files required to connect to the Siebel server. For more information, see [Installing JAR files to connect to the Siebel server](#).
- Valid connection details to connect to the Siebel server.

### About this task

Use this task to create either a Business Component hierarchy or an Integration Object on the Siebel server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

1. In an active orchestration, open the Activities tab and expand the Siebel folder contents.
2. Drag the Create Objects activity icon onto the orchestration. The Siebel create objects Checklist is displayed.
3. In the Checklist, click Summary.

4. Review the contents of the Activity Name field, and make the required changes.
  5. In the Checklist, click Pick Endpoint.
  6. Click Browse and use the Project Explorer dialog box to select the relevant Siebel endpoint.
  7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
- Note: For more information, see [Creating or editing a Siebel endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
  9. In the Checklist, click Configure.
  10. Enter the repository name in the Repository Name text box. Repository name is populated with a default value, which represents the Siebel Repository. Enter the repository name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this repository.
  11. Select one of the following objects for integration.

To work with **Business Object/Business Component**:

- a. Select the Object Type as Business Object / Business Component.
  - b. Click Browse to display the list of Business Objects.
  - c. Use the Business Object Filter to filter the business objects during selection.
  - d. Optional: Click Refresh to update the current object list from the Siebel server.
  - e. Select a Business Object from the business object list and click Next.
  - f. The list of business components for the selected business object is displayed. Select a business component and click Finish to generate schemas for the map input and map output.
  - g. If the selected business component is a child of a parent business component, then both the parent and the child business components are generated with a relation between them.
- Note: Each of the child object attributes created in the map input is processed by the activity as follows:
- The key attributes are not set on the parent business component. Siebel generates the key attributes when a record is created. If the key attributes are set, Siebel returns an exception and sets the read-only fields populated with values.
  - If the child object is a business component of a Picklists, and you want to select an existing child instance, do not create a new child object. Instead, set the value on the parent. For example, if you select an existing Business Address under Account, set the PrimaryAddressId instead of creating a Business Address. However, to create a new child instance, you must populate the non-key attributes in the child business component so that the activity tries to create the corresponding child instance in the Siebel application.
  - If there are static Picklists, then the corresponding simple attribute in the object is required. If a value is not listed in the Picklist's list of values, the activity tries to populate the value. If the list is unbounded and Insert is enabled, the activity processing is successful. If the activity is unable to populate the value by itself, the operation fails.
  - The child record is created with multi-value links. If the create operation for the child record fails, the child record is rolled back. If the create operation for the parent record fails, all the child and the parent records are rolled back.
  - The connector attempts to select an existing child business component (for example, Association) based on the values of all the attributes in the corresponding input child object. If a matching child business component is found, it is associated with the parent. If a matching child business component is not found, a new child business component is created and associated with the parent business component.
  - If the child create operation fails, the child is rolled back. If the parent create operation fails, only the parent is rolled back. Because association components can also be individual components, as well as children of other components, a child, or parent cannot be rolled back once an associated child has been created.

To work with Integration Object:

- a. For Siebel Integration Object, select the Object Type as Integration Object.
  - b. Click Browse to display the list of integration objects.
  - c. Use Integration Object Filter to filter the integration objects during selection.
  - d. Optional: Click Refresh to update the current object list from the Siebel server.
  - e. Select an integration object and click Finish to generate schemas for the map input and map output. During processing, the selected business service is executed and the output is sent back to the orchestration.
  12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery Options for Siebel Activities](#).
  13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
  14. Create a map between the orchestration variables and the input parameter of the activity.
- Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a

mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Siebel Create Objects activity.

## Using the Siebel Update Objects activity

---

Use the Siebel Update Objects activity to work with either Siebel Business Objects, Business Components, or Siebel Integration Objects.

### Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the Siebel server. For more information, see [Installing JAR files to connect to the Siebel server](#).
- Valid connection details to connect to the Siebel server.

### About this task

---

Use this task to update either a Business Component hierarchy or an Integration Object on the Siebel server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Siebel folder contents.
2. Drag the Update Objects activity icon onto the orchestration. The Siebel Update Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Siebel endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing a Siebel endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Enter the repository name in the Repository Name text box. Repository name is populated with a default value, which represents the Siebel Repository. Enter the repository name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this repository.
11. Select one of the following objects for integration.

To work with **Business Object/Business Component**:

- a. Select the Object Type as Business Object / Business Component.
- b. Click Browse to display the list of Business Objects.
- c. Use the Business Object Filter to filter the business objects during selection.

- d. Optional: Click Refresh to update the current object list from the Siebel server.
- e. Select a Business Object from the business object list and click Next.
- f. The list of business components for the selected business object is displayed. Select a business component and click Finish to generate schemas for the map input and map output.

During processing, the business component hierarchy is retrieved from the Siebel server and compared to the incoming top-level business object hierarchy of the activity. The child objects are created, updated, and deleted based on the results of this comparison. The Update activity fails if the key attributes (for example, ID) are not set correctly.

To work with Integration Object:

- a. For Siebel Integration Object, select the Object Type as Integration Object.
  - b. Click Browse to display the list of integration objects.
  - c. Use Integration Object Filter to filter the integration objects during selection.
  - d. Optional: Click Refresh to update the current object list from the Siebel server.
  - e. Select an integration object and click Finish to generate schemas for the map input and map output. During processing, the selected business service is executed and the output is sent back to the orchestration.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery Options for Siebel Activities](#).
  13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Update Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
  14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
  15. Select the Map Outputs in the checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
  16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Siebel Update Objects activity.

**Parent topic:** [Siebel activities](#)

## Using the Siebel Delete Objects activity

---

Use the Siebel Delete Objects activity to work with either Siebel Business Objects, Business Components, or Siebel Integration Objects.

### Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the Siebel server. For more information, see [Installing JAR files to connect to the Siebel server](#).
- Valid connection details to connect to the Siebel server.

### About this task

---

Use this task to delete either a Business Component hierarchy or an Integration Object on the Siebel server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Siebel folder contents.
2. Drag the Delete Objects activity icon onto the orchestration. The Siebel Delete Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Siebel endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing a Siebel endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Enter the repository name in the Repository Name text box. Repository name is populated with a default value, which represents the Siebel Repository. Enter the repository name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this repository.
11. Select one of the following objects for integration.

To work with **Business Object/Business Component**:

- a. Select the Object Type as Business Object / Business Component.
- b. Click Browse to display the list of Business Objects.
- c. Use the Business Object Filter to filter the business objects during selection.
- d. Optional: Click Refresh to update the current object list from the Siebel server.
- e. Select a Business Object from the business object list and click Next.
- f. The list of business components for the selected business object is displayed. Select a business component and click Finish to generate schemas for the map input and map output.

The Delete activity deletes the top-level business objects and its children. This results in a physical delete, and the record is removed from the Siebel application. The Delete activity fails if the key attributes (for example, ID) are not set correctly.

To work with Integration Object:

- a. For Siebel Integration Object, select the Object Type as Integration Object.
- b. Click Browse to display the list of integration objects.
- c. Use Integration Object Filter to filter the integration objects during selection.
- d. Optional: Click Refresh to update the current object list from the Siebel server.
- e. Select an integration object and click Finish to generate schemas for the map input and map output. During processing, the selected business service is executed and the output is sent back to the orchestration.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery Options for Siebel Activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Delete Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Siebel Delete Objects activity.

**Parent topic:** [Siebel activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel\\_delete\\_outactivity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel_delete_outactivity.html)

## Using the Siebel Query Objects activity

---

Use the Siebel Query Objects activity to work with either Siebel Business Objects, Business Components, or Siebel Integration Objects.

### Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the Siebel server. For more information, see [Installing JAR files to connect to the Siebel server](#).
- Valid connection details to connect to the Siebel server.

### About this task

---

Use this task to query either a Business Component hierarchy or an Integration Object on the Siebel server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Siebel folder contents.
2. Drag the Query Objects activity icon onto the orchestration. The Siebel Query Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Siebel endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing a Siebel endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Enter the repository name in the Repository Name text box. Repository name is populated with a default value, which represents the Siebel Repository. Enter the repository name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this repository.
11. Select one of the following objects for integration.

To work with **Business Object/Business Component**:

- a. Select the Object Type as Business Object / Business Component.
- b. Click Browse to display the list of Business Objects.
- c. Use the Business Object Filter to filter the business objects during selection.
- d. Optional: Click Refresh to update the current object list from the Siebel server.
- e. Select a Business Object from the business object list and click Next.
- f. The list of business components for the selected business object is displayed. Select a business component and click Finish to generate schemas for the map input and map output.

The Query activity retrieves the Siebel business component for the specified key in the map input. The following occurs during the Query activity:

- The keys are set on the top-level business component to search for records. If the record is not found, an error message is logged, and the job fails. If the record is found, the simple attribute values are retrieved from the top-level business component and set to the map output.  
Note: A simple PickList attribute is retrieved differently from other simple attributes. The simple PickList attribute is retrieved by obtaining the value of the PickListKey from the child picklist component. To retrieve a child picklist component, the FieldName value must be used.
- Child business components are retrieved based on the type of relationship they have with the parent business component.
- Child PickList instances are retrieved.

- If the child record is found with multi-value link and association, the attribute value is set to the parent.

To work with Integration Object:

- For Siebel Integration Object, select the Object Type as Integration Object.
  - Click Browse to display the list of integration objects.
  - Use Integration Object Filter to filter the integration objects during selection.
  - Optional: Click Refresh to update the current object list from the Siebel server.
  - Select an integration object and click Finish to generate schemas for the map input and map output. During processing, the selected business service is executed and the output is sent back to the orchestration.
- In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery Options for Siebel Activities](#).
  - Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Query Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
  - Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
  - Select the Map Outputs in the checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
  - Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Siebel Query Objects activity.

**Parent topic:** [Siebel activities](#)

## Using the Siebel Execute Business Service activity

---

The Siebel execute business service activity is used to run a Siebel business service on the Siebel Business Applications server.

### Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the Siebel server. For more information, see [Installing JAR files to connect to the Siebel server](#).
- The valid connection details to connect to the Siebel server.
- 

### About this task

---

The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration. The business service can be a standard business service like Siebel Contact or a custom business service where the integration object needs to be selected.

### Procedure

---

- In an active orchestration, open the Activities tab and expand the Siebel folder contents.
- Drag the Execute Business Service activity icon onto the orchestration.
- When the activity shows in the orchestration, the Siebel Execute Business Service Checklist is displayed.
- In the Checklist, click Summary.

5. Review the contents of the Activity Name field, and make the required changes.
  6. In the Checklist, click Pick Endpoint.
  7. Click Browse and use the Project Explorer dialog box to select the relevant Siebel endpoint.
  8. You can create the endpoint by clicking New and enter the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing a Siebel endpoint](#).
  9. To make any required changes to the selected endpoint configuration, click Edit to access the options in a separate window.  
Any changes you make globally affects all uses of the endpoint in active orchestrations.
  10. In the Checklist, click **Configure**.
  11. Type the repository name in the Repository Name text box. The repository name is populated with a default value, which represents the Siebel Repository. Specify the repository name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this repository.
  12. Select the business service.
    - a. Click Browse to display the list of Business Services.
    - b. Use the Business Service Filter to filter the business services during selection.
    - c. Optional: Click **Refresh** to update the current object list from the Siebel server.
    - d. Select a Business Service from the business service list and click Next. The list of business operations for the selected business service is displayed.
      - o If the business service has a fixed integration object associated with it then after selecting the business operation, click Finish to generate the schemas for the map input/output.
      - o If the business service has no fixed integration object associated with it then after selecting the business operation click Next and select the integration objects for the input/output message.
  13. Select Map Inputs from the Checklist. The XML Schemas generated from the selected service of the Execute Business Service activity are displayed as nodes under the request input parameter in the To Activity panel.
  14. Create a map between orchestration variables and the input parameter of the activity.
- Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with input node. During run time if no value is provided for a mandatory element, the activity throws an exception which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs from the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
  16. Create a map between the output parameters and the orchestration variables.

## Results

---

You have configured the Siebel Execute Business Service activity.

**Parent topic:** [Siebel activities](#)

## Prerequisites for starter activities in Siebel

---

This section contains the prerequisites to configure the Siebel inbound activities.

You must create an event store in Siebel as a prerequisite for using the starter activities.

### Creating the Event Store in Siebel

---

This procedure uses the Siebel Sales Enterprise application as an example. For convenience, whenever we say Siebel application, it means Siebel Sales Enterprise application in the following chapter. IBM Events are used as the event store name in this example. This name can be changed based on the end user needs.

To create an “Event Store” and “Object” in Siebel Business Applications, perform the following procedure in Siebel tools:

1. Using New Object Wizard, create a stand-alone table CX\_IBM\_EVENT.

2. Create these columns in your new table:

Table 1. Columns for the event table

Column Name / User Name	Type	Length	Physical Type	Required	Nullable	Status
DESCRIPTION	Data (public)	255	Varchar	Â“	âœ“	Active
EVENT_ID	Data (public)	30	Varchar	âœ“	Â	Active
CONNECTOR_ID	Data (public)	255	Varchar	Â	âœ“	Active
EVENT_TYPE	Data (public)	20	Varchar	âœ“	Â	Active
OBJECT_KEY	Data (public)	255	Varchar	âœ“	Â	Active
OBJECT_NAME	Data (public)	255	Varchar	âœ“	Â	Active
PRIORITY	Data (public)	10	Number	Â	âœ“	Active
STATUS	Data (public)	20	Number	âœ“	Â	Active
XID	Data (public)	255	Varchar	âœ“	Â	Active

3. Create a new Business Component (BC) IBM Events based on your new table. All fields are single value fields.

4. In addition to the fields in BC, create a new field Event Time Stamp and map it to CREATED column in from CX\_IBM\_EVENT. The Type of this field should be DTTYPE\_UTCDATETIME.

5. Create a new Business Object (BO) IBM Events.

6. Associate IBM Events BC to IBM Events BO.

7. Create IBM Event List Applet based on IBM Events BC.

8. Create IBM Event List View based on IBM Events BO.

9. Create IBM Events Screen and associate it to the IBM Event List View in Screen View.

10. Create a page tab as follows:

a. Access the Application > Siebel Sales Enterprise > Page tab.

b. Right-click and select New Record from the menu.

c. Enter IBM Events as the screen name and IBM Events for the Text-String Override.

d. Leave the inactive field unchecked

11. Create a screen menu item as follows:

a. Access the Application > Siebel Sales Enterprise > Screen Menu Item.

b. Right-click and select new record.

c. Enter IBM Events as the screen name and IBM Events for the Textâ€“String Override.

d. Leave the inactive field unchecked.

12. Create a new Business Object Schema Version for IBM project and associate it to Schema Version BC.

13. Apply the physical schema for the new tables in your local database. You can do this by querying on the new table,

CX\_IBM\_EVENT. Select the current query to create a physical schema. Make sure that you leave the table space and index space blank.

14. Activate the new schema using Activate.

15. Add or modify the Siebel VB or e-scripts for the BC that corresponds to the business objects used at your site. Siebel scripts triggers event notification for the configured objects (sample scripts are in the <studio\_root>/etc/Siebel folder). In the Siebel script, ensure that the event will not get created for the connector user name to prohibit the ping-pong effect.

16. Compile the updated and locked projects in your local database to create a new Siebel repository (.srf) file.

17. Open Siebel Sales Enterprise in your local database. You need to have administrative privileges to perform the following:

a. Create a new view called IBM Event List View.

b. Create a new responsibility called IBM Responsibility for IBM Event List View.

c. Add the employees or teams who are responsible for receiving events to the newly created IBM Responsibility.

d. Create the IBMCONN (or your connector user name) user and add it to IBM Responsibility and Administrative Responsibility.

18. Test the application in your local environment. Ensure that you have the visibility to IBM Event List View and that an event is generated in the view after you create a record in supported object. For example, create a new account in Siebel and check if a new account event appears in the IBM Event List View.

19. Check-in the new and updated projects into your development server.

20. Activate the new tables in the development database.

21. Compile a new Siebel.srf file and deploy it on the server.

You have successfully created the event store in the Siebel server.

## Using the Siebel Get Created Objects activity

---

Use the Get Created Objects activity to poll for Siebel Business Objects, Business Components, or Siebel Integration Objects from the Siebel server.

### Before you begin

---

Ensure that you have:

- Installed the necessary vendor software JAR files.
- The valid connection details to connect to the Siebel server.
- Configured the *EventStore* business objects and triggers to generate events. For more information, see [Prerequisites for starter activities in Siebel](#).

### About this task

---

Use this task to poll for either a Business Component hierarchy or an Integration Object, created on the Siebel server.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Siebel folder contents.
2. Drag the Get Created Objects activity icon onto the orchestration. The Siebel Get Created Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Siebel endpoint.
7. You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing a Siebel endpoint](#).
8. To make any required changes to the selected endpoint configuration, click Edit to access the options in a separate window.  
Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Specify the repository name in the Repository Name text box. Repository name is populated with a default value, which represents the Siebel Repository. Specify the repository name if it is not the same as the default value. All the metadata needed for discovering the objects are retrieved from this repository.
11. Specify the Event Store name configured in the Siebel server. The activity polls this Event Store for new events.
12. Select one of the following objects for integration.

To work with **Business Object/Business Component**:

- a. Select the Object Type as Business Object / Business Component.
- b. Click Browse to display the list of Business Objects.
- c. Use the Business Object Filter to filter the business objects during selection.
- d. Optional: Click Refresh to update the current object list from the Siebel server.
- e. Select a Business Object from the business object list and click Next.
- f. The list of business components for the selected business object is displayed. Select a business component and click Finish to generate schemas for the map output.

- g. If the selected business component is a child of a parent business component, then both the parent and the child business components are generated with a relation between them.

To work with Integration Object:

- a. Select the Object Type as Integration Object.
- b. Click Browse to display the list of integration objects.
- c. Use Integration Object Filter to filter the integration objects during selection.
- d. Optional: Click Refresh to update the object list from the Siebel server.
- e. Select an integration object and click Finish to generate schemas for the map output.

13. In the Checklist, click Retry. Review the default settings and make the required changes. Similarly, configure the **Delivery Rules** panel. For more information, see [Specifying Retry and Delivery Options for Siebel Activities](#).

The activity polls the event store at configured interval for create events and fetches the actual object for that event. This object is sent to the orchestration. After processing, the event is marked as archived in the event store.

14. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.

15. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Siebel Get Create Objects activity.

 Last updated: Wednesday, 15 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel\\_get\\_created\\_objects\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel_get_created_objects_activity.html)

## Using the Siebel Get Updated Objects activity

---

Use the Get Updated Objects activity to poll for events that were updated on the Siebel Sever.

### Before you begin

---

Ensure that you have:

- Installed the necessary vendor software JAR files.
- The valid connection details to connect to the Siebel server.
- Configured the *EventStore* business objects and triggers to generate events. For more information, see [Prerequisites for starter activities in Siebel](#)

### About this task

---

Use this task to get updated Business Component hierarchy or updated Integration Objects on the Siebel server.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Siebel folder contents.
  2. Drag the Get Updated Objects activity icon onto the orchestration. The Siebel Get Updated Objects Checklist is displayed.
  3. In the Checklist, click Summary.
  4. Review the contents of the Activity Name field, and make the required changes.
  5. In the Checklist, click **Pick Endpoint**.
  6. Click Browse and use the Project Explorer dialog box to select the relevant Siebel endpoint.
  7. You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
- Note: For more information, see [Creating or editing a Siebel endpoint](#).

8. To make any required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click **Configure**.
10. Enter the repository name in the **Repository Name** text box. Repository name is populated with a default value, which represents the Siebel Repository. Enter the repository name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this repository.
11. Specify the **Event Store** name which is configured in the Siebel server. The activity polls this Event Store for new events.
12. Select one of the following objects for integration.

To work with **Business Object/Business Component**:

- a. Select the Object Type as Business Object / Business Component.
- b. Click **Browse** to display the list of Business Objects.
- c. Use the **Business Object Filter** to filter the business objects during selection.
- d. Optional: Click **Refresh** to update the current object list from the Siebel server.
- e. Select a Business Object from the business object list and click **Next**.
- f. The list of business components for the selected business object is displayed. Select a business component and click **Finish** to generate schemas for the map input and map output.
- g. If the selected business component is a child of a parent business component, then both the parent and the child business components are generated with a relation between them.

To work with **Integration Object**:

- a. Select the Object Type as Integration Object.
- b. Click **Browse** to display the list of integration objects.
- c. Use **Integration Object Filter** to filter the integration objects during selection.
- d. Optional: Click **Refresh** to update the object list from the Siebel server.
- e. Select an integration object and click **Finish** to generate schemas for the map output.
13. In the Checklist, click **Retry**. Review the default settings and make the required changes. Similarly, configure the **Delivery Rules** panel. For more information, see [Specifying Retry and Delivery Options for Siebel Activities](#)
14. The activity polls the event store at configured intervals for update events, and fetches the actual object for that event. This object is sent to the orchestration. After processing, the event is marked as archived in the event store.
15. Select the **Map Outputs** in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Siebel Get Updated Objects activity.

**Parent topic:** [Siebel activities](#)

## Using the Siebel Get Deleted Objects activity

---

Use the Get Deleted Objects activity to poll for deleted Siebel Business Objects, Business Components, or Siebel Integration Objects from the Siebel server.

### Before you begin

---

Ensure that you have:

- Installed the necessary vendor software JAR files.
- The valid connection details to connect to the Siebel server.
- Configured the *EventStore* business objects and triggers to generate events. For more information, see [Prerequisites for starter activities in Siebel](#)

## About this task

---

Use this task to poll for events that are generated because of a delete operation performed on the Siebel Business Application server.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Siebel folder contents.
2. Drag the Get Deleted Objects activity icon onto the orchestration. The Siebel Get Deleted Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Siebel endpoint.
7. You can create the endpoint by clicking New and enter the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing a Siebel endpoint](#).
8. To make any required changes to the selected endpoint configuration, click Edit to access the options in a separate window.  
Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Enter the repository name in the Repository Name text box. Repository name is populated with a default value, which represents the Siebel Repository. Specify the repository name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this repository.
11. Specify the event store name which is configured in the Siebel server. The activity polls this event store for new events.
12. Select one of the following objects for integration.

To work with **Business Object/Business Component**:

- a. Select the Object Type as Business Object / Business Component.
- b. Click Browse to display the list of Business Objects.
- c. Use the Business Object Filter to filter the business objects during selection.
- d. Optional: Click Refresh to update the current object list from the Siebel server.
- e. Select a Business Object from the business object list and click Next.
- f. The list of business components for the selected business object is displayed. Select a business component and click Finish to generate schemas for the map input and map output.
- g. If the selected business component is a child of a parent business component, then both the parent and the child business components are generated with a relation between them.

To work with Integration Object:

- a. Select the Object Type as Integration Object.
- b. Click Browse to display the list of integration objects.
- c. Use Integration Object Filter to filter the integration objects during selection.
- d. Optional: Click Refresh to update the object list from the Siebel server.
- e. Select an integration object and click Finish to generate schemas for the map output.
13. In the Checklist, click Retry. Review the default settings and make the required changes. Similarly, configure the **Delivery Rules** panel. For more information, see [Specifying Retry and Delivery Options for Siebel Activities](#)
14. The activity polls the event store at configured interval for delete events and fetches the actual object for that event. This object is sent to the orchestration. After processing, the event is marked as archived in the event store.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Siebel Get Deleted Objects activity.

**Parent topic:** [Siebel activities](#)

## Specifying Retry and Delivery Options for Siebel Activities

Specifying the Retry and Delivery parameters is one of the tasks to configure a Siebel activity configuration.

### About this task

This section contains the procedure for configuring the retry options for Siebel outbound and inbound activities.

### Procedure

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry options for connecting to a Siebel server as described in the following table.

Table 1. Retry options

Retry Fields	Description
Wait -- seconds between each retry .	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Siebel server.
Try to connect -- time s before failing.	Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the Siebel server before issuing an error and stopping the processing of the current orchestration job. Note: If you deploy an orchestration that contains the inbound or outbound Siebel activity and the Integration Appliance cannot connect to the specified Siebel server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.

[Using the Siebel Invoke activity](#)

## Specifying the delivery rules options for Siebel inbound activities

### About this task

This section contains the procedure for configuring the delivery rule options for Siebel inbound activities.

### Procedure

1. Select the Delivery Rules task from the Checklist. The delivery rules pane is displayed.
2. Configure the delivery rules options to select the activity's behavior as described in the following table.

Table 2. Delivery rules

Delivery Rules Fields	Description
-----------------------	-------------

<b>Delivery Rules Fields</b>	<b>Description</b>
Poll for changes every _____ days/hours/minutes/seconds	Specifies the time interval to poll for objects in the Siebel server. (For example, the Get created object activity polls for create objects at the specified time internal.) Time can be selected in the format days, hours, minutes, or seconds.
Fetch _____ rows per poll	Specifies how many objects or components the activity should retrieve from the Siebel server in each poll cycle.
<b>Delivery Messages</b>	
ATMOST_ONCE	A non-persistent mode in which a Siebel business object or business component is either delivered once or not delivered at all.
ATLEAST_ONCE	A persistent mode, in which the Siebel business objects or business components are not lost. As a result, there are chances that the orchestration can receive events once or more than once.

---

## Siebel properties file

---

The Siebel connector uses Siebel API (Javaâ„¢ Data Bean) to interact with the Siebel server. Siebel API also provides a way to configure the connection settings on the client side. The `siebel.properties` file located in your classpath, can be used to provide default parameters for client applications connecting to Siebel applications using the Java Data Bean.

The following table describes the properties of the `siebel.properties` file:

Table 1. Siebel.properties file description

<b>Property Type</b>	<b>Property</b>	<b>Description</b>
Siebel Connection Manager Connection properties	<code>siebel.con mgr.txtimeout</code>	Indicates the transaction timeout (in milliseconds). The default value is 600000 = 10 minutes.
Â	<code>siebel.con mgr.poolsize</code>	Indicates the connection pool size. Connection pool maintains a set of connections to a specific server process. the default value is 2. Max connection pool size is 500.
Â	<code>siebel.con mgr.sesstimeout</code>	Indicates the transaction timeout (in seconds) on the client side. The default value is 2700 = 45 minutes.
Â	<code>siebel.con mgr.retry</code>	Indicates the number of open session retries. The default value is 3.
Â	<code>siebel.con mgr.jce</code>	Indicates the usage of Java Cryptography Extension. 1 for jce usage and 0 for no usage.
Â	<code>siebel.con mgr.virtualhosts</code>	Indicates the list of virtual servers representing a group of similar servers that perform the same function, for example, call center functions.  An incoming login for the call center Virtual Server tries servers from the list in a round-robin fashion. An example of such a list is as follows:  <code>VirtualServer1=sid1:host:port,sid2:host:port...;VirtualServer2=...</code> , where Virtual Servers is an assigned list of real Siebel Servers with host names and port numbers (of the local SCB).

<b>Property Type</b>	<b>Property</b>	<b>Description</b>
Siebel Generated code for JCA/JDB properties	siebel.connection.string siebel.user.name	Indicates the Siebel connection string. Indicates the user name to be used for logging on to Object Manager.
	siebel.user.password	Indicates the password to be used for logging on to Object Manager.
	siebel.user.language	Indicates the preferred language of the user.
	siebel.user.encrypted	Indicates whether the user name and password are encrypted.
	siebel.jdbc.classname	Indicates the default JDB classname.
Java System Properties Note: Java System Properties are System Properties, not Siebel Properties.	file.encoding	Indicates the code page on the client side. For example, cp1252, utf8, unicodeBig, cp942.

The following is a sample siebel.properties file:

```
siebel.conmgr.txttimeout = 3600
siebel.conmgr.poolsize = 5
siebel.conmgr.sesstimeout = 300000
```

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Silverpop\\_creating\\_or\\_editing\\_an\\_endpoin.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Silverpop_creating_or_editing_an_endpoin.html)

## Selecting or editing a Silverpop endpoint

---

1. In the Create Endpoint or Edit Endpoint pane, Configure the Silverpop Connection details as described in the following table.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the Silverpop server successfully.

3. Click OK.

*Table: Connection properties*

Field Name	Description
Application URL	Login URL for Silverpop portal
Authentication URL	URL Endpoint to connect and generate Access Token.
Access Token	Access Token as specified by user for OAuth based authentication.
Refresh Token	Refresh Token as specified by user in case of OAuth based authentication.
Client Id	Client Id as specified by user in case of OAuth based authentication
Client Secret	Client Secret as specified by user in case of OAuth based authentication
Proxy Host	Proxy host name of the Proxy Server to connect. (Optional)
Proxy Port	Proxy password of the Proxy Server to connect. (Optional)
Proxy Username	Proxy Username of the Proxy Server to connect. (Optional)
Proxy Password	Proxy Password of the Proxy Server to connect. (Optional)

Note: To generate the access token, check Silverpop documentation relating to "Authentication with the APIs : Authentication

Method: OAuth 2.0 Granted Access â€œ

## Activity: Add Contact

---

This interface adds one new contact to an existing database. If your database has a key other than Email, you must include all unique key columns with their corresponding name/value pairs. If adding and/or updating contacts in a database that has no Unique Identifier defined, one or more Sync Fields must be specified in order to look up the contact.

Add Contact Activity

Name	Type	R e q u i r	Description

		e d	
CR M- Ena ble- Syn c	String	N o	Yes or No type whether to sync the contact to your CRM system or not.
CRE ATE D_F RO M	Integer	Y e s	Value indicating the way in which you are adding the contact to the system. Values include: 0 â€“ Imported from a database 1 â€“ Added manually 2 â€“ Opted in 3 â€“ Created from tracking database
SEN D_A UTO REP LY	Boolean	N o	If the database has an autoresponder associated with it and the SEND_AUTOREPLY element is set to <b>true</b> , Engage sends the confirmation when the contact is added to the database.
UPD ATE _IF _FO UN D	Boolean	N o	If the UPDATE_IF_FOUND element is set to <b>true</b> , attempting to add a contact with a duplicate key will result in an update to their record. If the database has no Unique Identifier and UPDATE_IF_FOUND is set to <b>true</b> , attempting to add a contact with duplicate SYNC_FIELDS will result in an update to the record.
ALL OW _HT ML	Boolean	N o	If ALLOW_HTML is set to <b>true</b> , Engage will interpretâ€”and properly renderâ€”HTML within a value in the text field. The default value is <b>false</b> and will convert HTML tags to character entity references (and tags display as literal characters in the text field).
VIS ITO R_K EY	String	N o	Allows specifying a visitor key to associate a contact to a previously unknown when using the Web Tracking feature.
CO NTA CT_ LIS TS	Integer	N o	If included, the contact will be added to all specified contact lists in addition to a database.  Child Element : The contact list id that contact will be added to.
COL UM N	Depends on Each column name type.	Y e s	XML nodes defining the column name and value for fields being added or updated. <b>Note:</b> Each node must have a Name tag and a Value tag. If the database has a key that is not Email, Unique key columns must also be part of the submission with column names and values.  Child Element :  Name : Defines the field name. The name of the Email column must be EMAIL. The name of the email type column must be EMAIL_TYPE  Value : Contains the field value
SYN C_F IEL DS	Depends on Each column name type.	N o	Required if the database has no Unique Identifier and UPDATE_IF_FOUND is set to true. Used to look up a contact in a database that has no Unique Identifier defined. Include a SYNC_FIELDS element for each database column that defines a unique contact. Note: If more than one contact is found matching the lookup columns, the oldest contact will be updated. Sync fields will be ignored if the database has a key.  NAME: Defines the field name.  VALUE : Contains the field value.

## Click on Map Input link in Configure Activity section displayed below the orchestration.

---

The mandatory parameters for this Activity vary depending on the custom fields of the database.

Update Contact Activity

Name	Type	Required	Description
CRM-Enable-Sync	String	No	Yes or No type whether to sync the contact to your CRM system or not.
OLD_EMAIL	String	No	Old email address for the contact.
RECIPIENT_ID	String	No	The Recipient Id may be provided with a LIST_ID to look up a contact. No key fields are required when passing the Recipient Id.
ENCODED_RECIPIENT_ID	String	No	The encoded Recipient Id may be provided with a LIST_ID to look up a contact. No key fields are required when passing the Recipient Id. <b>Note:</b> The encoded Recipient Id can be obtained from a sent mailing when %%RECIPIENT_ID%% is placed in the mailing body.
SEND_AUTOREPLY	Boolean	No	If the database has an autoresponder associated with it and the SEND_AUTOREPLY element is set to <b>true</b> , Engage sends the confirmation when the contact is added to the database.
ALLOW_HTML	Boolean	No	If ALLOW_HTML is set to <b>true</b> , Engage will interpret and properly render HTML within a value in the text field. The default value is <b>false</b> and will convert HTML tags to character entity references (and tags display as literal characters in the text field).
VISITOR_KEY	String	No	Allows specifying a visitor key to associate a contact to a previously unknown when using the Web Tracking feature.
OPT_OUT	Boolean	No	<b>OPT_OUT</b> child element allows this operation to add a currently opted-out contact back into the database.
COLUMN	Depends on Each	Yes	XML nodes defining the column name and value. Note: Each node must have a <b>Name</b> tag and a <b>Value</b> tag. If the database has a key that is not Email, Unique key columns must also be part of the submission with column names and values. If changing a

	column name type.		value of one of the SYNC_FIELDS, the new value should be included as a COLUMN node.  NAME  Defines the field name.  VALUE  Contains the field value.
SYNC_FIELDS	Depends on Each column name type.	No	Required if the database has no Unique Identifier. Used to look up a contact in a database that has no Unique Identifier defined. Include a SYNC_FIELD element for each column that defines a unique contact. <b>Note:</b> If more than one contact is found matching the lookup columns, the oldest contact will be updated.  NAME: Defines the field name.  VALUE : Contains the field value.

## Mapping the outputs of the Activity

Create a map between the Silverpop output parameters and the orchestration variables. The expected response is generated on a successful mapping.

Name	Data type	Required	Description
SUCCESS	Boolean	Yes	<b>True</b> if successful.
RecipientId	String	Yes	ID of the updated contact. If an encoded Recipient Id is specified in the request, the Recipient Id in the response will be encoded.
ORGANIZATION_ID	String	No	Identifies your Engage Organization.
VISITOR_ASSOCIATION	String	No	Indicates whether the specified Visitor ID is valid and was associated to a profile.

## Activity: Update Lead

---

This interface updates a Lead in an existing database. Use of the optional **OPT\_OUT** allows this operation to add a currently opted-out Lead back into the database. If your database has a key other than Email, you must include all unique key columns with their corresponding name/value pairs. If updating Lead in a database that has no Unique Identifier defined, one or more Sync Fields must be specified in order to look up the Lead.

## Click on Map Input link in Configure Activity section displayed below the orchestration.

---

The mandatory parameters for this Activity vary depending on the custom fields of the database.

Select Contact Activity

Name	Type	Required	Description
EMAIL	String	No	The contact email address to look up. <b>Note:</b> When using a Non-Email Key or No-Key database, this element is not required
RECIPIENT_ID	String	No	The Recipient Id may be provided with a LIST_ID to look up a contact. No key fields are required when passing the Recipient Id.
ENCODED_RECIPIENT_ID	String	No	The encoded Recipient Id may be provided with a LIST_ID to look up a contact. No key fields are required when passing the encoded Recipient Id.
VISITOR_KEY	String	No	The Silverpop Web Tracking visitor key may be provided with a LIST_ID to look up a contact. No key fields are required when passing the Silverpop Web Tracking Visitor key. The Silverpop Web Tracking Visitor key is available in the Web Tracking cookie stored in a contact's browser settings.
RETURN_CONTACT_LISTS	Boolean	No	Indicates whether to return all Contact Lists which the contact belongs to. Valid values are: true false

COLU MN	Depends on Each column name type.	Y es	Required if the database has a key other than Email or no Unique Identifier. XML nodes defining the column name and value used to look up a contact in a database. Ignored for regular email key databases. <b>Note:</b> Unique key columns must be part of the submission with column names and values. <b>Note:</b> If more than one contact is found matching the lookup columns, the oldest contact will be returned.  Name  Specifies the field name of the unique key for the database.  Value  Specifies the field value for the field name of the unique key for the database.

## Mapping the outputs of the Activity

Create a map between the Silverpop output parameters and the orchestration variables. The expected response is generated on a successful mapping.

Name	Data type	Re qui red	Description
SUCCESS	Boolean	Yes	<b>True</b> if successful.
EMAIL	String	Yes	Email address for the contact.
Email	String	Yes	Email address for the contact. <b>Note:</b> At the time of this writing, email is included twice in the response.
RecipientId	String	Yes	Internal unique ID for each contact. If an encoded Recipient Id is specified in the request, the Recipient Id in the response will be encoded.
EmailType	String	Yes	Value indicating the preferred email type for the selected contact.  0 – HTML  1 – Text
LastModified	String	Yes	Last time the Contact record was modified.
CreatedFrom	String	Yes	Value indicating the way in which Engage added the selected contact to the system. 0 – Imported from a database  1 – Manually added 2 – Opted in  3 – Created from tracking database
OptedIn	Boolean	Yes	Contact's opt-in date, if applicable.
OptedOut	Boolean	Yes	Contact's opt-out date, if applicable.
Resume	String	Yes	The date contact will be opted back in if they are presently in a Snoozed state.

SendData			
ORGANIZATION_ID	String	Yes	Identifies your Engage Organization.
CONTACT_LISTS	String	Yes	If the RETURN_CONTACT_LISTS is "true" in the request, this parent node will be included in the response. It will contain a child element for each Contact List the contact belongs to.  <b>Child Elements</b>  CONTACT_LIST_ID Id of a Contact List which the contact belongs to.
COLUMNS	Depends on the type of Column child fields.	Yes	XML nodes defining the user-created column name and value.  <b>Child Elements</b>  Name Specifies the field name.  Value Specifies the field value.

## Creating, selecting, or editing a Silverpop endpoint

---

Click Pick Endpoint task from the Checklist and select one of the following actions:

1. Select an existing endpoint:
  - a. Select Browse. The Project Explorer is displayed.
  - b. Select an existing endpoint and click OK.
2. Select an existing endpoint and edit the endpoint:
  - a. Select Browse. The Project Explorer is displayed.
  - b. Select an existing endpoint and click OK.
  - c. Click Edit. The Edit Endpoint panel is displayed.
- c. Create a new endpoint: Select New. The Create Endpoint panel is displayed.

**Parent topic:** [Add the Select Lead Activity in the orchestration](#)

## Click on Map Input link in Configure Activity section displayed below the orchestration.

---

The mandatory parameters for this Activity vary depending on the custom fields of the database.

Select Lead Activity

Name	Type	R e q u ir e d	Description
EMAIL	String	No	The Lead email address to look up. <b>Note:</b> When using a Non-Email Key or No-Key database, this element is not required
RECIPIENT_ID	String	No	The Recipient Id may be provided with a LIST_ID to look up a Lead. No key fields are required when passing the Recipient Id.
ENCODED_RECIPIENT_ID	String	No	The encoded Recipient Id may be provided with a LIST_ID to look up a Lead. No key fields are required when passing the encoded Recipient Id.
VISITOR_KEY	String	No	The Silverpop Web Tracking visitor key may be provided with a LIST_ID to look up a Lead. No key fields are required when passing the Silverpop Web Tracking Visitor key. The Silverpop Web Tracking Visitor key is available in the Web Tracking cookie stored in a Lead's browser settings.

RETURNCNT	Boolean	No i., true ii., false	Indicates whether to return all Lead Lists which the Lead belongs to. Valid values are:
COLUMN	Depends on Each column name type.	Yes	<p>Required if the database has a key other than Email or no Unique Identifier. XML nodes defining the column name and value used to look up a Lead in a database. Ignored for regular email key databases. <b>Note:</b> Unique key columns must be part of the submission with column names and values. <b>Note:</b> If more than one Lead is found matching the lookup columns, the oldest Lead will be returned.</p> <p>Name Specifies the field name of the unique key for the database.</p> <p>Value Specifies the field value for the field name of the unique key for the database.</p>

## Mapping the outputs of the Activity

Create a map between the Silverpop output parameters and the orchestration variables. The expected response is generated on a successful mapping.

Name	Data type	Required	Description
SUCCESS	Boolean	Yes	<b>True</b> if successful.
EMAIL	String	Yes	Email address for the Lead.
Email	String	Yes	Email address for the Lead. <b>Note:</b> At the time of this writing, email is included twice in the response.
RecipientId	String	Yes	Internal unique ID for each Lead. If an encoded Recipient Id is specified in the request, the Recipient Id in the response will be encoded.
EmailType	String	Yes	Value indicating the preferred email type for the selected Lead. 0 – HTML 1 – Text
LastModified	String	Yes	Last time the Lead record was modified.
CreatedFrom	String	Yes	Value indicating the way in which Engage added the selected Lead to the system. 0 – Imported from a database 1 – Manually added 2 – Opted in 3 – Created from tracking database

OptedIn	Boolean	Yes	Lead's opt-in date, if applicable.
OptedOut	Boolean	Yes	Lead's opt-out date, if applicable.
ResumeSendDate	String	Yes	The date Lead will be opted back in if they are presently in a Snoozed state.
ORGANIZATION_ID	String	Yes	Identifies your Engage Organization.
CONTACT_LISTS	String	Yes	If the RETURN_CONTACT_LISTS is "true" in the request, this parent node will be included in the response. It will contain a child element for each Contact List the Lead belongs to.  <b>Child Elements</b>  CONTACT_LIST_ID  Id of a Contact List which the Lead belongs to.
COLUMNS	Depends on the type of Column child fields.	Yes	XML nodes defining the user-created column name and value.  <b>Child Elements</b>  Name  Specifies the field name.  Value  Specifies the field value.

## Security Token Service (STS) activities

---

- [Creating or editing an STS endpoint](#)

A Security Token Service (STS) endpoint provides the connection information that Studio and the Integration Appliance use to connect to an STS. You can request for a SAML 2.0 token/assertion from STS, which complies to WS-Trust specification.

- [Using the STS Get SAML 2.0 Token activity](#)

The **Get SAML 2.0 Token** activity is used to send a request that conforms to WS-Trust standard specification, to the Secure Token Service (STS) Provider. The request message is called the Request Security Token (RST). On receiving the request, the STS generates the requested token and sends it as part of the response, called the Request Security Token Response (RSTR). For this activity, the only token that is requested is SAML 2.0 token/assertion.

## Creating or editing an STS endpoint

---

A Security Token Service (STS) endpoint provides the connection information that Studio and the Integration Appliance use to connect to an STS. You can request for a SAML 2.0 token/assertion from STS, which complies to WS-Trust specification.

1. In the Create Endpoint or Edit Endpoint pane, configure the fields as described in the following table.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project as the edits are global, not local.

Table 1. Endpoint field description

Field Name	Description
<b>Location</b>	
Host Name	Specify the host name or IP address of the STS that this endpoint connects to.
Port	Specify the port number of the STS.
<b>Login</b>	<b>Description</b>
Log into the Server as an Anonymous User	Select this option to connect to STS anonymously (where user account is not required).

<b>Field Name</b>	<b>Description</b>
Log into the Server with User Name and Password	Select this option to connect to STS using a user account. Specify the User Name and Password.
Authentication	Allows you to select the type of authentication that the Integration Appliance uses when connecting to an STS server. From the list, select one of the following authentication options: <ul style="list-style-type: none"> <li>• <b>Basic</b> - Sends the user name and password you specify unencrypted to the server. This authentication scheme is the least secure.</li> </ul>
User Name	Specify the User Name for the account used to connect to the STS.
Password	Specify the Password for the account used to connect to the STS.
<b>Security</b>	<b>Description</b>
None	Select the None option if no security is required.
HTTPS	Select the HTTPS option to enable secure HTTP over SSL. <ul style="list-style-type: none"> <li>• When client authentication is required, select the Client Certificate Alias Name check box to specify that the Integration Appliance acting as a client should provide a certificate to STS. If selected, the name of the certificate must be provided. (For information about how to import a client certificate and private key for use with client authentication, see <a href="#">Importing an end-entity certificate</a>). A certificate specified at the endpoint level with this check box takes precedence over certificates specified on the <b>Security Certificates &gt; Settings &gt; Client SSL</b> entry in the WMC.</li> </ul>
Protocol Version	Select the protocol used for secure HTTP over SSL. By default, the protocol version used is <code>SSL_TLSv2</code> .
<b>Connection Timeout - The following Connection field is available for the Remote Server option only.</b>	
Time out after ____ seconds when establishing a connection to the Endpoint.	The number of seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the endpoint to respond to the connection request. For an STS activity, the amount of time the Integration Appliance attempts to establish a connection to STS before timing out. A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an endpoint and the time it takes the endpoint to respond.
<b>Proxy - The following Proxy fields are available for the Remote Server option only.</b>	
<b>Login</b>	<b>Description</b>
Connect via a Proxy Server	Select this check box if the request has to be routed through a proxy server.

Field Name	Description
Authentication	<p>Allows you to select the type of authentication that the Integration Appliance uses when connecting to a remote server. From the drop-down list, select one of the following authentication options:</p> <ul style="list-style-type: none"> <li>• <b>Basic</b> - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure.</li> <li>• <b>NTLM</b> - Requires an instance of NTCredentials to be available for the domain name of the server. This authentication is the most secure authentication option as the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server.</li> </ul> <p>Note: Do not prefix the user name with the domain.</p>
Realm / Domain	If you select the Basic authentication option, specify a realm. If you select the NTLM authentication option, specify a domain.
Host Name	Specify the host name or IP address of the proxy server that the request is routed through.
Port	Specify the port number of the proxy server that the request is routed through.
User Name	Specify the User Name for the account used to connect to the proxy server.
Password	Specify the Password for the account used to connect to the proxy server.
<b>Remote Endpoint Configuration</b>	Â
Endpoint Runs Behind Firewall	Select the check box to enable the secure connector name property so that secure connector can be used if STS is running behind a firewall.
Secure Connector Name	Specify the name of the secure connector that is used to connect to STS running behind a firewall. For example, if an orchestration containing an STS activity is deployed on to Cast Iron Live (cloud), then the secure connector needs to be configured.

Note: For some of the fields in the endpoint, you can define configuration properties to supply the values for these fields. Â The  icon is displayed when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/sts\\_create\\_edit\\_endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/sts_create_edit_endpoint.html)

## Using the STS Get SAML 2.0 Token activity

---

The **Get SAML 2.0 Token** activity is used to send a request that conforms to WS-Trust standard specification, to the Secure Token Service (STS) Provider. The request message is called the Request Security Token (RST). On receiving the request, the STS generates the requested token and sends it as part of the response, called the Request Security Token Response (RSTR). For this activity, the only token that is requested is SAML 2.0 token/assertion.

### Configuring the Get SAML 2.0 Token activity in the orchestration

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the STS folder.
3. Drag the **Get SAML 2.0 Token** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

The Get SAML 2.0 Token activity requires an endpoint to be configured, to send the request for a security token to the external STS (Secure Token Service). The endpoint that is used in this activity is called the STS endpoint. The configuration parameters and functions of this endpoint are similar to the HTTP endpoint. However, this endpoint has properties that are specific to the Get SAML 2.0 activity.

## Creating, selecting, or editing an STS endpoint

---

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an STS endpoint. See [Creating or editing an STS endpoint](#).

## Configuring the activity

---

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

<b>File Id or Ch ec k Bo x</b>	<b>Description</b>
<b>Request</b>	
UR L (Pa th aft er Ho stn am e)	Specifies the URI path that the <b>Get SAML 2.0 Token</b> activity sends the request to, for example: TrustServerWST13/services/RequestSecurityToken. The string that you specify in this field must exclude the protocol, for example: http://, the host name, and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number that is specified in the STS endpoint, and the URI path that is specified in this field. For example, if the complete URL that the <b>Get SAML 2.0 Token</b> activity sends the request to, is http://<applianceHost>:<appliancePort>/<URI>, in this field, you must only specify the URI.
<b>SAML Security Token Service Properties</b>	
Re qu est Ty pe	This activity supports only issuing of SAML 2.0 token/assertion. The default value is <code>http://docs.oasis-open.org/ws-sx/ws-trust/200512/Issue</code> .
Ap pli es To	The recipient endpoint reference/entity of SAML 2.0 token/assertion.
Iss uer	The authority responsible for issuing SAML 2.0 token/assertion.
To ke n Ty pe	This activity issues SAML 2.0 token/assertion. The default value is <code>SAML v2.0</code> . If you select <code>None</code> as the Token Type, then, no token type is sent as a part of the request. Note: Some STS services do not require a token type, but issues tokens that are based on the configurations in STS.

## Mapping the input into the activity

---

1. Select the **Map Inputs** task in the **Checklist**. The header input parameter is displayed in the To Activity pane of the **Map Inputs** task. The header input parameter is mandatory. The header input parameter contains the WSSE standard `Username Token`.
2. To view the optional input parameter in the To Activity pane of the Map Inputs pane, select **Map > Show Optional Parameters** from the toolbar menu or right-click in the To Activity pane and select the **Show Optional Parameters** option. If the **Map > Show Optional Parameters** option is not selectable in the toolbar menu, click a node in the Map Inputs pane to make this option active. The `requestSecurityToken`, `location`, `httpheaders`, and `proxyConnection` input parameters are displayed.

The following table defines the nodes of the optional `httpheaders` input parameter:

Table 2.

Input parameter	Description
<code>requestSecurityToken</code>	<code>requestSecurityToken</code> is sent as a SOAP body, which is interpreted by STS. Based on the input, STS issues the SAML 2.0 token/assertion. Note: If the values are populated in <code>requestSecurityToken</code> , the values that are provided in the Configure panel will not be considered.

3. Create a map between the orchestration variable or variables and the input parameter or parameters. See [Creating a map](#) for general instructions on mapping

## Mapping the output of the activity

---

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 3.

Output Parameter	Description
<code>httpheaders</code>	Specifies the HTTP header of the response.
<code>assertion</code>	Contains the SAML 2.0 token/assertion.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

Use the SugarCRM Get Reports activity to retrieve specific reports from the SugarCRM server.
- [Using the SugarCRM Delete Object activity](#)  
Use the SugarCRM Delete Object activity to delete objects from the SugarCRM server.
- [Using the SugarCRM Get Object activity](#)  
Use the SugarCRM Get Object activity to get objects from the SugarCRM server.
- [Using the SugarCRM Query Object activity](#)  
Use the SugarCRM Query Object activity to query objects in the SugarCRM server.
- [Using the SugarCRM Get ServerInfo activity](#)  
Use the SugarCRM Get ServerInfo activity to retrieve server information such as `flavor`, `version`, and `GMT time` from the SugarCRM server.

- [Using the SugarCRM Get UserInfo activity](#)  
Use the SugarCRM Get UserInfo activity to retrieve user information such as *userId*, *userTeamId*, and so on from the SugarCRM server.
- [Using the SugarCRM Search activity](#)  
Use the SugarCRM Search activity to search for objects from specified records. This activity searches for details based on a query.
- [Using the SugarCRM Set Relationship activity](#)  
Use the SugarCRM Set Relationship activity to set a single relationship between two records.
- [Using the SugarCRM Delete Relationship activity](#)  
Use the SugarCRM Delete Relationship activity to delete a relationship between two records.
- [Using the SugarCRM Get Relationship activity](#)  
Use the SugarCRM Get Relationship activity to retrieve the relationship data between two records. For example, you can use this activity to retrieve the contact details of a particular account and also retrieve the e-mail address and the opportunities information for that contact.
- [Specifying the Retry options for SugarCRM activities](#)  
Specifying the Retry parameters is one of the tasks to configure an SugarCRM activity. The SugarCRM connector uses a single login session for all connections to an SugarCRM endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_SugarCRMActivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_SugarCRMActivities.html)

## Creating and editing a SugarCRM endpoint

SugarCRM endpoints contain the connection information that studio and the Integration Appliance use to connect to the SugarCRM Server. You can create multiple endpoints that refer to separate instances.

### About this task

Use this task to create or edit a SugarCRM endpoint.

Note:

Any changes you make to the SugarCRM endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

### Procedure

1. Drag an activity from the SugarCRM folder under the Activities tab to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. Browse - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
  - b. New - To create a new endpoint. The Create Endpoint window opens.
  - c. Edit - To edit the existing endpoint. The Edit Endpoint window opens.
4. Complete the fields defined in the following table:

Table 1. Connection Details

Field Name	Description
Connection Details	
SugarCRM URL	Specify the SOAP URL of your SugarCRM instance. For example, <code>http://&lt;sugar-server&gt;/&lt;sugar-path&gt;/soap.php</code> .
User Name	Specifies the user name to connect to the SugarCRM server.

Field Name	Description
Password	Specifies the password associated with the user name to connect to the SugarCRM server.
Application Name	Indicates the name of the application used. The application name is populated automatically as <i>sugarCRM</i> .
Version	Indicates the version of the application used. The version number is populated automatically as <i>2.0</i> .

5. When finished, click Test Connection to confirm that you can connect to the SugarCRM system.

6. Click OK.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SugarCRM\\_creating\\_an\\_endpoint\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SugarCRM_creating_an_endpoint_activity.html)

## Using the SugarCRM Upsert Object activity

Use the SugarCRM Upsert Object activity to update or insert objects in the SugarCRM instance.

### About this task

Use this task to update or insert objects in the SugarCRM instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

1. In an active orchestration, open the Activities tab and expand the SugarCRM folder contents.
2. Drag the Upsert Object activity icon onto the orchestration. The SugarCRM Upsert Object Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a SugarCRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse SugarCRM window is displayed.
11. In Browse SugarCRM, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for SugarCRM activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Upsert Object activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the SugarCRM Upsert Object activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

## Using the SugarCRM Get Reports activity

---

Use the SugarCRM Get Reports activity to retrieve specific reports from the SugarCRM server.

### About this task

---

Use this task to retrieve specific reports from the SugarCRM server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the SugarCRM folder contents.
2. Drag the Get Reports activity icon onto the orchestration. The SugarCRM Get Reports Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a SugarCRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get Reports activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the SugarCRM Get Reports activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

**Parent topic:** [SugarCRM activities](#)

# Using the SugarCRM Query Object activity

---

Use the SugarCRM Query Object activity to query objects in the SugarCRM server.

## About this task

---

Use this task to query objects in the SugarCRM server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the SugarCRM folder contents.
2. Drag the Query Object activity icon onto the orchestration. The SugarCRM Query Object Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a SugarCRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse SugarCRM window is displayed.
11. In Browse SugarCRM, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list.
12. Click OK. The object field preferences are displayed.
13. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
14. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for SugarCRM activities](#).
15. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Query Object activity are displayed as nodes under the request input parameter in the To Activity panel.  
Note: To retrieve all deleted objects, set the required string in the QueryString, under Map Inputs. For example, to retrieve all deleted account objects, the query string should be accounts.deleted=1.
16. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
18. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the SugarCRM Query Object activity.

**Parent topic:** [SugarCRM activities](#)

## Using the SugarCRM Get ServerInfo activity

---

Use the SugarCRM Get ServerInfo activity to retrieve server information such as *flavor*, *version*, and *GMT time* from the SugarCRM server.

## About this task

---

Use this task to retrieve server information such as *flavor*, *version*, and *GMT time* from the SugarCRM server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the SugarCRM folder contents.
2. Drag the Get ServerInfo activity icon onto the orchestration. The SugarCRM Get ServerInfo Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a SugarCRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get ServerInfo activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
11. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the SugarCRM Get ServerInfo activity.

## Using the SugarCRM Search activity

---

Use the SugarCRM Search activity to search for objects from specified records. This activity searches for details based on a query.

### About this task

---

Use this task to search for objects from specified records. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the SugarCRM folder contents.
2. Drag the Search activity icon onto the orchestration. The SugarCRM Search Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a SugarCRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Search activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the SugarCRM Search activity.

## Using the SugarCRM Set Relationship activity

---

Use the SugarCRM Set Relationship activity to set a single relationship between two records.

### About this task

---

Use this task to set a single relationship between two records. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the SugarCRM folder contents.
2. Drag the Set Relationship activity icon onto the orchestration. The SugarCRM Set Relationship Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
*Note:* For more information, see [Creating and editing a SugarCRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse SugarCRM window is displayed.
11. In Browse SugarCRM, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list.
12. Click OK. The object field preferences are displayed.
13. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
14. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for SugarCRM activities](#).
15. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Set Relationship activity are displayed as nodes under the request input parameter in the To Activity panel.
16. Create a map between the orchestration variables and the input parameter of the activity.  
*Note:* Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
18. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the SugarCRM Set Relationship activity.

*Note:* You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

## Using the SugarCRM Delete Relationship activity

---

Use the SugarCRM Delete Relationship activity to delete a relationship between two records.

### About this task

---

Use this task to delete a relationship between two records. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the SugarCRM folder contents.
2. Drag the Delete Relationship activity icon onto the orchestration. The SugarCRM Delete Relationship Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
*Note:* For more information, see [Creating and editing a SugarCRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse SugarCRM window is displayed.
11. In Browse SugarCRM, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list.
12. Click OK. The object field preferences are displayed.
13. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
14. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for SugarCRM activities](#).
15. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Delete Relationship activity are displayed as nodes under the request input parameter in the To Activity panel.
16. Create a map between the orchestration variables and the input parameter of the activity.  
*Note:* Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
18. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the SugarCRM Delete Relationship activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

[Feedback](#) | [Notices](#)

## Specifying the Retry options for SugarCRM activities

Specifying the Retry parameters is one of the tasks to configure an SugarCRM activity. The SugarCRM connector uses a single login session for all connections to an SugarCRM endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

### About this task

Use this task to configure the Retry options for SugarCRM activities.

### Procedure

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry and timeout options for connecting to an SugarCRM instance, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the SugarCRM instance.
Try to connect __ times before failing.	Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the SugarCRM instance before issuing an error and stopping the processing of the current orchestration job.  Note: If you deploy an orchestration that contains the SugarCRM activity and the Integration Appliance cannot connect to the specified SugarCRM instance, the Integration Appliance logs the connection errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
Activity Timeout	
Timeout after ____ seconds when the endpoint does not respond to a request.	Specifies the number of seconds the Integration Appliance waits before timing out, when the endpoint does not respond to a request. The default is 300 seconds.

## Creating and editing a SugarCRM REST API endpoint

---

SugarCRM Rest API endpoints contain the connection information that studio and the Integration Appliance use to connect to the SugarCRM Server via Rest API. You can create multiple endpoints that refer to separate instances.

### About this task

---

Use this task to create or edit a SugarCRM Rest API endpoint.

Note:

Any changes you make to the SugarCRM Rest API endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

### Procedure

---

1. Drag an activity from the SugarCRM folder under the Activities tab to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. Browse - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick

- Endpoint panel.
- New - To create a new endpoint. The Create Endpoint window opens.
  - Edit - To edit the existing endpoint. The Edit Endpoint window opens.
- Complete the fields defined in the following table:
- Table 1. Connection Details**
- | <b>Field Name</b>  | <b>Description</b>  |
|--------------------|---|
| Connection Details |   |
| SugarCRM REST URL  | Specify the REST API URL of your SugarCRM Rest API instance. For example, <code>https://&lt;sugar-server&gt;/&lt;sugar-path&gt;/rest/v10</code> |
| User Name          | Specifies the user name of the SugarCRM Rest API to connect to the SugarCRM server.   |
| Password           | Specifies the password associated with the user name to connect to the SugarCRM server.   |
| Client ID          | Indicates the client ID of SugarCRM to get the OAuth token.   |
| Client Secret      | Indicates the client secret of SugarCRM to get the OAuth token.   |
- When finished, click Test Connection to confirm that you can connect to the SugarCRM system via REST API using OAuth tokens.
  - Click OK.

## Using the SugarCRM REST API Get UserInfo activity

Use the SugarCRM REST API Get UserInfo activity to retrieve user information such as `userId`, `userTeamId`, and so on from the SugarCRM server.

### About this task

Use this task to retrieve user information such as such as `userId`, `userTeamId`, and so on from the SugarCRM server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

- In an active orchestration, open the Activities tab and expand the SugarCRM REST API folder contents.
- Drag the Get UserInfo activity icon onto the orchestration. The SugarCRM REST API Get UserInfo Checklist is displayed.
- In the Checklist, click Summary.
- Review the contents of the Activity Name field, and make the required changes.
- In the Checklist, click Pick Endpoint.
- Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM REST API endpoint.
- Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
 Note: For more information, see [Creating and editing a SugarCRM REST API endpoint](#).
- To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
- Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get UserInfo activity are displayed as nodes under the request input parameter in the To Activity panel.
- Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
- Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the SugarCRM REST API Get UserInfo activity.

9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get Reports activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the SugarCRM REST API Get Reports activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

## Using the SugarCRM REST API Create Object activity

---

Use the SugarCRM REST API Create Object activity to create objects in the SugarCRM REST API instance.

## About this task

---

Use this task to create objects in the SugarCRM REST API instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the SugarCRM REST API folder contents.
2. Drag the Create Object activity icon onto the orchestration. The SugarCRM REST API Create Object Checklist is displayed.

3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM REST API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a SugarCRM REST API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse SugarCRM REST API window is displayed.
11. In Browse SugarCRM REST API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for SugarCRM REST API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Upsert Object activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the SugarCRM REST API Create Object activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

## Using the SugarCRM REST API Search activity

---

Use the SugarCRM REST API Search activity to search for objects from specified records. This activity searches for details based on a query.

### About this task

---

Use this task to search for objects from specified records. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the SugarCRM REST API folder contents.
2. Drag the Search activity icon onto the orchestration. The SugarCRM REST API Search Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM REST API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a SugarCRM REST API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Search activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a

mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the SugarCRM REST API Search activity.

## Specifying the Retry options for SugarCRM REST API activities

---

Specifying the Retry parameters is one of the tasks to configure a SugarCRM REST API activity. The SugarCRM REST API connector uses a single login session for all connections to an SugarCRM REST API endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

### About this task

---

Use this task to configure the Retry options for SugarCRM REST API activities.

### Procedure

---

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry and timeout options for connecting to an SugarCRM instance, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the SugarCRM instance.
Try to connect __ times before failing.	Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the SugarCRM instance before issuing an error and stopping the processing of the current orchestration job.  Note: If you deploy an orchestration that contains the SugarCRM REST API activity and the Integration Appliance cannot connect to the specified SugarCRM instance, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
Activity Timeout	

Retry Fields	Description
Timeout after _____ seconds when the endpoint does not respond to a request.	Specifies the number of seconds the Integration Appliance waits before timing out, when the endpoint does not respond to a request. The default is 300 seconds.

## Taleo activities

- [Creating and editing a Taleo endpoint](#)  
Taleo endpoints contain the connection information that Studio and the Integration Appliance use to connect to the Taleo HR Community, Resources, Application, and Recruitment database. You can create multiple endpoints that refer to separate instances.
- [Using the Taleo Create Attachments activity](#)  
Use the Taleo Create Attachments activity to create appended files associated with an object. For example, creating interview letters and appointment orders for a candidate in the Taleo server.
- [Using the Taleo Create Objects activity](#)  
Use the Taleo Create Objects activity to create objects such as Employee, Task, Calendar Event, Account, Candidate, Contact, Interview, Requisition, and User in the Taleo server.
- [Using the Taleo Get Objects activity](#)  
Use the Taleo Get Objects activity to get objects such as Employee, Task, Calendar Event, Account, Candidate, Contact, Interview, Requisition, and User from the Taleo server.
- [Using the Taleo Search Objects activity](#)  
Use the Taleo Search Objects activity to search for objects based on the search value entered in the field name, in the Taleo server.
- [Using the Taleo Delete Objects activity](#)  
Use the Taleo Objects activity to delete objects such as Employee, Task, Calendar Event, Account, Candidate, Contact, Interview, Requisition, and User from the Taleo server.
- [Using the Taleo Set Associated Users activity](#)  
Use the Taleo Set Associated Users activity to set an association with specific users and requisitions, in the Taleo server. Requisitions contain details of all the job openings that you want to track in Taleo.
- [Using the Taleo Set Binary Resume activity](#)  
Use the Taleo Set Binary Resume activity to append resumes in a binary format (Word, PDF, and so on) to Candidate IDs in the Taleo server.
- [Using the Taleo Submit Candidates activity](#)  
Use the Taleo Submit Candidates activity to submit candidates (Candidate ID) who are either applicants, employee referrals, sourced prospects, or agency submissions, for requisitions (job openings) in the Taleo server.
- [Using the Taleo Update Attachments activity](#)  
Use the Taleo Update Attachments activity to update attachments associated with Candidates in the Taleo server. The update request replaces the existing attachment file.
- [Using the Taleo Update Objects activity](#)  
Use the Taleo Update Objects activity to update objects such as Employee, Task, Calendar Event, Account, Candidate, Contact, Interview, Requisition, and User in the Taleo server.
- [Using the Taleo Upsert Objects activity](#)  
Use the Taleo Upsert Objects activity to insert or update employee records in the Taleo server.

- [Specifying retry parameters for Taleo activities](#)

Specifying the retry parameters is one of the tasks you must complete to configure a Taleo activity.

## Creating and editing a Taleo endpoint

---

Taleo endpoints contain the connection information that Studio and the Integration Appliance use to connect to the Taleo HR Community, Resources, Application, and Recruitment database. You can create multiple endpoints that refer to separate instances.

### About this task

---

Use this task to create or edit a Taleo endpoint. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Note:

Any changes you make to the Taleo endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

To create and edit a Taleo endpoint, complete the following steps:

### Procedure

---

1. Drag an activity from the Taleo folder under the Activities tab, to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. **Browse** - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
  - b. **New** - To create a new endpoint. The Create Endpoint window opens.
  - c. **Edit** - To edit the existing endpoint. The Edit Endpoint window opens.
4. In the Create Endpoint window, complete the fields defined in the following table:

Table 1. Connection details

Field Name	Description
<b>Connection Details</b>	
Instance Name	Specifies the name of the Taleo instance.
User Name	Specifies the user name to connect to the Taleo server.
Password	Specifies the password associated with the user name to connect to the Taleo server.

5. When finished, click Test Connection to confirm that you can connect to the Taleo system.
6. Click OK.

### Results

---

You have created or edited a Taleo endpoint.

**Parent topic:** [Taleo activities](#)

---

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Taleo\\_creating\\_an\\_endpoint\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Taleo_creating_an_endpoint_activity.html)

## Using the Taleo Create Attachments activity

---

Use the Taleo Create Attachments activity to create appended files associated with an object. For example, creating interview letters and appointment orders for a candidate in the Taleo server.

### About this task

---

Use this task to create attachments in the Taleo server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Taleo Create Attachments activity, complete the following steps:

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Taleo folder contents.
2. Drag the Create Attachments activity icon onto the orchestration. The Taleo Create Attachments Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Taleo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Taleo endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Attachments activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the Taleo Create Attachments activity.

**Parent topic:** [Taleo activities](#)

## Using the Taleo Create Objects activity

---

Use the Taleo Create Objects activity to create objects such as Employee, Task, Calendar Event, Account, Candidate, Contact, Interview, Requisition, and User in the Taleo server.

### About this task

---

Use this task to create objects in the Taleo server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Taleo Create Objects activity, complete the following steps:

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Taleo folder contents.
2. Drag the Create Objects activity icon onto the orchestration. The Taleo Create Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Taleo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Taleo endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Taleo window is displayed.
11. In Browse Taleo, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for Taleo activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Taleo Create Objects activity.

## Using the Taleo Get Objects activity

---

Use the Taleo Get Objects activity to get objects such as Employee, Task, Calendar Event, Account, Candidate, Contact, Interview, Requisition, and User from the Taleo server.

### About this task

---

Use this task to get objects from the Taleo server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure Taleo Get Objects, complete the following steps:

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Taleo folder contents.
2. Drag the Get Objects activity icon onto the orchestration. The Taleo Get Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Taleo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Taleo endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Taleo window is displayed.
11. In Browse Taleo, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for Taleo activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Taleo Get Objects activity.

## Using the Taleo Search Objects activity

---

Use the Taleo Search Objects activity to search for objects based on the search value entered in the field name, in the Taleo server.

### About this task

---

Use this task to search for objects in the Taleo server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Taleo Search Objects activity, complete the following steps:

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Taleo folder contents.
2. Drag the Search Objects activity icon onto the orchestration. The Taleo Search Objects Checklist is displayed.

3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Taleo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Taleo endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Search Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

## Results

## Using the Taleo Delete Objects activity

---

Use the Taleo Objects activity to delete objects such as Employee, Task, Calendar Event, Account, Candidate, Contact, Interview, Requisition, and User from the Taleo server.

### About this task

---

Use this task to delete objects from the Taleo server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Taleo Delete Objects activity, complete the following steps:

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Taleo folder contents.
2. Drag the Delete Objects activity icon onto the orchestration. The Taleo Delete Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Taleo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Taleo endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Taleo window is displayed.

11. In Browse Taleo, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for Taleo activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Delete Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.

## Using the Taleo Set Associated Users activity

---

Use the Taleo Set Associated Users activity to set an association with specific users and requisitions, in the Taleo server. Requisitions contain details of all the job openings that you want to track in Taleo.

### About this task

---

Use this task to set an association with users and requisitions. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Taleo Set Associated Users activity, complete the following steps:

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Taleo folder contents.
2. Drag the Set Associated Users activity icon onto the orchestration. The Taleo Set Associated Users Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Taleo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Taleo endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Set Associated Users activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a

mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Taleo Set Associated Users activity.

## Using the Taleo Set Binary Resume activity

---

Use the Taleo Set Binary Resume activity to append resumes in a binary format (Word, PDF, and so on) to Candidate IDs in the Taleo server.

### About this task

---

Use this task to append binary resumes to Candidate IDs in the Taleo server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Taleo Set Binary Resume activity, complete the following steps:

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Taleo folder contents.
2. Drag the Set Binary Resumes activity icon onto the orchestration. The Taleo Set Binary Resumes Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Taleo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Taleo endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Set Binary Resumes activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Taleo Set Binary Resumes activity.

## Using the Taleo Submit Candidates activity

---

Use the Taleo Submit Candidates activity to submit candidates (Candidate ID) who are either applicants, employee referrals, sourced prospects, or agency submissions, for requisitions (job openings) in the Taleo server.

### About this task

---

Use this task to submit candidates in the Taleo server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Taleo Submit Candidates activity, complete the following steps:

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Taleo folder contents.
2. Drag the Submit Candidates activity icon onto the orchestration. The Taleo Submit Candidates Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Taleo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Taleo endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Submit Candidates activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

### Results

## Using the Taleo Upsert Objects activity

---

Use the Taleo Upsert Objects activity to insert or update employee records in the Taleo server.

### About this task

---

Use this task to insert or update employee records in the Taleo server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Taleo Upsert Objects activity, complete the following steps:

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Taleo folder contents.
2. Drag the Upsert Objects activity icon onto the orchestration. The Taleo Upsert Objects Checklist is displayed.

3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Taleo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Taleo endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Taleo window is displayed.
11. In Browse Taleo, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for Taleo activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Upsert Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Specifying retry parameters for Taleo activities

---

Specifying the retry parameters is one of the tasks you must complete to configure a Taleo activity.

### About this task

---

The Taleo connector connects to the Taleo application to execute the activities. If a connection is lost or timed out, the connector automatically establishes a new connection based on the parameters described in Table 1. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

For more information about the configuration tasks in the Checklist, see the help topic for the specific Taleo activity.

To specify the retry parameters, complete the following steps:

### Procedure

---

1. In the Checklist, select Retry. The Retry panel is displayed.
2. Configure the retry options for connecting to a Taleo application.

The following table describes the retry options for connecting to a Taleo application:

Table 1. Retry options

Retry Fields	Description
Wait __ second(s) between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Taleo application. By default, this parameter is set to 30 seconds.
Try to connect __ times before failing.	Specifies the maximum number of times that the Integration Appliance attempts to establish a connection to the Taleo application before issuing an error and stopping the processing of the current orchestration job. By default this parameter is set to 5 attempts.
<b>Activity Timeout</b>	
Time out after __ second(s) when the endpoint does not respond to a request.	Specifies the number of seconds the Integration Appliance waits before timing out, when the endpoint does not respond to a request. The default is 300 seconds.

## Results

---

You have configured the retry parameters for Taleo activities.

## Web Services Activities

---

- [Creating or Editing a Web Services Endpoint](#)

You can define two types of Web Services endpoints.

- [Updating a Changed WSDL](#)

If you created a project that uses a WSDL and the WSDL changes, you can attempt to update the existing WSDL with the new WSDL.

- [Web Services Invoke Service Activity](#)

During run time, the Web Services **Invoke Service** activity starts an outside Web Service.

- [Compression/Decompression with the Web Services Invoke Service Activity](#)

During run time, the Web Services Invoke Service activity sends a HTTP request complaint with the HTTP/HTTPS 1.1 protocol to the Web Service. The Invoke Service activity supports compression with the gzip format only and decompression with the gzip or the deflate formats.

- [Web Services Provide Service Activity](#)

During run time the Provide Service activity provides a Web Service that can be started from an outside client.

- [Decompression with the Web Services Provide Service Activity](#)

The Web Services Provide Service activity supports decompression with the gzip format only.

- [Web Services Send Reply Activity](#)

During run time, the Send Reply activity returns a response for a Provide Service activity.

- [Web Services Send Reply with Fault Activity](#)

During run time, the Send Reply with Fault activity returns a fault to the calling orchestration. This activity provides SOAP functionality as a reply configuration option.

- [Compression with the Web Services Send Reply Activity](#)

During run time, the Web Services Send Reply activity sends an HTTP response complaint with the HTTP/HTTPS 1.0 protocol to the client. The Send Reply activity supports compression with the gzip format only.

- [Troubleshooting and support](#)

Troubleshooting techniques and self-help information help you identify and solve problems quickly. Here, you can find potential solutions for issues you would have with the Web Services connector.

## Creating or Editing a Web Services Endpoint

---

You can define two types of Web Services endpoints.

### About this task

---

For the **Invoke Service** activity - the endpoint defines the remote Web Service server and service that is started during run time.

For the **Provide Service** activity - the endpoint defines the port number and the path of the service provided by the Integration Appliance.

- [Creating or editing an endpoint for an Invoke Service activity](#)  
Create or edit a Web Service endpoint for a **Invoke Service** activity.
- [Creating or editing an endpoint for a Provide Service activity](#)  
Create or edit a Web Service endpoint for a Provide Service activity.

**Parent topic:** [Web Services Activities](#)

Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_creating\\_an\\_endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_creating_an_endpoint.html)

## Creating or editing an endpoint for an Invoke Service activity

---

Create or edit a Web Service endpoint for a **Invoke Service** activity.

### Procedure

---

1. In the Create Endpoint or Edit Endpoint pane, select the Remote Server option and click Browse. The Project Explorer displays.
2. In the Project Explorer pane, you can select one of the following options to select a WSDL file:
  - In the Project Explorer pane, select an existing WSDL file that has already been [uploaded into the project](#).
  - Select a WSDL file from the file system: Click Add. In the Add dialog box, browse for the WSDL file and click Add.
  - Download a WSDL file from a URL: Click Add URL. In the Add field, enter the URL of the WSDL to download. Click OK.

Note:

- The WSDL file you select must be compatible with the WSDL 1.1 and WS-I Basic Profile 1.1 specifications.
- While editing an existing Web Service endpoint that is referenced by an Invoke Service activity, if you select a different WSDL for the endpoint, you must select the appropriate operation in the Configure task of the [Web Services Invoke Service Activity](#). Â

The WSDL Name, Service, Port, and Location fields display with the values specified in the WSDL file as described in the following list:

WSDL Name

**XML element in the WSDL file that defines this field:**

```
<definitions targetNamespace="http://www.acme.com/wsdl/hello.wsdl"
  xmlns="http://schemas.xmlsoap.org/wsdl/"
  xmlns:tns="http://www.acme.com/wsdl/hello.wsdl"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema">
  <wsdl:service name="HelloService">
    <wsdl:port name="HelloPort" binding="tns:HelloBinding">
      <wsdl:operation name="sayHello">
        <wsdl:input message="tns:sayHelloRequest"/>
        <wsdl:output message="tns:sayHelloResponse"/>
      </wsdl:operation>
    </wsdl:port>
  </wsdl:service>
</definitions>
```

**Description:** Specifies the name of the Web Service and the namespaces used in the WSDL. In addition, the definitions element is the root element for the rest of the elements that define the Web Service. These other elements are contained within the </definitions> elements in WSDL.

#### Service

##### **XML element in the WSDL file that defines this field:**

```
<service name="HelloWorld">
  <port name="HelloWorld" binding="s0:HelloWorld">
    <soap:address location="http://localhost:7001/WS/HelloWorld.jws"/>
  </port>
</service>
```

**Description:** Specifies the name of the service. In the WSDL, the service element contains the port and location elements that define the location of the service. One or more services can be defined in a WSDL. If more than one service is defined, you can select a service by selecting the menu in the Service field of the endpoint pane.

#### Port

##### **XML element in the WSDL file that defines this field:**

```
<port name="HelloWorld" binding="s0:HelloWorld">
  <soap:address location="http://localhost:7001/WS/HelloWorld.jws"/>
</port>
```

**Description:** Specifies the binding of the service. One or more ports can be defined per service in a WSDL. If more than one port is defined for the service, you can select a port by selecting the menu in the Port field of the endpoint pane.

#### Location

##### **XML element in the WSDL file that defines this field:**

```
<soap:address location="http://localhost:7001/WS/HelloWorld.jws"/>
```

**Description:** Specifies the address for starting the specified service. Typically this is the URL for starting the Soap service.

3. Select a service from the Service list. See the previous table for details.

4. Select a port from the Port list. See the previous table for details.

5. Choose a Login option and specify settings described in the following table as needed.

Note: These options are only available when you select the Remote Server Location option.

Table 1. Login options

Option/Fiel d Name	Description
Log into the Server as an Anonymous User	Select this option to connect to the server anonymously. No user account information is required.
Log into the Server with User Name and Password	Select this option to connect to the server using a user account. When you select this option, you must choose an authentication mode and specify a user name and password.
Authenticati on	Allows you to select the type of authentication that the Integration Appliance uses when connecting to a remote server. From the list, select one of the following authentication modes: <ul style="list-style-type: none"> <li>o Basic - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure. Note: If the Remote Server is Cast Iron Live web service provider, then use the IBM ID credential for basic authentication.</li> <li>o Digest - Encrypts the user name and password you specify before sending the user name and password to the server. This authentication option is more secure than Basic authentication.</li> <li>o NTLM - Requires an instance of NTCredentials to be available for the domain name of the server. This authentication is the most secure authentication option. When you choose the NTLM authentication option, the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server. Note: Do not prefix the user name with the domain.</li> </ul>

Option/Field Name	Description
Realm/Domain	<ul style="list-style-type: none"> <li>o If you select the Basic or Digest authentication option, you can specify a realm. When you do not specify a realm, the activity authenticates to 'any realm'.</li> <li>o If you select the NTLM authentication option, you must specify a domain. If you do not specify a domain, the endpoint configuration is not valid and an error occurs.</li> </ul>
User Name	Specifies the User Name for the account used to connect to the Server.
Password	Specifies the Password for the account used to connect to the HTTP Server.

6. Specify security options.

When client authentication is required, select the Client Certificate Alias Name check box to specify that the Integration Appliance acting as a client should provide a certificate to the HTTP Server. If selected, the name of the certificate must be provided. A certificate specified at the activity level with this check box takes precedence over a certificate specified on the **Security-> Certificates-> Settings-> Client SSL** entry in the WMC.

Select the **Protocol Version** used for secure HTTP over SSL. By default, the protocol version used is **SSL\_TLSv2**.

7. For the Connection Pool Options, specify the maximum number of connections.

This value specifies the maximum number of connections that the Integration Appliance has open in the connection pool. By default, the Integration Appliance can have 25 connections open.

8. Specify the Connection Timeout. The connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. For a Web Services activity, the amount of time the Integration Appliance attempts to establish a connection to the Web Service before timing out. A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the Endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an Endpoint and the time it takes the Endpoint to respond. You set the activity timeout in Retry task of the [Web Services Invoke Service Activity](#).

9. Optional - To connect the Web Service through a proxy server, select the Connect via a Proxy Server check box and specify the fields defined in the following table:

Figure 1. Web Service options

Table 2.

Field name in Endpoint pane	Description	Required or Optional?
Host Name	Specifies the hostname of the proxy server.	Required
Port	Specifies the port number to use to connect to the proxy server.	Required
User Name	Specifies the username to use for proxy server authentication.	Optional - If your proxy server does not require authentication
Password	Specifies the password to use for proxy server authentication.	Optional - If your proxy server does not require authentication

**Parent topic:** [Creating or Editing a Web Services Endpoint](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_creating\\_for\\_invoke\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_creating_for_invoke_activity.html)

## Creating or editing an endpoint for a Provide Service activity

Create or edit a Web Service endpoint for a Provide Service activity.

## Procedure

---

1. In the Create Endpoint or Edit Endpoint pane, select the Provide option and configure the relevant fields.  
Note: Changing the configuration properties of an endpoint affects all of the orchestrations that use that endpoint in the project. These changes are global, not local.

2.

### Transport

Select one of the following transport options:

- HTTP : Select this option if the Web Service provide project is to be deployed on an Integration Appliance .
- Cast Iron Cloud : Select this option if the Web Service provide project is to be deployed on Cast Iron Live.
- Local : Select this option if this orchestration is called locally by other orchestrations. It can be used in Studio and on an Integration Appliance.

### Port

Specifies the port number to communicate with the Integration Appliance acting as the Web Service.

CAUTION:

This port number is different to the port name specified in the WSDL.

### Path

The path string specified in this field is added to the URL of the Integration Appliance to form the location element of the generated WSDL. For example, if your Integration Appliance is named: myAR.myCompany.com and the string specified in the Path field is /services/myservice/1.0, the resulting location element in the WSDL file is equal to the following string: http://myAR.myCompany.com/services/myservice/1.0

### Login

- Select the Log into the Server as an Anonymous User option to connect to the endpoint server anonymously (where a user account is not required).
- Select the Log into the Server with User Name and Password option connect to the endpoint server using a user account. Specify the User Name and Password.
- Select the type of Authentication to authenticate with the remote server.
  - **Basic** - Sends the user name and password you specify, base64 encoded as part of the HTTP Authorization header to the server.
- Specify the Realm.
- Specify the User Name for the account used to connect to the endpoint server.
- Specify the Password for the account used to connect to the endpoint server.

### Security

- Select the None option if no security is required.
- Select the HTTPS option to enable secure Web Service over SSL. Â
  - Available for the HTTP transport option only. When server authentication is required, select the Server Certificate Alias Name check box to specify that the Integration Appliance acting as a server provides a certificate to the client. This certificate is used by the client for authentication and encryption. If this check box is selected, the name of the certificate must be provided. A certificate specified at the activity level with this check box, takes precedence over certificates specified on the Security > Certificates > Settings > Server SSL over data NIC entry in the WMC.
- Select the Protocol Version used for secure HTTP over SSL. By default, the protocol version used is SSL\_TLSSv2.

### Connection Pool Options

The Maximum Connections parameter specifies the maximum number of connections that the Integration Appliance can open in the connection pool. By default, the Integration Appliance can have 25 connections open.

Note: For some of the fields in the endpoint, you can define configuration properties to supply the values for these fields. The  icon displays when you click in a field that supports a configuration property and a configuration property of the same type is already configured for the project.

# Updating a Changed WSDL

If you created a project that uses a WSDL and the WSDL changes, you can attempt to update the existing WSDL with the new WSDL.

## About this task

Updating a WSDL means that any entities that interface with the WSDL might be affected by the change. For example, the WSDL defines the input and output parameters of the operation and if the schema that defines these parameters changes in the new WSDL, the nodes that represent these parameters in the **Map Inputs** and **Map Outputs** tasks of the Web Services activities might no longer exist and any links to these nodes are no longer valid. You must recreate the links in order for the orchestration to be valid again.

Updating a WSDL might require other changes to the project besides recreating links, for details see Table 1. In some cases, the new WSDL is not loaded as described in the first three rows in the following table.

Note: Updating an existing WSDL is different from loading multiple WSDLs into a project by either dragging a file into the Project tab or right-clicking on the WSDL folder in the Project tab and selecting Add Document. Updating a WSDL replaces the existing WSDL in the project, while uploading the same file into the Project tab creates two instances of the WSDL in the project.

Table 1.

Change in WSDL	New WS DL replaces the initial WSDL?	How is the project affected?
New WSDL is not a valid WSDL. For example the final <code>&lt;/definitions&gt;</code> tag is missing at the end of the WSDL.	No, the update does not occur	None, the new WSDL is not loaded. No updates occur to any of the project entities.
Uploading the new WSDL to replace the existing one, would result in an invalid project.	No, the update does not occur	None, the new WSDL is not loaded. No updates occur to any of the project entities.
Attempt to update the current WSDL with a different WSDL and an orchestration or an endpoint in the project refers to the current WSDL. Note: You can load multiple WSDLs into a project.	No, the update does not occur	None, the new WSDL is not loaded. No updates occur to any of the project entities.
The Service Binding definition of the WSDL is defined by the service, port, and location elements. If the values of the service, port and location elements in the WSDL change, the values for these elements that are stored in the Web Service endpoint must be updated.	Yes, update occurs	The values in the Web Service endpoint are updated with the newest values specified in the WSDL. For details about these elements, see <a href="#">Creating or Editing a Web Services Endpoint</a> .

Change in WSDL	New WS DL replaces the initial WS DL?	How is the project affected?
The name of an operation changes in the WSDL and the orchestration is starting that operation in an <b>Invoke Service</b> activity.	Yes, update occurs	If the name of the operation changes and the operation is used by the <b>Invoke Service</b> activity, the first operation in the WSDL is by default assigned to the <b>Invoke Service</b> activity. This reassigning to the first operation might not be the wanted result. The input and output parameters of the first operation in the WSDL might be different than the operation originally specified and therefore the links might no longer exist in the <b>Map Inputs</b> and <b>Map Outputs</b> tasks. You must configure the <b>Invoke Service</b> activity again for the orchestration to be valid.
The name of one of the operations changes in the WSDL but the orchestration is not starting that operation in any <b>Invoke Service</b> activities.	Yes, update occurs	If the name of the operation changes and that operation is not used any <b>Invoke Service</b> activities, this change to the WSDL has no affect.
<p>Additional <i>&lt;part&gt;</i> elements are added to the elements that define the input or output parameters of the operation. This change affects any project entity that references this part of the WSDL. The following is a list of possible affected entities:</p> <ul style="list-style-type: none"> <li>• Standalone Maps</li> <li>• <b>Map Variables</b> activity</li> <li>• Variables based on this part of the WSDL</li> <li>• An orchestration that contains an <b>Invoke Service</b> activity which starts an operation that uses this message type. For example, to the following example <i>&lt;message&gt;</i> element</li> </ul> <p>For example, see <a href="#">Figure 1</a>.</p>	Yes, update occurs	Since new <i>&lt;part&gt;</i> elements have only been added to the <i>&lt;message&gt;</i> element, typically this change has no affect on the existing maps and variables based on the WSDL. For the <i>&lt;HelloIn&gt;</i> message example, adding the new city element has no affect on links to the existing address <i>&lt;part&gt;</i> element in the <b>Map Inputs</b> or <b>Map Outputs</b> tasks of the <b>Invoke Service</b> activity. If required, you can create links to the new element.
<p>Change the type of a <i>&lt;part&gt;</i> element in a <i>&lt;message&gt;</i> element that define the input and output parameters of the operation. This change affects any project entity that references this part of the WSDL. The following is a list of possible affected entities:</p> <ul style="list-style-type: none"> <li>• Standalone Maps</li> <li>• <b>Map Variables</b> activity</li> <li>• Variables based on this part of the WSDL</li> <li>• An orchestration that contains an <b>Invoke Service</b> activity which starts an operation that uses this message type.</li> </ul>	Yes, update occurs	<p>Any existing links in the maps are not removed even though the type might have changed.</p> <p><b>CAUTION:</b></p> <p>The type change might have run time impact, resulting in potentially bad output data. Check that any type conversions done in the links of maps do not result in bad output data being returned at run time.</p>

Change in WSDL	New WS DL replaces the initial WS DL?	How is the project affected?
<p>Change the <code>&lt;message&gt;</code> element of the input or output parameter of the operation.</p> <p>This change affects any project entity that references this part of the WSDL. The following is a list of possible affected entities:</p> <ul style="list-style-type: none"> <li>• Standalone Maps</li> <li>• <b>Map Variables</b> activity</li> <li>• Variables based on this part of the WSDL</li> <li>• An orchestration that contains an <b>Invoke Service</b> activity which starts an operation that uses this message type.</li> </ul>	Yes, update occurs	<p>Links to the input or output parameter that has changed in the map are removed. You must create links to the changed parameter in maps. For example, if the <code>&lt;message&gt;</code> element changes for the input parameter of the operation called by an <b>Invoke Service</b> activity, the links to the nodes in the <b>Map Inputs</b> task of the <b>Invoke Service</b> activity are removed. You must create links from variables to the new set of nodes that show in the To Activity pane of the <b>Map Inputs</b> task.</p>

Figure 1. Additional `<part>` elements example

```

<message name="HelloIn">
  <part name="address" type="xsd:string">
</message>
Add the following additional <part> element
<message name="HelloIn">
<part name="address" type="xsd:string">
<part name="city" type="xsd:string">
</message>

```

- **Updating a changed WSDL**

To update a WSDL, start the upgrade WSDL process using one of the following options:

**Parent topic:** [Web Services Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_updating\\_a\\_changed\\_WSDL\\_ov.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_updating_a_changed_WSDL_ov.html)

## Updating a changed WSDL

To update a WSDL, start the upgrade WSDL process using one of the following options:

### Procedure

1. Use one of the following options to start the upgrade:
  - o Double click an existing WSDL in the WSDLs folder of the Project tab. A WSDL tab displays with a graphical view of the WSDL. Drag a WSDL file from the local file system onto the WSDL open in the WSDL tab.

- o Double click an existing WSDL in the WSDLs folder of the Project tab. A WSDL tab displays with a graphical view of the WSDL. Click on a node of the WSDL in the WSDL tab. Select the File > Update WSDL or XML Schema option from Studio toolbar menu. The Update the Current WSDL Document dialog box displays. In the Location field, [specify the location of the new WSDL from an external web location or from the file system](#) and click OK.
- o Double click an existing WSDL in the WSDLs folder of the Project tab. A WSDL tab displays with a graphical view of the WSDL. Right-click a node in the WSDL tab and from the menu and select the Update option. The Update the Current WSDL Document dialog box displays. In the Location field, [specify the location of the new WSDL from an external web location or from the file system](#) and click OK.
- o Right-click an existing WSDL in the WSDLs folder of the Project tab and from the menu select the Update option. The Update the Current WSDL Document dialog box displays. In the Location field, [specify the location of the new WSDL from an external web location or from the file system](#) and click OK.

The Updating the WSDL Affects the Listed Dependant Project Entities dialog box displays and project entities that are affected by the replacement of the original WSDL with the new WSDL are listed.

2. Optional - In the dialog box, click any of the listed dependant entities to view the entity in Studio.
3. Click Update. Studio attempts to update the project with the new WSDL and the result of the attempted update depends on the following conditions:
  - o If any of the changes in the WSDL would result in a corrupt project after the update or the new WSDL is invalid, an Error dialog box displays describing the problem with the WSDL. Click OK and click Close. The update is canceled, the WSDL reverts to the original WSDL, and the project is not changed.
  - o If none of the changes to the WSDL would result in a corrupt project, the update occurs and the original WSDL is replaced by the new WSDL. Some of the project entities might be invalid after the update and could require clean up.
  - o Click Close.

## Web Services Invoke Service Activity

During run time, the Web Services **Invoke Service** activity starts an outside Web Service.

### About this task

The Web Services connection activity is a single-operation activity. It connects to a single service on a single portType in a Web Service. If you specify a WSDL containing more than one operation, select which operation the activity should start.  
Note: Web Services Basic Profile 1.1 2nd Edition is supported. SOAP encoding arrays are not supported in the Web Services Basic Profile 1.1.

By default, compression and decompression are enabled for the **Invoke Service** activity. For more information, see Compression/Decompression with the Web Services **Invoke Service** activity.

The steps for adding and configuring an **Invoke Service** activity to an orchestration are described in the following procedures:

- [Adding an activity](#)  
Add a Web Services **Invoke Service** activity in the orchestration.
- [Creating an endpoint](#)  
Create, select, or edit a Web Services endpoint.
- [Configuring the activity](#)  
Configure the **Invoke Service** activity.
- [Specifying the retry options](#)  
Specify the retry options for the **Invoke Service** activity.
- [Mapping the inputs of the activity](#)  
Map the inputs of the **Invoke Service** activity.
- [Mapping the outputs of the activity](#)  
Map the output of the **Invoke Service** activity.
- [Invoking an Orchestration with Web Services Provide Service Starter Activity](#)  
Invoke Service tool enables in house invocation of an orchestration with Web Services Provide Activity.

## Adding an activity

---

Add a Web Services **Invoke Service** activity in the orchestration.

### Procedure

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration displays.
2. Select the Activities tab and expand the Web Services folder.
3. Drag the Invoke Service activity onto the orchestration.
4. Select the activity. The Checklist is displayed.

## Creating an endpoint

---

Create, select, or edit a Web Services endpoint.

## Procedure

---

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:
  - Select an existing endpoint:
    - a. Select Browse. The Project Explorer displays.
    - b. Select an existing endpoint and click OK. Skip to the[Configuring the activity](#) procedure.
  - Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer displays.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane displays.
  - Create a new endpoint: Select New. The Create Endpoint pane displays.
2. [Create or edit a Web Services endpoint.](#)

## Configuring the activity

---

Configure the **Invoke Service** activity.

## Procedure

---

1. Select the Configure task from the Checklist. The Configure pane is displayed.
2. Select a single operation to start on the Web Service.
3. The Use Compression/Decompression check box specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is selected. Clear the Use Compression/Decompression check box to disable compression and decompression for this activity. For more information, see [Compression/Decompression with the Web Services Invoke Service Activity](#).
4. The Message Transmission Optimization Mechanism (MTOM) when checked specifies using MTOM to efficiently send SOAP messages containing binary data.

**Parent topic:** [Web Services Invoke Service Activity](#)

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_Invoke\\_Configure\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_Invoke_Configure_Activity.html)

## Specifying the retry options

---

Specify the retry options for the **Invoke Service** activity.

## Procedure

---

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to a Web Service. The following table describes the retry options for connecting to a Web Service:

Field	Description
-------	-------------

Retry	Â
Wait --- second (s) betwee n each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the Web Service.
Try to connec t --- times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the Web Service before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains a Web Services Invoke Service activity and the Integration Appliance cannot connect to the specified Web Service, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job.</p> <p>For example, the retry count is set to 3. The first, second, and third connection errors are shown in the system log as Warnings. The Integration Appliance logs the fourth connection error as an Error and stops processing the current orchestration job.</p>
Time out after --- second s when the Endpoi nt does not respon d to a request . .	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the Web Services Invoke Service, the activity timeout is the amount of time that the Integration Appliance waits for a response from the Web Service after attempting to start the Web Service, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the Endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. Set the connection timeout in Web Services Endpoint tab. For more information about connection timeouts, see <a href="#">Creating or Editing a Web Services Endpoint</a> .

## Mapping the inputs of the activity

---

Map the inputs of the **Invoke Service** activity.

### About this task

---

The XML input parameter for the operation selected in the Configure task is shown beneath the body input parameter listed in the To Activity pane of the Map Inputs task.

To view the optional input parameters called location, header, and httpheaders in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click a node in the Map Inputs pane to make this option active.

You can override the setting of the location element specified in the WSDL using the optional location input parameter. The location element in the WSDL, specifies the URL endpoint. A request to start a Web Services is made to the URL Endpoint.

The schema of the header input parameter is defined by WSDL. The header input parameter is optional because Web Service you start might not require a header.

The following table defines the nodes of the optional httpheaders input parameter.

<b>Nodes of the httpheaders Input Parameter</b>	<b>Description</b>
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/method	Specifies the type of HTTP request.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

Note: If the Content-Length header is explicitly set using the httpheaders/otherHeaders/headerItem/name and httpheaders/otherHeaders/headerItem/value, during run time this value is ignored. This activity automatically sets the Content-Length header to the size of the body.

You can optionally override the settings you specified for the proxy server in the Configure and Pick Endpoint task of the Checklist by providing values for the proxyConnection input parameter dynamically during run time. The following table defines the nodes of the optional proxyConnection input parameter:

<b>Input Parameter Name/Node</b>	<b>Description</b>	<b>Overrides the Setting in Task?</b>
proxyConnection/host	Specifies the hostname of the proxy server.	The host node of the proxyConnection input parameter overrides the Proxy Host Name field of the Web Services Endpoint.
proxyConnection/port	Specifies the port number to use to connect to the proxy server.	The port node of the proxyConnection input parameter overrides the Proxy Port field of the Web Services Endpoint.
proxyConnection/username	Specifies the username to use for proxy server authentication. This field is optional if your proxy server does not require authentication.	The username node of the proxyConnection input parameter overrides the Proxy User Name field of the Web Services Endpoint.
proxyConnection/password	Specifies the password to use for proxy server authentication. This field is optional if your proxy server does not require authentication.	The password node of the proxyConnection input parameter overrides the Proxy Password field of the Web Services Endpoint.

## Mapping the outputs of the activity

---

Map the output of the **Invoke Service** activity.

### Procedure

---

- Select the Map Outputs task in the Checklist. The output parameters of the activity display in the From Activity pane of the Map Outputs task as described in the following table.

Output Parameter	Description
body	Contains the body of the response from the Web Service. The nodes that defines the return parameter or parameters of the Web Service operation displays under the body output parameter.
header	Contains the header of the SOAP Envelope.
httpheaders	Contains the header of the HTTP response.

The following table defines the nodes of the httpheaders output parameter.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/method	Specifies the type of HTTP response.
httpheaders/otherHeaders/headerItem	Specifies a set of name/value pairs that contain the HTTP parameters of the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so headerItem is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP parameter.

- Map the output nodes of the activity to orchestration variables. See [Creating a Map](#) for general instructions on mapping.

## Invoking an Orchestration with Web Services Provide Service Starter Activity

---

Invoke Service tool enables in house invocation of an orchestration with Web Services Provide Activity.

### About this task

---

Use this task to create/ modify SOAP request based on configured schema for starter Web Services Provide Activity, and then invoke an orchestration that handle responses.

### Procedure

---

To Invoke an Orchestration, complete the following steps:

- Open an orchestration with Web Services Provide Service Starter Activity. A graphical representation of the orchestration is displayed in the Studio Workspace.
- Right-click Provide Service activity and select Invoke Service. The Invoke Service pane is displayed.

3. This pane displays a generated template request message. You can either fill the required details in the template request message or click Open to select a different text request message.
4. Click Save to save the current request message.
5. Click Execute to invoke a web service and hence an orchestration. It also enables you to retest a particular activity with the current request message by saving the request message across the Studio Start up.
6. Click Show Response to view the web service response.  
Note: Click Reset to reset the current request message to the template request message.

**Parent topic:** [Web Services Invoke Service Activity](#)

---

[Feedback](#) | [Notices](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_invoke\\_service.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_invoke_service.html)

## Compression/Decompression with the Web Services Invoke Service Activity

---

During run time, the Web Services Invoke Service activity sends a HTTP request complaint with the HTTP/HTTPS 1.1 protocol to the Web Service. The Invoke Service activity supports compression with the gzip format only and decompression with the gzip or the deflate formats.

Note: The Invoke Service activity does not support the common UNIX file compression format called compress.  
The compression/decompression run-time behavior of the Invoke Service activity is dependant on the following conditions:

- If the Endpoint supports compression/decompression
- Content-Encoding and Accept-Encoding Values at the Message Level
- The setting of the Use Compression/Decompression check box at the activity level

The affect of these conditions on the compression/decompression run-time behavior of the Invoke Service activity are described in the following sections and in the tables provided in the [Run-time Compression/Decompression Behavior](#) section.

### Endpoint Support for Compression/Decompression

---

The Integration Appliance determines whether or not the HTTP Endpoint supports compression when the Integration Appliance sends the first HTTP request in the compressed format to the HTTP Endpoint (the Web Service), if the Web Service returns an error code indicating that Web Service does not support compression or does not support the specified Content-Encoding type, the Integration Appliance resends the first request in uncompressed format and all subsequent requests to this Endpoint are sent in the uncompressed format. In addition, the HTTP response sent by the Web Service is not decompressed when received by Integration Appliance.

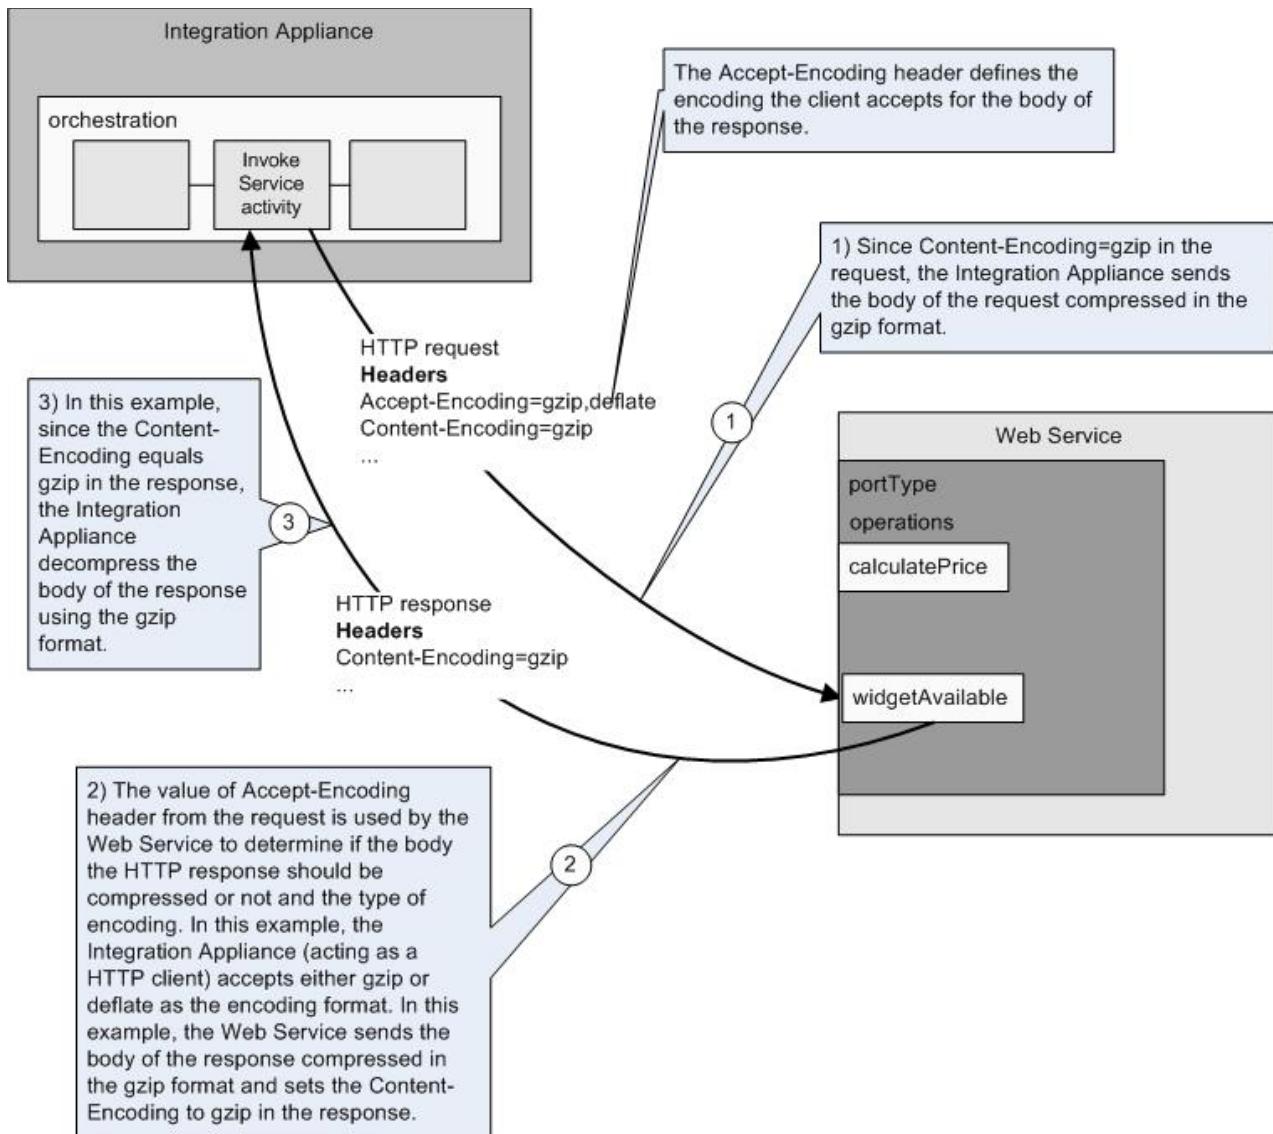

Endpoint support for compression/decompression is represented by the fourth column labeled Endpoint Supports Compression? in the tables provided in the [Run-time Compression/Decompression Behavior](#) section.

### Content-Encoding and Accept-Encoding Values at the Message Level

---

The value of the Content-Encoding header in the HTTP request determines if the body of the request is compressed or not using. For the Invoke Service activity, the Integration Appliance sets the Content-Encoding to gzip and sends the body of the request compressed in the gzip format as shown in the second row of the first table labeled [Compression Behavior When Sending a Request](#) and in the following figure.

The value of the Accept-Encoding header in the request defines the types of encoding that the HTTP client accepts in the response. For the Invoke Service activity, the Integration Appliance sets the Accept-Encoding equal to gzip,deflate in the request and the Web Service sends the body of the response compressed in either the gzip or the deflate format to the Integration Appliance (acting as a client) as shown in the following figure:

The values of the `Accept-Encoding` and `Content-Encoding` headers in the request are used by the Integration Appliance and the Web Service to determine the compression/decompression behavior.

## Setting Compression/Decompression at the Activity Level

By default, compression and decompression are turned on at the activity level for the **Invoke Service activity**. You can turn off compression/decompression at the activity level by clearing the **Use Compression/Decompression** check box. The **Use Compression/Decompression** check box is available in the **Configure** task of the activity. The second column labeled **Use Compression/Decompression** check box in the following tables provided in the **Run-time Compression/Decompression Behavior** section, represents the setting of the **Use Compression/Decompression** check box.

**Deprecation Note:** The **Use Compression/Decompression** check box will be deprecated in a future release. Use the `Content-Encoding` and `Accept-Encoding` HTTP Parameters in the HTTP request to specify how to decompresses the body of the HTTP request and compress the body of the HTTP response.

## Run-time Compression/Decompression Behavior

The first table provided in the [Compression Behavior When Sending a Request](#) section, describes the compression run-time behavior when the Integration Appliance sends a HTTP request to the Web Service.

The second table provided in the [Accept-Encoding Header Value Passed to the Request](#) section, describes the value of the `Accept-Encoding` header passed in the HTTP request.

The third table provided in the [Decompression Behavior When Receiving a Response](#) section, describes the decompression run-time behavior when the Integration Appliance receives the HTTP response from the Web Service.

## Compression Behavior When Sending a Request

The following table describes the compression run-time behavior when the Integration Appliance sends a HTTP request to the Web Service.

Use Compression/Decompression Check Box (Activity Level)	Content-Encoding Value in the HTTP Request (Message Level)	Endpoint Supports Compression?	Integration Appliance Compression Run-Time Behavior When Sending a Request
selected	gzip	yes	The Integration Appliance sends the body of the request compressed in the gzip format. The Content-Encoding header is set to gzip in the request.
selected	value is not significant	no	The Integration Appliance sends the body of the request uncompressed. The Content-Encoding header is set to identity in the request.
cleared	value is not significant	value is not significant	The Integration Appliance sends the body of the request as is (unchanged). The current value of the Content-Encoding header is passed as is in the request

## Accept-Encoding Header Value Passed to the Request

The following table describes the value of the Accept-Encoding header passed in the HTTP request.

Use Compression/ Decompression Check Box (Activity Level)	Initial Accept-Encoding Value	Endpoint Supports Compression?	Accept-Encoding Value Passed in the HTTP Request to the Web Service
selected	gzip,deflate	yes	The Accept-Encoding header is set to gzip,deflate in the request.
value is not significant	value is not significant	no	The current value of the Accept-Encoding header is passed as is in the request.
cleared	value is not significant	value is not significant	The current value of the Accept-Encoding header is passed as is in the request.

## Decompression Behavior When Receiving a Response

The following table describes the decompression run-time behavior when the Integration Appliance receives the HTTP response from the Web Service.

Use Compression/ Decompression Check Box (Activity Level)	Content-Encoding Value in the HTTP Response (Message Level)	Endpoint Supports Compression?	Integration Appliance Decompression Run-Time Behavior When Receiving a Response
selected	gzip	yes	The Integration Appliance decompresses the body of the response using the gzip format.
selected	deflate	yes	The Integration Appliance decompresses the body of the response using the deflate format.
selected	identity	yes	The Integration Appliance does not decompress the body of the response.
selected	value not listed in the Accept-Encoding header	yes	The Integration Appliance logs an error that the response data was received in an unsolicited content encoding type.
selected	value is not significant	no	The Integration Appliance does not decompress the body of the response. The current value of the Content-Encoding header is passed as is in the response.
cleared	value is not significant	value is not significant	The Integration Appliance does not decompress the body of the response. The current value of the Content-Encoding header is passed as is in the response.

Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

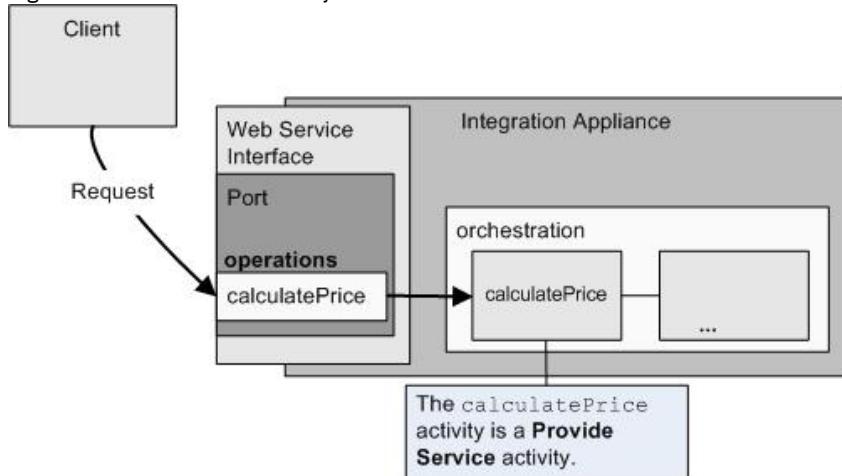

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_Compression\\_Decompression\\_with\\_the\\_WS\\_Invoke\\_Service\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_Compression_Decompression_with_the_WS_Invoke_Service_Activity.html)

## Web Services Provide Service Activity

During run time the Provide Service activity provides a Web Service that can be started from an outside client.

### About this task

Figure 1. Provide Service activity

The Provide Service activity is an inbound Web Service activity. It is a starter activity that listens for Web Service requests at the specified port.

Based on the configuration information you provide in Studio about the Web Service, the WMC generates a WSDL file that describes the Web Service Interface available during run time.

When a project with a WSDL is deployed, the Web Service interface defined by the WSDL is available. You can export and then view the WSDL file that has been generated for the Web Service from the WMC.

During run time, when a client sends a request to the Web Service, the Integration Appliance starts processing the Provide Service activity and the rest of the activities that make up the orchestration.

You can only specify one input and one output XML Schema for the Provide Service activity, so the generated WSDL defines only one request header and one response header. The WMC generates a WSDL with one operation. In Figure 1, the Web Service calculatePrice operation is derived from the name of the Provide Service activity. There is a one-to-one relationship between the Web Service operation and the Provide Service activity.

By default, decompression is enabled for the Provide Service activity. For more information, see [Decompression with the Web Services Provide Service Activity](#).

The steps for adding and configuring a Provide Service activity to an orchestration are described in the following procedures.

- [Adding an activity](#)  
Add a Web Services **Provide Service** activity in the orchestration.
- [Creating an endpoint](#)  
Create, select, or edit a Web Services endpoint.
- [Configuring the activity](#)  
Configure the **Provide Service** activity.
- [Mapping the outputs of the activity](#)  
Map the output of the **Provide Service** activity.

# Configuring the activity

---

Configure the **Provide Service** activity.

## Procedure

---

1. Select the Configure task from the Checklist. The Configure pane is displayed.
2. Configure all the fields in this pane as described in the following table.

Field	Description
Receive Request with	Â
Schema	Defines the XML Schema of incoming XML data to the operation of the Web Service. <ul style="list-style-type: none"><li>o Click Browse... to select a schema.</li><li>o Click Clear to disassociate the selected schema from the activity.</li></ul>
Soap Header	Defines the XML Schema of the incoming Soap Header. <ul style="list-style-type: none"><li>o Click Browse... to select a schema.</li><li>o Click Clear to disassociate the selected schema from the activity.</li></ul>
This activity	Â
Requires a Reply	This check box specifies to send a reply to the sender of the request. If this option is selected, you must add a Web Services Send Reply activity to your orchestration to send a reply to the client that started it.
Schema	Defines the XML Schema of the returned XML data from the operation of the Web Service. Â (The XML data is returned by the associated Send Reply activity.) <ul style="list-style-type: none"><li>o Click Browse... to select a schema.</li><li>o Click Clear to disassociate the selected schema from the activity.</li></ul>
Soap Header	Defines the XML Schema of the returned Soap Header of the Web Service. Â (The SOAP Header is returned by the associated Send Reply activity.) <ul style="list-style-type: none"><li>o Click Browse... to select a schema.</li><li>o Click Clear to disassociate the selected schema from the activity.</li></ul>
May throw the following Faults	Â
Fault Name	Specifies user-defined fault name for the activity.
Fault Element	Click Browse to display the schema and select the element for which the fault is thrown.
Options	Â
Use Compression / Decompression	Specifies if decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is selected. Clear the Use Compression/Decompression check box to disable decompression for this activity. For more information, see <a href="#">Decompression with the Web Services Provide Service Activity</a> .

# Mapping the outputs of the activity

---

Map the output of the **Provide Service** activity.

## Procedure

---

1. Select the Map Outputs task in the Checklist. The output parameters of the activity display in the From Activity pane of the Map Outputs task as described in the following table.

Output Parameter	Description
body	Contains the body of the response from the Web Service. The nodes that defines the return parameter or parameters of the Web Service operation displays under the body output parameter.
header	Contains the header of the SOAP Envelope.
httpheaders	Contains the header of the HTTP response.

The following table defines the nodes of the httpheaders output parameter.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/method	Specifies the type of HTTP response.
httpheaders/host	Specifies the IP address or the host name of the client.
httpheaders/otherHeaders/headerItem	Specifies a set of name/value pairs that contain the HTTP parameters of the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so headerItem is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP parameter.

2. Map the output nodes of the activity to orchestration variables. See [Creating a Map](#) for general instructions on mapping.

---

[Feedback](#) | [Notices](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_Provide\\_Map\\_Outputs.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_Provide_Map_Outputs.html)

## Decompression with the Web Services Provide Service Activity

---

The Web Services Provide Service activity supports decompression with the gzip format only.

Note: The Provide Service activity does not support the deflate format or the common UNIX file compression format called compress.

The **Provide Service** activity only supports receiving HTTP requests using HTTP/HTTPS 1.0 protocol.

The decompression run time behavior of the Provide Service activity when receiving an HTTP request is dependent on the following conditions:

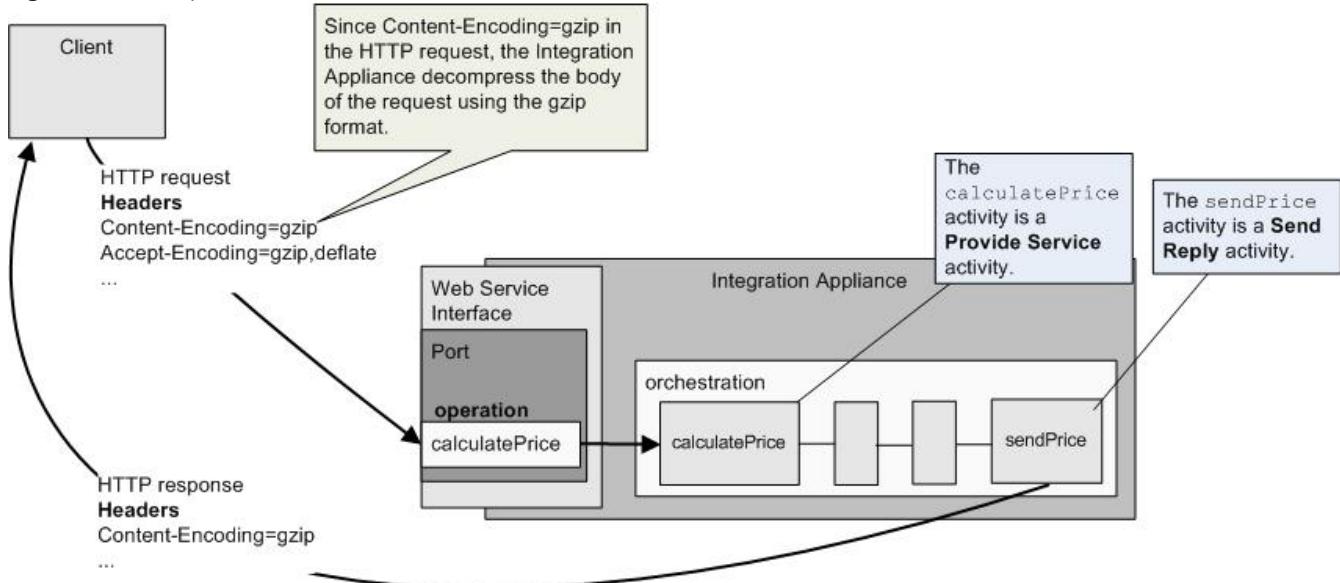

- The value of the Content-Encoding at the message level.
- The setting of the Use Compression/Decompression check box at the activity level.

These conditions affect the decompression run time behavior of the **Provide Service** activity and are described in the following sections and in the table provided in the [Run time Decompression Behavior](#) section.

## Content-Encoding Value at the Message Level

The value of the Content-Encoding header of the HTTP request can determine if the Integration Appliance decompresses the body of the HTTP request that is received from the client as shown in [Figure 1](#).

Figure 1. HTTP request

The value of the Content-Encoding header is represented by the third column labeled Content-Encoding Value in the table provided in the [Run time Decompression Behavior](#) section.

## Setting Decompression at the Activity Level

By default, decompression is turned on at the activity level for the **Provide Service** activity. You can turn off decompression at the activity level by clearing the Use Compression/Decompression check box. The Use Compression/Decompression check box is available in the **Configure** task of the activity. The second column labeled Use Compression/Decompression check box in the table provided in the [Run time Decompression Behavior](#) section, represents the setting of the Use Compression/Decompression check box.

## Run time Decompression Behavior

The following table describes the decompression run time behavior when the Integration Appliance receives an HTTP request from the HTTP Client:

Use Compression/ Decompression Check Box (Activity Level)	Content - Encoding Value (Message Level)	Integration Appliance Decompression Run Time Behavior
selected	gzip	The Integration Appliance decompresses the body of the request using the gzip format. The value of Content-Encoding is set to gzip in the headers output parameter returned from the activity.
selected	not set	The Integration Appliance sends the body of the request as is (unchanged). The value of Content-Encoding is not set in the headers output parameter returned from the activity.
selected	identify	The Integration Appliance sends the body of the request as is (unchanged). The value of Content-Encoding is not set in the headers output parameter returned from the activity.
selected	any other	The Integration Appliance sends the 415 (Unsupported Media Type) Response Code.

	string besides gzip or identity	
cleared	value is not significant	The Integration Appliance does not decompress the body of the request and the current value of Content-Encoding in the request is passed as is to the headers output parameter of the activity. For example, if the value of the Content-Encoding is set to gzip but the Use Compression/Decompression check box is cleared, the Integration Appliance does not decompress the body of the request but Content-Encoding is set to gzip in the headers output parameter of the activity.

## Compression Behavior When Sending a Request

The following table describes the compression run time behavior when the Integration Appliance sends an HTTP request to the Web Service.

### Accept-Encoding Header Value Passed to the Request

The following table describes the value of the Accept-Encoding header passed in the HTTP request.

Use Compression/ Decompression Check Box (Activity Level)	Initial Accept-Encoding Value	Endpoint Supports Compression?	Accept-Encoding Value Passed in the HTTP Request to the Web Service
selected	gzip,deflate	yes	The Accept-Encoding header is set to gzip,deflate in the request.
value is not significant	value is not significant	no	The current value of the Accept-Encoding header is passed as is in the request.
cleared	value is not significant	value is not significant	The current value of the Accept-Encoding header is passed as is in the request.

## Decompression Behavior When Receiving a Response

The following table describes the decompression run time behavior when the Integration Appliance receives the HTTP response from the Web Service.

Use Compression/ Decompression Check Box (Activity Level)	Content-Encoding Value in the HTTP Response (Message Level)	Endpoint Supports Compression?	Integration Appliance Decompression Run Time Behavior When Receiving a Response
selected	gzip	yes	The Integration Appliance decompresses the body of the response using the gzip format.
selected	deflate	yes	The Integration Appliance decompresses the body of the response using the deflate format.
selected	identity	yes	The Integration Appliance does not decompress the body of the response.
selected	value not listed in the Accept-Encoding header	yes	The Integration Appliance logs an error that the response data was received in an unsolicited content encoding type.
selected	value is not significant	no	The Integration Appliance does not decompress the body of the response. The current value of the Content-Encoding header is passed as is in the response.
cleared	value is not significant	value is not significant	The Integration Appliance does not decompress the body of the response. The current value of the Content-Encoding header is passed as is in the response.

## Web Services Send Reply Activity

During run time, the Send Reply activity returns a response for a Provide Service activity.

### About this task

Figure 1. Send Reply activity

As shown in [Figure 1](#), the client runs the calculatePrice Web Service operation (a Provide Service activity) by sending a request. The Integration Appliance receives the request and starts processing the activities in the orchestration. When the sendPrice activity (a Send Reply activity) is started, it returns a response to the client.

By default, compression is enabled for the Send Reply activity. For more information, see [Compression with the Web Services Send Reply Activity](#).

The steps for adding and configuring a Send Reply activity to an orchestration are described in the following procedures.

- [Adding an activity](#)  
Add a Web Services **Send Reply** activity in the orchestration.
- [Configuring the activity](#)  
Configure the **Send Reply** service activity.
- [Mapping the inputs of the activity](#)  
Map the inputs of the **Send Reply** service activity.

**Parent topic:** [Web Services Activities](#)

## Adding an activity

Add a Web Services **Send Reply** activity in the orchestration.

### Procedure

1. [Create](#) or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the Web Services folder.
3. Drag the Send Reply activity onto the orchestration. The Send Reply activity is used in conjunction with Provide Service activity to send a reply back to the client that started it. Place the Send Reply activity after the Provide Service activity.
4. Select the activity. The Checklist is displayed.

**Parent topic:** [Web Services Send Reply Activity](#)

## Configuring the activity

---

Configure the **Send Reply** service activity.

### Procedure

1. Select the Configure task from the Checklist. The Configure pane opens.
2. Select a Provide Service to which this Send Reply activity is returning the reply.
3. The Use Compression/Decompression check box specifies if compression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is selected. Clear the Use Compression/Decompression check box to disable compression/decompression for this activity. For more information, see [Compression with the Web Services Send Reply Activity](#).
4. The Message Transmission Optimization Mechanism (MTOM) when checked specifies using MTOM to efficiently send SOAP messages containing binary data.

## Mapping the inputs of the activity

---

Map the inputs of the **Send Reply** service activity.

### About this task

The return parameter for the operation selected in the Requires a Reply Schema field of the [Configure](#) task of the associated Provide Service activity, is shown beneath the body input parameter listed in the To Activity pane of the Map Inputs task.

To view the optional input parameters called header and httpheaders in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click a node in the Map Inputs pane to make this option active.

If a Soap Header XML Schema was selected in the Requires a Reply SOAP Header field of the [Configure](#) task of the associated Provide Service activity, this schema is shown beneath the header input parameter listed in the To Activity pane of the Map Inputs task.

The following table defines the nodes of the optional httpheaders input parameter.

Nodes of the httpheaders Input Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/method	Specifies the type of HTTP request.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, and is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

## Web Services Send Reply with Fault Activity

During run time, the Send Reply with Fault activity returns a fault to the calling orchestration. This activity provides SOAP functionality as a reply configuration option.

### About this task

The **WS Provide** activity must have previously been added as the starter activity to the active orchestration, since a Send Reply with Fault activity depends on a **WS Provide** activity.

The steps for creating and configuring a Send Reply with Fault activity to an orchestration are described in the following procedures.

- [Creating the Required Fault Names](#)  
Create the required fault names using the following procedure.
- [Configuring the Activity](#)  
Configure the **Send Reply** activity with the fault names.
- [Map the Inputs of the Activity](#)  
Map the inputs for the **Send Reply** activity with the fault names.

**Parent topic:** [Web Services Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_Send\\_Reply\\_with\\_Fault\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_Send_Reply_with_Fault_Activity.html)

## Creating the Required Fault Names

Create the required fault names using the following procedure.

### Procedure

1. In an active orchestration, click the WS Provide activity.
2. In the Checklist, click Configure.
3. In the Configure options, select Requires Reply.
4. Click Add Fault. The Add Fault dialog box is displayed.
5. Browse and select a valid schema. Repeat the preceding steps to create as many faults as are required.

**Parent topic:** [Web Services Send Reply with Fault Activity](#)

## Configuring the Activity

---

Configure the **Send Reply** activity with the fault names.

### Procedure

---

1. Open the Activities tab.
2. Expand the Web Services folder contents and drag Send Reply with Fault into the orchestration, following the existing **Web Services Provide Service** activity.
3. In the Checklist, click Configure.

The Reply To text area is displayed and lists the name of the preceding **Web Services Provide Service** activity.

4. In the With Fault section, select a fault name from the Fault Name list.
5. In the Options section, select Use Compression/Decompression to activate this feature.
6. Select Use Soap Message Transmission Optimization Mechanism (MTOM) to activate this feature.
7. In the Threshold field, enter the preferred value in a range of 1 to 9,999,999.

**Parent topic:** [Web Services Send Reply with Fault Activity](#)

## Map the Inputs of the Activity

---

Map the inputs for the **Send Reply** activity with the fault names.

### Procedure

---

1. In the Checklist, click Map Inputs.
2. The To Activity column lists the schema associated with the previously selected fault name.
3. In the From Orchestration column, select the variable that would be used to provide input values.
4. If no variables are listed, click Select Inputs, above the From Orchestration list.

The Select Inputs dialog box is displayed and lists available variables.

Tip: If needed, you can create a custom mapping variable in Source or Destination column by following the steps in [Creating Variables](#).

- 5.
6. Choose a variable, then click OK.

7. In the To Activity field, right-click faultcode and choose Define Default value. When the Define Default Value dialog box is displayed, select one of the predefined values.
8. To view any optional parameters, right-click either node and choose Show Optional Parameters. These are displayed in the To Activity column.
9. Map the variables from the Orchestration column to the parameters in the Activity column. For more information, see [Mapping Techniques](#).

## Compression with the Web Services Send Reply Activity

---

During run time, the Web Services Send Reply activity sends an HTTP response complaint with the HTTP/HTTPS 1.0 protocol to the client. The Send Reply activity supports compression with the gzip format only.

Note: The Send Reply activity does not support the deflate format or the common UNIX file compression format called compress. The compression run time behavior of the Send Reply activity is dependent on the following conditions:

- At the message level, the value of the Accept-Encoding header in the original HTTP request received by the Web Services Provide Service activity is passed to the Send Reply activity to determine if the body of the HTTP response is compressed or not compressed as shown in [Figure 1](#).
- The setting of the Use Compression/Decompression check box at the activity level.

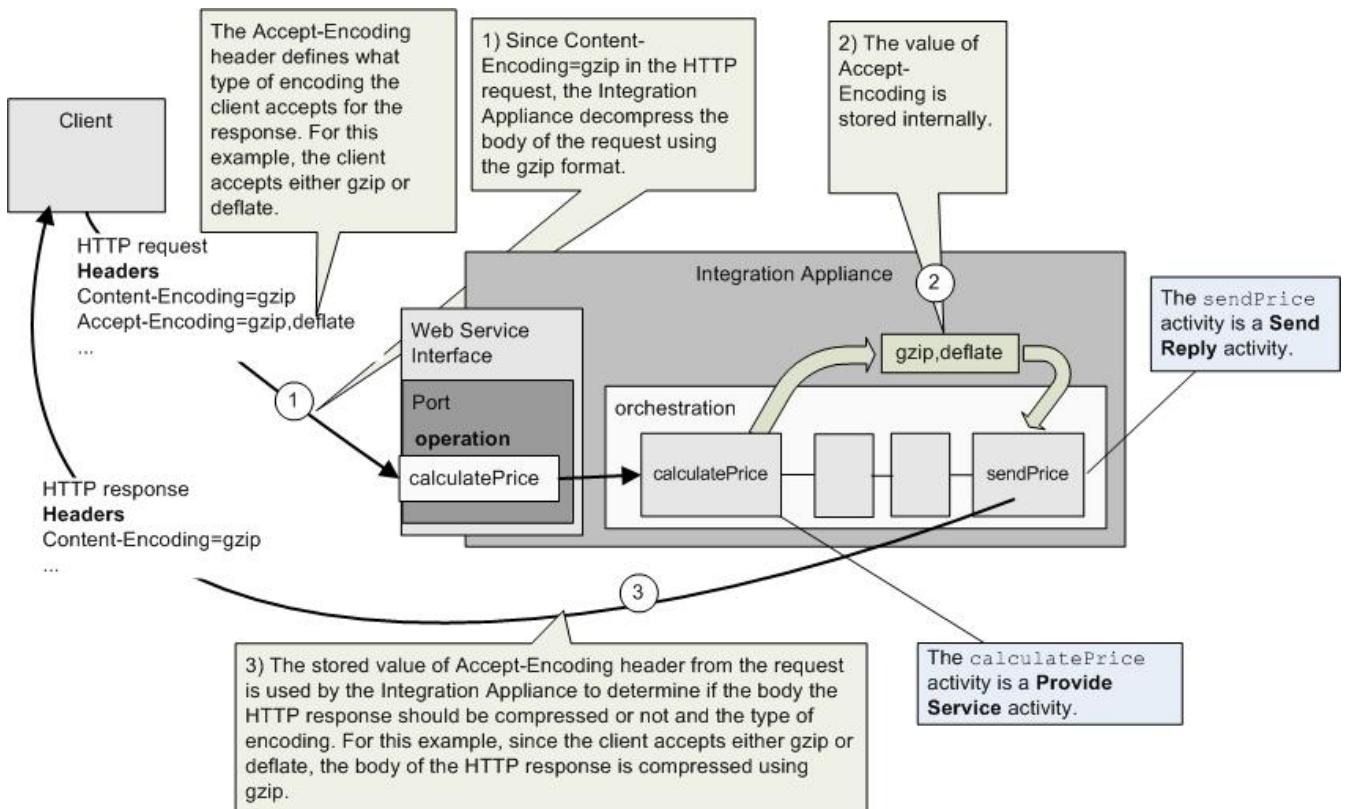

These conditions affect the compression run time behavior of the Send Reply activity are described in the following sections and in the table provided in the [Run time Compression Behavior](#) section.

### Accept-Encoding Value at the Message Level

---

During run time, a Web Services Provide Service activity receives an HTTP request from a client. In the same orchestration, a Send Reply activity sends a response back to the original client. The value of the Accept-Encoding header in the original request received by the Provide Service activity is stored internally on the Integration Appliance. The stored value is passed to the Send Reply activity and is used to determine if the body of the response is compressed or not and the encoding type, as shown in [Figure 1](#).

Figure 1. The Accept-Encoding header

## Setting Compression/Decompression at the Activity Level

By default, compression is turned on at the activity level for the Send Reply activity. You can turn off compression at the activity level by clearing the Use Compression/Decompression check box. The Use Compression/Decompression check box is available in the Configure task of the activity. The second column labeled HTTP Compression CLI Command in the following table represents the setting of the Use Compression/Decompression check box.

## Run time Compression Behavior

The following table describes the compression run time behavior when the Integration Appliance sends an HTTP response to the client:

Use Compression/ Decompression Check Box (Activity Level)	Accept-Encoding Value of the HTTP Request (Message Level)	Integration Appliance Compression Run Time Behavior
selected	gzip or gzip,deflate	The Integration Appliance sends the body of the response compressed in the gzip format and the Content-Encoding header is set to gzip in the response.
selected	identity	The Integration Appliance sends the body of the response uncompressed and the Content-Encoding header is set to identity in the response.Â
selected	not set, or any other string except gzip or identity	The Integration Appliance sends the body of the response uncompressed and the Content-Encoding header is set to identity in the response.Â
cleared	value is not significant	The Integration Appliance sends the body of the response as is (unchanged) and the Content-Encoding header is as is in the response. (The value of the Content-Encoding header in the request is passed unchanged to the response.)

Note: The Use Compression/Decompression check box will be deprecated in a future release. Use the Content-Encoding and Accept-Encoding HTTP Parameters in the HTTP request to specify how to decompress the body of the HTTP request and compress the body of the HTTP response.

## Troubleshooting and support

---

Troubleshooting techniques and self-help information help you identify and solve problems quickly. Here, you can find potential solutions for issues you would have with the Web Services connector.

### Exception thrown when Web Services Provide Service activity is processed

---

**Problem:** An Illegal Argument Exception is thrown during the processing of the Provide Service activity, if the Path name ends with a forward slash /.

**Cause:** This exception is caused because `ContextHandler context = new ContextHandler(); context.setContextPath(listenerDetails.getUri());` when the contextPath is being set. ContextHandler is a class in the jetty-6.1.6 JAR file.

**Solution:** Ensure that you specify the Path name such that the slash / is followed by a path string. For example, /abc or /abc/def.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WorkDay\\_overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WorkDay_overview.html)

## Creating and editing a Workday endpoint

---

Workday endpoints contain the connection information that studio and the Integration Appliance use to connect to the Workday application. You can create multiple endpoints that refer to separate instances.

### About this task

---

Use this task to create or edit Workday endpoint.

Note:

Any changes you make to Workday endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

### Procedure

---

1. Drag an activity from Workday folder in the Activities tab to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. Browse - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
  - b. New - To create a new endpoint. The Create Endpoint window opens.
  - c. Edit - To edit the existing endpoint. The Edit Endpoint window opens.
4. Complete the fields defined in the following table:

Table 1. Connection Details

Field Name	Description
Workday	
Domain Name	Specifies the domain name of your Workday endpoint. You can either specify the domain name of your choice or use the sandbox domain name given as a watermark reference.
Tenant Name	Specifies the tenant name of your Workday endpoint. You can either specify the tenant name of your choice or use the sandbox tenant name given as a watermark reference.
Login	
User Name	Specifies the user name to connect to the Workday application. You can either specify the user name of your choice or use the user name given as a watermark reference.
Password	Specifies the password associated with the user name to connect to the Workday application. You can either specify the password of your choice or use the password given as a watermark reference.

Field Name	Description
Connection Timeout	
Timeout after ..... seconds when establishing a connection to the endpoint	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. The default is 300 seconds.
Proxy	
Connect via a Proxy Server	Allows you to enable the proxy connection details.
Authentication	<p>Allows you to select the type of authentication that the Integration Appliance uses when connecting to a remote server. From the list, select one of the following authentication modes:</p> <ul style="list-style-type: none"> <li>○ Basic - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure.</li> <li>○ Digest - Encrypts the user name and password you specify before sending the user name and password to the server. This authentication option is more secure than Basic authentication.</li> <li>○ NTLM - Requires an instance of NTCredentials to be available for the domain name of the server. This authentication is the most secure authentication option.</li> </ul> <p>When you choose the NTLM authentication option, the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server.</p> <p>Note: Do not prefix the user name with the domain.</p>
Realm	If you select the Basic or Digest authentication option, you can specify a realm. When you do not specify a realm, the activity authenticates to 'any realm'. If you select the NTLM authentication option, you must specify a domain. If you do not specify a domain, the endpoint configuration is not valid and an error occurs.
Host Name	Specifies the host name of the proxy server.
Port	Specifies the port number needed to connect to the proxy server.
User Name	Specifies the user name needed to connect to the proxy server.
Password	Specifies the password needed to connect to the proxy server.

5. When finished, click Test Connection to confirm that you can connect to Workday application.

6. Click OK.

**Parent topic:** [Workday Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Workday\\_Creating\\_or\\_Editing\\_an\\_Endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Workday_Creating_or_Editing_an_Endpoint.html)

## Using the Invoke Workday activity

---

The Invoke Workday activity allows you to browse and execute operations in Workday management services related to human resources, finance, and so on. You can also fetch custom report operations and work with it.

### About this task

---

Use this task to browse and execute operations in Workday management services related to human resources, finance and so on.

### Procedure

---

To configure Invoke Workday activity, complete the following steps:

1. In an active orchestration, open the Activities tab and expand the Workday folder contents.
2. Drag the Invoke Workday activity icon onto the orchestration. The Invoke Workday Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Workday endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Workday endpoint](#).
8. In the Checklist, click Configure.
9. In the Workday Service pane, complete one of the following:
  - a. Click the Service option and select the required Workday services from the list.
  - b. Click the Custom Report Name field and specify the name of the report.
10. Click Fetch Workday Operations to populate the Workday operations pane with operations from the module selected in the Service option.
11. Optional: Click Workday Help to view the Workday help pages for the operation you have selected. If you click the help button before selecting an operation, you can view the Workday help page which displays information about all the Workday services.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the retry options for Workday activity](#).
13. Select the required Workday operation and click Map Inputs from the Checklist. The XML Schemas generated from the selected operation of the Invoke Workday activity are displayed as nodes under the request input parameter in the To Activity panel. The Version field will be populated automatically with the latest version of Workday supported by the connector.  
The user name and password in the map inputs are populated based on the details provided in the endpoint screen.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Invoke Workday activity.

**Parent topic:** [Workday Activities](#)

## Migrating WSDL of a WorkDay Connector Project

---

This section details the WSDL migration of WorkDay connector projects created with WSDL version that is lower than the current version supported by Cast Iron.

### About this task

---

Use this task to migrate your projects' WSDL version to the current version supported by Cast Iron.

### Procedure

---

To migrate the WSDL, complete the following steps:

1. Open the project to be migrated in the latest Cast Iron Studio.
2. Select the orchestration.
3. Select the Workday activity. The Invoke Workday Checklist is displayed.
4. In the Checklist, click Configure.
5. Click Fetch Workday Operations to populate the Workday operations pane with the latest operations supported by Workday Connector.

A Confirmation window is displayed with Updating the WSDL Affects the Listed Dependent Project Entities.

Note: If the project created earlier has used a WSDL version that is lower than the current version supported by Cast Iron, then Fetch Workday Operations button will be enabled otherwise, it will be disabled.

6. Click Update, if you want to update the project WSDL. The dependent entities have been updated successfully.
7. Click Close to close the migration wizard.
8. Click the Save button to save the changes made to the project.

## Results

---

You have migrated the WSDL of a WorkDay connector project to the latest WSDL version supported by Cast Iron.

**Parent topic:** [Workday Activities](#)

---

[Feedback | Notices](#)

## Specifying the retry options for Workday activity

---

Specify the retry options for the **Invoke Workday** activity.

### Procedure

---

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to the Workday application. The following table describes the retry options for connecting to the Workday application:

Field	Description
Retry	Â
1) Wait --- second(s) between each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the Workday application.
2) Try to connect --- times before failing.	Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the Workday application before issuing an error and stopping the processing of the current orchestration job.  If you deploy an orchestration that contains a Invoke Workday activity and the Integration Appliance cannot connect to the specified the Workday service, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and the stops processing the current orchestration job.  For example, the retry count is set to 5. The first, second, third, fourth, and fifth, connection errors are shown in the system log as Warnings. The Integration Appliance logs the sixth connection error as an Error and stops processing the current orchestration job.

3) Time out after ___ seconds when the Endpoint does not respond to a request.	<p>Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the Invoke Workday, the activity timeout is the amount of time that the Integration Appliance waits for a response from the Workday application after attempting to start the Workday service, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the Endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. Set the connection timeout in Workday Endpoint tab. For more information about connection timeouts, see <a href="#">Creating and editing a Workday endpoint</a>.</p>

Zuora endpoints contain the connection information that studio and the Integration Appliance use to connect to the Zuora application. You can create multiple endpoints that refer to separate instances.

- [Using the Zuora Create Objects activity](#)

Use the Zuora Create Objects activity to create objects such as Account, Amendment, Contact, InvoiceAdjustment, InvoiceItemAdjustment, InvoicePayment, Payment, PaymentMethod, Product, ProductRatePlan, ProductRatePlanCharge, ProductRatePlanChargeTier, RatePlan, RatePlanCharge, RatePlanChargeTier, Refund, and Usage in the Zuora application.

- [Using the Zuora Update Objects activity](#)

Use the Zuora Update Objects activity to update objects such as Account, Amendment, Contact, Invoice, InvoiceAdjustment, InvoiceItemAdjustment, Payment, PaymentMethod, Product, ProductRatePlan, ProductRatePlanCharge, ProductRatePlanChargeTier, RatePlanCharge, and Subscription in the Zuora application.

- [Using the Zuora Delete Objects activity](#)

Use the Zuora Delete Objects activity to delete objects such as Product, Account, or Contact from the Zuora application.

- [Using the Zuora Query Objects activity](#)

Use the Zuora Query Objects activity to query for objects such as Product, Account, or RatePlan from the Zuora application. The query string that you specify for this operation must adhere to the Zuora Object Query Language standard.

- [Using the Zuora Amend Subscription activity](#)

Use the Zuora Amend Subscription activity to amend or change objects such as Subscription, in the Zuora application.

- [Using the Zuora Create Subscription activity](#)

Use the Zuora Create Subscription activity to create a subscription by specifying the basic information about the subscription such as the Account, PaymentMethod, and RatePlanData in the Zuora application.

- [Using the Zuora Generate Invoice activity](#)

Use the Zuora Generate Invoice activity to generate an invoice for a customer by specifying the AccountId, InvoiceDate, TargetDate and so on, in the Zuora application.

- [Specifying the Retry options for Zuora activities](#)

Specifying the Retry parameters is one of the tasks to configure Zuora activity.

## Overview of the Zuora connector

---

The Zuora connector enables a two-way communication between Cast Iron and the Zuora application. You can create and modify objects within the Z-Billing and Z-Payment applications in Zuora, using the Zuora connector.

You can perform the following outbound activities using the Zuora connector:

- [Create Objects](#)
- [Update Objects](#)
- [Delete Objects](#)
- [Query Objects](#)
- [Amend Subscription](#)
- [Create Subscription](#)
- [Generate Invoice](#)

The Zuora connector supports version 41.0 of the Zuora application. For more information, see <http://knowledgecenter.zuora.com/>.

## Creating and editing a Zuora endpoint

---

Zuora endpoints contain the connection information that studio and the Integration Appliance use to connect to the Zuora application. You can create multiple endpoints that refer to separate instances.

### About this task

---

Use this task to create or edit Zuora endpoint.

Note:

Any changes you make to Zuora endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

### Procedure

---

1. Drag an activity from Zuora folder in the Activities tab to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. Browse - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
  - b. New - To create a new endpoint. The Create Endpoint window opens.
  - c. Edit - To edit the existing endpoint. The Edit Endpoint window opens.
4. Complete the fields defined in the following table:

Table 1. Connection Details

Field Name	Description
Provide Connection Information	
URL	Specifies the URL of the Zuora application. By default, the value of the production environment in Zuora <a href="https://www.zuora.com/apps/services/a/41.0">https://www.zuora.com/apps/services/a/41.0</a> is displayed.

Field Name	Description
User Name	Specifies the user name to connect to the Zuora application.
Proxy Connection Details	
Password	Specifies the password associated with the user name to connect to the Zuora application.
Proxy Host	Specifies the host name of the proxy server.
Proxy Port	Specifies the port number needed to connect to the proxy server.
Proxy User Name	Specifies the user name needed to connect to the proxy server.
Proxy Password	Specifies the password needed to connect to the proxy server.

5. When finished, click Test Connection to confirm that you can connect to Zuora application.
6. Click OK.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Zuora\\_Creating\\_or\\_Editing\\_an\\_Endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Zuora_Creating_or_Editing_an_Endpoint.html)

## Using the Zuora Create Objects activity

Use the Zuora Create Objects activity to create objects such as Account, Amendment, Contact, InvoiceAdjustment, InvoiceItemAdjustment, InvoicePayment, Payment, PaymentMethod, Product, ProductRatePlan, ProductRatePlanCharge, ProductRatePlanChargeTier, RatePlan, RatePlanCharge, RatePlanChargeTier, Refund, and Usage in the Zuora application.

### About this task

Use this task to create objects in the Zuora application. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Zuora Create Objects activity, complete the following steps:

### Procedure

1. In an active orchestration, open the Activities tab and expand the Zuora folder contents.
2. Drag the Create Objects activity icon onto the orchestration. The Zuora Create Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make required changes if necessary.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Zuora endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click Test Connection to test that you have connected successfully to the Zuora application. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Zuora endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Zuora window is displayed.
11. In Browse Zuora, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Zuora activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time, if no value is provided for a mandatory element, the activity will be completed and the result of createResponse will be populated with an error message.

By reviewing the response of the activity, you can know if the request had failed or was successful.

15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.

16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Zuora Create Objects activity.

## Using the Zuora Query Objects activity

---

Use the Zuora Query Objects activity to query for objects such as Product, Account, or RatePlan from the Zuora application. The query string that you specify for this operation must adhere to the Zuora Object Query Language standard.

### About this task

---

Use this task to query objects from the Zuora application. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Zuora Query Objects activity, complete the following steps:

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Zuora folder contents.
2. Drag the Query Objects activity icon onto the orchestration. The Zuora Query Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make required changes if necessary.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Zuora endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click Test Connection to test that you have connected successfully to the Zuora application. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Zuora endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes that you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Query Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time, if no value is provided for a mandatory element, the activity is completed and the result of queryResponse is populated with an error message. By reviewing the response of the activity, you can know if the request had failed or was successful.
11. Select the Map Outputs in the Checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.  
Note: The output of the Query Objects activity is queryResponse, which has a generic structure. If the output of the Query Objects activity must be used in a later activity, direct mapping cannot be done. The data must be extracted from the queryResponse with the help of the Apply XSLT activity.

Sample XSLT that can be used to extract specific data:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0" xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:ns1="http://api.zuora.com/" xmlns:ns2="http://object.api.zuora.com/">
  <xsl:template match="/ns1:queryResponse/ns1:result">
    <xsl:element name="Products">
      <xsl:apply-templates select="ns1:records" />
    </xsl:element>
  </xsl:template>
  <xsl:template match="ns1:records">
    <xsl:element name="Product">
      <xsl:element name="Id">
        <xsl:value-of select="ns2:Id"/>
      </xsl:element>
      <xsl:element name="Name">
        <xsl:value-of select="ns2:Name"/>
      </xsl:element>
      <xsl:element name="SKU">
```

```

<xsl:value-of select="ns2:SKU"/>
</xsl:element>
<xsl:element name="EffectiveStartDate">
<xsl:value-of select="ns2:EffectiveStartDate"/>
</xsl:element>
<xsl:element name="EffectiveEndDate">
<xsl:value-of select="ns2:EffectiveEndDate"/>
</xsl:element>
<xsl:element name="Description">
<xsl:value-of select="ns2:Description"/>
</xsl:element>
</xsl:template>
</xsl:stylesheet>

```

## Results

# Specifying the Retry options for Zuora activities

---

Specifying the Retry parameters is one of the tasks to configure Zuora activity.

## About this task

---

Use this task to configure the retry options for the Zuora activities. The Zuora connector obtains a new session for each activity. If the connector fails to obtain a session in the first attempt due to network issues, retry occurs. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

## Procedure

---

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry and timeout options for connecting to Zuora application, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to Zuora application.
Try to connect __ times before failing.	Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to Zuora application before issuing an error and stopping the processing of the current orchestration job. Note: If you deploy an orchestration that contains Zuora activity and the Integration Appliance cannot connect to the specified Zuora application, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
Activity Timeout	
Timeout after ____ seconds when the endpoint does not respond to a request.	Specifies the number of seconds the Integration Appliance waits before timing out, when the endpoint does not respond to a request. The default is 300 seconds.

## Using Secure Connectors

---

A Secure Connector facilitates the secure transfer of data between the IBM® WebSphere® Cast Iron® appliance and an endpoint that is located behind a firewall. You can perform the run time verification of the orchestration against an endpoint behind a firewall

from Studio, using Secure Connectors. This feature of discovering Secure Connectors and verifying the orchestrations in Studio, is applicable only for the Integration Appliance and not for Cast Iron Live.

## Before you begin

---

To verify the orchestration in Studio using Secure Connector, you must complete the following tasks:

- Create a Secure Connector on the appliance.
- Download the configuration file and the installer for the Secure Connector from the appliance, and install it on a machine behind the firewall.
- Start the Secure Connector that was installed in the earlier step, and ensure that the status of the Secure Connector in the Integration Appliance, is displayed as "running".

## Procedure

---

Configure the orchestration with a locally accessible endpoint, which is a replica of the endpoint behind the firewall.

To use Secure Connectors for the verification of the orchestration from Studio for the compatible Cast Iron connectors, such as, the HTTP connector, complete the following:

1. Edit the endpoint details of the activity, to use the other endpoint behind firewall.
2. Go to the Remote Endpoint Configuration section.
3. Select the Endpoint Runs Behind Firewall check box to enable the Secure Connector Name field.
4. Click Browse and specify the details of the Integration Appliance, where the Secure Connectors are registered. The Discover Secure Connectors dialog is displayed.

The appliance users of the Publisher or Admin group can connect to the appliance through Studio, to discover the Secure Connectors.

5. Click Discover. The Integration Appliance displays the list of all the Secure Connectors that are actively running.
6. Select the Secure Connector that corresponds to the environment where the endpoint is running.
7. Save the project and perform the verification of the orchestration.

During the verification of the orchestration in the Studio environment, the connector will execute the activity using the Secure Connector that you configured through the Integration appliance. You can now test the orchestration against an environment situated on a different network other than the Studio environment.

Note:

- The Discover Secure Connectors dialog displays only those Secure Connectors that are currently in the "running" state. So, ensure that the Secure Connector is started in the on-premise environment.
- The communication between Studio and Appliance is through HTTP transport.
- For an old project, you must import the project into the Studio and perform the steps described above.
- The test connection and discovery of the artifacts through a Secure Connector is not currently supported from the Studio environment.

---

## About variables

---

In orchestrations, variables provide temporary storage locations to hold the input and output data of activities.

This is shown in the example orchestration of the following figure:

During run time, this orchestration extracts data from and stores data into variables as described in the following steps:

1. The FTP Poll Directory activity polls for a Flat File on an FTP Server and places the contents of the Flat File into the data output parameter. The data output parameter is mapped to the string variable called *flatFileRawContent*.
2. The Flat File data returned from the FTP Poll Directory activity is stored as a string into the *flatFileRawContent* variable.
3. The *flatFileRawContent* variable is mapped to the Data input parameter of the Read Flat File activity. The Flat File data is parsed by the Read Flat File activity and returned from the activity in the XML output parameter.
4. The XML output parameter is mapped to the *batchOrderXML* Flat File Schema variable. The data is available in the orchestration from the *batchOrderXML* Flat File Schema variable. For example, if an activity is added to the orchestration to the right of the Read Flat File activity, it can use this data as input.

Variables must be initialized in an orchestration in order for the orchestration to be considered valid. This includes variables that are initialized in the branches of an If.. Then activity. The variable must be initialized in all branches. For more information see [Validating the orchestration](#).

## Variable scope

---

Variables defined within the Group, Try/Catch, If Then, While Loop, or For Each activities are considered as local variables. When such a variable is used as an input of a Map Inputs Tasks activity or a Map Variables activity that is outside of, and following the Group, Try/Catch, If Then, While Loop, or For Each activity, the variable is considered as uninitialized because it is outside the scope of the activities where it was declared. Therefore, these variables must be initialized with a default value.

For more information about specifying a default value, see the [Specifying a default value](#) section.

## The Variables tab

The Variables tab contains the following panes:

- **Variables:** Displays the variables that are defined and available for use in the Mapping Editor. A predefined variable called *JobInfo* is available in the Variables pane of the Variables tab by default.
- **Schema of <variable>:** Displays the schema for the selected variable.
- **Activities using <variable>:** Displays all activities in the orchestration which use the variable.
- **Properties of <variable>:** Where you define or edit variable properties or specify a default value.

## The JobInfo variable

By default, Studio provides the *JobInfo* variable. The Integration Appliance provides the values for the *JobInfo* nodes during run time. The *JobInfo* variable contains the nodes defined in the following table:

JobInfo Node Name	Data Type	Description
jobId	String	Contains the job ID number assigned to the instance of the orchestration. When the orchestration starts processing the activities contained in the orchestration, a job ID number is assigned to that instance of the orchestration. This job ID number is also visible from the Web Management Console (WMC).
jobStartTime	XML Schema data type xsd:dateTime	Contains the date and time that the instance of the orchestration started processing. Note: The <i>jobStartTime</i> is the date and time that the orchestration starts processing the messages or events and is assigned a job ID number. The <i>jobStartTime</i> is not the date and time that orchestration was deployed on the Integration Appliance and became active â€” ready to start processing messages and events. For example, an orchestration contains a FTP Poll Directory activity (a starter activity) that is deployed on the Integration Appliance. The orchestration becomes active waiting for a file to show on the FTP Server in a particular directory. When the orchestration determines that a file has been placed in a particular directory on the FTP Server, it starts processing the FTP Poll Directory activity. When the orchestration starts processing, the current date and time is stored in the <i>jobStartTime</i> node.
projectName	String	The name of the project that contains the current orchestration.
configurationName	String	The name of the configuration associated with the current instance of the orchestration. Different configurations of projects are created using the Web Management Console (WMC).
orchestrationName	String	The name of the orchestration currently processing.

<b>JobInfo Node Name</b>	<b>Data Type</b>	<b>Description</b>
routerHostName	String	The host name of the Integration Appliance that the current instance of the orchestration is running on.

Note: The *JobInfo* variable or the nodes of the *JobInfo* variable cannot be removed.

## Create a new variable using the Create New Variable option

---

### About this task

To create a new variable using the Create New Variable option of the Variables pane:

### Procedure

1. Open an orchestration and select the Variables tab.
2. Right-click the Variables pane and select the Create New Variable option from the list. The "Create New Variables Step 1 of 2" dialog box is displayed.
3. Select a data type or schema to base the new variable:
  - For a variable based on a primitive data type:
    - a. Scroll to the end of the "Create New Variables Step 1 of 2" dialog box.
    - b. Select a primitive data type from the Primitive Types folder.
    - c. Click Next.
  - For a variable based on a schema:
    - a. Optional: [To search for a node by name, click Find](#).
    - b. From the schema, select a node to be the root of the new variable.
    - c. Click Next.

4. Enter a name for the new variable and click Finish. The new variable is added to Variables toolbox, and the schema opens in the Schema of pane on the Variables tab.

Attention: Do not create a variable in the following format: `__variableName__`. Variable names that start with two underscore characters (`_`) and ends with two underscore characters (`_`) are not supported. If an orchestration contains variable names using this format, [the orchestration fails to validate](#).

## Create a new variable using the Select Inputs or Select Outputs buttons

---

### About this task

To add a new variable using the Select Inputs or Select Outputs buttons in the mapping panes of activities:

### Procedure

---

1. Open an orchestration.
2. Double-click an activity.
3. Select a mapping task in the Checklist.
4. Add a variable to the map:
  - o To add an input variable to the map, click Select Inputs.
  - o To add an output variable to the map, click Select Outputs.
5. Click New. The "Create New Variables Step 1 of 2" dialog box opens.
6. Select a data type or schema to base the new variable:
  - o For a variable based on a primitive data type:
    - a. Scroll to the end of the "Create New Variables Step 1 of 2" dialog box.
    - b. Select a primitive data type from the Primitive Types folder.
    - c. Click Next.
  - o For a variable based on a schema:
    - a. Optional: [To search for a node by name, click Find](#)
    - b. From the schema, select a node to be the root of the new variable.
    - c. Click Next.
7. Enter a name for the new variable and click Finish.

The new variable is added to Variables toolbox, and the schema displays in the Schema of pane on the Variables tab. The new variable is also added to the mapping pane.

Attention: Do not create a variable in the following format: `__variableName__`. Variable names that start with two underscore characters (`_`) and ends with two underscore characters (`_`) are not supported. If an orchestration contains variable names using this format, [the orchestration fails to validate](#).

# Create a new variable using the toolbar menu

---

## About this task

---

To add a new variable using the Map > Add options available from the toolbar menu:

## Procedure

---

1. Open a mapping pane of an activity.
2. Click a node in the mapping pane.
3. Select an active Map toolbar menu option
  - o Map > Add Input Variables
  - o Map > Add Output VariablesThe "Add Variables" dialog box is displayed.
4. Click New. The "Create New Variables Step 1 of 2" dialog box is displayed.
5. Select a data type or schema to base the new variable:
  - o For a variable based on a primitive data type:
    - a. Scroll to the end of the "Create New Variables Step 1 of 2" dialog box.
    - b. Select a primitive data type from the Primitive Types folder.
    - c. Click Next.
  - o For a variable based on a schema:
    - a. Optional: [To search for a node by name, click Find.](#)
    - b. From the schema, select a node to be the root of the new variable.
    - c. Click Next.
6. Enter a name for the new variable and click Finish. The new variable is added to Variables toolbox, and the schema is displayed in the Schema of pane on the Variables tab. The new variable is also added to the mapping pane.  
Attention: Do not create a variable in the following format: \_\_variableName\_\_. Variable names that start with two underscore characters (\_) and ends with two underscore characters (\_) are not supported. # Create a new variable using the Copy menu option

---

## About this task

---

To create a new variable using the Copy menu option while viewing the graphical representation of an XML Schema:

## Procedure

---

1. Open an orchestration.
2. Select the Project tab and double-click an XML Schema in the XML Schemas folder to open it. A schema tab opens with a graphical representation of the XML Schema.
3. Select the Variables tab.
4. Select a node in the schema to be the root of the new variable. Right-click the node in the schema tab (displayed on the left) and from the menu select Copy.
5. Select an orchestration tab and then select the Variables tab.
6. Click the Variables pane of the Variables tab and paste fragment of the schema using one of the following options:
  - o Right-click and from the menu select Paste.
  - o From the toolbar menu, select Edit > Paste.
7. Optional: Rename the variable by clicking in the Name field of the "Properties of" pane of the Variables tab.

Attention: Do not create a variable in the following format: \_\_variableName\_\_. Variable names that start with two underscore characters (\_) and ends with two underscore characters (\_) are not supported. If an orchestration contains variable names using this format, [the orchestration fails to validate](#).

## Primitive Data Types

---

The following table lists primitive data types that can be used when creating a variable:

Primitive Data Type	Description
base64binary	Base64-encoded arbitrary binary data The value space of base64Binary is the set of finite-length sequences of binary octets. For base64Binary data the entire binary stream is encoded using the Base64 Alphabet in [RFC 2045].
anyType	A concrete ur-Type, which can serve either as a complex type (non-scalar data, means elements), or as a simple type (scalar data) depending on the context.
dateTime	Specific instant of time. ISO 8601 extended format CCYY-MMDDThh:mm:ss
QName/q name	XML qualified names.
int	int is derived from long by setting the value of maxInclusive to be 2147483647 and minInclusive to be -2147483648
string	The string datatype represents character strings in XML
boolean	This data type has two possible values: true or false. It is typically used to track true or false conditions.
decimal	A subset of the real numbers, which can be represented by decimal numerals

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/creating\\_variables\\_primitivedatatypes.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/creating_variables_primitivedatatypes.html)

## Configuring variable properties

---

Configure variable properties from the Properties of pane on the Variables tab.

### About this task

---

When using variables within the Group or Try/Catch activities, these variables are regarded as local variables. When these variables are used outside of the scope of the activities where they were declared, they are considered to be uninitialised. If a variable defined within the Group or Try/Catch activities is used as an input of a Map Inputs Tasks activity or a Map Variables activity that is outside of, and following, the Group or Try/Catch activity, the variable is considered as uninitialised.

### Procedure

---

1. Click the Name field and enter a name for the variable.
2. Click the Data Type field and select a Data Type from the list. In addition to the default Data Types, the list lists the names of the root nodes of the Flat File Schemas, XML Schemas, and DTD files that have been defined or uploaded into the project. The following default Data Types are listed in the menu:
  - o DateTime: a date and time stored as an XML Schema xs:dateTime data type
  - o AnyType: any type of data can be stored in this catch-all (XML Schema xs:anyType) data type
  - o String: text characters (primitive)
  - o Integer: integers (primitive)
  - o Base64Binary: base64 binary encoded data stored as an XML Schema xs:base64Binary data type
  - o [Browse for Schema...:](#) use this option to redefine the schema or schema fragment that the variable is based on
3. Optional: Click the Default Value field and [specify a default value](#) for the variable.
4. Click the Shared field to specify to share this variable across orchestration jobs. By default, variables are not shared (False). To share this variable across all the orchestration jobs of this type of orchestration, select the True option from the list. If the Shared field is set to True, the Process Orchestration Jobs Sequentially check box becomes automatically selected.  
Note: Variables based on schema fragments can be created by [dragging a node from the Schema of pane into the Variables pane of the Variables tab](#).  
Note: Shared variables are sometimes used with scheduled orchestrations to maintain state information for each scheduled invocation of the orchestration job.

**Parent topic:** [Variables](#)

## Removing Variables

---

You can remove a specific variable, or all unused variables from the orchestration, as described in this section.

### About this task

---

Remove variables from the orchestration in one of the following methods:

To remove a specific variable:

1. Select the variable from the Variables pane inside of the Variables tab.
2. Right-click and select Remove Variable from the list

Note: Removing a variable can modify any maps that refer to it.

To remove variables not used in the orchestration:

1. Right-click the Variables pane inside of the Variables tab.
2. Select Remove Unused Variable(s).

## Specifying a default value

---

Specify a default value for a variable which is appropriate for its data type.

### About this task

---

The value you supply as a default must match the data type of the variable. You can enter a default value or you can select a default value from a file. Typically you select a default value from a file for variables that are based on schemas. For variables based on an XML Schema, you load an XML file that is valid to the XML Schema.

Specify a default value using one of the following methods:

To enter a default value manually:

1. Click the Default Value field of the "Properties of" pane.
2. Enter a value.

To select a default value from a file:

1. Click [...] in the Default Value field. The Default Value dialog box is displayed.
2. Click Upload. The Open Sample Document dialog box opens.
3. Select a sample file and click Open. The contents of the file show in the Default Value dialog box.
4. Click OK. The OK button is located at the end of the pane.

## Browse for Schema Element

---

Select a root element of a schema or fragment of a schema.

### About this task

---

The Browse for Schema Type Element dialog box shows the current nodes of the different schemas available in the project. You can select either a root element of the schema or a fragment of the schema (a child node of the root element). To upload a new schema into the project, see [Uploading Files into a Project](#).

To select the root of a schema or a schema fragment:

## Procedure

---

1. In the Browse for Schema Type Element dialog box select either a root element of the schema or a fragment of the schema (a child node of the root element).
2. Expand the schema to view the nodes that make up the schema. To find a particular node in the schema, enter the beginning characters of the node name.
3. Click OK.

**Parent topic:** [Variables](#)

---

[Feedback](#) | [Notices](#)

## Selecting a Substitution Type for Variables

---

When an XML Schema defines an XML element based on derived types, you must specify the derived type (or substitution type) expected during run time.

### About this task

---

The XML Schema specification supports the ability to derive complex types by extension. For more general information about type substitution and about using type substitution in mapping panes, see [Selecting a Substitution Type](#).

When an XML Schema defines an XML element based on derived types, you must specify the derived type (or substitution type) expected during run time. In Studio, you must specify the expected substitution type for the XML element of the variable using the Substitute Node With ... menu option as described in the following procedure.

To select a substitution type for a variable:

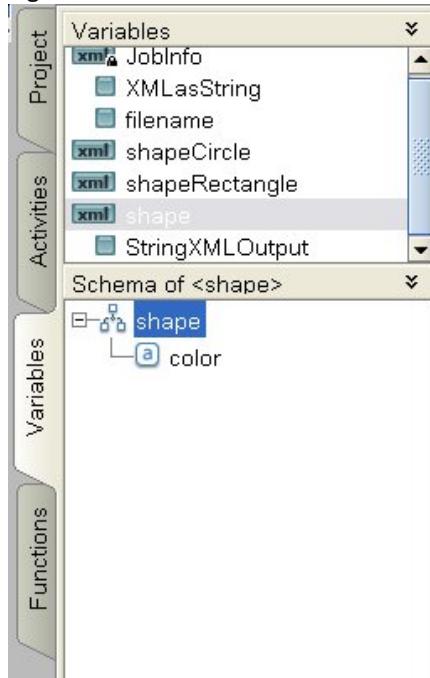

## Procedure

---

1. Upload an XML Schema that contains an XML element-based derived types into the project. For more information, see [Uploading Files into a Project](#).
2. Create a variable that contains an XML element based on derived types. The schema associated with the node displays in the "Schema of" pane of the Variables tab.

For the example XML Schema provided in [Selecting a Substitution Type](#), create a variable based on the `<shape>` element. The schema associated with the `<shape>` element is displayed in the "Schema of" pane of the Variables tab as shown in [Figure 1](#):

Figure 1. The schema associated with the shape element as displayed by the Schema of pane.

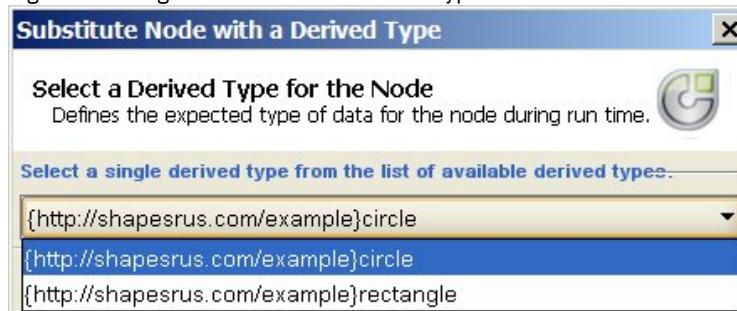

Note that the child elements of the derived types are not listed in the "Schema of" pane. In this example, the child element of circle which is named diameter is not listed, nor are the child elements of rectangle which are named width and length.

3. In the "Schema Of" pane of the Variables tab, select the derived type expected during run time, by right-clicking the node and from the menu selecting the Substitute Node With ... option.

The Substitute Node with a Derived Type dialog box is displayed. In the menu, the available derived types for the node as defined by the XML Schema are listed. For this example, the two derived types are available from the menu as shown in Figure 2:

Figure 2. The figure shows the two derived types for the Node: circle and rectangle.

4. Select one of the derived types. The selected derived type determines the expected type of XML instance document during run time.

In this example, the circle derived type is selected, so the XML data expected for this variable during run time is of type circle.

In addition to the child elements of the base type, the child elements of the derived type are displayed in the "Schema of" pane. In this example, the child element named diameter is displayed with the child element named color (inherited from the base type) in the "Schema of" pane of the Variables tab as shown in Figure 3:

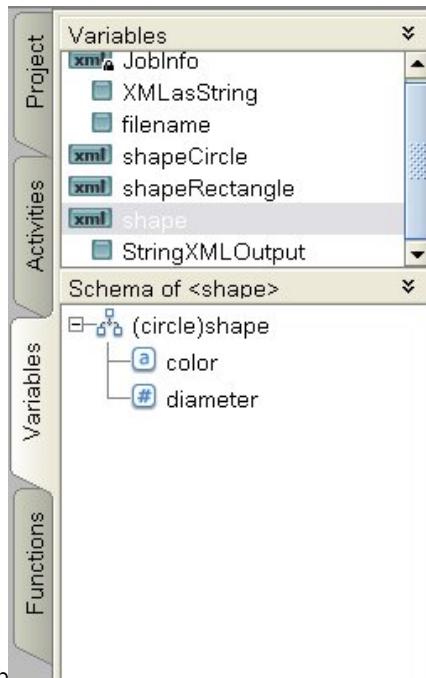

Figure 3. Variables tab

## What to do next

---

When a derived type has been selected for a node of a variable using the Substitute Node With ... option, you can remove the association between the node of a variable and the derived type by right-clicking the node and selecting the Unsubscribe Node option from the menu. An Unsubscribe dialog box opens. Click Yes.

## Flat File Schema Editor Overview

---

A Flat File Schema is metadata that describes the format and structure of Flat File data processed by the Integration Appliance. When you create a Flat File Schema, a corresponding internal XML Schema-based representation of the metadata is also generated.

During run time, the Integration Appliance uses the Flat File Schema for the following actions:

- Parse incoming Flat File data (valid to the Flat File Schema) and convert it to XML data. This parsing is done in the Read Flat File activity of an orchestration. The converted XML data is valid to the generated internal XML Schema generated from the Flat File Schema. For an example orchestration that reads Flat File data, see the "Developing the BookOrder Project" section of the [Getting Started Guide](#).
- Convert XML data into outgoing Flat File data valid to a Flat File Schema. This conversion is done in the Write Flat File activity of an orchestration.

Use the Flat File Schema Editor to create Flat File Schemas to describe the following types of data:

- [Delimited](#) data - A Flat File Schema can describe data that is defined using delimiters, for example: EDI data or by comma-separated values (CSV). A CSV file containing delimited data is shown in the following figure:

### Delimited Data

For an example Flat File Schema that parses delimited fields and contains repeating records, see "Developing the BookOrder Project" section of the [Getting Started Guide](#).

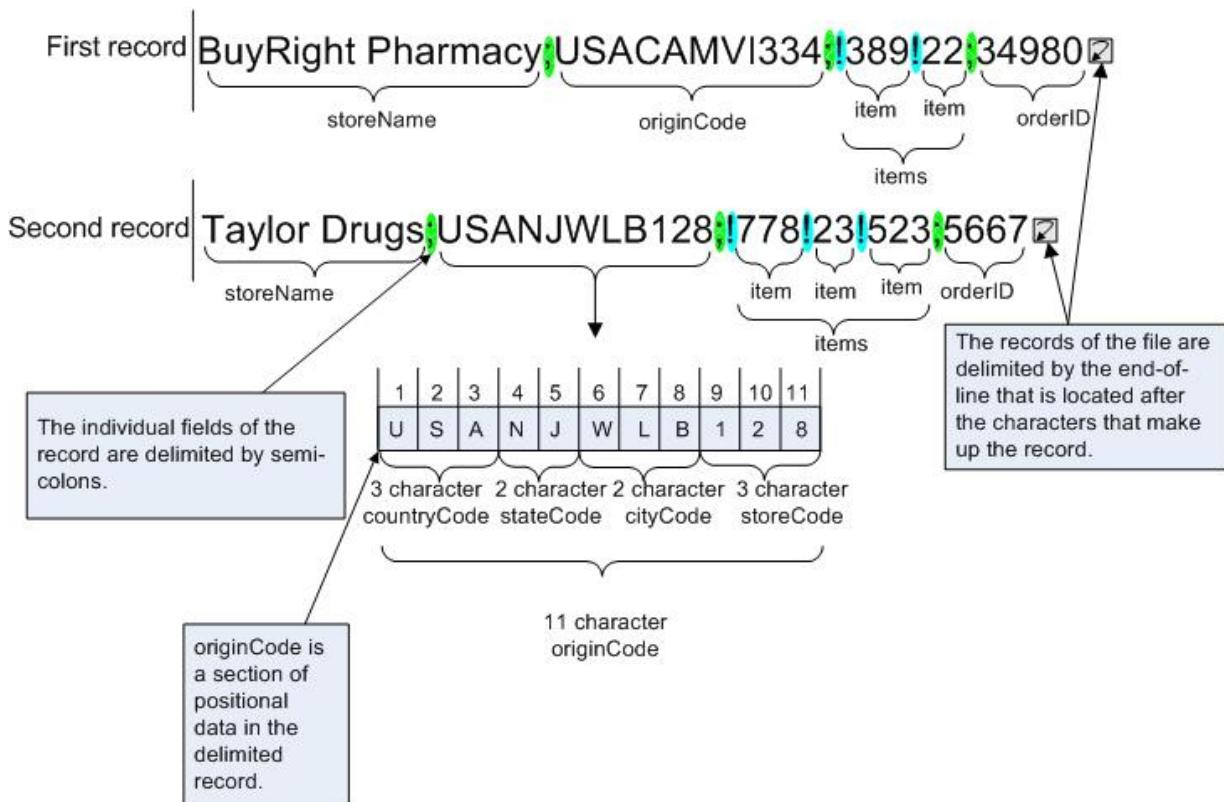

- **Fixed length or 'positional' data:** A Flat File Schema can describe fixed length or positional data. Many mainframe applications use positional data. Fixed-length data is shown in the following figure:

Positional or Fixed Length Data

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35
First record	H	A	N	F	O	R	D									S	U	S	A	N									7	7	3	5	7	9	
Second record	T	A	Y	L	O	R										C	A	T	H	E	R	I	N	E					6	7	8	9	1	4	

- **Mixed positional and delimited data** - A Flat File Schema can describe a mix of both delimited and positional data as shown in the following figure:

## Mix of Positional and Delimited Data

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Flat\\_File\\_Definition\\_Editor\\_Overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Flat_File_Definition_Editor_Overview.html)

## About delimited data

Delimited data is a collection of records or fields with variable lengths. Delimiters are used to signal the beginning or end of the record or field as shown in the following figure:

Figure 1. An example of delimited data where individual fields of the record are delimited by commas (LastName, FirstName and CustomerId), and the records of the file are delimited by the end of line.

## Delimited Data

Records can also have identifying codes, known as records IDs. In the data in [Figure 2](#), each record begins with a record ID and ends with a delimiter.

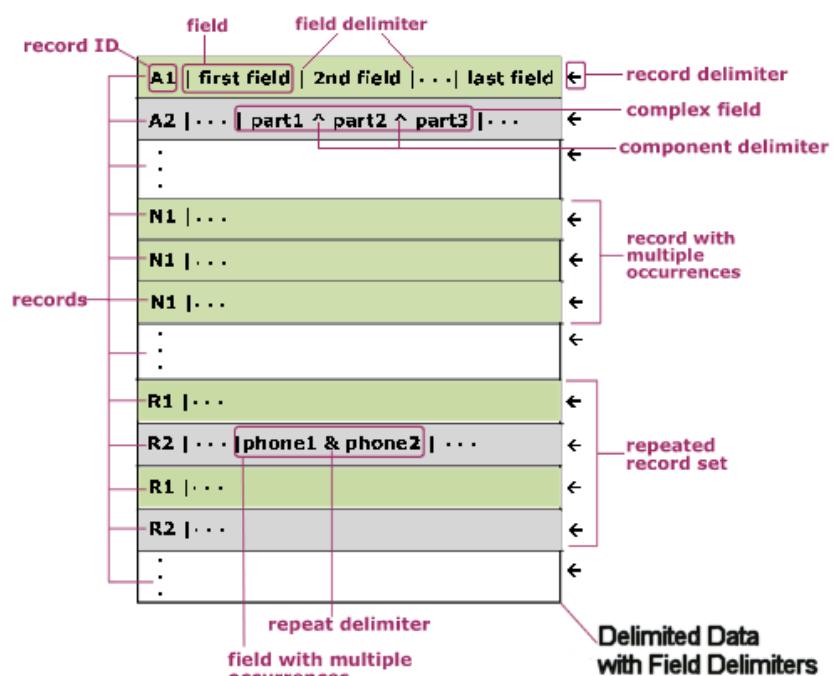

Figure 2. Records with identifying codes

As shown in [Figure 2](#), records can repeat individually; the end of the repetition is marked by the record ID of the next record. Records can also repeat as a set of records; the end of the repetition is marked by the record ID of the next record that is not in the set.

Records contain fields; each field begins with a field delimiter. Fields end with either the delimiter beginning in the next field or with the end of the record.

Fields can be complex, containing components that are delimited with a component delimiter. Fields can also contain multiple data values - they repeat and use a repeat delimiter between values as shown with the phone1 and phone2 fields.

To implement a Flat File Schema for this sample data with record IDs, you would map each characteristic of the data as shown in the following table:

Flat File Characteristic	Flat File Schema Implementation
Delimited format for the highest level of structure in the data	For the <a href="#">root node</a> set the Structure property to Delimited

Flat File Characteristic	Flat File Schema Implementation
Record delimiter	For the root node or a <a href="#">record node</a> set the child delimiter
Record IDs	<ul style="list-style-type: none"> <li>For the root node or a <a href="#">record node</a>, set the record identifier property to the respective ID value</li> <li>For the root node or a <a href="#">record node</a>, set the record identifier offset to 1</li> </ul>
Repeating records	For <a href="#">record nodes</a> , set the maximum occurrence property to unbounded or to a specific value
Repeating sets of records	Create a group node for each set and make the records in the set the content of the group
Field delimiter	Record nodes, set the child delimiter property
Repeating fields	Record nodes, set the repeat delimiter property
Complex fields	Define each as a subrecord that is child to the record containing the field
Components within complex fields	Define as field children in the subrecord
Component delimiter	Record node for the complex field, set the child delimiter property

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_About\\_Delimited\\_Data.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_About_Delimited_Data.html)

## About fixed length or 'positional' data

Fixed length or positional data are simple collections of records where each record has a known length. For example, the lastName field could contain the characters found between the 1 and the 16 character positions, as shown in [Figure 1](#):

Figure 1. Positional or Fixed Length Data example where a limited number of cells or boxes is allocated to each category, in this example: lastName, firstName, and customerID.

Positional or Fixed Length Data																																																																																																						
First record	<table border="1"> <tr> <td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td><td>11</td><td>12</td><td>13</td><td>14</td><td>15</td><td>16</td><td>17</td><td>18</td><td>19</td><td>20</td><td>21</td><td>22</td><td>23</td><td>24</td><td>25</td><td>26</td><td>27</td><td>28</td><td>29</td><td>30</td><td>31</td><td>32</td><td>33</td><td>34</td><td>35</td></tr> <tr> <td>H</td><td>A</td><td>N</td><td>F</td><td>O</td><td>R</td><td>D</td><td></td><td></td><td></td><td></td><td></td><td></td><td></td><td>S</td><td>U</td><td>S</td><td>A</td><td>N</td><td></td><td></td><td></td><td></td><td></td><td></td><td></td><td></td><td>7</td><td>7</td><td>3</td><td>5</td><td>7</td><td>9</td></tr> <tr> <td>T</td><td>A</td><td>Y</td><td>L</td><td>O</td><td>R</td><td></td><td></td><td></td><td></td><td></td><td></td><td></td><td>C</td><td>A</td><td>T</td><td>H</td><td>E</td><td>R</td><td>I</td><td>N</td><td>E</td><td></td><td></td><td></td><td></td><td>6</td><td>7</td><td>8</td><td>9</td><td>1</td><td>4</td></tr> </table>	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	H	A	N	F	O	R	D								S	U	S	A	N									7	7	3	5	7	9	T	A	Y	L	O	R								C	A	T	H	E	R	I	N	E					6	7	8	9	1	4	
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35																																																																				
H	A	N	F	O	R	D								S	U	S	A	N									7	7	3	5	7	9																																																																						
T	A	Y	L	O	R								C	A	T	H	E	R	I	N	E					6	7	8	9	1	4																																																																							
Second record																																																																																																						

As shown in [Figure 1](#), delimiters are not used to separate the characters between the following fields:

- lastName
- firstName
- customerID

For this example, the end-of-line delimiter is used to separate the data in the first and second records. You can define a Flat File Schema for a mix of positional and delimited data.

All data in the record is required because omitting the data would change the position of subsequent fields. If data is not available, spaces or zeros are added to pad out the field lengths as shown for the nickname and age fields in the following figure:

Figure 2. Padding using spaces or zeros

Susan Jane Susie Taylor 091 Catherine Erin	<?xml version="1.0" encoding="UTF-8"?> <NamePerson> <Names> <firstName>Susan      </firstName> <middleName>Jane      </middleName> <nickname>Susie      </nickname> <lastName>Taylor      </lastName> <age>091</age> </Names> <Names> <firstName>Catherine</firstName> <middleName>Erin      </middleName> <nickname/> <lastName>Halden      </lastName> <age>012</age> </Names> </NamePerson>
---	--

In the second line of data in the previous figure, no name is specified in for the nickname field - instead, there are spaces to pad out the missing nickname, so the string: Halden is correctly parsed as a last name. In addition, an extra zero was added to the front of the ages because the age field is three characters but the ages 12 and 91 are only two characters long.

Fields and records can repeat, but the number of repletions must be predefined in Studio and each record must have the same number of fields. For example, if you specified that the number of occurrences of the nickname field was equal to two, each record in the field must specify two nicknames or add spaces to pad for the missing nickname as shown in the following figure:

Figure 3. Padding with spaces

Susan Jane Susie Sue Taylor 091 Catherine Erin	<?xml version="1.0" encoding="UTF-8"?> <NamePerson> <Names> <firstName>Susan      </firstName> <middleName>Jane      </middleName> <nickname>Susie      </nickname> <nickname>Sue       </nickname> <lastName>Taylor      </lastName> <age>091</age> </Names> <Names> <firstName>Catherine</firstName> <middleName>Erin      </middleName> <nickname/> <nickname/> <lastName>Halden      </lastName> <age>012</age> </Names> </NamePerson>
---	--

For an example of parsing positional data, see the originNode of the [Mixed positional and delimited example](#).

## Mixed positional and delimited example

---

### About this task

---

This example shows how to build a Flat File Schema to parse a mix of positional and delimited data. To create a Flat File Schema, you must first analyze your Flat File data to determine what fields and nodes to add to the Flat File Schema. In this example, you create a Flat File Schema for the following two lines of data:

BuyRight Pharmacy;USACAMVI334;!389!22;34980;

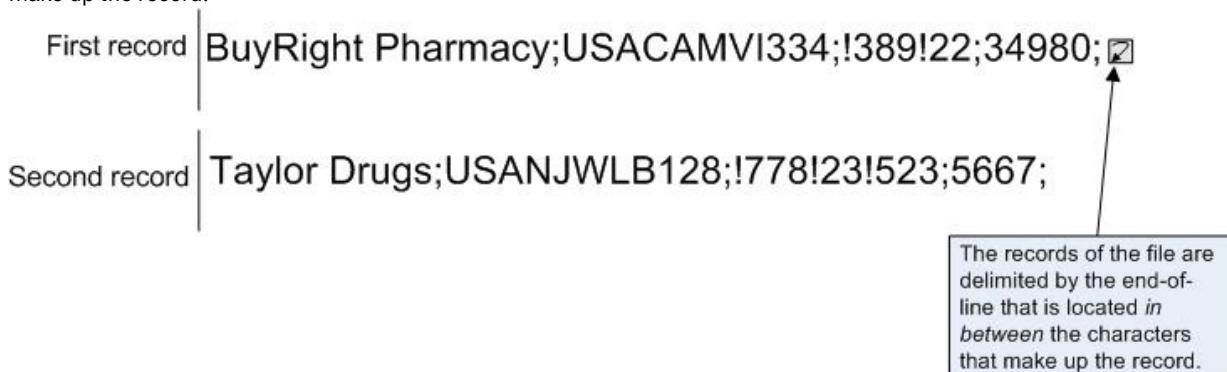

Taylor Drugs;USANJWLB128;!778!23!523;5667;

Use a top-down approach for defining the records and fields of the Flat File Schema as shown in the following steps:

## Procedure

1. Create a root node:
  - a. In the Project tab, right-click the Flat File Schemas folder and select New Flat File Schema. The Basic Wizard dialog box opens.
  - b. Enter Order in the Name field.
  - c. Click OK. The Flat File Schema Editor opens and the Flat File Schema is displayed beneath the Flat File Schemas folder in the Project tab. In addition, a root node of the same name shows in the Schema Layout tab.
2. Determine the highest level of structure in the data. In this example the largest structure is the two lines that each represent a record. The two records in this Flat File data are delimited by an end-of-line that is located in between the two records, as shown in [Figure 1](#):

Figure 1. Mixed example 1: the records of the file are delimited by the end-of-line that is located between the characters that make up the record.

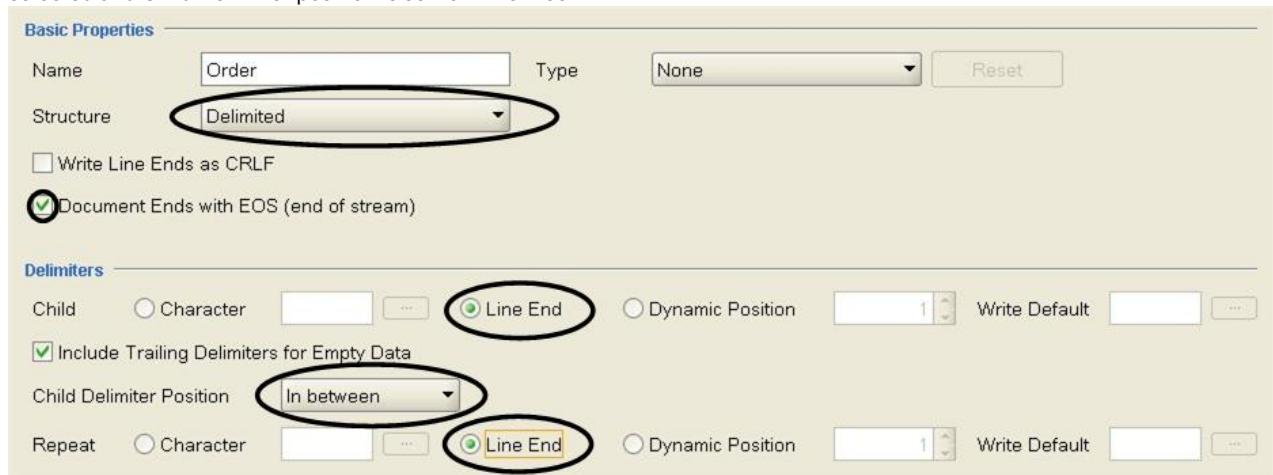

3. Configure the root node called Order to parse the child repeating records using the following criteria:

- o Separate the data into records using a delimiter.
- o Expect the document to end with an EOS (End Of Stream) because the last record does not end with a delimiter.
- o Use the end-of-line delimiter to delimit any child records.
- o Expect the delimiter in between the data.
- o Expect repeating child records.
- o Use the end-of-line delimiter to delimit the child repeating records.

Using these criteria, specify the following values for the Basic Properties and Delimiters pane of the Order node as shown in [Figure 2](#):

Figure 2. Mixed example pane 1 where Structure is Delimited and Document ends with EOS box ticked. The Line End option is selected and Child Delimiter position is set to In Between

- Add a child node to the root node to represent the records. In the Schema Layout tab, right-click the Order node. From the menu, select New Child > Record, enter purchaseOrder, and click OK.
- Determine the next level of structure in data. In this example, the next level of structure are the fields delimited by semicolons as shown in [Figure 3](#):

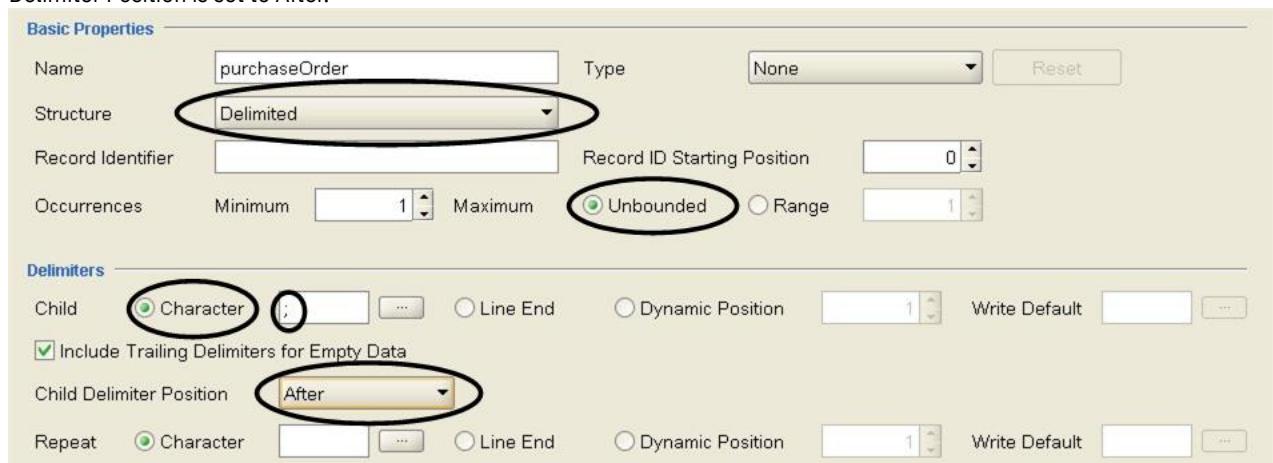

Figure 3. Mixed example 2: The individual fields of the record are delimited by semicolons.

- Configure the purchaseOrder node to parse these fields as described by following criteria:
  - The purchaseOrder node can have one or more occurrences.
  - Parse the data of the record into child fields using a delimiter.
  - Use the semicolon as the delimiter between the data.
  - Expect the delimiter after the data.

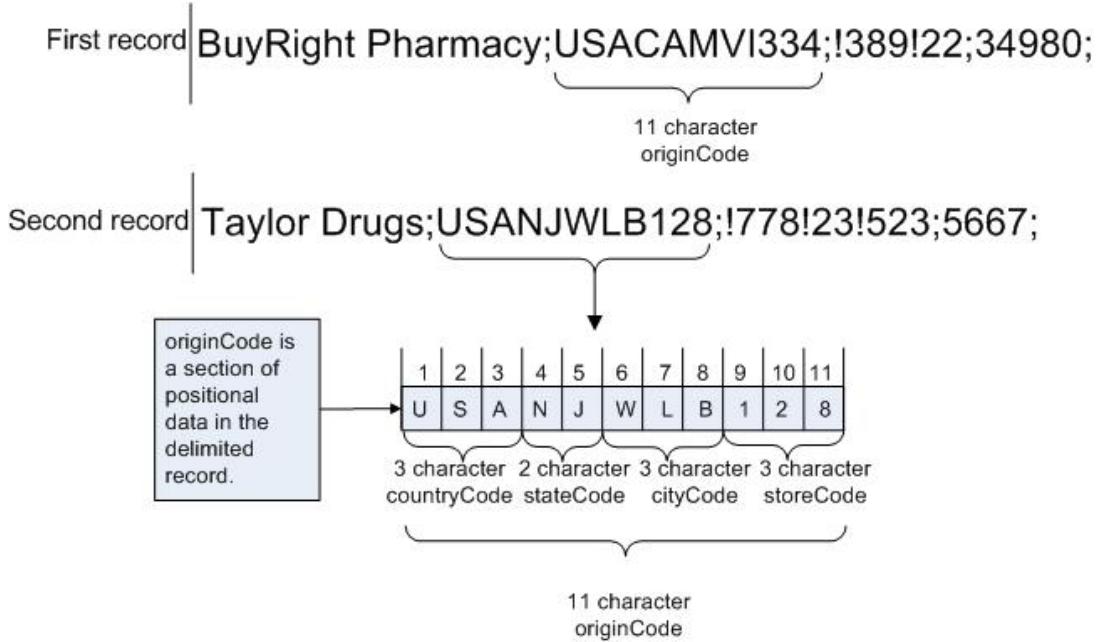

Using these criteria, specify the following values for the Basic Properties and Delimiters pane of the purchaseOrder node as shown in [Figure 4](#):

Figure 4. Mixed example pane 2: Structure is set to Delimited, Maximum unbounded and Character option selected. Child Delimiter Position is set to After.

- Add the fields of the purchaseOrder node by right-clicking the purchaseOrder node in the Schema Layout tab and selecting the New Children option from the list. The Bulk Add dialog box is displayed.
- In the Bulk Add dialog box, add all the child records and fields of the purchaseOrder node:
  - Click Add and change field1 to storeName. Leave the Node Type set to Field.
  - Click Add and change field2 to originCode. Change the Node Type to Record.
  - Click Add and change field3 to items. Change the Node Type to Record.
  - Click Add and change field4 to orderID. Leave the Node Type set to Field.
  - Click OK.
- Determine the next level of structure in data. In this example, the next level of structure is a set of positional data found in the originCode record as shown in [Figure 5](#):

Figure 5. Mixed example 3: originCode is a section of positional data in the delimited record.

10. Configure the originCode record to be positional:
  - a. In the Schema Layout tab, select the originCode node. The Basic Properties are displayed.
  - b. In the Structure list, select Positional.
11. Add the positional fields of the originCode node by right-clicking the originCode node in the Schema Layout tab and selecting the New Children option from the list. The Bulk Add dialog box opens.
12. In the Bulk Add dialog box, add all the child records and fields of the originCode node:
  - a. Click Add and change field1 to countryCode. Leave the Node Type set to Field.
  - b. Click Add and change field2 to stateCode. Leave the Node Type set to Field.
  - c. Click Add and change field3 to cityCode. Leave the Node Type set to Field.
  - d. Click Add and change field4 to storeCode. Leave the Node Type set to Field.
  - e. Click OK.
13. Configure the Positional Properties of each positional field. For each child node of the originCode node, click the node in the Schema Layout tab and at the end of the properties pane set the values of the Field Offset and Field Length as shown in the following list:

- o **countryCode** -
 

Positional Properties	
Field Offset: <input type="text" value="1"/>	Field Length: <input type="text" value="3"/>
- o **stateCode** -
 

Positional Properties	
Field Offset: <input type="text" value="1"/>	Field Length: <input type="text" value="2"/>
- o **cityCode** -
 

Positional Properties	
Field Offset: <input type="text" value="1"/>	Field Length: <input type="text" value="3"/>
- o **storeCode** -
 

Positional Properties	
Field Offset: <input type="text" value="1"/>	Field Length: <input type="text" value="3"/>

The Field Offset is calibrated from the current character location as the originCode string is being processed and not from the beginning of the originCode string for each field. In this example, the countryCode is processed and the first three characters of the originString are assigned to the countryCode. When the stateCode is processed, the current character location is already at the 3 character location, so the Field Offset of 1 of stateCode is added to the current character location to get the starting point for processing the stateCode string as shown in [Figure 6](#):

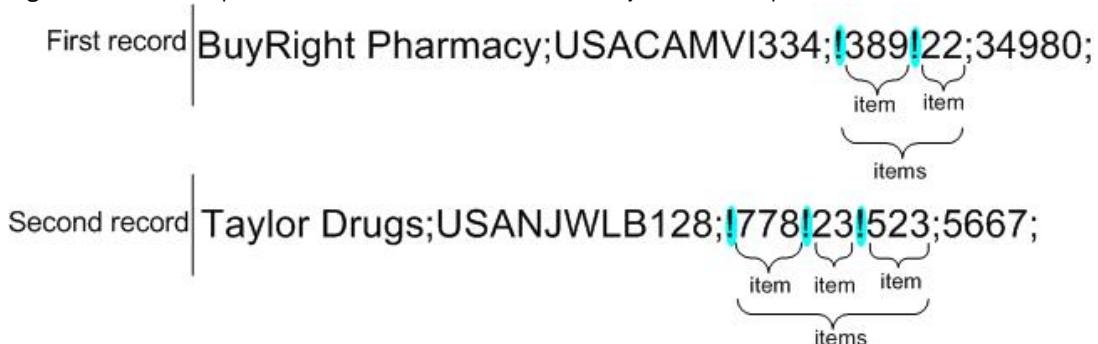

1	2	3	4	5	6	7	8	9	10	11
U	S	A	N	J	W	L	B	1	2	8

↑  
Current cursor location  
Field Offset location

Figure 6. Mixed Example 4 shows current cursor location and Field Offset.

14. Determine the next level of structure in data. In this example, the next level of structure are the repeating fields delimited by exclamation points as shown in [Figure 7](#):

Figure 7. Mixed example 5 where delimited data is indicated by exclamation points.

15. Configure the items node to parse child repeating records using the following criteria:

- o Separate the data into fields using a delimiter.
- o Use exclamation points as delimiters to delimit any child fields.
- o Expect the delimiter before the data.
- o Expect one or more repeating child fields.
- o Use exclamation points as delimiters to delimit the child repeating fields.

Using these criteria, specify the following values for the Basic Properties and Delimiters pane of the items node as shown in [Figure 8](#):

Figure 8. Mixed example pane 3 where Child Delimiter Position is set to Before.

The screenshot shows the configuration for the 'items' node. The 'Structure' dropdown is set to 'Delimited'. In the 'Delimiters' section, 'Child' is configured with a character delimiter '|'. 'Repeat' is also configured with a character delimiter '|'. The 'Child Delimiter Position' is set to 'Before', which is highlighted with a yellow oval. Other settings include 'Include Trailing Delimiters for Empty Data' checked and 'Record ID Starting Position' set to 0.

16. Add the repeating child field to the items node by right-clicking the items node in the Schema Layout tab and selecting the New Child > Field option from the list. The New Field dialog box opens.

17. In Field Name enter item and click OK.

18. Configure the item node to contain one or more occurrences as shown in [Figure 9](#):

Figure 9. Mixed example pane 4 where Maximum Repeat is set to Unbounded.

The screenshot shows the configuration for the 'item' node. The 'Type' is set to 'string'. Under 'Occurrences', there is a note: 'Optional-Field and delimiter (if applies) are omitted. Must be last field.' The 'Repeat' section shows 'Minimum' set to 1, 'Maximum' set to 'Unbounded' (which is highlighted with a yellow oval), and 'Range' set to 1.

The Flat File Schema is complete and ready to test.

19. Paste the following text into the left sub-pane of the test pane:

```
BuyRight Pharmacy;USACAMVI334;!389!22;34980;
```

```
Taylor Drugs;USANJWLB128;!778!23!523;5667;
```

This data is also provided in the mixedData.txt file. If you accepted the defaults during the installation of Studio, this file is located in the following directory: C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\FlatFileSchema

Attention: Do not add a carriage return after the last line.

20. Click the Test icon.

The Save Confirmation dialog box opens.

21. Click Yes. The following XML representation of the data is shown within the test pane:

```
<?xml version="1.0" encoding="UTF-8"?>
<Order>
    <purchaseOrder>
        <storeName>BuyRight Pharmacy</storeName>
        <originCode>
            <countryCode>USA</countryCode>
            <stateCode>CA</stateCode>
            <cityCode>MVI</cityCode>
            <storeCode>334</storeCode>
        </originCode>
        <items>
            <item>389</item>
            <item>22</item>
        </items>
        <orderId>34980</orderId>
    </purchaseOrder>
    <purchaseOrder>
        <storeName>Taylor Drugs</storeName>
        <originCode>
            <countryCode>USA</countryCode>
            <stateCode>NJ</stateCode>
            <cityCode>WLB</cityCode>
            <storeCode>128</storeCode>
        </originCode>
        <items>
            <item>778</item>
            <item>23</item>
            <item>523</item>
        </items>
        <orderId>5667</orderId>
    </purchaseOrder>
</Order>
```

22. In the Schema Layout tab, click the item node. In the right sub-pane of the test pane, the data parsed into the item node is highlighted as shown in [Figure 10](#):

Figure 10. The item node is highlighted

The screenshot shows the IBM WebSphere Cast Iron Studio interface. The left pane is titled 'Test File' and contains the input data: 'BuyRight Pharmacy;USACAMVI334;!389!22;34980;' and 'Taylor Drugs;USANJWLB128;!778!23!523;5667;'. The right pane is titled 'Schema Layout' and shows the XML structure. The 'item' node under the first purchaseOrder is highlighted in yellow, matching the highlighted lines in the Test File pane. The XML code is as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<Order>
    <purchaseOrder>
        <storeName>BuyRight Pharmacy</storeName>
        <originCode>
            <countryCode>USA</countryCode>
            <stateCode>CA</stateCode>
            <cityCode>MVI</cityCode>
            <storeCode>334</storeCode>
        </originCode>
        <items>
            <item>389</item>
            <item>22</item>
        </items>
        <orderId>34980</orderId>
    </purchaseOrder>
    <purchaseOrder>
        <storeName>Taylor Drugs</storeName>
        <originCode>
            <countryCode>USA</countryCode>
            <stateCode>NJ</stateCode>
            <cityCode>WLB</cityCode>
            <storeCode>128</storeCode>
        </originCode>
        <items>
            <item>778</item>
            <item>23</item>
            <item>523</item>
        </items>
        <orderId>5667</orderId>
    </purchaseOrder>
</Order>
```

23. Click the state node to view the data assigned into the state node.

Note: A reference implementation of the Order Flat File Schema is provided in the FlatFileSchemasExample project. To view and open the FlatFileSchemasExample project, follow steps 1 and 2 in the [Group Example](#) and double-click the Order Flat File Schema. The nodes of the Order Flat File Schema are displayed in the Schema Layout tab and the properties of the Order root node show in the right pane.

## Creating a flat file schema

---

### About this task

---

To create a Flat File Schema:

### Procedure

---

1. Select the Project tab from the Toolbox located on the right side of the main Studio pane.
2. To create a new Flat File Schema, choose from one of the following options:
  - o In the Project tab, right-click the Flat File Schemas folder and from the list select New Flat File Schema.
  - o In the Project tab, click New Flat File Schema ().
- The Basic Wizard dialog box is displayed.
3. Enter a [valid node name](#) for the Flat File Schema in the Name field.
4. Optional: If you want to use an existing Flat File Schema as a starting point, select the Inherit from an existing Flat File Schema check box. Click [...] to browse for the existing Flat File Schema from the Project Explorer dialog box, and click OK.
5. Click OK and press Enter. The Flat File Schema Editor opens and the Flat File Schema is displayed beneath the Flat File Schemas folder in the Project tab. Â In addition, a root node of the same name as the one shown in the Schema Layout tab.
6. Configure the root node:
  - a. Click the root node in the Schema Layout tab. The properties for the root node are displayed.
  - b. Configure the [root node properties](#).
7. Define the records, fields, and groups of the Flat File Schema for your Flat File data. Start from the outermost structure of data and work inwards. For an example on how to build a Flat File Schema from data see [Mixed positional and delimited example](#) or the "Developing the BookOrder Project" section of the *Getting Started Guide*.
8. Optional: You can select the Type Library tab and define the shared record types, group types, and field types for the data:
  - o [Add a Record Type](#) to define common record properties or content.
  - o [Add a Group Type](#) to define common group properties or content.
  - o [Add a Field Type](#) to define common field properties.
9. Select the Schema Layout tab, and add records, groups, and fields to the root node:
  - o [Add a Record](#) to define the major components of the message or for fields with complex structure.
  - o [Add a Group](#) to define a set of records or groups that repeat as a set.
  - o [Add a Field](#) to define the data within each record.
  - o [Add Several Children](#), of any type, to quickly build the content of records or groups.
10. [Test](#) the Flat File Schema.

The icons representing fields, field types, records, record types, groups, and group types are displayed in the Schema Layout and Type Library tabs as shown in the following table:

Node Type	Icon Displayed in Tabs
Field or field type that is not based on a field type	
Field or field type that is based on a field type	
Record or record type that is not based on a record type	
Record or record type that is based on a record type	
Group or group type that is not based on a group type	
Group or group type that is based on a group type

## Testing flat file schemas

---

### About this task

---

Test a flat file schema by completing the following steps:

### Procedure

---

1. [Create a flat file schema](#) or open an existing Flat File Schema by selecting it in the Project tab.
2. [Load input test data](#)
3. [Test a Flat File Schema](#) using the test data.
4. Optional: [Save test output data to a file](#).
  - [Load input test data](#)
  - [Test a Flat File Schema](#)
  - [Save test output data to a file](#)

**Parent topic:** [Flat File Schemas](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/testing\\_flat\\_file\\_schemas.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/testing_flat_file_schemas.html)

## Load input test data

---

### About this task

---

The format of the test data depends on how the Flat File Schema is used in your orchestration as described in the following examples:

- If your orchestration contains a Read Flat File activity that reads in Flat File data, test the Flat File Schema using the incoming Flat File Data. The resulting data from the test is XML data.
- If your orchestration contains a Write Flat File activity that writes in a Flat File data file, test the Flat File Schema using the incoming XML data. The resulting data from the test is Flat File data.

In the left input sub-pane of the test pane, you can enter the test data directly or load a test data from a file on the file system:

### Procedure

---

1. In the test pane, specify the path and the filename for the data file using one of the following options:
  - Enter the path and file name for the input data file into the Test File field.
  - Click Browse to navigate to the file:
    - a. In the Open Sample Data File dialog box, select the input data file.
    - b. Optional: Select an encoding for the input data, using one of the following options:

- From the encoding list located in the upper left side of the dialog box, select one of the default encoding types.

- Enter your encoding type directly by clicking in the encoding field and typing in your encoding type
- c. Click Open.

Note: The size of the data displayed and transformed is determined by the settings of the Flat File preferences. These settings are important when loading very large data files. For more information, see the Flat File section of the table in [Setting Preferences](#).

2. Optional: You can change the how the input data is displayed by clicking the Display in Hexadecimal ( ) icon to toggle between displaying the text in the following two ways:

- Display just the text.
- Display the hexadecimal representation next to the text.

Note: If the input data is displayed in hexadecimal form, you cannot test or edit the data.

## Test a Flat File Schema

---

### About this task

To test a Flat File Schema:

### Procedure

---

1. Click the Test () icon. The results pane is located on the right side of the test pane and shows the results of converting the sample data:
  - If the incoming data is Flat File data, the resulting data is an XML data.
  - If the incoming data is XML, the resulting data is Flat File data.
2. Optional: Change the font used to display the input and output data is displayed by clicking the following icons:
  - Click the Monospace font () button to display data using a font that displays each character with the same width. This option is useful for viewing positional text.
  - Click the Unicode font () button to display the input data using a font that supports double-byte characters.
3. Optional: Change the formatting used to display output data by clicking the following icons:
  - Click the Formatted () button to display XML output data formatted with carriage returns with indentation spacing of the XML elements.
  - Click the Unformatted () button to display the XML output data unformatted. During run time, the Integration Appliance produces the output XML data unformatted as shown when the Unformat button is selected.

# Save test output data to a file

---

## About this task

---

To save the test output data to a file:

## Procedure

---

1. Test sample data as described in [Test a Flat File Schema](#).
2. To save the test result data unformatted without carriage returns and indentation spacing of the XML elements, click the  Unformat button. During run time, the Integration Appliance produces the output XML data unformatted. If the Format () button is selected before saving the file, the carriage returns and spaces used to indent the XML elements are saved to the file.
3. When the resulting data displays in the results pane, click the Save () icon. The Save Test Result dialog box opens.
4. Browse for a directory on your computer where you want to save the result data file.
5. Enter the name and file extension for the result data file.
6. Click Save.

# Root node properties

---

When a root node is selected in the Schema Layout tab, the following two sections of properties are available in the pane: Basic Properties and Delimiters.

## Basic Properties

---

The Basic Properties of the root node are defined in the following table:

Property	Definition
Name	Specifies the name assigned to this Flat File Schema. When you create a Flat File Schema in the Project tab the name entered for the Flat File Schema is the default name of the root node. Attention: The root node name for a Flat File Schema must be a <a href="#">valid node name</a> .
Type	Optional: Specifies the record type used as a basis for the root node. Attention: Selecting a new type might reset some of the existing properties of the record with the new settings.
Reset	Resets properties that were set locally for this record to the values for the selected type. A Reset is only active if a record type has been selected from the Type list.
Structure	<ul style="list-style-type: none"><li>• Select <a href="#">Delimited</a> from the list if the outermost level of the structure in the data is determined by delimiters.</li><li>• Select <a href="#">Positional</a> from the list if the outermost level of the structure in the data is determined by their position.</li></ul>

Property	Definition
Write Line Ends as CRLF	Specifies how the Integration Appliance should write end of line characters when a Write Flat File activity creates outgoing data. If the receiving system for this data is a Windows platform, the Integration Appliance must write Line End characters as carriage return, line feed (CRLF). The default is to write Line End characters as a line feed (LF), the default for UNIX. The Integration Appliance accepts both line end characters (LF and CRLF) when parsing data.
Document Ends with EOS (end of stream)	Specifies that the end of the data is delimited with an end-of-stream (EOS) character for parsing incoming Flat File data in the Read Flat File activity or when producing Flat File data in the Write Flat File activity. End-of-stream might need to be specified for data where the transport mechanism treats the data as a stream rather than a file.

## Delimiters

If the Delimited option is selected for the Structure property for the root node, the following root node delimiter properties are active:

- Child Delimiter
- Include Trailing Delimiters for Empty Data
- Child Delimiter Position
- Repeat Delimiter

### Child Delimiters

The Child property defines the character that delimits children of the root node. This character is commonly called the record delimiter, segment delimiter, or line delimiter.

Specify the type of child delimiter by selecting one type from the three options listed in the following table:

Option	Definition
Character	<p>Specifies the character for the child delimiter. If the Character option is selected for the Child Delimiter, you must enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type in the Unicode value of the character. For example, enter /u0020 for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed.</li> </ul> <p>Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character.</p> <p>For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a>.</p>

Option	Definition
Line End	Specifies that the child delimiter is the end of the line, either a LF (line feed) or CRLF (carriage return, line feed). If the children are delimited with just a CR (carriage return), select the Character option and specify a CR (carriage return) character as the delimiter. The Integration Appliance accepts both line end characters (LF and CRLF) when parsing data. When writing data, the character used for line ends is determined by the Write Line Ends As CRLF property.
Dynamic Position	<p>Specifies that the character used as the child delimiter is defined dynamically within the data. Dynamic delimiters must show at a specific position within the first record of the data, such as in EDI or HL7 data. How the character is used by the Integration Appliance depends if the Flat File data is incoming or outgoing:</p> <ul style="list-style-type: none"> <li>• While parsing incoming Flat File data in the Read Flat File activity, the Integration Appliance reads the character at the specified position of the first record and uses it as a child delimiter to parse the rest of the data. The Write Default text field is not used when incoming Flat File data is read.</li> <li>• While writing outgoing Flat File data in the Write Flat File activity, the Integration Appliance uses the character specified in the Write Default text field to delimit the children of the root node. In addition, the specified character is written at the specified position of the first record in the outgoing data.</li> </ul>
Write Default	<p>Specifies the character that should be used as the child delimiter when the Integration Appliance writes outgoing data in the Write Flat File activity of the root node. In addition, the specified character is written at the specified position of the first record in the outgoing data. The character specified in this field is not used when incoming Flat File data is read in the Read Flat File activity. In the Write Default text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type in the Unicode value of the character. For example, enter /u0020 for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might display for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a></li> </ul>

#### Include Trailing Delimiters for Empty Data

Select the Include Trailing Delimiters for Empty Data check box to specify that delimiters for empty optional children must be present at the end of the record or field when the Integration Appliance writes outgoing Flat File data in the Write Flat File activity.

Clear this check box, if delimiters for empty optional children may be omitted.

This check box does not affect how the Integration Appliance reads incoming data because when reading data the Integration Appliance accepts either the absence or presence of delimiters with empty data.

### Child Delimiter Position

This property defines the position of record delimiters for data. Select one option from the following table:

Position	Definition
After	Specifies that the child delimiter marks the end of a child, including the last child in the data, as shown in the following example where the comma delimiter is shown after the fields: field1,field2,field3,  After is the most common position for record delimiters.
Before	Specifies that the child delimiter indicates the beginning of a child. The end of the last child is marked by the parent's delimiter as shown in the following example where the exclamation point delimiter is shown in <a href="#">Figure 1</a> .  !
In between	Specifies that delimiters are placed between children but do not show at either the beginning of the first child nor the end of the last child as shown in the following example, where the comma delimiter show in between the fields:  field1,field2,field3

Figure 1. Exclamation point delimiter in the Before position

```
!field1of1stRecord!field2of1stRecord!field3of1stRecord
!field1of2ndRecord!field1of2ndRecord!field1of2ndRecord
```

For an example with all three types of child delimiter positions, see [Mixed positional and delimited example](#).

### Repeat Delimiter

This property determines the delimiter used between repeated occurrences of one record in the Flat File data. Select one option from the following table:

Header	Header
Character	<p>Specifies the character for the repeat delimiter. If the Character option is selected for the Repeat Delimiter, you must enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type in the Unicode value of the character. For example, enter <code>/u0020</code> for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed.</li> </ul> <p>Select a character and click OK. Â If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character.</p> <p>For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: Â <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a>.</p>
Line End	<p>Specifies that the repeat delimiter is the end of the line, either a LF (line feed) or CRLF (carriage return, line feed). Â If the children are delimited with just a CR (carriage return), select the Character option and specify a CR (carriage return) character as the delimiter. The Integration Appliance accepts both line end characters (LF and CRLF) when parsing data. When writing data, the character used for line ends is determined by the Write Line Ends As CRLF property.</p>

Header	Header
Dynamic Position	<p>Specifies that the character used as the repeat delimiter is defined dynamically within the data. Dynamic delimiters must show at a specific position within the first record of the data, such as in EDI or HL7 data. How the character is used by the Integration Appliance depends if the Flat File data is incoming or outgoing:</p> <ul style="list-style-type: none"> <li>While parsing incoming Flat File data in the Read Flat File activity, the Integration Appliance reads the character at the specified position of the first record and uses it as a repeat delimiter to parse the rest of the data. The Write Default text field is not used when incoming Flat File data is read.</li> <li>While writing outgoing Flat File data in the Write Flat File activity, the Integration Appliance uses the character specified in the Write Default text field to delimit the repeating children of the root node. In addition, the specified character is written at the specified position of the first record in the outgoing data.</li> </ul>
Write Default	<p>Specifies the character that should be used as the child delimiter when the Integration Appliance writes outgoing data in the Write Flat File activity of the root node. In addition, the specified character is written at the specified position of the first record in the outgoing data. The character specified in this field is not used when incoming Flat File data is read in the Read Flat File activity. In the Write Default text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>Type in the character.</li> <li>Type if the Unicode value of the character. For example, enter /u0020 for the space character.</li> <li>Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might display for this character. For more information on any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a></li> </ul>

## Adding Fields or Field Types

---

### About this task

---

Why add fields?

You can define a field based on one of the following simple data types:

- boolean - true or false
- string - text in the specified encoding
- integer - whole numbers
- numeric - decimal numbers

You create fields in the Schema Layout tab. Fields are displayed in the Schema Layout tab using the following icon:

Fields that are based on a field type are displayed in the Schema Layout tab using the following icon:

Use records to model flat File data fields that have complex structures, such as components or subcomponents.

Why add Field Types?

You can define a field type with particular properties to be reused later. For example, if you wanted to create many fields that all use a double quotation mark as an encapsulation character, you could define a field type with the encapsulation character set to the double-quotes character and then create multiple fields based on this field type.

You create field types in the Type Library tab. Field types are displayed in the Type Library tab using the following icon:

Field types that are based on a field type are displayed in the Type Library tab using the following icon:

Adding Fields or Field Types

The procedure for adding fields and field types is identical except for the tab you initially select as described in the following procedure.

## Procedure

---

1. Open a Flat File Schema from the Project tab.
2. Select the appropriate tab:
  - To add a field, select the Schema Layout tab.
  - To add a field type, select the Type Library tab.
3. Select one of the following options from the list:
  - New Child > Field: To add a field as a child of the current node.
  - New Sibling > Field: To add a field as a sibling of the current node.
  - [New Children](#): to add child fields and records in bulk.
4. In the New Field dialog box, enter a valid node name in the Field Name field.
5. If this field should be based on a field type, select the field type from the Based on Field list.
6. Click OK. The field node () shows in the appropriate tree (Schema Layout or Type Library) and the field properties show in the properties pane to the right of the tree.
7. Specify the properties for the field or field type.

---

[Feedback](#) | [Notices](#)

Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/mde\\_Adding\\_Fields\\_or\\_Field\\_Types.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/mde_Adding_Fields_or_Field_Types.html)

## Field properties

---

When a field is selected in the Schema Layout tab or a field type is selected in the Type Library tab, the following properties sections display in the pane:

- Basic Properties
- Padding and Trimming
- Delimiters
- Positional Properties

## Basic Properties

---

The Basic Properties of a field are defined in the following table:

Property	Description
Name	Specifies the name of this field. Attention: The field name must be a <a href="#">valid node name</a> .
Type	Optional: Specifies the field type used as a basis for the field. The Type list is only active if a field type has been created. Attention: Selecting a new type might reset some of the existing properties of the field with the new settings.
Reset	Resets properties that have been set locally for this field to the values for the selected type.
Type	Specifies one of the following data types for the field: <ul style="list-style-type: none"> <li>• <b>string</b> - A text in the specified encoding</li> <li>• <b>boolean</b> - true or false</li> <li>• <b>integer</b> - any whole number</li> <li>• <b>numeric</b> - any decimal number</li> </ul>
Occurrences Optional	For delimited data, this check box specifies that both the field and its delimiter can be omitted from the data. For positional data there is no delimiter so just the field is just omitted. If the field can be empty but the delimiter must be present, then the field is considered required and this check box should not be selected. Attention: When specifying the optional property for a field, be careful not to create an ambiguous grammar for the Flat File Schema. For more information, see <a href="#">Specifying Optional Fields and Records</a> .
Repeat Minimum	Specifies the minimum number occurrences of the field.
Repeat Maximum	Controls repetitions of this single field. Select one of the following options: <ul style="list-style-type: none"> <li>• Unbounded - Specifies this field can repeat any number of times</li> <li>• Range - Specify the maximum number of repetitions for this field. The actual occurrences of the field can be less than or equal to this number.</li> </ul> Note: Multiple occurrences are only allowed when the parent node has specified a repeat delimiter.

## Padding and Trimming

---

Whether data is trimmed or padded depends on the following conditions:

- In the Read Flat File activity, when converting Flat File data to XML data, the characters of the Flat File field are *trimmed* before being placed into the corresponding XML field.
- In the Write Flat File activity, when converting XML data to Flat File Data, the characters of the XML element are *padded* before being placed into the corresponding Flat File field.

The Padding and Trimming properties of a field are defined in the following table:

Property	Description

Property	Description
Pad/Trim Character	<p>Specifies the single character used to pad the length of, or to trim from a field.</p> <p>In the Character text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>Type in the character.</li> <li>Type if the Unicode value. For example, enter /u0020 for the space character.</li> <li>Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a></li> </ul>
Pad to Length	<p>Specifies the final length of data for the field when converting XML data to Flat File Data in the Write Flat File activity. The specified padding characters are added to the data for the field up to this length. Typically the size of the padding is the same as the field.</p> <p>Note: This value specified in this field is not used while trimming Flat File data to XML data in the Read Flat File activity.</p>
Justification	<p>Specifies how what side of the field is padded or trimmed:</p> <ul style="list-style-type: none"> <li>Left - When the Left option is specified, the action that occurs depends on if the field is read or written: <ul style="list-style-type: none"> <li>Read Flat File activity - When the field is read, the specified trim characters are trimmed from the end of the field. For example, if the trim character is equal to a hyphen character, the Field Length is equal to 10, and the Flat File input field is equal to ---1234---. The result is the following XML element: &lt;element&gt;--1234&lt;/element&gt;.</li> <li>Write Flat File activity - When the field is written, the padding is added after the field data. For example, if the pad character is equal to a hyphen character, the Pad to Length is equal to 10, and the input XML element is equal to &lt;element&gt;1234&lt;/element&gt;, the result is the following Flat File field: 1234-----.</li> </ul> </li> </ul>
Â	<ul style="list-style-type: none"> <li>Right - When the Right option is specified, the action that occurs depends on if the field is being read or written: <ul style="list-style-type: none"> <li>Read Flat File activity - When the field is read, padding characters are trimmed from the beginning of the field. For example, if the trim character is equal to a hyphen character, the Field Length is equal to 10, and the Flat File input field is equal to ---1234---. The result is the following XML element: &lt;element&gt;1234---&lt;/element&gt;.</li> <li>Write Flat File activity - When the field is written, padding is added before the field data. For example, if the pad character is equal to a hyphen character, the Pad to Length is equal to 10, and the input XML element is equal to &lt;element&gt;1234&lt;/element&gt;, the result is the following Flat File field: -----1234. Â</li> </ul> </li> </ul>

## Delimiters

The Escape and Encapsulation Delimiters of a field are defined in the following table. These properties are only used if the parent record has the Delimited option selected for Structure property.

Property	Description

Property	Description
Escape character	<p>Specifies the single character used to escape delimiters within the data of the field. During run time, the Integration Appliance parses the character directly after this delimiter as a character, not as a delimiter.</p> <p>In the Character text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type in the Unicode value of the character. For example, enter /u0020 for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a></li> </ul>
Â	<p>For example, how is the following record parsed when no escape character is defined and the delimiter of the record is a colon?</p> <p>135:Caving: What You Really Need to Know:10</p> <p>The preceding Â record would be parsed into the following 4 fields:</p> <ul style="list-style-type: none"> <li>• 135</li> <li>• Caving</li> <li>• What You Really Need to Know</li> <li>• 10</li> </ul> <p>If you do not want the <i>Caving What You Really Need to Know</i> title broken up into two fields, you can specify an escape character of backslash and preface the colon with a backslash character as shown in the following record:</p> <p>135:Caving/: What You Really Need to Know:10</p> <p>When this Flat File record is parsed with the escape character before the colon, the title is not broken up into two sections even though the record uses the colon as a delimiter.</p>
Dynamic Position	<p>Specifies the character position, starting from 1, where the escape character is defined in the first record. Â The escape character is determined at run time using the character found at the specified character position. For example, how is the following record parsed when no encapsulation character is defined and the delimiter of the record is a colon?</p> <p>135:Caving: What You Really Need to Know:10</p> <p>The preceding Â record would be parsed into the following 4 fields:</p> <ul style="list-style-type: none"> <li>• 135</li> <li>• Caving</li> <li>• What You Really Need to Know</li> <li>• 10</li> </ul> <p>If you do not want the <i>Caving What You Really Need to Know</i> title broken up into two fields, you can specify a Dynamic Position of 11 and add a backslash character before the colon as shown in the following record:</p> <p>135:Caving/: What You Really Need to Know:10</p> <p>The escape character is now equal to the 11th character in the record: the backslash character. When this Flat File record is now parsed with the escape character is equal to the backslash character, the colon after Caving does not break this field into two sections even though the record uses the colon as a delimiter.</p>

Property	Description
Write Default	<p>Specifies the escape character to use when writing this field as Flat File data. Write Default is only used in the Write Flat File activity when converting XML data to Flat File data. Write Default is not used when converting Flat File data to XML data in the Read Flat File activity.</p> <p>In the Write Default text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>Type in the character.</li> <li>Type in the Unicode value of the character. For example, enter /u0020 for the space character.</li> <li>Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a></li> </ul> <p>For example, you wanted to escape the colon with a backslash in the <code>&lt;title&gt;Caving: What You Really Need to Know&lt;/title&gt;</code>. XML element, when converting it to Flat File data, specify a backslash in the Write Default field. The runtime result for this field is the following string:</p> <pre>Caving\: What You Need to Know</pre> <p>The character position specified in the Dynamic Position field is not used when an XML element is converted to Flat File data.</p>
Encapsulation Character	<p>Specifies a delimiter character to encapsulate data in the field because the field could contain character(s) that are being used to delimit this field in the parent record.</p> <p>In the Character text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>Type in the character.</li> <li>Type in the Unicode value of the character. For example, enter /u0020 for the space character.</li> <li>Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a></li> </ul>
Â	<p>For example, how is the following record parsed when no encapsulation character is defined and the delimiter of the record is a colon?</p> <pre>135:Caving: What You Really Need to Know:10</pre> <p>The preceding Â record would be parsed into the following 4 fields</p> <ul style="list-style-type: none"> <li>• 135</li> <li>• Caving</li> <li>• What You Really Need to Know</li> <li>• 10</li> </ul> <p>If you do not want the <i>Caving What You Really Need to Know</i> title broken up into two fields, you can specify the encapsulation character to be a double quotation mark and surround the book title with double quotation marks as shown in the following record:</p> <pre>135:"Caving: What You Really Need to Know":10</pre> <p>When this Flat File record is now parsed with the encapsulation character set to double quotation marks, the colon after Caving does not break this field into two sections even though the parent record uses the colon as a delimiter. The Integration Appliance reads all the characters between two encapsulation delimiters as characters rather than delimiters.</p>

Property	Description
Dynamic Position	<p>Specifies the character position, starting from 1, where the delimiter is defined in the first record. The encapsulation delimiter is determined at run time using the character found at the specified character position</p> <p>For example, how is the following record parsed when no encapsulation character is defined and the delimiter of the record is a colon?</p> <p>135:Caving: What You Really Need to Know:10</p> <p>The preceding record would be parsed into the following 4 fields:</p> <ul style="list-style-type: none"> <li>• 135</li> <li>• Caving</li> <li>• What You Really Need to Know</li> <li>• 10</li> </ul> <p>If you do not want the <i>Caving What You Really Need to Know</i> title broken up into two fields, you can specify the Dynamic Position of 5 and surround the book title with double quotation marks and as shown in the following record:</p> <p>135:"Caving: What You Really Need to Know":10</p> <p>The encapsulation character is equal to the 5th character in the record: the double quotation mark character. When this Flat File record is now parsed with the encapsulation character is equal to the double quotation mark character, the colon after Caving does not break this field into two sections even though the record uses the colon as a delimiter. The Integration Appliance reads all the characters between two encapsulation delimiters as characters and not delimiters.</p>
Write Default	<p>Specifies the encapsulation character to use when writing this field as Flat File data. Write Default is only used in the Write Flat File activity when converting XML data to Flat File data. The Write Default is not used when converting Flat File data to XML data in the Read Flat File activity.</p> <p>In the Write Default text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type in the Unicode value of the character. For example, enter /u0020 for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a>.</li> </ul>
Â	<p>For example, you wanted to encapsulate the data found in the &lt;title&gt;Caving: What You Really Need to Know&lt;/title&gt; XML element with quotation marks when converting it to Flat File data, specify the double quotation marks in the Write Default field. The runtime result for this field is the following string:</p> <p>"Caving: What You Need to Know"</p> <p>The character position specified in the Dynamic Position field is not used when an XML element is converted to Flat File data.</p>

## Positional Properties

The Positional Properties of a field are defined in the following table. These properties are only active if the parent record has the Positional option selected for Structure property.

Field	Description
Field Offset	Specifies the number of characters to skip, starting from the end of the previous field, to reach the beginning of this field.

Field	Description
Field Length	Specifies the length of the data for this field.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_field\\_properties.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_field_properties.html)

## Adding Records or a Record Type

---

### About this task

Why add records?

You use records to define the structure of your Flat File data. Records can contain fields, groups, or other records. ▶ Records that are children of another record are used to model fields with a complex structure. Records can also be used to define additional layers of hierarchy of the data.

The fields and subrecords of a record are parsed using one of the following methods:

- **Delimited:** The fields and child records within the record use delimiters to define their beginning and end points. Some delimited formats use record IDs as identifiers and beginning delimiters. For examples of defining records that parse delimited data, see the following examples:
  - [Mixed positional and delimited example](#)
  - "Developing the BookOrder Project" section of the *Getting Started Guide*
- **Positional:** the fields within the record use no delimiters but are defined instead by their position and length. Positional fields are also known as fixed-length fields. For an example of defining a record that parses positional data, see [Mixed positional and delimited example](#).

You create records in the Schema Layout tab. Records that contain child records and fields and are not based on a record type are displayed in the Schema Layout tab using the following icon:

Records that are based on a record type are displayed in the Schema Layout tab using the following icon:

Why Add Record Types?

Record types define a set of record properties, fields, and child records that can be reused by multiple records. ▶ For example, you could define an address record type that contains a street field, a city field, a state field, and a zip code field. You could then use the address record type as the basis of all the addresses in the Flat File Schema, for example to define the shipping address record and the billing address record.

You create record types in the Type Library tab. Record types that contain child records and fields and are not based on a record type are displayed in the Type Library tab using the following icon:

Record types that are based on a record type are displayed in the Type Library tab using the following icon:

Note:

- Record types are only reusable to the current Flat File Schema and are not global to the project.

- Records based on a record type can only inherit child nodes from the record type. Child nodes cannot be added to a record that is based on a record type.
- The child nodes inherited from the record type are only visible in the Type Library tab and are not visible in the Schema Layout tab.
- Record types can also be based on other record types, inheriting both properties and children from parent record types.

To add a record or a record type:

## Procedure

---

1. Open a Flat File Schema from the Project tab.
2. Select the appropriate tab:
  - To add a record, select the Schema Layout tab.
  - To add a record type, select the Type Library tab.
3. Right-click a node in the tab and select one of the options in the list:
  - New Child > Record: To add a record as a child of the current node. Records can only be children of the root node, another record, or a group.
  - New Sibling > Record: To add a record as a sibling after the current node.
  - New Children: to add child fields and records in bulk.
4. Enter a [valid node name](#) for the new record in the New Record pane.
5. If this record should be based on a record type, select the record type from the Based on Record list.
6. Click OK. The record node is shown in the appropriate tab (Schema Layout or Type Library) and record properties display in the Properties pane.
7. Specify the properties for the record or record type.
8. If you are creating a new record not based on a record type, add fields, groups, or records to define the content of the record. If you based the record on a record type, the record is complete and because the content of the record is defined by the record type.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/mde\\_Adding\\_Records\\_or\\_a\\_Record\\_Type.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/mde_Adding_Records_or_a_Record_Type.html)

## Record properties

---

When a record is selected in the Schema Layout tab or a record type is selected in the Type Library tab, the following sections of properties are available in the pane:

- Basic Properties
- Delimiters

## Basic Properties

---

The Basic Properties of a record are defined in the following table:

Property	Description
Name	Specifies the name of this record. Attention: The field name must be a <a href="#">valid node name</a> .
Type	Optional: Specifies the record type used as a basis for the record. The Type list is only active if the selected record node does not contain any children and a record type has been created. A record cannot inherit fields or subrecords from a record type if the record contains children. Attention: Selecting a new type might reset some of the existing properties of the record with the new settings.

Property	Description
Reset	Resets properties that have been set locally for this record to the values for the selected type. Reset is only active if a record type has been selected from the Type list.
Structure	<ul style="list-style-type: none"> <li>Specify Delimited if the structure of the record is determined by delimiters.</li> <li>Specify Positional if the structure of the record is determined positions in the record.</li> </ul>
Record Identifier	Specifies the unique string that identifies this record. Record identifiers are called segment IDs in X.12 message standards such as EDI or HL7, and typically begin each record.
Record ID Starting Position	Specifies the character position where the record ID begins after the end of the previous record. The default is 0, which places the record ID at the beginning of the record.
Minimum Occurrences	Specifies the minimum number of repetitions for this record. The default is 1, which means the record is required. Specify 0 if this record is optional. <b>WARNING:</b> When specifying the optional property for a record, be careful not to create an ambiguous grammar for the Flat File Schema. For more information, see Specifying Optional Fields and Records.
Maximum Occurrences	Controls repetitions of the single record. Select one of the following options: Unbounded - Specifies this record can repeat any number of times. Range - Specify the maximum number of repetitions for this record. The actual occurrences in a specific message can be less than or equal to this limit. <b>NOTE:</b> Multiple occurrences are only allowed when the parent node has specified

## Delimiters

---

If the Delimited option is selected for the Structure property for the record, the following record delimiter properties are active:

- Child Delimiter
- Include Trailing Delimiters for Empty Data
- Child Delimiter Position
- Repeat Delimiter

Child delimiters

### Child Delimiters

The Child property defines the character that delimits children of the record. This character is commonly called the record delimiter, segment delimiter, or line delimiter.

Specify the type of child delimiter by selecting one type from the three options listed in the following table:

Option	Definition

O pt io n	<b>Definition</b>
Character	<p>Specifies the character for the child delimiter. If the Character option is selected for the Child Delimiter, you must enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>Type in the character.</li> <li>Type in the Unicode value of the character. For example, enter <code>/u0020</code> for the space character.</li> <li>Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed.</li> </ul> <p>Select a character and click OK. Â If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character.</p> <p>For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a>.</p>
Lined	<p>Specifies that the child delimiter is the end of the line, either a LF (line feed) or CRLF (carriage return, line feed). If the children are delimited with just a CR (carriage return), select the Character option and specify a CR (carriage return) character as the delimiter. The Integration Appliance accepts both line end characters (LF and CRLF) when parsing data. When writing data, the character used for line ends is determined by the Write Line Ends As CRLF property.</p>
Dynamically Positio	<p>Specifies that the character used as the child delimiter is defined dynamically within the data. Dynamic delimiters must show at a specific position within the first record of the data, such as in EDI or HL7 data. How the character is used by the Integration Appliance depends if the Flat File data is incoming or outgoing:</p> <ul style="list-style-type: none"> <li>While parsing incoming Flat File data in the Read Flat File activity, the Integration Appliance reads the character at the specified position and uses it as a child delimiter to parse the rest of the data. The Write Default text field is not used when incoming Flat File data is read.</li> <li>While writing outgoing Flat File data in the Write Flat File activity, the Integration Appliance uses the character specified in the Write Default text field to delimit the children of the record. In addition, the specified character is written at the specified position of the first record in the outgoing data.</li> </ul>
Write Default	<p>Specifies the character that should be used as the child delimiter when the Integration Appliance writes outgoing data in the Write Flat File activity. In addition, the specified character is written at the specified position of the first record in the outgoing data. The character specified in this field is not used when incoming Flat File data is read in the Read Flat File activity.</p> <p>In the Write Default text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>Type in the character.</li> <li>Type in the Unicode value of the character. For example, enter <code>/u0020</code> for the space character.</li> <li>Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. Â If the selected character does not have a visual symbol, a mnemonic or the Unicode value might display for this character.</li> </ul> <p>For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a></p>

#### Include Trailing Delimiters for Empty Data

Select the Include Trailing Delimiters for Empty Data check box to specify that delimiters for empty optional children must be present at the end of the record or field when the Integration Appliance writes outgoing Flat File data in the Write Flat File activity.

Clear this checkbox, if delimiters for empty optional children might be omitted.

This check box does not affect how the Integration Appliance reads incoming data because when reading data the Integration Appliance accepts either the absence or presence of delimiters with empty data.

#### Child Delimiter Position

This property defines the position of record delimiters for data. Select one option from the following table:

Position	Definition

<b>Position</b>	<b>Definition</b>
After	Specifies that the child delimiter marks the end of a child, including the last child in the data. After is the most common position for record delimiters.
Before	Specifies that the child delimiter indicates the beginning of a child. The end of the last child is marked by the delimiter of the parent.
In between	Specifies that delimiters are placed between children but do not show at either the beginning of the first child nor the end of the last child.

For an example with all three types of child delimiter positions, see [Mixed positional and delimited example](#).

#### **Repeat Delimiter**

This property determines the delimiter used between repeated occurrences of one record in the Flat File data. Select one option from the following table:

P o s i t i o n	<b>Definition</b>
C h ar ac te r	Specifies the character for the repeat delimiter. If the Character option is selected for the Repeat Delimiter, you must enter a single character using one of the following actions: <ul style="list-style-type: none"> <li>Type in the character.</li> <li>Type in the Unicode value of the character. For example, enter /u0020 for the space character.</li> <li>Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed.</li> </ul> Select a character and click OK. Â If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character. <p>For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a>.</p>
Li n e E n d	Specifies that the repeat delimiter is the end of the line, either a LF (line feed) or CRLF (carriage return, line feed). Â If the children are delimited with just a CR (carriage return), select the Character option and specify a CR (carriage return) character as the delimiter. The Integration Appliance accepts both line end characters (LF and CRLF) when parsing data. When writing data, the character used for line ends is determined by the Write Line Ends As CRLF property.
D y n a m ic P os iti o n	Specifies that the character used as the repeat delimiter is defined dynamically within the data. Dynamic delimiters must show at a specific position within the first record of the data, such as in EDI or HL7 data. How the character is used by the Integration Appliance depends if the Flat File data is incoming or outgoing: <ul style="list-style-type: none"> <li>While parsing incoming Flat File data in the Read Flat File activity, the Integration Appliance reads the character is the specified position and uses it as a repeat delimiter to parse the rest of the data. The Write Default text field is not used when incoming Flat File data is read.</li> <li>While writing outgoing Flat File data in the Write Flat File activity, the Integration Appliance uses the character specified in the Write Default text field to delimit the repeating children of the root node. In addition, the specified character is written at the specified position of the first record in the outgoing data.</li> </ul>

<b>P o si ti o n</b>	<b>Definition</b>
W rit e  D ef a ul t	<p>Specifies the character that should be used as the repeat delimiter when the Integration Appliance writes outgoing data in the Write Flat File activity. In addition, the specified character is written at the specified position of the first record in the outgoing data. The character specified in this field is not used when incoming Flat File data is read in the Read Flat File activity.</p> <p>In the Write Default text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type if the Unicode value of the character. For example, enter /u0020 for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK.</li> </ul> <p>Â If the selected character does not have a visual symbol, a mnemonic or the Unicode value might display for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a></p>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_record\\_properties.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_record_properties.html)

## Adding Groups or Group Types

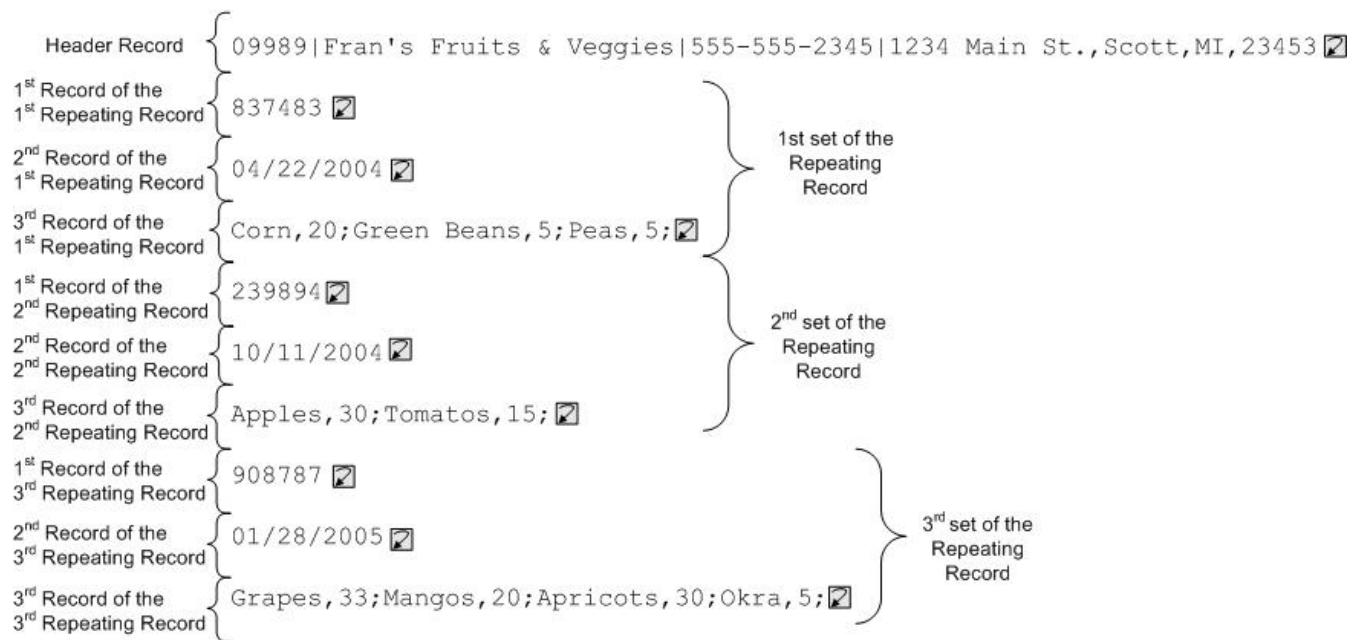

---

### About this task

Why add groups?

Groups allow you to define repeated occurrences of sets of records, for example the groups that are used with EDI messages to define loops. Groups are only required when the data does not provide any additional delimiters or structure to clearly mark the beginning and end of repetitions that contain more than one record. Â The following example data shows a repeating set of records that can be defined using groups:

## Using Groups to Define Repeating Sets of Data

Groups can contain any number of records or other groups. Groups cannot contain fields. For an example of using a group to model the preceding input Flat File data, see [Group Example](#).

You create groups in the Schema Layout tab. Groups that are not based on a group type are displayed in the Schema Layout tab using the following icon:

Groups that are based on a group type are displayed in the Schema Layout tab using the following icon:

Note: Groups are not global to the project and can only be reused in the current Flat File Schema.

### Why Add Group Types?

Group types allow you to define a set of repeating records or groups once and then use it many times within a Flat File Schema. Both the occurrence properties and the content you define in a group type are inherited by any group based on that type.

Note:

- Groups based on a group type cannot contain any other content besides the nodes inherited from the group type.
- The content inherited from the group type is not visible in the Schema Layout tab.
- Group types can also be based on other group types.
- Group types are not global to the project and can only be reused in the current Flat File Schema.

Create group types in the Type Library tab. Group types that are not based on a group type are displayed in the Type Library tab using the following icon:

Group types that are based on a group type are displayed in the Type Library tab using the following icon:

### Adding Groups or Group Types

The procedure for adding groups and group types is identical except for the tab you initially select as described in the following procedure. To add a group or group type:

## Procedure

1. Open a Flat File Schema from the Project tab.
2. Select the appropriate tab:

- o To add a group, select the Schema Layout tab.
  - o To add a group type, select the Type Library tab.
3. Select the appropriate tab:
- o To add a group, select the Schema Layout tab.
  - o To add a group type, select the Type Library tab.
4. Select one of the following options from the list:
- o New Child > Group: To add a group as a child of the current node.
  - o New Sibling > Group: To add a group as a sibling of the current node.
  - o **New Children:** to bulk add groups as a child of the current group or record.
5. In the New Group dialog box, enter a [valid node name](#) in the Group Name field.
6. If this group should be based on a group type, select the group type from the Based on Group list.
7. Click OK. The group node is shown in the appropriate tab (Schema Layout or Type Library) and group properties display in the Basic Properties pane.
8. Specify the properties for the group.
- If this group is based on a group type that defines the content for the group, the group is complete. If not, define the content of the group.

<file:///dcs/markdown/workspace/Transform/out.html>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/mde\\_Adding\\_Groups\\_or\\_Group\\_Types.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/mde_Adding_Groups_or_Group_Types.html)

## Group Properties

When a group is selected in the Schema Layout tab, the Basic Properties of a group are displayed. When a group type is selected in the Type Library tab, the Basic Properties of the group type are displayed. The Basic Properties of a group or group type are listed in the following table:

Field	Description
Name	Specifies the name of this field. Attention: The field name must be a <a href="#">valid node name</a> .
Type	Optional: Specifies the group type used as a basis for the group. The Type list is only active if the selected group node does not contain any children and a group type has been created. A group cannot inherit groups or records from a group type if the group contains children. Attention: Selecting a new type may reset some of the existing properties of the field with the new settings.
Reset	Resets properties that were set locally for this group to the values for the selected type. Reset is only active if a group type has been selected from the Type list.
Minimum Occurrences	Specifies the minimum occurrences for the group. Defaults to 1, making the group required. Select 0 if this group is optional.
Maximum Occurrences	Specifies the maximum occurrences for the group: <ul style="list-style-type: none"> <li>• Unbounded - Specifies this group can repeat any number of times. Unbounded, optional groups must contain at least one required record.</li> <li>• Range - Specifies the maximum number of repetitions for this group. The actual occurrences of the group can be less than or equal to this number.</li> </ul>

## Group Example

### About this task

This example shows a Flat File Schema that parses a repeating set of records using groups. Each set of the repeating record contains records of different types as shown in the following example input Flat File data:

Figure 1. An example input Flat File

In this example data, the first, second, and third records of the repeating set are each a different type of record. In addition, this example shows how types stored in the Type Library tab are used in a Flat Files Schema. In this example, you view and test an existing Flat File Schema rather than creating the Flat File Schema from scratch.

To open, view, and test the Flat File Schema used to parse the input data displayed in Figure 1:

### Procedure

1. In this example, the Flat File Schema is already built in the FlatFileSchemasExample project. To view the Flat File Schema, you must first extract the FlatFileSchemasExample project:
  - a. Find the Default Create Path defined in Studio - the directory that new projects are created in. To view the current Default Create Path, select File > Preferences... from the Studio toolbar menu. The Preferences dialog opens. The current Default Create Path shows at the end of the pane. By default, the Default Create Path is located in the following directory:

C:\Documents and Settings\myLogin\My Documents

Where *myLogin* represents your Windows login name.
  - b. Find the FlatFileSchemasExample.zip file that contains the files that make up the FlatFileSchemasExample project. If you accepted the defaults during the installation of Studio, this file is located in the following directory:

C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\FlatFileSchema
  - c. Copy the FlatFileSchemasExample.zip file from the FlatFileSchema directory to the Default Create Path directory.
  - d. Extract the contents of FlatFileSchemasExample.zip file into the Default Create Path directory.
2. Open the FlatFileSchemasExample project:
  - a. Select File > Open Project... from the Studio toolbar menu. The Open dialog box shows.

- b. Browse for and open the FlatFileSchemasExample directory.
  - c. Click the FlatFileSchemasExample.sp3 file and click Open. The project is displayed.
3. Open the prebuilt vegPO Flat File Schema. In the Flat File Schemas folder of the Project tab, double-click the vegPO Flat File Schema. The nodes of the vegPO Flat File Schema are displayed in the Schema Layout tab and the properties of the vegPO root node show in the right pane.
4. Test the vegPO Flat File Schema:
- a. In the test pane, click Browse. The Open Sample Test Data File dialog box opens.
  - b. Browse for the vegPO.txt file that contains the input data. If you accepted the defaults during the installation of Studio, this file is located in the following directory:
- C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\FlatFileSchema
- c. Click Open. The input data from the vegPO.txt file shows in the left pane of the Test tab.
  - d. Click the Test (play) icon. In the results pane, the result of the conversion is displayed as XML data.
5. In the Schema Layout tab, click the vegPO root node. The vegPO root node is displayed with the following properties:
- a. Structure property is equal to Delimited - The structure of the root node is delimited.
  - b. Child delimiter is equal to Line End- The child records are delimited by an end-of-line.
  - c. Child Delimiter Position is equal to After - Expect the delimiters after each record
  - d. Repeat delimiter is equal to Line End- Repeating records are also delimited by end-of-line.
6. In the Schema Layout tab, click the orderingStore node. The first line of the input data is highlighted within the test pane as shown in the following figure:

**vegPO**

**Basic Properties**

Name	orderingStore
Structure	Delimited
Record Identifier	
Occurrences	Minimum 1

**Delimiters**

Child	Character
<input checked="" type="checkbox"/> Include Trailing Delimiters for Empty Data	
Child Delimiter Position	In between
Repeat	Character

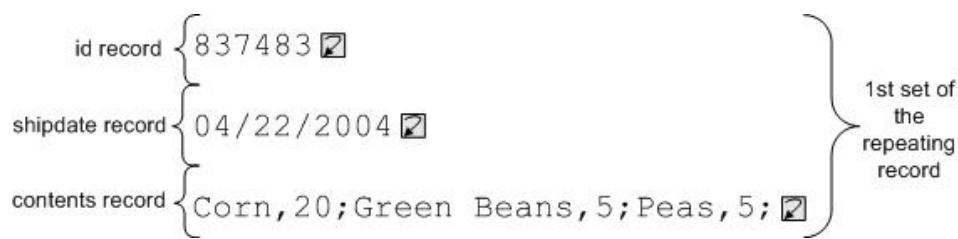

**Test File** \Cast Iron Studio 3.6\Samples\FlatFileSchema\vegPO.txt

```
09989|Fran's Fruits & Veggies|555-555-2345|1234 Main St., Scott, MI, 23453
837483
04/22/2004
Corn,20;Green Beans,5;Peas,5;
239894
10/11/2004
Apples,30;Tomatos,15;
908787
01/28/2005
Grapes,33;Mangos,20;Apricots,30;Okra,5;
```

The first record of the vegPO Flat File Schema is a header record called orderingStore that occurs only once. In the Schema Layout tab, the fields and record that make up the orderingStore record display as children. This first line is parsed into the

fields and records that make up the orderingStore record.

After the first header record, the sets of repeating elements start. Each set of repeating elements contains three child records of different types as shown in the following figure:

A repeating record that contains child records of different types can be modeled in the Flat File Schema Editor using groups. Groups are only required when the data does not provide any additional delimiters or structure to clearly mark the beginning and end of repetitions that contain more than one record. The delimiters for the repetitions are inherited from the parent record or root node. In this example for the vegPO root node, the repeat delimiter is set to end-of-line. The orders group node uses end-of-line delimiter to parse its repeating records

7. In the Schema Layout tab, click the orders group node. Note the following graphical changes in the panes:
  - o In the left subpane of the test pane, all the lines after the header line are highlighted. This highlighting indicates that after parsing, all the data after the first record are all assigned to the orders group node.
  - o In the Basic Properties pane, the Occurrences of the orders group is Unbounded. This setting means that there can be one or more instances of this group.
  - o In the Basic Properties pane, for the orders group the Type is equal to order. This setting means that the orders group is based on the order group type. The contents and the properties of the order group type are defined in the Type Library tab.
8. Select the Type Library tab. The record types and group types used in the vegPO Flat File Schema display. The order group type contains three records as shown in the following figure:

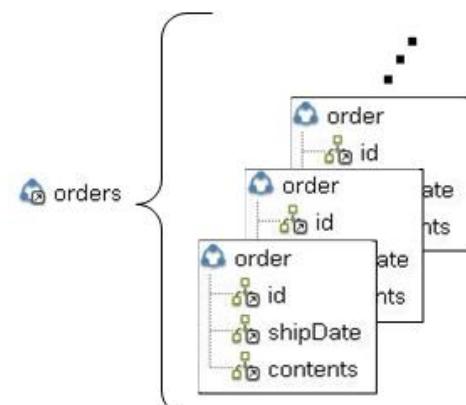

The following icon represents a record that is based on a record type:

The orders group with the order group type define a set of repeating records of different records because of the following characteristics:

- o There can be one to many instances of the orders group.
- o The order group type contains three records of different types.
- o The orders group is based on or inherits from the order group type.

The repeating relationship between the orders group and the order group type is shown in the following figure:

9. In the Type Library tab, click the id record node of the order group type. Note the following graphical changes in the panes:
  - o In the Basic Properties pane, the Type of the id record is equal to the record type named orderID. This setting means that the id record is based on the orderID record type.
  - o In the left subpane of the test pane, the first line of each repeating record is highlighted as shown in the following figure:

Test File Systems\Cast Iron Studio 3.0.2\Samples\BookOrder\vegPO.txt Browse

```
09989|Fran's Fruits & Veggies|555-555-2345|1234 Main St., Scott, MI, 23453

04/22/2004
Corn,20;Green Beans,5;Peas,5;
239894
10/11/2004
Apples,30;Tomatos,15;
908787
01/28/2005
Grapes,33;Mangos,20;Apricots,30;Okra,5;
```

This highlighting indicates that the first line of each repeating record is assigned to the id record.

- In the Type Library tab, click the shipdate record node of the order group type. Note the following graphical changes in the panes:

- In the Basic Properties pane, the Type of the shipdate record is equal to the record type named shippingDate. This setting means that the shipdate record is based on the shippingDate record type.
- In the Basic Properties pane, the Structure of the shipdate record is Positional. This setting means that the child fields of the shipDate record are determined by their position and length in the record and not by delimiters.
- In the left subpane of the test pane, the second line of each repeating record is highlighted as shown in the following figure:

Test File Systems\Cast Iron Studio 3.0.2\Samples\BookOrder\vegPO.txt Browse

```
09989|Fran's Fruits & Veggies|555-555-2345|1234 Main St., Scott, MI, 23453

908787
01/28/2005
Grapes,33;Mangos,20;Apricots,30;Okra,5;
```

- In the Type Library, click the contents record node of the order group type. Note the following graphical changes in the panes:

- In the Basic Properties pane, the Type of the contents record is equal to the record type named orderContent. This setting means that the contents record is based on the orderContent record type.
- In the left subpane of the test pane, the third line of each repeating record is highlighted as shown in the following figure:

Test File Systems\Cast Iron Studio 3.0.2\Samples\BookOrder\vegPO.txt [Browse](#)

## Working with Nodes in the Schema Tabs

---

### About this task

In the Schema tab or the Type Library tab, you can do the following actions:

- [Copy nodes](#)
- [Delete nodes](#)
- [Rename nodes](#)
- [Move nodes](#)

You can also bulk-add many children. For more information, see [Adding Several Children](#).

- [Copy nodes](#)
- [Delete nodes](#)
- [Rename nodes](#)
- [Move nodes](#)

**Parent topic:** [Flat File Schemas](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Working\\_with\\_Nodes\\_in\\_the\\_Schema\\_Tabs.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Working_with_Nodes_in_the_Schema_Tabs.html)

## Copy nodes

---

### About this task

---

You can copy nodes in the Schema Layout tab or in the Type Library tab using the following procedures:

- Copy and paste a Child node
- Copy and paste a Sibling node

You can also use keyboard shortcuts (CTRL+C, CTRL+V, CTRL+X) or the Edit toolbar menu options (Edit > Cut, Edit > Copy, Edit > Paste) to copy nodes.

#### To copy and paste a Child node:

Pasting a node as a child places the node inside the record or group you have selected at the end of any existing children.

1. Right-click the node you want to copy.
2. Select Copy.
3. Right-click the record or group that should be the parent of the node you are pasting.
4. Select Paste As Child.

If you paste a node within the same record or group that you copied it from, the Flat File Schema Editor changes the name of the new node to `copy_node-name`.

#### To copy and paste a Sibling node:

Pasting a node as a sibling places it directly above the node you have selected. This option is not available for the root node.

1. Right-click the node you want to copy.
2. Select Copy.
3. Right-click the node that should come directly after the node you are pasting.
4. Select Paste As Sibling.

If you paste a node within the same record or group that you copied it from, the Flat File Schema Editor changes the name of the new node to `copy_node-name`.

## Delete nodes

---

### About this task

---

You can delete nodes in the Schema Layout tab or the Type Library tab, using any of the following procedures:

- To delete a tree node by right-clicking the node
- To delete a tree node using the Delete key

You can also use keyboard shortcut cut (CTRL+X) or the Edit > Cut toolbar menu option to delete nodes.

#### To delete a tree node by right-clicking the node:

1. Right-click the node to be deleted.
2. Select Delete from the list.

#### To delete a tree node using the Delete key:

1. Click the node to be deleted.
2. Press Delete.

Attention: If you delete a type node in the Type Library tab that is used as the basis for records, groups, or fields within the Schema Layout tab, the nodes that are based on that type are affected in the following ways:

- The Type is changed to None.
- Node properties are left unchanged, but inherited content from the type node is removed.

## Rename nodes

---

### About this task

You can rename nodes in the Schema Layout tab or the Type Library tab, using any of the following procedures:

- Change a node name from the Basic Properties pane
- To change a node name using a shortcut menu
- To change a node name using F2

You can also use the Edit > Rename toolbar menu option to rename nodes.

#### To change a node name from the Basic Properties pane:

1. Double-click the node to open its properties.
2. Enter the new name into Name text field in the Basic Properties pane.

Note: Press Esc to cancel the editing of the name of a node.

#### To change a node name using a shortcut menu:

1. Right-click the node.
2. Select Rename from the list.
3. Enter a new [valid node name](#).

Note: Press Esc to cancel the editing of the name of a node.

#### To change a node name using F2:

1. Click the node to be renamed.
2. Press F2.
3. Enter a new [valid node name](#).

**Parent topic:** [Working with Nodes in the Schema Tabs](#)

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Working\\_with\\_Nodes\\_rename.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Working_with_Nodes_rename.html)

## Move nodes

---

### About this task

---

You can move nodes in the Schema Layout tab or the Type Library tab, using any of the following procedures:

- To copy and paste a Child node (as described in [Copy nodes](#)).
- To copy and paste a Sibling node (as described in [Copy nodes](#)).
- To move nodes using drag and drop

#### To move nodes using drag and drop:

1. Select the node you want to move in the Schema Layout or Type Library tab.
2. Drag it over another node:
  - To make it the last child, drop it over the root, record, or group that should be the new parent.

**Parent topic:** [Working with Nodes in the Schema Tabs](#)

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Working\\_with\\_Nodes\\_move.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Working_with_Nodes_move.html)

## Adding Several Children

---

### About this task

---

Add several child records and fields to a root node or a record by right-clicking the node and selecting the New Children option from the list.

To add multiple child nodes to a Flat File Schema:

### Procedure

---

1. [Create a new Flat File Schema](#) or open an existing Flat File Schema by selecting it in the Project tab.
2. Select either the Schema Layout or Type Library tab.
3. Right-click the root node or a record node in the tree and select New Children. The Bulk Add dialog box opens.
4. Click Add.
5. Click the Name field and enter a [valid node name](#) for the field, record, or group to be added.
6. Click the Node Type field and select a node type (Field, Group, or Record) for the child from the list.
7. If this node is based on a record type, group type, or field type, click the Based On Type field and select an existing type from the list.
8. Repeat steps 4-7 for each node you want to add.
9. To reorganize or delete the nodes in the list:
  - Click Up to move a child up the list.
  - Click Down to move a child down the list.
  - Click Delete to delete a child.
10. When finished, click OK.
11. In the Schema Layout or Type Library tab, select the node and edit the properties:

- [Edit the field properties](#)
- [Edit the record properties](#)
- [Edit group properties](#)

**Parent topic:** [Flat File Schemas](#)

## Valid Node Names

---

When a Flat File Schema is created, an internal XML Schema-based representation of the metadata is also generated, so the node names you specify for the records, fields, and groups *must* be valid XML names. Follow the naming restrictions listed in the following tables when creating node nodes in Flat File Schema.

Attention: You might be able to enter invalid characters into the Name field but the generated Flat File Schema might be incorrect. You cannot create a variable from an invalid schema.

XML naming restrictions are listed in the following tables.

Valid Name Types	Description
Starting Name Characters	<ul style="list-style-type: none"> <li>• <b>Letters:</b> both uppercase and lower case</li> <li>• <b>Punctuation:</b> underscore (_)</li> </ul>
Non-starting Name Characters	<ul style="list-style-type: none"> <li>• <b>Letters:</b> both uppercase and lowercase</li> <li>• <b>Punctuation:</b> underscore, period, and hyphen</li> <li>• <b>Numbers:</b> 0-9</li> </ul>

Invalid Characters	Description
Â Â Â	space
:	colon
~	tilde
/	forward slash
\	backslash
;	semicolon
?	question mark
\$	dollar sign
&	ampersand
%	percent sign
@	at sign
^	hat sign
=	equals sign
*	asterisk
+	plus sign
Â ()	any parentheses
	pipe

Invalid Characters	Description
' " `	any quotation marks
{ Â } [ ] > <	any brackets

## The Type Library Tab

---

In the Type Library tab, you can define reusable types for records, groups, and fields. Defining record types, group types, and field types allows you to define properties that can be reused in different parts of the Flat File Schema. Record and group types also allow you to define content that is reusable where a record or group can show in many places within the same set of Flat File Data.

Note: The type you create in the Type Library tab can only be used with the Flat File Schema visible in the Schema Layout tab. The type cannot be used by other Flat File Schemas in the same project.

## Specifying Optional Fields and Records

---

### About this task

When creating optional fields or records in a Flat File Schema, it is important to understand how the Flat File data is parsed so you can design your Flat File schema to avoid ambiguity. For example, if you create a Flat File Schema with a delimited root node and three child string fields where field1 is required, field2 is optional, and field3 is required, the grammar of the schema is ambiguous, as shown when the following data is parsed during run time:

A, C

This Flat File data could be parsed in the following two ways:

- field1 is equal to A and field2 is equal to B
- field1 is equal to A and field3 is equal to C

Specifying a required field after an optional field defines an ambiguous grammar that cannot be correctly parsed. Specifying a required record after an optional field also defines an ambiguous grammar that cannot be correctly parsed.

Redefining this Flat File Schema to contain three child string fields where field1 is required, field2 is optional, and field3 is optional does not fix this problem because when the Flat File data: A, C is parsed, field1 is equal to A, and field2 is equal to C. Again the grammar of the schema is ambiguous because this is not the wanted result, the wanted result was for the value: C to be assigned to field3. Specifying a required record followed by two optional records also defines an ambiguous grammar.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Specifying\\_Optional\\_Fields\\_and\\_Records.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Specifying_Optional_Fields_and_Records.html)

## Generating a flat file schema from an IDOC

---

At design time, using the Project > Import > SAP IDOC Schema toolbar menu option, you can interrogate an SAP endpoint for IDOC metadata and from that metadata generate a Flat File Schema.

WARNING: In order to connect to the SAP System from Studio, you must [download and install the SAP Jar file and DLLs](#) onto your Windows development workstation.

If you receive or send your SAP data as a file through a SAP File Port to the SAP system, you must use the Project > Import > SAP IDOC Schema toolbar menu option during design time to generate a Flat File Schema for your IDOC metadata and use the Read Flat File and Write Flat File activities to read and write the SAP data during run time. For more information, see the following two example orchestrations.

If you receive or send your SAP data directly from the SAP system using an RFC port, you must use the [SAP Receive IDOC](#) and [SAP Send IDOC](#) activities.

## Using the Generated Flat File Schema during Run Time

---

During design time, you use the Project > Import > SAP IDOC Schema toolbar menu option, to generate a Flat File Schema that describes the SAP data you receive or send to the SAP File Port. This section describes how that Flat File Schema is used by the following two example orchestrations during run time.

### Receive SAP Flat File Data from a SAP System Using an SAP File Port.

---

This first example orchestration receives SAP data from a SAP System during run time, using the following activities:

1. An SAP data file is placed into a directory that the FTP Poll Directory activity is polling in. This starts the processing of the orchestration job.
2. The FTP Poll Directory reads the SAP Flat File data and saves the result into a string variable.
3. Using the Flat File Schema generated during design time using the Project > Import > SAP IDOC Schema toolbar menu option, the Read Flat File activity converts the SAP data stored in the string variable to XML data and saves the XML data into an XML variable.
4. The Database Insert Rows activity maps the XML data from the XML variable to some database rows and inserts these rows into a database

### Send SAP Flat File Data From a SAP System Using an SAP File Port

---

This second example orchestration sends SAP data to a SAP System during run time, using the following activities:

1. Data is inserted into a database, triggering the Database Get Inserted Rows activity to start processing.
2. The Database Get Inserted Rows activity gets the data that was inserted into the database and converts it to XML data.
3. The Write Flat File activity converts the contents of the XML variable to the SAP Flat File data valid against the Flat File Schema generated during design time using the Project > Import > SAP IDOC Schema toolbar menu option.
4. The FTP Put File activity writes the Flat File data to a file into a directory.
5. The SAP System reads the data from the file.

#### To generate a Flat File Schema from an IDOC:

1. Select Project > Import > SAP IDOC Schema from the toolbar menu. The SAP IDOC Flat File Schema Generator Step 1 of 2 dialog box shows.
2. Enter the SAP connection information as described in the following table:

Field	Description
Location	Â
Host Name	Specifies the IP address or the workstation name that contains the SAP system.

Field	Description
System Number	Specifies the number that identifies the specific instance of the SAP system that Studio is to connect to. Your SAP administrator must supply this information.
SAP Client	Specifies a number that identifies Studio as a client for the SAP system. Your SAP administrator must supply this information.
Login	Â
User Name Â	Specifies the user name to use when connecting to the SAP system.
Password	Specifies the password to the user name when connecting to the SAP system.

3. Click Next. The SAP IDOC Flat File Schema Generator Step 2 of 2 dialog box is displayed.
4. Select an IDOC Type and optionally an IDOC SubType using one of the following options:
  - o Click [...] to browse for the IDOC Type, the IDOC SubType, or both. The IDOC List dialog box opens with the list of IDOC Types and IDOC SubTypes available on the selected SAP endpoint. Select an IDOC Type, the IDOC SubType, or both and click OK.
  - o Enter the IDOC Type, and optionally the IDOC SubType directly into the respective fields.
5. Select the Bundled check box if the incoming IDOC contains more than one instance of the IDOC message of the same IDOC Type and IDOC SubType. If Bundled is checked, the IDOC element in the generated Flat File Schema is a repeating element.
6. Click Finish.

If the generation of the Flat File Schema was successful, the Flat File Schema is shown in the Flat File Schemas folder of the Project tab.

**Parent topic:** [Flat File Schemas](#)

---

#### [Feedback | Notices](#)

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Generating\\_a\\_Flat\\_File\\_Schema\\_from\\_an\\_IDOC.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Generating_a_Flat_File_Schema_from_an_IDOC.html)

## Using the Flat File Wizard

---

The Flat File Wizard creates a schema that defines the format of a flat file based on sample data that you provide. The **Read Flat File** activity uses this schema to convert flat files into an XML document.

For the best results, provide sample data that is like the actual data. For example, if the actual data contains header and footer rows, provide sample data with a header row for field names and footer rows. If the actual data contains quoted fields, the appropriate fields in the sample data should be quoted fields as well.

The Flat File Wizard only reads the first 1000 lines of a file. If the sample file contains more than 1000 lines and contains footer rows, remove lines before the footer rows so that the total line count stays within the 1000 line limit.

Important: All rows in your sample data must have the same number of fields.

**To use the Flat File Wizard:**

1. From the Studio menus select Project > Flat File Wizard. The Flat File Wizard opens in a tab in the Studio workspace.
2. Enter sample data into the Sample Data text box or click Browse... to load a sample file.
3. Click Next >. The File Format page opens.
4. Choose one of the file format options:
  - o Character-delimited format (including Comma Separated Values format) - Choose this option when each line in the file has a record with fields separated by a single character, such as a comma or tab.
  - o This file is in another format - Choose this option when your file does not meet the criteria of the previous file format option. If you select this option, you cannot use the Flat File Wizard to create a schema for your flat file.
5. Click Next >. The Field Delimiters page opens.
6. Select a field separator from the Fields separated by list. If you select Other:, specify the field separator in the field that displays to the right.
7. If the field is enclosed by a specific character, select the character that encloses the field from the Fields enclosed by list. If you select Other:, specify the enclosing character in the field that displays to the right.
8. Click Next >. The Header & Trailer page opens

9. Specify whether header and trailer rows exist:
  - a. Select Treat first row as header for field names, if a header row exists.
  - b. Select Treat last \_\_ row(s) as trailer, if a trailer row exists and specify the row number.
10. Click Next >. The Edit Schema Name page opens.
11. Enter a schema name.  
Tip: Choose a schema name that describes the data and file format.
12. Click Finish. In the Project tab of the Studio Toolbox, the flat file schema you just created displays in the Flat File Schemas directory.

**To read the flat file you created and convert it to XML:**

1. Add the Read Flat File activity to an orchestration.
2. In the Checklist, select Configure. The Configure pane opens.
3. In the Select a Flat File Schema field, specify the name of the flat file schema you have created. Â

Â **To convert XML data to a flat file:**

1. Add the Write Flat File activity to an orchestration.
2. In the Checklist, select Configure. The Configure pane opens.
3. In the Select a Flat File Schema field, specify the name of the flat file schema you have created.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_mapping.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_mapping.html)

## About Maps

---

Maps define how data is transformed by the Integration Appliance during run time. Maps can reorganize data, convert data, suppress or add data, and performing calculations or other complex conversions.

Maps can transform data from one or more sources to one or more destinations. For example, during run time a map can transform XML data valid against one XML Schema to XML data valid against another XML Schema. The XML Schemas and Flat File Schemas you use to define the source and destination nodes of a map must exist in the current project before you start creating a map. For more information about uploading an XML Schema or DTD to a project, see [Uploading Files into a Project](#). For more information about creating a Flat File Schema, see [Creating a flat file schema](#).

The following types of maps can be created in Studio:

- **Inline maps** - Inline or embedded maps are not visible in the Project tab. These maps are created automatically inline when you configure activities that contain Map Input and Map Output tasks, or when you configure a [Map Variables](#) activity. The source and destination types of an inline map are determined from the variables you select by clicking Add in the From Orchestrations and To Orchestrations panes of the Mapping Editor. Inline maps transform data from one or more source variables to one or more destination variables. The source and destination variables can be of any data type.

- **Standalone maps** - A standalone map is visible in the Transformations folder of the Project tab and represents a set of one or more mappings between source and destination nodes. You can create standalone maps by right-clicking the Transformations folder in the Project tab or from the Project > New > New Standalone Map toolbar menu option. For more information, see [Creating a Standalone Map](#). The source and destination types of an inline map are determined from the schema types you select by clicking Add in the From Orchestrations and To Orchestrations panes of the Mapping Editor.

You can also test a map against sample data, for more information see [Testing maps](#).

**Parent topic:** [Mapping](#)

 Last updated: Wednesday, 15 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_About\\_Maps.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_About_Maps.html)

# Creating a map

Create a map between the variables and the input parameter or between the output parameters and the variables.

Many Studio activities contain inline or embedded maps that you must configure in the activity **Checklist**. You configure the inline maps in an activity in either the Map Inputs or Map Outputs tasks in an activity **Checklist**. In addition, configure an inline map in the Map Variables activity. The Mapping Editor is displayed beneath the orchestration.

For instructions about creating maps while configuring a Map Variables activity, see [Map Activity](#)

In addition to the inline maps that you create in the Map Inputs or Map Outputs tasks or when configuring a Map Variable activity, you can also create standalone maps. You can create an inline map in a Map Variables activity from a standalone map. For more information, see [Creating a Map Variables Activity from a Standalone Map](#).

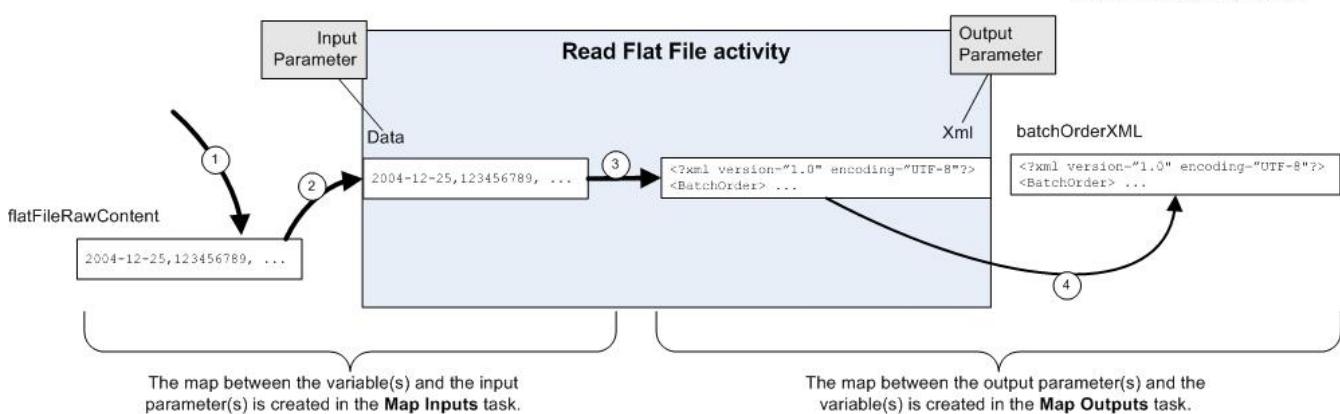

In the Map Inputs task, you map variable or variables from the orchestration (From Orchestration pane) to the input parameter or parameters of the activity (To Activity pane).

In the Map Outputs task, you map output parameters from the activity (the From Activity pane) to variable or variables of the orchestration (the To Orchestration pane).

During run time, an activity typically takes data from orchestration variable or variables manipulates the data in some way and returns the result in another set of variables as shown in the following figure:

Orchestration Variables

Orchestration Variables

The flow of data (from left to right) through the example activity (shown in the preceding figure) is described in the following steps:

1. In this case, the contents of the variable was supplied by the previous activity in the orchestration, the FTP Poll Directory activity. Comma separated values are stored in the *flatFileRawContent* variable by the FTP Poll Directory activity.
2. The contents of the *flatFileRawContent* variable is assigned to the input parameter called Data of the Read Flat File activity.
3. The Read Flat File activity converts the comma separated values to XML data and places the resulting data into the Xml output parameter.
4. The contents of the Xml output parameter is assigned to the *batchOrderXML* variable. The *batchOrderXML* variable is available in the orchestration. The next activity in the orchestration can use the contents of the *batchOrderXML* variable.

You can also manipulate the data in the maps between parameters and variables (created in the [Map Inputs](#) and [Map Outputs](#) task) using the functions available from the Functions tab. For more information see [Assigning Function\(s\) to a Mapping Rule](#).

The following activities require mapping:

- All connection activities that are listed under the following folders in the Activities tab:
  - Database
  - Email
  - FTP
  - HTTP
  - MQ
  - SAP
  - Web Services
- All the Transform activities that are listed under the Transform folder in the Activities tab.
- [Create Job Keys Activity](#)

- [Mapping Inputs](#)

When you map inputs, you are mapping from the orchestration (variables) to the activity (parameters).

- [Mapping Outputs](#)

When you map outputs, you are mapping from the activity (parameters) to the orchestration (variables). ^

**Parent topic:** [Mapping](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map\\_creating\\_a\\_map.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_creating_a_map.html)

## Mapping Inputs

---

When you map inputs, you are mapping from the orchestration (variables) to the activity (parameters).

### About this task

---

To create a map between variables and input parameters:

### Procedure

---

1. Open or [create](#) an orchestration.
2. If the activity is mapping variables that conform to a particular XML Schema or DTD, [upload the XML Schema or DTD file into your project](#).
3. Click the activity in the orchestration that contains the Map Inputs task in the Checklist.
4. Select the Map Inputs task from the Checklist.
5. If not already selected, click Design. The Mapping Editor is displayed and the input parameters of the activity show in the To Activity pane.
6. [Add variables](#) to the From Orchestration pane.
7. Drag a source node from the From Orchestration pane to a destination node of an input parameter listed in the To Activity pane. If the mapping is valid, a link (line) displays from the source node to the destination node, indicating that a mapping rule has been established. Repeat this step until all the required nodes have been mapped. For more information, see the help topic for an activity to determine which nodes are required.  
Note: You can [find a node in a source or destination schema](#) using the Find dialog box.
8. Optional: [Assign Function\(s\) to a Mapping Rule](#).
9. If possible, [test](#) your mappings to ensure that the output is what you expect.  
Note: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#).

### What to do next

---

You can show the optional input parameters of an activity using the Map > Show Optional Parameters toolbar menu option or hide the optional input parameters of an activity using the Map > Hide Optional Parameters toolbar menu option.

In addition, you can show or hide the optional input parameters of an activity by right-clicking in the To Activity pane and selecting the Show Optional Parameters to show the optional input parameters or selecting Hide Optional Parameters option to hide the optional input parameters. When the Show optional parameters option is set, the optional input parameters of an activity display in the To Activity pane of the Map Inputs pane with the prefix string: {optional}. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click a node in the Map Inputs pane to make this option active

**Parent topic:** [Creating a map](#)

---

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map\\_creating\\_a\\_map\\_mapping\\_inputs.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_creating_a_map_mapping_inputs.html)

## Mapping Outputs

---

When you map outputs, you are mapping from the activity (parameters) to the orchestration (variables). 

### About this task

---

To create a map between output parameters and variables:

### Procedure

---

1. Open or [create](#) an orchestration.
2. If the activity is mapping variables that conform to a particular XML Schema or DTD [upload the XML Schema or DTD file into your project](#).
3. Click the activity in the orchestration that contains the Map Outputs task in the Checklist.
4. Select the Map Outputs task from the Checklist.
5. If not already selected, click Design. The Mapping Editor is displayed and the output parameters of the activity show in the To Activity pane.
6. Add output variables to the To Orchestration pane:
  - o To add existing variables to the To Orchestration pane or create new variables, click [Select Outputs....](#)
  - o To create new variables and to automatically map those variables in the To Orchestration pane, click [Copy](#).
7. Drag a source node from the From Activity pane to a destination node of an input parameter listed in the To Orchestration pane. If the mapping is valid, a link (line) is displayed from the source node to the destination node, indicating that a mapping rule has been established. Repeat this step until all the required nodes have been mapped. In general, it is not a requirement that you map all the outputs from an activity.  
Note: You can [find a node in a source or destination schema](#) using the Find dialog box.
8. Optional: [Assign Function\(s\) to a Mapping Rule](#).
9. If possible, [test](#) your mappings to ensure that the output is what you expect.  
Note: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#).

**Parent topic:** [Creating a map](#)

---

[Feedback](#) | [Notices](#)

## Creating a Standalone Map

---

A standalone map is visible in the Transformations folder of the Project tab and represents a set of one or more mappings between source and destination nodes.

### About this task

---

The set of source nodes available in the From Orchestration pane and destination nodes in the To Orchestration panes of the Mapping Editor are determined by the schema types defined for the source and destination variables of the map. A standalone map can be used to create any number of Map Variables activities in the same orchestration or in other orchestrations in the same project. For example, you could create a standalone map called `myMap` that contains a set of mappings between an source XML Schema called `IncomingOrder` and a destination XML Schema called `ShippingOrder`.

You can reuse this map by selecting the `myMap` entity from the Transformations folder in the Project tab and dropping it onto any orchestration in the project. This dropping action creates a new Map Variables activity in the orchestration with the same set of

mappings as defined for the map called `myMap`. The new inline map created for the Map Variables activity is a copy of parent standalone map. If you change the mappings between the source and destination nodes in `myMap`, the changes are not propagated to new Map Variables activity because it is a local copy. For more information see [Creating a Map Variables Activity from a Standalone Map](#).

To create a standalone map:

## Procedure

---

1. Create a new instance of a standalone map using one of the following options:
  - Select the Project tab, right-click on the Transformations folder, and select the New Standalone Map option from the menu.
  - From the toolbar menu, select the Project > New Standalone Map option.
  - In the Project tab, click New Standalone Map ().
- An instance of a standalone map shows in the Maps folder in the Project tab
2. Double-click the instance of the standalone map in the Transformations folder in the Project tab. The Mapping Editor opens in the lower part of the pane.
3. Select the source schemas.
4. Select the destination schemas
5. Drag a source node from the From Orchestration pane to a destination node in the To Orchestration pane. If the mapping is valid, a link (line) displays from the source node to the destination node, indicating that a mapping rule has been established. Repeat this step until all the required nodes have been mapped.  
Note: You can find a node in a source or destination schema using the Find dialog box. For more information about finding a node in a source or destination schema, see [Assigning Function\(s\) to a Mapping Rule](#).
6. Optional: Assign function or functions to a mapping rule. For more information, see [Assigning Function\(s\) to a Mapping Rule](#).
7. If possible, test your mappings to ensure that the output is what you expect. For more information about testing mappings, see [Testing maps](#).
  - Select source schemas for a standalone map
  - Select destination schemas for a standalone map

**Parent topic:** [Mapping](#)

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map\\_creating\\_a\\_standalone\\_map.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_creating_a_standalone_map.html)

## Select source schemas for a standalone map

---

### Before you begin

---

Before you can select a schema or a fragment of the schema as a source schema for a map, you must first [upload the XML Schema or DTD file](#) that contains the schema into the Project or you must [create the Flat File Schema](#) that represents the Flat File data.

### About this task

---

To select the source schemas for a standalone map:

## Procedure

---

1. Click Add in the From Orchestration pane. The Browse For Schema Type Element dialog box shows.
2. Browse for the schema or schema fragment.
3. Select the schema or schema fragment and click OK. The schema or schema fragment is displayed in the From Orchestration pane.
4. Repeat these steps to add additional source schema or schema fragments to a map.

**Parent topic:** [Creating a Standalone Map](#)

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map\\_creating\\_a\\_standalone\\_map\\_select\\_source\\_schemas.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_creating_a_standalone_map_select_source_schemas.html)

## Select destination schemas for a standalone map

---

### Before you begin

---

Before you can select a schema or a fragment of the schema as a destination schema for a map, you must first [Uploading Files into a Project](#) that contains the schema into the Project or you must [create the Flat File Schema](#) that represents the Flat File data.

### About this task

---

To select destination schemas for a standalone Map:

### Procedure

---

1. Click Add in the To Orchestration pane. The Browse For Schema Type Element dialog box is displayed.
2. Browse for the schema or schema fragment.
3. Select the schema or schema fragment and click OK. The schema or schema fragment is displayed in the To Orchestration pane.
4. Repeat these steps to add additional destination schema or schema fragments to a map.

**Parent topic:** [Creating a Standalone Map](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map\\_creating\\_a\\_standalone\\_map\\_select\\_destination\\_schemas.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_creating_a_standalone_map_select_destination_schemas.html)

## Creating a Standalone Map from a Map Variables Activity

---

### About this task

---

The following procedure provides instructions for creating a standalone map from a Map Variables activity. For more information about standalone maps and the inline map of a Map Variables activity, see [About Maps](#).

To create a standalone map from a **Map Variables** activity:

### Procedure

---

1. Select the Project tab.
2. Double-click an orchestration that contains the Map Variables activity, in the Orchestrations folder of the Project tab.
3. Drag the Map Variables activity from the orchestration into the Project tab. A new Map shows under the Transformations folder of the Project tab. New schemas might also be created when this new map is created.  
Important: The new standalone map is a copy of the map from the Map Variables activity. Changing the map in the Map Variables activity does not change the new standalone map. The converse is also true, changing the new standalone map does not change the map in the Map Variables activity.

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Creating\\_a\\_Standalone\\_Map\\_from\\_a\\_Map\\_Variables\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Creating_a_Standalone_Map_from_a_Map_Variables_Activity.html)

## Creating a Map Variables Activity from a Standalone Map

---

### About this task

---

The following procedure provides instructions for creating a Map Variables activity from a standalone map. For more information about standalone maps and the inline map of a Map Variables activity, see [About Maps](#).

To create a **Map Variables** activity from a standalone map:

### Procedure

---

1. Select the Project tab.
2. Select the orchestration that you want to add the Map Variables activity to, by double-clicking the orchestration in the Orchestrations folder of the Project tab.
3. Drag a Map from the Transformations folder of the Project tab, onto the orchestration. The Link Schema Type to Variables dialog box opens.
4. For all the input and output schema types of the map, enter the name of an existing variable or a new variable in the Orchestration Variable field.
5. Click OK. The new Map Activity shows in the orchestration.  
**Important:** The new inline map created for the Map Variables activity is a copy of the standalone map in the Project tab. Changing the map in the Map Variables activity does not change the new standalone map. The converse is also true, changing the new standalone map does not change the map in the Map Variables activity.

## Adding Variables to Mapping Panes

---

You can add existing variables to a map or create new variables and add them to a map using the **Select Inputs..** or **Select Outputs...** buttons available from the mapping panes of an activity.

### About this task

---

To add a variable using the **Select Inputs..** or **Select Outputs...** buttons:

### Procedure

---

1. Click an activity in the orchestration.

2. Select a mapping task from the **Checklist** for the activity. The mapping tasks of an activity are typically called Mapping Inputs or Mapping Outputs.
  3. To add variables:
    - o To add input variables to the map, click **Select Inputs...**
    - o To add output variables to the map, click **Select Outputs....**The Select Inputs or Select Outputs dialog box opens.
  4. Select from one of the following options:
    - o Add an existing variable to the mapping pane - Select an existing variable and click **OK**. The existing variable is added to the mapping pane.
    - o Add a new variable to the mapping pane - To add a new variable to the mapping pane:
      - a. Click **New**. The Create New Variables Step 1 of 2 dialog box opens.
      - b. Select a data type or schema to base the new variable:
        - For a variable based on a primitive data type:
          - i. Scroll to the end of the Create New Variables Step 1 of 2 dialog box.
          - ii. Select a primitive data type from the Primitive Types folder.
          - iii. Click **Next**.
        - For a variable based on a schema:
          - i. Optional: To search for a node by name, click **Find**.
          - ii. From the schema, select a node to be the root of the new variable.
          - iii. Click **Next**.
      - c. Enter a name for the new variable and click **Finish**. Click **OK**.
- The new variable is added to Variables toolbox, and the schema is displayed in the "Schema of" pane on the Variables tab. The new variable is also added to the mapping pane

## Copying Parameters

---

### About this task

Using the Copy button () available from the Map Outputs pane, you can create new orchestration variables that match the output parameters of the current activity.

To copy variables:

### Procedure

---

1. Click an activity in the orchestration.
2. Select the Map Outputs task from the Checklist for the activity. The mapping pane displays the output parameters of the current activity in the From Activity pane.
3. Click **Copy**. The Copy Parameters dialog box opens, containing a list of parameters matching those in the From Activity pane.
4. Click the output parameter or parameters to create variables from. The data type, schema, or schema fragment of the selected output parameter defines the data type, schema, or schema fragment of the new variable. To select more than one output parameter, press Shift while clicking the output parameters.
5. Click **Create**. The variables display in the To Orchestration pane. If required, rename the newly created variable to a more meaningful name. To rename the variable, double-click the variable in the blue section of the To Orchestration pane, enter the new name, and press **Return**.

**Parent topic:** [Mapping](#)

## Replacing a Variable used in a Map

### About this task

You can change the variables used in the From Activity and To Orchestration panes without changing the links between source and destination nodes of a map.

For example, you could have a Map Variables activity that maps the nodes of the *varBatchOrder* variable to the nodes of the *varPurchaseOrder* variable as shown in the following figure.

The *varBatchOrder* variable is based on the BatchOrder XML Schema and the *varPurchaseOrder* variable is based on the PurchaseOrder XML Schema.

If you wanted another Map Variables activity in your orchestration maps source and destination nodes but you wanted to use a different set of variables. You could copy the original Map Variables activity and then paste the new Map Variables activity into the orchestration and then change the variables used in the map without changing the links of the map.

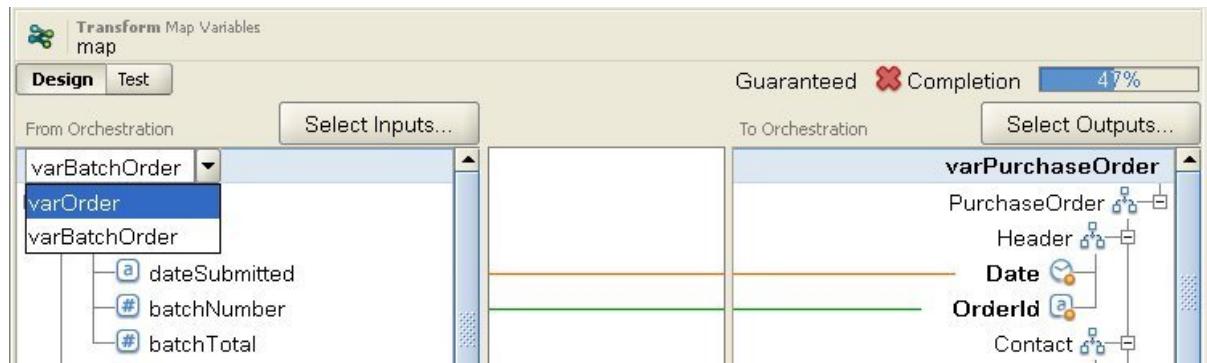

To replace an original variable used in a map:

### Procedure

1. Click the Map Variables activity or the Map Inputs or Map Outputs tasks of an activity.
2. Create a new variable or replace a source or destination variable:
  - o Double-click the blue area where the variable is listed in the From Activity, From Orchestration, To Activity, or To Orchestration panes and enter the name of the variable. A new variable of the same schema type is created.
  - o Replace a source or destination variable using one of the following actions:
    - Right-click the blue area where the variable is listed in the From Activity, From Orchestration, To Activity, or To Orchestration panes and select the Choose Another Variable option from the list.
    - Double-click the blue area where the variable is listed in the From Activity, From Orchestration, To Activity, or To Orchestration panes.

An arrow shows to the right of the variable name as shown in the following figure.

Select another variable from the list. Â For this example, select the varOrder variable from the list.

Note: You can only change the variables used in Map Input and Map Output panes and not the parameters that are used in a map. For example in the FTP Poll Directory activity, the filename, data, and timestamp input parameters located in the From Activity pane of the Map Outputs task cannot be changed but the variables that the parameters map to in the To Orchestration pane can be changed.

## Finding Nodes

---

### About this task

You can search for nodes in the mapping panes of activities as described in the following procedure.

To find nodes:

### Procedure

---

1. Open the mapping pane containing the node you want to search for.
2. Open the Find dialog box using one of the following options:
  - o Right-click either the source pane or the destination pane and select Find. The Find dialog box opens.
  - o Click a node in either the source pane or the destination pane. Select Edit > Find from the Studio toolbar menu. The Find dialog box opens.
3. Enter the name of the node that you want to search for in the Text to find field.
4. Select any options or change the direction of the search:
  - o Case Sensitive - Exactly matches the case of the text entered in the Text to find field.
  - o Whole Words Only - Matches the search text only as whole words. No partial matches are allowed.
  - o Wrap Search - Continues searching through the entire schema regardless of where the search was started.
  - o Forward - Searches from the root node or current node down through the schema in node-tree order.
  - o Backward. Searches from the last node in the tree or the current node up through the schema in reverse node-tree order.
5. Click Find. Click Find again to continue the search through the schema.
6. Click Cancel to close the dialog box.

**Parent topic:** [Mapping](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map\\_Finding\\_Nodes.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_Finding_Nodes.html)

## Assigning a Default Value for a Destination Node

### About this task

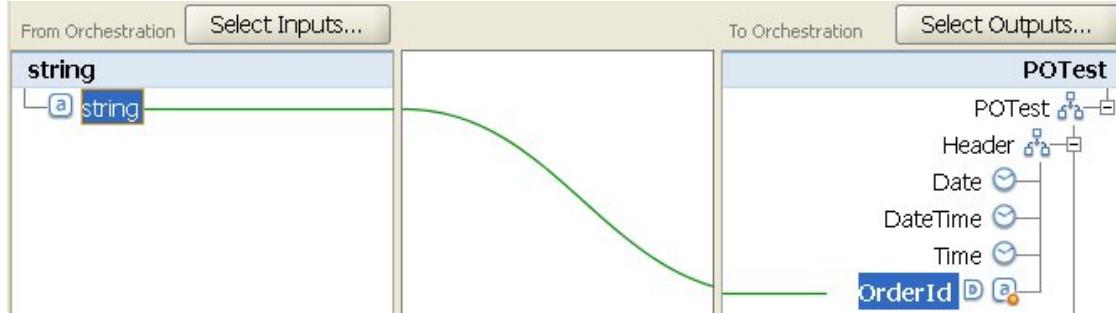

You can assign a default value for a destination node in a map. A destination node of a map is displayed in the mapping pane. The following figure shows the To Orchestration pane. How the default value is used during run time depends if a link is assigned to the destination node as described in the following cases:

- Define a default value for a destination node that does not have a link from a source node or function as shown in the following figure:

For this case, the specified constant value is always assigned to the destination node during run time.

- Define a default value for a destination node that has a link from a source node or function as shown in the following figure:

For this case, the specified value is only assigned to the destination node, if the link from the source node or a function to the destination node does not provide a value for the destination node during run time. Â

You can also use configuration properties to supply the default values for destination nodes of a map of a mapping pane as described in step 2 of the following procedure. You must [create the configuration property](#) before defining the default value as described in the following procedure.

To define a default value for a destination node:

### Procedure

1. Right-click a destination node within the mapping pane. The name of the pane within the mapping pane depends on the type of map you are currently configuring as described in the following list:
  - While configuring a Map Inputs task of an activity, the destination nodes of a map show in the To Activity pane.
  - While configuring a Map Outputs task of an activity, the destination nodes of a map show in the To Orchestration pane.
  - While configuring a stand-alone map or a Map Variables activity, the destination nodes of a map show in the To Orchestration pane.
2. Select the Define Default Value option from the list. The Define Default Value dialog box opens. If any configuration properties have been defined for the project, the icon shows in the right of the Default Value field.
3. In the Default Value field, define the default value using one of the following options:
  - Directly enter the characters that define the default value.

- Select a configuration property to supply the default value by clicking the  icon and selecting a configuration property from the list.
4. Click OK. The default () icon shows next to the destination node in the mapping pane.

## What to do next

---

To clear the default value for a destination node:

1. Right-click a destination node with a default value assigned to the node within the mapping pane. A destination node with a value assigned shows the default () icon to the left of the node.
2. Select the Define Default Value option from the list. The Define Default Value dialog box opens with the text or the selected configuration property highlighted.
3. Press the Delete key.
4. Click OK. The default () icon is removed from the destination node in the mapping pane.

## Mapping Techniques

---

### About this task

---

You can map from Source nodes to Destination nodes in various ways, depending on how your mapping is set up. You can:

- Map from one Source node to one Destination node
- Map from multiple Source nodes to one Destination node
- Map from one Source node to multiple Destination nodes
- Conditional Mapping for a Recurring Node
- [Mapping One Source to One Destination](#)
- [Mapping Multiple Sources to One Destination](#)
- [Mapping One Source to Multiple Destinations](#)
- [Conditional Mapping for a Recurring Node](#)

## Mapping One Source to One Destination

---

### About this task

---

To map from one Source node to one Destination node:

### Procedure

---

1. Open the Mapping Editor.
  2. Drag a Source node onto a Destination node. The Mapping Editor draws a link between the nodes and marks the destination node as mapped.
- Note: You may receive a validation warning if this mapping rule is not guaranteed or is not allowed.

## Mapping Multiple Sources to One Destination

---

### About this task

You cannot map several source nodes to a single destination node unless you use functions to define how the source data should be combined. For example, you can use the [Concatenate](#) function to combine several source nodes with string datatypes.

See [Assigning Function\(s\) to a Mapping Rule](#) for more information.

# Conditional Mapping for a Recurring Node

---

## About this task

---

To map from one Source node to multiple Destination nodes:

## Procedure

---

1. Right-click the element or variable in the recurring node for which you want a conditional mapping. The Select Occurrence pane opens.
2. Enter the code for the condition.
3. Click OK.

**Parent topic:** [Mapping Techniques](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

# Automapping Matching Nodes

---

Automapping quickly maps source nodes to matching destination nodes. Matching is ‘fuzzy’ and ignores differences in case or punctuation. It does not match nodes that are at different levels within the structure or have differences such as abbreviations in names.

- To automap, select Map > Automap from the toolbar. The Mapping Editor draws mapping rules for each matching node that it finds.

The Mapping Editor also displays warnings for any mapping rules that it attempts to create that are not guaranteed.

**Parent topic:** [Mapping](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Automapping\\_Matching\\_Nodes.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Automapping_Matching_Nodes.html)

# Bulk Mapping Nodes

---

## About this task

---

Bulk mapping can quickly map similar structures, such as addresses, that use similar or identical names and organization. Matching is ‘fuzzy’ and ignores differences in case or punctuation. It does not match nodes that are at different levels within the structure or have differences such as abbreviations in names.

Bulk mapping is applied to structure nodes that you identify in the Source and Destination.

To bulk map a structure node:

## Procedure

---

1. Right-click a structure node in the Source tree displayed in the Mapping Editor.
  2. Select Map > Create Bulk Mapping Rules from the menu toolbar.
  3. Drag a Source structure node onto a Destination structure node. The Mapping Editor draws mapping rules for each matching node that it finds within the structures you have selected.
- Note: Bulk mapping removes any existing mapping rules for the Destination structure you select.

**Parent topic:** [Mapping](#)

## Mapping Recurring Nodes

---

### About this task

Mapping rules for recurring nodes can:

- Determine the output for all occurrences
- Determine the output for specific occurrences
- Reconcile cardinality issues, such as different minimum occurrences or source and destination schemas that model recurring structures with different levels or no recurrence.

How you map recurring nodes is determined by the recurring relationships in your source and destination schemas, as outlined in the following table.

Source	Destination	Action to take
Not recurring	Recurring	Expand the destination node to map the source nodes to specific destination node occurrences.
Recurring	Not recurring	Select specific occurrences of the source and map them to the destination.
Matching Recurring Levels	Matching Recurring Levels	Map all occurrences or select/expand specific occurrences if you need to.
More Recurring Levels	Fewer Recurring Levels	Select specific occurrences of the source nodes and map them to specific occurrences of the destination. See the discussion on mapping limitations for recurring nodes in the Getting Started Guide for more information.
Fewer Recurring Levels	More Recurring Levels	Expand specific occurrences of the additional recurring levels of the destination nodes and map the source levels within the expanded destination nodes.

For more information on recurring nodes and how to limit the recurring nodes returned by a mapping activity, see [Filter Recurring Nodes](#).

**Parent topic:** [Mapping](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map\\_Mapping\\_Recurring\\_Nodes.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_Mapping_Recurring_Nodes.html)

# Mapping All Occurrences

---

## About this task

---

You can map all occurrences of a recurring source node to a recurring destination node as long as the nested levels of recurrence match or you have specified how any uneven levels should be handled.

To map all occurrences of a recurring source node:

- Drag a node in the Source tree to the appropriate node in the Destination tree. The Mapping Editor automatically creates mapping rules linking the Source occurrence nodes to the matching Destination occurrence nodes

Note: If the levels of recurrence in the source and destination schema trees do not match, you must [map specific occurrences](#) instead.

**Parent topic:** [Mapping](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map\\_Mapping\\_All\\_Occurrences.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_Mapping_All_Occurrences.html)

# Mapping Specific Occurrences

---

## About this task

---

When the recurring levels in the Source tree do not match those in the Destination tree, you must expand the recurring nodes and define mapping rules for specific occurrences to resolve cardinality differences:

- When source tree recurring levels are greater than destination tree levels, Select Source Occurrences
- When source tree recurring levels are less than destination tree levels, Expand Destination Occurrences

In addition, the following functionality is available for a recurring destination node that has already been expanded:

- Collapse Destination Occurrences - Removes all the occurrences of a recurring destination node, leaving just the recurring destination node.
- Add Destination Occurrence - Adds a single occurrence of a recurring destination node.
- Remove Destination Occurrence - Removes the selected occurrence.
- [Select Source Occurrences](#)
- [Expand Destination Occurrences](#)
- [Collapse Destination Occurrences](#)
- [Add destination occurrence](#)
- [Remove Destination Occurrence](#)
- [Select a substitution type in a mapping pane](#)

**Parent topic:** [Mapping](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map\\_Mapping\\_Specific\\_Occurrences.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_Mapping_Specific_Occurrences.html)

# Select Source Occurrences

---

## About this task

---

To select source occurrences:

### Procedure

---

1. Open a mapping pane and right-click the source node that you want to map.
2. Select Select One Occurrence from the list. The Select One Occurrence dialog box opens.
3. This dialog box displays the path to the source node you have chosen with an occurrence property for each recurring level.  
Select the number of occurrences to use at each recurring level.
4. Click OK. The source node is highlighted in red in the Mapping Editor.
5. Select the source node and drag it onto the destination node to complete the mapping.

**Parent topic:** [Mapping Specific Occurrences](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map\\_Mapping\\_Specific\\_Occurrences\\_Select\\_Source.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_Mapping_Specific_Occurrences_Select_Source.html)

## Expand Destination Occurrences

---

### About this task

---

To expand destination occurrences:

### Procedure

---

1. Right-click the recurring (⌚) destination node in the mapping panes of activities. Destination nodes are located on the right side of mapping panes.
2. Select Expand Occurrences from the list
3. In the Expand Occurrences dialog box, specify the number of occurrences that you want to expand and map to explicitly. You can map to both the recurring node and the explicit occurrences.
4. Select a setting for the Before check box:
  - Select the Before check box if you want the set of single occurrences to show in the map before the set of recurring nodes.
  - Clear the Before check box if you want the set of single occurrences to show in the map after the set of recurring nodes.
5. Click OK. The specified number of occurrences shows for the selected recurring destination node.
6. Map to the expanded destination nodes as needed, treating each set as one occurrence of that structure.

You can specify the [substitution type](#) for an expanded occurrence of a recurring destination node. This [type substitution](#) of an expanded occurrence is only supported for the recurring destination nodes. Destination nodes are located on the right side of mapping panes.

**Parent topic:** [Mapping Specific Occurrences](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

# Collapse Destination Occurrences

---

## About this task

---

To collapse destination occurrences:

Attention: Collapsing destination occurrences removes all the current mappings for all of the expanded occurrences.

## Procedure

---

1. Open a mapping pane and right-click the recurring destination node or any occurrence of a recurring destination node.  
Destination nodes are located on the right side of mapping panes.
2. Select Collapse Occurrences from the list.
3. Click OK.

**Parent topic:** [Mapping Specific Occurrences](#)

---

[Feedback](#) | [Notices](#)

# Add destination occurrence

---

## About this task

---

To add an occurrence to a destination node with existing expanded occurrences:

## Procedure

---

1. Open a mapping pane and right-click the recurring destination node or any occurrence of a recurring destination node.  
Destination nodes are located on the right of the mapping panes.
2. From the list, select one of the following options (if available) from the Add New Occurrence menu option:
  - Add New Occurrence > After - Select this option if you want add the new occurrence after the currently selected destination occurrence.
  - Add New Occurrence > Before - Select this option if you want add the new occurrence before the currently selected destination occurrence.
3. Click OK.

You can specify the substitution type for an expanded occurrence of a recurring destination node. This type substitution of an expanded occurrence is only supported for the recurring destination nodes. Destination nodes are located on the right of the mapping panes.

**Parent topic:** [Mapping Specific Occurrences](#)

---

# Remove Destination Occurrence

---

## About this task

To remove a destination occurrence:

### Procedure

1. Open a mapping pane and right-click the recurring destination node or any occurrence of a recurring destination node.  
Destination nodes are located on the right of the mapping panes.
2. From the list, select the Remove Selected Occurrence menu option. A Confirmation dialog box opens.
3. Click Yes.

## Select a substitution type in a mapping pane

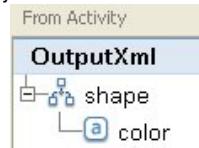

### About this task

To select a substitution type in a mapping pane:

### Procedure

1. [Upload an XML Schema](#) that contains an XML element based on derived types into the project.
2. In an activity that uses an XML Schema, select the node representing the XML element that is based on a derived type for the input or output parameter of the activity.

For example, the Read XML activity uses an XML Schema to define the output parameter of the activity. In the Configure task of the Checklist for the Read XML activity, select an XML variable that defines the node of the XML Schema to use the output parameter. Using example XML Schema shown in the preceding figure, a variable based on the `<shape>` element can be used to define the node of the XML Schema to use as the output parameter of the Read XML activity. Since the derived type for the `<shape>` element is not selected, only the child element (named color) of the base type are displayed in the From Activity

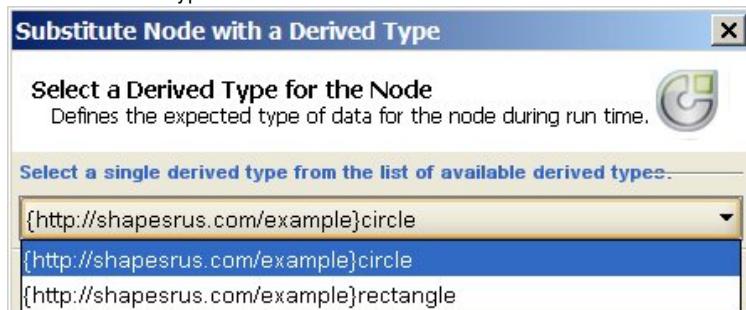

pane as shown in the following figure:

Note that the child elements of the derived types are not listed in the mapping pane. In this example, the child element of circle which is named diameter is not listed, nor are the child elements of rectangle which are named width and length.

3. In the From Activity and To Orchestration panes of an activity, select the derived type expected during run time, by right-clicking on the node and from the menu selecting the Substitute Node With ... option. The Substitute Node with a Derived Type dialog box open the menu, the available derived types for the node as defined by the XML Schema are listed. For this example,

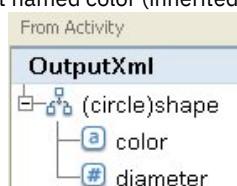

the two derived types are available from the menu as shown in the following figure:

4. Select one of the derived types. The selected derived type determines the expected type of XML instance document during run time.

In this example, the circle derived type is selected, so the XML data expected for this node during run time is of type circle as shown in the XML instance document displayed at the top of this page.

In addition to the child elements of the base type, the child elements of the derived type show in the mapping panes. In this example, the child element named diameter is displayed with the child element named color (inherited from the base type) in

the From Activity pane of the Read XML activity as shown in the following figure:

[Parent topic: Mapping Specific Occurrences](#)

[Parent topic: Selecting a substitution type](#)

---

#### [Feedback | Notices](#)

Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

## [Mapping Destination Nodes](#)

---

When you map a destination node, you indicate the data source used to complete the node and create a mapping rule. Mapping rules provide data to a destination node in various ways, as described in the following topics.

### [From source nodes](#)

---

Mapping from a source node to a destination node creates a link between them. This is the most common way to define a mapping rule. There are several ways to link source and destination nodes as described in these topics:

[Mapping Techniques](#)

[Mapping Recurring Nodes](#)

[Automapping Matching Nodes](#)

[Bulk Mapping Nodes](#)

### [By assignment](#)

---

Mapping by assignment means that you provide a default value or use functions to determine the value of the destination node. See [Assigning a Default Value for a Destination Node](#) and [Assigning a Function Without a Source Node Link](#) for more information.

## Using a combination of source nodes and functions

---

Mapping using a combination of source nodes and functions refers to manipulating the link between source and destination nodes with functions to convert data, calculate or assign data. See the [Assigning Function\(s\) to a Mapping Rule](#) for details

**Parent topic:** [Mapping](#)

---

[Feedback](#) | [Notices](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Mapping\\_Destination\\_Nodes.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Mapping_Destination_Nodes.html)

## Selecting a substitution type

---

The XML Schema specification supports the ability to derive complex types by extension.

In the XML instance document, you declare the type of an XML element from a set of types that are all derived from the same base type, rather than explicitly declaring the type for the XML element in the XML Schema. The type for the element is defined using the type attribute as shown by the following example XML instance document:

```
<?xml version="1.0" encoding="UTF-8"?>
<shape xmlns="http://shapesrus.com/example"
       xmlns:xsd="http://www.w3.org/2001/XMLSchema-instance" xsd:type="circle">
  <color xmlns="">blue</color>
  <diameter xmlns="">10</diameter>
</shape>
```

In the preceding XML instance document, the `<shape>` element is declared as a `circle` type. The `<shape>` element in the XML instance document can also be defined as a `rectangle` type as defined in the following example XML instance document:

```
<?xml version="1.0" encoding="UTF-8"?>
<shape xmlns="http://shapesrus.com/example"
       xmlns:xsd="http://www.w3.org/2001/XMLSchema-instance" xsd:type="rectangle">
  <color xmlns="">blue</color>
  <length xmlns="">5</length>
  <width xmlns="">8</width>
</shape>
```

In this example, the `<shape>` element is based on one of the derived types of `shapeType` base type. The derived types of `shapeType` are named `circle` and `rectangle`, as shown in the following example XML Schema:

```

<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
    targetNamespace="http://shapesrus.com/example"
    xmlns:sru="http://shapesrus.com/example">

    <xsd:element name="shape" type="sru:shapeType"/> } Defines an element
    based on one of the
    derived types of
    shapeType.

    <xsd:complexType name="shapeType" abstract="true"> } Base type
        <xsd:sequence>
            <xsd:element name="color" type="xsd:string"/>
        </xsd:sequence>
    </xsd:complexType> named
                        shapeType.

    <xsd:complexType name="circle">
        <xsd:complexContent>
            <xsd:extension base="sru:shapeType">
                <xsd:sequence>
                    <xsd:element name="diameter" type="xsd:integer"/>
                </xsd:sequence>
            </xsd:extension>
        </xsd:complexContent>
    </xsd:complexType> } Derived type
                        named
                        circle that
                        extends the
                        base type
                        named
                        shapeType.

    <xsd:complexType name="rectangle">
        <xsd:complexContent>
            <xsd:extension base="sru:shapeType">
                <xsd:sequence>
                    <xsd:element name="length" type="xsd:integer"/>
                    <xsd:element name="width" type="xsd:integer"/>
                </xsd:sequence>
            </xsd:extension>
        </xsd:complexContent>
    </xsd:complexType> } Derived type
                        named
                        rectangle
                        that extends
                        the base
                        type named
                        shapeType.

</xsd:schema>

```

When an XML Schema defines an XML element based on derived types, you must specify the derived type (or substitution type) expected for the XML element during run time. For the preceding example XML Schema, you must specify the type of the `<shape>` element — either `circle` or `rectangle`. In Studio, you specify the expected substitution type of an XML element using the Substitute Node With ... menu option:

- For a variable based on a substitution type - Select the expected type of the XML element by right-clicking the node in the Schema of pane in the Variables tab and by selecting the Substitute Node With ... option from the menu. For more information see [Selecting a Substitution Type for Variables](#).
- For a node based on substitution type in a mapping pane - Select the expected type of the XML element by right-clicking the node in the Schema of pane in the Variables tab and by selecting the Substitute Node With ... option from the menu, as described in the following procedure.

In the preceding example XML Schema, the base type called `<shapeType>` is defined as abstract. An abstract base type cannot be used in the XML instance document to define the type for the element - one of the derived types must be specified instead. In this example, the `<shape>` element in the XML instance document cannot be declared as `shapeType`, it must be declared as one of the derived types; either `circle` or `rectangle`.

In the preceding example, the base type is defined as abstract but type substitution of derived types based on a base type that is not abstract is also supported. To make the complexType called `shapeType` not abstract in the example XML Schema, remove the `abstract=true` attribute as shown in the following XML Schema segment:

```

<xsd:complexType name="shapeType">
    <xsd:sequence>
        <xsd:element name="color" type="xsd:string"/>
    </xsd:sequence>
</xsd:complexType>

```

A WSDL is a specific XML Schema that defines a Web Service. Using type substitution with a WSDL is also supported.

You can specify the substitution type for an [expanded occurrence](#) of a recurring destination node. This type substitution of an expanded occurrence is only supported for the recurring destination nodes. Destination nodes are located on the right side of

mapping panes.

Attention: Type substitution of complex types is supported in the mapping panes of activities and for variables. However, deriving elements by extension using substitution groups is not supported in the mapping panes of activities or for variables. For more information, see [Unsupported XML Schema Features](#).

## Example XML Schema

---

The example XML Schema used in this topic is provided for reference:

```
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  targetNamespace="http://shapesrus.com/example"
  xmlns:sru="http://shapesrus.com/example">
  <xsd:element name="shape" type="sru:shapeType"/>
  <xsd:complexType name="shapeType" abstract="true">
    <xsd:sequence>
      <xsd:element name="color" type="xsd:string"/>
    </xsd:sequence>
    </xsd:complexType>
    <xsd:complexType name="circle">
      <xsd:complexContent>
        <xsd:extension base="sru:shapeType">
          <xsd:sequence>
            <xsd:element name="diameter" type="xsd:integer"/>
          </xsd:sequence>
        </xsd:extension>
      </xsd:complexContent>
    </xsd:complexType>
    <xsd:complexType name="rectangle">
      <xsd:complexContent>
        <xsd:extension base="sru:shapeType">
          <xsd:sequence>
            <xsd:element name="length" type="xsd:integer"/>
            <xsd:element name="width" type="xsd:integer"/>
          </xsd:sequence>
        </xsd:extension>
      </xsd:complexContent>
    </xsd:complexType>
  </xsd:complexType>
</xsd:schema>
```

- Select a substitution type in a mapping pane
- Remove the Derived Type Associated with a Node

## Select a substitution type in a mapping pane

---

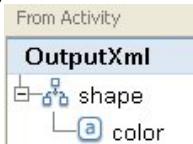

### About this task

To select a substitution type in a mapping pane:

### Procedure

1. [Upload an XML Schema](#) that contains an XML element based on derived types into the project.
2. In an activity that uses an XML Schema, select the node representing the XML element that is based on a derived type for the input or output parameter of the activity.

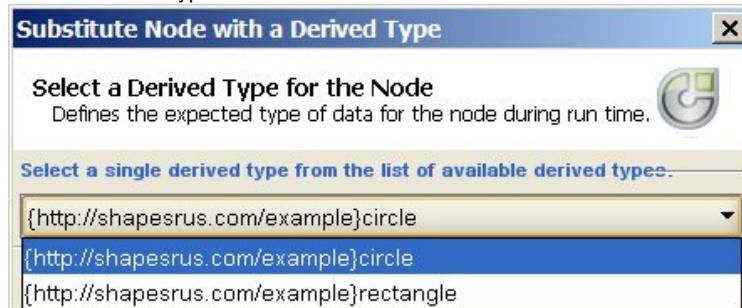

For example, the Read XML activity uses an XML Schema to define the output parameter of the activity. In the Configure task of the Checklist for the Read XML activity, select an XML variable that defines the node of the XML Schema to use as the output parameter. Using example XML Schema shown in the preceding figure, a variable based on the `<shape>` element can be used to define the node of the XML Schema to use as the output parameter of the Read XML activity. Since the derived type for the `<shape>` element is not selected, only the child element (named color) of the base type are displayed in the From Activity pane as shown in the following figure:

pane as shown in the following figure:

Note that the child elements of the derived types are not listed in the mapping pane. In this example, the child element of circle which is named diameter is not listed, nor are the child elements of rectangle which are named width and length.

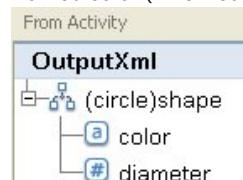

3. In the From Activity and To Orchestration panes of an activity, select the derived type expected during run time, by right-clicking on the node and from the menu selecting the Substitute Node With ... option. The Substitute Node with a Derived Type dialog box open the menu, the available derived types for the node as defined by the XML Schema are listed. For this example, the two derived types are available from the menu as shown in the following figure:

4. Select one of the derived types. The selected derived type determines the expected type of XML instance document during run time.

In this example, the circle derived type is selected, so the XML data expected for this node during run time is of type circle as shown in the XML instance document displayed at the top of this page.

In addition to the child elements of the base type, the child elements of the derived type show in the mapping panes. In this example, the child element named diameter is displayed with the child element named color (inherited from the base type) in

the From Activity pane of the Read XML activity as shown in the following figure:

## Remove the Derived Type Associated with a Node

### About this task

To remove the derived type associated with a node:

## Procedure

---

1. Once a derived type has been selected for a node using the Substitute Node With ... option, you can remove the association between the node and the derived type by right-clicking the node and selecting the Unsubscribe Node option from the menu. A Unsubscribe dialog box opens.
2. Click Yes.

## Mapping Rules That Are Automatically Deleted

---

When you open a map, the Mapping Editor automatically deletes mapping rules from the map in two cases:

### Case 1: One or both of the XML Schemas that the map refers to have been changed.

---

Schemas can change due to changes in the connection activities or message definitions they are generated from. Schemas that you add to the project can also be edited directly.

Note: The warning message from the Mapping Editor lists the mapping rules that were deleted. This list might also include rules for property nodes, such as `ihmap:exists` for the optional property node.

Review the map and recreate or alter mapping rules to handle the schema changes properly.

### Case 2: One of the XML Schemas that the map refers to has been deleted from the project.

---

In this case, the Mapping Editor deletes all mapping rules, and the map cannot be recreated. Close the map and delete it from the project.

## Assigning a Count of Occurrences

---

### About this task

---

You can assign a value to a destination node that counts the actual occurrences in a message of a specific recurring node.

To assign a count of occurrences:

## Procedure

---

1. Drag the Count function from the Functions tab to the Function Graph pane in the Mapping Editor.
2. Link the recurring node that should be counted to the Count function.  
Note: Count works with any recurring node, including recurring structure nodes.
3. Link the Count function to the destination node.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map\\_Removing\\_Mapping\\_Rules.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_Removing_Mapping_Rules.html)

## Removing mapping rules with links

---

### About this task

---

To remove a mapping rule that has a link from source to destination node:

### Procedure

---

Delete the mapping rule in one of the following ways:

- Select the link for the mapping rule and press Delete.
- Right-click the link and select Delete Mapping.

### Results

---

The Mapping Editor prompts you to confirm the removal if the mapping rule you select links occurrence property nodes. Removing occurrence mapping rules also removes all the mapping rules for descendant nodes within that recurring structure.

**Parent topic:** [Removing Mapping Rules](#)

---

[Feedback](#) | [Notices](#)

## Removing mapping rules with no visible links

---

### About this task

Mapping rules can have no visible link if they use only functions or a default value.

To remove mapping rules with no links:

### Procedure

1. Select the destination node and right-click.
2. Select one of these options:
  - a. Define Default Value. If the node has a default assigned. Remove the default value in the Default Value window and click OK.
  - b. Edit Function Graph. If the node has a function graph assigned. Once the function graph is expanded, right-click the function and select Delete Mapping.

## Finding Sample or Result Content

---

### About this task

You can search the sample messages or the test result to find specific nodes or content:

## Procedure

---

1. Open the Mapping pane containing the node you want to search for and click Test.
2. Right-click either the Selected Test Files pane or the Test Result pane and select Find from the shortcut menu.
3. Enter the text that you want to search for in the Text to find field.
4. Select any options or change the direction of the search:
  - o Case Sensitive - Exactly matches the case of the text entered in the Text to find field.
  - o Whole Words Only - Matches the search text only as whole words. No partial matches are allowed.
  - o Wrap Search - Continues searching through the entire schema regardless of where the search was started.
  - o Forward - Searches from the root node or current node down through the schema in node-tree order.
  - o Backward. Searches from the last node in the tree or the current node up through the schema in reverse node-tree order.
5. Click Find. Click Find again to continue the search through the schema.
6. Click Cancel to close the dialog box.

**Parent topic:** [Mapping](#)

## Loading a Sample Message

---

### About this task

---

It is recommended that you test the mapping rules you set up in the Mapping Editor before mapping the next activity in your orchestration. You do this by loading a sample message into the project and testing against it to verify that the mapping rules are applied correctly.

To load a sample message into the project:

## Procedure

---

1. Click Test. The Test Files pane opens.
2. In the Find Test Files pane, click Browse and search for the message you want to load.
3. Select the XML file to use as a sample message in the window and click OK.

If the sample is valid, it displays in the Selected Test Files pane. If there are several source schemas for this map, test files are displayed in source schema order.

4. If the map uses several source schemas, you can load sample messages for other source schemas before you test the transformation. Repeat steps 2 and 3 for each sample you want to test

**Parent topic:** [Mapping](#)

---

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map>Loading\\_a\\_Sample\\_Message.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map>Loading_a_Sample_Message.html)

# Testing maps

---

You can test the transformation defined in a map using one or more sample messages that match the source schemas for the map.

## About this task

---

To test a map:

## Procedure

---

1. Click Test from either the Map Inputs or Map Outputs pane. The Test pane is displayed. The variables or parameters that show in the Select Input Test Files table depend on the type of task:
  - o In the Test pane of a **Map Inputs** task, the variables that are mapped to the input parameters of the activity are displayed in the Select Input Test Files table.
  - o In the Test pane of a **Map Outputs** task, input parameters of the activity are displayed in the Select Input Test Files table.
2. Get sample data to use as input to the map, using one of the following options:
  - o Generate sample data - To generate sample XML data valid against the source schema, select the Map > Generate Test Data from the toolbar menu.
  - o Import sample data from files - For each parameter in the Find Test Files list, click [...] to [browse for a sample message](#) from your computer or a network drive. The selected message is displayed in the Selected Test Files table.  
Note: The sample message must be valid XML that meets the requirements defined in the source XML Schema for the map. If the map uses several source schemas, you can load a sample message for any or all of the schemas.
3. Click Run Test. The transformation defined in your map is run against the sample message you specified in the Location column. The result of the transformation is displayed in the Test Result pane.

## What to do next

---

Either [save the transformation result](#), or [clear](#) it from the Mapping Editor panes.

**Parent topic:** [Mapping](#)

---

# Saving or Clearing the Transformation Result

---

## About this task

---

You can save the result of the map test to a file on your computer or a network drive. This can be useful if you would like to review the result using XML tools outside of Studio. It can also be useful if the result of the transformation is input to another activity, such as a message definition or another map.

To save the result of a map test:

## Procedure

---

1. Test your mapping. For more information, see [Testing maps](#).
2. Select Map > Save Results. The Save Results Message dialog box opens.
3. Navigate to the directory where you want to save the file and enter a file name.
4. Click Save.

**Parent topic:** [Mapping](#)

## Clearing the transformation result

---

## Procedure

Select Map > Clear Results. The results are cleared.

---

## The Emit CData Option

---

### About this task

Select the Emit CData option for a destination node for the text in the destination XML element to be treated as an XML CDATA section and assigned to the destination node as a block and is not parsed during run time. It is equivalent to specifying data for an XML element using the following XML syntax:

```
<! [CDATA[  
text  
]]>
```

The Emit CData option can be selected for any destination nodes (located on the right pane of the Mapping Editor). You can also select the Emit CData option for default values.

Note: The Emit CData option is not available for input nodes (located on the left pane of the Mapping Editor.)

To select the Emit CData option:

## Procedure

---

1. In the Mapping Editor, right-click a destination node that is linked (or mapped) or has a default value associated with it. Destination nodes are located in the right pane of the Mapping Editor either in the To Activity or To Orchestration pane
2. Select the Emit CData option from the list. During run time, the Integration Appliance treats that destination node as a CDATA section.

**Parent topic:** [Mapping](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map\\_The\\_Emit\\_CData\\_Option.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_The_Emit_CData_Option.html)

## The Emit Only If Option

---

### About this task

The Emit Only If condition allows you to map elements conditionally (based on a condition) by evaluating XPath expressions.

This mapping option is available when the target node is a recurrent node with `minOccurs="0"`, which means it is optional. Mapping occurs only if the condition is True.

To select the Emit Only If option:

## Procedure

---

1. In the Mapping Editor, right-click a destination node that is linked (or mapped). Destination nodes are located in the right pane of the Mapping Editor either in the To Activity or To Orchestration pane.
2. Select the Emit Only If option from the list. The Emit Condition dialog box is displayed.
3. Specify an XPath expression in the Left Hand Expression column using the browse button, select the operator, and then specify the value in the Right Hand Expression column.

For example, `bpws:getVariableData('fullName')/fullName/firstName = 'John'` and `bpws:getVariableData('fullName')/fullName/lastName = 'Smith'`

Note: If the condition compares a STRING to the Right Hand Expression it needs to be specified in single quotes ('').

Note: To add multiple conditions, click the Add button. The conditions can be clubbed by AND or OR, and parenthesis is not supported.

Note: To specify conditions that are more complex than what can be specified in the Enter Condition dialog, click the Advanced button.

**Parent topic:** [Mapping](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map\\_the\\_Emit\\_Only\\_if\\_Option.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_the_Emit_Only_if_Option.html)

## Unsupported XML Schema Features

---

Using the following XML Schema features can cause maps to display or transform incorrectly, and can cause validation warnings:

### Choice

---

Limitations to mapping rules might not allow you to correctly define transformation requirements for nodes within a choice. The guaranteed status of mapping rules involving choice structures might be incorrect. Transformations to destination schemas that have choice structures might incorrectly include all choices.

### Mixed Content

---

Elements that allow mixed content can contain both data and other nodes. These nodes display correctly and can be mapped. However, transformation of messages with mixed content nodes might not be complete.

### Recursive Content

---

You cannot create a map with unlimited levels of recursive elements. You can specify mapping rules for no more than five recursive levels.

### Substitution Groups

---

Substitution groups support deriving elements by extension. Using substitution groups in an XML Schema to extend an xs:anyType element to different types of elements is not supported. For example, extending an xs:anyType element to either an element based on a simple type or an element based on a complexType is not supported.

The ability to derive complex types by extension using type substitution is supported. For more information, see [Selecting a substitution type](#) and [Selecting a Substitution Type for Variables](#).

### Unique, Key, or Keyref

---

The Mapping Editor does not provide information about elements that have unique, key, or keyref constraints and mapping rules do not evaluate.

### Various facets for restrictions or extensions

---

Information about the following facets is not available within the Mapping Editor and these facets are not considered when you create mapping rules:

- minInclusive, maxInclusive, minExclusive, and maxExclusive
- length, minLength, and maxLength
- totalDigits and fractionDigits
- whitespace
- patterns
- enumeration

**Parent topic:** [Mapping](#)

## About Unmapped Destination Nodes

---

During transformations, the Integration Appliance includes all destination nodes in the result message. Destination nodes that are not mapped become empty nodes in the resulting message.

In most cases, this is desired behavior. With updates to databases, however, the Integration Appliance treats an empty node in the outbound message as a NULL value for the database.

To prevent NULL values from being saved to the database, you must remove the unmapped nodes from the XML Schema by clearing the columns from the database activity in the Configure pane. See the following topics for more details:

[Single-Table Inbound Database Activities](#)

[Single-Table Outbound Database Activities](#)

[Poll Table Activity](#)

## Filter Recurring Nodes

---

By specifying an XPath predicate to filter against during run time, you can limit the recurring nodes returned by a mapping activity.

### About this task

---

Filtering using a predicate directly in the mapping panes of activities eliminates the need for the following activities:

- A While Loop or For Each activity that loops through the recurring structures
- An If..Then activity to test for values.

Eliminating the looping and If..Then activities improves orchestration performance.

For example, you can limit the books processed by the BatchOrderProcessingSample orchestration to only return book titles that start with the letter B using either of the following methods:

- After the Read Flat File activity which converts flat file data to XML, you can add a While Loop activity that contains an If..Then activity that tests for all book titles that start with the letter B. When the While Loop activity completes at run time, it returns the set of recurring BookOrder nodes that have titles beginning with the letter B.
- Filter by specifying a predicate directly in the To Orchestration pane of the Map Outputs task of the Read Flat File activity that converts flat file data to XML. This is the preferred method because it reduces the processing during run time - improving orchestration performance. For example, you can specify the following predicate on the recurring BookOrder node to limit the Bookorder nodes returned during run time to only those titles that begin with the letter B:  
\*:title/starts-with(., 'B')

This example predicate is explained in the following table:

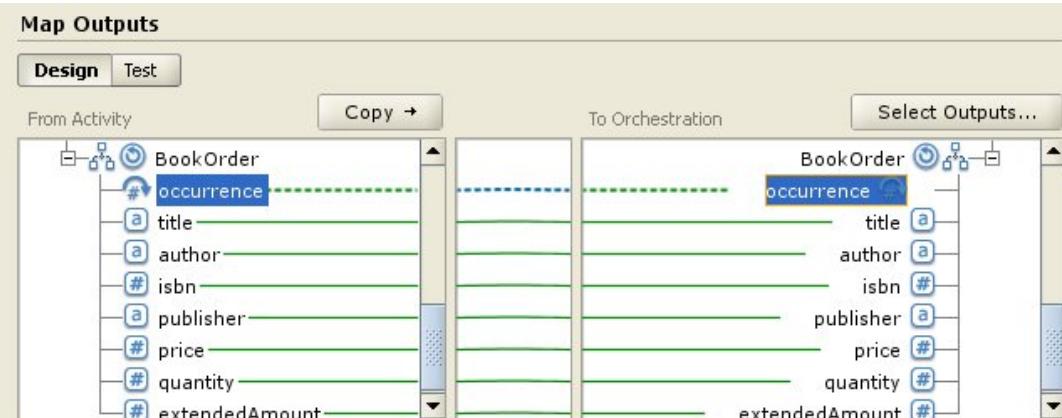

Predicate Characters	Description
*:	Specifies this predicate applies to any namespace of the source node.
title/	Specifies to apply this predicate against the title node of the current source node.
starts-with(., 'B')	Specifies this predicate returns only nodes that have title nodes that start with the letter B. The starts-with function is a built-in XPath function.

For more information about the BookOrder sample, see the *Getting Started Guide*. If you accepted the defaults during the installation of Studio, you can find the reference implementation of the sample in the following directory:C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\BookOrder

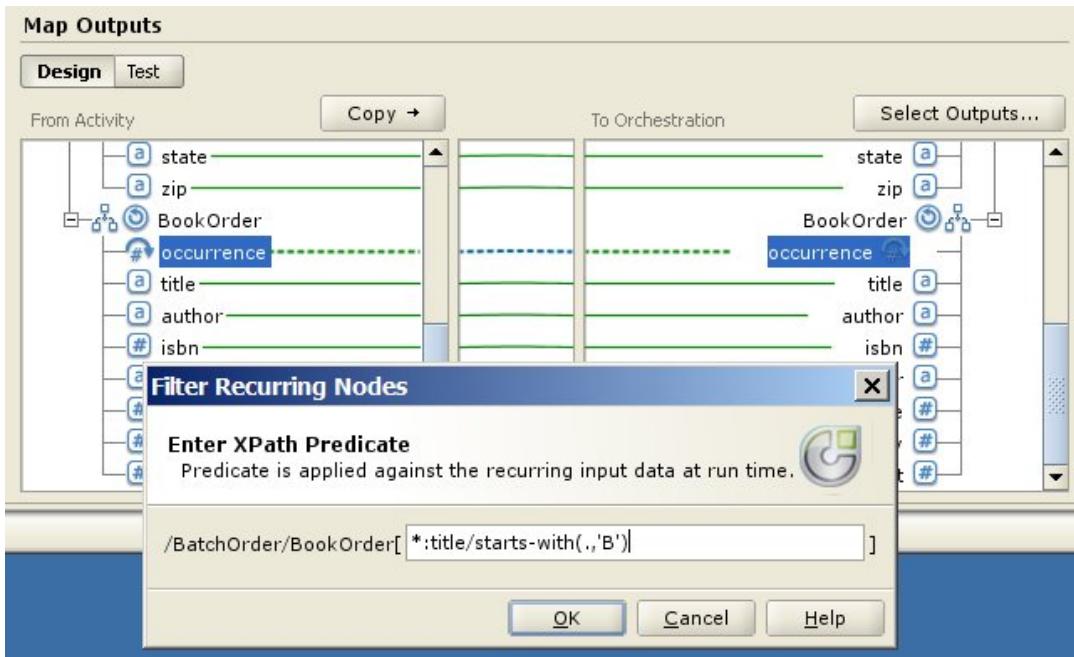

To specify a predicate on a recurring node:

## Procedure

1. You can only apply a filter on a recurring destination node which is mapped to a recurring source node in the mapping panes of activities, as shown in the following Map Outputs pane of the Read Flat File activity in the BatchOrderProcessingSample orchestration:

2. Right-click on the destination occurrence node (in this example BookOrder/occurrence) and select Filter Recurring Nodes from the menu. The Filter Recurring Nodes dialog box opens.
3. Enter the XPath predicate. For this example, enter the predicate shown in the following figure:

4. Click OK. The predicate is evaluated to determine if it is valid:
- If the predicate is invalid, an error message is reported.
  - If the predicate is valid, the filter icon ( ) shows next to the destination occurrence node.

## About Lookup Tables

---

Lookup tables define a set of key-value (name-value) pairs. During run time, these key-value pairs are used to translate the passed in key to the associated value.

A lookup table is similar to a function that has one input string parameter (the source value to translate) and a string return value (the result of the translation). In the Mapping Editor, a lookup table can be dragged onto a mapping rule in the same way that a function can be.

Lookup tables are available to use in any map in the project where they were defined.

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_About\\_Lookup\\_Tables.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_About_Lookup_Tables.html)

## Defining Lookup Tables

---

### About this task

---

To define or create a lookup table:

### Procedure

---

1. Select the Functions tab. In the Function tab, the list of standard functions shows. In addition, the Actions pane is displayed.
2. To display the Lookup Table dialog box, choose from one of the following options:
  - o Right-click the Lookup Tables node in the Functions tab and from the menu select Add New Lookup Table.... .
  - o In the Actions pane, select Add New Lookup Table.The Lookup Table dialog box opens.
3. In the Table Name field of the Lookup Table dialog box, enter a name for your lookup table.  
Note: This name must be unique for all tables in the current project. The name of the table is not case sensitive - the case of a character is not considered. For example, the table name: Aaa is equivalent to the table name: AAA.
4. Optional: In the Description field enter descriptive information about the table.
5. Define the Key Value pairs for the table.  
Repeat the following steps for each Key Value pair in the table:
  - a. Click Add.
  - b. In the Key field, enter the value of the key. During run time, this key will be matched by the specified value.
  - c. In the Value field, enter the value that the key will be translated to during run time. Press the Return key.
6. Optional: Enter a value in the Default Value field. Enter a value in this field, if you want the lookup table to supply a value even when no keys are matched during run time. Leave this field blank, if the lookup table should not return a value when no keys are matched during run time.
7. Optional: Enter a value in the Value if "nil" field. This property only affects nullable nodes. Enter a value in this field, if during run time you want the lookup table to supply a value even when the source node is empty and the source node is nullable. Leave

this field blank, if during run time the lookup table should not return any value when the source node is empty and the source node is nullable.

8. Click OK.

**Parent topic:** [Using Custom Functions and Lookup Tables](#)

## Editing Lookup Tables

---

### About this task

---

To edit an existing lookup table:

### Procedure

---

1. Select the Functions tab. In the Function tab, the list of standard functions shows. In addition, the Actions pane is displayed.
2. In the Function tab, expand Lookup Tables.
3. Select the table to edit.
4. To display the Lookup Table dialog box, choose from one of the following options:
  - o Right-click the table node in the Functions tab and from the menu select Edit....
  - o In the Actions pane, select Add New Lookup Table.The Lookup Table dialog box opens.
5. Edit your table using one of the following actions:
  - o **Add a Key Value pair** - To add another key value pair to your table, follow these steps:
    - a. Click Add.
    - b. In the Key field, enter the name of the key. During run time, this key will be replaced by the specified value.
    - c. In the Value field, enter the value that the key will be translated to during run time. Press the Return key.
  - o **Delete a Key Value pair** - To delete a key value pair from your table, follow these steps:
    - a. Select a key value pair.
    - b. Click Delete.
  - o **Change the Default Value field** - Ä Edit the current setting of the Default Value field. Enter a value in this field, if you want the lookup table to supply a value even when no keys are matched during run time. Leave this field blank, if the lookup table should not return a value when no keys are matched during run time.
  - o **Change the Value if "nil" value field** - Edit the current setting of the Value if "nil" value field. This property only affects nullable nodes. Enter a value in this field, if during run time you want the Lookup table to supply a value even when the source node is empty and the nullable. Leave this field blank, if during run time the lookup table should not return any value when the source node is empty and the source node is nullable.
6. Click OK.

### What to do next

---

Lookup tables are added to mapping rules like functions. For more information about adding functions to mapping rules, see [Assigning Function\(s\) to a Mapping Rule](#).

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_About\\_Custom\\_Functions.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_About_Custom_Functions.html)

## Defining a custom function

---

### About this task

---

To define or create a custom function:

### Procedure

---

1. Select the Functions tab. In the Function tab, the list of standard functions is displayed. In addition, the Actions pane opens.
2. To display the Custom Function dialog box, choose from one of the following options:
  - o Right-click the Custom Functions node in the Functions tab and from the menu select Add New Custom Function....
  - o In the Actions pane, select Add New Custom Function.The Custom Function dialog box opens.
3. In the Function Name field of the Custom Function dialog box, enter a valid JavaScript name for your custom function.  
Note: This name must be unique for all custom functions in the current project. The name of the function is not case sensitive - the case of a character is not considered. For example the function name: Aaa is equivalent to the function name: AAA.
4. Select a Return Type for your custom function from one of the following options:
  - o string
  - o number
  - o booleanFor more information about these datatypes, see [Custom Function Parameter and Return Datatypes](#).
5. Define the parameters for your custom function. Repeat the following steps for each parameter in your custom function:
  - a. Click Add.
  - b. In the Name field of the Parameters table, enter the name of the parameter and press the Return key.
  - c. Select a Type for the parameter, from one of the following options:
    - string
    - number
    - booleand. For more information about these datatypes, see [Custom Function Parameter and Return Datatypes](#).
6. Enter the source code for your custom function by following these steps:
  - a. Click Next.
  - b. In the white area displayed between the braces enter the JavaScript code of your custom function. Â
  - c. Click Compile. The syntax of the function will be checked and any errors reported. The location of the errors are highlighted in red in the source code.
  - d. Fix any syntax errors and once the function compiles successfully, click OK and then Finish.

### Results

---

The custom function is now available from the Custom Functions folder of the Functions tab.

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/defining\\_a\\_custom\\_function.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/defining_a_custom_function.html)

## Editing a custom function

---

### About this task

---

To edit an existing custom function:

### Procedure

---

1. Select the Functions tab. In the Function tab, the list of standard functions is displayed. In addition, the Actions pane opens.
2. In the Function tab, expand Custom Functions.
3. Select the custom function to edit.
4. To display the Custom Function dialog box, choose from one of the following options:
  - o Right-click the function node in the Functions tab and from the menu select Edit.... Â
  - o In the Actions pane, select Add New Lookup Table.

The Custom Function dialog box opens.

5. In the Custom Function dialog box, edit your custom function using one of the following actions:

- o **Add a Parameter** - To add a parameter to your custom function follow these steps:
  - a. Click Add. Â
  - b. In the Name field of the Parameters table, enter the name of the parameter.
  - c. Select a Type for the parameter, from one of the following options:
    - string
    - number
    - boolean

For more information about these datatypes, see [Custom Function Parameter and Return Datatypes](#).

- o **Delete a Parameter** - To delete a parameter from your custom function follow these steps:
  - a. In the Name field of the Parameters table, select the parameter and press the Return key.
  - b. Click Delete.
- o **Change the Return Type** - To select one of the following options from the Return Type field:
  - string
  - number
  - boolean

For more information about these datatypes, see [Custom Function Parameter and Return Datatypes](#).

- o **Edit the source code** - To edit the source code of your custom function, follow these steps:
  - a. Click Next.
  - b. In the white area displayed between the braces enter the JavaScript code of your custom function.
  - c. Click Compile.

The syntax of the function will be checked and any errors reported. The location of the errors is highlighted in red in the source code.

- d. Fix any syntax errors and once the function compiles successfully, click OK and then Finish.

The custom function is now available from the Custom Functions folder of the Functions tab.

## Custom Function Parameter and Return Datatypes

---

The datatypes supported in the parameters and the return types of custom functions and their equivalent JavaScript types are listed in the following table.

Custom Datatype	JavaScript Datatype	Description
string	string	Text characters
number	double	Integer or decimal numbers
boolean	bool	Boolean value equal to either <i>true</i> or <i>false</i>

**Parent topic:** [Using Custom Functions and Lookup Tables](#)

## Assigning a Function Without a Source Node Link

---

### About this task

To define a mapping rule in which the input for the destination node is provided by the return value of a function and not from a source node:

### Procedure

1. Select the Functions tab. In the Functions tab, the list of available functions is displayed. Â
2. In the Functions tab, expand folder that contains the function to assign to the destination node. This function must have no input parameters. For example, the **Get Current® Date and Time** function has no parameters and returns the current date and time.
3. Select the function icon and drag it into the Mapping Editors middle pane, near the destination node you want to map.
4. In the Mapping Editor, drag from the function icon to the destination node. A link from the function to the destination node is displayed.
5. Optional: Test if the mapping rule is valid by right-clicking on the function in the mapping rule and selecting Apply Function Graph. If the mapping rule is valid, the square function icon in the graphical representation of the mapping link is not displayed and a function icon is shown to the left of the destination node icon, as shown in [Figure 1](#).

### Results

Figure 1. No source node function icon

**Parent topic:** [Using Custom Functions and Lookup Tables](#)

---

[Feedback](#) | [Notices](#)

## Assigning a Function While Creating Maps

---

### About this task

---

To assign a function while creating maps:

### Procedure

---

1. Select the Function tab. In the Function tab, the list of available functions is displayed.
2. From the Function tab, drag a function between the two nodes you want to map in the Mapping Editor.
3. Drag the source node onto the function icon to create a link. The source node is assigned to the first parameter of the function. During run time, the value of this source node is provided as the first parameter of the function.
4. Drag the destination node onto the function to create the link. During run time, the return value of the function populates the destination node.
5. If the function has more than one input parameter, you must assign the remaining input parameters using one of the following options:
  - o Create links from other source nodes (as described in step 3) or from functions used in the current mapping rule.
  - o Edit the assignment of input parameters using the Functions Properties dialog box. To open the Functions Properties dialog box, double-click the function in the Mapping Editor.
6. Optional: Add additional functions to the mapping rule using the procedure described in the topic [Adding a Function to an Existing Mapping Rule](#). For an example, see [Example: Chaining Multiple Functions](#).
7. Optional: If any functions are still associated with the mapping rule, test if the mapping rule is valid by right-clicking on the function in the mapping rule and selecting Apply Function Graph. If the mapping rule is *valid*, the square function icon or icons in the graphical representation of the mapping link are not displayed and a blue bar with small squares at each end is displayed (). If the mapping rule is not valid, the graphical representation of the mapping rule does not change, the function icons are still visible, (for example ) and an error dialog opens.  
Note: A mapping rule with function or functions is considered valid if all the input parameters of the function or functions are assigned with values of the correct datatype and if the return value of the last function matches the datatype of the destination node. The input parameters of a function can be provided by source nodes or by the return type of other functions associated with that mapping rule.

## Adding a Function to an Existing Mapping Rule

---

### About this task

---

To add a function to an existing mapping rule:

### Procedure

---

1. Select the Function tab. In the Function tab, the list of available functions is displayed.
2. From the Function tab, drag a function onto an existing mapping rule in the Mapping Editor.

The source node of the mapping rule is assigned to the first parameter of the function. During run time, the value of the source node is provided to the first parameter of the function.

The destination node of the mapping rule is assigned to the return type of the function. During run time, the return value of the function populates the destination node.

3. If the function has more than one input parameter, you must assign the remaining input parameters using one of the following options:

- Create links from other source nodes (as described in step 3 of [Assigning a Function While Creating Maps](#)) or from functions used in the current mapping rule.
- Edit the assignment of input parameters using the Functions Properties dialog box. To open the Functions Properties dialog box double-click the function in the Mapping Editor.

4. Optional: Add additional functions to the mapping rule using this same procedure. For more information, see [Example: Chaining Multiple Functions](#).

5. Optional: Test if the mapping rule is valid by right-clicking on the function in the mapping rule and selecting Apply Function Graph. If the mapping rule is valid, the square function icon or icons in the graphical representation of the mapping link are not displayed and a blue bar with small squares at each end is displayed (  ). If the mapping rule is not valid, the graphical representation of the mapping rule does not change, the function icons are still visible, (for example:  ) and an error dialog opens.

Note: A mapping rule with function or functions is considered valid if all the input parameters of the function or functions are assigned with values of the correct datatype and if the return value of the last function matches the datatype of the destination node. The input parameters of a function can be provided by source nodes or by the return type of other functions associated with that mapping rule.

## Example: Chaining Multiple Functions

---

### About this task

---

Multiple functions can be chained together in a single mapping rule. The flow of execution of the functions in the mapping rule is from left to right.

For example, you could build a mapping rule that uses multiple functions as described in the following sequence:

### Procedure

---

1. A source node of type: string is the input parameter to the **trim** function.
2. The **trim** function removes trailing and leading white space from the input parameter and the resulting string is returned.
3. The return string of the **trim** function is the input parameter to the **lowercase** function.
4. The **lowercase** function converts each of the uppercase characters of the input string into their lowercase form and the resulting string is returned.
5. The return string of the **lowercase** function populates the destination node of type: string.

### Results

---

In the Mapping Editor, this mapping rule is displayed as shown in the following figure.

**Parent topic:** [Using Custom Functions and Lookup Tables](#)

---

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map\\_assigning\\_functions\\_example.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_assigning_functions_example.html)

## Assigning Function(s) to a Mapping Rule

---

Assign built-in or custom function(s) to a map to convert or manipulate the data from source node(s) before it populates the destination node. In addition, the source data for input parameters can be provided by other functions associated with the mapping rule.

**Parent topic:** [Using Custom Functions and Lookup Tables](#)

 Last updated: Wednesday, 15 June 2016

## Deleting a Function from a Mapping Rule

---

### About this task

To delete a function used in a mapping rule in the Mapping Editor:

### Procedure

---

1. Display the mapping link with the functions visible. If the mapping link with function or functions has functions associated with it but the functions are not displayed (as shown here: , right-click the mapping rule and from the list and select Edit Function Graph. The functions associated with the mapping rule are displayed.
2. Choose one of the following options:
  - o Select the function to delete and press the Delete key.
  - o Right-click the function and select Delete Function in the list.

Depending on your mapping rule, links between source nodes, other functions, or the destination node might be deleted.

3. Repair any missing links in the mapping rule.
4. Optional: If any functions are still associated with the mapping rule, test if the mapping rule is valid by right-clicking on the function in the mapping rule and selecting Apply Function Graph. If the mapping rule is *valid*, the square function icon or icons in the graphical representation of the mapping link are not displayed and a blue bar with small squares at each end displays (). If the mapping rule is not valid, the graphical representation of the mapping rule does not change, the function icons are still visible, () and an error dialog opens

Note: A mapping rule with function or functions is considered *valid* if all the input parameters of the function or functions are assigned with values of the correct datatype and if the return value of the last function matches the datatype of the destination node. The input parameters of a function can be provided by source nodes or by the return type of other functions associated with that mapping rule.

## Math Functions with Node Set Constraints

---

The following math functions calculate values from sets of nodes:

- **Average**
- **Count**
- **Maximum**
- **Minimum**
- **Sum**

For example, the Sum function calculates the total value of all ItemPrice nodes when ItemPrice is a recurring source node.

You can use several node sets as parameters with these functions, including single nodes. You can also use literal numbers or the results of other math functions as parameters for functions that accept node sets.

### Limitations in Combining Other Math Functions or Literals

---

When using numbers or other functions to supply node set parameters, some math functions use the first occurrence of a node set in calculations. In a mapping rule, if you link functions that work with only one node of the set as a parameter to another function that works with the full node set, the final result will not include values from the full node set.

For example, the Multiply function is linked with the Sum function in a mapping rule and so during run time, the result of the Multiply function becomes the input to the Sum function. If the input to the Multiply function is a recurring item structure, the **Multiply** function multiples the UnitPrice with the Quantity and then passes the result to the Sum function. The result from Sum function would be the product of the first UnitPrice and Quantity — not the total extended price for all items.

Note: The Count function accepts any source node as a parameter, including structure or choice nodes which you usually cannot map.

## Adding a Parameter

---

### About this task

---

You can only add parameters if required parameters are missing or if the maximum number of optional parameters has not been filled.

To add a parameter:

### Procedure

---

1. Click Add from the Function Parameters dialog box.
2. Enter a value for that parameter in the Value cell.
3. Click OK.

Note: Some functions can only accept source nodes as parameters. For more information, see [Math Functions with Node Set Constraints](#).

**Parent topic:** [Using Custom Functions and Lookup Tables](#)

 Last updated: Wednesday, 15 June 2016

## Editing a Parameter

---

### About this task

---

To edit a parameter:

### Procedure

---

1. Open the Function Parameters dialog box for the function to be edited.
2. Click the cell containing the value you want to change. Alternatively, click one of the buttons in the dialog box to add, delete, or reorder the selected parameter.
3. When finished editing, click OK to save changes and close the dialog box.

**Parent topic:** [Using Custom Functions and Lookup Tables](#)

## Deleting a Parameter

---

### About this task

---

To delete a parameter:

### Procedure

---

1. Open the Function Parameters dialog box for the function to be edited.
2. Select the *optional* parameter you want to delete from the parameter list.
3. Click Delete.

**Parent topic:** [Using Custom Functions and Lookup Tables](#)

---

## Reordering Parameters

---

### About this task

---

To change the order of a parameter in the Parameters list:

## Procedure

---

1. Select the parameter from within the Function Parameters dialog box.
2. Click Up to move the parameter up the list; click Down to move the parameter down the list.

**Parent topic:** [Using Custom Functions and Lookup Tables](#)

---

## Specifying Default Values for Functions that Accept Recurring Nodes as Input

---

### About this task

The following math functions calculate values from sets of nodes:

- [Average](#)
- [Count](#)
- [Maximum](#)
- [Minimum](#)
- [Sum](#)

You cannot specify a default value (or constant) for the input parameters of these functions in their Functions Properties dialog box. To specify default values for the input parameters of these functions, complete these steps:

## Procedure

---

1. Create a variable with the same data type as the input parameter for the function.
2. In the "Properties of" pane of the Variables tab, enter the constant value in the Default Value field for the variable.
3. In the From Orchestration pane of the activity, add the variable that has the default value.
4. Map the variable to the input parameter of the function.

**Parent topic:** [Using Custom Functions and Lookup Tables](#)

## Mapping Function Reference

---

- [Mapping functions overview](#)

There are seven mapping function types: String, Mathematical, HTTP Header, Miscellaneous, Binary Data, Date, and Security functions.

- [Mapping Function Syntax and Datatypes](#)

Use the Mapping Function to describe the purpose of the function, set valid input parameters and syntax, and set what the

- function returns.
- [Absolute Value function](#)  
The **Absolute Value** function determines the absolute value of the parameter.
- [Add function](#)  
The **Add** function adds all the parameters.
- [AES Decrypt function](#)  
The **AES Decrypt** function decrypts fields and content using the Advanced Encryption Standard (AES) algorithm with 128 bit strength. 128-bit encryption level requires an 8-byte key, which must be a 32-character hexadecimal string.
- [AES Encrypt function](#)  
The **AES Encrypt** function encrypts fields and content using the Advanced Encryption Standard (AES) algorithm with 128 bit strength. 128-bit encryption level requires an 8-byte key, which must be a 32-character hexadecimal string.
- [Align Center function](#)  
The **Align Center** function centers a string within a padding string. If the padding for both sides is uneven, the lesser amount of padding is placed on the left.
- [Align Left function](#)  
The **Align Left** function places a string within a padding string starting from the left-most character.
- [Align Right function](#)  
The **Align Right** function places a string within a padding string ending at the right-most character.
- [Average function](#)  
The **Average** function determines the average value for the sets of numeric nodes in all parameters.
- [Base64 Encode and Decode functions](#)  
Base64 refers to a specific MIME content transfer encoding. Base64 encoding represents arbitrary sequences of octets in a form that requires case sensitivity but need not be humanly readable.
- [Boolean function](#)  
The **Boolean** function evaluates the parameter and returns either 'true' or 'false' depending on the datatype of the input:
- [Ceiling function](#)  
The **Ceiling** function rounds the parameter up to the next closest integer.
- [Concatenate function](#)  
The **Concatenate** function joins all parameter strings into a single result in the order you specify the parameters.
- [Cast From Base64Binary function](#)  
The **Cast From Base64Binary** function casts from one specific XML Schema data type to another XML Schema data type.
- [Casts From HexBinary function](#)  
The **Casts From HexBinary** function casts from one specific XML Schema data type to another XML Schema data type.
- [Cast To Base64Binary function](#)  
The **Cast To Base64Binary** function casts from one specific XML Schema data type to another XML Schema data type.
- [Cast To HexBinary function](#)  
The **Cast To HexBinary** function casts from one specific XML Schema data type to another XML Schema data type.
- [CopyOf function](#)  
The **CopyOf** function copies the entire contents of the source node to the destination node.
- [Count Function](#)  
The **Count** function determines the number of nodes in all of the sets of nodes in parameters.
- [Decode Configuration Property of Type Password](#)  
The **Decode Configuration Property** of type Password decodes base64-encoded passwords between two orchestrations.
- [Digest/Hash function](#)  
The **Digest/Hash** function produces a digital summary of information called a message digest. Message digests provide a digital identifier for a digital document. The message digest produced by the Digest/Hash function is Base64 encoded.
- [Divide function](#)  
The **Divide** function returns the decimal quotient of the first parameter divided by all subsequent parameters.
- [Extract HTTP Header Field function](#)  
The **Extract HTTP Header Field** function extracts a string with a specified delimiter. It can be used to further extract strings from HTTP headers.
- [Extract Query Parameter function](#)  
The **Extract Query Parameter** function extracts a query string from the HTTP header's URI string.
- [Extract URI Path function](#)  
The **Extract URI Path** function extracts a URI from the HTTP header's URI string.
- [Floor function](#)  
The **Floor** function rounds the parameter down to the next closest integer.
- [Format Date String function](#)  
The **Format Date String** function converts the XML Schema data type: xs:dateTime to a string in the format defined by the second parameter.
- [Format Number function](#)  
The **Format Number** function returns a string that is a number formatted to fit the specified pattern.

- [Generate RFC2104 HMAC Compliant Signature](#)

HMAC is a mechanism for message authentication using cryptographic hash functions.

- [Get Current Date and Time function](#)

The **Get Current Date and Time** function returns the current date and time as a specific XML Schema data type.

- [Get Current Date function](#)

The **Get Current Date** function returns the current date (with the local timezone) as a XML Schema data type: xs:date.

- [Get Current Time function](#)

The **Get Current Time** function returns the current time (with the local timezone) as a XML Schema data type: xs:time

- [Length function](#)

The **Length** function determines the number of character in the parameter.

- [Lowercase function](#)

The **Lowercase** function converts all uppercase characters to lowercase characters.

- [Maximum function](#)

The **Maximum** function determines the highest value in the nodes, sets of numeric nodes, or numbers in parameters.

- [Minimum function](#)

The **Minimum** function determines the lowest value in the nodes, sets of numeric nodes, or numbers in parameters.

- [Modulo function](#)

The **Modulo** function determines the remainder from dividing the first parameter by all subsequent parameters.

- [Multiply function](#)

The **Multiply** function returns the product of all parameters.

- [Not function](#)

The **Not** function is typically used in conditions to specify negative or complimentary conditions.

- [Number function](#)

The **Number** function changes the datatype of the parameter to number.

- [Padding String function](#)

The **Padding String** function returns a padding string of the specified length and characters. Padding strings are used in alignment functions.

- [Position function](#)

The **Position** function is used with conditions to represent the index to the current node within the set of its siblings. The function works only within the context of a recurring node and has no parameters.

- [Read Date String function](#)

The **Read Date String** function converts a string (that contains a date and time) to the XML Schema data type: xs:dateTime.

- [Replace function](#)

The **Replace** function replaces individual characters with other individual characters.

- [Replace String function](#)

The **Replace String** function replaces individual characters or a string with other individual characters or string.

- [Round function](#)

The **Round** function rounds a number to the closest integer.

- [Starts With function](#)

The **Starts With** function determines whether or not the first parameter begins with the characters in the second parameter.

- [String function](#)

The **String** function changes the datatype of the parameter to string.

- [Substring function](#)

The **Substring** function extracts a portion of the parameter based on the specified character placement.

- [Substring After function](#)

The **Substring After** function extracts all the characters in a string starting after the first occurrence of a specified substring (one or more characters) through the end of the string.

- [Substring Before function](#)

The **Substring Before** function extracts all the characters in a string starting at the beginning up to the first occurrence of a specified substring (one or more characters).

- [Subtract function](#)

The **Subtract** function returns the difference of the first parameter less all subsequent parameters.

- [Sum function](#)

The **Sum** function determines the sum of values in the numeric node, sets of numeric nodes, or numbers in parameters.

- [Trim function](#)

The **Trim** function trims all leading and trailing spaces and replaces continuous sets of white space characters by a single space.

- [Uppercase function](#)

The **Uppercase** function converts all lowercase characters to the corresponding uppercase character.

## Mapping functions overview

---

There are seven mapping function types: String, Mathematical, HTTP Header, Miscellaneous, Binary Data, Date, and Security functions.

The mapping functions can be displayed by clicking the Functions tab. Mapping functions are divided into the following categories:

- [String](#)
- [Mathematical](#)
- [HTTP Header](#)
- [Miscellaneous](#)
- [Binary Data](#)
- [Date](#)
- [Security](#)

<b>String functions</b>	<b>Definition</b>
<a href="#">Align Center</a>	Centers a string within the specified padding string.
<a href="#">Align Left</a>	Places a string inside a padding string starting from the leftmost character.
<a href="#">Align Right</a>	Places a string inside a padding string ending with the rightmost character.
<a href="#">Concatenate</a>	Joins all the parameter strings into a single string.
<a href="#">Format Number</a>	Returns a string that is a number formatted to fit the specified pattern.
<a href="#">Length</a>	Determines the number of characters in the parameter.
<a href="#">Lowercase</a>	Converts all uppercase English characters to lowercase characters.
<a href="#">Padding String</a>	Returns a padding string of the specified length and characters.
<a href="#">Replace</a>	Replaces individual characters with other individual characters.
<a href="#">Starts With</a>	Determines whether the first parameter begins with the characters in the second parameter.
<a href="#">Substring</a>	Extracts a portion of the parameter that is based on the specified character placement.
<a href="#">Substring After</a>	Extracts all the characters in a string starting after the first occurrence of a specified substring (one or more characters) through the end of the string.
<a href="#">Substring Before</a>	Extracts all the characters in a string from the beginning to the first occurrence of a specified substring (one or more characters).
<a href="#">Trim</a>	Trims all leading and trailing space from the parameter and normalizes all space within the parameter.
<a href="#">Uppercase</a>	Converts all lowercase English characters to the corresponding uppercase character.

<b>Mathematical functions</b>	<b>Description</b>
<a href="#">Absolute Value</a>	Determines the absolute value of a parameter.
<a href="#">Add</a>	Adds all parameters.
<a href="#">Average</a>	Determines the average value of the numeric nodes or sets of nodes in parameters.
<a href="#">Ceiling</a>	Rounds the parameter up to the next closest integer.
<a href="#">Count</a>	Counts the number of nodes in all the nodes or sets of nodes in parameters.
<a href="#">Divide</a>	Returns the quotient of the first parameter that is divided by all the subsequent parameters.

<b>Mathematical functions</b>		<b>Description</b>
<a href="#">Floor</a>		Rounds the parameter down to the next closest integer.
<a href="#">Maximum</a>		Determines the highest value in the numeric nodes or sets of nodes in parameters.
<a href="#">Minimum</a>		Determines the lowest value in the numeric nodes or sets of nodes in parameters.
<a href="#">Modulo</a>		Determines the remainder from dividing the first parameter by all subsequent parameters.
<a href="#">Multiply</a>		Returns the product of all parameters.
<a href="#">Round</a>		Rounds a number to the closest integer.
<a href="#">Subtract</a>		Returns the difference of the first parameter less all subsequent parameters.
<a href="#">Sum</a>		Adds all the numeric nodes or sets of node in parameters.
<b>HTTP Header functions</b>		<b>Description</b>
<a href="#">Extract HTTP Header Field function</a>		Extracts a string with a specified delimiter. It can also be used to further extract strings from HTTP headers.
<a href="#">Extract URI Path function</a>		Extracts a URI from the HTTP header's URI string.
<a href="#">Extract Query Parameter function</a>		Extracts a query string from the HTTP header's URI string.
<b>Miscellaneous functions</b>		<b>Description</b>
<a href="#">Boolean</a>		Evaluates the parameter and returns either true or false depending on the data type of the input.
<a href="#">CopyOf</a>		When the name of the source node matches the passed in value, this function copies the entire contents of the source node (the entire subtree of the source node including all children) to the destination node.
<a href="#">Not</a>		Returns true if the parameter evaluates as false. Returns false if the parameter evaluates as true.
<a href="#">Number</a>		Changes the data type of the parameter to number.
<a href="#">Position oh</a>		Determines the index to the current node within the set of its siblings.
<a href="#">String</a>		Changes the data type of the parameter to string.
<b>Functions for Binary Data</b>		<b>Description</b>
<a href="#">Cast From Base64Binary function</a>		Casts from the XML schema data type: xs:base64Binary to the XML schema data type: xs:string.
<a href="#">Cast From HexBinary function</a>		Casts from the XML schema data type: xs:hexBinary to the XML schema data type: xs:string.
<a href="#">Cast To Base64Binary function</a>		Casts from the XML schema data type: xs:string to the XML schema data type: xs:base64Binary.
<a href="#">Cast To HexBinary function</a>		Casts from the XML schema data type: xs:string to the XML schema data type: xs:hexBinary.
<b>Date functions</b>		<b>Description</b>
<a href="#">Get Current® Date and Time function</a>		Returns the current date and time (with the local timezone) as an XML schema data type: xs:dateTime.
<a href="#">Get Current Date function</a>		Returns the current date (with the local timezone) as an XML schema data type: xs:date.
<a href="#">Get Current Time function</a>		Returns the current time (with the local timezone) as an XML schema data type: xs:time.
<a href="#">Read Date String function</a>		Converts a string (that contains a date and time) to the XML schema data type: xs:dateTime
<a href="#">Format Date String function</a>		Converts an XML schema data type: xs:dateTime to a string in the format that is defined by the second parameter.
<b>Security functions</b>		<b>Description</b>
<a href="#">AES Encrypt function</a>		Encrypts the fields and content using the Advanced Encryption Standard (AES) algorithm.
<a href="#">AES Decrypt function</a>		Decrypts the fields and content using the Advanced Encryption Standard (AES) algorithm.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Mapping\\_Function\\_Overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Mapping_Function_Overview.html)

## Mapping Function Syntax and Datatypes

---

Use the Mapping Function to describe the purpose of the function, set valid input parameters and syntax, and set what the function returns.

Mapping function topic descriptions include the following:

- A brief description of the purpose of the function.
- Valid input parameters. Parameters are listed in order as the order is significant for most functions. The following syntax is used with parameters:

datatype<sup>n</sup> where n indicates an order if several parameters of the same type are allowed

[datatype] where [ ] indicates that the parameter is optional.

- What the function returns.

Mapping functions can process the following datatypes:

anySimpleType

Any type of data is allowed including numbers, strings, dates, or boolean.

boolean

Either *true* or *false*.

date

A string representing a date in the format YYYY-MM-DD (see datetime for the component descriptions).

datetime

A string representing a date and time in the format:YYYY-MM-DDThh:mm:ss.ssss

Where:

- YYYY = year
- MM = month
- DD = day
- T = date/time separator character
- hh = hour
- mm = minute
- ss = second
- ssss = optional millisecond

day

A string representing the day portion of a date in the format: DD

dt

Several different date or time datatypes can be supplied. See the description of the parameter for a list of the datatypes that are valid.

duration

A string representing a time interval in the form [-]PnYnMnDTnHnMnS:

- [-] = an optional minus sign
- P = period indicator
- nY = the number of years
- nM = the number of months
- nD = the number of days
- T = date/time separator
- nH = the number of hours

- nM = the number of minutes
- nS = the number of seconds

#### empty string

A string with no contents (for example, ''). This is typically returned for error conditions when the result is normally a string.

#### month

A string representing the month portion of a date in the format: MM

#### monthday

A string representing the month and day portion of a date in the format: MM-DD

#### nodeset

A set of nodes within the schema. Node sets are identified by a specific path to a node or structure in the schema. Node sets are used in certain math functions. The datatype of the nodes within the set should be number.

#### number

Any integer or decimal number including:

- positive and negative zero
- positive and negative infinity
- NaN (This is a value indicating that the result is not a number.)

#### string

Text characters within the character encoding of the message

#### time

A string representing a time of day in the format:

hh:mm:ss.sss[-time-zone-indicator]

See [datetime](#) for the component descriptions.

#### tm

Several different time datatypes can be supplied. See the description of the parameter for a list of the datatypes that are valid.

#### year

A string representing the year portion of a date in the format: YYYY

#### yearmonth

A string representing the year and month portion of a date in the format: YYYY-MM

## Absolute Value function

The **Absolute Value** function determines the absolute value of the parameter.

**Parameter:** number

The number for which an absolute value is determined. This can be a source node, the result of another function, or a value you specify.

**Returns:** number

The absolute value of the parameter.

Â **Example:**

10 is the result for both 10 and -10.

**Parent topic:** [Mapping Function Reference](#)

---

[Feedback](#) | [Notices](#)

## Add function

---

The **Add** function adds all the parameters.

**Parameter:** number1, [number2 - 1000]

Each parameter can be a source node, the result of another function, or a value you specify. At least one parameter is required.

**Returns:** number

The sum of all parameters.

**Parent topic:** [Mapping Function Reference](#)

---

[Feedback](#) | [Notices](#)

## AES Decrypt function

---

The **AES Decrypt** function decrypts fields and content using the Advanced Encryption Standard (AES) algorithm with 128 bit strength. 128-bit encryption level requires an 8-byte key, which must be a 32-character hexadecimal string.

**Parameter:** data, key

Data that is passed as the encrypted content is decrypted to the original content using the AES key.

**Returns:** string

The decrypted content is returned and stored as a string.

**Parent topic:** [Mapping Function Reference](#)

---

[Feedback](#) | [Notices](#)

## AES Encrypt function

---

The **AES Encrypt** function encrypts fields and content using the Advanced Encryption Standard (AES) algorithm with 128 bit strength. 128-bit encryption level requires an 8-byte key, which must be a 32-character hexadecimal string.

**Parameter:** data, key

Data that is passed as the input is encrypted using the AES key.

**Returns:** string

The encrypted content is returned and stored as a string.

**Parent topic:** [Mapping Function Reference](#)

---

[Feedback](#) | [Notices](#)

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/AES\\_Encrypt\\_function.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/AES_Encrypt_function.html)

## Align Center function

---

The **Align Center** function centers a string within a padding string. If the padding for both sides is uneven, the lesser amount of padding is placed on the left.

**Parameter:** string1

The string to be aligned. This can come from a source node, the result of another function, or a value you specify.

**Parameter:** string2

A padding string. This string must be long enough to create a result and must contain the character or characters to use for padding. This can come from a source node, the result of another function, or a value that you specify. You can use the [Padding String](#) function to produce a padding string.

**Returns:** string

The padded and centered string.

**Example:**

```
align-center('widgets', '-----') = '-widgets--'
```

## Align Left function

---

The **Align Left** function places a string within a padding string starting from the left-most character.

**Parameter:** string1

The string to be aligned. This can come from a source node, the result of another function, or a value you specify.

**Parameter:** string2

A padding string. This string must be long enough to create a result and must contain the character or characters to use for padding. This can come from a source node, the result of another function, or a value that you specify. You can use the [Padding String](#) function to produce a padding string.

**Returns:** string

The padded and left-aligned string.

Example: align-left('widgets','-----') = 'widgets---

**Example:**

```
align-center('widgets','-----') = '-widgets--'
```

**Parent topic:** [Mapping Function Reference](#)

## Align Right function

---

The **Align Right** function places a string within a padding string ending at the right-most character.

**Parameter:** string1

The string to be aligned. This can come from a source node, the result of another function, or a value you specify.

**Parameter:** string2

A padding string. This string must be long enough to create the result and must contain the character or characters to use for padding. This can come from a source node, the result of another function, or a value that you specify. You can use the [Padding String](#) function to produce a padding string.

**Example:**

```
align-center('widgets','-----') = '-widgets--'
```

## Average function

---

The **Average** function determines the average value for the sets of numeric nodes in all parameters.

If you use literal numbers or the results of other functions as parameters to this function, the numbers are added to the total. They are also counted as nodes to determine the average.

**Parameter:** input, input...

The numeric nodes to calculate an average from. These can come from recurring or nonrecurring source nodes, the results of other functions, or values that you specify.

You cannot specify a default value (or constant) for the input parameters of this function but you can specify a variable with a default value and then pass that variable as an input parameter to this function. For more information, see [Specifying Default Values for Functions that Allow Recurring Nodes as Input](#).

Attention: In the Mapping Editor, if you chain together a recurring source node, a function that does not support recurring nodes, and then map that result to this function, during run time you may get an unexpected result. For more information, see [Limitations in Combining Other Math Functions or Literals](#).

**Returns:** number

The average value of all parameters. This returns NaN (not a number) in the following cases:

- If any parameters are not numeric nodes.
- If both the sum of all values and the count of node sets are zero (the average of 0 / 0).

## Base64 Encode and Decode functions

---

Base64 refers to a specific MIME content transfer encoding. Base64 encoding represents arbitrary sequences of octets in a form that requires case sensitivity but need not be humanly readable.

A 65-character subset of US-ASCII is used, enabling 6 bits to be represented per printable character. The 65th character, "=", is used to signify a special processing function.

The encoding process represents 24-bit groups of input bits as output strings of 4 encoded characters. Proceeding from left to right, a 24-bit input group is formed by concatenating 3 8-bit input groups. These 24 bits are then treated as 4 concatenated 6-bit groups, each of which is translated into a single digit in the base 64 alphabet.

Each 6-bit group is used as an index into an array of 64 printable characters. The character referenced by the index is placed in the output string.

### Base64 Alphabet

Value	Encoding	Value	Encoding	Value	Encoding	Value	Encoding
0	A	17	R	34	i	51	z
1	B	18	S	35	j	52	0
2	C	19	T	36	k	53	1
3	D	20	U	37	l	54	2
4	E	21	V	38	m	55	3
5	F	22	W	39	n	56	4
6	G	23	X	40	o	57	5
7	H	24	Y	41	p	58	6
8	I	25	Z	42	q	59	7
9	J	26	a	43	r	60	8
10	K	27	b	44	s	61	9
11	L	28	c	45	t	62	+
12	M	29	d	46	u	63	/
13	N	30	e	47	v		
14	O	31	f	48	w	(pad)	=
15	P	32	g	49	x		
16	Q	33	h	50	y		

Special processing is performed if fewer than 24 bits are available at the end of the data being encoded. A full encoding quantum is always completed at the end of a quantity. When fewer than 24 input bits are available in an input group, zero bits are added (on the

right) to form an integral number of 6-bit groups. Padding at the end of the data is performed using the '=' character. Since all base 64 input is an integral number of octets, only the following cases can arise:

- The final quantum of encoding input is an integral multiple of 24 bits; here, the final unit of encoded output will be an integral multiple of 4 characters with no "=" padding.
- The final quantum of encoding input is exactly 8 bits; here, the final unit of encoded output will be two characters followed by two "=" padding characters.
- The final quantum of encoding input is exactly 16 bits; here, the final unit of encoded output will be three characters followed by one "=" padding character.

## Boolean function

---

The **Boolean** function evaluates the parameter and returns either 'true' or 'false' depending on the datatype of the input:

- string "true" unless the string is empty
- number "true" if the number is not zero, *false* if the number is zero

**Parameter:** anysimpletype

The value to be evaluated. This can come from a source node, the result of another function, or a value that you specify.

**Returns:** boolean

Either *true* or *false*.

**Parent topic:** [Mapping Function Reference](#)

---

[Feedback](#) | [Notices](#)

## Ceiling function

---

The **Ceiling** function rounds the parameter up to the next closest integer.

**Parameter:** number

The number to round up to an integer. This can come from a source node, the result of another function, or a value that you specify.

**Returns:** number

The closest integer that is greater than the parameter.

**Example:**

`ceiling(4.2) = 5`

**Parent topic:** [Mapping Function Reference](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Ceiling.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Ceiling.html)

## Concatenate function

---

The **Concatenate** function joins all parameter strings into a single result in the order you specify the parameters.

**Parameters:** string1, string2, [string3-string1000]

Each parameter can be a source node, the result of another function, or a value that you specify. The order of the parameters determines the order in which the parameters are joined (that is, the first parameter displays as left-most in the resulting string).

Note: You must specify at least two parameters in order for the function to be valid. While configuring the properties of the **Concatenate** function in the Function Properties dialog box, you cannot click Delete for the top two parameters in the list. (The Delete button is not active for the top two parameters.) You can only click Delete, if there are more than two parameters in the list and only for the parameters at the bottom of the list. To delete a parameter from the top two positions of the list, first move the parameter down the list clicking Down and then click Delete.

**Returns:** string

The joined strings.

**Parent topic:** [Mapping Function Reference](#)

## Cast From Base64Binary function

---

The **Cast From Base64Binary** function casts from one specific XML Schema data type to another XML Schema data type.

### About this task

---

Casts from the XML Schema data type: xs:base64Binary to the XML Schema data type: xs:string. The data is not converted, only the type associated with the data is changed.

**Parameter:** base64Binary

The data to cast from the XML Schema data type: xs:base64Binary.

**Returns:** string

The data that has been cast to the XML Schema data type xs:string.

**Parent topic:** [Mapping Function Reference](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Convert\\_From\\_Base64Binary\\_function.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Convert_From_Base64Binary_function.html)

## Casts From HexBinary function

---

The **Casts From HexBinary** function casts from one specific XML Schema data type to another XML Schema data type.

### About this task

---

Casts from the XML Schema data type: xs:hexBinary to the XML Schema data type: xs:string. The data is not converted, only the type associated with the data is changed.

**Parameter:** HexBinary

The data to cast from the XML Schema data type: xs:hexBinary

**Returns:** string

The data that has been cast to the XML Schema data type: xs:string.

**Parent topic:** [Mapping Function Reference](#)

---

[Feedback](#) | [Notices](#)

# CopyOf function

The **CopyOf** function copies the entire contents of the source node to the destination node.

The **CopyOf** function () copies the entire contents of the source node (the entire subtree of the source node including all children) to the destination node.

Attention: The XML Schema of the destination node must match the XML Schema of the source node for the CopyOf function to correctly copy the values of the source nodes to the destination nodes.

For example, if the Call Procedure activity returns the following result set nodes (through the any node) during run time:

- results/result/resultSet/column1, where column1 is an integer.
- results/result/resultSet/column2, where column2 is an integer.

The XML Schema of the destination nodes in the To Orchestration pane, must match the expected XML Schema of the result set that is returned from the Call Procedure activity, as shown in the following figure:

In the preceding figure, the CopyOf function () is linking the source result node and the destination result node.

**Parameter:** input

The name of the source nodes to copy.  $\wedge \wedge$

**Returns:** anySimpleType

The resulting subtree of XML data.

**Parent topic:** [Mapping Function Reference](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/CopyOfFunction.html>

## Count Function

---

The **Count** function determines the number of nodes in all of the sets of nodes in parameters.

For recurring nodes, this function determines the actual number of occurrences.

This function accepts any source node as a parameter. This includes structure or choice nodes which you normally cannot map.

If you use literal numbers as parameters in this function, the numbers are considered one node and incremented by a count of one.

**Parameter:** input, input...

The sets of nodes to count. These can come from recurring or nonrecurring source nodes, the results of other functions, or values that you specify.

You cannot specify a default value (or constant) for the input parameters of this function but you can specify a variable with a default value and then pass that variable as an input parameter to this function. ▶ For more information see [Specifying Default Values for Functions that Allow Recurring Nodes as Input](#). ▶ ▶

Attention: In the Mapping Editor, if you chain together a recurring source node, a function that does not support recurring nodes, and then map that result to this function, during run time you might get an unexpected result. ▶ For more information see [Limitations in Combining Other Math Functions or Literals](#).

**Returns:** number

The total number of nodes in the parameters.

**Parent topic:** [Mapping Function Reference](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

## Decode Configuration Property of Type Password

---

The **Decode Configuration Property** of type Password decodes base64-encoded passwords between two orchestrations.

The calling orchestration sends a user ID and a password. The decode password configuration property ensures that the receiving orchestration receives a base64-encoded password which it can decode.

**Parent topic:** [Mapping Function Reference](#)

---

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Decode\\_Password\\_Configuration\\_Property.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Decode_Password_Configuration_Property.html)

## Digest/Hash function

---

The **Digest/Hash** function produces a digital summary of information called a message digest. Message digests provide a digital identifier for a digital document. The message digest produced by the Digest/Hash function is Base64 encoded.

Message digest functions are mathematical functions that process information to produce a message digest for each unique document. Identical documents have the same message digest, which can be used to ensure that the message received is the same as the message sent.

There are three **Digest/Hash** functions in Studio:

- **Digest/Hash the Input Data with MD5**
- **Digest/Hash the Input Data with SHA-1**
- **Digest/Hash the Input Data with SHA-256**

The input is the document or string for which you want a digest. For example, MD5 ("Austin was happy that the band played on") =NjJhODJhNTViZmI3Y2YwZDc2NDkxYjc0ZTkzZDlmMTQ=

MD5 is defined in RFC 1321. IBMÂ® Cast IronÂ® uses the MD5 algorithm included in the JDK security package. The algorithm takes a message of undefined length and outputs a message digest of 128 bits.

SHA-1 is defined by the Federal Information Processing Standards Publication 180-1 (FIPS PUB 180-1). IBM Cast Iron uses the SHA-1 algorithm included in the JDK security package. SHA-1 takes an input message of any length less than 264 bits and produces a message digest of 160-bits.

SHA-256 is a 256-bit hash function and is compliant with the National Institute of Standards SP 800-131a specification. IBM Cast Iron uses the SHA-256 algorithm included in the JDK security package. The input is the document or string for which you want a digest. For example, SHA-56 ("Sample Input") =bEzV+7Tz6afzJhY0E5u0Zt1+9uBURb/2pgi2PT9Ms/s=. The hash value is 32 bytes or 256 bits length.

Use **Digest/Hash the Input Data with MD5** function to create a Base64 encoded digest of the input data using MD5.

Use the **Digest/Hash the Input Data with SHA-1** function to create a Base64 encoded digest of the input data using SHA-1.

Use the **Digest/Hash the Input Data with SHA-256** function to create a Base64 encoded digest of the input data using SHA-256.

## Divide function

---

The **Divide** function returns the decimal quotient of the first parameter divided by all subsequent parameters.

**Parameter:** number1

The number to be divided (dividend). This can be a source node, the result of another function, or a value that you specify.

**Parameter:** number2, [number3-999]

The numbers to divide by (divisor). These can be source nodes, the results of other functions, or values that you specify. At least one parameter is required.

**Returns:** number

The result of the division operation. If the divisor is zero (positive or negative), the result is infinity (positive or negative), or NaN (not a number) if the dividend is also zero.

## Extract HTTP Header Field function

---

The **Extract HTTP Header Field** function extracts a string with a specified delimiter. It can be used to further extract strings from HTTP headers.

Input1 – Header string, for example: *text/html; charset=UTF-8* or *text/\*;q=0.3, text/html;q=0.7, text/html;level=1*

Input2 – A string that specifies the name value, for example: *charset*

Input3 – Specified delimiter, for example: *";* or *"*

Output – The value string. For example: *UTF-8* when *char-set* is extracted from **Content-Type** header.

## Extract Query Parameter function

---

The **Extract Query Parameter** function extracts a query string from the HTTP header's URI string.

Input1 – HTTP header's URI string, for example: *URI?name1=value1&name2=value2....#anchor*. The characters after *?* or *#* may not be present.

Input2 – A string that specifies the query string's name, for example: *name1* in the *input1* string.

Output – The query string's string value, for example: *value1* in the *input1* string.

## Floor function

---

The **Floor** function rounds the parameter down to the next closest integer.

**Parameter:** number

The number to round down to an integer. This can come from a source node, the result of another function or a value that you specify.

**Returns:** number

The closest integer that is less than the parameter.

**Example:**

`floor(4.7) = 4`

**Parent topic:** [Mapping Function Reference](#)

## Format Date String function

---

The **Format Date String** function converts the XML Schema data type: xs:dateTime to a string in the format defined by the second parameter.

**Parameter:** dateTime

The date and time as a XML Schema data type: xs:dateTime.

**Parameter:** string

This string defines the format of the date and time string returned from this function. For example, the format string could be equal to MM/dd/yyyy. For more information about the supported date and time pattern strings see the SimpleDateFormat class in the Sun J2SE 1.4.2 JavaDoc: <http://www.science.uva.nl/ict/ossdocs/java/jdk1.3/docs/api/java/text/SimpleDateFormat.html>.

<b>Pattern Letter</b>	<b>Description</b>	<b>Example1</b>	<b>Example2</b>
G	Era Â designation	AD	BC
y	Year	2004	2001
M	Month in a year	April	04
w	Week in a year	12	24
W	Week in a month	3	1
D	Day in a year	234	333
d	Day in a month	13	20
F	Day of week in a month	1	3
E	Day in a week	Monday	Friday
a	AM or PM designation	AM	PM
H	Hour in a day - a number between 0 and 23	12	13
k	Hour in a day - a number between 1 and 24	14	23
K	Hour in AM or PM - a number between 0 and 11	0	10
h	Hour in AM or PM - a number between 1 and 12	11	12
m	Minute in an hour	20	50
s	Second in a minute	10	30
S	Milliseconds	224	338
z	Time zone in General time zone designation	PDT	EDT
Z	Time zone in ISO-8601 time zone designation	-03:00	+02:00

**Parameter:** string Â (Optional)

This string defines the locale. For example, the English United States locale is defined with the following string: en\_US.

The locale string can be defined by any of the following formats:

- LANGUAGE
- LANGUAGE\_COUNTRY
- LANGUAGE\_COUNTRY\_VARIANT

Where LANGUAGE represents a two letter code as defined by the ISO-639 standard, COUNTRY represents a two letter code defined by the ISO-3166, and VARIANT represents a vendor or browser-specific code, for example WIN for Windows.

This parameter is optional.

To add this parameter:

1. Drop the Format Date String function into the middle pane of the Mapping Editor.
2. Double-click the function. The Function Properties pane opens.
3. Click Add. The Locale input parameter shows in the list of parameters.

**Returns:** string

The passed in date and time as a string in the format defined by the second parameter.

For example, if the Format Date String function was called with the following input parameters:

dateTime: 2005-02-22T16:18:00.852-08:00

format string: MM/dd/yyyy

locale string: en\_US

The following string would be returned: 02/22/2005.

## Format Number function

---

The **Format Number** function returns a string that is a number formatted to fit the specified pattern.

**Parameter:** number

The number to format. This can come from a source node, the result of another function, or a value that you specify.

**Parameter:** string

A pattern that specifies how the first parameter should be formatted. This pattern uses these symbols to define the pattern:

- Required digits = 0
- Optional digits = #
- Minus symbol = -
- Decimal symbol = .
- Grouping separator = ,. Typically used to separate groups of three digits.
- Percent symbol = %. When the percent symbol is present, the input number is multiplied by 100 and the result is shown as a percentage.
- Per mille symbol = ª (Unicode x2030). This symbol multiplies the number by 1000 and shows the result as a per mille.
- Positive/negative separator = ;
- Infinity = infinity
- Not a number = NaN
- \$ = \$

Patterns can have constant text as a prefix, suffix, or both. Common uses are to specify the currency symbol or some unit of measurement.

- \$#,##0.00 ª formats a number in the standard format for United States dollars with the dollar sign, commas for separators and at least one dollar digit and two digits for cents.
- #.000% ª formats a decimal number as a percentage with at least three decimal places.
- #,##0.00;(#,##0.00) ª formats negative number with parentheses, a format commonly used in accounting.

**Returns:** string

The first parameter reformatted to reflect the pattern specified by the second parameter.

## Examples

---

Patterns can have constant text as a prefix, suffix, or both. Common uses are to specify the currency symbol or some unit of measurement. ª

### Example 1

\$#,##0.00 ª formats a number in the standard format for United States dollars with the dollar sign, commas for separators and at least one dollar digit and two digits for cents.

```
format-number(12345.6789, '$#,##0.00') = '$12,345.67'
```

### Example 2

#.000% ª formats a decimal number as a percentage with at least three decimal places.

```
format-number(.67890123, '#.000%') = '67.890%'
```

When the percent symbol is present, the input number is multiplied by 100.

### Example 3

#,##0.00;(#,##0.00) formats negative number with parentheses, a format commonly used in accounting.

```
format-number(-12345.6789, '#,##0.00; (#,##0.00)') = '(12,345.67)'
```

## Generate RFC2104 HMAC Compliant Signature

---

HMAC is a mechanism for message authentication using cryptographic hash functions.

This HMAC function uses the iterative cryptographic hash function SHA-1 with a secret shared key.

Use this function to generate a digital signature that is compliant with HMAC.

#### Parameter: data (type=string)

The information or message to be validated.

#### Parameter: key (type=string)

The key used to validate the data.

#### Parameter: encoding (type=string)

The encoding to apply to the data and key. This can be one of:

- **US-ASCII** - Seven-bit ASCII. Also called ISO646-US. The Basic Latin block of the Unicode character set.
- **ISO-8859-1** - ISO Latin Alphabet No. 1. Also called ISO-LATIN-1.
- **UTF-8** - Eight-bit UCS Transformation Format.
- **UTF-16BE** - Sixteen-bit UCS Transformation Format, big-endian byte order.
- **UTF-16LE** - Sixteen-bit UCS Transformation Format, little-endian byte order.
- **UTF-16** - Sixteen-bit UCS Transformation Format, byte order identified by an optional byte-order mark.

#### Returns: HMAC signature (type string)

The generated HMAC signature in UTF-8 encoding.

## Get Current Date and Time function

---

The **Get Current® Date and Time** function returns the current date and time as a specific XML Schema data type.

### About this task

---

The Get Current Date and Time function returns the current date and time (with the local timezone) as an XML Schema data type: xs:dateTime.

**Parameter:**Â none

**Returns:** dateTime

The current date and time as the XML Schema data type: xs:dateTime. For example, if this function is run on February 22, 2005, at 12:43 PM in the PST timezone (- 08:00) this function returns the following dateTime:

2005-02-22T12:43:51-08:00

Note: If this function is called twice in a map, it is not guaranteed that the same dateTime is returned. This function is not **stable** as defined by the W3C.

## Get Current Date function

---

The **Get CurrentÂ® Date** function returns the current date (with the local timezone) as a XML Schema data type: xs:date.

### About this task

---

**Parameter:**Â none

**Returns:** date

The current date as the XML Schema data type: xs:date. For example, if this function is run on February 22, 2005 in the PST timezone (- 08:00) this function returns the following date:

2005-02-22-08:00

Note: If this function is called twice in a map, it is not guaranteed that the same date is returned. This function is not **stable** as defined by the W3C.

## Get Current Time function

---

The **Get CurrentÂ® Time** function returns the current time (with the local timezone) as a XML Schema data type: xs:time

### About this task

---

**Parameter:**Â none

**Returns:** time

The current time as the XML Schema data type: xs:time. For example, if this function is run at 12:43 PM in the PST timezone (-08:00) this function returns the following time:

12:43:51-08:00

Note: If this function is called twice in a map, it is not guaranteed that the same time is returned. This function is not **stable** as defined by the W3C.

## Length function

---

The **Length** function determines the number of character in the parameter.

**Returns:** number

The number of characters in the parameter.

**Parameter:** string

The string to count. This can come from a source node, the result of another function, or a value you specify.

### Example

---

`length('The string to count') = 19`

**Parent topic:** [Mapping Function Reference](#)

## Lowercase function

---

The **Lowercase** function converts all uppercase characters to lowercase characters.

**Parameter:** string

The string to convert. This can come from a source node, the result of another function, or a value you specify.

**Returns:** string

The converted string.

**Parent topic:** [Mapping Function Reference](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

## Maximum function

---

The **Maximum** function determines the highest value in the nodes, sets of numeric nodes, or numbers in parameters.

**Parameter:** input, input ...

The numeric nodes to compare. These can come from recurring or nonrecurring source nodes, the results of other functions, or values that you specify.

You cannot specify a default value (or constant) for the input parameters of this function but you can specify a variable with a default value and then pass that variable as an input parameter to this function. For more information see [Specifying Default Values for Functions that Allow Recurring Nodes as Input](#).

Attention: In the Mapping Editor, if you chain together a recurring source node, a function that does not support recurring nodes, and then map that result to this function, during run time you might get an unexpected result. For more information see [Limitations in Combining Other Math Functions or Literals](#).

**Returns:** number

The maximum value of all nodes in the parameters. For recurring nodes, values for every occurrence in the recurring set is used to find the maximum. If any parameter is not a set of numeric nodes or is an empty node set, the function returns NaN (not a number).

**Parent topic:** [Mapping Function Reference](#)

---

[Feedback](#) | [Notices](#)

## Minimum function

---

The **Minimum** function determines the lowest value in the nodes, sets of numeric nodes, or numbers in parameters.

**Parameter:** input, input ...

The numeric nodes to compare. These can come from recurring or nonrecurring source nodes, the results of other functions, or values that you specify.

You cannot specify a default value (or constant) for the input parameters of this function but you can specify a variable with a default value and then pass that variable as an input parameter to this function. For more information see [Specifying Default Values for Functions that Allow Recurring Nodes as Input](#).

Attention: In the Mapping Editor, if you chain together a recurring source node, a function that does not support recurring nodes, and then map that result to this function, during run time you might get an unexpected result. For more information see [Limitations in Combining Other Math Functions or Literals](#).

**Returns:** number

The minimum value of all nodes in the parameters. For recurring nodes, values for every occurrence in the recurring set is used to find the minimum. If any parameter is not a number, not a set of numeric nodes, or is an empty node set, the function returns NaN (not a number).

**Parent topic:** [Mapping Function Reference](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Minimum\\_function.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Minimum_function.html)

## Modulo function

---

The **Modulo** function determines the remainder from dividing the first parameter by all subsequent parameters.

**Returns:** number

The remainder from dividing the first parameter by the remaining parameters. If the divisor is zero, returns NaN (not a number).

**Parameter:** number1

The number to be divided (dividend). This can come from a source node, the result of a function, or a value you specify.

**Parameter:** number2, [number3-999]

The numbers to divide with (divisor). These can come from source nodes, the results of other functions, or values you specify. At least one divisor parameter is required.

If multiple parameters are specified as divisors, the order of operations is as follows: the remainder returned from the first division operation becomes the dividend for the second operation, and so forth. See Example 2.

### Example 1: Using one divisor parameter

---

modulo(42, 5) = 2

42 / 5 = 8 R2

### Example 2: Using multiple divisor parameters

---

modulo(61, 7, 2) = 1

61 / 7 = 8 R5

5 / 2 = 2 R1

**Parent topic:** [Mapping Function Reference](#)

## Multiply function

---

The **Multiply** function returns the product of all parameters.

**Parameter(s):** number1, number2, [number3-1,000]

The numbers to multiply. At least two parameters are required. Each parameter can come from a source node, the result of a function, or a value you specify.

**Returns:** number

The product of the parameters.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Multiply.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Multiply.html)

## Not function

---

The **Not** function is typically used in conditions to specify negative or complimentary conditions.

Returns true if the parameter evaluates as false. Returns false if the parameter evaluates as true.

**Parameter:** datatype

Any number, string, date, time, or boolean value. This can come from a source node, the result of a function, or a value you specify.

**Returns:** boolean

The boolean inverse of the parameter. The evaluation rules depend on the datatype of the parameter.

For number datatypes:

- Positive and negative zero evaluate as false
- Any other number evaluates as true

For string, any date or any time datatypes:

- An empty string evaluates as false
- Any other string, date or time evaluates as true

For the boolean datatype:

- The evaluation returns the inverse value

**Parent topic:** [Mapping Function Reference](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Not.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Not.html)

## Number function

---

The **Number** function changes the datatype of the parameter to number.

**Parameter:** datatype

Any number, string, date, time, or boolean value. This can come from a source node, the result of a function, or a value you specify.

**Returns:** number

The numeric value of the parameter or NaN (not a number). The conversion rules depend on the datatype of the parameter:

For number datatypes:

- NaN for NaN, positive infinity or negative infinity

- The same number for any other value

For string, any date, or any time datatypes:

- The corresponding number if the string is in any of these formats, where n represents any set of digits:

n or -n

n. or -n.

n.n or -n.n

.n or -.n

NaN for any other value

For the boolean datatype:

- 'true' evaluates to 1
- 'false' evaluates to 0

## Padding String function

---

The **Padding String** function returns a padding string of the specified length and characters. Padding strings are used in alignment functions.

**Parameter:** number

The total length to make the padding string. This can come from a source node, the result of another function, or a value you specify.

**Parameter:** [string]

One or more characters to use to build the padding string. If you use multiple characters and the length of the padding string is not an even multiple, these characters are truncated at the end of the string to fit the overall length. This can come from a source node, the result of another function, or a value you specify. If you omit this parameter, it defaults to the space character.

**Returns:** string

The string to use for padding.

## Position function

---

The **Position** function is used with conditions to represent the index to the current node within the set of its siblings. The function works only within the context of a recurring node and has no parameters.

**Returns:** number

The index or number identifying the position of the current node within the set of its siblings.

**Parent topic:** [Mapping Function Reference](#)

---

[Feedback](#) | [Notices](#)

## Read Date String function

---

The **Read Date String** function converts a string (that contains a date and time) to the XML Schema data type: xs:dateTime.

### Purpose

---

**Parameter:** string

The date and time as a string.

**Parameter:** string

This string defines the format of the date and time string of the first parameter. For example, the format string could be equal to MM/dd/yyyy. For more information about the supported date and time pattern strings see SimpleDateFormat class in the Sun J2SE 1.4.2 Javadoc: <http://www.science.uva.nl/ict/ossdocs/java/jdk1.3/docs/api/java/text/SimpleDateFormat.html>.

Pattern Letter	Description	Example1	Example2
G	Era Â designation	AD	BC
y	Year	2004	2001
M	Month in a year	April	04
w	Week in a year	12	24
W	Week in a month	3	1
D	Day in a year	234	333
d	Day in a month	13	20
F	Day of week in a month	1	3
E	Day in a week	Monday	Friday
a	AM or PM designation	AM	PM
H	Hour in a day - a number between 0 and 23	12	13
k	Hour in a day - a number between 1 and 24	14	23
K	Hour in AM or PM - a number between 0 and 11	0	10
h	Hour in AM or PM - a number between 1 and 12	11	12
m	Minute in an hour	20	50
s	Second in a minute	10	30
S	Milliseconds	224	338
z	Time zone in General time zone designation	PDT	EDT
Z	Time zone in RFC 822 time zone designation	-0300	+0200

**Parameter:** string Â (Optional)

This string defines the locale. For example, the English United States locale is defined with the following string: en\_US.

The locale string can be defined by any of the following formats:

- LANGUAGE
- LANGUAGE\_COUNTRY
- LANGUAGE\_COUNTRY\_VARIANT

Where LANGUAGE represents a two letter code as defined by the ISO-639 standard, COUNTRY represents a two letter code defined by the ISO-3166, and VARIANT represents a vendor or browser-specific code, for example WIN for Windows.

This parameter is optional.

To add this parameter:

1. Drop the Format Date String function into the middle pane of the Mapping Editor.
2. Double-click the function. The Function Properties pane opens.
3. Click Add. The Locale input parameter shows in the list of parameters.

**Returns:** dateTime

The date and time as an XML Schema data type: xs:dateTime is returned. For example, if the Read Date String function was run with the following input parameters:

date and time string: 02/22/2005/12/20/44

format string: MM/dd/yyyy/HH/mm/ss

A dateTime representing February 22, 2005 at 12:20 and 44 seconds is returned from Read Date String Function.

**Parent topic:** [Mapping Function Reference](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Read\\_Date\\_String.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Read_Date_String.html)

## Replace function

---

The **Replace** function replaces individual characters with other individual characters.

The replacement is done at the individual character level and not the string level. Every occurrence of a character is replaced with specified replacement character as shown in the following example:

- list of characters to be replaced is equal to 'abc'
- list of replacement characters is equal to 'ABC'
- input string is equal to 'aWWWWbYYYYcPPPPabc'

The result string is equal to "AWWWBYYYYCPPPABC" because the replacement is done at the character level - every character is replaced. (If the replacement was done at the string level the resulting string would be equal to 'aWWWWbYYYYcPPPPABC'.)

**Parameter:** input

The string to search for characters to replace. The value for this parameter can be provided by a source node, the result of another function, or a value you specify.

**Parameter:** fromChars

A list of the character or characters to be replaced. If you need to replace several characters, they should be listed without any separation. The value for this parameter can be provided by a source node, the result of another function, or a value you specify.

**Parameter:** toChars

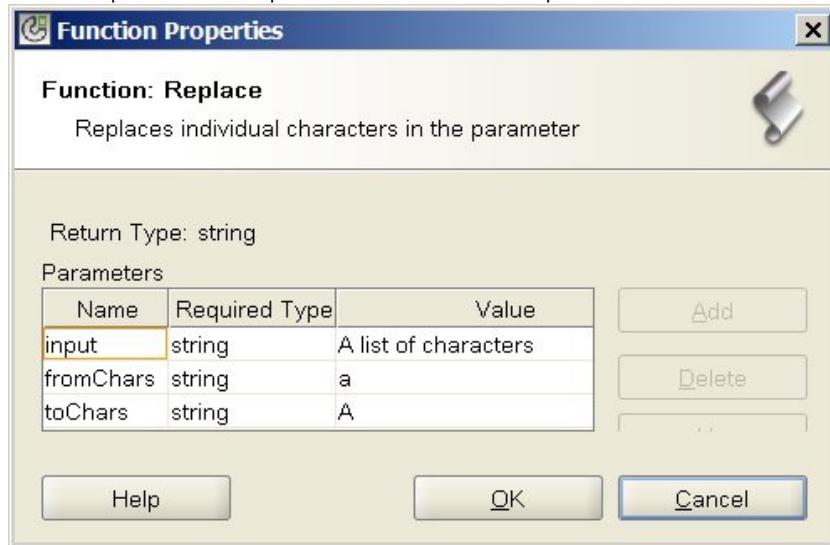

A list of character or characters to use as replacements. List the replacement characters in this parameter in the same order as characters to be replaced in the fromChars parameter because the first character from the fromChars parameter is replaced by the first character in toChars parameter and so on. For more information, see Example 2. The value for this parameter can be provided by a source node, the result of another function, or a value you specify.  
Note: You can not directly replace a single character with an empty string because the toChars parameter cannot equal an empty string - a string with no characters. For a workaround, see Example 3.

**Returns:** string

The result of replacing all occurrences of characters in the second parameter (fromChars) that are found in the first parameter (input) with the matching characters in the third parameter (toChars).

## Example 1

This example shows a simple one-to-one character replacement as shown in the following figure:

The run-time result of running this function is the following string:

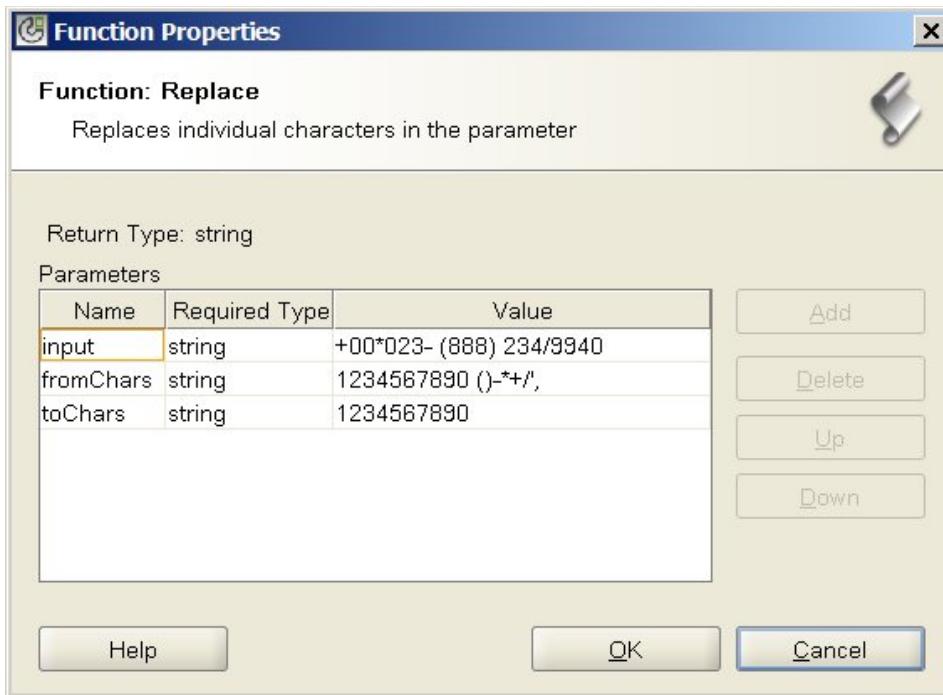

A list of chArActers

All lowercase a characters are replaced with uppercase A characters.

Note: In this example, the input parameter is hardcoded to a specific value. Typically this value is supplied by a source node in a map.

## Example 2

In this example, the first character from the fromChars parameter is replaced by the first character of the toChars parameter, the second character from the fromChars parameter is replaced by the second character of the toChars parameter, and so on. The replacement of multiple characters is shown in the following figure:

In this example, the non-numeric characters (specified at the end of the fromChars parameter) are removed from the phone number string. All the numeric characters are replaced with the same numeric character; for example, the 1 character is replaced by the 1 character. The other non-numeric characters at the end of the fromChars do not have a replacement character specified in the toChars, so they are removed from the returned string.

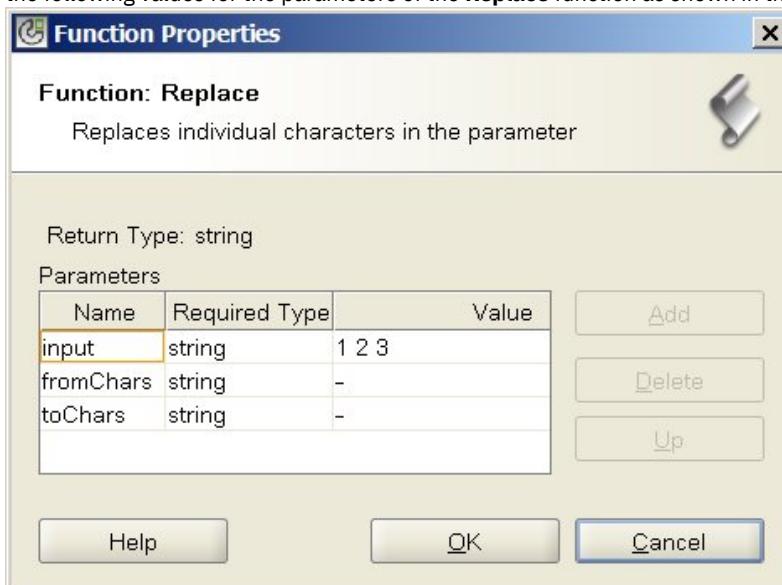

The run-time result of running this function is the following string:

000238882349940

Note: In this example, the input parameter is hardcoded to a specific value. Typically this value is supplied by a source node in a map.

### Example 3

This example shows a workaround to the limitation that you cannot replace a single character with an empty string. This limitation exists because the toChars parameter cannot be set to an empty string - a string with no characters. You can workaround this limitation by supplying a dummy character like a hyphen (-) that is not found in the input parameter. For example, you could specify the following values for the parameters of the **Replace** function as shown in the following figure:

In this example, the input parameter is equal to '1 2 3' (1, space, 2, space, 3), the fromChars parameter is equal to '-' (hyphen, space), and the toChars parameter is equal to '-' (hyphen). During run time, the **Replace** function with these values strips the spaces from input parameter and the run-time result is the following string:

Attention: When you specify the strings in the Value field of the Function Properties dialog box, do not enter the quotes. Enter just the hyphen and the space and not the quote characters.

Note: In this example, the input parameter is hardcoded to a specific value. Typically this value is supplied by a source node in a map.

## Replace String function

---

The **Replace String** function replaces individual characters or a string with other individual characters or string.

**Parameter:** input

The string to search for characters to be replaced. The value for this parameter can be provided by a source node, the result of another function, or a value you specify.

**Parameter:** pattern

A regular expression pattern that needs to be replaced. The value for this parameter can be provided by a source node, the result of another function, or a value you specify.

**Parameter:** replace

Any substring within the input that matches the pattern will be replaced with the Replace String. The value for this parameter can be provided by a source node, the result of another function, or a value you specify.

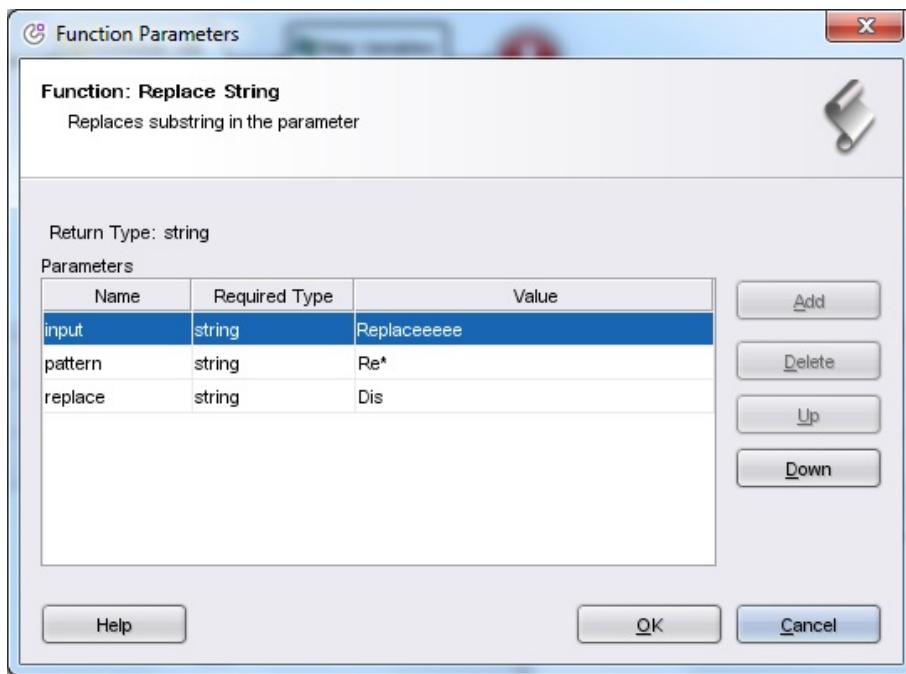

**Returns:** string

The result of replacing all occurrences of pattern that are found in the first parameter (input) with the matching string in the second parameter (pattern).

## Example

---

This example shows a simple replacement of a substring matching a regular expression in pattern parameter, as shown in the following figure:

The runtime result of running this function is the following string:

Replaceeeee

The string that matches the pattern with the value `Re*` will be replaced by the replace string `Dis`.

Note: In this example, the input parameter is hardcoded to a specific value. Typically this value is supplied by a source node in a map.

## Round function

---

The **Round** function rounds a number to the closest integer.

**Parameter:** number

The number to be rounded. This can come from a source node, the result of another function, or a value you specify.

**Returns:** number

The closest integer to the parameter, rounding up if two integers are equally close. This can come from a source node, the result of another function, or a value you specify.

**Example:**

- `round(4.2) = 4`
- `round(4.5) = 5`

## Starts With function

---

The **Starts With** function determines whether or not the first parameter begins with the characters in the second parameter.

**Parameter:** string1

The string to test. This can come from a source node, the result of another function, or a value that you specify.

**Parameter:** string2

The beginning string to test for. This can come from a source node, the result of another function, or a value that you specify.

**Returns:** boolean

True or false indicating whether the first parameter begins with the second parameter.

**Parent topic:** [Mapping Function Reference](#)

---

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Starts\\_With.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Starts_With.html)

## String function

---

The **String** function changes the datatype of the parameter to string.

**Parameter:** datatype

Any string, boolean, date, or numeric datatype. This can come from a source node, the result of another function, or a value that you specify.

**Returns:** string

The result of changing the parameter to string. The conversion rules depend on the datatype of the parameter:

- For boolean datatypes, returns the string *true* or *false*
- For date or time datatypes, returns the date or time as a string in the specific format for that datatype, such as '2003-01-20T05:00:00' for a datetime datatype.
- For number datatypes, this returns:
  - 'NaN' if the value is NaN (not a number)
  - '0' if the value is positive or negative zero.
  - 'Infinity' or '-Infinity' if the value is positive or negative infinity (respectively).
  - The corresponding numeral, with a minus sign if negative and no leading zeroes. Decimal values have at least one numeral before the decimal point and as many decimal places as needed.

**Parent topic:** [Mapping Function Reference](#)

---

[Feedback](#) | [Notices](#)

## Substring function

---

The **Substring** function extracts a portion of the parameter based on the specified character placement.

**Parameter:** string

The string to extract from. This can come from a source node, the result of another function, or a value you specify.

**Parameter:** number1

The position of the first character to extract. Characters are numbered in the string beginning from 1.

**Parameter:** [number2]

The total number of characters to extract. If you omit this parameter, it defaults to the length from the starting position to the end of the first parameter.

**Returns:** string

The substring for the specified character places.

### Example

---

```
substring('abcde', 3, 2) = 'cd'
```

**Parent topic:** [Mapping Function Reference](#)

---

## Substring After function

---

The **Substring After** function extracts all the characters in a string starting after the first occurrence of a specified substring (one or more characters) through the end of the string.

**Parameter:** string

The string to extract a substring from. This can come from a source node, the result of another function, or a value you specify.

**Parameter:** string

The character to use as a starting point for the extraction. The first occurrence of the character is used as the starting point. This parameter can come from a source node, the result of another function, or a value you specify.

**Returns:** string

A substring of the first parameter which starts after the first occurrence of the specified start string through the end of the string. If the start string is not present, returns an empty string.

### Example

---

```
substring-after('12/31/1999', '/') = '31/1999',
```

**Parent topic:** [Mapping Function Reference](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Substring\\_After.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Substring_After.html)

## Substring Before function

---

The **Substring Before** function extracts all the characters in a string starting at the beginning up to the first occurrence of a specified substring (one or more characters).

**Parameter:** string

The string to extract a substring from. This can come from a source node, the result of another function, or a value you specify.

**Parameter:** string

The characters to use as the ending point for the extraction. The first occurrence of these characters is used as the ending point. This can come from a source node, the result of another function, or a value you specify.

**Returns:** string

The substring in the first parameter starting at the beginning up to the first occurrence of the specified end string. If the end string is not present, this returns an empty string.

### Example

---

substring-before('12/31/1999', '/') = '12'

## Subtract function

---

The **Subtract** function returns the difference of the first parameter less all subsequent parameters.

**Parameter:** number1

The number to subtract from. This can come from a source node, the result of another function, or a value that you specify.

**Parameter:** number2,, [number3-999]

The numbers to subtract. These can come from source nodes, the results of other functions, or values that you specify. You can specify multiple parameters here, but at least one parameter is required.

**Returns:** number

The difference of the two parameters. If either parameter is not a number, returns NaN (not a number).

### Example

---

number 1 = 42

number 2 = 7

number 3 = 8

returns: 27

**Parent topic:** [Mapping Function Reference](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Subtract.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Subtract.html)

## Sum function

---

The **Sum** function determines the sum of values in the numeric node, sets of numeric nodes, or numbers in parameters.

**Parameter:** input, input ...

The numeric nodes to add. These can come from recurring or nonrecurring source nodes, the results of other functions, or values that you specify.

You cannot specify a default value (or constant) for the input parameters of this function but you can specify a variable with a default value and then pass that variable as an input parameter to this function. ▶ For more information see [Specifying Default Values for Functions that Allow Recurring Nodes as Input](#).

Attention: In the Mapping Editor, if you chain together a recurring source node, a function that does not support recurring nodes, and then map that result to this function, during run time you might get an unexpected result. ▶ For more information see [Limitations in Combining Other Math Functions or Literals](#)

.

**Returns:** number

The total sum of all parameters. If any parameter is a nodeset, the total includes values for every node in the set. If any parameter is not a number or a numeric node set, returns NaN (not a number).

**Parent topic:** [Mapping Function Reference](#)

---

[Feedback](#) | [Notices](#)

## Trim function

---

The **Trim** function trims all leading and trailing spaces and replaces continuous sets of white space characters by a single space.

The string value of the parameter is normalized, as described in the following steps:

1. All tabs, carriage returns, and line feeds are replaced with spaces. ▶
2. Contiguous sequences of spaces are reduced to a single space.
3. Trailing and leading spaces are removed.

**Parameter:** string

The string to trim and normalize. This can come from a source node, the result of another function, or a value you specify

**Returns:** string

The trimmed and normalized parameter.

Examples:

Input String Equals...	The Trim Function Returns...
' The string to trim and normalize. '	'The string to trim and normalize.'
' first line second line third line' third line '	'first line second line third line'

## Uppercase function

---

The **Uppercase** function converts all lowercase characters to the corresponding uppercase character.

**Parameter:** string

The string to convert. This can come from a source node, the result of another function, or a value you specify.

**Returns:** string

The converted string.

## Glossary

---

## A

### Activity

A complete, functional unit of processing within an orchestration. Activities include flow-control (logic) activities; data activities to facilitate consumption and transmission of data; and activities that enable integration with database systems, enterprise systems, Web servers, email servers, and other systems. An orchestration comprises a series of activities.

### Assets

Supplemental configuration files, scripts, or other materials associated with a specific activity. For example, the buffer table scripts created for a database insert activity are assets. Assets are controlled by the Web Management Console (WMC). Access privileges to assets can be given to users beyond the users of the WMC. For example, DBAs can be given privileges to the assets associated with a database activity so that they can create the required tables or triggers.

## B

### Buffer table

An auxiliary table used in conjunction with various database activities, such as the single-table insert, update, or delete database activities. When you configure one of the database DML (data manipulation language) activities, Studio generates a SQL script that can be used to create the appropriate trigger on the database table; the buffer table gets populated when the triggering event (INSERT, UPDATE, DELETE) occurs. The buffer table provides the means to capture database changes and initiate processing by the orchestration.

## C

### Cast Iron® Studio

An integrated development environment (IDE) for creating, configuring, and publishing integration projects and the orchestrations they comprise. Studio projects run on the WebSphere® Cast Iron Appliance.

### Command-line interface

A text-based alternative to the Web Management Console (WMC) for configuring, managing, and querying an Integration Appliance.

### Control table

A database table that facilitates using database endpoints in integrations. As it does with buffer tables, Studio generates scripts to create control tables that can be used to ensure that inserts, updates, and deletes to specific tables occur once and only once.

### Copy parameters

Copy creates new default orchestration variables that match the output from the parameters.

## D

### Deploy

Create an instance of an integration project (instantiate) on an Integration Appliance.

### Document

Any of the XML Schema files, DTDs, and other configuration files that comprise integration projects.

### Dynamic delimiter

A delimiter that is obtained from within the fields of the message itself, such as an HL7 PID (patient ID) message header that denotes the beginning of a new record in a file containing a batch of electronic health records.

## E

### Empty Placeholder

Appears in activities that have multiple branches as an initial placeholder for the activities in that branch. Dropping other activities on this icon removes it.

### Endpoint

Represents the properties of an external system, such as a database server, FTP server, email system, or enterprise application that is either the source of data to the Integration Appliance or the target of processing by the Integration Appliance.

## F

### For Each

A function that iterates over a message structure.

### Flat File

A file containing non-XML data. Flat Files are typically of two types: delimited, in which a comma, tab, white space, or other delimiter is used to separate variable-length fields and records; or positional, in which fields and records have a fixed width.

### Flat File Schema

Defines how to interpret a specific set of Flat Files. Cast Iron Studio creates Flat File Schema (XML Schema) based on the configuration you define in the Flat File Schema Editor. A Flat File Schema is used by the Read Flat File activity to convert a source Flat File into XML.

## Function

String, mathematical, and miscellaneous functions provided by Studio that you can use in defining processing in your orchestrations. In addition to the pre-built functions, Studio lets you build your own custom functions and add lookup tables.

## I

### Integration project

The various inputs, outputs (endpoints), mapping and schema definitions (transformations, message formats), orchestrations, and configuration information that comprise an integration solution as designed in Studio and deployed to the Integration Appliance.

## J

### Job

A specific run-time instance of an orchestration.

## M

### Map

A component that lets you bind input parameters to variables, and variables to the orchestration. Many Studio activities contain embedded maps that you must configure at design time, in the context of an orchestration, to define how actual parameters should map to variables, and how the variables should be processed in the orchestration. In addition to the embedded activity maps, Studio has a stand-alone Map Variables activity that can be used to bind any type of input and output to the orchestration

## N

### Node

All data input to or output from the Integration Appliance is materialized in Studio as a series of nodes, as in a tree-like, hierarchical structure. In many cases, the nodes represent the structure and content of an XML document, but in many cases they don't (e.g., rows in a database table are displayed as nodes). Nodes in Studio convey information about structure; the type of content that can be supported; or additional characteristics of the data.

### Notification policy

Applies across an entire orchestration. Rules are based on event levels from 0 (no logging) to 9 for complete logging information.

## O

### Orchestration

The specific sequence of processing activities (such as data mapping, transformation, and control logic activities), endpoints, and data types defined and configured using Studio and deployed to run on the Integration Appliance.

## P

### Parameter

A value passed to an activity or to an orchestration. For example, Filename and data are two of the parameters that can be passed from an FTP endpoint to an orchestration.

### Parameterized query

A database SQL statement that contains input or output database parameters. The **Execute Query** activity supports parameterized queries.

### Parse

The converse of serialize. To convert to constituent pieces according to some established rules.

### Pick

An activity that chooses from two or more alternatives. Typically used to start an orchestration, the **Pick** activity can support either synchronous or asynchronous messaging.

### Project

An integration project defined and created using Cast Iron Studio. Each project has a properties file (filename.sp3) and several additional metadata files and folders that comprise all integration elements - orchestrations, endpoints, XML schemas, flat files - and their specific configuration (variables, parameters)

### Publish

Copy all project files from Studio to an Integration Appliance or to an intermediate staging area, such as a shared directory on a file server, for subsequent runtime configuration and deployment to a specific environment. The Publish process encompasses

validating the project; creating a .par file of project configuration documents; and sending the package to the Integration Appliance specified.

## R

### Raw message

The configuration that defines the character encoding for raw messages

### Record identifier

A special field that delimits records in certain types of flat files, such as EDI (electronic data interchange) or HL7 (Health Level 7) files. For example, an HL7 PID (patient ID) number is a record identifier.

### Repetition delimiters

A delimiter in a flat file that is used when the data lacks a unique value, such as record ID, to distinguish one record from another.

### Replace

Appears in activity branches as an initial placeholder for the endpoint activity to receive a message for that branch. Dropping a **Receive endpoint** activity on this icon removes it.

### Reply

Sends an acknowledgement when it receives a message.

### Repository

Persistent storage for various types of data. Cast Iron Appliance has a configuration repository and a message repository.

## S

### Serialize

The converse of parse. Serialization assumes that the data is in XML format

### Stored procedure

A functional code unit that resides in a database and is started explicitly by name. Stored procedures can be used to populate buffer tables when specific insert, update, or delete activities occur on a particular database table.

### System store

A repository containing Appliance configuration information. Same as configuration repository.

## T

### Terminate

Stops orchestration processing.

### Toolbox

The five-tab-set of Project, Activities, Variables, Functions, and Verify available in the right corner of Studio. These tabs provide access to all the entities you need to create new projects, create new orchestrations within projects, and develop the processing logic.

### Trigger

A type of database stored procedure that is called implicitly when a triggering event occurs such as an INSERT, UPDATE, or DELETE on a table.

## V

### Variable

Used to pass data values processed by an orchestration. Variables are used by maps to identify the source and target. Some Activities create variables automatically.

## W

### While Loop

Initiates and continually processes any children activities for as long as a specified condition is true.

## Getting started with Cast Iron Express

---

By using IBM® WebSphere® Cast Iron® Express®, you can quickly sign up for a free trial account, create integrations, and manage your Cast Iron Express environment securely. You can also analyze your integration usage by using the analytics provided.

### Why use Cast Iron Express?

---

WebSphere Cast Iron Express is a purpose-built solution for you to quickly create, define, run, and manage integration projects. Within minutes, you can create integrations between your salesforce.com account and other data sources.

The emphasis is on speed and simplicity, therefore, integrations are defined by using a configuration approach. You do not code the integration.

When complete, you can run your integration to move data in and out of salesforce.com, from remote databases, local files, and Dropbox.

At any time, you can extend the capability of your Cast Iron Express account by selecting one or more of the available add-on function packages.

You can invite other users to your Cast Iron Express account. You can also monitor and administer your account.

To Sign Up, go to the WebSphere Cast Iron Express home page <https://express.castiron.com/express/>.

### What do you need to know?

---

Depending on your role, there are different tasks that are outlined in the following documentation. Each task is explained in sequence, starting with how to register for a Cast Iron Express account.

For security reasons, your session times out if you leave your user name signed in and there is no activity.

Some of the Cast Iron Express function uses pop-up windows. Therefore, you might want to prevent pop-up windows from being blocked in your web browser.

Before you start, check that the browser you are using is supported and meets the required minimum levels:

- Google Chrome 18
- Mozilla Firefox 10
- Windows Internet Explorer 8

You can select the following tasks to learn about Cast Iron Express. Then you can start to create and manage your integrations, invite other users to your account, and monitor the activity within your account.

To learn how to create an integration from a local file to your salesforce.com account, see [Tutorial: Creating a local file to salesforce.com integration](#).

- [Registering an account](#)  
You can register for an IBM Cast Iron Express account by clicking Sign Up on the Cast Iron Express home page.
- [Help with getting started](#)  
When you sign in with the user name and password that you received, the Getting Started with Cast Iron Express view opens.
- [Managing your account profile](#)  
You can add details, or change your current details by using the Manage Profile view. You can also change your account password.
- [Managing users](#)  
Administrators can manage the users for an Cast Iron Express account. Only administrators can add new users to an account, and remove existing users that no longer require access.
- [The Cast Iron Express Help Center](#)  
When you sign in to Cast Iron Express, a Help Center which contains a series of useful resources is available to help you to understand and use the function available in the product.
- [Adding function to your Express account](#)  
You can customize your Cast Iron Express account by requesting extra function. By selecting one or more of the available function packages, you can increase the capability of your account.

- [Keeping up to date with Cast Iron Express](#)

You can find out What's New in Cast Iron Express, by looking at the Cast Iron Express Help Center.

---

## Registering an account

---

You can register for an IBM® Cast Iron® Express® account by clicking Sign Up on the Cast Iron Express home page.

You can register for an IBM Cast Iron Express account by going to <https://express.castiron.com/express/>.

There is no commitment to buy the product. The registration link from the Cast Iron Express home page sets up a free trial account. You can extend the function within your account by requesting the available add-on packages. For more information, see [Adding function to your Express account](#).

When registering an account, you must identify a single user for login purposes. Every Cast Iron Express account has one user with administrator privileges. This user is named *admin* and is created when you first complete your registration. The admin user can invite additional users to the same Cast Iron Express account.

## Procedure

---

1. With the Cast Iron Express home page open, click Sign Up. The Sign Up page opens.
2. Complete all of the fields by entering the requested details. If you omit a field, you are prompted to enter the information.
3. Read the Terms of Use. When you submit your registration request, you are agreeing to the Cast Iron Express terms.
4. When complete, click Sign Up. A confirmation message is displayed which shows that an email is being sent to the registered address.
5. Go to your email account and open the Welcome to IBM WebSphere Cast Iron Express note. To confirm the registration and activate your account you must click the link provided. An account verification message is displayed.
6. Following your confirmation, two further emails are sent. One note contains your *admin@YourCompanyName* Cast Iron Express user name. The other note contains your password. The *admin* user ID has the authority to create and define integrations, to invite other users to access the account, and manage the company Cast Iron Express account.
7. Sign in with the provided credentials to begin using your free trial account.

Restriction: Cast Iron Express limits users to a single trial account per company. If you receive an error message which indicates that the company name you provided is already registered, please contact the administrator at your company. The administrator can invite additional users within the existing account.

## Help with getting started

---

When you sign in with the user name and password that you received, the Getting Started with Cast Iron Express view opens.

To help you to understand the function available within your Cast Iron® Express® account, you can click each of the options displayed in the Getting Started view.

You can access the Getting Started page, at any time, by clicking the Help icon in the toolbar. The following screen capture shows the Help icon and the various help options:

## Procedure

---

1. Sign in with the user name and password that you received from IBM® Cast Iron Express. The Getting Started with Express view opens.
2. In the Getting Started with Express view, you can click one of the three options displayed:
  - o Create to quickly define and run your integrations.
  - o Monitor to open the dashboard page and analyze your integrations in real time. You can also check for any reported problems.
  - o Extend to add more function to your account and extend the capability of your integrations.

You can now start to define your Cast Iron Express environment.

**Parent topic:** [Getting started with Cast Iron Express](#)

---

### [Feedback | Notices](#)

>Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

## Managing your account profile

---

You can add details, or change your current details by using the Manage Profile view. You can also change your account password.

Sign in to your Cast Iron® Express® account.

## Procedure

---

1. Click your sign-in name in the upper right of the page to display the menu options. Click Manage Profile. The following screen capture shows the menu.

2. You can add or update the details in the following fields:

- o First Name
- o Last Name
- o E-mail
- o Country
- o Phone
- o Job Title

3. To change your password, click Change Password. You must provide your existing password before entering your new password.

The typical password rules apply. Passwords must have a minimum of eight characters and can contain special characters.

4. Optional: If you want to receive the Cast Iron Express newsletter, you can select Sign me up for the Cast Iron Express Newsletter and let IBM contact me with special offers.

5. To modify your profile, click Save. To cancel the addition or amendment, click the close icon .

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/intro\\_ManagingYourProfile.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/intro_ManagingYourProfile.html)

## Managing users

---

Administrators can manage the users for an Cast Iron® Express® account. Only administrators can add new users to an account, and remove existing users that no longer require access.

By default, when you register for a Cast Iron Express account, the Manage Users function is disabled. To use this additional function, click Add-ons and select the *Collaboration* package. For more information, see [Adding function to your Express account](#).

Complete the following steps to invite one or more users to access your Cast Iron Express account.

### Procedure

---

1. To open the Manage Users page, click Manage Users.
2. In the Add New Users section, enter the email address of the user that you want to add to your Cast Iron Express account. If you want to invite several people, separate each email address with a comma.
3. Optional: To customize the email that is sent to the users, select Customize email, and edit the content in the text area provided.
4. When you are finished, click Send. A message is displayed to confirm that an email is being sent.
5. The people that you invite receive a note which includes a link that guides them through the sign-up process. The first time they sign in the license agreement is displayed. The invited author must click Accept to complete the sign-in process.
6. After the new users sign in, you can see the details of their last login to Cast Iron Express in the Active Users section.
7. If required, you can delete a user by clicking the delete icon next to the Last Login field.

## The Cast Iron Express Help Center

---

When you sign in to Cast Iron® Express®, a Help Center which contains a series of useful resources is available to help you to understand and use the function available in the product.

The Cast Iron Express Help Center contains the following information:

- What's New details
- A series of short video tutorials
- Documented tutorials
- A frequently asked questions (FAQ) section

You can open the Help Center by clicking the Help icon, at any time. The following screen capture shows the Help icon and menu options:

The Help Center section can be closed by clicking the close icon in the upper right of the page.

You can also access the Cast Iron Express Information Center from the help menu options.

**Parent topic:** Getting started with Cast Iron Express

## Adding function to your Express account

---

You can customize your Cast Iron® Express® account by requesting extra function. By selecting one or more of the available function packages, you can increase the capability of your account.

Sign in to your Cast Iron Express account.

Depending on which additional function you select, you might be charged for some of the function packages. You are redirected to the IBM® Software and services online site, where you can add the Cast Iron Express product item to your basket. When prompted, sign in with your IBM user ID (which must be configured separately from your Cast Iron Express sign-in name).

At the end of the order process, record the confirmation number for future reference.

Important: The payment system opens in a new window. Therefore, you must ensure that your web browser does not block pop-up windows.

### Procedure

---

1. To see a list of available packages, click Add-ons.

The available function packages include:

- Mapping Functions. To define transformations to manipulate the data, mapped from the source endpoint before it populates the target endpoint.
- On-premise Support. To provide continuous synchronization between your local and remote systems.
- Collaboration. To invite other users to help create and manage integrations in your Cast Iron Express account.

Each package details the function included and whether there is a free trial. You can use the one-off free trial to experience how the function can enhance your business applications.

2. To select all of the extra function, click Try All for 90 Days. To continue to use the function when the free 90 day trial finishes, you must purchase the package.
3. To select individual packages, click Free for 90 Days for the specific function that you want to use. When you choose only some of the packages, you cannot then select Try All for 90 Days.
4. If relevant, complete the purchase on the IBM Software and services online site.
5. Submit your new function request.

The Add-ons view shows the status of your request, your current package usage, and indicates the time remaining for the free trials.

## Keeping up to date with Cast Iron Express

---

You can find out What's New in Cast Iron® Express®, by looking at the Cast Iron Express Help Center.

You can see details of the latest features as they are added. To open the Help Center, click the option displayed in the menu under the Help icon. The following screen capture shows the Help icon and menu:

**Parent topic:** [Getting started with Cast Iron Express](#)

## Integrating with Cast Iron Express

---

- [Supported Source and Target systems](#)

Cast Iron® Express® provides the capability to integrate between databases, FTP servers, local files, Dropbox, and salesforce.com accounts.

- [Managing secure connectors](#)

To communicate with on-site systems such as databases and FTP servers, Cast Iron Express provides the use of a secure connector. The secure connectors are managed from the Integrations page.

- [Creating integrations](#)

Integrations can be created in Cast Iron Express from the Integrations page.

- [Using the Integration editor](#)

You can use the Integration editor to customize all information about an integration.

- [Composite functions](#)

A composite function is a combination of two separate functions, where the output of one function is chained as input to a subsequent function. The following topics provide information on creating, editing, or deleting composite functions.

- [List of functions](#)

Cast Iron Express offers a selection of functions for use within mappings. These functions can be used to manipulate the field values being mapped, such as altering the content of strings, performing numeric operations on numbers, and manipulating date and time values.

- [Managing integrations](#)

Cast Iron Express displays a list of all of the integrations defined in an account on the Integrations page.

- [Monitoring integration activity](#)

You can use the Cast Iron Express Activities page to see details of all of the activity within your account.

- [Utilization Charts](#)

Utilization charts allow you to quickly identify the most active integrations and endpoints for a specific tenant. A summary of job successes and failures and a breakdown of integration activity is presented in a monthly and yearly chart.

## Supported Source and Target systems

---

Cast Iron® Express® provides the capability to integrate between databases, FTP servers, local files, Dropbox, and salesforce.com accounts.

### A complete list of the supported integration source and target pairs

---

The following table outlines the various Source endpoints that you can select in Cast Iron Express. When you select your Source endpoint, only the Target endpoints that are supported for that specific Source endpoint are displayed.

Table 1. Selected Source endpoint and the corresponding supported Target endpoint

Selected Source endpoint	Supported Target endpoint
DB2®	• salesforce.com
MySQL	• salesforce.com
SQL Server	• salesforce.com
Oracle	• salesforce.com
salesforce.com	• DB2 • MySQL • SQL Server • Oracle • salesforce.com
FTP	• salesforce.com
Local File	• salesforce.com
Dropbox	• salesforce.com

- [Supported file types for FTP sources](#)

Cast Iron Express supports the use of FTP as a source for certain file types.

**Parent topic:** [Integrating with Cast Iron Express](#)

>Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_supportedsourceandtargetsyst.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_supportedsourceandtargetsyst.html)

## Supported file types for FTP sources

---

Cast Iron® Express® supports the use of FTP as a source for certain file types.

The following file types are supported when you select FTP as a source endpoint:

- CSV files, where the first line of the file defines the field names for the remaining lines.
- Other text files, where the text content is made available as a single text field.
- Binary files, where the content is made available as a single binary field.

**Parent topic:** [Supported Source and Target systems](#)

## Managing secure connectors

---

To communicate with on-site systems such as databases and FTP servers, Cast Iron® Express® provides the use of a secure connector. The secure connectors are managed from the Integrations page.

By default, when you register for a Cast Iron Express account, the Secure Connector function is disabled. To use this additional function, click Add-ons and select the *On-premise Support* package. For more information, see [Adding function to your Express account](#).

When you open the Integrations page, the defined secure connectors are listed in the lower left area of the page. For each connector listed, you see the name, and the status of the connector.

You can delete any of the secure connectors by clicking the delete icon.

- [Creating a secure connector](#)  
You can create secure connectors from the Cast Iron Express Integrations page.
- [Installing a secure connector](#)  
You can install a secure connector on the host system.
- [Starting and stopping the secure connector](#)  
When you install a secure connect, menu items to start and stop the secure connector are added to your operating system in a group called Cast Iron Secure Connector 1.6.2.0.0.
- [Removing a secure connector](#)  
Secure connectors can be removed from the host system by first running the Stop Secure Connector item, followed by the Uninstall Secure Connector item.

**Parent topic:** [Integrating with Cast Iron Express](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Thursday, 2 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_ManagingSecureConnectors.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_ManagingSecureConnectors.html)

## Creating a secure connector

---

You can create secure connectors from the Cast Iron® Express® Integrations page.

By default, when you register for a Cast Iron Express account, the Secure Connector function is disabled. To use this additional function, click Add-ons and select the *On-premise Support* package. For more information, see [Adding function to your Express](#)

account.

## Procedure

---

1. With the Integrations page open, click the Add icon: .
2. Enter a unique and descriptive name for the secure connector.
3. Click Create.

The secure connector is created in the background, and when ready, it is displayed in the list of Secure Connectors.

Download the installation and configuration files and install the secure connector on the host system. For more information, see [Installing a secure connector](#).

**Parent topic:** [Managing secure connectors](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_creatingasecureconnector.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_creatingasecureconnector.html)

## Installing a secure connector

---

You can install a secure connector on the host system.

Restriction: The host system must be on the same local network as the target system.

## Procedure

---

1. Log in to the host system, and go to <http://express.castiron.com> in a web browser.
2. Click the download icon next to the secure connector that you want to install:  A dialog box is displayed containing links to download the installation and configuration files for both Windows and Linux platforms, and an option to download just the configuration file itself.
3. Download the relevant files on to the host system and run the installation program. You are prompted during the installation for the configuration file.

**Parent topic:** [Managing secure connectors](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_InstallingASecureConnector.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_InstallingASecureConnector.html)

## Starting and stopping the secure connector

---

When you install a secure connect, menu items to start and stop the secure connector are added to your operating system in a group called Cast Iron® Secure Connector 1.6.2.0.0.

You can find the menu items to start and stop the secure connector in your Start menu (Windows), or Applications menu (Linux).

Important: If you are running the secure connector on a Windows 7 system, run the secure connector as the administrator. Right-click the Start Secure Connector option and choose Run as Administrator.

When started, the secure connector communicates with your Cast Iron Express® account, and signals that it is running.

Tip: During the installation on a Windows system, the secure connector can be installed as a Windows service. Installing the secure connector as a Windows service means that you do not need to use the Start menu to start the secure connector.

## Procedure

---

When the secure connector is started, on the Cast Iron Express Integrations page click the Refresh icon  in the Secure Connectors section. The status changes to Running.

The refresh updates the secure connector list with the latest status.

**Parent topic:** [Managing secure connectors](#)

---

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_startingandstoppingthesecureconnector.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_startingandstoppingthesecureconnector.html)

## Removing a secure connector

---

Secure connectors can be removed from the host system by first running the Stop Secure Connector item, followed by the Uninstall Secure Connector item.

## Procedure

---

1. On the host system:
  - a. Stop the secure connector by using the Start menu option Stop Secure Connector.
  - b. Uninstall the secure connector by using the Start menu option Uninstall Secure Connector.
2. On the Cast Iron® Express® Integrations page:
  - a. Click the Delete icon  next to the relevant secure connector.
  - b. Click OK.

The secure connector is removed from your Cast Iron Express Integrations page.

**Parent topic:** [Managing secure connectors](#)

## Creating integrations

---

Integrations can be created in Cast Iron® Express® from the Integrations page.

Sign in to your Cast Iron Express account and click Integrations.

## Procedure

---

1. Choose your Source from the list. Depending on your source endpoint, the Target list is filtered down to list only the supported systems.
2. Choose your Target.

3. Click New Blank Integration to create the integration and enter the Integration editor.

**Parent topic:** [Integrating with Cast Iron Express](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Thursday, 2 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_creatingintegrations1.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_creatingintegrations1.html)

## Using the Integration editor

---

You can use the Integration editor to customize all information about an integration.

You can provide a custom name for the integration by entering it in the text field in the upper section of the editor. You can click Save to save the integration changes. To close the integration editor without saving, click Close. An integration can be saved at any time, but the integration cannot be run until it is complete.

The Integration editor contains three large panels:

- Source
- Transformation
- Target

For more information about the configuring of Source and Target sections, see the following topics:

- [Configuring the connection](#)
- [Selecting an operation](#)
- [Selecting an object](#)
- [Selecting the fields](#)
- [Setting up your integration](#)

## Procedure

---

1. Select the Source section. The Source editor opens.

- Configure the Connection
- Select an Operation
- Select an Object
- Select the Fields

When the Source is configured, a tick is displayed to indicate that the step is complete.

2. Select the Target section. The Target editor opens.

- Configure the Connection
- Select an Operation
- Select an Object
- Select the Fields

When the Target is configured, a tick is displayed to indicate that the step is complete.

3. Create the Transformation

- Define the Mappings
- Define the Functions

When both the Source and Target endpoints are configured, the Integration editor displays a list of Source fields on the left side and a list of Target fields on the right side. Step 3 of the procedure creates the data transformation between the Source and Target by interacting with the Transformation section. For more information, see the following topics:

- [Defining the mappings](#)
- [Defining the functions](#)
- [Setting up your integration](#)

When the transformation is complete, the integration can be saved, then closed to return to the Integrations page. For more information about starting and stopping your new integration, see [Managing integrations](#).

- [Configuring the connection](#)  
You must provide the connection details of the system which the integration is going to connect to. The set of connection details must be given a name, which can then later be used to identify these connection details for reuse in other integrations.
- [Connecting to a MySQL database](#)  
To successfully connect to a MySQL instance, the relevant MySQL JDBC driver must be installed in to the secure connector.
- [Selecting an operation](#)  
The choice of operation determines how Cast Iron Express monitors and interacts with your Source and Target endpoints. Support for individual operations can vary between implementations. For example, FTP utilizes get and put operations, while salesforce.com supports the upsert and get updated operations.
- [Database trigger tables](#)  
When using a database system as a Source, Cast Iron Express requires a trigger table to be created within the database system.
- [Selecting an object](#)  
When a Source or Target is successfully connected, Cast Iron Express queries the system for the available objects with which it can work.
- [Selecting the fields](#)  
When an object is selected, Cast Iron Express automatically queries the Source or Target system to identify the fields within that object.
- [Using an external ID when connecting to salesforce.com](#)  
When connecting to salesforce.com, you can configure Cast Iron Express to use an external ID on an Upsert objects operation. You can also use external ID fields to relate target salesforce.com objects to other salesforce.com objects.
- [Filtering source objects](#)  
The Cast Iron Express filtering capability lets you control which records are passed from your source application to your integration, based on field values displayed in the Integrations page.
- [Setting up your integration](#)  
After the Source and Target endpoints are configured, you are ready to define the mappings. Understanding the Cast Iron guidelines for implicit conversion between data types is key to setting up your integration. Before proceeding, familiarize yourself with the information in this section.
- [Defining the mappings](#)  
When both the Source and the Target are configured, you are presented with a list of source fields on the left, a list of target fields on the right, and two columns of anchors. You define mappings by connecting these anchor points.
- [Defining the functions](#)  
Simple mappings can copy data from a source field and place it in the target field. However, sometimes more complex transformations are required. All mappings have an add function icon which is used to define functions.
- [Configuring functions](#)  
You can configure functions to meet your specific requirements. To do this, you edit source fields and parameters to add or remove sources or change the order in which they appear.

**Parent topic:** [Integrating with Cast Iron Express](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Thursday, 2 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_UsingTheIntegrationEditor.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_UsingTheIntegrationEditor.html)

## Configuring the connection

---

You must provide the connection details of the system which the integration is going to connect to. The set of connection details must be given a name, which can then later be used to identify these connection details for reuse in other integrations.

For on-premise systems such as databases and FTP servers, the connection details require a secure connector to be specified. For more information, see [Managing secure connectors](#).

When the connection details are complete, click Connect to connect to the system to validate the connection details. A message is displayed at the top of the Connection Details panel to indicate whether the connection was successful.

---

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_ConfiguringTheConnection.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_ConfiguringTheConnection.html)

## Connecting to a MySQL database

---

To successfully connect to a MySQL instance, the relevant MySQL JDBC driver must be installed in to the secure connector.

Attention: If Cast Iron® Express® detects that the secure connector does not have the driver available, an error message is displayed which contains information about how to install the driver.

### Procedure

---

1. Download the driver from [here](#).
2. Go to the machine where your Secure Connector is running and stop the Secure Connector.
3. Copy the file to *Secure Connector install root\lib\plugins* where *Secure Connector install root* is the directory in which the Secure Connector is installed. For example, C:\Program Files\IBM\Secure Connector.
4. Start the Secure Connector.

**Parent topic:** Using the Integration editor

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_ConnectingToAMySQLDatabase.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_ConnectingToAMySQLDatabase.html)

## Selecting an operation

---

The choice of operation determines how Cast Iron® Express® monitors and interacts with your Source and Target endpoints. Support for individual operations can vary between implementations. For example, FTP utilizes get and put operations, while salesforce.com supports the upsert and get updated operations.

Before selecting an operation, review the following information to ensure that the activity that you want to use, is supported by the specific endpoint that you are working with.

Table 1. FTP as a Source endpoint

Operation	Resulting activity
Poll directory	Monitors the chosen file for updates on a 30 second interval.

Table 2. Databases (MySQL, SQL Server, DB2®, Oracle) as a Source endpoint

Operation	Resulting activity
Get inserted rows	Retrieves newly inserted entries from the database table and triggers the integration.
Get updated rows	Retrieves newly modified entries from the database table and triggers the integration.
Get deleted rows	Passes newly deleted entries from the database table and triggers the integration.

Table 3. Databases (MySQL, SQL Server, DB2, Oracle) as a Target endpoint

Operation	Resulting activity
-----------	--------------------

<b>Operation</b>	<b>Resulting activity</b>
Insert rows	Creates database entries based upon the data flowing through the integration.
Update rows	Modifies database entries based upon the data flowing through the integration.
Delete rows	Deletes database entries based upon the data flowing through the integration.

Table 4. salesforce.com as a Source endpoint

<b>Operation</b>	<b>Resulting activity</b>
Get deleted objects	Passes newly deleted objects of the selected type from salesforce.com and triggers the integration.
Get updated objects	Passes newly modified objects of the selected type from salesforce.com and triggers the integration.

Table 5. salesforce.com as a Target endpoint

<b>Operation</b>	<b>Resulting activity</b>
Create objects	Creates object entries based upon the data flowing through the integration.
Update objects	Modifies object entries based upon the data flowing through the integration.
Upsert objects	Updates and/or inserts object entries based upon the data flowing through the integration.
Delete objects	Deletes object entries based upon the data flowing through the integration.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_SelectingAnOperation.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_SelectingAnOperation.html)

## Database trigger tables

When using a database system as a Source, Cast Iron® Express® requires a trigger table to be created within the database system.

When starting an integration which uses a table in a database for the first time, Cast Iron Express notifies the user that this trigger table needs to be created. An information dialog is displayed containing an explanation of what is required and two links. One link attempts to connect to the database, and automatically creates the trigger table on behalf of the user. To use this method means that the connection details configured in the integration include the required permissions within the database system to create the tables. If the configured user does not have the required permissions, a second link is displayed which makes available a DDL document for creating the required table.

This document link can be passed to the database administrator who can create the required table on behalf of the user.

Restriction: The Cast Iron Express buffer table uses the following field names:

- IH\_PK
- IH\_OPERATION\_NAME
- IH\_FLAG

Therefore, these field names are not supported when you create your own table because they clash with the trigger mechanism.

**Parent topic:** [Using the Integration editor](#)

#### [Feedback | Notices](#)

Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/DatabaseTriggerTables.html>

# Selecting an object

---

When a Source or Target is successfully connected, Cast Iron® Express® queries the system for the available objects with which it can work.

Objects can be files on an FTP server, database schemas and tables, or salesforce.com objects. All available objects are represented as a tree structure for navigation to the intended object for the integration.

At any time, the Source or Target system might change. For example, a new custom object can be added to the connected salesforce.com account, a new table might be added to a database schema, or a new file uploaded to an FTP server.

## Procedure

---

1. To choose an object with which to work, select the object from the available list.
2. To refresh the list of objects, click the refresh icon  in the Available Objects section.

**Parent topic:** [Using the Integration editor](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_SelectingAnObject.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_SelectingAnObject.html)

# Selecting the fields

---

When an object is selected, Cast Iron® Express® automatically queries the Source or Target system to identify the fields within that object.

Fields within an object can be:

- Records in a CSV file.
- Columns in a table.
- Fields in a salesforce.com object.

The fields are displayed in a list with check boxes next to each field name.

Note: When the source endpoint is an FTP server, you have extra options on the Available Fields panel, where you can specify how Cast Iron Express interprets the selected file. These options are:

- Separator character. This identifies the character used to delimit individual fields within the file.
- Quote character. This identifies the character used to enclose field values, that may span more than one line.
- File has header row checkbox. This determines whether Cast Iron Express processes the first row of the file as a header row.
- Number of footer rows. This determines the number of rows at the bottom of the file to be ignored. For example, if the file contains totals or summaries.

Some fields are marked as optional by the Target system and some are marked as required. For example, you must provide a name to create an Account object using salesforce.com. Cast Iron Express pre-selects these required fields and disables the check-box for that field to prevent de-selection. These fields are marked with an asterisk (\*) after their name.

Other fields may be optional but commonly used; Cast Iron Express pre-selects these fields to save time, but you can alter these selections.

Note: Select All and Clear All links are provided above the list of fields.

At any time, the Source or Target system may change; a new custom field may be added to the connected salesforce.com account, a new column may be added to a database table, or a new file format uploaded to an FTP server. Refresh the list of fields for a given object by clicking the refresh icon  in the Available Fields section.

Once field selections are complete, click the Done button.

The Source or Target is now completely defined and you are returned to the main integration overview. The Source or Target is marked as complete with a green tick 

**Parent topic:** [Using the Integration editor](#)

## Using an external ID when connecting to salesforce.com

---

When connecting to salesforce.com, you can configure Cast Iron® Express® to use an external ID on an Upsert objects operation. You can also use external ID fields to relate target salesforce.com objects to other salesforce.com objects.

External IDs are used to identify objects in salesforce.com, based on identifiers or key values that originate in other systems. An external ID field can be added to salesforce.com objects by your salesforce.com administrator. For more information, see your salesforce.com documentation.

When a salesforce.com object is selected, Cast Iron Express automatically queries the target system to identify the fields within that object.

- [Using an external ID with the Upsert operation](#)

In salesforce.com, when an *Upsert* operation is selected, you can choose which external ID to use in the Available Fields section.

- [Using an external ID with related objects](#)

In salesforce.com, when a *Create* or *Upsert* operation is selected, you can use external ID fields to relate target objects to other objects. For example, a Contact object can relate to an Account object, based on the value of an external ID field defined in the Account object.

**Parent topic:** [Using the Integration editor](#)

## Using an external ID with the Upsert operation

---

In salesforce.com, when an *Upsert* operation is selected, you can choose which external ID to use in the Available Fields section.

### Procedure

---

1. In the salesforce.com Target editor, select the Upsert objects option from the Operations menu.
2. In the Available Fields section, choose the required external ID from the Use as external ID menu.
3. Click Done.

**Parent topic:** [Using an external ID when connecting to salesforce.com](#)

---

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_externalids.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_externalids.html)

## Using an external ID with related objects

---

In salesforce.com, when a *Create* or *Upsert* operation is selected, you can use external ID fields to relate target objects to other objects. For example, a Contact object can relate to an Account object, based on the value of an external ID field defined in the Account object.

### Procedure

---

1. In the salesforce.com Target editor, select either Create objects or the Upsert objects option from the Operations menu.
2. In the Available Fields section, select the field which relates to the intended object. Those fields which contain a defined external ID display a selection list in the Type column. Select the required external ID field from the list.
3. Click Done.

**Parent topic:** [Using an external ID when connecting to salesforce.com](#)

## Filtering source objects

---

The Cast Iron® Express® filtering capability lets you control which records are passed from your source application to your integration, based on field values displayed in the Integrations page.

For this task, you use the Integrations page to specify search criteria for what is retrieved from your source application. Each field in the Source area of the Integrations page has a filter icon displayed immediately next to it:

When you click a filter icon, a pop-up window is displayed, enabling you to set parameters that control the data processed by your integration. You can specify single or multiple filters on a source field. For example, instead of retrieving all current sales orders, you may want to retrieve only orders with values that exceed a specific amount and originate in another country.

### Procedure

---

1. To filter a source object, click an object in the Source area of the Integrations page. A list of fields related to the source object is displayed.
2. In the list of source fields, find the field that you want to filter and click the filter icon next to it. The Filters pop-up window is displayed. The field that you selected in the Integrations window is displayed in the Filters window.
3. In the **Add new filter** section of the Filters window, click the drop-down menu and select a filtering option.  
Available options are:
  - is equal to
  - is not equal to
  - is less than
  - is greater than
  - is in the range
4. In the text field, enter your filter parameters.
5. Click **Add**. The new filter is displayed in the shaded area of the Filters window.
6. To add additional filters to a source field, repeat the preceding steps.
7. To control how multiple filters are applied to a source field, use the Match which filters button. If you wish to have *any* of your filter parameters used on the source, click Any. If you want *all* of your filters to apply to the source field, click the Any button to toggle it to All.

8. When you are finished, click Close.

The filter icon on the Integrations page next to the source field is shaded green to indicate that a filter is defined.

**Parent topic:** [Using the Integration editor](#)

## Modifying filters

---

You also use the Integrations page to modify an existing filter setting or to delete a filter.

### Procedure

1. Click the green filter icon that is next to the source field in the Integrations page. The Filters window is displayed.
  - a. To modify a specific filter, go to the filter definition and click Edit. The filter parameters are displayed. Use the drop-down menu and the text field to modify your filter settings. When you are finished, click Save.
  - b. To delete a filter, go to the filter that you want to delete and click the delete icon next to it.
2. Click Close to return to the Integrations page.

The modified filter is displayed in the shaded area of the Filters window. If you deleted a filter, it is removed from the Filters window and the filter icon next to the source field is no longer green in color.

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_filtering.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_filtering.html)

## Setting up your integration

---

After the Source and Target endpoints are configured, you are ready to define the mappings. Understanding the Cast Iron® guidelines for implicit conversion between data types is key to setting up your integration. Before proceeding, familiarize yourself with the information in this section.

When you use the Integration editor to define your mappings, you are presented with a list of source and target fields with two columns of anchor points. You define mappings by connecting these anchor points. For more information about mappings, details on valid data types, and how to convert data types, see [Defining the mappings](#).

The following table shows the specific guidelines for implicit casting between data types. The Source column specifies the source data used in the mapping conversion. The Target column shows the derived target. The Comment column provides any necessary additional information about the selected operation.

Table 1. Cast Iron Express® guidelines for casting between data types.

S o u r c e	T ar g et	Comment
A n y	St ri n g	All data types are converted to string.
A n y	B o ol e a n	â€œT," â€œt,â€ â€œtrue,â€ â€œTRUE,â€, â€œtRuE,â€ â€œ1â€ and similar are cast to â€œTRUE.â€ Anything else is cast as â€œFALSE.â€

S o u r c e	T ar g et	Comment
Strin g	Nu m b er	Converts a string that contains a numeric representation such as "10" or "3.14" into a decimal number type.  Note: Strings which do not contain numbers result in a failure when the source data is processed.
Strin g	In te g er	Converts a string that contains an integer numeric representation such as "10" into an integer number type. Strings which do not contain integer numbers result in a failure when the source data is processed. Users can avoid this situation by using Round, Ceiling, or Floor functions to convert from decimal number strings to integer types.
Nu m b er	In te g er	Converts a decimal number such as 10 or 3.14 into an integer. For non-integer numbers the value is automatically converted in the same way as if the user applied the Round function. Users can enforce more specific control of the conversion by using a Round, Ceiling, or Floor function.

---

[Feedback](#) | [Notices](#)

>Last updated: Thursday, 2 June 2016  
 file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_settingupintegration.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_settingupintegration.html)

## Defining the mappings

When both the Source and the Target are configured, you are presented with a list of source fields on the left, a list of target fields on the right, and two columns of anchors. You define mappings by connecting these anchor points.

Each field has an anchor point displayed immediately next to it: 

You use anchor points to map source fields to target fields by drawing a wire to connect them.

Mappings are displayed in one of three colors:

Green

Indicates that the source and target data types match and that the mapping is valid.

Amber

Indicates that there is a mismatch in data type, but it is possible to automatically convert from one data type to the other. For example, a numeric data type can be automatically converted to a string. In this situation, a warning icon  is displayed in the Result column on the right. Click this icon to see detailed information about the warning.

Red

Indicates that the source field cannot be mapped to the target field because of data type incompatibility. You cannot save any integrations with red mappings. In this situation, an error icon  is displayed in the Result column on the right. Click this icon to see detailed information about the error.

## Procedure

---

To draw a wire, either click the chosen source anchor followed by the intended target anchor or drag the source anchor and drop it on the target anchor.

A wire is drawn connecting the two fields. This signifies that when the integration is running and receives data from the source system, the value of the source field is copied unchanged into the target field. Cast Iron® Express® provides sample data from the Source system on the left side and uses this sample data to populate the results of the mapping in the Target Result column on the right side.

**Parent topic:** [Using the Integration editor](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_definingthemappings.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_definingthemappings.html)

## Defining the functions

---

Simple mappings can copy data from a source field and place it in the target field. However, sometimes more complex transformations are required. All mappings have an add function icon which is used to define functions.

By default, when you register for a Cast Iron® Express® account, this function is disabled. To use this additional function, click Add-ons and select the *Mapping Functions* package. For more information, see [Adding function to your Express account](#).

The Add function icon  can be clicked to open a list of available functions. The functions are group in to the following categories:

- String
- Mathematical
- Boolean
- Date
- Utility

For more information about these functions, see the [Glossary](#).

## Procedure

---

Click the required function. A function box is inserted into the mapping.

## Example

---

This example shows a simple String Length function.

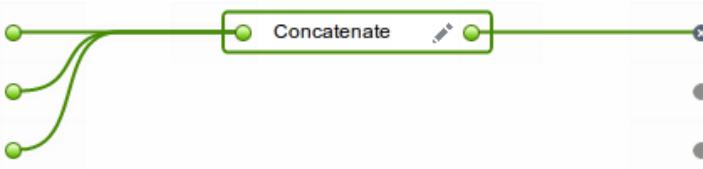

Also, the Result column on the right is updated to reflect the result of the function instead of a simple copy.

Some functions are more configurable and can accept multiple input fields. For example, the following screen capture shows a Concatenate function.

Additional source fields can be connected to the anchor point on the left side of the function, as shown in the following screen capture.

The Concatenate function also has configuration options which can be displayed by clicking the Edit icon . You can change the order of the inputs and specify configuration options for the Concatenate function such as prefix, defaultDelimiter, and postfix.

Click **Apply** to save your changes. The Target Results column on the right is updated.

**Restriction:** If the result is too long to display on the screen, it is truncated. Click the truncated result to see the full result in a tooltip.

**Parent topic:** [Using the Integration editor](#)

[Feedback](#) | [Notices](#)

Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_DefiningTheFunctions.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_DefiningTheFunctions.html)

## Configuring functions

You can configure functions to meet your specific requirements. To do this, you edit source fields and parameters to add or remove sources or change the order in which they appear.

By default, when you register for a Cast Iron® Express® account, this function is disabled. To use this additional function, click **Add-ons** and select the *Mapping Functions* package. For more information, see [Adding function to your Express account](#).

Complete the following steps to specify configuration options for concatenate and other functions.

### Procedure

1. On the Integrations page, click the integration that you want to edit. The integration is displayed in the integration editor with the fields that you previously selected shown in the Transformation view.
2. In the Transformation view, map a field by clicking the anchor point on a source object field and then clicking a field on the target object. The Add function icon is displayed.
3. Click the Add function icon to view a list of available functions. The Configure Function pop-up window is displayed showing a list of available functions.
4. In the Configure Function window, click the function that you want to apply to the mapping. If the function permits or requires additional information to be configured, the Edit icon is displayed.
5. Click on the Edit icon. The Edit Source Fields window is displayed showing the source fields and parameters.
6. To edit a source field, click on a row in the Edit Source Fields window that contains the source field you want to edit. The field is highlighted.
  - a. To delete a source field, click the Delete icon .
  - b. To move a source field up or down, click the appropriate Up or Down arrow.
7. When you are finished, click **Apply**.
8. On the Integrations page, click **Save** to save the changes to the integration.

Your edits are saved.

If you are using function composites, see [Composite functions](#).

**Parent topic:** [Using the Integration editor](#)

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_configuringthefunctions.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_configuringthefunctions.html)

## Composite functions

---

A composite function is a combination of two separate functions, where the output of one function is chained as input to a subsequent function. The following topics provide information on creating, editing, or deleting composite functions.

By default, when you register for a Cast Iron® Express® account, this function is disabled. To use this additional function, click Add-ons and select the *Mapping Functions* package. For more information, see [Adding function to your Express account](#).

- [Working with composite functions](#)

You can add a function to an existing composite, change the order of a composite, and delete a function.

**Parent topic:** [Integrating with Cast Iron Express](#)

---

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_compositefunctions.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_compositefunctions.html)

## Working with composite functions

---

You can add a function to an existing composite, change the order of a composite, and delete a function.

By default, when you register for a Cast Iron® Express® account, this function is disabled. To use this additional function, click Add-ons and select the *Mapping Functions* package. For more information, see [Adding function to your Express account](#).

Complete the following steps to add a function to an existing composite function.

### Procedure

---

1. On the **Integrations** page, click the integration that you want to edit. The integration is displayed in the Integration editor with the fields that you previously selected shown in the Transformations view.
2. In the Transformations view, click the anchor point of a field from the source object and then click the anchor point of a field on the target object. The Add Function  icon is displayed.
3. Click the Add Function icon to view a list of available functions. The Configure Function pop-up window is displayed showing a list of available functions.
4. In the Configure Function window, click the function that you want to apply to the mapping. If the function permits editing or requires additional information to be configured, the Edit icon  is displayed adjacent to it.
5. Click the Edit icon. A pop-up window is displayed containing Edit Composites, Edit Source Fields and Edit Parameters window sections.  
Note:
  - The Edit Composites window section displays the available composite functions.
  - The Edit Source Fields window section defines the source (input) to the first composite function.
  - The Edit Parameters window section displays the configured parameters for the composite that you selected in the Edit Composites section.
6. In the Edit Composites window section click **Concatenate**. A drop-down menu is displayed showing a list of available concatenate function parameters.
7. Select a parameter from the drop-down menu. The window is updated with your selection.
8. Click **Apply**. The composite function is updated.
9. On the Integrations page, click **Save** to save the integration.

The composite function is updated with the new function.

Note: Because a **subsequent** function receives a single input, functions that require two or more inputs cannot be chosen as a **subsequent** composite function. Additionally, attempting to create a composite function within a composite is not allowed and is not displayed as an option.

**Parent topic:** Composite functions

## Editing composite functions

---

You can also edit composites to move, delete, or change the order of functions.

Complete the following steps to delete or move a composite function.

### Procedure

1. On the **Integrations** page, click the integration that you want to edit. The integration is displayed in the Integration editor with the fields that you previously selected shown in the Transformations view.
2. In the Transformations view, click the anchor point of a field from the source object and then click the anchor point of a field on the target object. The Add Function  icon is displayed.
3. Click the Add Function icon. The Configure Function window is displayed showing a list of available functions.
4. In the Configure Function window, click the function that you want to apply to the mapping. If the function permits editing or requires additional information to be configured, the Edit icon  is displayed adjacent to it.
5. Click the Edit icon. A pop-up window is displayed containing Edit Composites, Edit Source Fields and Edit Parameters window sections.
6. In the Edit Source Fields, select the function you want to delete or move. Use the  icon or the Up and Down arrows, to delete the function or move it up and down. The source (input) to the function is modified or moved to its new position.
7. When you are finished, click **Apply**.
8. On the Integrations page, click **Save** to save the integration.

---

## List of functions

---

Cast Iron® Express® offers a selection of functions for use within mappings. These functions can be used to manipulate the field values being mapped, such as altering the content of strings, performing numeric operations on numbers, and manipulating date and time values.

By default, when you register for a Cast Iron Express account, this function is disabled. To use this additional function, click Add-ons and select the *Mapping Functions* package. For more information, see [Adding function to your Express account](#).

Table 1. String functions. This table lists and describes string functions

Mapping function	Description
Concatenate	Accepts two or more arguments and casts them to string. Returns the string that is the concatenation of the values of its arguments after conversion. The user can also configure prefix and/or postfix strings, plus a delimiter that is inserted between each of the arguments.
Length	Returns an integer equal to the length in characters of the value of the argument. If the value of the argument is the empty sequence, the integer 0 is returned.

Mapping function	Description
Lowercase	Returns the value of the argument after translating every character to its lowercase correspondent as defined in the appropriate case mappings section in the Unicode standard.
Uppercase	Returns the value of the argument after translating every character to its uppercase correspondent as defined in the appropriate case mappings section in the Unicode standard.
Replace	Returns the string that is obtained by replacing each non-overlapping substring of the input that matches the supplied pattern with an occurrence of the replacement string.
Starts with	Returns a boolean result indicating whether the value of the first argument starts with the value of the second argument.
String	Returns the value of the argument represented as a string. This value can be used to cast numeric data types into strings to prevent mappings from displaying a warning.
Substring	Returns the portion of the value of the first argument beginning at the position indicated by the value of the second argument and continuing for the number of characters indicated by the value of the third argument. For substring, there is only one field as "input" to the function. However, for the function, the start index and length values are configured in the function dialog window. In the existing text (and all other descriptions) <i>argument</i> is used in both cases.
Trim	Returns the value of the argument with white space normalized by stripping leading and trailing white space and replacing sequences of one or more than one white space character with a single space.

Table 2. Mathematical functions. This table lists and describes mathematical functions

Mapping function	Description
Absolute value	Returns the numeric value (or modulus) of a number without regard to its sign.
Mean	Returns the average of the values in the input sequence, that is, the sum of the values divided by the number of values.
Ceiling	Returns the smallest integer not less than X.
Divide	Returns a result value when the first argument is divided by the second.
Floor	Returns the largest integer not greater than X.

Mapping function	Description
Format	<p>The format-number function converts its first argument to a string by using the format pattern string specified by the second argument and the decimal-format named by the third argument, or the default decimal-format, if there is no third argument.</p> <p>The formatting options for the second parameter are as follows:</p> <ul style="list-style-type: none"> <li>• 0 - Digit</li> <li>• # - Digit (zero shows as absent)</li> <li>• . - The position of the decimal point. For example: ###.##</li> <li>• , - The group separator for thousands. For example: ###,###.##</li> <li>• % - Displays the number as a percentage. For example: ##%</li> <li>• ; - Pattern separator. The first pattern is used for positive numbers and the second for negative numbers</li> </ul> <p>The decimal format of the third parameter assists with localization of the number, and the following options can be used:</p> <ul style="list-style-type: none"> <li>• 0 - Digit</li> <li>• # - Digit (zero shows as absent)</li> <li>• . - Decimal separator or monetary decimal separator</li> <li>• - - Minus sign</li> <li>• , - Grouping separator</li> <li>• E - Separates mantissa and exponent in scientific notation. Need not be quoted in prefix or suffix</li> <li>• ; - Separates positive and negative subpatterns</li> <li>• % - Multiply by 100 and show as percentage</li> <li>• \u2030 - Multiply by 1000 and show as per mille value</li> <li>• Â¤ (\u00A4) - Currency sign, replaced by currency symbol. If doubled, replaced by international currency symbol. If present in a pattern, the monetary decimal separator is used instead of the decimal separator</li> <li>• ' - Used to quote special characters in a prefix or suffix. For example, '# #' formats 123 to #123. To create a single quote itself, use two in a row: # o' 'clock</li> </ul>
Maximum	Returns the largest value of the nodes passed as the argument.
Minimum	Returns the smallest value of the nodes passed as the argument.
Modulo	Returns the modulus, or remainder value after the first argument is divided by the second.
Multiply	Returns the value of all arguments multiplied together.
Number	Converts the argument to a decimal.
Round	Returns the number with no fractional part that is closest to the argument. If there are two such numbers, then the one that is closest to positive infinity is returned.
Subtract	Returns a value whereby the second argument is subtracted from the first
Sum	Returns a value obtained by adding the values in the argument.

Table 3. Boolean functions. This table lists and describes boolean functions

Mapping function	Description
Boolean	Computes the effective boolean value of the argument.
Not	Returns true if the effective boolean value is false, and false if the effective boolean value is true.

Table 4. Date functions. This table lists and describes date functions

Mapping function	Description
Date Time (Date)	The first argument must be in date format, the second argument is a time format. The result is a DateTime format that has both the date, and time, from the arguments

Mapping function	Description
Date to String (Date)	<p>The second argument is a string that shows how to format the date/time. The following key characters are replaced by parts of the date/time:</p> <ul style="list-style-type: none"> <li>• <b>yy</b> - Last two digits of year. For example, 86 from 1986</li> <li>• <b>MM</b> - Two-digit month</li> <li>• <b>dd</b> - Two-digit date</li> <li>• <b>HH</b> - Two-digit hour</li> <li>• <b>mm</b> - Two-digit minutes</li> <li>• <b>ss</b> - Two-digit seconds</li> </ul> <p>For example, if the Format Date String function was called with the following input parameters:</p> <p>dateTime: 2012-02-22T16:18:00.852-08:00  format string: MM/dd/yyyy  locale string: en_US</p> <p>The following string would be returned: 02/22/2012.</p> <p>For more information about the Date to String function, see the Format Date String topic in the Studio help section.</p>
Adjust to Timezone (Date)	<p>Converts the TimeDate to hold a particular time zone, or to none. Time zone applied is the second argument, for example:</p> <ul style="list-style-type: none"> <li>• <b>-10H</b> - A timezone of minus ten hours</li> <li>• <b>+5H30M</b> - A timezone of plus 5 hours and 30 minutes</li> <li>• <b>0H</b> - A timezone at 0 hours</li> </ul>

Table 5. Utility functions. This table lists and describes utility functions

Mapping function	Description
Composite	Chains together a series of functions.

## Managing integrations

---

Cast Iron® Express® displays a list of all of the integrations defined in an account on the Integrations page.

The list contains the name of each integration, the date and time that the integration was last updated, and the sign-in name that made the last change.

The current status of the integration is also displayed:

- Running. The integration runs continuously until stopped.
- Stopped. By default, when an integration is defined the status is stopped. You must click Stopped to run the integration. When the integration status shows as stopped, no updates are made to the target system.

You can remove an integration by clicking the delete icon. You must confirm the deletion before any action is taken.

- **Modifying integrations**

You can modify an integration at any time by clicking its name in the list on the Integrations page.

- **Deleting integrations**

You can delete an integration at any time from the Integrations page.

**Parent topic:** [Integrating with Cast Iron Express](#)

## Modifying integrations

---

You can modify an integration at any time by clicking its name in the list on the Integrations page.

The Integration Editor displays the integration as it was last saved. You can change the configuration for the integration, except the Source and Target system types.

Users can change

- The name of the integration Connection details for the Source or Target system.
- The operations used in connecting with the Source and Target systems.
- The object with which the integration interacts.
- The list of fields the integration uses.
- The transformation between the Source and Target systems.

When you are finished, click Save. If the integration is in Running state, it is stopped first, then updated, and started again

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations\\_ModifyingIntegrations.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_ModifyingIntegrations.html)

## Deleting integrations

---

You can delete an integration at any time from the Integrations page.

### Procedure

---

1. Click the delete icon 

2. Click OK. If the integration was in Running state, it is stopped first and then deleted.

## Monitoring integration activity

---

You can use the Cast Iron® Express® Activities page to see details of all of the activity within your account.

The Activities page shows a number of different types of events:

- Integration creation, modification, and deletion.
- The jobs that were run by the integration. A job is a single instance of data that arrives from the Source system that is transformed and then pushed to the Target system.
- Alerts detailing potential problems with the account. For example, if a secure connector is not available for a running integration, an alert is displayed indicating it must be started before any jobs can run.

The Activity feed can be filtered by clicking the three buttons at the top of the page. The options are:

- All Activity, which shows all the different types of activity message in one list.
- Integration Activity, which shows only activity messages that relate to jobs that are running in the system.
- Alerts, which shows only warnings and errors that might require user intervention.

The Activities page displays the most recent messages first.

This list is automatically updated every time the Activities page is opened and automatically, in the background every 60 seconds, to ensure that the latest information is available.

## Utilization Charts

---

Utilization charts allow you to quickly identify the most active integrations and endpoints for a specific tenant. A summary of job successes and failures and a breakdown of integration activity is presented in a monthly and yearly chart.

From the Integrations page, open the charts display by clicking the charts icon:

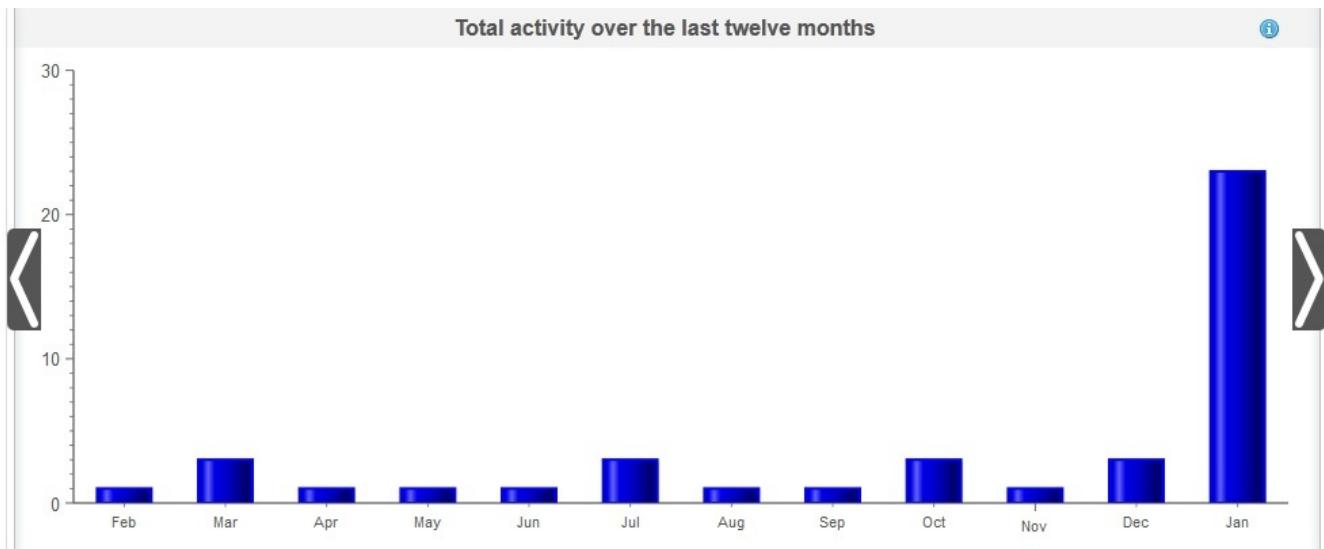

To close the utilization charts display, click the charts icon again.

You can use the left and right arrows to scroll through various utilization charts:

- Top most active integrations over the last thirty days
- Top most active endpoints over the last thirty days
- Total activity over the last twelve months

Information displayed in the utilization charts is refreshed every 60 seconds.

An example of a *Total activity over the last twelve months* chart is shown in the following screen capture:

## Top most active integrations over the last thirty days

This chart provides data on the integrations that processed the most jobs during the last 30 days. The top ten integrations display in the chart in order of activity: the most active integration is at the top of the chart descending the least active integration at the bottom of the chart. For each of the top ten integrations, the chart further breaks down the total number of successful jobs (represented by a green bar) and failed jobs (represented by a red bar). Click the green or red bar to see more detailed job information.

## Top most active endpoints over the last thirty days

This chart provides data on the endpoints that processed the most jobs during the last 30 days. The chart displays the most active endpoint at the top. For each endpoint, the chart further breaks down the total number of successful jobs (represented by a green bar) and failed jobs (represented by a red bar). Click the green or red bar to see more detailed job information.

## Total activity over the last twelve months

This chart provides a view of all integration activity that occurred during the last 12 months for a specific tenant. All integration activity that occurred over the last 12 months is displayed in monthly intervals. Click a specific bar to obtain more details about the breakdown of successful and failed invocations for that month.

## Tutorial

---

The following tutorial provides an example of how to create an integration. You can use the information to quickly create an integration within your Cast Iron® Express® account.

- [Tutorial: Creating a local file to salesforce.com integration](#)

You can create and run integrations with IBM® Cast Iron Express. This tutorial describes how to create an integration from a local file to salesforce.com. You can quickly define the integration and upload your data in a one-off operation.

Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/tutorials.html>

## Tutorial: Creating a local file to salesforce.com integration

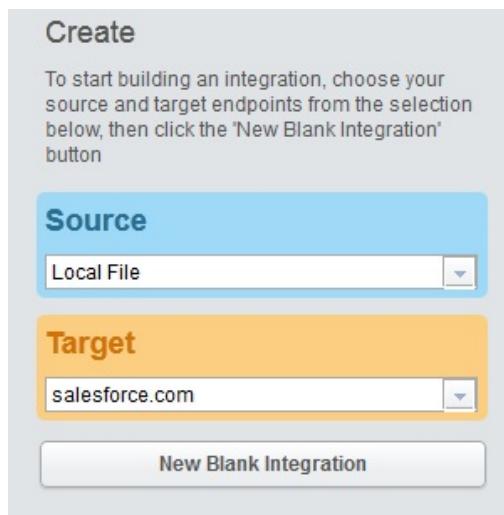

You can create and run integrations with IBM® Cast Iron® Express®. This tutorial describes how to create an integration from a local file to salesforce.com. You can quickly define the integration and upload your data in a one-off operation.

### Step 1: Create the Integration

After signing in to Cast Iron Express, click Integrations. With the Integrations view open, create an integration by selecting your source and target endpoints.

Tip: You might want to click Save at regular intervals when creating and defining an integration. Your work is not lost if you then experience web browser problems or you are signed out of Cast Iron Express because of inactivity.

For this tutorial, select Local File as the Source and salesforce.com as the Target.

Click New Blank Integration, which is displayed under the Target selection.

An outline integration is displayed in which the Source, Transformation, and Target, must be defined. The numerals indicate the integration definition sequence:

1. Define the source endpoint
2. Define the target endpoint
3. Define the transformation by mapping the data path from the source endpoint to the target endpoint

The screenshot shows the integration configuration interface with three tabs: 'Source' (selected), 'Transformation', and 'Target'.  
**Step 1: Define the Source:** Describes the process of defining the source endpoint.  
**Step 3: Map the Data:** Describes the process of mapping data between source and target.  
**Step 2: Define the Target:** Describes the process of defining the target endpoint.

### Step 2: Configure the endpoints

In the Source header, click Edit.

The source endpoint configuration view opens.

Click Select File and choose the local file that you want to upload the data from. The file must be a delimited file.

For this tutorial, we are using a file named *accounts.csv*.

The file contains some account information and includes a field called "id" that uniquely identifies each of the account records in the file. The contents of the *accounts.csv* file used is included here:

```
id,name,streetAddress,city,postcode,phoneNumber  
0,AcmeCo,10 Downing Street,London,SW1A 2AA,02012345678  
1,MyOtherCompany,221b Baker Street,London,SW2B 3FG,020654321
```

1 Source

**Step 1: Upload File**

Select a file from your local File System below. Your file will then be uploaded to our servers, and you will be able to begin selecting what fields to use.

*accounts.csv*      [Change](#)

[Load Fields >](#)

If you want to select a different file, click Change.

Click Load Fields and verify the details that are automatically generated about your selected file. For example, the delimiter character used in the file.

For this tutorial, the *accounts.csv* file uses a comma as the delimiter character. Also, the remaining fields can be left with their default values.

Local File to salesforce.com Save

1 Source Done

**Step 1: Upload File**

Select a file from your local File System below. Your file will then be uploaded to our servers, and you will be able to begin selecting what fields to use.

*accounts.csv*      [Change](#)

[Load Fields >](#)

**Available Fields**

Separator character *	<input checked="" type="checkbox"/> Comma (,)	<input checked="" type="checkbox"/> File has header row
Quote character	<input checked="" type="checkbox"/> Single quote ('')	Number of footer rows
		<input type="text" value="0"/>

[Continue](#)

Click Continue to display all of the available fields within the selected file.

**1 Source**

**Step 1: Upload File**

Select a file from your local File System below. Your file will then be uploaded to our servers, and you will be able to begin selecting what fields to use.

accounts.csv [Change](#)

[Load Fields >](#)

**Available Fields** [Select All](#) [Clear All](#)

Separator character *	<input checked="" type="text"/> Comma (,)	<input checked="" type="checkbox"/> File has header row
Quote character	<input checked="" type="text"/> Single quote ('')	<input type="text"/> Number of footer rows
		<input type="text"/> 0

[Continue](#)

Field	Type	Sample Data
... ▾ Record	...	...
<input checked="" type="checkbox"/> id	string	0
<input checked="" type="checkbox"/> name	string	AcmeCo
<input checked="" type="checkbox"/> streetAddress	string	10 Downing Street
<input checked="" type="checkbox"/> city	string	London
<input checked="" type="checkbox"/> postcode	string	SW1A 2AA
<input checked="" type="checkbox"/> phoneNumber	string	02012345678

Select the fields that you want to upload the data from. By default, all of the fields are selected.

For this tutorial, we are using all of the selected fields.

When you are finished, click Done.

The source endpoint is defined for this integration.

You return to the integration overview and the selected Source fields are displayed.

Local File to salesforce.com [Save](#) [Close](#)

Source		Transformation		Target
Field	Type	Sample		
File		...		
Record		...		
id	xy	0	→↑	
name	xy	AcmeCo	→↑	
streetAddress	xy	10	→↑	
city	xy	London	→↑	
postcode	xy	SW1A 2AA	→↑	
phoneNumber	xy	0201234	→↑	

**Step 3: Map the Data**

The middle panel is used to map the data between the source and target that you've selected. Come back to this step once you have filled in the Source and Target to complete your integration.

**Step 2: Define the Target**

Click on the title bar or the number to expand the target definition pane, fill in the details for the connection you want to use, and select to object and fields that you would like to integrate.

You can now define the target endpoint.

In the Target header, click Edit. Enter the credentials required to sign in to salesforce.com.

These credentials are validated, and if correct, you are signed in to the salesforce.com account. The available business objects that you can use in your integration are listed.

For this tutorial, from the list of objects, select Account. The description of the Account object is presented in the Available Fields section which shows all fields in the Account object.

Note: You can select the fields that you are interested in and want to load with the data from your local file. You do not have to integrate the whole object, only the fields that are required for your integration definition.

Use the Operations option to specify the context of the data operation that you want for your integration.

For this tutorial, select Update objects as the operation. When the integration is running, it automatically updates the selected Accounts fields in salesforce.com.

Select the required Account fields as shown in the following screen capture:

The screenshot shows the 'Target' configuration screen. On the left, 'Connection information' is filled with details for 'salesforce.com'. In the center, the 'Operations' dropdown is set to 'Update objects'. On the right, the 'Available Objects' list shows 'Account' selected. The 'Available Fields' table lists various account fields, with several checked: Id\*, Name, Type, ParentId, BillingStreet, BillingCity, BillingState, BillingPostalCode, BillingCountry, ShippingStreet, ShippingCity, ShippingState, ShippingPostalCode, ShippingCountry, and Phone. A 'Select All' and 'Clear All' button is at the top of the table.

Field	Type
Id*	tns:ID
IsDeleted	xsd:boolean
MasterRecordId	SalesForce.com
Name	xsd:string
Type	xsd:string
ParentId	SalesForce.com
BillingStreet	xsd:string
BillingCity	xsd:string
BillingState	xsd:string
BillingPostalCode	xsd:string
BillingCountry	xsd:string
ShippingStreet	xsd:string
ShippingCity	xsd:string
ShippingState	xsd:string
ShippingPostalCode	xsd:string
ShippingCountry	xsd:string
Phone	xsd:string

When complete, click Done.

The target endpoint is defined for this integration.

You return to the integration overview. The integration is updated with the Target selected fields in salesforce.com.

The screenshot shows the integration overview. It includes three main sections: 'Source' (Local File to salesforce.com), 'Transformation' (with a step icon), and 'Target' (salesforce.com). The 'Source' section lists file and record fields with their types and samples. The 'Target' section maps these to specific account fields in salesforce.com, including Id\*, Name, BillingStreet, BillingCity, BillingState, BillingPostalCode, BillingCountry, ShippingStreet, ShippingCity, ShippingState, ShippingPostalCode, ShippingCountry, and Phone. Buttons for 'Save' and 'Close' are at the top right.

Field	Type	Result
Id*	xy	[•]
Name	xy	[•]
BillingStreet	xy	[•]
BillingCity	xy	[•]
BillingPostalCode	xy	[•]
Phone	xy	[•]

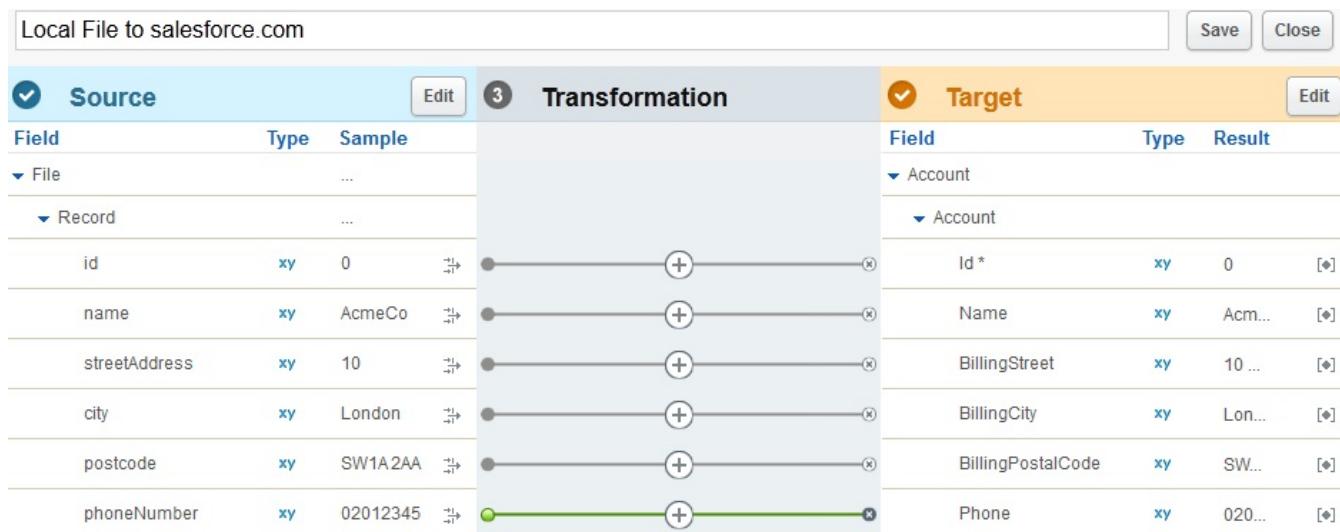

In the integration overview, you can now see both the source and the target fields that are ready to be mapped.

## Step 3: Define the transformation

To complete the integration you must map the fields from the source to the target.

Connect the source and target fields as required. For each source field, click the anchor point and then click the corresponding target field anchor point.

In this tutorial, you map the data from the source fields to the target fields as shown in the following screen capture. You are not required to define functions on the data.

Defining functions and more complex transforms is covered in the tutorial on transformations.

Enter a name that is meaningful and representative of the integration. For example, Local File Accounts to salesforce.com Account.

Local File Accounts to salesforce.com Account

Save Close

Save the completed integration by clicking Save. Then, click Close to return to the Integrations view.

The Integrations view lists all of the defined integrations and their current state.

## Integrations

Name	Updated	Status	Actions
Local File Accounts to salesforce.com Account	Sep 11, 2012 12:41:37 PM by admin@CompanyName	Stopped	Run Delete accounts.csv Change

## Step 4: Run the integration

Now that integration is defined, you must run the integration to copy the data from the source endpoint to the target endpoint.

Click Run, displayed to the right of the integration that you created.

The integration runs and the data is uploaded from your defined source local file to the defined target salesforce.com object in a one-off operation.

The integration status changes to running:

## Integrations

Name	Updated	Status	Actions
Local File Accounts to salesforce.com Account	Sep 11, 2012 12:41:37 PM by admin@CompanyName	Running...	<a href="#">Run</a> <a href="#">Delete</a> <a href="#">accounts.csv</a> <a href="#">Change</a>

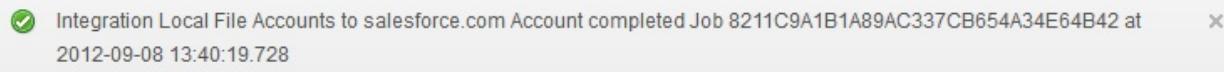

You can click Activities > Integration Activity to view the recent Cast Iron Express integration activities. The activities are displayed with the most recent at the top of the list.

For this tutorial, the following screen capture shows the completed integration details.

The screenshot shows a summary of integration activities. It includes three buttons: 'All Activity' (12), 'Integration Activity' (4, highlighted in blue), and 'Alerts' (0). Below this, a message indicates a successful job completion: 'Integration Local File Accounts to salesforce.com Account completed Job 8211C9A1B1A89AC337CB654A34E64B42 at 2012-09-08 13:40:19.728' on '08 September 2012 14:40:21'.

To verify the successful integration, go to the target system and check that the data arrived.

When the integration completes, a successful integration acknowledgment message is also displayed momentarily in the lower part of the view.

## Glossary

---

This glossary includes terms and definitions for Cast Iron® Express®.

- [Bundles](#)  
Bundles are a collection of endpoints.
- [Connection](#)  
A set of properties that together can be used to establish a connection to a source or target (db user name, password, server, port etc).
- [Endpoint](#)  
Represents the properties of an external system, such as a database server, FTP server, email system, or enterprise application. This can be either the source of data to the Integration Appliance, or the target of processing by the Integration Appliance.
- [Fields](#)  
Properties of the object / table / file (depending on the context).
- [Functions](#)  
Simple XSLT-style functions for manipulating data. For example, move, concat, not, or max.
- [Integration](#)  
The specific sequence of processing activities (such as data mapping, transformation, and control logic activities), endpoints, and data types, defined and configured using Cast Iron Express.
- [Operations](#)  
Actions that have been used during transformation. On the source side, these are in the past tense, for example created,

updated, deleted, or upserted. On the target side, these are in the active voice, for example create, update, delete, or upsert.

- **Source**  
The originating endpoint, located on the left side of an integration.
  - **Target**  
The target endpoint, located on the right side of an integration.
  - **Transformation**  
The definition of the process for transforming the in-flight data, from the source format, to the target format. This may or may not include lookups, filtering, and functions.
-

## About Environment Dashboards

---

An environment dashboard provides multiple snapshot views of project configurations and jobs, a list of unresolved critical system errors, and an overall project configurations summary, and status of Secure Connectors. The Dashboard also allows you to search for orchestration jobs by job key. The Search box is located in the Results section of the dashboard.

To expand the views of the Critical Alerts and Secure Connector Summary, click the icon in the upper right corner. An expanded view of Project Configuration is available by selecting Repository > Configurations from the navigation pane. An expanded view of Results is available by selecting Repository > Job Log from the navigation pane.

A dashboard is available for each environment in a multi-environment cloud. The information the dashboard displays is specific to its environment.

## About the Cloud

---

The IBM® WebSphere® Cast Iron® Cloud (Cloud) administrator provisions a tenant for your organization and can create multiple environments for you to deploy your projects in. The Cloud administrator also provides a username and password for the tenant administrator.

After the tenant, and any environments are created, it is the tenant administrator that creates users and groups, and manages environments in the tenant.

## Cloud Tenants

---

The IBM WebSphere Cast Iron Cloud (Cloud) supports multiple organizations (tenants). Each cloud tenant is managed by a tenant administrator. The tenant administrator creates and manages users and groups, for a specific cloud tenant.

You can get a trial version or buy Cast Iron Live licenses using the IBM Marketplace: <https://www.ibm.com/marketplace/cloud/cloud-integration/us/en-us>.

## Cloud Environments

---

The Cloud supports multiple environments for each tenant. The environments allow you to stage project development or isolate project development.

For example, you can have a Development, Staging, and Production environment. These environments display as tabs in the Cloud Web Application. While the Cloud administrator, not the tenant administrator, creates these environments for each tenant, it is the tenant administrator that grants permissions to individual users/groups for each environment.

Note: Some connectors require you to install 3rd party libraries before you can deploy a project to an environment. In a multi-environment tenant, verify that the environment to which you deploy a project has all required libraries installed.

Note: To use Studio Verify in a multi-environment tenant, you must specify the environment from which Studio will retrieve connector libraries.

For example, SAP libraries are installed in the Development environment and Production environment. You specify the Development environment in your user profile. When you execute Studio Verify for your SAP project, Studio uses the libraries in the Development environment. You can then chose to deploy your project to the Development environment or Production environment.

To specify the environment from which Studio Verify retrieves connector libraries:

1. Click your username, located in the upper right corner of the console. The User Profile dialog is displayed.
2. Click Change Libraries Environment.
3. Select a libraries environment from the list.
4. Click Save.

## Studio Cloud

---

In addition to the desktop version of Studio, you can launch and work with the Studio directly in the Cloud. This cloud version of Studio (Studio Cloud) allows you to create and deploy projects from the cloud.

Functionally, Studio Cloud is similar to Studio Desktop with a few differences listed here:

- The Recently Opened Project option is not available in Studio Cloud.
- The Save Remotely toolbar is not available in Studio Cloud, but is available in Studio Desktop when you are logged in to the Cloud.
- For Studio Cloud, when you select Save As Project [Cloud] or Rename Project [Cloud], the wizard does not display the location on the local file system where the wizard saves a project.
- Instead of a New Project option, Studio Cloud has a New Project Local option. The new option creates a new project on the local file system.
- Instead of a Open Project option, Studio Cloud has an Open Project Local option. The new option opens a project from the local file system.
- Instead of the Save Project option, Studio Cloud has two new options, which depend on whether you are logged in. If you are logged in, the Save Project [Cloud] options saves projects to the cloud. If you are not logged in, Save Project [Local] saves the project locally.
- Instead of the Save As option, Studio Cloud has a Save As to Local option.
- In Studio Cloud, you can select the Save As To Cloud option, which saves a copy of a project to the cloud.
- Instead of Rename Project, Studio Cloud has two new options, which depend on whether you are logged in. If you are logged in, the Rename Project [Cloud] option renames the project locally and remotely. If you are not logged in, the Rename Project [Local] option only renames the project locally.

## Cloud TIPs Wizard

---

You can now access the TIP Wizard in the Cloud. The TIP Wizard steps you through an integration project template to help you quickly build your own integration project.

The Cloud Management Console allows you to search all the templates available in the Solutions Repository. When search results are returned, a check mark in the Certified column of the Solutions page identifies templates that Cast Iron has tested and certified. User rating information is also available in the Template Details pane. The final step in the TIP Wizard allows you to rate the template.

To launch the TIP Wizard:

1. In the cloud, select the Create tab. The Solutions page is displayed.

2. In the Search Templates by keyword(s) field, enter a keyword. For example: SAP.
3. Click Search. All templates that match the keyword display.  
Note: You can select the Advanced Search option to filter templates by first endpoint or second endpoint.
4. Click the appropriate template. The Templates Details pane is displayed.
5. Click the Create a Project Based on this Template link.

## Secure Connector

---

The Secure Connector allows you to access the cloud using endpoints that sit behind your internal firewalls and transfers data using a secure protocol.

## Navigating the Management Console

---

The Management Console is a web-based tool that allows you to manage and monitor the various systems and resources of your integration environment. This environment can be a physical Integration Appliance or an environment in the WebSphere® Cast Iron® Cloud.

The navigation pane on the left of the Management Console displays a menu of pages that allow you to view, configure, and take actions on various systems and resources.

The back and forward buttons on browsers do not allow you to move through the Management Console pages in the order which you opened them. Use the back and forward arrows in the top right corner of the Management Console to move through the Management Console pages in the order you opened them.

The user that is currently logged in is also displayed in the top right corner. Click the username to open the User Profile window.

## Downloading and Installing SAP JAR Files and DLLs

---

### Before you begin

You must have an SAP User ID and password to enter the SAP Support Portal to download the files.

### About this task

In order to connect to an SAP system, you must install SAP DLLs and JAR files onto your development environment.

To download and install the SAP jar files and DLLs:

1. Contact SAP Technical Support to obtain the zip files for the following SAP Components:
  - If the secure connector is running on Windows:
    - SAP 32 bit JCo version 3.0.10 or later versions - Windows
    - SAP Java IDoc Class Library 3.0.10 or later versions
  - If the secure connector is running on Linux:

- 32 bit SAP JCo 3.0.10 or later versions - Linux (for Intel compatible processors)
  - SAP Java IDoc Class Library 3.0.10 or later versions
2. Unzip the SAP JCo zip file:
    - Double-click the sapjidoc30P\_x-1000xxxx.zip file.
    - Use the decompression tool to extract the contents of the compressed file to a temporary directory. This zip file contains another zip file sapjco3-NTintel-3.0.x.zip. Extract this zip also to a temporary directory, for example, in Windows: C:\temp\sapjco3-NTintel-3.0.x. This directory contains the required libraries sapjco3.jar and sapjco3.dll. For example in Linux: /tmp/sapjco-linuxintel-3.0.x. This directory contains the required libraries sapjco3.jar and libsapjco3.so.
  3. Unzip the SAP IDoc JCo zip file:
    - Double-click the sapjidoc30P\_x-1000xxxx.zip file.
    - Use the decompression tool to extract the contents of the compressed file to a temporary directory, for example, C:\temp\sapjidoc30P\_x-1000xxxx. This directory contains the required library sapidoc3.jar.

## Procedure

---

1. Log on to the Management Console and select System > Connectors. The Connectors page is displayed.
2. Click Update Libraries. The Update Connector Libraries window is displayed.
3. Select SAP in the Connector column.
4. Click the plus (+) button and repeat the following substeps until you have imported all the jar files you just downloaded.
  - a. Locate one of the jar files you just downloaded.
  - b. Click Open to import the jar file. The file displays in the Files to Add column.
5. Click Update.

The files that display in the Files to Add column are not committed until you click Update. If you click Reset before you click Update, the Management Console does not add the files you uploaded. If the Management Console times out before you click Update and commit the added files, repeat the last two steps.

## Results

---

You can now run SAP projects.

**Parent topic:** [Managing Cloud Instances](#)

## Installing Vendor Supplied Libraries

---

### About this task

If your integration project uses a connector that requires additional libraries, you must install the additional libraries before you deploy the project configuration. Deploying the project configuration before installing the additional libraries generates runtime errors. For a complete list of connectors that require vendor supplied libraries, open the Update Connector Libraries page. See the following procedure.

If you have a multi-environment tenant, you must install the 3rd party libraries in each environment where you deploy a project configuration with a connector that requires the additional libraries.

For example, you have a tenant with three environments: Development, Staging, and Production. You publish a project configuration for an SAP endpoint in the Development and Production environments. Before you can deploy the project configuration, you must install additional SAP libraries on both the Development and Production environments.

## Procedure

---

1. Click an environment tab.
2. Select System > Connector Libraries to open the Update Connector Libraries page.
3. In the Connector column, select the connector for which you want to install additional files.

Any files that have already been installed display in the Installed Files column.
4. Click the (+) icon and select the library file or files to upload. In the cloud, .jar and .dll are valid library files types. The files you select display in the Files to Add column.
5. Click Update.

The files that display in the Files to Add column are not committed until you click Update. If you click Reset before you click Update, the Cloud Management Console does not add the files you uploaded. If the Cloud Management Console times out before you click Update and commit the added files, repeat the last two steps.

## Scheduling Downtime

---

### About this task

Scheduling downtime allows you to perform maintenance on an environment or related system. You can create downtime rules for project configurations that stop or suspend all enabled orchestration jobs in that project configuration for a specified duration of time. The project configuration does not have to be undeployed to create or edit a downtime rule. Downtime rules can occur once or repeat at specific intervals. You must have administrator or publisher permissions to create, edit, or delete a downtime rule.

By default, downtime rules are stored in GMT time zone. If an administrator modifies the system clock from GMT to another time zone, downtime rules are executed at the same absolute time. For example: You create a downtime rule to stop all orchestration between 4:00pm - 4:15pm GMT. The administrator then modifies the system clock to display PDT. Your downtime rule is modified to now stop all orchestration between 8:00am - 8:15am PDT. To execute the downtime rule at 4:00pm - 4:15pm PDT, you must edit the downtime rule. Times differences caused by daylight savings are automatically adjusted.

If the environment is offline when a downtime rule is scheduled to occur, all unexecuted rules are identified and executed in the appropriate order when the environment returns online. After all the backlogged downtime rules are executed, you regain control to modify the deployment state of a project configuration.

### Procedure

---

1. From the Navigation pane, select Repository > Configurations. The Project Configurations page is displayed.
2. Click the project configuration, which contains the downtime rule you want to work with. The Configuration Details page is displayed.
3. In the Scheduled Downtimes section, click New Rule. The New Downtime Rule dialog box is displayed.
4. Select one of the following actions from the list:
  - o **Stop (allows jobs to finish)** - At the specified time, prevents any new orchestration jobs from starting while allowing current jobs to finish processing. This action allows all jobs to end.
  - o **Stop (cancel running jobs)** - At the specified time, prevents any new orchestration jobs from starting and stops all currently running jobs. This action immediately stops all jobs.
  - o **Suspend** - At the specified time, prevents any new orchestrations from starting and pauses any jobs that are currently running. At the end of the scheduled downtime, the runtime processes the suspended job from the point it paused.
5. Specify the duration of the downtime by specifying a date and time for Start Downtime and End Downtime.
6. Optional: Select the Repeat option to create a repeat downtime rule.
  - a. Specify a repeat interval (numeric value).
  - b. Specify frequency from the list: Days, Weeks, Months, or Years.
7. Click Save.

## Results

---

The new downtime rule displays in the Scheduled Downtimes section and the Scheduled Downtime counter increases by one.

**Parent topic:** [Managing Cloud Instances](#)

## Edit Downtime Rules

---

### Procedure

---

1. From the Navigation pane, select Repository > Configurations. The Project Configurations page is displayed.
2. Click the project configuration, which contains the downtime rule you want to work with. The Configuration Details page is displayed.
3. In the Scheduled Downtime section, click the downtime rule you want to edit. The Edit Downtime Rule is displayed.
4. Select one of the following actions from the list:
  - o **Stop (allows jobs to finish)** - At the specified time, prevents any new orchestration jobs from starting while allowing current jobs to finish processing. This action allows all jobs to end.
  - o **Stop (cancel running jobs)** - At the specified time, prevents any new orchestration jobs from starting and stops all currently running jobs. This action immediately stops all jobs.
  - o **Suspend** - At the specified time, prevents any new orchestrations from starting and pauses any jobs that are currently running. At the end of the scheduled downtime, the runtime processes the suspended job from the point it paused.
5. Specify the duration of the downtime by specifying a date and time for Start Downtime and End Downtime.
6. Optional: Select the Repeat option to create a repeat downtime rule.
  - a. Specify a repeat interval (numeric value).
  - b. Specify frequency from the list: Days, Weeks, Months, or Years.
7. Click Save.

## Deleting Downtime Rules

---

### Procedure

---

1. From the Navigation pane, select Repository > Configurations. The Project Configurations page is displayed.
2. Click the project configuration, which contains the downtime rule you want to work with. The Configuration Details page is displayed.
3. In the Scheduled Downtime section, select the downtime rule you want to delete. The Delete Rules confirmation window is displayed.
4. Click Yes.

### Results

---

The downtime rule no longer displays.

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/CloudHelp/Managing\\_Orchestrations/toc\\_managing\\_orchestrations.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/CloudHelp/Managing_Orchestrations/toc_managing_orchestrations.html)

## About Orchestration Settings

---

Orchestration settings allow you to configure properties for individual orchestrations in a project configuration. For each orchestration you can specify whether the orchestration is enabled, the logging levels, logging behavior, and the maximum number of jobs that the orchestration can simultaneously run.

When a project configuration is undeployed you can edit the following orchestration settings:

Orchestration Settings	Description
Enabled	Indicates whether an orchestration is enabled and can be deployed. At least one orchestration in a project configuration must be enabled to deploy a project configuration. By default, all orchestrations in a project configuration are enabled.
Logging Level	Allows you to specify the level of orchestration details that are logged in the System Logs. <ul style="list-style-type: none"><li>• <b>None</b> - Orchestration status and activity are not logged.</li><li>• <b>Initial Values</b> - Only the initial values of orchestration variables are logged.</li><li>• <b>Initial and Error Values</b>- Both the initial values of orchestration variables and orchestration errors are logged.</li><li>• <b>Error Values</b>- Only orchestration errors are logged.</li><li>• <b>Inline</b> - Orchestration job details are logged for suborchestrations inline with the job details of the calling orchestration.</li><li>• <b>All</b>- The highest level of logging. All orchestration activity is logged.</li></ul>
Log Synchronously	Allows the runtime to synchronize the writing of orchestration events to the orchestration monitoring logs as the orchestration is running.  By default, this orchestration setting is disabled and orchestration jobs are not synchronously logged.  Note: When you enable this orchestration setting, the time it takes to process an orchestration job increases.
Max Simultaneous Job	Allows you to specify the number of orchestration jobs that can run simultaneously.

**Parent topic:** [Managing Orchestrations](#)

Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/CloudHelp/Managing\\_Orchestrations/aboutOrchestrationSettings.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/CloudHelp/Managing_Orchestrations/aboutOrchestrationSettings.html)

## Editing Orchestration Settings

---

## Before you begin

---

To edit orchestration settings, the project configuration must be undeployed.

Tenant administrators, environment administrators (for the environment where the project is published), and publisher of a project can edit its orchestration properties.

## About this task

---

Note: If you grant project configuration permissions to a group, the users in that group will have full access to the project configuration- the user will be able to create new versions of the project configuration, as well as edit and delete the project configuration.

## Procedure

---

1. Select the environment tab, where the project configuration is published.
2. From the navigation pane, select Repository > Configurations. The Project Configuration page is displayed.
3. If the project configuration you want to edit is running, stop the project configuration by clicking the Stop icon in the Actions column. When the Stop Configuration dialog box displays, click one of the following options:
  - o **Finish Jobs** - At the specified time, prevents any new orchestration jobs from starting while allowing current jobs to finish processing. Allow the jobs to end.
  - o **Cancel Jobs** - At the specified time, prevents any new orchestration jobs from starting and stops all currently running jobs. This action immediately stops all jobs.
4. Undeploy the project Configuration, by clicking the Undeploy icon in the Action Column.
5. Click the project configuration you want to edit. The Configuration Details page displays.
6. In the Orchestration section, click Edit to edit the orchestration settings. The Edit Orchestration Settings window is displayed.
7. Click Save.
8. Deploy the project configuration to begin processing orchestration jobs.

## Results

---

The updates you made display in the Orchestration section of the Configuration Details page and the runtime processes the orchestration as specified.

## About Naming Projects and Configurations

---

Project and project configuration names cannot be longer than 42 characters. When you create a project or project configurations avoid using the following list of reserved characters.

Reserved Characters	Description
&	ampersand
{ } [ ] < >	any brackets
*	asterisk
\	backslash
' ^ '	caret
:	colon
\$	dollar sign
/	forward slash
#	number sign
( )	parenthesis
	pipe
.	period
?	question mark
;	semicolon
	space
~	tilde

**Parent topic:** [Managing Projects](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Thursday, 2 June 2016

file:///dcs/markdown/workspace/Transform/out.html

## About Project Configurations

---

Project configurations allow you to create multiple variations of the same integration project, so you can create and publish one project and deploy it to many different scenarios. Within a project configuration you can specify which orchestrations are enabled, modify configuration properties for endpoints, generate or modify assets, manage scheduled downtime rules, and control permissions for the project configuration.

Each project you publish has a Default project configuration. In the Management Console, you can create additional project configurations. The project name, project version, configuration name, and project state uniquely identify each project configuration.

You must have Administrator privileges or be the publisher of the specific project to create, edit, and delete project configurations. Administrators and publishers can grant users and groups permissions that allow them to a create, edit, and delete project configurations.

## Enabling and Disabling Orchestrations

---

The runtime only runs orchestration jobs for enabled orchestration. Before you can deploy a project configuration, the project configuration must contain at least one enabled orchestration. By default, all orchestrations are enabled.

Specifying the orchestration logging level allows you to control the type of orchestration errors that are written to the system logs. The Management Console also allows you to limit the number of jobs that run simultaneously. The number of jobs that run simultaneously can affect performance.

You must have administrator or publisher permissions to specify orchestration properties.

## Understanding Configuration Properties

---

You create these configuration properties for a project in Studio. For more information about creating project properties and specifying a project version, see the Studio online help.

When you publish the project, you can specify values for the configuration properties. The values you specify for the configuration properties determine how the project is deployed. For example, in a project that contains database endpoints, you can create properties for database connection parameters. This allows you to create a project configuration for a test environment connecting to a test database and then use the same project to create another project configuration for a production environment that connects to another database.

You must have administrator or publisher permissions to edit configuration properties in the Management Console.

## Modifying Assets

---

If your project configuration contains a database or WebServices endpoint, you must generate assets before you can deploy the project configuration. If your project does not contain a database or WebServices endpoint, assets are irrelevant to your project configuration.

You must have administrator or publisher permissions to generate or modify assets.

## Scheduling Downtimes

---

Scheduling downtime allows you to perform maintenance. You can create downtime rules for project configurations that stop or suspend all enabled orchestration jobs in that project configuration for a specified duration of time. The project configuration does not have to be undeployed to create or edit a downtime rule. Downtime rules can occur once or repeat at specific intervals.

You must have administrator or publisher permissions to create, edit, or delete a downtime rule.

## Editing Project Configuration Permissions

---

As an administrator or project publisher, you can grant permissions for project configurations to other users and groups. When you grant users or groups permissions to a project configuration they are able to create, edit, and delete the project configuration. By default, permissions to project configurations are granted to only the Administrator Group. If you want to grant permissions to another group you must explicitly do so.

For example, you are a user with publisher rights and belong to the built-in Publisher group. You publish a project. Only the Administrator Group and you have permissions to the project configuration. Members of the Publisher group, of which you are a member, do not have permissions to the project configuration. You must edit the permission on the project configuration to include another group like Publisher. For more information, see [Granting Project Configuration Permissions](#).

[Feedback](#) | [Notices](#)

 Last updated: Thursday, 2 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/CloudHelp/Managing\\_Projects/aboutProjectConfigurations.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/CloudHelp/Managing_Projects/aboutProjectConfigurations.html)

## About Projects

---

Projects contain components that the runtime needs to execute an integration scenario: orchestrations, endpoints, maps, and other documents. Use Studio to create and test projects without being connected to an integration environment.

Multiple people can publish multiple projects to the same integration environment. Use Studio to publish projects to an integration environment or export projects to a staging location. You can later use the Management Console to upload the exported project. You must have Administrator or Publisher privileges to publish or upload a project to the integration environment.

When you publish a project from Studio, the Management Console displays the project with default project settings; creating a default project configuration. You can clone this default project configuration to create new project configurations, which you can configure for separate development and production environments.

Use the Studio to create projects and specify endpoint configurations properties and then use the Management Console to specify project configurations and deploy project configurations.

## Cloning Project Configurations

---

### Before you begin

You must have Administrator privileges or be the publisher of a project to clone project configurations.

### About this task

Project configurations contain properties and assets that you can configure in the Management Console to create multiple variations of the same integration project. When you create a new configuration you can choose to clone an existing project configuration. A cloned project configuration inherits all the configurations from the original project configurations. However, if you edit the original configuration project, the changes are not propagated to the cloned project.

Note: The project configuration you clone does not display on the Favorites view, unless you explicitly add the project configuration to the view.

### Procedure

1. From the Navigation pane, select Repository > Configurations. The Project Configurations page is displayed.
2. From the Configuration Filter list, select All. All project configurations display.
3. Locate the project configuration you want to clone.
4. Click the Clone icon . The Create Project Configuration dialog box is displayed.
5. Provide a unique name for the new project configuration.
6. Click OK.

## Results

---

The cloned project configuration is displayed on the Project Configurations page. The cloned project has all the same project configuration details as the original project configuration.

## Copying Projects

---

### About this task

---

The Management Console allows you to copy a project by assigning a new version number to an existing project.

### Procedure

---

1. Click the Modify tab. The Projects page is displayed.
2. Click the project you want to copy. The Copy Project dialog is displayed.
3. Enter a new project version. The version number can contain a decimal.
4. Click Save.

## Results

---

The copy of the project is displayed in alphabetical order in the Projects page.

## Creating Projects From Scratch

---

### About this task

---

You can create a project from scratch in the cloud.

### Procedure

---

1. Click the Create tab. The Solutions page is displayed.
2. Click Create One From Scratch. The Create Project dialog box is displayed.
3. Specify a unique project name.
4. Click Save. The project displays in the Projects page of the Modify tab.

## Results

---

You can now take edit, publish, delete or copy your project. Select the project to view the project details and assign permissions to your project. If you do assign permissions, click Save to save your updates.

Project details include the environment to which the project configuration was published, a timestamp of the last time you published the project, and the current state of the project configuration. For example: deployed.

## Creating Projects From a Template

---

### About this task

---

You can create a project from a template. Templates are stored in the Solutions Repository. All users can create a template solution and upload it to the Solutions Repository.

Note: Not all templates in the Solutions Repository are certified. The templates that are certified are denoted with a Cast Iron® logo.

### Procedure

---

1. Click the Create tab. The Solutions page is displayed.
2. Search for a template.
  - a. Select a source endpoint.
  - b. Select a target endpoint.
  - c. Click Search

You can also select the Keyword Search option to search for a template using a keyword.

3. Choose a template from the solutions that are returned. The template details are displayed.
4. Click Create a project based on this template. Studio Cloud opens and the wizard guides you through the process of creating your project.

## Deleting Project Configurations

---

## Before you begin

---

The publisher of a project configuration, the environment administrator, or tenant administrator can delete project configurations. The publisher of a project configuration can grant permissions that allow other users to delete his project configuration. The environment administrator can grant permissions that allow other users to delete any project configuration in the environment. The tenant administrator can grant permissions that allow other users to delete any project configuration in the tenant.

Project configurations must be undeployed before you can delete them.

## About this task

---

When you delete a project configuration, all monitoring history associated with the project configuration is also deleted.

## Procedure

---

1. Select the environment tab, where the project configuration is published. A list of project configurations is displayed in the Project Configuration section of the Dashboard.
2. Verify that the project configuration you want to delete is undeployed. The state displays in parentheses () at the end of the project configuration name. For example, (undeployed)
3. If the project configuration is in any other state but undeployed, undeploy the project configuration by clicking the Undeploy icon in the Actions column.
4. In the Actions column, click the Delete icon. The Delete Project Configuration dialog box is displayed.
5. Click Yes.

## Results

---

The project configuration is deleted and no longer available.

## Deploying Project Configurations

---

### Before you begin

---

To deploy or undeploy project configurations, you must have tenant administrator or environment administrator privileges, or be the publisher of the project configuration.

### About this task

---

The type of endpoint in an orchestration determines the steps you must complete to deploy a project configuration. A project configuration must contain at least one enabled orchestration before you can deploy the project configuration. If the orchestration contains a database or Web Services endpoint, you must also generate assets for the endpoints before you can deploy the project configuration.

By default, all the orchestrations in a project configuration are enabled. Therefore, if the orchestrations in a project configuration do not require additional configuration and do not access database or Web Services endpoints, you can deploy your project configuration by clicking the deploy icon next to the project configuration in any of the Project tabs. If your project configuration requires assets or additional configuration, see the following deployment procedure.

Note: A project configuration must be in the stopped state for you to undeploy the project configuration.

### Procedure

---

1. Select the environment tab to which you published your project.
2. In the Project Configuration section, select the project configuration you want to deploy. The Configuration Details page is displayed.
3. In the Orchestrations section, verify that at least one orchestration in the project configuration is enabled. Edit orchestration settings, as needed.

You cannot edit orchestration settings while a project configuration is running. Stop and undeploy the project configuration to edit configuration settings.

4. In the Properties section, edit configuration properties, as needed.

You cannot edit configuration properties while a project configuration is running. Stop and undeploy the project configuration to edit configuration settings.

5. If the project configuration contains a Database or Web Services endpoint, you must generate assets for these endpoints.
6. Optional: Add a schedule downtime rule.
7. Optional: Assign permissions for the project configuration, which specify which group of users can edit and deploy a project configuration. By default, tenant administrators, environment administrators, and the publisher of a project configuration can edit and deploy a project configuration.
8. If you assign permissions, click Save.
9. In the Summary section, click the Deploy icon  to deploy the project configuration.

### Results

---

The project configuration deploys, the runtime starts to process orchestration jobs, and the status is appropriately updated in the Summary section.

## Editing Project Configuration Properties

---

### Before you begin

---

You must have administrator or publisher permissions to edit configuration properties.

### About this task

---

You create configuration properties for an integration project in Studio, before you publish the project to an environment in the cloud. When you publish the project, you can specify values for the configuration properties. Configuration properties allow you to move a project configuration from a staging environment to a production environment.

For example, in a project that contains database endpoints, you can create properties for database connection parameters. This allows you to create a project configuration for a test environment connecting to a test database and then use the same project to create another project configuration for a production environment that connects to another database.

### Procedure

---

1. Select the environment tab, where the project configuration is published.
2. From the navigation pane, select Repository > Configurations. The Project Configuration page is displayed.
3. If the project configuration you want to edit is running, stop the project configuration by clicking the  Stop icon in the Actions column. When the Stop Configuration dialog box displays, click one of the following options:
  - o **Finish Jobs** - At the specified time, prevents any new orchestration jobs from starting while allowing current jobs to finish processing. Allow the jobs to end.
  - o **Cancel Jobs** - At the specified time, prevents any new orchestration jobs from starting and stops all currently running jobs. This action immediately stops all jobs.
4. Click the project configuration you want to edit. The Configuration Details page displays.
5. In the Properties section, click Edit to edit configuration property values.
6. Modify the configuration properties.
7. Click Save.

### Results

---

The Configuration Details page displays the updated configuration property values.

# Publishing Projects

---

## Before you begin

---

You must be a tenant administrator, environment administrator, or environment publisher to publish projects.

## About this task

---

Publishing a project uploads a project from Studio to a runtime environment.

## Procedure

---

1. In the Management console, select the Modify tab. The Projects page is displayed.
2. In the Actions column, click the Publish Project icon. A lists displays all the environments in the tenant.
3. Select the environment to which you want to publish the project.

## Results

---

A confirmation displays. The project is available in the environment you selected.

# Push WSDL from Cast Iron Project to API Management

---

## Before you begin

---

You need to have valid IBM ID account on Cast Iron Live & API management to use this feature.

## About this task

---

This topic details how you can quickly create API in IBM API Management from WebSphere Cast Iron Project (WSDL) in a seamless manner.

## Procedure

---

1. Login to Cast Iron Live using your IBM ID.
2. Go to your Project configuration screen, click on the project which needs to be published to IBM API Management. This displays the Configuration Details of the project to be published.
3. Click on the Asset and select the orchestration whose WSDL need to created as API in IBM API Management.
4. Click on Push to API Management button at the bottom of the screen. Click OK in the popup confirmation window.

## Results

---

A new tab on your browser opens with the newly created API.

# Stopping Project Configurations

---

## About this task

There are two ways to stop a running project configuration:

- **Stop (allows jobs to finish)** - When you click Finish Jobs, prevents any new orchestration jobs from starting while allowing current jobs to finish processing. This action allows the Integration Appliance to end.
- **Stop (cancel running jobs)**- When you click Cancel Jobs, this option prevents any new orchestration jobs from starting and stops all currently running jobs. This action immediately stops all jobs.

## Procedure

1. From the Project Configurations page, select a project configuration.
2. In the Actions column, click the Stop icon . The Stop Configuration window is displayed.
3. Click either Finish Jobs or Cancel Jobs to stop the project configuration.

**Parent topic:** [Managing Projects](#)

# Uploading Project Configurations

---

## Before you begin

To upload a project configuration, you must have tenant administrator, environment administrator, or environment publisher permissions.

## About this task

When you upload a project configuration, you are publishing a project using a two-stage process. First, you export a project from Studio to an intermediate location. Then from the Management Console, you upload the project to a cloud environment.

## Procedure

---

1. Select the environment tab, to which you want to upload the project configuration.
2. From the Navigation pane, select Repository > Upload Project. The Upload Project Configuration dialog box is displayed.
3. In the Local Project File field, specify the path from which to upload the project. You can click Browse to select a file from your local machine.
4. Specify a project name. The name should not exceed 42 characters and should not contain any restricted characters.
5. Specify a product version number. This field is not populated with the project version you specified in Studio. However as a best practice, you should specify a project version that matches the version you specified in Studio.
6. Click Upload.

## Results

---

The project configuration is displayed in the cloud environment Project Configuration page.

## Working with Project Configurations

---

Various views are available for project configurations:

- **All** - Displays the deployment state and status of all project configurations, regardless of the state of the project configuration. You can clone or delete project configurations from this view.
- **Recent** - Displays the deployment state and status of the most recently published or modified project configurations. You can clone or delete project configurations from this view.
- **Favorites** - Displays the deployment state and status of project configurations for which you have permissions. By default, this view is not populated. You must explicitly add project configurations from either the Recent view or All view.

You can access these views from the Dashboard or by selecting the following path in the Navigation pane: Repository > Configurations. The Configuration Filter allows you to choose your view from a drop-down list.

The following table describes information available in the various project configuration views:

Columns in Project Configuration Views	Descriptions
Configuration	Displays published project configurations.
Running	Displays the number of currently running jobs for the project configuration.
Completed	Displays the number of orchestration jobs, for the project configuration, that were completely processed.  When orchestration monitoring data is purged, the number of orchestration jobs is reset to 0. For more information about modifying log purging parameters, see the purging help topics.
Errored	Displays the number of orchestration jobs where a runtime error occurred for the project configuration.  When orchestration monitoring data is purged, the number of orchestration jobs is reset to 0. For more information about modifying log purging parameters, see the purging help topics.

Columns in Project Configuration Views	Descriptions
Total	<p>Displays the total number of orchestration jobs, for the project configuration, that have run.</p> <p>When orchestration monitoring data is purged, the number of orchestration jobs is reset to 0. For more information about modifying log purging parameters, see the purging help topics.</p>
Actions	<p>Displays the state of project configurations, as well as options for you to delete  or clone  project configurations.</p> <p>  Clicking this icon deploys and runs a project configuration.   Clicking this icon causes the runtime to suspend the orchestration job processing of the project configuration.   Clicking this icon undeploys a project configurations. You must stop the project configuration before you can undeploy the project configuration.   Clicking this icon stops the runtime from processing orchestration jobs for the project configuration.  When you stop a project configuration, you can choose to have the runtime completely process all currently running jobs or have the runtime cancel all currently running jobs.   Only available in All and Recent views. Clicking this icon adds the project configuration to Favorites.  When the Management Console displays the project configuration in Favorites, this icon is no longer active next to the project configuration in the All and Recent views.   Clicking this icon removes the project configuration from Favorites, but does not delete the project configuration from the environment. You can view the project configuration from the All and Recent views. </p>

## About Environment Dashboards

---

An environment dashboard provides multiple snapshot views of project configurations and jobs, a list of unresolved critical system errors, and an overall project configurations summary, and status of Secure Connectors. The Dashboard also allows you to search for orchestration jobs by job key. The Search box is located in the Results section of the dashboard.

To expand the views of the Critical Alerts and Secure Connector Summary, click the icon in the upper right corner. An expanded view of Project Configuration is available by selecting Repository > Configurations from the navigation pane. An expanded view of Results is available by selecting Repository > Job Log from the navigation pane.

A dashboard is available for each environment in a multi-environment cloud. The information the dashboard displays is specific to its environment.

## Choosing a Notification Level

---

Notification levels define the severity of events that can trigger an alert. When you specify a notification level, an alert is only sent for errors that meet or exceed the level you choose. 

Note: If you do not receive notifications for events, it might be that you do not have the system log level set to produce entries that would trigger a notification. For example, if you chose the Error level for Deployment, all events that were Error or Critical level in the Deployment system are logged.

You can specify the following notification levels:

Notification Level	Description
Critical	Sends an alert when an error condition causes the a shutdown.
Error	Sends an alert when non-critical issues that must be handled immediately occur.
Warning	Sends an alert when potential error conditions occur.
Info	Sends an alert for informational usage.

# Creating Notification Policies

---

## About this task

---

Notification policies allow you to monitor potential errors in a specific system. When you create a notification policy, the notification policy monitors the system log for the system you specify. When a system log event occurs that meets or exceeds the notification level of a notification policy, an alert is sent to the specified users.

Note: If you do not receive notifications for events, it might be that you do not have the system log level set to produce entries that would trigger a notification or you did not enable the notification policy. For more information about specifying system log settings, see [Specify System Log Settings](#). For more information about enabling email notification policies, see [Enabling Email Notification Policies](#).

## Procedure

---

1. Click the environment for which you will create a notification policy. The Navigation pane is displayed.
2. Select Logs > Notifications. The Notifications page is displayed.
3. Click New Policy. The New Policy dialog box is displayed.
4. Specify a policy name.
5. From the Level Exceeds list, select a level. Alerts are only sent for errors that exceed the level you choose.
6. From the With System list, select the system you want the notification policy to monitor.
7. Specify the email address or addresses of the person or people that will receive the email notification. When you have multiple email addresses, add one email address per line.
8. Click Save.

## Results

---

The new policy displays on the Notifications page. You must enable email notifications before any alerts can be sent. If the Email status displays as (inactive), email notifications are not enabled.

**Parent topic:** [Monitoring](#)

---

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/CloudHelp/Monitoring/deletingNotificationPolicies.html>

## Editing Notification Policies

---

### Procedure

1. In the Navigation pane, select Logs > Notifications. The Notifications page is displayed.
2. Click a notification policy. The Edit Policy dialog box is displayed.
3. Update the appropriate notification settings.
4. Click Save.

### Results

---

The updated policy is displayed on the Notifications page. You must enable email notifications before any alerts can be sent. If the Email status is displayed as (inactive), email notifications are not enabled.

**Parent topic:** [Monitoring](#)

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/CloudHelp/Monitoring/editingNotificationPolicies.html>

## Enabling Email Notification Policies

---

### About this task

---

When you create an email notification policy, you must enable the email notification policy for alerts to be sent. By default, email notifications are not enabled.

If you enable email notification policies, the settings you specified when you created the email notification determine when an email alert is sent.

Note: If you disable the email notification policy by clearing the Enable Email option, alerts are not delivered for any email notification policy.

### Procedure

---

1. Click the environment for which you will enable an email notification policy. The Navigation pane is displayed.
2. Select Logs > Notifications. The Notifications page is displayed.
3. At the top of the page, click the Email link. The Enable Email option is displayed.
4. Select the Enable Email option.
5. Optional: Provide a email subject line that will qualify the alert sent.
6. Click Save.

### Results

---

The Notifications page is displayed with the new policy and the Email status changes from (Inactive) to (Active). Email notifications will now be sent when an event that triggers the notification policy occurs.

## Searching for Orchestration Jobs

---

### About this task

Job IDs and keys allow you to search for orchestration jobs. You define primary message keys in Studio, when you configure connectors. The primary message key must be a unique value. For example, the purchase order number for a purchase order message. If you do not define a primary key, the runtime uses the job ID, a unique number that the runtime generates, to identify an orchestration job.

From the Management Console, you can search orchestration jobs by job ID. By default, the Management Console searches only for completed orchestration jobs that match the job ID you specify. Use the Advanced Search option to search for all other orchestration jobs.

### Procedure

---

1. From the navigation pane, select Dashboard.
2. In the Results section, enter a job ID in the Key Search field.
3. From your keyboard, press Enter. The completed job with the matching job ID displays.

**Parent topic:** [Monitoring](#)

## Using Advanced Search

---

### About this task

Use the Advanced Search option to further refine your job search. If you enter values for multiple fields in the Advanced Search box, the Management Console uses AND logic to refine the search.

For example, you specify a time range in addition to selecting the errored status. The Management Console searches for all orchestration jobs that had an error within the time range specified.

Note: If you choose to search by date and time, you must specify a start and end date and time.

### Procedure

---

1. From the navigation pane, select Dashboard.
2. In the Results section, select an orchestration. The Orchestration Details page displays all the jobs associated with the orchestration.
3. In the Advanced Search box, specify values for Job ID, Key, Status, Start Date and Time, or End Date and Time as appropriate for your search.  
Note: If you choose to search by date and time, you must specify a start and end date and time.
4. Click Search.

## Results

---

The search results are displayed in the table.

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/CloudHelp/Monitoring/searchingOrchestrationJobs.html>

## Viewing Orchestration Job Logs

---

The Dashboard displays information about orchestration jobs, including status, timestamp of job events, and key/job ID in multiple tabs:

- **All** - displays orchestration job information for all project configurations.
- **Recent** - displays orchestration job information for the most recently published or modified project configurations.
- **Favorites** - displays orchestration job information for the project configurations displayed in the Favorites filter. Orchestration job information displayed through this filter also displays in the Recent and All filters.

In some cases, the Management Console displays an orchestration job status of Unknown, even though the orchestration job completed successfully. Rebooting the environment, while orchestration jobs are processing, can result in the Unknown status because monitoring data is lost during the reboot. Stop all orchestration jobs before rebooting the environment to avoid an Unknown status.

Click an orchestration job to view the orchestration details for that orchestration. The Orchestration Details page displays all the jobs associated with the orchestration you selected and the status of each individual job. Use the Left and Right arrows (<< , < , > , >>) to view all orchestration jobs.

**Parent topic:** [Monitoring](#)

## Sorting Orchestration Jobs

---

### About this task

You can search orchestration jobs by job ID. To sort orchestration jobs by project configuration name, orchestration name, status, time, or job ID click the appropriate column header.

## About Built-In Groups

---

Built-in groups are predefined groups. In the cloud, in addition to a tenant administrator group, each environment has a built-in administrator, publisher, and user group.

For example: A tenant, named Cumulus, is created for your organization. Within this tenant there are two environments: Development and Production. The following built-in groups would be available:

- admin [cumulus.com]
- admin [Development]
- publisher [Development]
- user [Development]
- admin [Production]
- publisher [Production]
- user [Production]

The same user can be a part of multiple groups. You can assign users to a built-in group or create a new group.

Note: If you grant project configuration permissions to a group, the users in that group will have full access to the project configuration- the user will be able to create new versions of the project configuration, as well as edit and delete the project configuration.

The following list defines the permissions granted to each of the built-in groups:

- **Tenant Administrator Group.** Provides privileges to all environments, users, groups, and projects in a specific tenant. Permits users to create, edit, and delete users and custom groups in the tenant. Users in this group can add and delete users to and from any built-in or custom group in the tenant. Users in this group can view, edit, and delete permissions for all source projects in the tenant.

Users in this group can view all the environments in the tenant and have all the permissions of an environment administrator in each of the tenant environments.

- **Environment Administrator Group.** Provides privileges to all users, groups, and projects in a specific environment. Permits users to create, edit, and delete users and custom groups in a specific environment. Users in this group can add and delete users to and from any built-in or custom group in the environment.

Environment Administrators can also create and deploy project configurations for project that any environment publisher publishes, and view orchestration job details for any project configuration in the environment. With environment administrator group privileges you can edit permissions that publishers for the same environment set for their individual project configurations.

Even though members of the Environment Administrator group have Environment Publisher group and Environment User group privileges, the members of the Environment Administrator Group do not appear in other groups in the same environment until you explicitly add the user.

- **Environment Publisher Group.** Provides project privileges in a specific environment. Permits users to create, deploy, or delete project configurations for any project that they publish in the environment. Users in this group can also start and stop orchestrations and view orchestration job details for project configurations they deployed in the environment. As an environment publisher, you can grant permissions for individual project configurations you create to another user with environment publisher privileges for the same environment.

The members of the Environment Publisher Group are not displayed in the Environment User Group, until you explicitly add the user.

- **Environment User Group.** Permits users to monitor alerts and orchestrations in a specific environment. Users in this group can create and edit projects; however, they cannot publish the project to an environment. You must have Publisher privileges for the specific environment to which you want to publish a project. All users are automatically members of the Environment User group.

In a multi-environment tenant, users in this group only see the environment tab for environments of which they are a member. For example, a tenant has a Development, a Staging, and a Production environment. The tenant administrator or administrator of the Development environment adds a user to the User [Development] group. When the user logs in to the tenant, the user can only see the Development environment, even though the tenant has two other environments.

**Parent topic:** [Permissions](#)

## About Libraries Environments

---

Libraries Environment is a user profile parameter that specifies the environment from which Studio retrieves connector libraries.

In a multi-environment tenant, each environment can potentially have different versions of connector libraries installed. Setting this parameter points Studio to the libraries you want to use while verifying your projects. This parameter is not as critical if your project does not use an endpoint that requires additional libraries to be installed. See the Connector Release Notes for a complete list of endpoints that require you to install additional libraries.

Note: The environment you select should match the environment of the primary group the user is a member of. For example: If you select the Development environment as the Libraries Environment, you should be a member of groups in the Development environment.

## About User Profiles

---

A user profile provides a summary of user details, such as: name, display name, email, and group memberships. The user profile displayed is for the user currently logged in to the Management Console.

From the User Profile window, you can change the user password and specify libraries environments.

**Parent topic:** [Permissions](#)

## Accessing User Profile Information

---

### Procedure

1. Click your username in the upper right corner of the Management Console. The User Profile window is displayed.

2. Optional: Click Change Password, to change the user password.
3. Optional: Click Change Libraries Environment, to specify the environment from which Studio retrieves connector libraries.
4. Click Save to save any updates to the user profile.
5. Click Close to close the User Profile window.

## Changing Your Password

---

### About this task

You can change your own password at anytime. However, to modify another user's password, you must have tenant administrator permissions. Environment administrators cannot change passwords for users in their environment.

For example, you are the administrator for the Development environment. You can change your password, but you cannot change the password for any specific user with permissions to the Development environment.

### Procedure

1. Click your username in the upper right-hand corner of the Management Console. The User Profile window is displayed.
2. Click Change Password.
3. Enter values for the Old Password, New Password, and Confirm Password fields.

If you clear the Hide Password Text option, your password displays and is no longer encrypted.

4. Click Save to change your password.

### Results

---

A confirmation message is displayed when the Management Console has successfully saved the new password.

**Parent topic:** [Permissions](#)

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/CloudHelp/Permissions/changingPassword.html>

## Changing User Passwords

---

### About this task

---

You can change your own password at anytime. However, to modify another user's password, you must have tenant administrator permissions. Environment administrators cannot change passwords for users in their environment.

For example, you are the administrator for the Development environment. You can change your password, but you cannot change the password for any specific user with permissions to the Development environment.

To change another user's password:

### Procedure

---

1. Log in to the Management Console as the tenant administrator.
2. Select Setup > Users and Groups.
3. Click the name of the user whose password you want to change.
4. In the Edit User window, enter a password and confirm the password.

If you clear the Hide Password Text option, your password displays and is no longer encrypted.

5. Click Save to change your password.

### Results

---

A confirmation message displays when the Management Console has successfully saved the new password.

## Creating New Groups

---

### Before you begin

---

In the cloud, only the tenant admin user can create new groups. In a multi-environment tenant, environment administrators can also create new groups for their specific environment.

On a physical or virtual Integration Appliance, only admin users can create new groups.

### Procedure

---

1. In the Management Console, login as administrator.
2. Select Setup > Users and Groups.
3. In the New Group dialog box, enter a Name and Display Name for the new group.

4. From the Scope list, select the scope of permissions you want to grant the group. You can select to give permissions to the entire tenant or to a specific environment.
5. In the User list, select the users to join the group.

Select the User checkbox to select all the users in the list.
6. Click Save.

## Results

---

In the Groups section of the Users and Groups page, the new group is displayed in alphabetical order.

**Parent topic:** [Permissions](#)

---

## Creating New Users

---

### Before you begin

In the cloud, only the tenant admin user can create new users. In a multi-environment tenant, environment administrators can also create new users for their specific environment.

On a physical or virtual Integration Appliance, only admin users can create new users.

### Procedure

---

#### 1. Tenant migrated from v7.0

- a. In the Management Console, login as administrator.
- b. Select Setup > Users and Groups.
- c. In the New User window, enter a value for the following fields: Name, Display Name, Email, Password, and Confirm Password.

Specify the user name without the @tenantname as that will be appended by default.

If you clear the Hide Password Text option, your password displays and is no longer encrypted.

- d. From the Libraries Environment list, select the environment from which the user's projects can retrieve additional libraries and files for endpoints. The environment you select should match the environment of the primary group the user is a member of. For example: If you select the Development environment as the Libraries Environment, you should be a member of groups in the Development environment.
- e. In the Groups list, select all the groups to which the new user will have access.
- f. Optional: Clear the Active checkbox. If you clear this option, the user cannot log in to the Management Console.
- g. Click Save.

#### 2. New v7.5 Tenant with 'My IBM Cloud' link

##### a. Users who neither have an existing Cast Iron account nor any other IBM subscription

- i. In the Management Console, login as administrator.
- ii. Click My IBM Cloud > Manage Users > Add User Account.
- iii. In the Add User window, enter a value for the following fields: IBM ID, First Name, Last Name.  
Note: Specify a valid IBM ID in the IBM ID field.
- iv. Choose the Account Administrative Role to be Administrator.
- v. Click Save.

##### b. Users who do not have an existing Cast Iron account but have some other IBM subscription

- i. In the Management Console, login as administrator.
- ii. Click My IBM Cloud > Services > Invite User.
- iii. In the Invite User window, enter a value for the following fields: First Name, Last Name, Email.

- Note: If the Email is not a valid IBM ID, the IBM ID will be created and the user will need to set the password for it at the time of activation.
- iv. Choose the Account Administrative Role to be Administrator.
  - v. Click Invite.
- c. **Users with an existing Cast Iron account**
- i. In the Management Console, login as administrator.
  - ii. Select Setup > Users and Groups.
  - iii. In the Add User window, enter a value for the following fields: Name, Display Name, Email.  
Note: Specify a valid IBM ID in the Name field.
  - iv. From the Libraries Environment list, select the environment from which the user's projects can retrieve additional libraries and files for endpoints. The environment you select should match the environment of the primary group the user is a member of. For example, if you select the Development environment as the Libraries Environment, you should be a member of groups in the Development environment.
  - v. In the Groups list, select all the groups to which the new user will have access.
  - vi. Clear the Active checkbox. If you clear this option, the user cannot log in to the Management Console.
  - vii. Click Save.
3. **New v7.5 Tenant without the 'My IBM Cloud' link**
- a. In the Management Console, login as administrator.
  - b. Select Setup > Users and Groups.
  - c. In the Add User window, enter a value for the following fields: Name, Display Name, Email.  
Note: Specify a valid IBM ID in the Name field.
  - d. From the Libraries Environment list, select the environment from which the user's projects can retrieve additional libraries and files for endpoints. The environment you select should match the environment of the primary group the user is a member of. For example: If you select the Development environment as the Libraries Environment, you should be a member of groups in the Development environment.
  - e. In the Groups list, select all the groups to which the new user will have access.
  - f. Optional: Clear the Active checkbox. If you clear this option, the user cannot log in to the Management Console.
  - g. Click Save.

## Results

---

In the Users section of the Users and Groups page, the new user is displayed in alphabetical order.

## Granting Project Configuration Permissions

---

### Before you begin

You must have Administrator privileges or be the publisher of a project to grant permissions to other users or groups to create, edit, or delete project configurations.

### About this task

---

Once you grant permissions to a user or group, they can edit or delete the project configuration. By default, permissions to project configurations are granted to only the Administrator Group. If you want to grant permissions to another group you must explicitly do so.

For example, you are a user with publisher rights and belong to the built-in Publisher group. You publish a project. Only the Administrator Group and you have permissions to the project configuration. Members of the Publisher group, of which you are a

member, do not have permissions to the project configuration. You must edit the permission on the project configuration to include another group like Publisher.

## Procedure

---

1. Click on a project configuration. The Configuration Details page is displayed.
2. In the Permissions section, select users and groups to grant permissions to.
3. Click Save.

## Results

---

All the users and groups you select now have full access to the project configuration. These users and groups can now create new project configurations, edit the project configuration and any new project configurations they create, and delete the source project.

## Using Secure Connectors

---

Using Secure Connectors topics provide information about creating, installing, and managing Secure Connectors.

- [About Secure Connectors](#)  
This topic provides information about minimum system requirements needed to use a Secure Connector.
- [Creating Secure Connectors](#)  
This topic provides information about creating Secure Connectors.
- [Downloading Secure Connector Configuration Files](#)  
How to download Secure Connector configuration files.
- [Installing Secure Connectors](#)  
Provides the procedures to download the Secure Connector installer and install the Secure Connector.
- [Adding or importing certificates to the Secure Connector TrustStore/KeyStore](#)  
For Cast Iron connector activities, such as HTTP, FTP, Email, or Web Services (or any other connector) that need to establish connection with the SSL enabled server (HTTPS/FTPS), you must import the corresponding certificates into the TrustStore or KeyStore of the Secure Connector.
- [Installing Vendor Supplied Libraries for Secure Connectors](#)  
Certain endpoints require additional libraries to be installed before the Secure Connector can communicate with them. This section provides information about using the Cloud Management Console to install these vendor supplied libraries. For a complete list of connectors that require vendor supplied libraries, open the Update Connector Libraries page in the Cloud Management Console.
- [Downloading and installing the SAP Jar Files and DLLs](#)  
To connect to an SAP system from studio, you must install SAP DLLs and jar files onto your Windows development machine. You must have the SAP login credentials to enter the SAP Support Portal and download the files.
- [Uninstalling Secure Connectors \(Windows\)](#)  
This topic provides information about uninstalling a Secure Connector from a Windows machine.
- [Uninstalling Secure Connectors \(Linux\)](#)  
This topic provides information about uninstalling a Secure Connector from a Linux machine.
- [Starting and Stopping Secure Connectors](#)  
Starting and Stopping Secure Connectors topics provide information about starting and stopping Secure Connectors on Windows and Linux machines. For Windows machines, options you chose during installation affect how you can start and stop Secure Connectors. If you installed the Secure Connector as an automatic Windows Service, as recommended, then you can use the Windows Services control panel to stop and start the Secure Connector. If you installed the Secure Connector as a Windows application, then you can start and stop the Secure Connector using Windows Start menu shortcuts or desktop

shortcuts. For Linux machines, you can start and stop Secure Connectors by using a graphical interface or by running commands from the command line.

- [Upgrading Secure Connectors](#)

This topic provides information about upgrading Secure Connectors.

- [Updating Secure Connector Configuration](#)

This topic provides information about updating Secure Connector configuration.

- [Troubleshooting Secure Connectors](#)

This topic provides potential solutions for issues you have with the Secure Connector.

## About Secure Connectors

---

A Secure Connector facilitates the secure transfer of data between the IBM® WebSphere® Cast Iron® Cloud and an endpoint located behind a firewall. The Secure Connector installer for appliance supports both 32-bit and 64-bit Windows and Linux machines.

To enable a Secure Connector a tenant administrator must complete the following tasks:

- Create a Secure Connector.
- Download the Secure Connector configuration file.
- Launch the Secure Connector installer.
- Install vendor supplied libraries.

**Parent topic:** [Using Secure Connectors](#)

## Secure Connector Minimum Requirements

---

This topic provides information about minimum system requirements needed to use a Secure Connector.

You can run the Secure Connector on the following operating systems:

- Microsoft Windows 7
- Microsoft Windows 8
- Microsoft Windows 2008
- Microsoft Windows 2012 R2 64 bit server
- Linux (RHEL 6.5, Ubuntu 14.04)

Note: For installing Secure Connectors on Linux platform, use xWindows or KDE environment to use the GUI option.

The Secure Connector has the following minimum system requirements:

- 1 GHz CPU

- 2 GB RAM
- Java 1.7 and above.

## Creating Secure Connectors

---

This topic provides information about creating Secure Connectors.

### About this task

---

Use the Management Console to create a Secure Connector for your environment.

After you create a Secure Connector in the cloud, you must configure a machine behind the firewall to facilitate communication between the Secure Connector and a specific endpoint behind the firewall. Use the Secure Connector installer to configure the machine behind the firewall.

Note: If the endpoint you are creating a Secure Connector for requires additional libraries, use the Management Console to install the libraries before you deploy any project configurations that use the Secure Connector.

### Procedure

---

1. From the Navigation pane of an environment tab, select System > Secure Connector.
2. Click New Secure Connector. The Create Secure Connector dialog box is displayed.
3. Provide a name for the new Secure Connector.
4. Provide a brief description of the Secure Connector.
5. Click Save. The Secure Connector is displayed in the Secure Connector page.

**Parent topic:** [Using Secure Connectors](#)

---

## Downloading Secure Connector Configuration Files

---

How to download Secure Connector configuration files.

### About this task

---

When you download a configuration file, the configuration file is saved to your default download directory. You can choose to save configuration files to different locations. Regardless of the number of configuration files you download, you can only use one configuration file during the Secure Connector installation process.

Once you select a configuration file to set up a Secure Connector, that configuration file will be used to configure any subsequent Secure Connector. It is not recommended to configure multiple Secure Connectors using the same configuration file. Instead, use a new configuration file or modify the existing configuration file. The Gateway, Listen to Port, and Transmit to Port parameters should have unique values for each Secure Connector.

The Secure Connector configuration file provides the Secure Connector installer with values for the following parameters:

- **Secure Connector Name** - Specify the name of the Secure Connector you created.
- **Tenant ID** - Specify the hexadecimal UUID for the tenant. You can retrieve this information by logging in to the cloud and selecting Setup > Support Information. The Support Information page is displayed. Copy the Identifier column value for the tenant. You can copy the value by selecting the cell value, right-clicking, and selecting copy from the menu.
- **Environment ID** - Specify the hexadecimal UUID for the environment. You can retrieve this information by logging in to the cloud and selecting Setup > Support Information. The Support Information page is displayed. Copy the Identifier column value for the environment where you want the Secure Connector installed. You can copy the value by selecting the cell value, right-clicking, and selecting copy from the menu.
- **Cloud Gateway** - Specify the gateway name.
- **Listen on Port** - Only modify this parameter if another service is using the port specified or you want to run multiple Secure Connectors on the box.
- **Transmit on Port** - Only modify this parameter if another service is using the port specified or you want to run multiple Secure Connectors on the box.
- **Secure Connector Auth Key** - Specify the Auth key from the Secure Connector you created in the cloud.
- **Secure Connector Private Key** - Specify the Auth private key, which you downloaded while creating the Secure Connector in the cloud.

## Procedure

---

1. Log into the Cloud Management Console as the tenant administrator.
2. From the Navigation pane of an environment tab, select System > Secure Connector.
3. In the Secure Connector window, click the Secure Connector that will communicate with an endpoint behind the firewall. The Edit Secure Connector dialog box is displayed.
4. Click Download Secure Connector Configuration and click Download now. The Opening Secure Connector Configuration dialog box is displayed.
5. Choose Save File and click OK. The configuration file is saved to the default download directory of the current user.

## Installing Secure Connectors

---

Provides the procedures to download the Secure Connector installer and install the Secure Connector.

### Before you begin

---

For Windows installations, verify that you do not have an existing version of the Secure Connector installed. If you have an earlier version installed, you can upgrade it to the latest version using the Upgrade option. For more information about upgrading Secure Connectors, see [Upgrading Secure Connectors](#).

For Linux installations, while it is not required, it is good practice to uninstall previous Secure Connector installations.

For Linux machines, install a desktop environment, such as GNOME or KDE, to provide a graphical interface.

### About this task

---

After you create a Secure Connector in the cloud, you must configure a machine behind the firewall to facilitate communication between the Secure Connector and a specific endpoint behind the firewall. Use the Secure Connector installer to configure the machine behind the firewall.

Note: The machine on which you choose to run the installer must have access to the endpoint. You do not have to run the installer on the same machine as the endpoint.

**To download the Secure Connector installer:**

1. Log on to the Cloud Management Console as the tenant administrator. The Home page is displayed.
2. Click one of the environment tabs, that is, Development, Staging, and Production.
3. From the Navigation pane of the selected environment tab, click System > Secure Connector.
4. In the Secure Connector window, if you have already created a Secure Connector, click the Secure Connector that will communicate with the endpoint behind the firewall. The Edit Secure Connector dialog box is displayed.  
Note: If there are no Secure Connectors available in the Secure Connector window, create a new Secure Connector. For more information about creating a Secure Connector, see [Creating a Secure Connector](#).
5. Click Download Installer and choose the operating system of the machine to which the installer is downloaded: Windows or Linux.
6. Click Save File. The file is saved to the default download directory.

**To install the Secure Connector:**

1. Launch the Secure Connector installer you downloaded.
  - o windows-secure-connector-installer.exe (for 32-bit Windows machine)
  - o windows-secure-connector-installer\_64 (for 64-bit Windows machine)
  - o linux-secure-connector-installer.sh (for 32-bit Linux machine)
  - o linux-secure-connector-installer\_64.sh (for 64-bit Linux machine)

The Secure Connector Installer Wizard is displayed.

2. Select the Install option.
3. Click Next then read and accept the licensing agreement.
4. Click Next and choose an installation directory.
5. Click Next. A message window states the location where the target directory will be created.  
Note: If an install directory exists, a warning message displays and you must confirm that you want to install and overwrite existing files.
6. Click OK.
7. Set up shortcut options to start, stop, and edit a Secure Connector.
  - a. Select one or both of the following options:
    - Create shortcuts in the Start menu.
    - Create additional shortcuts on the desktop.
  - b. Select a program group from which you will access the shortcuts.
  - c. Choose to create shortcuts for the current user or all users.
8. Click Next. The installation progress is displayed.
9. Select a Secure Connector configuration file. If you have not already downloaded a Secure Connector configuration file, download one now. For more information about how to download Secure Connector configuration files, see [Downloading Secure Connector Configuration Files](#).
10. Click Next.
11. For Windows installation, choose to install and run the Secure Connector as a Windows Service. If you choose to install the Secure Connector as a Windows Service, you can control the Secure Connector using the Windows Services control panel (recommended). If you choose not to install and run the Secure Connector as a Windows Service, then the Secure Connector is installed as a Windows application. To run the Secure Connector as a Windows Service, you must specify the following service account information:
  - o Service Start Mode
  - o Service Account Domain
  - o Service Account User
  - o Service Account Password
12. Click Next. The installation is complete.
13. Click Done.

Note: If your endpoint, for example, SAP, requires additional libraries, you must install the additional libraries before you start the Secure Connector. For more information about installing additional libraries, see [Installing Vendor Supplied Libraries for Secure Connectors](#).

**Parent topic:** [Using Secure Connectors](#)

## Adding or importing certificates to the Secure Connector TrustStore/KeyStore

---

For Cast Iron connector activities, such as HTTP, FTP, Email, or Web Services (or any other connector) that need to establish connection with the SSL enabled server (HTTPS/FTPS), you must import the corresponding certificates into the TrustStore or KeyStore of the Secure Connector.

### Procedure

1. Use the Java keytool utility to import the required certificates to TrustStore(cacerts) or KeyStore(cert) in the path mentioned:  
`<secure_connector_install_directory>\etc\security`
2. Restart Secure Connector for the changes to take effect.

**Parent topic:** [Using Secure Connectors](#)

## Installing Vendor Supplied Libraries for Secure Connectors

---

Certain endpoints require additional libraries to be installed before the Secure Connector can communicate with them. This section provides information about using the Cloud Management Console to install these vendor supplied libraries. For a complete list of connectors that require vendor supplied libraries, open the Update Connector Libraries page in the Cloud Management Console.

### About this task

If your integration project uses a connector that requires additional libraries, you must install the additional libraries before you deploy the project configuration. Deploying the project configuration before installing the additional libraries generates runtime errors. For a complete list of connectors that require vendor supplied libraries, open the Update Connector Libraries page. See the following procedure.

If you have a multi-environment tenant, you must install the 3rd party libraries in each environment where you deploy a project configuration with a connector that requires the additional libraries.

For example, you have a tenant with three environments: Development, Staging, and Production. You publish a project configuration for an SAP endpoint in the Development and Production environments. Before you can deploy the project configuration, you must install additional SAP libraries on both the Development and Production environments. For more information about installing SAP libraries, see [Downloading and installing the SAP Jar Files and DLLs](#).

### Procedure

1. Click an environment tab.
2. Select System > Connector Libraries to open the Update Connector Libraries page.
3. In the Connector column, select the connector for which you want to install additional files.

Any files that have already been installed display in the Installed Files column.

4. Click the (+) icon and select the library file or files to upload. In the cloud, .jar and .dll are valid library files types. The files you select display in the Files to Add column.
5. Click Update.

The files that display in the Files to Add column are not committed until you click Update. If you click Reset before you click Update, the Cloud Management Console does not add the files you uploaded. If the Cloud Management Console times out before you click Update and commit the added files, repeat the last two steps.

6. In the same environment tab, select: System > Secure Connectors.
7. Click Download Libraries and save the libraries.zip file to your workstation.
8. Unzip the libraries.zip file and find a \*.tp-1.0.0.jar for each connector module.
9. Use the .jar files in the libraries.zip to replace the files in the Secure Connector install directory: lib/plugins.
10. Copy all the remaining .zip files to following Secure Connector install directory: lib/thirdparty
11. Restart the Secure Connector by running one of the following files from a command line:
  - o For Windows: runclient osgi.bat
  - o For Linux: runclient osgi.sh

## Downloading and installing the SAP Jar Files and DLLs

---

To connect to an SAP system from studio, you must install SAP DLLs and jar files onto your Windows development machine. You must have the SAP login credentials to enter the SAP Support Portal and download the files.

### About this task

---

To download and install the SAP jar files and DLLs:

1. Contact SAP Technical Support to obtain the zip files for the following SAP Components:
  - o **SAP JCo Release 3.0.x - based on the platform on which studio is running.**  
Note: Latest version of JCo jar available: 3.0.14, IDoc version 3.0.12.
2. Unzip the SAP JCo zip file:
  - o Double-click the sapjidoc30P\_x-1000xxxx.zip file.
  - o Use the decompression tool to extract the contents of the compressed file to a temporary directory. This zip file contains another zip file sapjco3- NTintel-3.0.x.zip. Extract this zip also to a temporary directory, for example: C:\temp\sapjco3-NTintel-3.0.x. This directory contains the required libraries sapjco3.jar and sapjco3.dll.
3. Unzip the SAP IDoc JCo zip file:
  - o Double-click the sapjidoc30P\_x-1000xxxx.zip file.
  - o Use the decompression tool to extract the contents of the compressed file to a temporary directory, for example, C:\temp\sapjidoc30P\_x-1000xxxx. This directory contains the required library sapidoc3.jar.

### Procedure

---

1. Open studio, select Tools > Install Module Providers.
2. When the Add Providers dialog box is displayed, click the plus (+) button present beneath SAP Connector.

A text entry field and a Browse button is displayed.
3. Click Browse, and use the browse dialog box to locate and select the sapjco3.jar file.
4. Click Open to import the jar file contents.
5. Click the next available plus (+) button to add the sapidoc3.jar and sapjco3.dll files.

- When the jar file is listed in the Add Providers dialog box, click OK.

## Results

---

A prompt is displayed to restart studio and activate the changes.

## What to do next

---

You can now create SAP endpoints and orchestrations.

## Uninstalling Secure Connectors (Windows)

---

This topic provides information about uninstalling a Secure Connector from a Windows machine.

### About this task

---

The following procedure allows you to uninstall a Secure Connector and all its configuration settings.

### Procedure

---

- Verify that another program, such as your browser or command shell, does not have any of the Secure Connector directories open.
- From the Windows Start button, select All Programs > IBM > Cast Iron Secure Connector <connector\_name> > Stop Secure Connector.
- From the Windows Start button, select All Programs > IBM > Cast Iron Secure Connector <connector\_name> > Uninstall Secure Connector. The Uninstaller window is displayed.
- Select Force the deletion of C:\Program Files\IBM\Secure\_Connector \_<connector\_name>.
- Click Uninstall.
- When the status bar displays [Finished], you can close the Uninstaller window.

## Uninstalling Secure Connectors (Linux)

---

This topic provides information about uninstalling a Secure Connector from a Linux machine.

### Before you begin

---

You must have root level permissions to uninstall the Secure Connector from a Linux machine.

## About this task

---

You can uninstall the Secure Connector by using a graphical interface, issuing a command line command, or running the Java uninstall.jar file. Choose one of the following options to uninstall a Secure Connector and all its configuration settings from a Linux machine.

**Uninstalling the Secure Connector using a graphical interface:** You must have a desktop environment, such as GNOME or KDE, to successfully uninstall the Secure Connector using this procedure.

1. Verify that another program, such as your browser or command shell, does not have any of the Secure Connector directories open.
2. From the application directory, select IBM > Cast Iron Secure Connector <connector\_name> > Stop Secure Connector.
3. From the application directory, select IBM > Cast Iron Secure Connector <connector\_name> > Uninstall Secure Connector.

**Uninstalling the Secure Connector from the command prompt:**

1. Verify that another program, such as your browser or command shell, does not have any of the Secure Connector directories open.
2. From the command prompt, issue the ./Uninstaller/uninstall.sh command.

**Uninstalling the Secure Connector with .jar file.** You must have Java® version 1.6 or higher installed to successfully uninstall the Secure Connector using this procedure.

1. Verify that another program, such as your browser or command shell, does not have any of the Secure Connector directories open.
2. From the command prompt, enter the runclient osgi.sh stop command.
3. In the directory where you installed the Secure Connector, navigate to the Uninstaller sub-directory to find the uninstaller.jar file: "\${JAVA}" -jar "\${INSTALL\_DIR}/Uninstaller/uninstaller.jar" where {JAVA} is the Java executable and {INSTALL\_DIR} is the Secure Connector name.

A dialog box is displayed.

4. Select the Force the Deletion option.
5. Click Uninstall.
6. Click Quit.

## Results

---

The Secure Connector is uninstalled. Configuration settings are retained in the home directory.

## Starting and Stopping Secure Connectors

---

Starting and Stopping Secure Connectors topics provide information about starting and stopping Secure Connectors on Windows and Linux machines. For Windows machines, options you chose during installation affect how you can start and stop Secure Connectors. If you installed the Secure Connector as an automatic Windows Service, as recommended, then you can use the Windows Services control panel to stop and start the Secure Connector. If you installed the Secure Connector as a Windows application, then you can start and stop the Secure Connector using Windows Start menu shortcuts or desktop shortcuts. For Linux machines, you can start and stop Secure Connectors by using a graphical interface or by running commands from the command line.

- [Starting and Stopping Secure Connectors on Windows \(Installed as a Windows Service\)](#)  
This topic provides information about starting and stopping Secure Connectors on Windows machines, where you have a Secure Connector installed as a Windows Service.
- [Enabling Interactive Mode for Windows Services](#)  
When the Secure Connector is installed as a Windows Service, enable the interactive mode for the service to view system tray icons and command window.
- [Starting and Stopping Secure Connectors on Windows \(Installed as a Windows Application\)](#)  
This topic provides information about starting and stopping Secure Connectors on Windows machines, where you have a Secure Connector installed as a Windows application.

## Starting and Stopping Secure Connectors on Windows (Installed as a Windows Service)

---

This topic provides information about starting and stopping Secure Connectors on Windows machines, where you have a Secure Connector installed as a Windows Service.

### About this task

---

If you installed the Secure Connector as an automatic Windows Service, as recommended, use the Windows Services control panel to stop or restart the Secure Connector.

By default, when a Secure Connector is installed as a Windows Service, the Secure Connector is not configured to interact with the Windows Desktop. However, if the Secure Connector service was installed under a local system account, you can enable an interactive mode that presents system tray icons and a command window when the Secure Connector service is running.

For steps to enable the interactive mode for a Windows service, see [Enabling Interactive Mode for Windows Services](#).

Note: If you use the **Start Secure Connector** Start menu shortcut or desktop shortcut to start a Secure Connector, the Secure Connector starts as a normal application rather than as a service. You must use the Windows Services control panel to start Secure Connectors as a service. You can use either the **Stop Secure Connector** Start menu shortcut or desktop shortcut to stop a Secure Connector.

#### **Starting and stopping Secure Connectors, using the Windows Services control panel:**

### Procedure

---

1. Open the Windows Services window : Start > Control Panel > Administrative Tools > Services.
2. Scroll down the list of services to locate the IBM® Secure Connector service.
3. Right-click on the IBM Secure Connector service and select the appropriate command: Start, Stop, Pause, Resume, or Restart.

**Parent topic:** [Starting and Stopping Secure Connectors](#)

---

## Enabling Interactive Mode for Windows Services

---

When the Secure Connector is installed as a Windows Service, enable the interactive mode for the service to view system tray icons and command window.

### About this task

---

By default, when a Secure Connector is installed as a Windows Service, the Secure Connector is not configured to interact with the Windows Desktop. However, if the Secure Connector service was installed under a local system account, you can enable an interactive mode that presents system tray icons and a command window when the Secure Connector service is running.

### Procedure

---

1. Open the Services control panel. For example: Start > Control Panel > Administrative Tools > Services.
2. Select the Cast Iron Secure Connector service.
3. Right-click the service name, and select Properties. The Service Properties window is displayed.
4. Select the Log On tab.
5. Select Local System account and then select Allow service to interact with desktop.
6. Click OK.
7. Click Restart.

### Results

---

When the Cast Iron Secure Connector service is restarted, system tray icons and a command window is displayed.

Note: You can minimize the command window. However, if you close the command window, the Cast Iron Secure Connector service will be stopped and terminated. Closing the command window is the equivalent of stopping the Secure Connector service from the Windows Services control panel.

## Starting and Stopping Secure Connectors on Windows (Installed as a Windows Application)

---

This topic provides information about starting and stopping Secure Connectors on Windows machines, where you have a Secure Connector installed as a Windows application.

### About this task

---

When the Secure Connector is installed on a Windows machine as a Windows application, rather than a Windows Service, you can start and stop the Secure Connector using Windows Start menu shortcuts or desktop shortcuts.

### Procedure

---

1. Start the Secure Connector from either the Windows Start menu shortcut or desktop shortcut.
  - o From the Windows Start button, select All Programs > IBM > Cast Iron Secure Connector <connector\_name> > Start Secure Connector.

- o From the Windows desktop, click the Start Secure Connector shortcut to start the Secure Connector.
- 2. Stop the Secure Connector from either the Windows Start menu shortcut or desktop shortcut.
  - o From the Windows Start button, select All Programs > IBM > Cast Iron Secure Connector <connector\_name> > Stop Secure Connector.
  - o From the Windows desktop, click the Stop Secure Connector shortcut to stop the Secure Connector.

## Starting and Stopping Secure Connectors on Linux

---

This topic provides information about starting and stopping Secure Connectors on Linux machines.

### About this task

---

If you have a desktop environment, such as GNOME or KDE, you can start and stop the Secure Connector using menu shortcuts or desktop shortcuts. You can also start and stop the Secure Connector using the command line.

### Procedure

---

1. Start the Secure Connector from either the menu shortcut , desktop shortcut or command line. Choose one of the following options:
  - o Select <application> > IBMÂ® > Cast IronÂ® Secure Connector <connector\_name> > Start Secure Connector .
  - o From the desktop, click the Start Secure Connector shortcut to start the Secure Connector.
  - o From the command prompt, enter `runclient osgi.sh start` .
2. Stop the Secure Connector from either the menu shortcut, desktop shortcut, or command line. Choose one of the following options:
  - o Select <application> > IBM > Cast Iron Secure Connector <connector\_name> > Stop Secure Connector .
  - o From the desktop, click the Stop Secure Connector shortcut to stop the Secure Connector.
  - o From the command prompt, enter `runclient osgi.sh stop` .

## Upgrading Secure Connectors

---

This topic provides information about upgrading Secure Connectors.

### Procedure

---

1. Create a new Secure Connector.

2. Download the latest version of the Secure Connector installer, based on your operating system. For example, Windows or Linux.
3. On a Windows or Linux machine, launch the Secure Connector installer. The Cast Iron® Secure Connector wizard guides you through the upgrade process.  
Note: If you already have a Secure Connector installation that is higher than or same as the latest version, a warning message states that you have an existing installation and alternatively you can upgrade the existing installation.  
Note: You must stop the Secure Connector (if already started) before upgrading.  
Note: Before you proceed with the Secure Connector upgrade process, ensure that you have:
  - o Stopped the Secure Connector
  - o Taken a manual backup of the certificates (if any) located at <secure\_connector\_install\_path>/etc/security or jre/lib. You may want to replace/add your certificates after upgrade.
4. Click the Upgrade option. The Select the installed path list box is displayed.
5. Select the Secure Connector installed path, if it is displayed in the list box. Else, click Browse button to select the installed path.
6. Click Next, then read and accept the licensing agreement.
7. Click Next. The installation progress is displayed. A message is displayed stating that the installation has been completed successfully. The path to the installer program is also displayed.
8. Click Done.
9. Start the Secure Connector.

## Updating Secure Connector Configuration

---

This topic provides information about updating Secure Connector configuration.

### Procedure

---

1. Download the new Secure Connector configuration file. For more information, see [Downloading Secure Connector Configuration Files](#).
2. Launch the Secure Connector Configuration wizard. To launch the wizard:
  - a. Windows machine: Go to Start > All Programs > IBM > Cast Iron Secure Connector <connector\_name> > Secure Connector Configuration.
  - b. Linux machine: Select <application> > IBM > Cast Iron Secure Connector <connector\_name> > Secure Connector Configuration.
3. The Secure Connector configuration wizard guides you through the upgrade process.
4. Click Next. The current Secure Connector Configurations are displayed if the Secure Connector is already configured. If not, browse for the newly downloaded configuration file and click Next.
5. Modify the Secure Connector configuration by completing one of the follow steps:
  - a. Modify the Cloud Gateway, Listen on Port, and Transmit on Port parameters and click Next. Or
  - b. Click the Previous button and select a new Secure Connector file.
    - i. Click Next and verify the configuration settings.
    - ii. Click Next.
6. Specify settings for a proxy server: Proxy Server, Proxy Port, Login ID, Login Password, and Retype Password. These parameters are only required if your network requires that the Secure Connector uses a proxy to connect to the Cast Iron® Cloud Gateway.
7. The Create Vendor Supplied Libraries screen is displayed.
8. Click Add and select the library files to upload. In the appliance, the valid files are .jar, .dll, and .so file types. The files that you select are displayed in the Files to Add column.
9. Click Update.

The files that display in the Files to Add column are not committed until you click Update.

10. Click Next. A dialog box is displayed to confirm the changes made, if you have not clicked the Update button. Click Yes to update changes and proceed further. If you click No to go to the next screen without any changes. Click the Cancel button to stay on the same screen.
11. When you click Yes to proceed further, the Vendor JAR created/updated successfully message is displayed.
12. Click OK. A message saying that the installation has completed successfully is displayed.
13. Restart the Secure Connector.

## Troubleshooting Secure Connectors

---

This topic provides potential solutions for issues you have with the Secure Connector.

Secure Connector log files are available for your review. The Log directory is created after the initial start of the Secure Connector. The Log directory is located in the Secure Connector install directory. For example: C:\Program Files\IBM\Secure\_Connector\_1.development\logs

- **A port contention error occurs.** A port contention error can occur when two Secure Connectors are configured to use the same port and gateway. To resolve the issue, provide unique values for the Gateway, Listen on Port, and Transmit on Port parameters in each Secure Connector configuration file.
- **Unable to run .jar file to uninstall a Secure Connector.** Verify that the Javaâ„¢ path is specified correctly and that you have Java version 1.6x or higher installed on the machine.

## About Certificates

---

Certificates enable secure communication between the Integration Appliance and endpoints located in your intranet and extranet. Use the Management Console to manage certificates.

From the Certificates page, you can generate, import, and update security certificates and security settings.

The following tables provides definitions for certificate terminology.

Certificate Terminology	Definition
Alias	A string of alphanumeric characters you assign to a KeyStore or TrustStore entry to provide a more user friendly name. Within a KeyStore or TrustStore you can use an alias to refer to the keys and certificates. Note: Aliases are not case sensitive. For example, MyCert and mycert refer to the same entry.
Certificate	A signed credential which identifies an endpoint or organization.
Key Pair	A public key and associated private key.
KeyStore	A Java data store that houses private keys and certificates used by a Java SSL endpoint. For example, a local Java endpoint supplies a certificate from its KeyStore as a credential to identify itself to a remote SSL endpoint.
PKI	Public Key Infrastructure is a system for managing encryption keys and identity information. The purpose of the system is to provide standards based system for protecting/securing communications over the internet.
Private Key	A key known only to a single endpoint used to encrypt and/or sign data.
Public Key	A key associated with a private key that can be distributed to anyone.
SSL	Secure Sockets Layer enables secure web communications and permits endpoints to optionally authenticate each other.
TrustStore	A Java data store that houses certificate authority signed certificates. For example, a local Java endpoint utilizes a TrustStore to authenticate the identity (certificate) provided to it by a remote SSL endpoint.

## Editing Security Settings

---

### Procedure

1. In the Key Store section, click Generate. The Generate Self-Signing Certificate dialog box displays.
2. In the Settings section, click Edit. The Edit Settings dialog box is displayed.
3. Select the certificate alias for which you want to edit settings.

4. Select the cipher strength:

- Standard
- Strong

5. Click Save.

## Exporting Certificates

---

### Procedure

1. In the Key Store section, click Generate. The Generate Self-Signing Certificate dialog box displays.
2. In the Key Store section, click on an alias. The Certificate Details window is displayed.
3. Click Export. The Export Certificate dialog box is displayed.
4. Select an exporting format.
5. Provide a password.
6. Click Export.

## Generating Certificate Signing Requests

---

### Procedure

1. In the Key Store section, click Generate. The Generate Self-Signing Certificate dialog box displays.
2. In the Key Store section, click on an alias. The Certificate Details window is displayed.
3. Click Generate CSR. The Certificate Content window is displayed.
4. Click Copy. The entire contents of the window is copied.
5. Click Download and enter a location for the download.
6. Click Save. The certificate contents are downloaded to the specified location.

## Generating Self-Signed Certificates

---

### Procedure

---

1. In the Key Store section, click Generate. The Generate Self-Signing Certificate dialog box displays.
2. Specify values for the following parameters:
  - o Alias - The name used to identify the key pair.
  - o Common Name (CN)
  - o Organization (O)
  - o Organization Unit (OU)
  - o Country (C) - Select a country from the list
  - o State (ST)
  - o Locale (L)
  - o Email (EMAILADDRESS)
  - o OID -
  - o Key Algorithm - Choose an algorithm type from the list.
  - o Key Length - Choose a value from the list.
  - o Valid For: - Specify the length of time this certificate is valid for in years and days.
3. Click Generate.

### Results

---

The self-signed certificate displays in the Key Store table.

## Importing Certificates

---

### About this task

---

You can import a certificate or certificate chain into the IBM® WebSphere® Cast Iron KeyStore. You can also import trusted Certificate Authority certificates (CA Certs) to the TrustStore.

### Procedure

---

1. In the Key Store section, click Generate. The Generate Self-Signing Certificate dialog box displays.
2. In the Key Store or Trust Store section, click Import. The Import Certificates dialog box is displayed.
3. Specify an alias name. This name is used to identify the imported certificate or certificate chain.
4. Optional: Provide a key password.

The password protects the private key of the key pair associated with the alias. If you do not specify a password, the password defaults to the password protecting the KeyStore.

5. If you are importing a certificate from a trusted site, select the Trusted option.

If you select the Trusted option, the certificate is imported without checking for an existing chain of trust. If you do not select the Trusted option, the KeyStore and TrustStore is checked to ensure a chain of trust exists for the certificate being imported.

6. Choose to import the content from a file or from content in the clipboard that contains the certificate or certificate chain to be imported.

Supported formats include: CER/PEM (RFC 1421), DER, PKCS7, and PKCS12.

7. Click Import.

## Results

---

The certificate is displayed in the Certificates page.

## Renaming Certificate Alias

---

### Procedure

1. In the Key Store section, click Generate. The Generate Self-Signing Certificate dialog box displays.
2. In the Certificate page, select an Alias. The Certificate Details dialog box is displayed.
3. Click Rename.
4. In the Alias field, enter a new alias.
5. Click Apply.

## Results

---

The updated alias is displayed on the Certificates page.

## Working with Logs

---

Working with Logs topics provide information about specifying system settings, and viewing system logs.

- [Specify System Log Settings](#)
- [Viewing System Logs](#)
- [Viewing Job Logs](#)
- [Customizing columns in System log and Job log](#)

You can customize the columns displayed in the System log and Job log pages, respectively.

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/CloudHelp/Working\\_with\\_Logs/toc\\_working\\_with\\_logs.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/CloudHelp/Working_with_Logs/toc_working_with_logs.html)

## Specify System Log Settings

---

### About this task

You can specify the level of details that appears in the system logs. The log level you specify affects alerts for notification policies. Alerts are only sent for events that meet or exceed the log level you specify.

Note: If you do not receive notifications for events, it might be that you do not have the system log level set to produce entries that would trigger a notification.

### Procedure

1. In the Navigation pane, select Logs > System Log. The System Log page is displayed.
2. Click Settings. The System Log Settings dialog box is displayed.
3. From the list, select a log level for each system.
4. Click Save.

### Results

A confirmation message displays. The system log logs all events that occur at the level you specified or higher for the specific system. For example, if you chose the Error level for Deployment, all events that were Error or Critical level in the Deployment system are logged.

**Parent topic:** [Working with Logs](#)

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

## Viewing System Logs

### About this task

You can view system logs from the Management Console and use the system log filters to sort through system log entries.

When you upgrade, the Management Console does not persist system logs. To retain system log information, export system logs before you upgrade.

Note: The Management Console displays a maximum of 99,999 system log entries. When the number of system log entries exceeds 99,999, the oldest log entry is deleted from the system log.

### Procedure

1. From the navigation pane, select Logs > System Log. The System Log page is displayed.
2. Choose the filter values from the lists at the top of the System Log page.

You can filter the log entries according to the level of severity for the event, the environment system that generated the log event, dates, and resolution state. The filters use AND logic.

**Parent topic:** [Working with Logs](#)

## System Log Content

The system log provides the following information:

System Log Content	Description
Level	Identifies the level of severity of the log event: <ul style="list-style-type: none"><li>• Critical</li><li>• Error</li><li>• Warning</li><li>• Info</li></ul>
System	Identifies the system where the log event occurred.
Message	Text messages that provides details about the log event.
Job	When available displays Job ID information for log events that occur in the Orchestration system.
When	Records the time when the log event occurred.
Resolved On	Provides a time stamp of when you resolved a log event.
Resolved By	Identifies which user resolved a log event.
Resolved	Select this checkbox to acknowledge that you have resolved a log event. When a user resolves a log event, a time stamp documents the date and time the issue was resolved. Information about the user who resolved the log event is tracked in the Resolved By column. You can resolve all the system log issues, by clicking Resolve All. Clear the checkbox next to any log events that are not resolved and the Resolved On and Resolved By values are cleared.

[Feedback | Notices](#)

## Viewing Job Logs

---

### About this task

---

You can view job logs from the Cloud Management Console and use the job log filters to sort through job log entries.

### Procedure

---

1. From the navigation pane, select Logs > Job Log. The Job Log page is displayed.
2. Choose the filter values from the lists at the top of the Job Log page.

**Parent topic:** [Working with Logs](#)

---

## Customizing columns in System log and Job log

---

You can customize the columns displayed in the System log and Job log pages, respectively.

### About this task

---

You can customize the columns to be displayed in the System Log and Job Log pages by editing the column display settings. To customize the log page columns, complete the following steps:

### Procedure

---

1. From the navigation pane, select Logs > System Log or Job Log. The System Log page or the Job Log page is displayed.
2. Click Edit Columns. The Log Columns Settings window is displayed.
3. Select the columns that need to be displayed on the System Log or Job Log page. By default, all the columns are selected in the Log Columns Settings window.
4. Click Save. Only those columns selected by you will be displayed in the System Log or Job Log page.

**Parent topic:** [Working with Logs](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/ApplianceHelp/About\\_the\\_WMC/toc\\_about\\_the\\_wmc.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/ApplianceHelp/About_the_WMC/toc_about_the_wmc.html)

## About Management Console Settings

---

From the Settings link, you can manage various user profile, session, and display preferences. The Web Management Console supports only the English language. The Settings link is in the upper right corner of the Management Console.

From the Settings dialog box, you can view and edit the following settings and preferences.

Table 1. User Profile Setting

User Profile Setting	Description
User Name	The name of the user currently logged in.
Display Name	The name that displays on the console and that displays in the logs.
Password	Password for the current user: <ul style="list-style-type: none"><li>• Minimum length is 8 characters</li><li>• Maximum length is 15 characters</li><li>• Must contain characters from 3 of the 4 following categories:<ol style="list-style-type: none"><li>1. upper-case</li><li>2. lower-case</li><li>3. numeric</li><li>4. punctuation (for example, !, \$, #, %)</li></ol></li><li>• Must not contain any 3 character substring of user name</li><li>• Must not contain any 3 character substring of prior password</li></ul>
Email	Current® user email address. Email notifications are sent to this email.
User Groups	User groups for which the user is a member.

## Login Policy

---

When the 5th consecutive login failure occurs for a single user, in any span of time, the user is prohibited from logging-in again for a delay interval of 15 seconds.

For each subsequent login failure, the delay interval doubles until the delay interval capacity is reached. The delay interval capacity is 1 hour. A successful login by the user resets the login failure count and the delay interval for the user.

Table 2. Session Settings

Session Settings	Description
------------------	-------------

Session Settings	Description
Inactivity Timeout	The amount of inactive time the console waits before logging off the current user. You can choose one of the following timeout intervals: <ul style="list-style-type: none"> <li>• 5 minutes</li> <li>• 15 minutes</li> <li>• 30 minutes</li> <li>• 60 minutes</li> <li>• Never</li> </ul>
Dashboard Refresh Interval	The amount of time the console waits before refreshing the view. You can choose one of the following refresh intervals: <ul style="list-style-type: none"> <li>• 15 seconds</li> <li>• 30 seconds</li> <li>• 60 seconds</li> <li>• Off</li> </ul>

Table 3. Display Settings

Display Settings	Description
Time Zone	Allows you to specify the time displayed on the console. You can specify one of the following display modes: <ul style="list-style-type: none"> <li>• Local Time (GMT-0800)</li> <li>• Remote Time (GMT)</li> <li>• GMT</li> </ul>
Page Size for Jobs Log	Allows you to specify the number of rows of the Jobs log to display on the console. You can choose to display 15, 25, 50, or 100 rows.
Page Size for System Log	Allows you to specify the number of rows of the System log to display on the console. You can choose to display 15, 25, 50, or 100 rows.
Maximum Age for Recent Jobs	Allows you to specify the age of the recent jobs that are displayed on the console. For example, if you choose 1 hour, any job that is older than an hour is not displayed. You can include jobs as old as: 1 hour, 2 hours, 4 hours, 8 hours, 1 day, 2 days, 5 days, or 1 week.
Maximum Age for Recent Configurations	Allows you to specify the age of the recent project configurations that are displayed on the console. For example, if you choose 1 day, any project configuration that is older than a day is not displayed. You can include project configurations as old as: 1 day, 2 days, 5 days, 1 week, 2 weeks, 3 weeks, or 4 weeks.

## Navigating the Management Console

---

The Management Console is a web-based tool that allows you to manage and monitor the various systems and resources of your integration environment. This environment can be a physical Integration Appliance or an environment in the WebSphere® Cast Iron® Cloud.

The navigation pane on the left of the Management Console displays a menu of pages that allow you view, configure, and take actions on various systems and resources.

If you have logged on to the Management Console as an administrator, you can view the reports of:

- **Publish details:** Displays the configurations published, by whom it was published, and the date and time when it was published.
- **Login History:** Displays the login history of the user or users that logged on to the appliance. The login history includes the name of the user, the log in time, and the log out time.

The back and forward buttons on browsers do not allow you to move through the Management Console pages in the order which you opened them. Use the back and forward arrows in the top right corner of the Management Console to move through the Management Console pages in the order you opened them.

The user that is currently logged in is also displayed in the upper right corner. Click Settings > User Profile to open the User Profile window.

**Parent topic:** [About the Web Management Console](#)

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/ApplianceHelp/About\\_the\\_WMC/navigatingManagementConsole.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/ApplianceHelp/About_the_WMC/navigatingManagementConsole.html)

## Local Staging Database

---

Local Staging Database topics provide information about using the local staging database in the Web Management Console.

- [About the Local Staging Database](#)
- [Starting the Local Staging Database](#)
- [Stopping the Local Staging Database](#)

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

## About the Local Staging Database

---

In Studio, you can build projects with Data Quality activities that sort and merge data from a source system to help you cleanse and quickly migrate the data to a target system. As the Data Quality activities in a project iteratively process data from a source system-- sorting "good" and "bad" data, the Integration Appliance can store the data in a Local Staging Database.

From the WMC, you can view the local database tables and lookup tables to make further changes, as needed, to the processed data. You must have the appropriate permissions to view tables and perform operations on the Local Staging Database.

Important: The Local Staging Database must be started before you can view the Database Viewer in the WMC.

## Database Viewer Panes

---

The Database Viewer is made up of three panes:

### Database Objects pane

Located on the left-hand side of the Database Viewer, this pane displays all tables in the Local Staging Database, including fields and rows.

### Query pane

Located in the upper-right side of the Database Viewer, this pane provides a workspace for you to validate and submit queries to the Local Staging Database. You can manage each query in a separate tab. You can perform the following operations on each tab:

- Validate Query
- Submit Query
- Clear Query
- Close Tab

### Summary pane

Located in the lower-right side of the Database Viewer, this pane contains two tabs: Results and History.

- **Results tab** - Provides a summary of the rows returned from the query.
- **History tab** - Provides a log of events that have occurred on the Local Staging Database. A time stamp marks each event logged. The log of events persists as long as the WMC is open. Once you close the WMC, the History tab is cleared.

**Parent topic:** [Local Staging Database](#)

## Starting the Local Staging Database

---

### About this task

---

From the WMC, you can start and stop the Local Staging Database. You must start the staging database to view or update data. By default, the staging database is in a stopped state. In the stopped state, you cannot view or update the staging database. When you stop the database, all sessions for all users also stop.

Only users with Administrator privileges, granted as being part of the built-in Administrator group, can start, stop, and perform operations on the Local Staging Database. Users with Publisher privileges can only view the database if the Local Staging Database has already been started by a user with Administrator privileges. If the Local Staging Database has not been started, users with Publisher privileges will not be able to view the database. Users that are part of the built-in Users group or with WMC login credentials created in an LDAP Server do not have access to the Local Staging Database.

## Procedure

---

1. From the navigation pane, select System > Staging DB. The Staging DB page is displayed.
2. Click Start Database.

**Parent topic:** [Local Staging Database](#)

## Best Practices for Memory Management

---

Outlines memory management best practices to maintain a healthy runtime environment and avoid out of memory errors.

An Integration Appliance sets aside a pool of memory to run orchestration jobs. Managing this pool of memory is key to maintaining a healthy runtime environment.

There is a direct relationship between the amount of memory used and garbage collection cycles. Garbage collection is a process that returns memory, held by completed jobs and variable data, back to a pool of memory used by all orchestration jobs. This garbage collection process ensures that the Integration Appliance has a constant supply of free memory that new orchestration jobs can use.

Garbage collection (GC) is a continual process that runs in the background with no effect on orchestration job performance. However, when memory reaches a critical threshold, a more in-depth process known as full garbage collection occurs. The full garbage collection process puts all the running jobs into a sleep state and returns unused memory back to the pool. Because all orchestration jobs stop during a full garbage collection, frequent full garbage collections can affect orchestration performance.

When the GC Activity value on the Resource Utilization Graph spikes at regular intervals, there is most likely a high demand on memory that the Integration Appliance is trying to manage by initiating more frequent full garbage collection cycles. However, high memory usage does not necessarily mean an increase in full garbage collection cycles. For example, a large volume of short running orchestrations results in a larger percentage of memory being used. But the garbage collection cycles, constantly running in the background, most likely return memory back to the pool of memory quickly enough that the overall memory usage is never high enough to trigger a full garbage collection. Full garbage collections stop all orchestrations, so frequent full garbage collections can affect orchestration performance.

Scenarios where high memory usage likely results in frequent full garbage collection cycles include a mix of orchestration types. For example, having multiple, non-persistent, long running orchestrations with numerous variables processing large objects. These types of orchestrations would consume and tie up large amounts of memory that could not quickly be returned to the memory pool.

Note: These types of orchestrations are not recommended by Cast Iron®.

The following table provides a list of best practices that will help you manage memory usage and maintain a healthy runtime environment.

Table 1. Best Practices for Memory Management

Best Practice Principles	Description
Reduce logging levels.	<p>More detailed logging requires more memory to process and store the data and also increases the I/O load on the Integration Appliance disk, which can slow performance. Detailed logging levels are recommended for debugging purposes only and not recommended for production environments, where high volumes of data are processed.</p> <p>The Integration Appliance generates system logs and orchestration job logs.</p> <p>Cast Iron recommends setting the System Log level to "Warning" for all components that are tracked in the system log:</p> <ul style="list-style-type: none"> <li>• Hardware</li> <li>• Resources</li> <li>• Network</li> <li>• Security</li> <li>• Orchestration</li> <li>• Deployment</li> </ul> <p>If the number of warnings generated by the various system components is high, memory usage might become an issue. Either resolve the problem that is causing the warnings to be generated or increase the system logging level to "Error". For more information about setting system log levels, see <a href="#">Specify System Log Settings</a>.</p> <p>Orchestration logging levels are specified for each orchestration in a project. Cast Iron recommends setting Logging Levels to "Error Values" for all orchestrations under all projects on the Integration Appliance. For more information about setting orchestration log levels, see <a href="#">Editing Orchestration Settings</a>.</p>
Verify persistence is enabled for all orchestrations.	<p>By default, persistence is enabled for an orchestration and variable data is written to disk instead of memory. Enabling persistence has the added benefit of point-in-time data recovery should a fault occur during runtime.</p> <p>If you disable persistence for an orchestration, data is stored in memory. While disabling persistence can improve performance, as the number of running jobs increases the likelihood of running out of memory also increases. Because of the high risk of running out of memory, proceed with extreme caution when you choose to disable persistence.</p> <p>Note: Turning off persistence reduces the number of orchestration jobs that the Integration Appliance can run simultaneously. The limit is set by the amount of memory available on the Integration Appliance.</p>

Best Practice Principles	Description
Use scheduling capabilities available in the Web Management Console (WMC) and Studio to stagger orchestration jobs.	<p>By scheduling memory intensive jobs to start at different times or to run during off-peak hours, you relieve some of the load on memory, reduce the number of full garbage collections, and potentially improve performance.</p> <p>In Studio, you can use the Schedule Job activity or configure polling intervals for activities in an orchestration to stagger orchestration jobs and maximize resource utilization. You can also create a schedule in the WMC, to control when the Integration Appliance should run an orchestration job. Measure the average execution time of a given orchestration job, so you can optimize job schedules.</p>
Minimize the number of variables used in an orchestration.	<p>The more variables you use in an orchestration, the more memory is required to store the data. This in turn could increase the number of garbage collection cycles and affect performance. Review your orchestrations to see if you can reduce the number of variables used.</p>
Reduce the number of simultaneously running jobs.	<p>In the WMC, you are able to specify the maximum number of simultaneously running jobs for an orchestration. As the number of concurrently running orchestrations increases, so does the percentage of memory usage increase. If you notice memory is getting overloaded, reduce the number of jobs running simultaneously.</p> <p>The effects of reducing the number of simultaneously running jobs is especially impactful for non-persistent, long running orchestrations jobs that contain a large number of variables.</p> <p>Note: These types of orchestrations are not recommended by Cast Iron.</p>
Do not exceed 75% load on memory.	<p>In the WMC Resource Utilization Graph, you can track the percentage of memory used. When the percentage of memory used is approximately 75% or less, the Integration Appliance has capacity to process more orchestrations. When the percentage of memory used exceeds approximately 75%, you will likely notice performance issues as the number of full garbage collections increase.</p>
Limit full garbage collection cycles.	<p>In the WMC Resource Utilization Graph, you can use the GC Activity value to track a percentage of full garbage collections. When this percentage exceeds 50%, you might notice a reduction in the throughput of your orchestrations jobs. Implement the best practices for memory management to reduce memory usage and thus reduce the likelihood of full garbage collection cycles occurring.</p>
Add additional Integration Appliances to your environment.	<p>After implementing the best practices principles, if memory usage continues to be high, it might be time to add another Integration Appliance to your environment.</p>

## Managing Integration Appliances

---

Managing Integration Appliances topics provide information about downloading 3rd party libraries, importing and exporting repositories, as well as describing and using commands on the Web Management Console.

- [About Connectors](#)
  - [System Summary](#)
  - [Downloading and installing SAP library files](#)
  - [Configuring Secure Network Communications \(SNC\) for SAP connector](#)
- In Cast Iron version 6.3.0.2 and later versions, you can connect to SAP through the SAP connector by using the SNC feature.
- [Executing Commands](#)
  - [Exporting A Repository](#)
  - [Importing A Repository](#)
  - [Installing Libraries from Other Vendors](#)
  - [Scheduling Downtime](#)
  - [Specifying Network Settings](#)
  - [Executing a System Command](#)

- [Upgrading a Dell Integration Appliance](#)

This section provides information on using the WMC to upload minor and patch releases to a Dell Integration Appliance. When you upgrade the appliance, you are able to access the latest features of the Cast Iron® operating system. This upgrade process only replaces or adds necessary files, it does not destroy any data.

- [Upgrading a DataPower Integration Appliance](#)

This section provides information on using the WMC to upload minor and patch releases to a DataPower Cast Iron XH40 Integration Appliance. When you upgrade the appliance, you are able to access the latest features of the Cast Iron operating system. The upgrade process only replaces or adds necessary files, it does not destroy any data.

- [Working with Network Routes](#)

You can add and delete network routes for the Integration Appliance.

## About Connectors

---

The Connectors page displays all the connectors that are installed on the Integration Appliance. From the Connectors page you can also see the version number of each installed connector and licensing status for each connector. The Integration Appliance can only process configuration projects that contain endpoints with valid connector licenses. To open the Connectors page, select System > Connectors from the navigation page.

Some connectors require you to install additional libraries, before you can deploy a configuration project. On the Connectors page, click the Update Libraries link to manage these additional connector libraries.

## Downloading and installing SAP library files

---

### Before you begin

You must have an SAP User ID and password to enter the SAP Support Portal to download the files.

### About this task

In order to connect to an SAP system, you must install SAP libraries onto your development environment.

Note:

If you have older versions of the `librfccm.so` and `libsapjcorfc.so` files in any system directories, you must remove these files. Appliance must use the `libsapjco3.so` file provided with SAP JCo Release 3.0.x. You must use 64 bit SAP JCo libraries for Cast Iron® version 7.0 and later versions; and 32 bit SAP JCo libraries for Cast Iron version 6.4 and earlier versions.

### Procedure

1. Contact SAP Technical Support to obtain the following zip files for the following SAP Components:
  - o SAP 32/64 bit JCo version 3.0.14 - Linux 32/64 bit version.
  - o SAP Javaâ„¢ IDoc Class Library 3.0.12.
2. Extract the contents of the package received from SAP Technical Support and copy it onto a local folder.
3. Log on to the Management Console and select System > Connectors. The Connectors page is displayed.
4. Click Update Libraries. The Update Connector Libraries window is displayed.
5. Select SAP in the Connector column.
6. Click the plus (+) button and repeat the following substeps until you have imported all the jar files you just downloaded.
  - a. Locate one of the jar files you just downloaded (`sapjco3.jar`, `sapidoc3.jar`, and `libsapjco3.so`).
  - b. Click Open to import the jar file. The file is displayed in the Files to Add column.
7. Click Update.

The files that display in the Files to Add column are not committed until you click Update. If you click Reset before you click Update, the Management Console does not add the files you uploaded. If the Management Console times out before you click Update and commit the added files, repeat the last two steps.

### Results

You can now run SAP projects.

# Configuring Secure Network Communications (SNC) for SAP connector

---

In Cast Iron version 6.3.0.2 and later versions, you can connect to SAP through the SAP connector by using the SNC feature.

## Procedure

---

1. Upload `libsapcrypto.so` to the same place where SAP JCo JARs are uploaded (for more information, see [Downloading and installing SAP library files](#)) in system library using WMC.
2. Run the shell commands to add the SAP crypto directory to the path variable of the system and to add the system credentials to the `.pse` file.  
Note: Shell commands can be run only by the IBM WebSphere Cast Iron L2 or L3 support engineers and share the `.pse` file with IBM Support if required.

## Executing Commands

---

### About this task

---

To run a system control command against the Integration Appliance:

## Procedure

---

1. From the navigation pane, select System > Command. The System Commands page is displayed.
2. From the Choose Command drop-down list, select a command. You can view command details by clicking the drop-down arrow.
3. Click Go.

**Parent topic:** [Managing Integration Appliances](#)

## System Control Commands

---

You can execute the following commands against a standalone Integration Appliance or an High Availability (HA) Pair. For more information about HA specific commands, see [Working with High Availability Pairs](#).

System Control Commands	Descriptions
Remove Job History	Removes all job history from the Integration Appliance.
Remove Projects & Configurations	Removes all projects, orchestrations, and project configurations from the Integration Appliance.
Remove All Jobs in Progress	Removes all data for currently running projects.
Download Postmortem	Generates and downloads a postmortem file to the location you specify.
Restart	Stops and restarts the Integration Appliance.
Reboot	Shuts down all services and then reboots the Integration Appliance.

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/ApplianceHelp/Managing\\_Integration\\_Appliances/executingCommands.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/ApplianceHelp/Managing_Integration_Appliances/executingCommands.html)

## Exporting A Repository

---

### About this task

Export the project repository to create a backup before upgrading an Integration Appliance. You can export all project configuration and user settings, which includes: network configurations, users and groups, licenses, job log parameters, log levels, notifications, downtime rules, and passwords, from the WMC to another location.

The Integration Appliance system logs are not exported when you export a repository. So if you import an earlier version of the repository, the system logs still contain events that occurred before the new repository was imported.

You can export a repository with the project configurations running. However, when you import this repository, the project configurations will all be in the undeployed state.

### Procedure

1. In the Navigation pane, select Repository > Import/Export. The Import/Export Repository dialog box is displayed.
2. Click Export. The Save As window displays.
3. Specify the location where you would like to save the exported repository.
4. Click Save. The WMC exports a copy of the repository as a .tar.gz file.

**Parent topic:** [Managing Integration Appliances](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/ApplianceHelp/Managing\\_Integration\\_Appliances/exportingRepository.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/ApplianceHelp/Managing_Integration_Appliances/exportingRepository.html)

## Importing A Repository

---

### About this task

When you import a repository, the WMC deletes some information held in the existing repository. Exactly which information is deleted depends on which option you select when you import the repository, as explained in this topic. However, the system log is not deleted. Therefore, you could potentially see system log entries from the previous repository. Once you have imported a repository, you cannot roll back to a previous repository. Therefore, it is recommended that you export the existing repository before importing another repository.

You must stop and undeploy all project configurations on the WMC, before you can import a repository. When the WMC successfully imports a repository, all the project configurations are in the undeployed state.

### Procedure

1. In the Navigation pane, select Repository > Configurations. The Project Configurations page is displayed.
2. From the Configurations Filter list, select All. All project configurations are displayed.
3. Stop and undeploy all project configurations.
4. In the Navigation pane, select Repository > Import/Export. The Import/Export Repository dialog box is displayed.

5. In the Repository File field, specify the path for the repository that you want to import.
6. Choose an import option:
  - o Project and User Settings  
Imports all the contents of the repository file you select. All projects are imported in the undeployed state.
  - o Project Settings Only  
Imports projects, configurations, notification policies, and job logs, from the repository file you select. All projects are imported in the undeployed state.  
Note: Any projects, configurations, notification policies and job logs that exist prior to the import will be deleted.
  - o User Settings Only  
Imports only the user setting information from the repository file you select. User setting information includes: network configurations, users and groups, licenses, job log filter parameters, system log levels, downtime rules and passwords.
7. Click Import. A warning is displayed.
8. Click Import to verify that you would like to proceed.

## Results

---

The Integration Appliance imports the repository and restarts the Integration Appliance. When the import is complete, the WMC login window displays.

**Parent topic:** [Managing Integration Appliances](#)

---

## Installing Libraries from Other Vendors

---

### About this task

If your integration project uses a connector that requires extra libraries, you must install the additional libraries before you deploy the project configuration. Deploying the project configuration before installing the additional libraries generates run time errors. For a complete list of connectors that require vendor libraries, open the Update Connector Libraries page. See the following procedure.

If you have a multi-environment tenant, you must install the vendor libraries in each environment where you deploy a project configuration with a connector that requires the additional libraries.

For example, you have a tenant with three environments: Development, Staging, and Production. You publish a project configuration for an SAP endpoint in the Development and Production environments. Before you can deploy the project configuration, you must install extra SAP libraries on both the Development and Production environments.

### Procedure

---

1. Click an environment tab.
2. Select System > Upgrade > Upgrade Connector Libraries to open the Update Connector Libraries page.
3. In the Connector column, select the connector for which you want to install additional files.

Any files that have already been installed display in the Installed Files column.

4. Click the plus (+) icon and select the library files to upload. In a Linux system, the valid files are .jar or .so; in a Windows system, the valid files are .jar or .dll. The files that you select are displayed in the Files to Add column.
5. Click Update.

The files that display in the Files to Add column are not committed until you click Update. If you click Reset before you click Update, WMC does not add the files that you have uploaded. If WMC times out before you click Update and commit the added files, repeat the last two steps.

## Scheduling Downtime

---

### About this task

Scheduling downtime allows you to perform maintenance on an environment or related system. You can create downtime rules for project configurations that stop or suspend all enabled orchestration jobs in that project configuration for a specified duration of time. The project configuration does not have to be undeployed to create or edit a downtime rule. Downtime rules can occur once or repeat at specific intervals. You must have administrator or publisher permissions to create, edit, or delete a downtime rule.

By default, downtime rules are stored in GMT time zone. If an administrator modifies the system clock from GMT to another time zone, downtime rules are executed at the same absolute time. For example: You create a downtime rule to stop all orchestration between 4:00pm - 4:15pm GMT. The administrator then modifies the system clock to display PDT. Your downtime rule is modified to now stop all orchestration between 8:00am - 8:15am PDT. To execute the downtime rule at 4:00pm - 4:15pm PDT, you must edit the downtime rule. Times differences caused by daylight savings are automatically adjusted.

If the environment is offline when a downtime rule is scheduled to occur, all unexecuted rules are identified and executed in the appropriate order when the environment returns online. After all the backlogged downtime rules are executed, you regain control to modify the deployment state of a project configuration.

### Procedure

---

1. From the Navigation pane, select Repository > Configurations. The Project Configurations page is displayed.
2. Click the project configuration, which contains the downtime rule you want to work with. The Configuration Details page is displayed.
3. In the Scheduled Downtimes section, click New Rule. The New Downtime Rule dialog box is displayed.
4. Select one of the following actions from the drop-down list:
  - **Stop (allows jobs to finish)** - At the specified time, prevents any new orchestration jobs from starting while allowing current jobs to finish processing. This action facilitates a gracefully stop.
  - **Stop (cancel running jobs)** - At the specified time, prevents any new orchestration jobs from starting and stops all currently running jobs. This action immediately stops all jobs.
  - **Suspend** - At the specified time, prevents any new orchestrations from starting and pauses any jobs that are currently running. At the end of the scheduled downtime, the runtime processes the suspended job from the point it paused.
5. Specify the duration of the downtime by specifying a date and time for Start Downtime and End Downtime.
6. (Optional) Select the Repeat option to create a repeat downtime rule.
  - a. Specify a repeat interval (numeric value).
  - b. Specify frequency from the drop-down list: Days, Weeks, Months, or years.
7. Click Save.

### Results

---

The new downtime rule displays in the Scheduled Downtimes section and the Scheduled Downtime counter increases by one.

**Parent topic:** [Managing Integration Appliances](#)

# Edit Downtime Rules

---

## Procedure

---

1. From the Navigation pane, select Repository > Configurations. The Project Configurations is displayed
2. Click the project configuration, which contains the downtime rule you want to work with. The Configuration Details page is displayed
3. In the Scheduled Downtime section, click the downtime rule you want to edit. The Edit Downtime Rule displays.
4. Select one of the following actions from the drop-down list:
  - o **Stop (allows jobs to finish)** - At the specified time, prevents any new orchestration jobs from starting while allowing current jobs to finish processing. This action facilitates a gracefully stop.
  - o **Stop (cancel running jobs)** - At the specified time, prevents any new orchestration jobs from starting and stops all currently running jobs. This action immediately stops all jobs.
  - o **Suspend** - At the specified time, prevents any new orchestrations from starting and pauses any jobs that are currently running. At the end of the scheduled downtime, the runtime processes the suspended job from the point it paused.
5. Specify the duration of the downtime by specifying a date and time for Start Downtime and End Downtime.
6. Optional: Select the Repeat option to create a repeat downtime rule.
  - a. Specify a repeat interval (numeric value).
  - b. Specify frequency from the drop-down list: Days, Weeks, Months, or years.
7. Click Save.

## Deleting Downtime Rules

---

## Procedure

---

1. From the Navigation pane, select Repository > Configurations. The Project Configurations page is displayed.
2. Click the project configuration, which contains the downtime rule you want to work with. The Configuration Details page is displayed.
3. In the Scheduled Downtime section, select the downtime rule you want to delete. The Delete Rules confirmation window is displayed.
4. Click Yes.

## Results

---

The downtime rule no longer displays.

---

# Specifying Network Settings

---

## About this task

---

Network opens Network Settings page.

The iA300 only has one physical port; however, for network configuration purposes, you specify separate IP addresses for data networking and management networking. The iA1000, iA1500, iA2000, iA2500, and iA3000 have two physical ports.

You must have Administrator privileges to specify network configurations. By default, the Integration Appliance uses DHCP to configure network settings. When you choose to use DHCP to configure network settings, the WMC displays the settings in the Network Configuration page. You can edit these settings by clearing the Use DHCP option or selecting the Manual option.

Note: Using DHCP to configure your network settings can result in longer startup times. For faster startup time, select the Manual option and specify a static value.

## Procedure

---

1. In the navigation pane, select Network. The Network Settings page is displayed.
2. Click Edit. The Edit Network Settings wizard is displayed.
3. In the Data Network section, select the Use DHCP option. If you clear this option, the Integration Appliance requires that you specify the IP address, subnet, and broadcast settings.

By default, the Integration Appliance uses DHCP to configure data network settings. To manually configure data network settings, clear the Use DHCP option and enter a valid value for the required settings. The Integration Appliance requires the following management network settings:

- IP address
- Subnet
- Broadcast

4. In the Management Network section, select the Use DHCP option. If you clear this option, the Integration Appliance requires that you specify the IP address, subnet, and broadcast settings.

By default, the Integration Appliance uses DHCP to configure management network settings. To manually configure management network settings, clear the Use DHCP option and enter a valid value for the required settings. The Integration Appliance requires the following management network settings:

- IP address
- Subnet
- Broadcast

5. Select a Gateway Interface and Gateway Source.
6. Select an option to set the HostName.
7. Select an option to set the Domain.
8. Select an option to set the DNS. When specifying multiple DNS values, use a space to separate the values.
9. Select an option to set the Time Server.
10. Click Next to validate settings.
11. Click Next to apply settings.
12. Click Finish.
13. Wait for the Integration Appliance to restart and log in.

## Executing a System Command

---

### Procedure

---

1. In the navigation pane, select System > Commands. The System Command page is displayed.
2. From the Choose Command list, select a command.
3. Click Go.

**Parent topic:** [Managing Integration Appliances](#)

## System Commands

---

From the Management Console, you can run system commands. Different system commands are available depending on the Integration Appliance configuration (stand-alone vs. high availability pairs) and Integration Appliance state (active or standby). The following table lists all system commands available from the Management Console and notes behavioral differences due to Integration Appliance configuration or state.

<b>Command</b>	<b>Description</b>
Remove job history	The remove job history command removes orchestration monitoring data.
Remove project and configurations	The remove projects and configurations command removes currently deployed project(s) data.
Remove all jobs in progress	The remove all job in progress command removes all currently running project data.
Download postmortem	The download postmortem command exports the postmortem archive to an FTP Server you specify. The Integration Appliance does not require that you specify an export file name; however, as a best practice, you should include the Integration Appliance serial number, date, and timestamp. If you do not specify an export file name, the Integration Appliance exports a file named postmortem.tar.gz. Note: Do not use reserved words in the user name or password.
Restart	Restarts the Integration Appliance routing subsystem.
Reboot	Shuts down all routing services and then reboots the Integration Appliance. If the force parameter is used, reboot begins immediately.
HA Connect	Only available for HA pairs. The ha connect command reconnects an Active and Standby Integration Appliance to create an HA pair that can resume fail-over operations. This command is only available if you disconnected an HA pair by issuing the HA Disconnect command.
HA Disconnect	Only available for HA pairs. The ha disconnect temporarily disconnects an HA pair without causing the Standby machine to take over the Active machine. This action allows you to perform any necessary hardware or software maintenance on the Standby machine without interrupting orchestration processing. When you choose this action, the Standby machine transitions to an idle state. Reboot the Active machine or execute the Connect action to reestablish communications between an HA pair and resumes data synchronization and fail-over operations. To perform maintenance on an Active machine, use the Switch action. The Active machine becomes the Standby machine, where you can use the Disconnect action and perform Integration Appliance maintenance without interrupting orchestration processing.
HA Switch	Only available for HA pairs. The ha switch command causes the Integration Appliances in an HA pair to switch roles: the Active machine becomes the Standby machine and the Standby machine becomes the Active machine.
Reboot active machine (allow peer takeover)	Only available for HA pairs. The reboot active machine (allow peer takeover) command shuts down all routing services and then reboots the active Integration Appliance in an HA pair. When you reboot the Active Integration Appliance using this command, the Standby Integration Appliance takes over data processing.

Command	Description
Reboot active machine (prevent peer takeover)	Only available for HA pairs. The reboot active machine (prevent peer takeover) command shuts down all routing services and then reboots the Active Integration Appliance in an HA pair. When you reboot the Active Integration Appliance using this command, the Active Integration Appliance stops all data processing and the Standby Integration Appliance does not take over data processing.
Reboot standby machine	Only available for HA pairs. Thereboot standby machine command reboots the Standby Integration Appliance in an HA pair. While the Standby Integration Appliance is rebooting, the Active Integration Appliance continues to process data. After a successful reboot, the Standby Integration Appliance synchronizes with the Active Integration Appliance.

## Upgrading a Dell Integration Appliance

---

This section provides information on using the WMC to upload minor and patch releases to a Dell Integration Appliance. When you upgrade the appliance, you are able to access the latest features of the Cast Iron® operating system. This upgrade process only replaces or adds necessary files, it does not destroy any data.

### About this task

---

Use the Web Management Console (WMC) to upgrade to the latest version of Cast Iron operating system by uploading an upgrade image onto the appliance. Please note that the WMC forces any running projects to be undeployed and stops any active orchestration jobs currently running on the appliance during the upgrade procedure. After the appliance is upgraded, you cannot undo or rollback to the previous version.

Note: Upgrades may also be applied through the Command Line Interface (CLI). See the system update command in the *CLI Reference Guide* for more information about using this option.

### Procedure

---

1. Request the latest patch and download the patch to a location where you can access it. For example: C:\Desktop
2. Using the WMC, log into the Dell Integration Appliance that you want to upgrade.
3. Select System > Upgrade. The Upgrade page displays.
4. Click the Upgrade Operating System link. The Upgrade Wizard launches.
5. Click Browse to locate the upgrade file.
6. Click Upgrade. The Integration Appliance uploads the upgrade file and starts the upgrade process. When the upgrade is complete, the Integration Appliance automatically reboots.
7. When the reboot is complete, the WMC Login page displays. If the page does not display, click the browser refresh button.

### What to do next

---

Using the WMC, redeploy any projects that were undeployed by this upgrade procedure. Upgrade to a Studio version compatible with the installed Cast Iron operating system. For more information about appliance and Studio compatibility, see the Compatibility section of the *Cast Iron Operating System Release Notes* or the *Cast Iron Studio Release Notes*. For the procedure on upgrading Studio, see *Installing Studio*.

## Upgrading a DataPower Integration Appliance

---

This section provides information on using the WMC to upload minor and patch releases to a Cast Iron® Cast Iron XH40 Integration Appliance. When you upgrade the appliance, you are able to access the latest features of the Cast Iron operating system. The upgrade process only replaces or adds necessary files, it does not destroy any data.

### About this task

---

Use the Web Management Console (WMC) to upgrade to the latest version of Cast Iron operating system by uploading an upgrade image onto the appliance. Please note that the WMC forces any running projects to be undeployed and stops any active orchestration jobs currently running on the appliance during the upgrade procedure. After the appliance is upgraded, you cannot undo or rollback to the previous version.

Note: Upgrades may also be applied through the Command Line Interface (CLI). See the system update command in the *CLI Reference Guide* for more information about using this option.

### Procedure

---

1. Obtain the latest patch, then download the appliance upgrade image file to a location you can access from your Windows workstation, for example: C:\Desktop.
2. Use the WMC to log into the Integration Appliance running the Cast Iron operating system.
3. From the Items menu in the WMC, select System > Upgrade. The System Summary window is displayed showing the model, version and serial number.
4. Click Upgrade Operating System. The Upgrade window is displayed.
5. In the text field, specify the path to the appliance upgrade image file or click Browse to locate the upgrade image file.
6. Click Upgrade. In the Upgrade panel, the following message is displayed: Upload in progress. Please wait. A progress bar displays the status of the upload. When the upload is complete, the WMC validates the upgrade. If the upgrade is successful, the appliance reboots.
7. Use the WMC to log into the appliance. You may need to click the browser refresh button.

### What to do next

---

Using the WMC, redeploy any projects that were undeployed by this upgrade procedure. Upgrade to a Studio version compatible with the installed Cast Iron operating system. For more information about appliance and Studio compatibility, see the Compatibility section of the *Cast Iron Operating System Release Notes* or the *Cast Iron Studio Release Notes*. For the procedure on upgrading Studio, see *Installing Studio*.

## Working with Network Routes

---

You can add and delete network routes for the Integration Appliance.

**Parent topic:** [Managing Integration Appliances](#)

## [Adding Network Routes](#)

---

### **Procedure**

1. In the navigation pane, select Network. The Network Settings page is displayed.
2. Click Edit. The Edit Network Settings wizard is displayed.
3. In the Routes section, click New Rule. The New Network Route dialog displays.
4. Specify a destination.
5. Specify a netmask.
6. Choose an interface from the drop-down list.
7. Specify a gateway.
8. Click Save.
9. Click Next to validate settings.
10. Click Next to apply settings.
11. Click Finish.
12. Wait for the Integration Appliance to restart and log in.

## [Deleting Network Routes](#)

---

### **Procedure**

1. In the navigation pane, select Network. The Network Settings page is displayed.
2. Click Edit. The Edit Network Settings wizard is displayed.
3. In the Routes section, click Delete. A confirmation window displays.
4. Click Yes.
5. Click Next to validate settings.
6. Click Next to apply settings.
7. Click Finish.
8. Wait for the Integration Appliance to restart and log in.
