

The IBM logo is centered on a white background. It consists of the letters "IBM" in a bold, blue, sans-serif font. The letters are composed of horizontal bars of varying lengths, creating a striped effect. The "I" has two bars, the "B" has four bars, and the "M" has five bars.

**IBM**

Terms and conditions for information centers	22
<b>Cast Iron Studio</b>	23
IBM Cast Iron Studio	23
Working with projects	24
Studio basics	25
Creating a new project	29
Protecting a project with a password	30
Changing a password associated with a project	30
Removing a password associated with a project	31
Opening a Project	31
Saving a Project	32
Renaming a Project	33
Publishing a Project	33
Exporting a Project	34
Configuring Project Settings	35
Setting Preferences	35
Project Preferences	36
Orchestration Preferences	37
Other Preferences	38
Creating Configuration Properties	40

Editing Configuration Properties	41
Creating Global Configuration Properties	42
Searching for Template Integration Projects (TIPs)	43
Installing Module Provider Libraries	44
Uploading Files into a Project	44
Uploading Files into a Project using the Mouse	45
Uploading Files into a Project using the Add Document Button	45
Uploading Included XML Schemas	46
Specifying the Location of a File to Upload	49
Valid External File Types for a Project	50
About Valid Names	50
Undo and Redo Operations	52
Updating a Changed XML Schema	52
Using the Project Explorer	53
Using the HTTP Post Utility	54
Orchestrations	54
Configuring an orchestration to orchestration connection	56
Creating an orchestration	56
Renaming an orchestration	57
Building an orchestration	57
Verifying orchestrations	58
Using SSL in Studio	59
Importing an end-entity certificate	61
Importing a Certification Authority (CA) Certificate	61
SSL server authentication	62
Testing an SSL server connection	63
SSL client authentication	63
Using the Log Viewer	64
Viewing an orchestration	64
Validating an orchestration	66
Working with activities in an orchestration	67
Printing an orchestration	68
Processing orchestration jobs sequentially	68
Enabling persistence	69
Adding a global exception handler to an orchestration	70
Saving an image of an orchestration	72
Connection Activities	72
Creating an endpoint	73
Downloading plug-in connectors	73
Uninstalling Plug-in Connectors	74
Using an existing endpoint	74
Polling interval behavior	75
Using the Shift-JIS encoding	76
Template Integration Process (TIPs)	76
About the Template Integration Project (TIP) Configuration Editor	77
Creating a Template Integration Project (TIP)	78
Modifying a Template Integration Project (TIP)	79
Verifying a Template Integration Project (TIP)	79
Searching for Template Integration Projects (TIPs)	43
Rating and Reviewing Template Integration Projects (TIPs)	80
Rating and Reviewing Template Integration Projects (TIPs) using the Publish Review Dialog box	81
Uploading Template Integration Projects (TIPs) to the Cast Iron solutions repository	82
Transform Activities	83
Map Variables Activity	84
Read MIME activity	84
Adding a Read MIME activity to an orchestration	85
Mapping the input of the activity	86

Mapping the output to an activity	87
Write MIME activity	87
Adding a Write MIME activity to an orchestration	88
Mapping the input of the activity	89
Mapping the output to an activity	91
Read XML activity	91
Read XML activity configuration	92
Read XML map inputs	92
Read XML map output	93
Write XML activity	93
Write XML activity configuration	94
Write XML map inputs	95
Write XML map output	95
Validate XML activity	95
Adding a Validate XML activity to an orchestration	97
Configuring a Validate XML activity	97
Mapping the input to an activity	98
Mapping the output to an activity - Validate XML	98
Read JSON activity	99
Read JSON activity configuration	100
Read JSON map inputs	101
Read JSON map output	101
Write JSON activity	102
Write JSON activity configuration	102
Write JSON map inputs	103
Write JSON map output	104
Validate JSON activity	104
Adding a Validate JSON activity to an orchestration	105
Configuring a Validate JSON activity	106
Mapping the input to an activity - Validate JSON	106
Mapping the output to an activity - Validate JSON	107
Read Flat File activity	108
Read Flat File activity configuration	108
Read Flat File map inputs	109
Read Flat File map outputs	110
Write Flat File activity	110
Write Flat File activity configuration	111
Write Flat File map inputs and outputs	112
OData Activities	112
Configuring OData Activities	113
Read OData Activity	114
Write OData Activity	117
OData Datatypes Mapping	119
Apply XSLT activity	120
Logic Activities	120
Logic activities overview	121
Terminate activity	122
Pick activity	122
If..Then activity	123
Try activity	125
Group activity	126
While Loop activity	127
For Each activity	127
Split activity	128
Break Loop activity	129
Continue activity	130
Adding branches to the If..Then activity	131

Moving branches	131
Defining conditions	131
Basic condition syntax	132
bpws:getVariableData function	133
Basic XPath expressions	134
Testing XPath expressions	136
Utilities Activities	138
Create Job Keys Activity	138
Creating Job Keys	139
Log Message activity	140
Schedule Job activity	141
Archives Activities	142
Archive activity	142
Adding an Archive activity	142
Configuring an Archive activity	143
Archive activity map input	145
Archive activity map output	146
Unarchive Activity	146
Adding an Unarchive activity	147
Unarchive activity map input	148
Unarchive activity map output	148
Cryptoservice Activities	150
Overview of the PGP activities	150
Using the PGP Encrypt activity	151
Using the PGP Decrypt activity	152
Importing PGP keys	153
Troubleshooting and support	154
Data Quality Activities	154
About Data Quality Activities	155
Filter and Profile Activity	155
Configuring the Filter and Profile activity	156
Mapping Filter and Profile activity outputs	156
Creating Profile Summaries	157
Filtering Expressions	158
Creating a filter expression	158
Adding a filter expression condition	159
Deleting a filter expression condition	159
Editing a filter expression condition	160
Changing the processing order of filter expression conditions	160
Lookup Activity	160
Using the Lookup activity	161
Mapping Lookup activity outputs	163
Sort Activity	163
Merge Activity	164
Merging two sorted inputs	165
Database Activities	166
Creating or Editing a Database Activity Endpoint	167
Browsing Database Tables	171
Character Encodings	171
Database Entities and Activities	172
Defining Columns for Old Values in Updates	174
MaxPooledStatements Parameter	175
Oracle, Sybase, DB2, and Informix Parameters	175
Retry Options For Inbound Database Activities	176
Retry Options For Outbound Database Activities	177
SequeLink Parameters	178
Single-Table Inbound Database Activities	179

Single-Table Outbound Database Activities	182
Specifying Delivery Rules for Database Activities	186
Viewing Column Details	187
Working with Database Parameters	188
Call Procedure Activity	188
Execute Query Activity	191
Poll Table Activity	193
Testing an SSL Database Connection	196
Box.com Activities	197
Overview of Box.com connector	198
Creating or editing an endpoint for Box.com activity	198
Selecting or editing a Box.com endpoint	199
Create Folders activity	200
Adding the Create Folders activity in the orchestration	200
Creating, selecting, or editing a Box.com endpoint	200
Configuring the activity	201
Mapping the inputs of the activity	201
Mapping the outputs of the activity	202
Note about deploying a Box.com orchestration	202
Update Folders activity	202
Adding the Update Folders activity in the orchestration	202
Creating, selecting, or editing a Box.com endpoint	203
Configuring the activity:	203
Mapping the inputs of the activity	203
Mapping the outputs of the activity	205
Note about deploying a Box.com orchestration	205
Delete Folders activity	205
Adding the Delete Folders activity in the orchestration	206
Creating, selecting, or editing a Box.com endpoint	206
Configuring the activity	206
Mapping the inputs of the activity	207
Mapping the outputs of the activity	207
Note about deploying a Box.com orchestration	207
Get Folder Details activity	208
Adding the Get Folder Details activity in the orchestration	208
Creating, selecting, or editing a Box.com endpoint	208
Configuring the activity	209
Mapping the inputs of the activity	209
Mapping the outputs of the activity	210
Note about deploying a Box.com orchestration	210
Copy Folders activity	210
Adding the Copy Folders activity in the orchestration	211
Creating, selecting, or editing a Box.com endpoint	211
Configuring the activity	212
Mapping the inputs of the activity	212
Mapping the outputs of the activity	212
Note about deploying a Box.com orchestration	213
Create Folder Shared Link activity	213
Adding the Create Folder Shared Link activity in the orchestration	213
Creating, selecting, or editing a Box.com endpoint	214
Configuring the activity	214
Mapping the inputs of the activity	214
Mapping the outputs of the activity	215
Note about deploying a Box.com orchestration	215
Upload File activity	216
Adding the Upload Files activity in the orchestration	216
Creating, selecting, or editing a Box.com endpoint	216

Configuring the activity	217
Mapping the inputs of the activity	217
Mapping the outputs of the activity	218
Note about deploying a Box.com orchestration	218
Download Files activity	218
Adding the Download Files activity in the orchestration	219
Creating, selecting, or editing a Box.com endpoint	219
Configuring the activity	220
Mapping the inputs of the activity	220
Mapping the outputs of the activity	220
Note about deploying a Box.com orchestration	221
Update Files activity	221
Adding the Update Files activity in the orchestration	221
Creating, selecting, or editing a Box.com endpoint	222
Configuring the activity	222
Mapping the inputs of the activity	222
Mapping the outputs of the activity	223
Note about deploying a Box.com orchestration	223
Delete Files activity	224
Adding the Delete Files activity in the orchestration	224
Creating, selecting, or editing a Box.com endpoint	224
Configuring the activity	225
Mapping the inputs of the activity	225
Mapping the outputs of the activity	225
Note about deploying a Box.com orchestration	226
Get File Details activity	226
Adding the Get File Details activity in the orchestration	226
Creating, selecting, or editing a Box.com endpoint	227
Configuring the activity	227
Mapping the inputs of the activity	227
Mapping the outputs of the activity	228
Note about deploying a Box.com orchestration	228
Copy Files activity	229
Adding the Copy Files activity in the orchestration	229
Creating, selecting, or editing a Box.com endpoint	229
Configuring the activity	230
Mapping the inputs of the activity	230
Mapping the outputs of the activity	230
Note about deploying a Box.com orchestration	231
Create File Shared Link activity	231
Adding the Create File Shared Link activity in the orchestration	231
Creating, selecting, or editing a Box.com endpoint	232
Configuring the activity	232
Mapping the inputs of the activity	232
Mapping the outputs of the activity	233
Note about deploying a Box.com orchestration	233
Search Files activity	234
Adding the Search Files activity in the orchestration	234
Creating, selecting, or editing a Box.com endpoint	234
Configuring the activity	235
Mapping the inputs of the activity	235
Mapping the outputs of the activity	236
Note about deploying a Box.com orchestration	236
Create Users activity	236
Adding the Create Users activity in the orchestration	237
Creating, selecting, or editing a Box.com endpoint	237
Configuring the activity	237

Mapping the inputs of the activity	238
Mapping the outputs of the activity	239
Note about deploying a Box.com orchestration	239
<b>Update Users activity</b>	<b>239</b>
Adding the Update Users activity in the orchestration	239
Creating, selecting, or editing a Box.com endpoint	240
Configuring the activity	240
Mapping the inputs of the activity	241
Mapping the outputs of the activity	241
Note about deploying a Box.com orchestration	242
<b>Delete Users activity</b>	<b>242</b>
Adding the Delete Users activity in the orchestration	242
Creating, selecting, or editing a Box.com endpoint	243
Configuring the activity	243
Mapping the inputs of the activity	243
Mapping the outputs of the activity	244
Note about deploying a Box.com orchestration	244
<b>Get User Details activity</b>	<b>244</b>
Adding the Get User Details activity in the orchestration	245
Creating, selecting, or editing a Box.com endpoint	245
Configuring the activity	246
Mapping the inputs of the activity	246
Mapping the outputs of the activity	246
Note about deploying a Box.com orchestration	247
<b>Create Groups activity</b>	<b>247</b>
Adding the Create Groups activity in the orchestration	247
Creating, selecting, or editing a Box.com endpoint	248
Configuring the activity	248
Mapping the inputs of the activity	248
Mapping the outputs of the activity	249
Note about deploying a Box.com orchestration	249
<b>Update Groups activity</b>	<b>249</b>
Adding the Update Groups activity in the orchestration	250
Creating, selecting, or editing a Box.com endpoint	250
Configuring the activity	251
Mapping the inputs of the activity	251
Mapping the outputs of the activity	251
Note about deploying a Box.com orchestration	252
<b>Delete Groups activity</b>	<b>252</b>
Adding the Delete Groups activity in the orchestration	252
Creating, selecting, or editing a Box.com endpoint	252
Configuring the activity	253
Mapping the inputs of the activity	253
Mapping the outputs of the activity	254
Note about deploying a Box.com orchestration	254
<b>Get Group Details activity</b>	<b>254</b>
Adding the Get Group Details activity in the orchestration	255
Creating, selecting, or editing a Box.com endpoint	255
Configuring the activity	255
Mapping the inputs of the activity	256
Mapping the outputs of the activity	256
Note about deploying a Box.com orchestration	257
<b>Add Users to Groups activity</b>	<b>257</b>
Adding the Add Users to Groups activity in the orchestration	257
Creating, selecting, or editing a Box.com endpoint	258
Configuring the activity	258
Mapping the inputs of the activity	258

Mapping the outputs of the activity	259
Note about deploying a Box.com orchestration	259
Delete Users from Groups activity	259
Adding the Delete Users from Groups activity in the orchestration	260
Creating, selecting, or editing a Box.com endpoint	260
Configuring the activity	261
Mapping the inputs of the activity	261
Mapping the outputs of the activity	261
Note about deploying a Box.com orchestration	261
Create Folder Permissions activity	262
Adding the Create Folder Permissions activity in the orchestration	262
Creating, selecting, or editing a Box.com endpoint	262
Configuring the activity	263
Mapping the inputs of the activity	263
Mapping the outputs of the activity	264
Note about deploying a Box.com orchestration	264
Delete Folder Permissions activity	264
Adding the Delete Folder Permissions in the orchestration	265
Creating, selecting, or editing a Box.com endpoint	265
Configuring the activity	266
Mapping the inputs of the activity	266
Mapping the outputs of the activity	266
Note about deploying a Box.com orchestration	267
Create Documents for HTML View activity	267
Adding the Create Documents for HTML View activity in the orchestration	267
Creating, selecting, or editing a Box.com endpoint	268
Configuring the activity	268
Mapping the inputs of the activity	268
Mapping the outputs of the activity	269
Note about deploying a Box.com orchestration	269
Update HTML View Documents activity	270
Adding the Update HTML View Documents activity in the orchestration	270
Creating, selecting, or editing a Box.com endpoint	270
Configuring the activity	271
Mapping the inputs of the activity	271
Mapping the outputs of the activity	271
Note about deploying a Box.com orchestration	272
Get Document as Extension activity	272
Adding the Get Document as Extension activity in the orchestration	272
Creating, selecting, or editing a Box.com endpoint	273
Configuring the activity	273
Mapping the inputs of the activity	273
Mapping the outputs of the activity	274
Note about deploying a Box.com orchestration	274
Get HTML View Documents activity	274
Adding the Get HTML View Documents activity in the orchestration	275
Creating, selecting, or editing a Box.com endpoint	275
Configuring the activity	276
Mapping the inputs of the activity	276
Mapping the outputs of the activity	277
Note about deploying a Box.com orchestration	277
View Document as HTML activity	277
Adding the View Document as HTML activity in the orchestration	278
Creating, selecting, or editing a Box.com endpoint	278
Configuring the activity	278
Mapping the inputs of the activity	279
Mapping the outputs of the activity	279

Note about deploying a Box.com orchestration	279
View Box.com File as HTML activity	280
Adding the View Box.com File as HTML as HTML activity in the orchestration	280
Creating, selecting, or editing a Box.com endpoint	280
Configuring the activity	281
Mapping the inputs of the activity	281
Mapping the outputs of the activity	282
Note about deploying a Box.com orchestration	282
Cassandra Activities	282
Overview of the Cassandra connector	283
Creating or editing an endpoint for Casandra activity	283
Cassandra Insert Rows Activity	285
Cassandra Update Rows Activity	287
Cassandra Delete Rows Activity	289
Cassandra Execute Query Activity	290
Coupa Activities	291
Creating or editing an endpoint for Coupa activity	291
Custom Fields support	292
Objects Supported by the Coupa Connector	292
Using the Coupa Create activity	293
Using the Coupa Query activity	294
Using the Coupa Retrieve activity	295
Using the Coupa Update activity	297
Domino Activities	297
Overview of the Domino connector	299
Creating or editing an endpoint for a Domino activity	300
Creating a Domino document	301
Updating a Domino document	303
Retrieving a Domino document	306
Querying Domino documents	308
Querying views for Domino documents	311
Deleting a Domino document	313
Getting events from Domino server	315
Getting invitations from Domino server	316
Getting notices from Domino server	317
Processing calendar events in Domino server	318
Processing calendar notices in Domino server	319
Creating calendar events in Domino server	319
Updating calendar events in Domino server	320
Deleting calendar events from Domino server	321
Specifying Retry and Delivery Options for Domino activities	322
Prerequisites to use Domino inbound activities	324
Get Created Documents activity	324
Get Updated Documents activity	326
Get Deleted Documents activity	327
Handling Date/Time and Time zone data types	328
Rich text support for Domino connector	329
Troubleshooting and support	330
Dropbox Activities	330
Creating or editing an endpoint for Dropbox Activity.	331
Selecting or editing a Dropbox endpoint	331
Activity: Download File	332
Add the Download File Activity in the orchestration	332
Creating, selecting, or editing a Dropbox endpoint	333
Mapping the inputs of the Activity	333
Click on Map Input link in Configure Activity section displayed below the orchestration.	333
Mapping the outputs of the Activity	334

Note about Deploying a Dropbox Orchestration	334
Activity: Upload File	334
Add the Upload File Activity in the orchestration	335
Creating, selecting, or editing a Dropbox endpoint	335
Mapping the inputs of the Activity	336
Click on Map Input link in Configure Activity section displayed below the orchestration.	336
Mapping the outputs of the Activity	337
Note about Deploying a Dropbox Orchestration	339
Activity: Commit a Chunked Upload	339
Add the Commit a Chunked Upload Activity in the orchestration:	340
Creating, selecting, or editing a Dropbox endpoint	340
Mapping the inputs of the Activity	340
Click on Map Input link in Configure Activity section displayed below the orchestration.	341
Mapping the outputs of the Activity	342
Activity: Get File Details	342
Add the Get File Details Activity in the orchestration:	342
Creating, selecting, or editing a Dropbox endpoint	343
Mapping the inputs of the Activity	343
Click on Map Input link in Configure Activity section displayed below the orchestration.	343
Mapping the outputs of the Activity	345
Note about Deploying a Dropbox Orchestration	346
Activity: Get File Copy reference	346
Add the Get File Copy reference Activity in the orchestration	346
Creating, selecting, or editing a Dropbox endpoint	347
Mapping the inputs of the Activity	347
Click on Map Input link in Configure Activity section displayed below the orchestration.	347
Mapping the outputs of the Activity	348
Note about Deploying a Dropbox Orchestration	348
Activity: Copy File	348
Add the Copy File Activity in the orchestration:	349
Creating, selecting, or editing a Dropbox endpoint	349
Mapping the inputs of the Activity	350
Click on Map Input link in Configure Activity section displayed below the orchestration.	350
Mapping the outputs of the Activity	350
Note about Deploying a Dropbox Orchestration	351
Activity: Delete File	351
Add the Delete File Activity in the orchestration:	352
Creating, selecting, or editing a Dropbox endpoint	352
Mapping the inputs of the Activity	352
Click on Map Input link in Configure Activity section displayed below the orchestration.	353
Mapping the outputs of the Activity	353
Note about Deploying a Dropbox Orchestration	354
Activity: Move File	354
Add the Move File Activity in the orchestration:	354
Creating, selecting, or editing a Dropbox endpoint	355
Mapping the inputs of the Activity	355
Click on Map Input link in Configure Activity section displayed below the orchestration.	355
Mapping the outputs of the Activity	356
Note about Deploying a Dropbox Orchestration	357
Activity: Search Files	357
Add the Search Files Activity in the orchestration:	358
Creating, selecting, or editing a Dropbox endpoint	358
Mapping the inputs of the Activity	358
Click on Map Input link in Configure Activity section displayed below the orchestration.	359
Mapping the outputs of the Activity	359
Note about Deploying a Dropbox Orchestration	360
Activity: Get Shared Link	360

Add the Get Shared Link Activity in the orchestration:	361
Creating, selecting, or editing a Dropbox endpoint	361
Mapping the inputs of the Activity	361
Click on Map Input link in Configure Activity section displayed below the orchestration.	362
Mapping the outputs of the Activity	362
Note about Deploying a Dropbox Orchestration	363
Activity: Copy Folder	363
Add the Copy Folder Activity in the orchestration:	363
Creating, selecting, or editing a Dropbox endpoint	364
Mapping the inputs of the Activity	364
Click on Map Input link in Configure Activity section displayed below the orchestration.	364
Mapping the outputs of the Activity	365
Note about Deploying a Dropbox Orchestration	366
Activity: Create Folder	366
Add the Create Folder Activity in the orchestration:	366
Creating, selecting, or editing a Dropbox endpoint	367
Mapping the inputs of the Activity	367
Click on Map Input link in Configure Activity section displayed below the orchestration.	367
Mapping the outputs of the Activity	368
Note about Deploying a Dropbox Orchestration	368
Activity: Delete Folder	369
Add the Delete Folder Activity in the orchestration:	369
Creating, selecting, or editing a Dropbox endpoint	369
Mapping the inputs of the Activity	370
Click on Map Input link in Configure Activity section displayed below the orchestration.	370
Mapping the outputs of the Activity	370
Note about Deploying a Dropbox Orchestration	371
Activity: Move Folder	372
Add the Move Folder Activity in the orchestration:	372
Creating, selecting, or editing a Dropbox endpoint	372
Mapping the inputs of the Activity	373
Click on Map Input link in Configure Activity section displayed below the orchestration.	373
Mapping the outputs of the Activity	373
Note about Deploying a Dropbox Orchestration	375
Activity: Get Folder Details	375
Add the Get Folder Details Activity in the orchestration:	375
Creating, selecting, or editing a Dropbox endpoint	375
Mapping the inputs of the Activity	376
Click on Map Input link in Configure Activity section displayed below the orchestration.	376
Mapping the outputs of the Activity	378
Note about Deploying a Dropbox Orchestration	379
Activity: Get User Details	379
Add the Get User Details Activity in the orchestration:	379
Creating, selecting, or editing a Dropbox endpoint	380
Mapping the inputs of the Activity	380
Click on Map Input link in Configure Activity section displayed below the orchestration.	380
Mapping the outputs of the Activity	381
Note about Deploying a Dropbox Orchestration	382
Activity: Preview File	382
Add the Preview File Activity in the orchestration:	382
Creating, selecting, or editing a Dropbox endpoint	383
Mapping the inputs of the Activity	383
Click on Map Input link in Configure Activity section displayed below the orchestration.	383
Mapping the outputs of the Activity	384
Note about Deploying a Dropbox Orchestration	384
Activity: Restore File Revision	384
Add the Restore File Revision Activity in the orchestration:	385

Creating, selecting, or editing a Dropbox endpoint	385
Mapping the inputs of the Activity	386
Click on Map Input link in Configure Activity section displayed below the orchestration.	386
Mapping the outputs of the Activity	386
Note about Deploying a Dropbox Orchestration	387
<b>Eloqua Bulk API Activities</b>	<b>388</b>
Creating or editing an endpoint for Eloqua Bulk API activity	388
Using the Eloqua Bulk API Create Import Definition activity	389
Using the Eloqua Bulk API Create Export Definition activity	390
Using the Eloqua Bulk API Get Import Definition activity	391
Using the Eloqua Bulk API Push Data for Import activity	393
Using the Eloqua Bulk API Synchronize Data activity	394
Using the Eloqua Bulk API Get Synchronization Status Details activity	395
Using the Eloqua Bulk API Get Export Definition activity	396
Using the Eloqua Bulk API Get Data for Export Definition activity	397
Using the Eloqua Bulk API Update Import Definition activity	398
Using the Eloqua Bulk API Update Export Definition activity	400
Using the Eloqua Bulk API Delete Import Definition activity	401
Using the Eloqua Bulk API Delete Export Definition activity	402
<b>Eloqua ReST API Activities</b>	<b>403</b>
Overview of Eloqua ReST API Connector	403
Creating or editing an endpoint for Eloqua ReST API activity	404
Using the Eloqua ReST API Create activity	405
Using the Eloqua ReST API Delete activity	406
Using the Eloqua ReST API Retrieve activity	407
Using the Eloqua ReST API Update activity	408
<b>Email Activities</b>	<b>409</b>
Creating or editing an email endpoint	410
Get Email activity	413
Send Email activity	415
Testing an SSL email connection	419
<b>Force.com Bulk API Activities</b>	<b>419</b>
Preparing Data for the Force.com Bulk API connector	420
Creating a Force.com Bulk API endpoint	420
Specifying the Retry options for Force.com Bulk API activities	421
Using the Force.com Bulk API Batch Insert activity	422
Using the Force.com Bulk API Batch Update activity	423
Using the Force.com Bulk API Batch Upsert activity	424
Using the Force.com Bulk API Batch Delete activity	425
Using the Force.com Bulk API Get Batch Status activity	426
Using the Force.com Bulk API Get Batch Results activity	427
<b>FTP Activities</b>	<b>427</b>
Creating or Editing an FTP endpoint	428
Configuring the FTP endpoint for the Parse Directory Listing Example	430
FTP Poll Directory activity	432
FTP Put File activity	437
FTP Get File activity	441
FTP Delete File activity	445
FTP List Files activity	448
FTP Rename File activity	453
Parse directory listing example	457
Testing an FTPS server connection	458
<b>HTTP Activities</b>	<b>459</b>
Creating or editing an HTTP endpoint	460
HTTP Receive Request activity	464
Decompression with the HTTP Receive Request activity	467
HTTP Send Response activity	469

Compression/Decompression with the HTTP Send Response activity	471
HTTP Post Request activity	473
HTTP Get Request activity	478
HTTP Head Request activity	483
HTTP Invoke Request activity	487
HTTP Put Request activity	492
HTTP Delete Request activity	497
Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity	502
Troubleshooting and support	505
<b>Infosphere MDM Activities</b>	<b>507</b>
Overview of InfoSphere MDM and Cast Iron Connector	507
Creating or editing an endpoint for MDM Connector activity	508
Updating modified MDM model or WSDL	509
Starting an MDM service activity	509
Adding an activity	510
Creating an endpoint	510
Configuring the activity	511
Specifying retry options	511
Mapping activity input	512
Mapping activity output	513
Troubleshooting and support	513
<b>Insightly Activities</b>	<b>513</b>
Overview of Insightly connector	514
Creating or editing an endpoint for Insightly Activity	515
Insightly Create Objects Activity	517
Insightly Retrieve Objects Activity	517
Insightly Update Objects Activity	518
Insightly Delete Objects Activity	519
Insightly Retrieve All Objects Activity	520
Specifying Retry Options for Insightly REST API Activities	521
<b>JDE Activities</b>	<b>522</b>
Overview of the JD Edwards (JDE) connector	522
Creating or editing an endpoint for a JDE activity	523
Importing JDE Libraries	524
Installing JAR files to connect to the JDE server	525
Using the JDE Invoke Business Function activity	526
Using the JDE Poll Real-Time Events activity	527
Specifying Retry and Delivery Options for JDE Activities	528
<b>JIRA Activities</b>	<b>529</b>
Overview of JIRA connector	530
Creating or editing an endpoint for JIRA Activity	530
JIRA Create Objects Activity	533
JIRA Retrieve Objects Activity	534
JIRA Retrieve All Objects Activity	535
JIRA Update Objects Activity	536
JIRA Delete Objects Activity	537
JIRA Search Objects Activity	537
Specifying Retry Options for JIRA REST API Activities	539
<b>JMS Activities</b>	<b>540</b>
Creating or editing a JMS endpoint	541
Specifying delivery rules and retry parameters for JMS activities	542
Specifying delivery rules parameters for JMS activities	542
Specifying retry parameters for JMS activities	543
Get Message activity	544
Adding a JMS activity to an orchestration	544
Changing the Activity Name	544
Picking a JMS endpoint	545

Configuring the Get Message activity	545
Mapping the Inputs	546
Mapping the Outputs	546
Poll Message activity	547
Adding a JMS activity to an orchestration	548
Changing the Activity Name	548
Picking a JMS endpoint	548
Configuring the Poll Message activity	549
Mapping the Outputs	549
Publish Message activity	550
Adding a JMS activity to an orchestration	550
Changing the Activity Name	551
Picking a JMS endpoint	551
Configuring the Publish Message activity	551
Mapping the Inputs	552
Send Message activity	553
Adding a JMS activity to an orchestration	553
Changing the Activity Name	553
Picking a JMS endpoint	554
Configuring the Send Message activity	554
Mapping the Inputs	555
Subscribe Message activity	555
Adding a JMS activity to an orchestration	556
Changing the Activity Name	556
Picking a JMS endpoint	556
Configuring the Subscribe Message activity	557
Mapping the Outputs	557
Creating a JMS endpoint to a WebLogic server	558
LDAP Connector Activities	559
Overview of the LDAP connector	560
Creating or editing an endpoint for LDAP connector	560
Creating LDAP Entry	561
Delete LDAP Entry	562
Retrieve LDAP Entry	563
Search LDAP Entry	565
MailChimp Activities	566
Overview of MailChimp Connector	567
Creating or editing an endpoint for MailChimp Connector	568
MailChimp Create Objects Activity	573
MailChimp Update Objects Activity	574
MailChimp Delete Objects Activity	575
MailChimp Retrieve Objects Activity	576
MailChimp Retrieve All Objects Activity	577
MailChimp Search Objects Activity	578
MailChimp Upsert Members Activity	579
MailChimp Retrieve Reports Activity	580
MailChimp Retrieve All Reports Activity	581
MailChimp Send Campaigns Activity	583
MailChimp Cancel Campaigns Activity	584
MailChimp Batch Create Objects Activity	585
MailChimp Batch Update Objects Activity	586
MailChimp Batch Upsert Objects Activity	587
MailChimp Batch Retrieve Objects Activity	588
MailChimp Get Batch Status Activity	589
MailChimp Get Batch Results Activity	590
Specifying the Retry Option for MailChimp REST API activities	591
Marketo Activities	592

Overview of Marketo Connector	593
Creating or editing an Endpoint for Marketo	594
Marketo Create Objects Activity	597
Marketo Update Objects Activity	598
Marketo Upsert Objects Activity	599
Marketo Delete Objects Activity	600
Marketo Retrieve Objects Activity	601
Marketo Retrieve All Objects Activity	602
Marketo Search Objects Activity	603
Marketo Get Paging Token Activity	604
Marketo Request Campaigns Activity	605
Marketo Schedule Campaigns Activity	606
Marketo Merge Lead Activity	607
Marketo Add Leads to List Activity	608
Marketo Remove Leads from List Activity	608
Marketo Member of List Activity	609
Marketo Import Lead Activity	610
Marketo Get Import Lead Status Activity	611
Marketo Get Import Error File Activity	611
Marketo Get Import Warning File Activity	612
Marketo Send Sample Email Activity	613
Marketo Update Email Content Activity	614
Marketo Approve Objects Activity	615
Marketo Unapprove Objects Activity	615
Marketo Discard Objects Activity	616
Marketo Clone Objects Activity	617
Specifying the Retry Options for Marketo REST API Activities	618
MS Dynamics AX Activities	619
Services Provided	620
Authentication supported	620
Creation and Deployment of new port on IIS	621
Creating a MS Dynamics AX Endpoint in Cast Iron	622
Using the MS Dynamics AX Invoke service Activity	623
Connector Operations	623
Services	624
Advance shipping notice	625
Operations and their Mandatory fields	625
Fixed Asset	626
Operations and their Mandatory fields	626
Vendor Group	627
Operations and their Mandatory fields	627
Exchange Rate	628

<b>MS Office 365 Activities</b>	<b>664</b>
Creating or editing an endpoint for MS Office 365 activity	665
Using the MS Office 365 Send Mails activity	665
Using the MS Office 365 Get Mails activity	667
Using the MS Office 365 Delete Mails activity	668
Using the MS Office 365 Move Mails activity	668
Using the MS Office 365 Respond Mail activity	669
Using the MS Office 365 Update Mails activity	670
Using the MS Office 365 Create Draft Mails activity	671
Using the MS Office 365 Get Folders activity	672
Using the MS Office 365 Create Folders activity	673
Using the MS Office 365 Update Folders activity	674
Using the MS Office 365 Delete Folders activity	675
Using the MS Office 365 Move Folders activity	676
Using the MS Office 365 Create Contacts activity	677
Using the MS Office 365 Update Contacts activity	678
Using the MS Office 365 Get Contacts activity	679
Using the MS Office 365 Delete Contacts activity	680
Using the MS Office 365 Get Contact Folders activity	681
Using the MS Office 365 Create Calendars activity	682
Using the MS Office 365 Update Calendars activity	682
Using the MS Office 365 Get Calendars activity	683
Using the MS Office 365 Delete Calendars activity	684
Using the MS Office 365 Create Calendar Groups activity	685
Using the MS Office 365 Update Calendar Groups activity	686
Using the MS Office 365 Get Calendar Groups activity	687
Using the MS Office 365 Delete Calendar Groups activity	688
Using the MS Office 365 Create Events activity	689
Using the MS Office 365 Update Events activity	690
Using the MS Office 365 Get Events activity	692
Using the MS Office 365 Delete Events activity	693
<b>MS Office One Drive Activities</b>	<b>694</b>
Creating or editing an endpoint for MS Office 365 OneDrive activity	694
Using the MS Office 365 OneDrive Create Folders Activity	695
Using the MS Office 365 OneDrive Upload Files Activity	695
Using the MS Office 365 OneDrive List Folder Contents Activity	696
Using the MS Office 365 OneDrive Download Files Activity	697
Using the MS Office 365 One Drive Get Properties Activity	698
Using the MS Office 365 One Drive Update Properties Activity	699
Using the MS Office 365 One Drive Copy Files or Folders Activity	700
Using the MS Office 365 One Drive Delete Files or Folders Activity	701
<b>MS SharePoint Activities</b>	<b>702</b>
MS SharePoint Connector Overview	703
Creating or editing an endpoint for MS SharePoint activity	704
MS SharePoint Upload File Activity	705
MS SharePoint Update File Activity	706
MS SharePoint Delete File Activity	707
MS SharePoint Download File Activity	708
MS SharePoint Create Folder Activity	709
MS SharePoint Retrieve Folder Activity	710
MS SharePoint Update Folder Activity	711
MS SharePoint Delete Folder Activity	712
MS SharePoint Retrieve User Activity	713
MS SharePoint Share Files Activity	714
MS SharePoint Search Files Activity	715
MS SharePoint Create Lists Activity	716

MS SharePoint Update Lists Activity	717
MS SharePoint Retrieve Lists Activity	718
MS SharePoint Delete Lists Activity	719
MS SharePoint Create List Items Activity	720
MS SharePoint Update List Items Activity	721
MS SharePoint Retrieve List Items Activity	722
MS SharePoint Delete List Items Activity	723
MS SharePoint Create Attachments Activity	724
MS SharePoint Update Attachments Activity	725
MS SharePoint Retrieve Attachments Activity	726
MS SharePoint Retrieve Attachment Content Activity	727
MS SharePoint Delete Attachments Activity	728
Specifying the Retry options for MS SharePoint REST API activities	730
MS Dynamics CRM Activities	730
Creating and editing the MSDynamics CRM endpoint	731
Using the MSDynamics CRM Create activity	733
Using the MSDynamics CRM Update activity	733
Using the MSDynamics CRM Delete activity	734
Using the MSDynamics CRM Retrieve activity	735
Specifying retry parameters for MSDynamics CRM activities	736
MQ Activities	737
Creating or editing a MQ Activity endpoint	737
Installing JAR files to connect to the MQ system	739
Defining and loading an XML schema for a MQRFH2 header	739
MQ Get Message activity	740
MQ Put Message activity	744
MQ Poll Queue activity	746
MQRFH2 XML data and schema examples	748
NetSuite Activities	751
Creating or editing a NetSuite endpoint	752
Add Records activity	753
Using the Add Records activity	754
Mapping the inputs for the Add Records activity	754
Mapping the outputs for the Add Records activity	755
Attach Records activity	755
Using the Attach Records activity	756
Mapping the inputs for the Attach Records activity	757
Mapping the outputs for the Attach Records activity	757
Delete Records activity	758
Using the Delete Records activity	758
Mapping the inputs for the Delete Records activity	759
Mapping the outputs for the Delete Records activity	759
Detach Records activity	760
Using the Detach Records activity	761
Mapping the inputs for the Detach Records activity	761
Mapping the outputs for the Detach Records activity	762
Get Records activity	762
Using the Get Records activity	762
Mapping the inputs for the Get Records activity	763
Mapping the outputs for the Get Records activity	764
Initialize Record activity	764
Using the Initialize Record activity	765
Mapping the inputs for the Initialize Records activity	766
Mapping the outputs for the Initialize Records activity	767
Search Records activity	767
Using the Search Records activity	768
Mapping the inputs for the Search Records activity	769

Mapping the outputs for the Search Records activity	769
Update Records activity	769
Using the Update Records activity	770
Mapping the inputs for the Update Records activity	771
Mapping the outputs for the Update Records activity	771
Upsert Records Activity	772
Using the Upsert Records activity	772
Mapping the inputs for the Upsert Records activity	773
Mapping the outputs for the Upsert Records activity	773
Troubleshooting and support	774
Oracle CRM On Demand Activities	774
Creating or editing an Oracle CRM On Demand endpoint	775
Specifying the Retry options for Oracle CRM On Demand activities	776
Using the Oracle CRM On Demand Insert Object activity	777
Using the Oracle CRM On Demand Update Object activity	778
Using the Oracle CRM On Demand Query Object activity	779
Using the Oracle CRM On Demand Delete Object activity	780
Oracle E-Business Suite Activities	780
Overview of the Oracle E-Business Suite connector	781
Installing JAR files to connect to Oracle E-Business Suite	782
Creating or editing an endpoint for an Oracle E-Business Suite activity	782
Using the Oracle E-Business Suite Create Objects activity	783
Using the Oracle E-Business Suite Update Objects activity	784
Using the Oracle E-Business Suite Delete Objects activity	785
Using the Oracle E-Business Suite Retrieve Objects activity	786
Specifying Retry and Delivery options for Oracle E-Business Suite activities	787
Prerequisites for starter activities in Oracle E-Business Suite	789
Using the Oracle E-Business Suite Get Created Objects activity	790
Using the Oracle E-Business Suite Get Updated Objects activity	791
Using the Oracle E-Business Suite Get Deleted Objects activity	792
PeopleSoft activities	793
Overview of the PeopleSoft connector	794
Creating or editing an endpoint for a PeopleSoft activity	795
Installing JAR files to connect to the PeopleSoft server	796
Using the PeopleSoft Create Component Interface activity	796
Using the PeopleSoft Update Component Interface activity	797
Using the PeopleSoft Delete Component Interface activity	799
Using the PeopleSoft Get Component Interface activity	800
Using the PeopleSoft Find Component Interface activity	801
Creating events table and compiling PeopleSoft JAR files	802
Using the PeopleSoft Get Created Component Interface activity	804
Using the PeopleSoft Get Updated Component Interface activity	805
Using the PeopleSoft Get Deleted Component Interface activity	806
Specifying retry and Delivery Options for PeopleSoft Activities	807
QuickBooks Activities	808
Services Provided	808
Creating or editing an endpoint for Intuit QuickBooks activity	809
Regeneration of Access Token	810
Required connection Headers	810
QuickBooks Supported Objects	811
Using the QuickBooks Create activity	812
Using the QuickBooks Delete activity	813
Using the QuickBooks Update activity	813
Using the QuickBooks Query activity	814
Using the QuickBooks Retrieve activity	815
RightNow SOAP API Activities	815
Overview of the RightNow SOAP API connector	816

Creating and editing a RightNow SOAP API endpoint	816
Using the RightNow SOAP API Create Objects activity	817
Using the RightNow SOAP API Get Objects activity	818
Using the RightNow SOAP API Update Objects activity	819
Using the RightNow SOAP API Destroy Objects activity	820
Using the RightNow SOAP API Query Objects activity	821
Specifying retry parameters for RightNow SOAP API activities	822
Salesforce.com activities	823
Creating or editing a Salesforce.com endpoint	824
Configuring Salesforce.com activities	826
Migrating Salesforce.com projects	827
Setting Salesforce.com configuration properties	827
Specifying the Retry and Time Out parameters for Salesforce.com activities	828
Understanding and setting polling preferences for the Salesforce.com connector	829
Convert Lead activity	829
Map the input of the Convert Lead activity	830
Map the output of the Convert Lead activity	830
Set password activity	831
Reset password activity	832
Send email activity	833
Create Objects activity	834
Map the input of the Create Objects activity	834
Map the output of the Create Object activity	835
Delete Objects activity	836
Map the input of the Delete Objects activity	836
Map the output of the Delete Object activity	837
Get Deleted Objects	837
Map the input of the Get Deleted Objects activity	838
Map the output of the Get Deleted Object activity	838
Get Updated Objects	839
Map the input of the Get Updated Objects activity	839
Map the output of the Get Updated Object activity	840
Get User Information activity	840
Map the output of the Get User Information activity	841
Get Server Timestamp activity	841
Map the output of the Get Server Timestamp activity	842
Merge Objects Activity	842
Map the input of the Merge Objects activity	843
Map the output of the Merge Object activity	844
Poll Deleted Objects activity	844
Map the output of the Poll Deleted Object activity	844
Poll Updated Objects activity	845
Map the output of the Poll Updated Object activity	846
Query Objects activity	846
Configuring the Query Objects activity	847
Retrieve Objects activity	849
Search Objects activity	850
Undelete Objects activity	851
Configuring the Search Objects activity	852
Update Objects activity	853
Upsert Objects activity	855
Sage CRM Activities	856
Overview of Sage CRM Connector	856
Creating or editing an endpoint for Sage CRM Activity	857
Sage CRM Create Objects Activity	860
Sage CRM Retrieve Objects Activity	861
Sage CRM Update Objects Activity	862

Sage CRM Delete Objects Activity	863
Sage CRM Retrieve All Objects Activity	864
Sage CRM Query Objects Activity	865
Specifying Retry options for Sage CRM REST API Activities	866
Salesforce Analytics activities	867
Overview of the Salesforce Analytics connector	868
How to Install the Salesforce Analytics Connector	868
Use case with CSV format data	869
Use case with XML format data	869
Create Dataset Activity	869
Load Data Activity	870
Load Data Activity - Continued	871
Update Dataset Activity	871
Retrieve Dataset Activity	872
Example 1: How to Configure the Write XML Activity for XML Data	873
Example 1: Continued	873
SAP activities	874
Overview of the SAP connector	875
Creating or editing a SAP endpoint	875
Downloading and installing the SAP Jar Files and DLLs	877
Configuring Single Sign-on (SSO) and Secure Network Communications (SNC) for SAP connector	878
SAP Invoke BAPI activity	879
SAP Invoke RFC activity	882
SAP Receive IDOC activity	885
SAP Send IDOC activity	886
SAP Receive RFC activity	889
SAP Send RFC Response activity	890
Troubleshooting and support	891
SAP C4C Activities	898
Overview of SAP C4C Core Connector	898
Creating and editing a SAP C4C Core Endpoint	899
Using the Query Activity	900
Using the Manage Activity	901
Using the Invoke Service Activity	902
Specifying the retry options for SAP C4C Core activities	903
X.509 Certificate Authentication for SAP C4C Connector - Points to remember	904
ServiceMax activities	904
Creating or editing a ServiceMax endpoint	905
Configuring ServiceMax activities	907
Setting ServiceMax configuration properties	908
Specifying the Retry and Time Out parameters for ServiceMax activities	908
Understanding and setting polling preferences for the ServiceMax connector	909
Poll Updated Objects activity	910
Get Updated Objects	911
Poll Deleted Objects activity	912
Get Deleted Objects	913
Create Objects activity	914
Update Objects activity	915
Upsert Objects activity	916
Delete Objects activity	917
Undelete Objects activity	919
Retrieve Objects activity	919
Query Objects activity	846
Configuring the Query Objects activity	922
Search Objects activity	924
Configuring the Search Objects activity	925
Convert Lead activity	926

Merge Objects Activity	927
Get User Information activity	929
Get Server Timestamp activity	930
Send email activity	930
Set password activity	931
Reset password activity	932
ServiceNow Activities	933
Overview of ServiceNow Connector	934
Creating or editing an endpoint for ServiceNow activity	934
Using the ServiceNow Session Management	935
Using the ServiceNow Create activity	936
Using the ServiceNow Retrieve activity	937
Using the ServiceNow Update activity	938
Using the ServiceNow Delete activity	938
Siebel activities	939
Overview of the Siebel connector	940
Installing JAR files to connect to the Siebel server	940
Creating or editing a Siebel endpoint	941
Using the Siebel Create Objects activity	943
Using the Siebel Update Objects activity	945
Using the Siebel Delete Objects activity	946
Using the Siebel Query Objects activity	948
Using the Siebel Execute Business Service activity	949
Prerequisites for starter activities in Siebel	950
Using the Siebel Get Created Objects activity	952
Using the Siebel Get Updated Objects activity	953
Using the Siebel Get Deleted Objects activity	954
Specifying Retry and Delivery Options for Siebel Activities	956
Siebel properties file	957
Silver Pop Activities	958
Creating or editing an endpoint for Silverpop Activity.	959
Selecting or editing a Silverpop endpoint	959
Activity: Add Contact	960
Add the Add Contact Activity in the orchestration	960
Creating, selecting, or editing a Silverpop endpoint	960
Configuring the Activity	961
Mapping the inputs of the Activity	961
Click on Map Input link in Configure Activity section displayed below the orchestration.	961
Mapping the outputs of the Activity	963
Note about Deploying a Silverpop Orchestration	963
Activity: Add Lead	963
Add the Add Lead Activity in the orchestration	964
Creating, selecting, or editing a Silverpop endpoint	964
Configuring the Activity	964
Mapping the inputs of the Activity	965
Click on Map Input link in Configure Activity section displayed below the orchestration.	965
Mapping the outputs of the Activity	966
Note about Deploying a Silverpop Orchestration	967
Activity: Update Contact	967
Add the Update Contact Activity in the orchestration:	967
Creating, selecting, or editing a Silverpop endpoint	968
Configuring the Activity	968
Mapping the inputs of the Activity	969
Click on Map Input link in Configure Activity section displayed below the orchestration.	969
Mapping the outputs of the Activity	970
Note about Deploying a Silverpop Orchestration	970
Activity: Update Lead	971

Add the Update Lead Activity in the orchestration	971
Creating, selecting, or editing a Silverpop endpoint	971
Configuring the Activity	972
Mapping the inputs of the Activity	972
Click on Map Input link in Configure Activity section displayed below the orchestration.	972
Mapping the outputs of the Activity	974
Note about Deploying a Silverpop Orchestration	974
Activity: Select Contact	974
Add the Select Contact Activity in the orchestration	975
Creating, selecting, or editing a Silverpop endpoint	975
Configuring the Activity	975
Mapping the inputs of the Activity	976
Click on Map Input link in Configure Activity section displayed below the orchestration.	976
Mapping the outputs of the Activity	977
Note about Deploying a Silverpop Orchestration	978
Activity: Select Lead	978
Add the Select Lead Activity in the orchestration	979
Creating, selecting, or editing a Silverpop endpoint	979
Configuring the Activity	979
Mapping the inputs of the Activity	980
Click on Map Input link in Configure Activity section displayed below the orchestration.	980
Mapping the outputs of the Activity	981
Note about Deploying a Silverpop Orchestration	982
Activity: Remove Contact	982
Add the Remove Contact Activity in the orchestration	983
Creating, selecting, or editing a Silverpop endpoint	983
Configuring the Activity	984
Mapping the inputs of the Activity	984
Click on Map Input link in Configure Activity section displayed below the orchestration.	984
Mapping the outputs of the Activity	985
Note about Deploying a Silverpop Orchestration	985
Activity: Remove Lead	986
Add the Remove Lead Activity in the orchestration	986
Creating, selecting, or editing a Silverpop endpoint	986
Configuring the Activity	987
Mapping the inputs of the Activity	987
Click on Map Input link in Configure Activity section displayed below the orchestration.	987
Mapping the outputs of the Activity	988
Note about Deploying a Silverpop Orchestration	988
Security Token Service (STS) activities	989
Creating or editing an STS endpoint	989
Using the STS Get SAML 2.0 Token activity	991
SugarCRM activities	993
Creating and editing a SugarCRM endpoint	994
Using the SugarCRM Upsert Object activity	995
Using the SugarCRM Get Reports activity	996
Using the SugarCRM Delete Object activity	997
Using the SugarCRM Get Object activity	998
Using the SugarCRM Query Object activity	998
Using the SugarCRM Get ServerInfo activity	999
Using the SugarCRM Get UserInfo activity	1000
Using the SugarCRM Search activity	1001
Using the SugarCRM Set Relationship activity	1002
Using the SugarCRM Delete Relationship activity	1003
Using the SugarCRM Get Relationship activity	1004
Specifying the Retry options for SugarCRM activities	1005
SugarCRM REST API Activities	1006

Creating and editing a SugarCRM REST API endpoint	1006
Using the SugarCRM REST API Get UserInfo activity	1007
Using the SugarCRM REST API Get ServerInfo activity	1008

<b>CDK Developer's Guide</b>	2514
Introduction	2514
Design considerations	2514
How this guide is organized	2515
Getting started with the CDK Connector Wizard	2516
Connector Information window	2516
Using the Add Connection Fields window	2517
Using the Add Activities window	2518
Final Summary window	2520

Completing your orchestrations	2521
Cast Iron connector interfaces	2522
Completing the connector interface orchestrations	2524
Completing the TestConnection orchestration	2524
Completing the ListObjects orchestration	2525
Completing the DescribeObjects orchestration	2527
Publishing to a local repository	2529
Test and debug	2530
Unit testing your connector components	2530
Integration testing your connector services and activities	2531
Exporting and importing a connector project	2533
Exporting your connector project	2533
Importing a connector project	2533
Cast Iron CDK components	2534
Cast Iron CDK schema files	2535
Cast Iron CDK XML file	2550

# IBM WebSphere Cast Iron Version 7.5.1 documentation

---

Contains information that leads you through the key tasks that are required to use IBM® WebSphere® Cast Iron® Version 7.5.1.

**Effective September 30, 2016, IBM Cast Iron is being rebranded as IBM App Connect Professional, as announced on September 13, 2016.**

## Getting started

### What's new

[What's New for This Release](#)

### Introductory topics

[IBM Cast Iron Studio](#)

[IBM Cast Iron Express®](#)

[IBM Cast Iron Live](#)

[IBM Cast Iron Web Management Console \(WMC\)](#)

[IBM Cast Iron Command Line Interface \(CLI\) Reference](#)

[IBM Cast Iron High Availability Pairs \(HA\) Reference](#)

[IBM Cast Iron Hypervisor Edition](#)

[IBM Cast Iron Notification Reference](#)

[IBM Cast Iron Management API Guide](#)

[IBM Cast Iron Connector Developer Kit \(CDK\) Developers Guide](#)

### Take a course

[IBM Education Assistant](#)

### Common tasks

#### Getting Started

---

Copyright IBM Corporation 2003, 2013. All Rights Reserved.

## Documentation for older versions of WebSphere Cast Iron

---

For older versions of WebSphere® Cast Iron products, the following archive files are available for you to download:

- [WebSphere\\_Cast\\_Iron\\_v6.0.0.zip](#)
- [WebSphere\\_Cast\\_Iron\\_v6.1.0.zip](#)
- [WebSphere\\_Cast\\_Iron\\_v6.3.0.zip](#)

The archive files contain the following content sub-directories:

- /plugins : Contains Eclipse plugins for use in IBM Knowledge Center - Customer installed edition or in Eclipse help
- /html : Contains normalised HTML + HTML TOC, for use as an HTML web site or local files

## What's New for This Release

---

IBM® WebSphere® Cast Iron® version 7.5.1 delivers new and enhanced features.

IBM WebSphere Cast Iron Version 7.5.1 contains new features and updates for the following components:

- Studio
- Connectors
- Management Console

## Studio

---

This section describes new features and updates for Studio. For more information about connector new features and updates, see the Connectors section.

- Support for migrating WSDL of a WorkDay Connector Project
- Enhancements to supported activities of JIRA Connector, Insightly Connector, and MS SharePoint.
- SAP dependency JCo Jar files - Version Specific information
- Transformation activities for Open Data Protocol (OData)
- New connectors are available for download. For more information about the new connectors, see the Connectors section.

## Connectors

---

Along with updates to the existing connectors, Studio now supports the following:

- The new connectors added to the list are:
  - Apache Cassandra connector - Allows you to Insert Rows, Update Rows, Delete Rows, and Execute Query on Cassandra.
  - MailChimp connector - Supports Objects on CRUD operations, Batch operations, and Atomic operations.
  - Marketo connector - interacts using Restful Web Service API's, which allow users to access bi-directional data-level integration.
  - Sage CRM connector - Enables fetching data from the CRM and saving / updating data into the CRM for integration.
- Enhancements to supported activities of JIRA Connector, Insightly Connector, and MS SharePoint.

## Management Console

---

The following section describes new features and updates for the Web Management Console (WMC):

- Agent Monitoring tool for Secure Connectors
- Push WSDL from Cast Iron Project to API Management
- Push REST API (Swagger) from Cast Iron Project to API Management
- Support for Cast Iron Docker Container

---

### Feedback | Notices

## Introduction

---

This section gives an introduction to the Integration Appliance, Studio, and the Web Management Console. There is also information about accessing Template Integration Projects, and information about installation and configuration.

- [Development Environment](#)  
The Integration Appliance combines data integration, transformation, routing, monitoring, and management capabilities in a single product. During run time, the Integration Appliance shares data and processing among databases, enterprise applications, legacy systems, and business applications.
- [Integration Appliance](#)  
The Integration Appliance is a rack-mountable appliance comprised of redundant and hot-swappable components
- [Web Management Console](#)  
The Web Management Console (WMC) is a browser-based application hosted by the Integration Appliance
- [Studio](#)  
Studio is a development tool for designing and building integration projects.
- [Installation and configuration](#)  
This topic discusses the installation and configuration steps you must complete before you build and run an integration

project.

---

## [Feedback | Notices](#)

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_introduction.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_introduction.html)

# Development Environment

---

The Integration Appliance combines data integration, transformation, routing, monitoring, and management capabilities in a single product. During run time, the Integration Appliance shares data and processing among databases, enterprise applications, legacy systems, and business applications.

## Capabilities

---

- Broad support for the following industry-standard formats:
  - XML (W3C XML Schemas, DTDs, and XML documents)
  - Flat File, raw text, and raw binary data types
  - Supports many character encodings including UTF-8, US-ASCII, ISO- 8859-1, SHIFT\_JIS, EBDIC-XML-US, and EUC-JP
  - Commercial database systems, including Informix®, Sybase, DB2®, MySQL, Oracle and others through Sequelink.
  - System-specific protocols, such as SAP IDOC and IBM® MQ Series
  - Web Services
- Ability to transform data easily from one format to another format, for example: Flat File data to XML data.
- Guaranteed message delivery by means of a built-in message repository that holds all messages processed by the Integration Appliance.
- Support for a variety of application programming styles: synchronous and asynchronous (request/reply, store-andforward, publish/subscribe).
- Support for data transfer through configurable ports for HTTP, secure HTTP (HTTPS), FTP, secure FTP (SFTP).
- Support for client-side PKI authentication—the ability to connect to a secure server from the Integration Appliance.
- Ability to be managed remotely, from anywhere on the network, using a Web Management Console (WMC) and Command Line Interface (CLI).
- Support for email-based notifications using your network's SMTP-based email system and simple network management protocol (SNMP) traps.

## Components

---

The development environment contains the following hardware and software components:

### Studio

A graphical tool used to create integration projects on your Windows development environment. You publish integration projects from Studio to the Integration Appliance.

### Integration Appliance

An appliance that connects directly into a network and runs the integration projects that you create using Studio.

### Web Management Console (WMC)

A browser-based console that you use to manage the projects on the Integration Appliance.

### Command Line Interface (CLI)

A set of commands that you can use to manage the projects on the Integration Appliance.

- [Development process example](#)

The steps in this topic provide an example of the development process for an integration project:

**Parent topic:** [Introduction](#)

---

## [Feedback | Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_dvlpmntenv.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_dvlpmntenv.html)

## Development process example

---

The steps in this topic provide an example of the development process for an integration project:

### Procedure

---

1. Develop your integration project using Studio on a standard Windows 7 machine.
2. In Studio, verify that the orchestration is valid.
3. Publish the integration project to the Integration Appliance.
4. Open a browser on a Windows 7 machine. In the browser, start the Web Management Console (WMC). From the WMC, issue a request to the Integration Appliance to deploy the orchestration job (instance) of the integration project.
5. An event triggers an orchestration job to be created and to start processing the activities that make up the orchestration. For example, a file being placed in a particular directory on a FTP server can trigger an orchestration job to be created and start processing.
6. From the WMC, verify that the orchestration job has completed and that no errors have occurred.
7. Modify the integration project in Studio. For example, your original integration project checks if a file appears in a particular directory on the FTP server and now you want to modify your integration project to move the file from the FTP source directory to an FTP output directory.
8. In Studio, verify that the project updates are valid by using the Verify tab to run each affected orchestration.
9. From the WMC, undeploy the original integration project.
10. Publish the modified integration project to the Integration Appliance.
11. From the WMC, deploy the modified integration project.
12. An event triggers an orchestration job to be created and to start processing the activities in the orchestration.
13. From the WMC, verify that the integration project has run.

**Parent topic:** [Development Environment](#)

---

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_developmentprocessexample.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_developmentprocessexample.html)

## Integration Appliance

---

The Integration Appliance is a rack-mountable appliance comprised of redundant and hot-swappable components

Components that can be used in the Integration Appliance include network ports, hard-disk drives, RAM, cooling fans, and other critical components, that ensures fault-tolerant operations.

Use the Web Management Console (WMC) and the Command Line Interface (CLI) to manage the Integration Appliance.

**Parent topic:** [Introduction](#)

---

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_integrationappliance.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_integrationappliance.html)

# Web Management Console

---

The Web Management Console (WMC) is a browser-based application hosted by the Integration Appliance

The WMC can configure and monitor hardware, orchestration, and network status of an Integration Appliance, using a Web browser.

System Administrators can use the WMC for the following monitoring tasks:

- Obtaining Integration Appliance status information, such as memory-usage statics, disk-space statistics, CPU status, fan status, and power-supply status.
- Obtaining overall processing information at a glance, and then drill-down on specific orchestrations and obtain comprehensive information about specific messages, activities, errors, and other details.
- Viewing logs and error notifications.

In addition to the WMC, you can also use the Command Line Interface (CLI) to perform many administrative and monitoring tasks. For more information on the CLI, see the Command Line Interface reference.

 Last updated: Thursday, 2 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_webmanagementconsole.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_webmanagementconsole.html)

## Studio

---

Studio is a development tool for designing and building integration projects.

In Studio, you build orchestrations that model business-process and data integration solutions. Studio provides a palette of activities that you drag onto the Studio Workspace and then configure. During run time, these activities perform actions, such as polling for a insert event in a database table. An orchestration is made up of one or more activities. An integration project can contain one or more orchestrations.

You can design simple point-to-point orchestrations, as well as more complex orchestrations that involve multiple endpoints, without writing any code.

After building an integration project, you publish it to an Integration Appliance.

## Studio Layout

---

The main pane of Studio contains the following two sections:

### Workspace

Visible on the left side of the main Studio pane. As you create components, such as Endpoints and flat File Schemas, property panes for the component display in the Workspace. When you create a new orchestration, a blank orchestration are displayed in the Workspace. You drag activities from the Activities tab into the orchestration displayed in the Workspace. When you configure an activity of an orchestration, the configuration panes of activity are also displayed in this Workspace.

### Tabs

On the right side of the main Studio pane, the following tabs are available:

- Project
- Activities
- Variables
- Functions
- Verify

- [The Project tab](#)

The Project tab contains folders for each component

- [The Activities tab](#)  
An activity performs a particular operation in an orchestration, and are organized into categories on the activities tab
- [The Variables tab](#)  
The variables used in the current orchestration are listed in the Variables tab.
- [The Functions tab](#)  
The functions that you can add to a map between input and output parameters of an activity are listed in the Functions tab.
- [The Verify tab](#)  
By simulating the DataPower® Cast Iron® Operating System, the Verify tab allows you to test orchestrations within a project and resolve any issues before deploying the project to the Integration Appliance.
- [Understanding nodes and mappings](#)  
The integration projects that you build using Studio are based on industry standards, including BPEL4WS (business process execution language for Web Services), WSDL (web services description language), and other XML based standards.
- [Understanding parameters](#)  
Parameters are values that are passed to activities from an orchestration, or to the orchestration from an activity. The values from parameters are used to initialize the variables that comprise the orchestration.

<file:///dcs/markdown/workspace/Transform/out.html>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_studio.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_studio.html)

## The Project tab

---

The Project tab contains folders for each component

The following component folders can be accessed from the Project tab:

- Orchestrations
- Endpoints
- Flat File Schemas
- Stylesheets
- Transformations
- WSDLs
- XML Schemas

When you create new instances of a Project tab component, these instances display within the appropriate component folder.

To create new instances of any of the components in the Project tab, right-click on the folder (e.g., Endpoint) to display a menu and select the create option. The component is then created and displays under the appropriate folder, and given a generic name: Orchestration, Orchestration1, and so on. You should rename all components to something meaningful in the context of your integration project.

You can create these components in any order. To ensure that all components are available, create Flat File Schemas, and upload XML Schemas, WSDLs, and Stylesheets before you start defining the orchestration.

### Orchestrations

Orchestrations are the central component of any integration project. An orchestration contains a sequence of activities that perform a specific business process. For example, an orchestration could get a Flat File from a FTP Server, take the data from the Flat File, transform it, and then save the result into a database. An integration project must contain at least one orchestration.

### Endpoints

Endpoint components display in the Endpoint folder of the Project tab and specify the connection information required to connect to the various external systems or endpoints. The Integration Appliance supports connecting to Endpoints of many types including Email (SMTP, POP), FTP, SFTP, HTTP, HTTPS, JDE, JMS, MQ, NetSuite, PeopleSoft, Salesforce.com, SAP, Siebel, Web Services, and many commercial database systems.

Each type of endpoint has an associated configuration pane where you specify endpoint connection information. For example for a database endpoint, you must provide a database name, server name, user account, and password. You may, however,

want to specify a different set of configuration information when you move from a testing environment to the production environment. You can simplify the process of moving from one set of connection information to another (for example: from one database to another) by defining configuration properties (or name/ value pairs) in studio, to define the configuration information.

#### Flat File Schemas

A Flat File Schema defines the parsing rules, content, and structure of a Flat File. Flat Files are any non-XML text data, such as comma- and tab-delimited files and EDI or industry-specific textual formats, such as the Health Level 7 (HL7) format for the health care industry.

In addition to supporting variable-length Flat File formats that use delimiters to distinguish one record or field from another, studio also supports fixed-length records and fields such as the COBOL copy book format. In studio using the Flat File Schema Editor, you can create definitions for either type of text file and groups.

#### Stylesheets

An XSLT Stylesheet defines how to transform XML data from one format to another format. You can upload a XSLT Stylesheet into studio and add an Apply XSLT activity to your orchestration that uses the XSLT Stylesheet during run time.

#### Transformations

The Transformation folder contains standalone maps. A standalone map represents a set of one or more mappings between source and destination nodes.

For example, you can create a standalone map called myMap that contains a set of mappings between a source XML Schema called IncomingOrder and a destination XML Schema called ShippingOrder. A standalone map can be used to create any number of Map Variables activities in the same orchestration or in other orchestrations in the same project. You can create a Map Variables activity from a standalone map by dragging the standalone map from the Transformations folder to an empty node on the orchestration. A Map Variables activity based on the standalone map is created.

#### WSDLs

A WSDL (Web Services Description Language) is an XML document that describes a Web Service. It defines how to access a Web Service and the operations available for the Web Service.

#### XML Schemas

An XML Schema defines the content and structure of XML data. XML Schemas are typically stored in files that end with the .xsd extension. Once you upload an XML Schema into a project, you can use that XML Schema to create variables used in the activities of an orchestration.

**Parent topic:** [Studio](#)

---

#### [Feedback](#) | [Notices](#)

 Last updated: Thursday, 2 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_theprojecttab.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_theprojecttab.html)

## The Activities tab

---

An activity performs a particular operation in an orchestration, and are organized into categories on the activities tab

Activities are organized into the following general categories:

#### Transform activities

Transform activities transform data from one format to another. For example, the Read Flat File activity converts Flat File data to XML data. The transform activities are listed under the Transform folder of the Activities tab.

#### Logic activities

Logic activities affect the processing flow of an orchestration, such as control-flow logic, branching, or looping (for example: the For Each and the While Loop activities). The logic activities are listed under the Logic folder of the Activities tab.

#### Utilities activities

Utilities activities are utilities that start or act on the current orchestration job (or instance of the orchestration). The utilities activities are listed under the Utilities folder of the Activities tab.

## Connector activities

Connector activities perform operations on the various external systems associated with the orchestration. Connection-oriented activities are grouped into various folders named for the type of system, such as Database, Email, FTP, HTTP, JMS, Salesforce.com, Siebel, MQ, SAP, and Web Services.

To use any activities, drag the activity icon from the Activities tab to the orchestration in the workspace. To configure the specifics of an activity, click the icon in the orchestration. The configuration pane displays underneath the orchestration.

The configuration pane includes an activity-specific Checklist to guide you through the configuration of each activity. A key part of configuring most activities involves the mapping of input and output parameters.

**Parent topic:** [Studio](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Thursday, 2 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_theactivitiesstab.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_theactivitiesstab.html)

## The Variables tab

---

The variables used in the current orchestration are listed in the Variables tab.

Variables are used in the context of a specific orchestration to bind data sources to an orchestration, and to pass (or operate on) data values created as the result of orchestration processing. An orchestration's variables are typically initialized by the parameters from the specific activities that make up the orchestration.

Variables can store primitive data, such as a string or integer value, or can represent an entire XML Schema or a fragment of an XML Schema. In Studio, you can automatically create variables for the orchestration using the Mapping Editor's Copy button. In the Variables tab of Studio, you can create a variable based on a fragment of an XML Schema, by dragging a fragment (or sub-node) of an XML Schema from the Schema of pane, into the Variables pane.

**Parent topic:** [Studio](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Thursday, 2 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_thevariablestab.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_thevariablestab.html)

## The Functions tab

---

The functions that you can add to a map between input and output parameters of an activity are listed in the Functions tab.

You can add functions to the mappings between the input and output parameters of an activity to alter the data flowing through the orchestrations. Using the functions available on the Function tab, you can complete the following actions:

- calculations
- converting datatypes
- re-formatting data
- combining multiple data fields into a single field

For the list of functions available with Studio and for reference information about each function including the input and output parameters, see the Mapping Function Reference section of the Studio online help.

From the Functions tab, you drag the desired function onto the link between an input and output node of the Mapping editor. If the functionality you need is not available in one of the standard Studio functions, you can create your own custom functions. For more

information, see the Mapping Custom Functions section of the Studio online help.

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_thefunctionstab.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_thefunctionstab.html)

## The Verify tab

---

By simulating the DataPower® Cast Iron® Operating System, the Verify tab allows you to test orchestrations within a project and resolve any issues before deploying the project to the Integration Appliance.

When initiating a test run, you can start a single orchestration or all the orchestrations in a project. Studio runs one orchestration job for each orchestration. You can start and stop orchestrations, and view orchestration monitoring logs from the Studio toolbar or from the Verify tab.

If the orchestration is invalid, a message dialog displays possible resolutions. In the workspace, Studio highlights each activity in the orchestration as the activity is processing the data. As Studio runs the orchestration, the Verify tab provides orchestration job details such as activity name, processing status, variable/parameter names, and variable/ parameter data in a tree view. If an error occurs, Studio highlights the node where the error occurred. Clicking the node takes you to the location of the error, where you can resolve any issues before running another instance of the orchestration.

When you click a node in the tree view, Studio displays in the Properties Pane the Checklist task that corresponds to the node. For example, when you click an activity node, Studio displays the Configure panel for the activity in the Properties Pane. When you click the Map Outputs node, Studio displays the Map Outputs panel in the Properties Pane. If you click a mapping variable or parameter, the data displays in the Variable/Parameter Message Data section of the Verify tab.

While Studio only runs one orchestration job for each orchestration, you can start the same orchestration multiple times. The Verify tab displays the results for each run of the same orchestration under a separate instance. For example, Instance #1 and Instance #2. You must allow an orchestration job to complete before you can run another instance of the same orchestration.

Note: Studio does not persist the results of the runtime test. When you close the orchestration tab, you lose runtime results for the orchestration.

## Additional Requirements

---

Depending on the activities in the orchestration, Studio might require more input to run the orchestration job.

For example, an orchestration with a database activity requires that you generate database assets before running the orchestration in Studio, just as you must do in the WMC before running the orchestration on the Integration Appliance. If the orchestration contains an HTTP Receive Request activity, you must post a message to the specified URL. Studio provides an HTTP Post Utility to help you post a message. If the orchestration contains an FTP Poll activity, you must place a file in the specified location before Studio can run the orchestration. Studio prompts you for this information before it runs an orchestration.

Since the Verify tab allows you to simulate the runtime on the Integration Appliance, you can also specify Kerberos Protocol settings in Studio to test the settings before actually deploying to the Integration Appliance. Specifying these setting in Studio does not impact the runtime on the Integration Appliance. You must specify the Kerberos Protocol settings in the WMC to allow the Integration Appliance to authenticate the server that the Integration Appliance is communicating with. For more information about specifying Kerberos Protocol settings for the Integration Appliance, see the WMC Online Help.

## Navigating the Verify Tab Toolbar

---

The following table describes the Verify tab toolbar:

Table 1.

I c o n	Description
▶	Starts the open orchestration. The orchestration must be valid before Studio can run an orchestration job.
■	Stops the running orchestration job immediately. Studio does not allow the orchestration job to complete before stopping.
▶	Starts all the valid orchestrations in the project that are not already running. If an orchestration is already running when you click this icon, Studio does not rerun the orchestration.
■	Stops all running orchestration jobs immediately. Studio does not allow the orchestration jobs to complete before stopping.
⌚	Displays orchestration monitoring data in a table or text format.
🕒	In the Workspace, highlights the activities in the execution path of the orchestration job, which allows you can follow the logic Studio used to complete the orchestration job. Different instances can have a different path depending on the inputs and orchestration logic. Click this icon to toggle between providing and not providing a highlighted path.
⤓	Assigns the results from the selected instance to the Map Inputs and Map Outputs, so that when you run a test from the Properties Pane, Studio populates the inputs and outputs with the results of the orchestration job.
✖	Deletes one or more selected instances from the orchestration details tree. To delete multiple instances hold the Shift key or Ctrl key, select the instances you want to delete, and click the icon.
-expand	Expands all the nodes under the selected node in the orchestration details tree.
-collapse	Collapses all the nodes under the selected node in the orchestration details tree.
+expand	Expands a single node under the selected node in the orchestration details tree.
-collapse	Collapses a single node under the selected node in the orchestration details tree.

#### [Feedback | Notices](#)

>Last updated: Thursday, 2 June 2016  
<file:///dcs/markdown/workspace/Transform/out.html>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_theverifytab.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_theverifytab.html)

## Understanding nodes and mappings

---

The integration projects that you build using Studio are based on industry standards, including BPEL4WS (business process execution language for Web Services), WSDL (web services description language), and other XML based standards.

You do not need to know the technical details of these standards to use the product. Nonetheless, as you work with Studio, you are exposed to the XML content of your inputs and outputs. Since orchestrations running on the Integration Appliance use, process, and deliver messages in an optimized XML format, all data and its definition is presented as a hierarchy of nodes, as in an XML document.

For example, columns in a database table are represented as nodes. As another example, Flat File Schemas are defined in Studio as a series of record, field, or group nodes in a tree structure that comprises a root node containing descendants (children, grandchildren, etc.).

There are two basic distinctions between node types in Studio:

- Structure nodes are nodes that convey information about structure only. An example of a structure node is a record definition (defined for a Flat File Schema). Structure nodes can contain other structure nodes, and nodes that contain data.
- Data nodes are nodes that can contain data.

In a typical complete node representation, the top node is often referred to as the root node—“root” in the sense that it contains all other nodes. Subsequent nodes are descendent nodes comprised of both structure nodes and data nodes.

A key part of designing an orchestration is specifying the mapping between nodes, that is, defining how nodes and the data they contain should be used and transformed in the course of orchestration processing.

Several XML-specific characteristics can be associated with nodes; these characteristics are represented as an additional icon adjacent to a node in a tree. These properties include:

- Recurring - denotes that a node can repeat (either a specified number of times or an unbounded number of times). Each time a recurring node repeats is an occurrence of the node.
- Nillable - a boolean property that denotes whether the data node to which this property is associated can have an attribute set to “nil” by the application. The nillable mechanism is defined by the XML Schema recommendation as a way to identify non-required data elements that are empty vs. those that convey a null data value.
- Optional - denotes whether an optional node exists or not.

Studio activities contain embedded maps that you must configure at design time, in the context of an orchestration, to define how actual parameters should map to variables, and how the variables should be processed in the orchestration.

The characteristics and node structure of the node tree in the right pane of the mapping editor determines whether a node from the left pane can be mapped to the right pane.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_understandingnodesandmappings.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_understandingnodesandmappings.html)

## Understanding parameters

---

Parameters are values that are passed to activities from an orchestration, or to the orchestration from an activity. The values from parameters are used to initialize the variables that comprise the orchestration.

Parameters can be either input parameters or output parameters. Activities can either contain just input parameters, just output parameters, or both.

You map variables of an orchestration to the input parameters of an activity in the Map Inputs task. During run time, the values of the variables are passed into the input parameters of the activity and are used by the activity. For example during run time, the FTP Put File activity creates a file using the name provided in the input parameter called filename and with the data provided in the input parameter called data. The values for the filename and data input parameters are populated by the data in variables in the orchestration.

Output parameters are return values from an activity. For example, the FTP Poll Directory activity passes three output parameters to an orchestration, as shown in the following table, each of which can be used to initialize a variable in the orchestration. Output parameters can be mapped from an activity to the orchestration.

Table 1.

Activity	Parameter	Description
FTP Poll Directory	filename	Name of the file obtained from the FTP server.
FTP Poll Directory	data	String containing the contents of the file.
FTP Poll Directory	timestamp	Timestamp on the file.

# Installation and configuration

---

This topic discusses the installation and configuration steps you must complete before you build and run an integration project.

## Integration Appliance

---

The Integration Appliance is shipped with DataPower® Cast Iron® Operating System preinstalled. You must however, set up and configure your Integration Appliance before publishing and deploying your integration project to the Integration Appliance. Setup might include installing additional connector licenses. For more information, see the Installation Guide. Once the Integration Appliance is set up, configured, and available to the network, you can bring up the Web Management Console by entering the following URL into the address field of a browser: `https://hostname`

Where hostname is the name of the Integration Appliance. This name was assigned to the Integration Appliance during the installation process.

The Web Management Console opens to the Login screen in the browser window. The default login account and password is `admin/!n0r1t5@C`

Note: The Web Management Console uses the default port 443.

You can also access the Integration Appliance through the Command Line Interface.

## Studio

---

To start creating integration projects to run on the Integration Appliance, you must install Studio on a Windows development workstation. Your Windows development workstation must meet some minimum hardware and software requirements. For more information, see the Installation Guide.

Once you have Studio installed, you can log into the Solutions Repository and access a repository of template integration projects (TIPs). Each TIP addresses a specific integration project scenario. For example, you can find a TIP for integrating data from a Salesforce.com endpoint to a database endpoint. When you select a TIP from the Solutions Repository and download the TIP to your workstation, a wizard opens and guides you through the configuration steps.

Note: The Solutions Repository contains TIPs that have been certified, as well as uncertified TIPs. Anyone who has access to the Solutions Repository can upload a TIP. For more information about creating, modifying, and searching for TIPs, see the Studio online help.

## Deployment concepts

---

Use Studio to create integration projects, which you deploy to the Cloud using the Management Console or deploy to the Integration Appliance using the Web Management Console. A deployment of a project contains all runtime components necessary to run the processing defined in the orchestrations of the project.

With respect to deployment, there are two important concepts to keep in mind as you develop a project:

- Publishing and Deploying are two distinct steps. Publishing is the act of promoting a project from Studio to an integration environment (cloud or Integration Appliance) or to another intermediate location. A project does not run in the integration environment until you deploy it.
- Projects can have multiple configurations that support completely different environments (development, test, production). Using Studio to create configuration properties for projects offers greater flexibility at deployment time, because you can bind the properties to different environments.

The Integration Appliance provides the following two options for getting your projects from Studio to the Integration Appliance:

- Projects can be published directly to an Integration Appliance.

- Projects can be exported from Studio to a staging location and then uploaded to an Integration Appliance.

Whether you export from Studio and later upload to the Integration Appliance or publish directly to the Integration Appliance from Studio, the project does not run on the Integration Appliance until you deploy.

- [About configurations](#)

You publish a project to the Integration Appliance. The WMC then runs a configuration of the project. Once you publish a project to an Integration Appliance, the WMC creates a default project configuration. The default project configuration settings enable all orchestration in the project and allow you to quickly deploy a project.

---

## [Feedback | Notices](#)

 Last updated: Thursday, 2 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_deploymentconcepts.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_deploymentconcepts.html)

## About configurations

---

You publish a project to the Integration Appliance. The WMC then runs a configuration of the project. Once you publish a project to an Integration Appliance, the WMC creates a default project configuration. The default project configuration settings enable all orchestration in the project and allow you to quickly deploy a project.

You can create numerous configurations of the same project on your Integration Appliance. Each configuration can connect to a different endpoint, if you have used configuration properties to specify the connection information for the endpoint. For example, one configuration could connect to a test database while another configuration connects a production database. Project configurations are created using the WMC, and by default, are not deployed when they are created.

## Publishing

---

Publishing is the process of bundling up a specific integration project (the named project in Studio) and preparing the project for deployment on an Integration Appliance. When you publish a project, Studio creates a runnable version of the project and sends it to the Integration Appliance that you specify.

### Exporting

Exporting is a process very similar to publishing in that it compresses your project, but instead of pushing the result to the Integration Appliance, you give the file a name and save it for subsequent uploading to the Integration Appliance. For example, this allows for additional testing by a quality control team.

### Uploading

Uploading is the process of moving a project that has been exported from Studio to the Integration Appliance. A menu selection is available for this task in the WMC.

## Deploying

---

Deploying is the process of instantiating all the runtime components necessary so that the Integration Appliance can perform the actual integration. Deploying presumes that a project has been published or uploaded to the Integration Appliance. Use the Web Management Console to deploy a project configuration.

## Understanding configuration properties

---

Configuration Properties simplify the deployment process in moving from a development environment to a production environment. Rather than hard-code configuration details into the endpoint properties, you can create Configuration Properties, and then use these property names in the configuration pages of your endpoints.

This is because endpoints created in Studio are configured with specific address information (hostname, IP address) and other details (user account, password). These details may need to be changed at deployment for the specifics of the actual environment in which the project will run (assuming that the development, test, and production environments use different servers and systems).

At deployment , the values associated with the properties can be changed to the appropriate hostnames, IP addresses etc.

For more information about creating configuration properties, see the Studio online help.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_beforedevelopingyourprojects.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_beforedevelopingyourprojects.html)

## Planning an Integration Project

---

When beginning the development process for an integration project you must define the integration scenario before using Studio to translate the project requirements into an orchestration.

### Defining an integration scenario

---

When defining an integration scenario, specify a clear goal. With this goal in mind, identify the high level project requirements:

- Endpoints - From what source system and to what target system are you moving the data?
- Formats - What is the format of the data from the source system? What data format does the target system accept?
- Transformation - If the source data and target data have different formats or structure, then what type of data transformation is needed? Are there any special processing rules?

For example, if your goal is to consolidate multiple purchase orders and place the consolidated purchase order into a supplier's database. High level project requirements might include the following details:

- Endpoints - The source system is an FTP server. The target system is an Oracle database.
- Formats - The source data is pulled from CVS flat files stored on the FTP server. The target database requires data in table format.
- Transformation - A flat file to table transformation is required. Also orders from locations that have sales tax should be processed differently than orders from locations without sales tax.

- Overall goal of the integration project. For example, combining a flat file purchase order with an XML purchase order, into a single large purchase order that is stored in the supplier's database.

For example, you want to consolidate multiple purchase orders, verify that they conform to a specific format, and then:

- A few Flat File sources need to be consolidated into a target XML file.
- Files from one FTP site need to be moved to another.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_planninganintegrationproject.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_planninganintegrationproject.html)

## Translating project requirements into Studio components

---

After identifying high-level goals for your integration project, you can start analyzing more specific aspects of the integration project and identifying the Studio components that you can use to accomplish your goals.

You can start by analyzing the following characteristics of your integration project:

- From what source, or sources, do you want to obtain the data, and to what target do you want to transmit the data? These sources and targets (databases, FTP servers, HTTP servers, Email, etc) comprise the endpoints that are created as part of a project in Studio.
- In what format is the source data, and in what format is the required target data? Text-based files, including EDI formats, CSV, and other formats can be defined in Studio as a Flat File Schema that converts the data into the appropriate format for the Integration Appliance. In addition, a Flat File Schema can be used to produce data in a flat file format to be used outside of the Integration Appliance. XML-based data can be included in an integration project by uploading the appropriate XML Schemas (.xsd) or document type definitions (.dtd) to Studio.
- Does the data format or structure need to change from source to target, and if so, how does it need to change? Should some of the processing be based on the content itself?

Identifying these requirements provides the information needed to define (in Studio) one or more orchestrations that comprises a set of activities, including transformations on data. Transformations convert data from one format to another. For example converting Flat File data in a CSV (Comma Separated Values) format to XML data. Transformations can also suppress data, add data, alter datatypes, and perform calculations.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_translatingprojectrequirements.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_translatingprojectrequirements.html)

## Integration appliance configuration tips

---

You might want to make the changes to your Integration Appliance configuration. This topic covers some changing passwords, creating users and groups and optimal performance configuration.

### Change the default password

---

Using the Web Management Console:

1. In the upper right corner of the WMC, click your username.
2. Select Change Password.
3. Enter the old and new passwords, and confirm the new password.
4. Click Save.

Using the Command Line Interface:

1. Use an SSH connection to log in to the CLI, by starting an application like PuTTY.
2. Enter the appliance-host-name.
3. If needed, select SSH as the connection protocol or set other connection parameters offered by the application.
4. Initiate® the connection. The login prompt displays at first access.
5. Log in to the Integration Appliance using the default username and password [Username=admin, Password = ! n0r1t5@c].
6. Run the following command: auth set user admin <old\_password> <new\_password>

## Create users and groups, and define appropriate privileges.

---

As you would with any multi-user device, be sure to create users and groups and provide access to the Integration Appliance using the rule of 'least privilege,' that is, users should have no more privileges than necessary to do their jobs. For more information about setting privileges, see the Web Management Console online help.

## Configure the Integration Appliance for optimal performance

---

For better performance, once an integration project has been deployed to production and runs as expected, tune the following parameters:

- For each orchestration, change the logging level from the All option to the Error Values option.
- For each notification, set the Level exceeds field to the Critical option.

**Parent topic:** [Before developing your projects](#)

## Studio best practices

---

Some guidance for using Studio to its full potential.

Establish naming conventions for your organization

Provide unique, meaningful names (meaningful in the context of the business problem being solved) for all your Studio projects and related components—files, folders, projects, orchestrations, endpoints, and so on. Names should be:

- Unique - Studio is case sensitive: filename1, FILENAME1, and FileName1 are three different files. However, do not rely on capitalization to distinguish among Studio projects, it can lead to confusion.
- Descriptive - For example, a project that integrates suppliers and an inventory system might be called “SupplyChainIntegration.”

Back up projects frequently

In multi-user environments especially, be sure to back up projects frequently. You can quickly back up all Studio project components by simply creating a compressed file of the contents in a specific project's directory. Store the compressed file elsewhere, in a secure location. Ideally, in a version control system that will let you also track project changes.

Store projects in a central location

Place all project files in a central location, preferably using version control software, so that projects are easy to find and previous iterations are easy to recover (this is especially important if you have numerous developers working on the same project).

Design orchestrations for optimal performance

When possible, preprocess as much input data using the native facilities of the source systems before integrating. Transforming data outside the source system adds to the processing overhead. If performance becomes an issue, investigate how you can minimize the use of the Map Activity in an integration project's orchestration. For example, if you are integrating data from several different database systems, consider creating extract tables that preprocess the data, rather than trying to resolve all differences among disparate data types in the orchestration.

#### Use Configuration Properties for endpoint definitions

Rather than hard-coding details in your project endpoints, you can use properties for some of the details. You define these configuration properties in Studio and then use the Management Console to specify various runtime values. Before deploying the project, you must configure the properties for the actual endpoints in the production environment. For more details, see the online help.

#### Test activities and all definitions in Studio, as you design

As you use Studio to design all the elements of an orchestration, be sure to use test data wherever appropriate to ensure that mappings work as expected. Before publishing a project, test all mappings and flat-file schemas using Studio.

#### Set up development and test environments

Ideally, you should set up development and testing environments that mirror your production environment, including replicating data sources and targets in the test environment.

- Extract (or replicate) production data to your development and test environments.

Before deploying the project, you must configure the properties for the actual endpoints in the production environment by changing the Configuration Properties. See the Management Console online help for details.

**Parent topic:** [Before developing your projects](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_studiobestpractices.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_studiobestpractices.html)

## Upgrading v6.x.0.x to v7.0.0.x

---

The underlying OS versions used in Cast Iron v6.0.0.x and Cast Iron v7.0.0.x are different. A direct upgrade from v6.0.0.x to v7.0.0.x is not supported.

### Upgrading the physical appliance

---

1. If you are using a v6.0.0.x physical appliance, then upgrade this appliance to v6.4.0.x, and then from v6.4.0.x upgrade it to v7.0.0.x.
2. If you are using a v6.1.0.x physical appliance, then upgrade this appliance to v6.4.0.x and then from v6.4.0.x upgrade it to v7.0.0.x.
3. If the physical appliance is of v6.3.0.x or v6.4.0.x, then upgrade the appliance directly to v7.0.0.x.

### Upgrading the virtual appliance

---

1. If the virtual appliance is of v6.0.0.x, OR, if you have upgraded from v6.0.0.x to any of the following versions: v6.1.0.x, v6.3.0.x, or v6.4.0.x, and currently you are using either v6.1.0.x, or v6.3.0.x, or v6.4.0.x, do the following:
  - a. Save your Projects and User Settings from the appliance using Repository > Import/Export in Web Management Console (WMC).
  - b. Install a fresh instance of Cast Iron v7.0.0.x on the appliance and restore the Projects and User Settings.
  - c. Upload the vendor libraries (required by your projects) to WMC.

Note: Attempting an upgrade to Cast Iron v7.0.0.x on HVE running Cast Iron v6.0.0.x directly or indirectly will lead to an unusable system. This MUST NOT be attempted.

2. If you have a fresh installation of v6.1.0.x, then upgrade this appliance to v6.4.0.x and then from v6.4.0.x upgrade it to v7.0.0.x.
3. If you have a fresh installation of v6.3.0.x or v6.4.0.x, then you can directly upgrade to v7.0.0.x.

For further assistance, contact IBM Support.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_migration61to70.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_migration61to70.html)

## Glossary

---

A glossary of terms

**Activity**

A complete, functional unit of processing within an orchestration. Activities include flow-control (logic) activities; data activities to facilitate consumption and transmission of data; and activities that enable integration with database systems, enterprise systems, Web servers, e-mail servers, and other systems. An orchestration contains a series of activities.

**Assets**

Supplemental configuration files, scripts, or other materials associated with a specific activity. For example, the buffer table scripts created for a database insert activity are assets. Assets are controlled by the Web Management Console. Access privileges to assets can be given to users beyond the users of the WMC. For example, DBAs can be given privileges to the assets associated with a database activity so that they can create the required tables or triggers.

**Buffer table**

An auxiliary table used in conjunction with various Database Module Activities, such as the single-table insert, update, or delete database activities. When you configure one of the database DML (data manipulation language) activities, Studio generates a SQL script that can be used to create the appropriate trigger on the database table; the buffer table gets populated when the triggering event (INSERT, UPDATE, DELETE) occurs. The buffer table provides the means to capture database changes and initiate processing by the orchestration.

**Command-line interface**

A text-based alternative to the Web Management Console for configuring, managing, and querying an Integration Appliance.

**Control table**

A database table that facilitates using database endpoints in integrations. As it does with buffer tables, Studio generates scripts to create control tables that can be used to ensure that inserts, updates, and deletes to specific tables occur once and only once.

**Deploy**

Create an instance of a project configuration on an Integration Appliance.

**Document**

Any of the XML Schema files, DTDs, and other configuration files that comprise integration projects.

**Dynamic delimiters**

A delimiter that is obtained from within the fields of the message itself, such as an HL7 PID (patient ID) message header that denotes the beginning of a new record in a file containing a batch of electronic health records.

**Empty placeholder**

Appears in activities that have multiple branches as an initial placeholder for the activities in that branch. Dropping other activities on this icon removes it.

**Endpoint**

Is an external system, such as a database server, FTP server, e-mail system, or enterprise application that the Integration Appliance connects to either get data or return data during run time.

**Flat file**

A file containing non-XML data. Flat files are typically of two types: delimited, in which a comma, tab, white space, or other delimiter is used to separate variable-length fields and records; or positional, in which fields and records have a fixed width.

**For each**

A activity that iterates over a message structure where the data repeats.

**Flat File Schema**

Defines how to interpret a specific set of Flat Files. Studio creates flat-file schema (XML Schema) based on the configuration you define in the Message Definition pane. A flat-file schema is used in conjunction with Read Flat File activity to convert a source flat-file into XML.

**Function**

String, mathematical, and miscellaneous functions provided by Studio that you can use in defining processing in your orchestrations. In addition to the pre-built functions, Studio lets you build your own custom functions and add lookup tables.

**Integration project**

	The various inputs, outputs (endpoints), mapping and schema definitions (transformations, message formats), orchestrations, and configuration information that comprise an integration solution as designed in Studio and deployed to the Integration Appliance.
Job	A specific runtime instance of an orchestration.
Map	A component that lets you bind input parameters to variables, and variables to the orchestration. Many Studio activities contain embedded maps that you must configure at design time, in the context of an orchestration, to define how actual parameters should map to variables, and how the variables should be processed in the orchestration. In addition to the embedded activity maps, Studio has a stand-alone Map activity that can be used to bind any type of input and output to the orchestration.
Node	All data input to or output from the Integration Appliance is materialized in Studio as a series of nodes, as in a tree-like, hierarchical structure. In many cases, the nodes represent the structure and content of an XML document, but in many cases they don't (e.g., rows in a database table display as nodes). Nodes in Studio convey information about structure; the type of content that can be supported; or additional characteristics of the data.
Orchestration	The specific sequence of processing activities (such as data mapping, transformation, and control logic activities), endpoints, and data types defined and configured using Studio and deployed to run on the Integration Appliance.
Parameter	A value passed to an activity or to an orchestration. For example, filename and data are two of the parameters that can be passed from an FTP endpoint to an orchestration.
Pick	An activity that determines what starter activity to launch based on the action that has occurred. For example, a Pick activity could contain three branches, one that contains a Get Inserted Rows activity, one that contains a Get Deleted Rows activity, and the other contains a Get Updated Rows activity. If an UPDATE event occurs on the database, an instance of the orchestration is created and branch that contains the Get Updated Rows activity is invoked.
Project	A project defined and created using Cast Iron® Studio. Each project has a properties file (filename.sp3) and several additional metadata files and folders that comprise all integration elements - orchestrations, endpoints, XML schemas, Flat Files - and their specific configuration (variables, parameters).
Publish	Copy all project files from Studio to an Integration Appliance or to an intermediate staging area, such as a shared directory on a file server, for subsequent runtime configuration and deployment to a specific environment. The Publish process encompasses validating the project; creating a .par file of project configuration documents; and sending the package to the Integration Appliance specified.
Record identifier	A special field that delimits records in certain types of Flat Files, such as EDI (electronic data interchange) or HL7 (Health Level 7) files. For example, an HL7 PID (patient ID) number is a record identifier.
Repetition delimiters	A delimiter in a Flat File that is used when the data lacks a unique value, such as record ID, to distinguish one record from another.
Replace	Appears in Pick and other activity branches as an initial placeholder for the endpoint activity to receive a message for that branch. Dropping a Receive endpoint Activity on this icon removes it.
Stored procedure	A functional code unit that resides in a database and is ran explicitly by invoking its name. Stored procedures can be used to populate buffer tables when specific insert, update, or delete activities occur on a particular database table.
Studio	An integrated development environment (IDE) for creating, configuring, and publishing integration projects and the orchestrations they comprise. Studio projects run on the Cast Iron Integration Appliance.
Terminate	Stops orchestration processing.
Transformation	Converting data from one format to another. For example converting Flat File data in a CSV (Comma Separated Values) format to XML data. Transformations can also suppress data, add data, alter datatypes, and perform calculations.
Trigger	A type of database stored procedure that is called implicitly when a triggering event occurs. In the Database Module, a “triggering event” is an INSERT, UPDATE, or DELETE on a table.
Variable	Used to pass data values processed by an orchestration. Variables are used by maps to identify the source and target. Some Activities create variables automatically.
While loop	

Initiates and continually processes any children activities for as long as a specified condition is true.

## Trademarks

---

IBM, the IBM logo, and ibm.com® are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM

trademarks is available on the Web at "Copyright and trademark information" at <http://www.ibm.com/legal/copytrade.shtml>.

Adobe, the Adobe logo, PostScript, and the PostScript logo are either registered trademarks or trademarks of Adobe Systems Incorporated in the United States, and/or other countries.

Intel, Intel Inside (logos), MMX, and Pentium are trademarks of Intel Corporation in the United States, other countries, or both.

Java® and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

Microsoft and Windows are trademarks of Microsoft Corporation in the United States, other countries, or both.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Other company, product, and service names might be trademarks of IBM or other companies.

## Privacy Policy Considerations

---

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth in the following paragraphs.

Depending upon the configurations deployed, this Software Offering may use session and persistent cookies that collect each user's session ID for purposes of session management, or functional purposes. These cookies can be disabled, but disabling them will also eliminate the functionality they enable.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, See IBM's Privacy Policy at <http://www.ibm.com/privacy> and IBM's Online Privacy Statement at <http://www.ibm.com/privacy/details> the section entitled "Cookies, Web Beacons and Other Technologies" and the "IBM Software Products and Software-as-a-Service Privacy Statement" at <http://www.ibm.com/software/info/product-privacy>.

## Terms and conditions for information centers

---

Permissions for the use of these publications are granted subject to the following terms and conditions.

### Applicability

---

These terms and conditions are in addition to any terms of use for the IBM® website.

### Personal use

---

You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative work of these publications, or any portion thereof, without the express consent of IBM.

### Commercial use

---

You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

## Rights

---

Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

## IBM Cast Iron Studio

---

IBM® Cast Iron® Studio is a development tool that is used to design, test, and publish integration projects to an IBM Cast Iron Integration Appliance. Studio provides numerous entities that you can drag into a workspace and configure as part of one, or more, business-process orchestrations that comprise an integration project.

Before you start, read [Studio basics](#) to familiarize yourself with the Studio environment and the terminology used, then refer to the topics in the help to find out how to complete specific tasks.

For detailed information about deploying your projects and working with them on the Integration Appliance, see the [Web Management console](#) help.

For a conceptual overview of Studio, including a step-by-step sample of how to create, test, and publish a project, see the [Introduction to getting started](#) section.

## IBM Cast Iron Studio introduction pane

---

When you first launch Studio, the IBM Cast Iron Studio introduction pane is displayed. If Studio was closed while editing an existing project, Studio automatically loads the last edited project. To edit the loaded project, click an entity in the Project tab.

The following options are available from the IBM Cast Iron Studio introduction pane:

- [Create Project](#) - Launches the New Studio Project dialog box. Use the New Studio Project dialog box to create a new empty project with a default empty orchestration.
- [Open Project](#) - Launches the Open dialog box. Use the Open dialog box to browse for and open an existing project file. A Studio project file ends in the .sp3 extension.
- [Recent Project](#) - To view a project that was recently opened, click directly on project name under the Recent Projects folder.
- [View Help](#) - Launches the Studio help.
- [Find Solutions](#) - Launches the Template Integration Projects (TIPs) [Searching for Template Integration Projects \(TIPs\)](#) dialog box, which allows you to search for TIPs from the Cast Iron solutions repository.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics\\_welcome.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_welcome.html)

## Working with projects

---

This page is the starting point for finding information about working with projects using IBM® Cast Iron® Studio.

- [Studio basics](#)

Studio provides an environment called a Workspace in which you can design and configure your integration projects. The Toolbox is the area next to the Workspace where multiple tabs contain components that you use to build an integration project; components such as endpoints, schemas, orchestrations, style sheets, transformation, WSDLs, activities, variables, and functions.

- [Creating a new project](#)

Each time you create a project, a project properties file is also created with the project name. These property files are used when you export or publish projects.

- [Protecting a project with a password](#)

In Studio, you can protect a project by assigning a password to it.

- [Opening a Project](#)

When you first launch Studio, the Project last worked on is opened by default. There are several ways to open a different project.

- [Saving a Project](#)

You can save a project using the Studio toolbar.

- [Renaming a Project](#)

You can rename a project using the Studio toolbar.

- [Publishing a Project](#)

When you publish a project, Studio connects to an Integration Appliance and directly updates the Integration Appliance with the documents that make up the project. Publish a project when the project is complete, has been validated, and has been tested in Studio. You cannot publish a project that has not been successfully validated.

- [Exporting a Project](#)

Export saves all the orchestrations, endpoints, schemas, and other items associated with the project, into a single file that ends in the .par extension.

- [Configuring Project Settings](#)

You can assign a unique version number to a project using the Project Settings dialog box.

- [Setting Preferences](#)

You can specify Project, Orchestration, Flat File, SSL/Kerberos, Session Login, and XML Schema preferences from the Preferences dialog box. You can change preferences at any time.

- [Creating Configuration Properties](#)

Create configuration properties or name/value pairs in a project. Use configuration properties to supply the default values for destination nodes of a map in the Mapping Editor. Â

- [Editing Configuration Properties](#)

You can edit configuration properties in Studio and in the Web Management Console (WMC).

- [Creating Global Configuration Properties](#)

When a global configuration property is created, you can import the global configuration property into a project as a project configuration property.

- [Searching for Template Integration Projects \(TIPs\)](#)

Template Integration Projects (TIPs) are stored in the Cast Iron solutions repository. Through the Configuration Wizard, TIPs guide you through the configuration steps for an integration scenario. TIPs can be downloaded to your local machine. The login window is pre-populated with the User Name and Password to make it easier for you to download the TIPs, without registration.

- [Installing Module Provider Libraries](#)

Both IBM Cast Iron Studio and the Integration Appliance require library files (.jar and .dll) associated with instances of certain connector types to be imported. For example, the following connectors require additional libraries: Database Connector, JDE, JMS, MQ, PeopleSoft, and SAP. These files must be present in Studio to enableÂ configuration of the endpoints and orchestrations that use any of those connectors.

- [Uploading Files into a Project](#)

You can upload only specific types of files into a project. For example, if you plan on mapping a string to XML data (valid to a particular XML Schema), you must first upload the XML Schema file (ends in the .xsd extension) into the project before mapping the nodes in the XML Schema.

- [Uploading Included XML Schemas](#)  
An XML Schema or WSDL document can include other XML Schemas in the main document, using Schema Inclusion, Schema Inclusion with Redefinition, or Importing a Namespace.
- [Specifying the Location of a File to Upload](#)  
Files can be uploaded into a project from a web location (HTTP or FTP Server) or from the local file system.
- [Valid External File Types for a Project](#)  
When building orchestrations, you can upload XML Schemas or other files into your project to complete configuration tasks. External files are used in connection activities and orchestrations that use a message that Studio cannot generate an XML schema for automatically. You must supply an XML schema or DTD if the message must be transformed or if you need to define a job key for the message.
- [About Valid Names](#)  
To be valid, the names for projects, Endpoints, orchestrations, stylesheets, Flat File Schemas, XML Schemas, WSDLs, and transformations must not exceed 42 characters and must not contain any of the reserved characters or words.
- [Undo and Redo Operations](#)  
Studio stores up to the last 100 actions you make and you can undo and redo those actions. You can undo and redo an action that you take on the fields in the UI, orchestration views, Mapping Editor, project tree, configuration properties, and variable panel activities.
- [Updating a Changed XML Schema](#)  
If you created a project that uses an XML Schema and the XML Schema changes, you can attempt to update the existing XML Schema with the new XML Schema.
- [Using the Project Explorer](#)  
The Project Explorer dialog box lists the set of entities of the current type, that have been already defined for the project.
- [Using the HTTP Post Utility](#)  
This utility provides a simple HTTP client interface that enables you to post messages/requests to HTTP servers, which is useful for orchestrations that have an **HTTP Receive Request** activity as the starter activity.

#### [Feedback | Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_workingwithprojects.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_workingwithprojects.html)

## Studio basics

Studio provides an environment called a Workspace in which you can design and configure your integration projects. The Toolbox is the area next to the Workspace where multiple tabs contain components that you use to build an integration project; components such as endpoints, schemas, orchestrations, style sheets, transformation, WSDLs, activities, variables, and functions.

### Toolbar icons

Directly under the Studio toolbar menu options are the following Studio toolbar icons:

- New Project:  [Create Project](#)
- Open Project:  [Opening a Project](#)
- Save Project:  [Saving a Project](#)
- Close Project:  see [Saving a Project](#)
- Undo:  Allows you to undo previous actions.
- Redo:  Allows you to redo previously undone actions.
- Cut:  Removes an entity and saves a copy of the entity in the clipboard that can be used later by a paste action. For example, from an orchestration you can remove and store an activity to the clipboard. For more information, see [Working with activities in an orchestration](#)
- Copy:  Saves a copy of the selected entity into the clipboard that can be used later by a paste action.
- Paste:  Copy the stored entity from the clipboard.

- Delete:  Removes the entity. The activity is not saved in the clipboard.
- Validate Project:  Validates all the orchestrations in the project. If an orchestration is invalid the invalid orchestration icon  is displayed next to the orchestration in the Project tab. If the orchestration is invalid, click the orchestration to view the errors in the Validation Results window.
- Publish Project:  Opens the [Publishing a Project](#) dialog box. From the Publish Project dialog box, you can publish a project to an Integration Appliance
- Export Project:  Opens the Save dialog box. From the Save dialog box, you can save all the orchestrations, endpoints, schemas, and other objects associated with the project, into a single file that ends in the .par extension.
- Project Documentation Generation: Generates and saves project documentation as an HTML file.
- Preferences:  Opens the Preferences dialog box. You can specify Project, Orchestration, Flat File Properties, SSL/Kerberos, Session Login, and XML Schema preferences from the Preferences dialog box.
- Help:  Opens the Studio help. You can also connect to the [WebSphere Cast Iron Community](#) by selecting the option from the main Help menu.

## Orchestrations and the Workspace

---

When you select an orchestration a tab view of the selected entities is displayed in the upper half of the Workspace. For example, if you double-click an orchestration in the Project tab, a graphic view of the orchestration is displayed as a tab. An orchestration or workflow contains the logical flow of your integration. Drag-and-drop activities from the Activity tab onto the orchestration to visually define the logical flow of your integration. For a list of other entities configurable from the top half of the Workspace, see the Project tab.

The lower half of the Workspace is where you define or configure the activities you added to the orchestration. It is referred to by different names, depending on what you are doing at the time. If you are creating a map, this area is called the Mapping Editor. If you are configuring endpoints or configuring an activity, it is referred to as the Properties pane.

## Toolbox tabs

---

The Toolbox comprises five sideways-oriented tabs: Project, Activities, Variables, Functions, and Verify.

Note: You can make the Toolbox larger or smaller by moving the invisible slider between the Workspace and the Toolbox.

## Project tab

---

The Project tab contains folders that store the basic entities that make up any integration project. These folders are initially empty. The Project tab contains the following folders:

### Endpoints

Specifies the connection information required to connect to the various external systems. The Integration Appliance supports connecting to endpoints of many types including FTP, SFTP, HTTP, HTTPS, Email (SMTP, POP), SAP, MQ, Web Services, and many commercial database systems.

### Flat File Schemas

Defines the content and structure of a Flat File. Flat Files are any non-XML text data, such as comma and tab-delimited files and EDI or industry-specific textual formats, such as the Health Level 7 (HL7) format for the healthcare industry.

### Orchestrations

Contains a sequence of activities that performs a specific business process. Orchestrations are the central entity of any integration project.

### Stylesheets

Defines how to transform XML data from one format to another. You can upload an XSLT Stylesheet into Studio and add an Apply XSLT activity to your orchestration that starts the XSLT Stylesheet during run time.

### Transformations

Contains stand-alone maps that represents a set of one or more mappings between source and destination nodes.

### WSDLs

A WSDL is an XML document that describes a Web Service. It defines how to access a Web Service and the operations available for the Web Service.

### XML Schemas

Defines the content and structure of XML data. XML Schemas are typically stored in files that end with the .xsd extension.

When you upload an XML Schema into a project, you can use that XML Schema to create variables used by the activities of an orchestration.

In addition, the following icons are provided:

- New Orchestration:  Click to create an Orchestration.
- New Endpoint:  Click to create an Endpoint.
- New Flat File Schema:  Click to create a new Flat File Schema.
- New Standalone Map:  Click to create a Standalone map.
- Add Document:  Click to upload a file into the current project.
- Revalidate Project:  Click to validate the orchestrations in the current project.

To view the entities that make up the Project tab as a list view:

1. Select Edit > Preferences from the Studio toolbar menu. The Preferences dialog box displays.
2. Select the Show the entities of the Project tab as a list check box.

To view and configure an existing entity in the Project tab, open an entity choose from one of the following options:

- Double-click the entity in the Project tab
- Select the entity in the Project tab and press Return.

The properties of the entity show in the Properties pane. Clicking an orchestration in the Project tab, validates the orchestration. If the orchestration is invalid, the orchestration warning icon is displayed , and the Validation Results window opens next to the Project tab. Click the error message in the window to open the appropriate panel to fix the error.

To rename or delete an entity in the Project tab, right-click the entity and from the list select Rename or Delete.

To copy and paste an entity in the Project tab:

1. Select an entity in one of the folders in the Project tab.
2. To copy the entity, enter the key sequence:  $\text{CTRL}+\text{C}$ .
3. To paste the entity, enter the key sequence:  $\text{CTRL}+\text{V}$ . A copy of the entity displays in the Project tab.

To view the entities of the Project tab as a list, select the Show entities of the Project tab as a list check box in the Preferences pane of Studio. For more information, see [Setting Preferences](#).

When the Project tab opens, a Dependencies pane shows by default in the Project tab. Selecting an entity in the Project tab shows the entities that are directly dependent on this entity in the project, which entities in the project would be incomplete if this entity was removed.

For example, if you had FTP endpoint that was used by the **FTP Poll Directory** and **FTP Put File** activities of the BatchOrder orchestration, clicking the FTP endpoint in the Project tab, displays the BatchOrder orchestration in the Dependencies pane because the endpoint is used by the orchestration. If you deleted the FTP endpoint, the BatchOrder orchestration would be incomplete. If you select the BatchOrder orchestration, you would not see the FTP endpoint listed in the Dependencies pane because you can delete the BatchOrder orchestration without affecting the FTP endpoint.

By default, the Dependencies pane appears underneath the Project tab. You can hide the Dependencies pane, by clearing the Show dependant project nodes check box for the Project in the Preferences pane. To view the preferences for a project, select Edit > Preferences from the toolbar menu and then select Project in the left pane. The preferences for the project display.

## Activities tab

---

An activity performs a specific operation in an orchestration. Activities are organized into the following general categories on the Activities tab:

- Transform
- Logic
- Utilities
- Archives
- Cryptoservice
- Database
- Data Quality
- Domino
- Email
- Force.com Bulk API
- FTP
- HTTP
- JDE
- JMS

- MQ
- NetSuite
- PeopleSoft
- SAP
- Salesforce.com
- ServiceMax
- Siebel
- STS
- Web Services
- Workday

## Variables tab

---

Variables are tools for orchestrations. They are used to bind data sources to orchestrations and pass or operate on data values as they pass through the orchestration. The Variables tab provides an area where you can create and edit variables.

## Functions tab

---

Functions are tools used in the Mapping Editor. Use the tools to specify how to transform data as it passes through an orchestration. If the functions provided in the Functions tab do not meet your needs, you can create your own custom functions.

## Memory usage and garbage collection

---

If the Show memory usage in status bar option is selected in the Preference dialog box, a memory bar and trash can icon is displayed as shown in the following figure. This memory bar displays how much memory is currently used by Studio, compared to the total memory that is currently allocated to Studio (520 MBytes) from the Operating System, as shown in [Figure 1](#):

Figure 1. Memory usage

To request that Studio attempt garbage collection, reclaiming any unused memory inside of Studio, click the trash can icon located to the right of the memory bar. Clicking the garbage collection trash can icon might reduce the amount of memory Studio is currently using internally, potentially increasing the performance of Studio when working with a large project. Clicking the garbage collection trash can does not reduce the memory used by Studio from the operating system, the size of this memory remains constant to the 520 MBytes size initially allocated to Studio.

## Entity tabs

---

To manage the Entities tabs: in the upper half of the Workspace, the entities selected from Project tab are displayed as tabs (for example: Orchestrations and Endpoints). You can manage these tabs by right-clicking a tab and selecting the appropriate action from the menu:

- Close: Close the tab that you right-clicked on to open the menu.
- Close Other Tabs: Close all the open entity tabs except the entity tab that you right-clicked to open the menu.
- Close All Tabs: Closes all the entity tabs currently open.
- Close All But Current Tab: Close all the open entity tabs except the entity tab that is currently selected.

To navigate to hidden entity tabs, when many entities have been opened from the Project tab, the hidden tabs icon

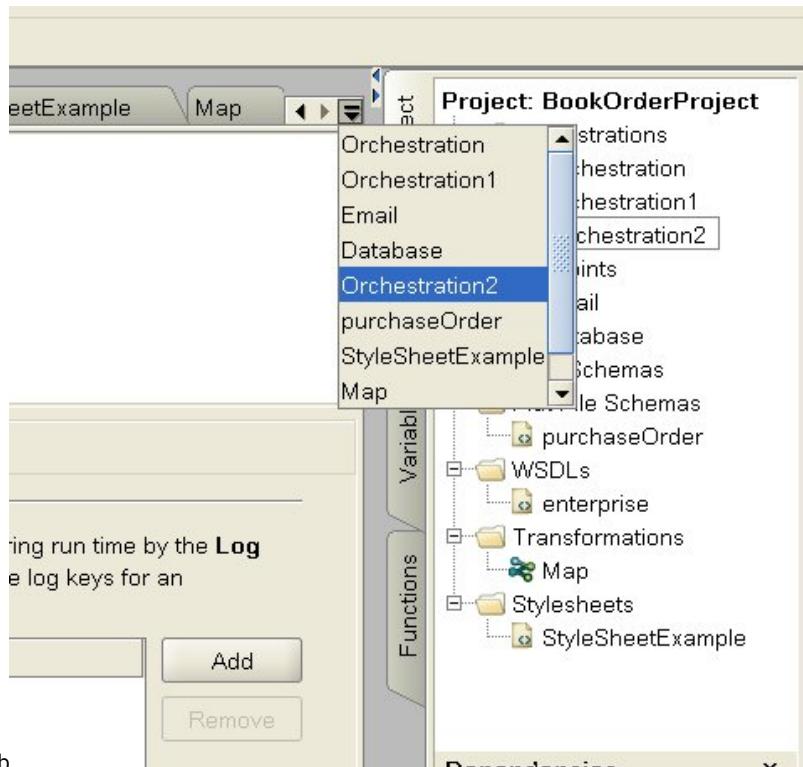

Figure 2. Hidden Tab

To access the hidden entity tabs, click the hidden tabs icon . A list of all the currently opened tabs is displayed. Select one of the tabs from the menu.

## Creating a new project

Each time you create a project, a project properties file is also created with the project name. These property files are used when you export or publish projects.

### Procedure

1. Select File > New Project
2. Enter CTRL+N, or click the New Project toolbar icon The New Studio Project dialog box is displayed.
3. Enter a name in the Project Name field. The name of the project cannot be longer than 42 characters and cannot contain any reserved characters or words. For the list of reserved characters and words see [About Valid Names](#).
4. In the Project Directory field, click [...], to browse for the folder in which to save the project. The Open dialog box is displayed
5. Select a folder and click Open.
6. Click OK.

**Parent topic:** [Working with projects](#)

## Protecting a project with a password

---

In Studio, you can protect a project by assigning a password to it.

### Before you begin

---

This password does not protect a project that has been exported from Studio or published to an Integration Appliance. This password is not used by the Integration Appliance.

### Procedure

---

1. Select Project > Permissions > Protect from the Studio toolbar menu. The Enter Project Password dialog box is displayed.
2. In the Enter Password field, enter a valid password. Passwords must be 4-15 characters in length and contain at least one letter and one number. Once a valid password is entered, the message displayed at the end of the dialog box changes from Enter password to Confirm password.
3. In the Confirm Password field, enter the same password. The message displayed at the end of the dialog box changes from Passwords do not match to Passwords match when the correct password is entered in the Confirm password field.
4. Click OK.

### Results

---

The project is now protected with a password.

### What to do next

---

Note: Studio does not store passwords. If you forget the password for the project and Studio does not currently have that project open, you must rebuild the project. If the project is still open, you can change the current password as described in the following topics.

- [Changing a password associated with a project](#)  
If a project is protected with a password, it can be changed from the Studio toolbar menu
- [Removing a password associated with a project](#)  
If a project is protected with a password, it can be removed from the Studio toolbar menu

**Parent topic:** [Working with projects](#)

---

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics\\_setting\\_project\\_security.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_setting_project_security.html)

## Changing a password associated with a project

---

If a project is protected with a password, it can be changed from the Studio toolbar menu

### About this task

---

The option to change the password is only available if the project has already been protected with a password.

### Procedure

---

1. Select Project > Permissions > Change Password from the Studio toolbar menu. The Enter Project Password dialog box displays.
2. In the Old Password field, enter the existing password assigned to the project.
3. In the New Password field, enter a new valid password. Passwords must be 4-15 characters in length and contain at least one letter and one number. Once a valid password is entered, the error changes from Invalid password selected to Passwords do not match.
4. In the Confirm Password field, enter the same new password. Once the same password has been entered in the Confirm Password field, the message displayed in the dialog box changes from Passwords do not match to Passwords match.
5. Click OK.

## Results

---

The project password has been changed.

**Parent topic:** [Protecting a project with a password](#)

## Removing a password associated with a project

---

If a project is protected with a password, it can be removed from the Studio toolbar menu

### About this task

---

The option to remove the password is only available if the project has already been protected with a password.

### Procedure

---

1. Select Project > Permissions > Unprotect from the Studio toolbar menu. The Enter Project Password dialog box displays.
2. In the Password field, enter the existing password assigned to the project.
3. Click OK.

## Results

---

The project is no longer protected by password.

**Parent topic:** [Protecting a project with a password](#)

## Opening a Project

---

When you first launch Studio, the Project last worked on is opened by default. There are several ways to open a different project.

### About this task

---

The following steps explain how to open a project using the menu toolbar. You can have only one project open at a time.

## Procedure

---

1. Select File > Open Project , or select the Open Project  toolbar icon.
  2. Navigate to the location of the project you want to open.
  3. Select the project to open. Either:
    - o Select a project file that ends in the .sp3 extension and click Open.
    - o To view a project that was recently opened, select File > Reopen Projects > *OldProjectName*, where *OldProjectName* is the name of the recently opened project.
- If the project is secure, you must enter a valid password to open it.

## What to do next

---

You can also open a project using the Studio Introduction pane or by using the keyboard.

- Using the Studio Introduction pane, click Open Project to display the Open dialog box
- Using the keyboard, use CTRL+O to select a project file that ends in the .sp3 extension

## Saving a Project

---

You can save a project using the Studio toolbar.

### About this task

---

To save a project to the file system using the default project name, choose one of the following options:

- SelectFile > Save Project from the Studio toolbar
- Press CTRL+S
- Click the Save Project toolbar icon 

### Procedure

---

1. Choose one from one of the following options:
  - o Select File > Save As from the Studio toolbar
  - o Press CTRL+AThe Save As dialog box displays.
2. In the Project Name field, enter the new name of the project.
3. Optional: By default, the project is saved into the directory location specified by the Default Create Path field of the Preferences dialog box. To specify a different directory location, click Browse.
4. Click OK.

### Results

---

The Saving Project progress dialog box displays as the current project is saved using the new name. The new project is saved into a directory on the local file system and the new project is opened and displays in the Project tab. The original project remains unchanged since the last time it was saved to the local file system

## What to do next

---

To close the current project, choose from one of the following options:

- SelectFile > Close Project from the Studio toolbar.
- Click the Close Project toolbar icon .

**Parent topic:** [Working with projects](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics\\_saving\\_closing\\_a\\_project.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_saving_closing_a_project.html)

## Renaming a Project

---

You can rename a project using the Studio toolbar.

### Procedure

1. Choose one from one of the following options:
  - Select File > Rename Project from the Studio toolbar
  - Press CTRL+RThe Rename Project dialog box displays.
2. In the Project Name field, enter the new name of the project.
3. Optional: By default, the renamed project is saved into the directory location specified by the Default Create Path field of the Preferences dialog box. To specify a different directory location, click Browse.
4. Click OK.

### Results

---

If the project was changed since the last save, the current project is saved before the project is renamed.

The Saving Project progress dialog box displays as the current project is renamed and saved into a directory on the local file system using the new name. The current project with the new name is opened and displays in the Project tab. The original project with the old name no longer exists on the local file system.

### What to do next

---

To close the current project, choose from one of the following options:

- SelectFile > Close Project from the Studio toolbar.
- Click the Close Project toolbar icon .

## Publishing a Project

---

When you publish a project, Studio connects to an Integration Appliance and directly updates the Integration Appliance with the documents that make up the project. Publish a project when the project is complete, has been validated, and has been tested in Studio. You cannot publish a project that has not been successfully validated.

## About this task

---

You can publish multiple projects to the Integration Appliance.

Note: If you attempt to publish a project from Studio to the Integration Appliance and a project of the same name already exists on the Integration Appliance, whether the project gets published depends on the status of the project on the Integration Appliance:

- If any of the orchestrations in the project have been deployed on the Integration Appliance, the new project does not get updated on the Integration Appliance.
- If all the orchestrations in the project have been removed from the Integration Appliance, the new project from Studio overrides the existing project of the same name on the Integration Appliance.

As an alternative to publishing a project, you can choose to export a project. Exporting is typically used for publishing projects to production environments where administrators need to control the timing and impact of the deployment. For more information about exporting, see [Exporting a Project](#).

Note: To publish a project, Studio relies on the supported SSL and TLS protocols enabled in the SSL/Kerberos - Preferences window. You can select the TLSv2 or TLSv1.2 protocol. The default is TLSv2.

## Procedure

---

1. Select File > Publish Project or the Publish Project toolbar button.  The Publish Project dialog box displays.
2. In the Host name field, enter the host name or the IP address of the Integration Appliance you want to publish the project to. This is the host name for the management interface (mgmt).
3. Enter the User Name and Password for the Web Management Console (WMC) account for this Integration Appliance. The default account name is admin and the default password is !n0r1t5@C.
4. Optional: To specify that the project documents are to be sent over HTTPS to the Integration Appliance, select the Security check box.
5. Click OK. Studio connects to the Integration Appliance and updates the Integration Appliance with the documents that make up the project.
6. When the publish is confirmed, click OK.

## Exporting a Project

---

Export saves all the orchestrations, endpoints, schemas, and other items associated with the project, into a single file that ends in the .par extension.

## About this task

---

Exporting is typically used for publishing projects to production environments where administrators need to control the timing and impact of the deployment. When a project is exported to a PAR file (in Studio), an administrator can use the Web Management Console (WMC) to upload the project to the Integration Appliance. This two-step process (exporting to a PAR file and uploading a project using the WMC) is equivalent to publishing a project directly from Studio to an Integration Appliance.

## Procedure

---

1. Select File > Export Project from the toolbar menu or select the Export Project toolbar button . The Save dialog box displays.
2. Navigate to the directory where you want to save the exported project.
3. Optional: Change the name of the exported file. Keep the .par extension.

4. Click Save.
  - o If successfully exported, a project file shows in the specified directory. The file name is the same as the current name of the project with a .par extension. For example, if you export a project named *MySimpleProject*, the project is saved in the *MySimpleProject.par* file. A dialog box displays indicating that the export process was successful.
  - o If there are problems with the project it is not exported; the Exporting Results dialog box displays with a list of problems that must be corrected before the project can be successfully exported.
5. Click OK.

## What to do next

---

For more information about exporting a project into the Integration Appliance using the WMC, see the WMC online help.

## Configuring Project Settings

---

You can assign a unique version number to a project using the Project Settings dialog box.

### About this task

---

When you publish a project to the Integration Appliance, the version number associated with the project is visible in the Web Management Console (WMC). By changing the version number in the Version field, you can publish different versions of a project, even if the project itself hasn't changed. The different versions of the project are listed separately in the WMC and can be deployed individually.

### Procedure

---

1. Select Project > Project Settings from the menu toolbar. The Project Settings dialog box displays.
2. Enter a version number in the Version field.
3. Enter a description of the project in the Description field.
4. Enter any comments for the project in the Comments field
5. Click OK.

## Setting Preferences

---

You can specify Project, Orchestration, Flat File, SSL/Kerberos, Session Login, and XML Schema preferences from the Preferences dialog box. You can change preferences at any time.

### Procedure

---

1. Select Edit > Preferences option from the toolbar. The Preferences dialog box opens.
2. In the left pane, select the type of preferences to change:
  - o Appearance
  - o Project
  - o Orchestration
  - o Flat File
  - o SSL/Kerberos
  - o Session Login
  - o XML Schema
  - o Current Project
3. Specify, select, or clear preferences in the dialog box.
4. Click OK.

## Results

---

The tables in the following topics describe the Appearance, Project, Orchestration, Flat File, SSL/Kerberos, Session Login, and XML Schema preferences available from the Preferences dialog box.

Using the Appearance preferences you can change the application display and font.

- [Project Preferences](#)  
Project preferences can be set using the Preferences dialog box.
- [Orchestration Preferences](#)  
Orchestration preferences can be set using the Preferences dialog box.
- [Other Preferences](#)  
Appearance, Flat File, SSL/Kerberos, Session Login, XML Schema, and Current® Project preferences can all be set using the Preferences dialog box.

## Project Preferences

---

Project preferences can be set using the Preferences dialog box.

Table 1.

Button or Option Label	Description
Open editor automatically for new orchestrations	<ul style="list-style-type: none"> <li>• If this check box is selected, when you create an orchestration the orchestration is automatically displayed in the main Studio pane.</li> <li>• If this check box is cleared, when you create an orchestration the orchestration is not automatically displayed in the main Studio pane.</li> </ul>
Reopen the last project when studio starts	<ul style="list-style-type: none"> <li>• If this check box is selected, the last project opened in Studio is opened again when Studio is restarted.</li> <li>• If this check box is cleared, no project is opened when Studio is restarted.</li> </ul>

Button or Option Label	Description
Always overwrite existing projects	<ul style="list-style-type: none"> <li>If this check box is selected, when creating a project with the same name as an existing project already saved in the default directory, the new project is created, overriding the existing project and no warning dialog box is displayed.</li> <li>If this check box is cleared, when creating a project with the same name as an existing project already saved in the default directory, a warning dialog box is displayed asking if you want to override an existing project.</li> </ul>
Always ask to save project before closing	<ul style="list-style-type: none"> <li>If this check box is selected, when a project is closed, a dialog box asking if you want to save the project is displayed even if no changes have been made to the project.</li> <li>If this check box is cleared, when a project is closed and no changes have been made to the project, a dialog box is not displayed asking if you want to save the project.</li> </ul>
Show dependant project nodes	<ul style="list-style-type: none"> <li>If this check box is selected, the Dependencies pane is displayed underneath the Project tab. For more information see Dependencies Pane in the Project tab.</li> <li>If this check box is cleared, the Dependencies pane is not displayed underneath the Project tab.</li> </ul>
Show memory usage in status bar	<ul style="list-style-type: none"> <li>If this check box is selected, a memory bar displays underneath the 4 sideways-oriented tabs: Project, Activities, Variables, and Functions. For more information see <a href="#">Memory usage and garbage collection</a>.</li> <li>If this check box is cleared, a memory bar does not display underneath the four sideways-oriented tabs: Project, Activities, Variables, and Functions. For more information see <a href="#">Memory usage and garbage collection</a>.</li> </ul>
Show the entities of the Project tab as a list	<ul style="list-style-type: none"> <li>If this check box is selected, the entities in Project tab display as a list.</li> <li>If this check box is cleared, the entities in Project tab are grouped in folders.</li> </ul>
Clear Recent Projects	Click Clear Recent Projects to clear the cache of projects you have recently opened and listed when the File > Reopen Project toolbar menu option is selected.
Default Create Path	Click Browse... to select the default directory path where new projects are saved.

**Parent topic:** [Setting Preferences](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basis\\_projectpreferences.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basis_projectpreferences.html)

## Orchestration Preferences

---

Orchestration preferences can be set using the Preferences dialog box.

Table 1.

Button or Option Label	Description
By Default Animate Orchestration Views	<p>This is a global option that determines the behavior for all orchestrations. By default, this option is selected and all actions that occur in the Studio Workspace are animated.</p> <p>Clear this option, to turn off workspace animation. When this option is clear and you perform action in the Workspace, such as adding an activity, the Workspace snaps into place.</p> <p>You can override this option at the individual orchestration level, using the Animate Graph orchestration view icon. However, if the global option is modified after you set the option for an individual orchestration, the global change overrides any individual orchestration setting you previously set.</p>

<b>Button or Option Label</b>	<b>Description</b>
Use Old Orchestration View	Select this option to view an orchestration as it would display in Studio 3.X. When you select this option, Studio 4.X orchestration view improvements are no longer available. For a complete list of 4.X orchestration view improvements, see the Studio Release Notes®.
Maximum Job Instances to be displayed	Determines the maximum number of jobs that can display in the Verify tab. For example, if you specify 2, the status of two jobs display: instance #1 and instance #2. If you run the orchestration again, the Verify tab displays: instance #2 and instance #3.
Show Activity ID	When you select this option, ID numbers display in the activities of an orchestration.
Enforce Strict Validation for Reply activities	By default, this option is selected. If you clear this option, Studio allows more than two Reply activities on the execution path. Reply activities include: Web Services <b>Send Reply</b> , Web Services <b>Send Reply with Fault</b> , and <b>HTTP Send Response</b> .
WS Provide-Generate WSDL compatible with 3.6.x version	Typically, when you upgrade projects that contain Web Services <b>Provide Service</b> activities, the Studio generates a WSDL with a new namespace. Select this option so that Studio keeps the 3.6X WSDLs instead.  If you select this option, Studio does not generate WSDLs with the most current namespaces.
CDK Log Enable/Disable	Select this option to view CDK Connector activity log (or flow) in the Verify pane.

## Other Preferences

Appearance, Flat File, SSL/Kerberos, Session Login, XML Schema, and Current® Project preferences can all be set using the Preferences dialog box.

Table 1. Appearance Preferences

<b>Button or Option Label</b>	<b>Description</b>
<i>Application</i>	
Use native application frame	Indicates that if you select this check box, the look and feel of the operating system will be applied to the application window.
Use Color Scheme	Indicates the color schemes available to customize your application display. This option is available only if the Use native application frame options is not selected.
<i>Font</i>	
User Interface	Lists the font types available to change the font of the user interface. The Reset button allows you to set the default font.
Data Fields	Lists the font types available to change the font of the data fields. The Reset button allows you to set the default font.

Table 2. Flat File Preferences

<b>Button or Option Label</b>	<b>Description</b>

<b>Button or Option Label</b>	<b>Description</b>
Maximum Preview Size of Sample File (in KBytes)	<p>When testing a Flat File Schema, this field specifies how many KBytes of data is displayed in the source pane - the left side of the Test tab. This field is useful when you have a large source data file and you need to only view the top portion of the file to design the Flat File Schema.</p> <p>This field does not affect the size of the file that is transformed when you click the Test icon in the Test tab. The entire source data file is transformed if the Maximum Size of Sample File (in KBytes) field is set to a large enough size to load the entire file.</p>
Maximum Size of Sample File (in KBytes)	When testing a Flat File Schema, this field limits the size in KBytes of the test data that is loaded into Studio for testing a Flat File Schema. The maximum supported sample data size is 2000 KBytes. If you specify a value greater than 2000 KBytes in this field, Studio resets the value to 2000 KBytes.

Table 3. SSL/Kerberos Preferences

<b>Button or Option Label</b>	<b>Description</b>
Kerberos Realm	Specifies the Kerberos realm.
Kerberos Server Name	Specifies the Kerberos server name.
KeyStore Password	Provides the password to access the keystore.
KeyStore Path	Specifies the path to the local Javaâ„¢ keystore.
TrustStore Password	Provides the password to access the truststore.
TrustStore Path	Specifies the path to the local Java truststore.
SSL Protocol	Use the drop-down menu to specify the SSL Protocol. TLSv2 is the default and enables all SSL and TLS protocols (including TLSv1.2) for SSL negotiation. TLSv1.2 enables the SSL communication using the TLSv1.2 protocol only.

Table 4. Session Login Preferences

<b>Button or Check Box Label</b>	<b>Description</b>
Username	Studio uses this user name to log in to the Cast Iron® TIPs repository.
Password	Studio uses this password to log in to the Cast Iron TIPs repository.
URL	Specifies the URL to the Cast Iron Service Login. Note: Do not modify the default value.
Host Name	Specifies a proxy host if you choose to use one.
Port	The proxy server port. By default, 8080.

Table 5. XML Schema Preferences. The following preferences determine the number of child levels, which Studio allocates and displays, for each XML Schema (including WSDLs) in the currently opened project.

<b>Button or Check Box Label</b>	<b>Description</b>
Number of child node levels allocated in memory for the schema Â	<p>Specifies the number of child node levels that are allocated in memory for the XML Schema. The number of child nodes allocated in the internal tree that stores the metadata of the XML Schema in Studio.</p> <p>Note: Specifying a large number of child node levels can adversely affect the performance of Studio. The recommended value for this preference is 6.</p>
Number of recursive node levels	<p>Specifies the number of recursive node levels allowed and graphically displayed. Â</p> <p>Note: Specifying a large number of recursive node levels can adversely affect the performance of Studio. The recommended value for this preference is 3.</p>

Button or Check Box Label	Description
Number of child node levels that are initially expanded when a schema is displayed graphically	<p>Specifies the number of child node levels that are initially expanded when an XML Schema is displayed graphically. For example if this limit was set to 6 in the preferences and a variable was selected for the From Orchestration pane of the Map Inputs task contained 8 node levels (<i>input/po/purchase/widgetId/price/discount/special/december</i>), only the first 6 levels (<i>input/po/purchase/widgetId/price/discount</i>) would be displayed in the Map Inputs task. You can expand a child node manually, by clicking the + sign next to the unexpanded child node.</p> <p>Note: Specifying a large number of child node levels can adversely affect the performance of Studio. The recommended value for this preference is 4.</p>
Number of child node levels allocated in memory for the substituted types of schema	<p>Specifies the number of child node levels that are allocated in memory for the substituted types of XML Schema. The number of child nodes allocated in the internal tree that stores the metadata of the substituted types of XML Schema in Studio. The default value is 10. The minimum value is 4.</p> <p>Note: Lowering this value decreases the memory requirement for child node levels in Studio.</p>

Note: A word about memory consumption: Studio allocates memory for each variable or parameter displayed in the Variables or Mapper panes and generates metadata in a tree structure with each node containing information about a specific element/complexType. Because elements or complex types have references to themselves, the tree depth of those elements can exceed ten levels, resulting in OutOfMemory errors. To avoid this, use the XML Schema preference parameters to improve memory consumption. For example, you can use the Number of recursive node levels function to limit how many times a self-referring node is added to the tree structure. Additionally, you can use the Number of child node levels allocated in memory for the schema function to control tree depth and prevent Studio from exceeding a certain limit.

Table 6. Current Project Preferences. The following preference determines whether the password is encrypted or not for the current opened project.

Check Box Label	Description
Backwards compatibility with pre-4.5 projects is not required	<p>When checked, encrypts the password upon publishing. This is the default starting with the Cast Iron 4.5 release. Before the 4.5 release, passwords were symmetrically encoded. If you plan to have the current project send the password to pre-4.5 projects, clear the check box. This avoids errors when the password is consumed by pre-4.5 projects.</p>

## Creating Configuration Properties

---

Create configuration properties or name/value pairs in a project. Use configuration properties to supply the default values for destination nodes of a map in the Mapping Editor. Â

### About this task

---

When you add configuration properties to the project, using the Project > Configuration Properties option of the Studio toolbar menu, you can choose from these properties to supply the values for some of the fields in endpoints and default values for destination nodes in maps.

For example, if you created a configuration property named *myDatabaseName* of String type in Studio. While configuring your database endpoint, click the Database Name field and the  icon displays on the right side of field because at least one configuration property of String type was previously created. Click the  icon and select the *myDatabaseName* configuration property from the menu. The Database Name for the endpoint is supplied by the *myDatabaseName* configuration property during both design time (in Studio) and run time (on the Integration Appliance). A configuration property can be of type String or Password.

A destination node of a map is located in the right pane of the Mapping Editor. For more information, see [Assigning a Default Value for a Destination Node](#).

You can create configuration properties in the Configuration Properties dialog box or use the quick create method.

**To create configuration properties using the Configuration Properties dialog box:**

## Procedure

---

1. Open a Project.
2. Select Project > Configuration Properties from the toolbar menu. The Configuration Properties dialog box displays.
3. In the Add Name field, enter the name of the property you want to create.
4. From the Type list, select either String or Password.
5. Click Create. The new property name and type display in the properties list.
6. Click in the Value column for the newly created property.
7. Enter a value for the property; if it is of type password, the value is masked.
8. Press Enter or click out of the Value table cell to stop editing.
9. Continue adding additional properties as required. When finished, click OK.

## Example

---

Instead of creating configuration properties in the Configuration Properties dialog box, you can use the quick create option to define configuration properties directly from a text field in Studio. Fields that are enabled for the quick create option display a small green globe in the lower-right corner.

You can change the values of the configuration properties using the Web Management Console (WMC), like the configuration properties created in the Configuration Properties dialog box, after publishing a project.

Updating the value of the configuration property in the WMC does not affect the original value of the configuration property, that you defined in Studio.

**To create configuration properties using the quick create option:**

1. In an Enabled field, click the green globe. The Create Configuration Property window is displayed.
2. In the text field, enter a name for this property.
3. Click Create to save the entry as a reusable property.

The property displays in the current text field, the  icon is replaced by the green globe, and the property is saved in the Configuration Properties dialog box.

## Editing Configuration Properties

---

You can edit configuration properties in Studio and in the Web Management Console (WMC).

### About this task

---

#### Editing Configuration Properties in Studio

You can edit specific information for an existing property by opening the Configuration Properties dialog box and double-clicking the entry. This does not include changing the type. If you make a change and click OK, all of the applications of that property are updated automatically. You cannot delete properties that are in use in an orchestration. You can delete only unused properties or properties that you have removed from active orchestrations.

#### Editing Configuration Properties in the WMC

When the project is published to the Integration Appliance, you can change the values of the configuration properties using the WMC. For example, you can create configuration properties in Studio that stores the following database connection information for a database endpoint: hostname, IP address, username, and password. You can then publish the project to the Integration Appliance, deploy the project, and test against a development database. When testing is complete, you might want to connect to a different database; for example, your production database. Using the WMC, you can update the values of the configuration properties in the project on the Integration Appliance to point to the production database.

## Results

---

Changes you make to configuration properties in a project configuration using the WMC are independent of values you specified for the configuration property in Studio. When you create project configuration properties in Studio and publish the project to the WMC, the WMC displays a Default project configuration. In this project configuration, and any project configuration you generate from the published project, you can use the WMC to modify the configuration property values you specified in Studio before publishing the project.

If you undeploy the project, update the configuration property values using Studio, and publish the project to the WMC again. The existing project configurations do not reflect the changes. To see the changes you just made to the configuration properties (using Studio), you must use the WMC to create a project configuration. This new project configuration displays the configuration property values you specified for the project in Studio.

## What to do next

---

For more information, see "Enhancing the Simple Project" in the Getting Started Guide.

## Creating Global Configuration Properties

---

When a global configuration property is created, you can import the global configuration property into a project as a project configuration property.

### About this task

---

You can use global properties to supply the values for fields in endpoints or for default values for destination nodes in maps. Create global configuration properties in Studio using the Edit > Manage Global Configuration Properties option of the Studio toolbar menu. For example, create a global configuration property named dbPassWord of the type Password in Studio, then create a configuration property in your project by importing dbPassWord.

A global configuration property can be of type String or Password.

### Procedure

---

1. In Studio, click Edit > Manage Global Configuration Properties.
2. Under the Global Property Lists pane, click New. The New Global Properties dialog displays.
3. Enter a name for the new global configuration property list and click OK. You can create one or more global configuration properties for each list.
4. Enter a name for the global configuration property that you want to create.
5. Select either String or Password from the Type list. If you select Password, the value is masked.
6. Click Create.
7. In the Value field, enter the value you want for the property.
8. Click OK. If you want to add more properties to the list, repeat steps 4 through 8.

## What to do next

---

Import project properties into a global properties list by clicking Import, select the project property you want to make global, and click Add.

To delete a global property from a global property list, select the property and click Delete.

## Searching for Template Integration Projects (TIPs)

---

Template Integration Projects (TIPs) are stored in the Cast Iron® solutions repository. Through the Configuration Wizard, TIPs guide you through the configuration steps for an integration scenario. TIPs can be downloaded to your local machine. The login window is pre-populated with the User Name and Password to make it easier for you to download the TIPs, without registration.

### Procedure

---

1. From the Solutions menu, select Search For TIPs. The Login window is displayed with the pre-populated User Name and Password. These credentials have the access privilege only to download TIPs.  
Note: You can also log on by clicking the Login link present on the right-hand side, near the memory bar.
2. If you already have the credentials to log on, specify the user name and password. You can specify default login settings for the central repository in the Preferences dialog.
3. Click OK. The Search window is displayed and a confirmation message displays at the end of the main Studio window.
4. In the Search window, choose Keywords, Filter, or My TIPs as the method by which you want to search for TIPs.
  - o If you select the Keywords search option, the Keywords field is displayed.
    - a. Enter a search keyword.
    - b. Click Go. The results are displayed in the Results table and a "Searching ... completed" message is displayed at the end of the Search window. For example, if you enter the keyword USECASES, all TIPs under the USECASES category in the Cast Iron solutions repository are returned.
  - o If you select Filter search option, the filter options: Source Endpoint, Target Endpoint, Integration Patterns, and Searchable Keywords are displayed.
    - a. You must specify a value for at least one filter option. The options lists provide valid values.
    - b. Click Query. The results are displayed in the Results table and a "Searching ... completed" message is displayed at the end of the Search window.
  - o If you select My TIPs, all TIPs that you have created are displayed in the Results table.
5. In the Results table, select a TIP. The details for the project are displayed in the details section.
6. Optional: You can rate the TIP that you have selected.
  - a. Click the Edit Review link. The Publish Review window is displayed.
  - b. Move the slider until the appropriate number of stars are highlighted. Rate the TIP on a scale between 1-5, 5 being the highest rating.
  - c. In the My Title field, add a brief description for your review.
  - d. In the My Summary field, add more details about your review of the project.
  - e. Click OK. Studio submits the review to the Cast Iron solutions repository.
7. In the Search window, click Download. The Select directory where to save the TIP window is displayed.
8. Specify the download directory and click Open. The project is saved to the directory you specified and Studio opens the Configuration Wizard for the project.

## Installing Module Provider Libraries

---

Both IBM® Cast Iron® Studio and the Integration Appliance require library files (.jar and .dll) associated with instances of certain connector types to be imported. For example, the following connectors require additional libraries: Database Connector, JDE, JMS, MQ, PeopleSoft, and SAP. These files must be present in Studio to enable configuration of the endpoints and orchestrations that use any of those connectors.

### About this task

---

For information about installing the required library files on the Integration Appliance using Web Management Console, see the WMC Online Help.

You need access to the connector-specific library files, either on your Studio workstation or through the network.

### Procedure

---

1. With Studio open, select Tools > Install Module Providers. The Add Provider(s) dialog box displays.
2. Click the plus button under the relevant provider name. A text entry field and a browse button display to the right.
3. Click Browse, and use the browse dialog box to locate and select the files. Press the CTRL or SHIFT key to select more than one file.
4. Click Open to import the file contents. The library files display in the Add Provider(s) dialog box.
5. Click OK. When a library is installed or removed you are prompted to shut down Cast Iron Studio to apply the changes.
6. To apply the changes, click Yes then manually restart Cast Iron Studio. The library files are installed and you can proceed with your endpoint configurations. To return to the Add Provider(s) dialog box without applying the changes, click No.

## Uploading Files into a Project

---

You can upload only specific types of files into a project. For example, if you plan on mapping a string to XML data (valid to a particular XML Schema), you must first upload the XML Schema file (ends in the .xsd extension) into the project before mapping the nodes in the XML Schema.

### About this task

---

See [Valid External File Types for a Project](#) for a complete list of valid external file types.

There are three ways to upload a file from the file system into a project:

- Upload files into a project by dragging a file into the Project tab
- Upload files into a project by right-clicking the appropriate folder in the Project tab
- Upload files into a project by clicking Add Document in the Project tab

The following procedure describes how to upload files into a project by dragging a file into the Project tab.

### Procedure

---

1. Select a file from a Windows folder in the local file system and drag into the Project tab.

- o If file is a supported file type and ends in the correct extension, a node displays under the appropriate folder in the Project tab with a default name. For example, if you dragged an XML Schema file called PurchaseOrder.xsd from the file system to the Project tab, a new node called PurchaseOrder shows in the XML Schemas folder of the Project tab. For a list of supported file types see [Valid External File Types for a Project](#).
- o If the uploaded file is an XML Schema or WSDL that includes other XML Schemas, the Uploading Included XML Schemas dialog box automatically displays. For more information, see [Uploading Included XML Schemas](#).

2. Optional: Change the default name.

3. Press Return.

- [Uploading Files into a Project using the Mouse](#)

There are three ways to upload a file from the file system into a project, this procedure describes how to upload files into a project by right-clicking the appropriate folder in the Project tab.

- [Uploading Files into a Project using the Add Document Button](#)

There are three ways to upload a file from the file system into a project, this procedure describes how to upload files into a project by clicking the Add Document button in the Project tab.

## Uploading Files into a Project using the Mouse

There are three ways to upload a file from the file system into a project, this procedure describes how to upload files into a project by right-clicking the appropriate folder in the Project tab.

### Procedure

1. In the Project tab, right-click the appropriate folder for the type of file you are uploading, and select Add Document from the list. Â For example, if you are uploading an XML Schema file, select the XML Schemas folder in the Project tab. The Add Document dialog box displays.
2. In the Location field, [specify the location of the file from an external web location or from the file system](#).
3. Optional: In the Name field, enter the name for the entity that you want to display in Studio. The name you enter must not exceed 42 characters, and must not contain any reserved characters. For a list of reserved characters see [About Valid Names](#).
4. Click OK.

### Results

If the uploaded file is an XML Schema or WSDL that includes other XML Schemas, the Uploading Included XML Schemas dialog box automatically displays. For more information, see [Uploading Included XML Schemas](#).

The file is uploaded into the project.

## Uploading Included XML Schemas

---

An XML Schema or WSDL document can include other XML Schemas in the main document, using Schema Inclusion, Schema Inclusion with Redefinition, or Importing a Namespace.

### About this task

---

#### Schema Inclusion

You can include other XML Schema fragments into the main XML Schema or WSDL using the `include` element as shown by the following example: `<xsd:include schemaLocation="myTypes.xsd"/>`

#### Schema Inclusion with Redefinition

The XML Schema specification supports redefining definitions included by other XML Schema fragments in the current XML Schema or WSDL. For example, the `myTypes.xsd` XML Schema fragment defines a complex type called `PurchaseOrderType`.

Another XML Schema called `PurchaseOrder.xsd` includes the `myTypes.xsd` XML Schema fragment using the `redefine` element and redefines the complex type called `PurchaseOrderType`.

You can include other XML Schema fragments into the main XML Schema or WSDL using the `redefine` element as shown in the following example: `<xsd:redefine schemaLocation="myTypes.xsd"/>`

#### Importing a Namespace

You can include a namespace into the current document using the `import` element as shown in the following example:

`<xsi:import namespace="http://acme.com/ns/example" schemaLocation="mySchema.xsd" />`

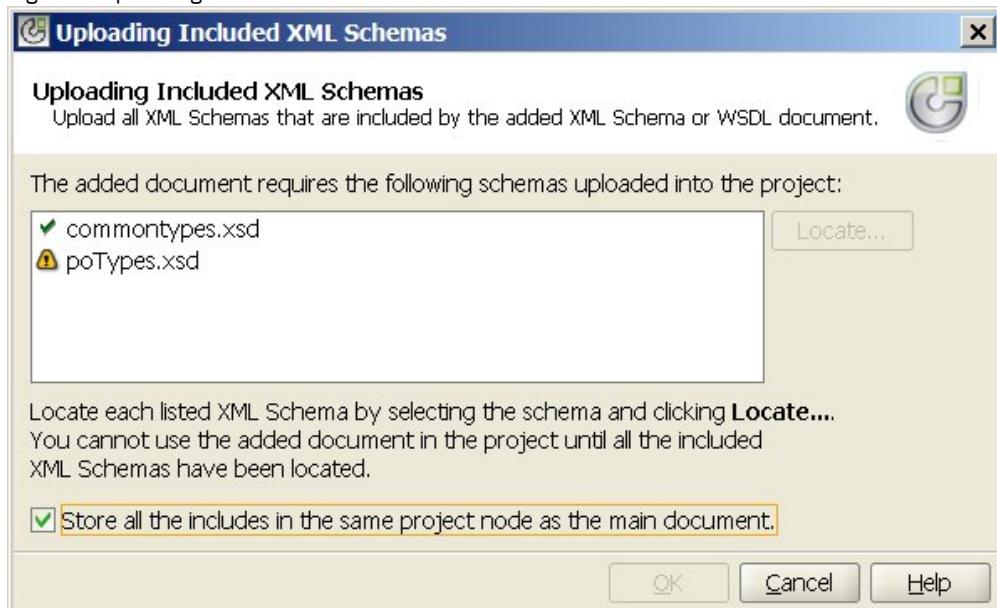

When you add or upload the main XML Schema or WSDL to the project using the Add Document dialog box, you are prompted to locate any included XML Schema or XML Schemas into the project, as shown in the following procedure. All the included XML Schemas must be located before the main XML Schema or WSDL document shows in the Project tab and can be used in the project.

## Procedure

---

1. Upload an XML Schema or WSDL document into the current project. If the XML Schema or WSDL document includes other XML Schemas, the Uploading Included XML Schemas dialog box displays listing all the included XML Schemas as shown in [Figure 1](#).

Figure 1. Uploading Included XML Schemas

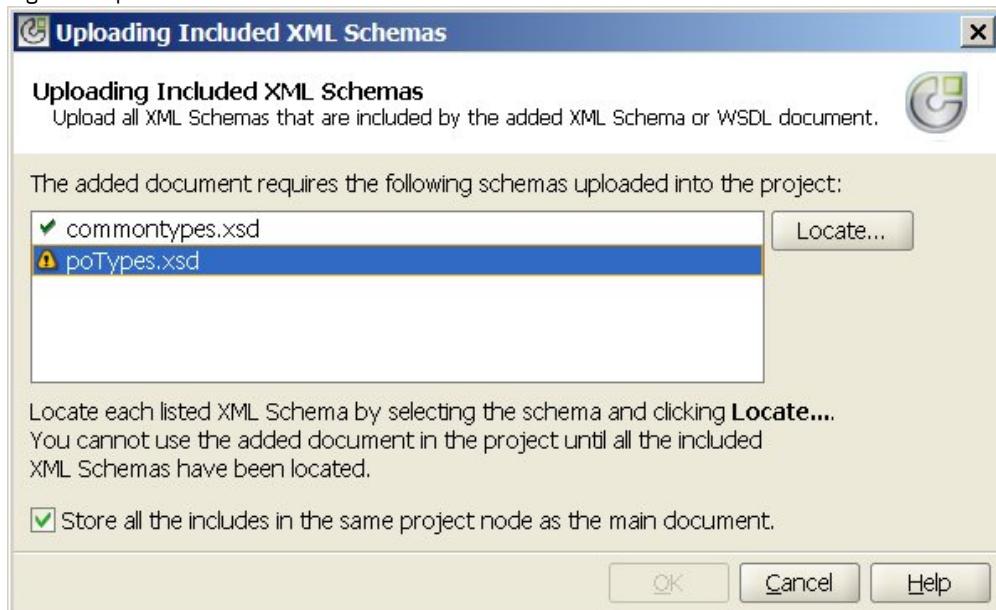

If the included XML Schema is automatically located, the checkmark icon displays next to the XML Schema in the Uploading Included XML Schemas dialog box as shown for the `commonTypes.xsd` XML Schema in the preceding figure. If the main XML Schema or WSDL was located on the local file system, Studio looks for the included XML Schemas in the same directory and automatically locates them; for example, if you uploaded `mySchema.xsd` from the `C:\temp` directory and `mySchema.xsd` includes the `commonTypes.xsd` XML Schema, Studio automatically locates the `commonTypes.xsd` XML Schema in the `C:\temp` directory. If the included XML Schema is not automatically located, the warning icon displays next to the XML Schema in the Uploading Included XML Schemas dialog box as shown for the `poTypes.xsd` XML Schema in Figure 1.

2. Repeat the following steps to locate all the unlocated XML Schemas:

- Select the XML Schema in the Uploading Included XML Schemas dialog box. The XML Schema is highlighted in the table as shown in Figure 2.

Figure 2. Upload an XML Schema

- Click Locate. The Locate the Selected XML Schema dialog box is displayed.
- In the Location field, specify the location of the included XML Schema from an external web location or from the file system.
- Click OK. If the XML Schema is located, the checkmark icon displays next to the XML Schema in the Uploading Included XML Schemas dialog box.

3. By default, the `Store all the includes in the same project node as the main document` check box is selected. When this check box is selected, the included XML Schemas and the main XML Schema or WSDL are uploaded as a single project node. When this check box is cleared, all the included XML Schemas and the main XML Schema or WSDL are all displayed separately in the Project tab. A checkmark icon shows next to every listed XML Schema indicating that all the included XML Schemas have been located.

4. Click OK.

## Example

If the Store all the includes in the same project node as the main document check box is selected, only the main XML Schema or WSDL displays in the Project tab as shown in [Figure 3](#).

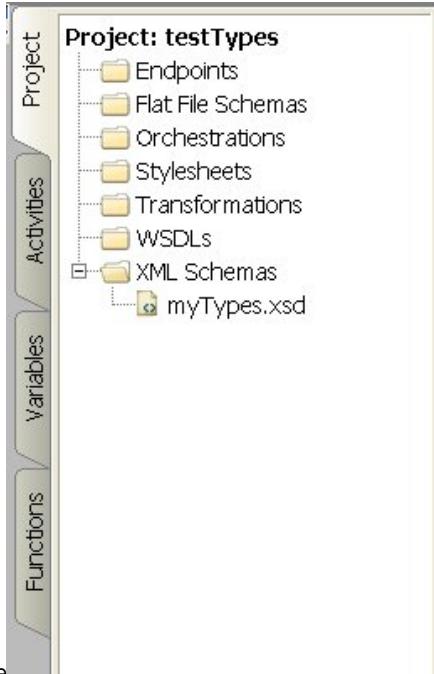

Figure 3. Example

With the check box selected, the included XML Schemas are still uploaded into the project but are not displayed in the Project tab, so you cannot individually update these XML Schemas in the project as described in [Uploading Included XML Schemas](#).

If the Store all the includes in the same project node as the main document check box is cleared, the main XML Schema or WSDL displays and all the included XML Schemas are uploaded in the project and show in the Project tab as shown in [Figure 4](#).

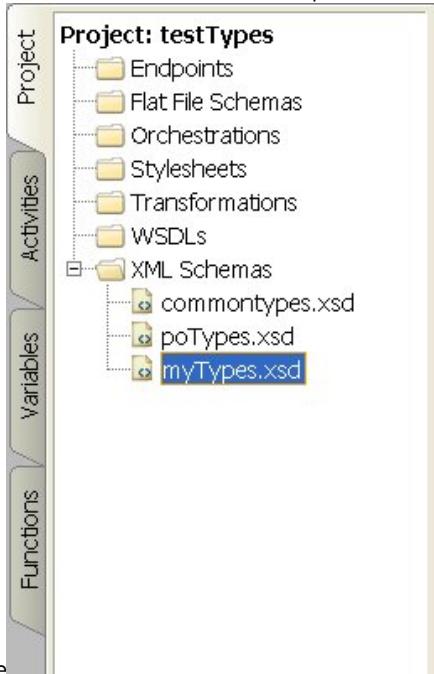

Figure 4. Example

With the check box cleared, all the included XML Schemas can be individually updated as described in [Uploading Included XML Schemas](#).

Note: If possible, always load the main XML Schema or WSDL with this check box selected (as one project node) to reduce potential dependency conflicts between XML Schemas. For example, if you upload the main "myTypes.xsd" file into the project with the Store all

the includes in the same project node as the main document check box cleared, the following XSD files are also uploaded and show in the Project tab:

- commonTypes.xsd
- poTypes.xsd

If you created and uploaded a third XSD file called *myTypesTwo.xsd* that also included and used the types defined in the *commonTypes.xsd* file, and you then changed the names of the types defined in the *commonTypes.xsd* and used in *myTypes.xsd* outside of Studio and uploaded new versions these files, the *myTypesTwo.xsd* file in the project still refers to the original names of the types and is now invalid.

## Specifying the Location of a File to Upload

---

Files can be uploaded into a project from a web location (HTTP or FTP Server) or from the local file system.

### Procedure

---

1. To specify a location for the file from the local file system, choose from one of the following options:
  - Click Browse to browse for the file, and click Open.
  - In the Location field, enter the URI of the file on the local file system, for example: file:/C:/temp/mySchema.xsd
2. To specify a location for the file from an external web location (FTP or HTTP Server), in the Location field enter the URI of the file using any of the following format descriptions:
  - http://[username:password@]hostname[:portNumber]/location
  - https://[username:password@]hostname[:portNumber]/location
  - ftp://[username:password@]hostname[:portNumber]/locationThe preceding format descriptions contain the following representations:
  - brackets [] - represent optional parameters and should not be included in the URI
  - username - specifies the user name to connect to the HTTP or FTP server
  - password - specifies the password of the specified user name to connect to the HTTP or FTP server
  - portNumber - specifies the port number to use to connect to the HTTP or FTP server
  - location - specifies the URL path to find the file. The URL must include the name of the file as shown in the following example.

### Example

---

To upload the *mySchema.xsd* file from the *acme.com* FTP server in the /input directory using the username *bob* with a password of *snippy1*, specify the following string in the Location field:

- ftp://bob:snippy1@acme.com/input/mySchema.xsd

## Valid External File Types for a Project

---

When building orchestrations, you can upload XML Schemas or other files into your project to complete configuration tasks. External files are used in connection activities and orchestrations that use a message that Studio cannot generate an XML schema for automatically. You must supply an XML schema or DTD if the message must be transformed or if you need to define a job key for the message.

The types of files that you can upload into a project and the file extensions they are required to include:

Table 1.

Type	File Extension	Description
XML DTD	*.dtd	XML Document Type Definitions (DTDs) define XML message formats using a non-XML syntax. Studio automatically converts DTDs to XML Schemas when you load them into a project.
Web Services Definition Language	*.wsdl	An XML document that defines the W3C Web Services Definition Language. Studio uses WSDLs to describe all messages in integration transactions.
XML Schema	*.xsd	A definition of an XML message format using the W3C XML Schema language. Studio uses XML Schemas to describe all messages in integration transactions.  Note: Only global elements are shown as schema types in Studio. A global element is an immediate child of the schema element. If the schema file contains no global elements, then the schema will appear to be empty in Studio.

**Parent topic:** [Working with projects](#)

## About Valid Names

---

To be valid, the names for projects, Endpoints, orchestrations, stylesheets, Flat File Schemas, XML Schemas, WSDLs, and transformations must not exceed 42 characters and must not contain any of the reserved characters or words.

Reserved characters or words are listed in the following tables.

The names of activities must not exceed 30 characters and must not contain any of the reserved characters listed in the table provided in [Table 3](#).

Table 1. Reserved Characters

Reserved Characters	Description
&	ampersand
{ } [ ] < > Â	any brackets
*	asterisk
\	backslash
^	caret
:	colon
\$	dollar sign
/	forward slash

<b>Reserved Characters</b>	<b>Description</b>
#	number sign
()	parenthesis
	pipe
.	period
?	question mark
;	semicolon
Â	space
~	tilde

Table 2. Reserved Words  
for Windows

<b>Reserved Words for Windows</b>
AUX
COM1
COM2
COM3
COM4
CON
LPT1
LPT2
LPT3
PRN
NUL

Table 3. Reserved Characters  
For Activity Names.

The names of activities must not exceed 30 characters and must not contain any of the reserved characters listed in the following table:

<b>Reserved Characters</b>	<b>Description</b>

## Undo and Redo Operations

---

Studio stores up to the last 100 actions you make and you can undo and redo those actions. You can undo and redo an action that you take on the fields in the UI, orchestration views, Mapping Editor, project tree, configuration properties, and variable panel activities.

### Before you begin

---

Note: When you close Studio, the history of actions you have taken is cleared and you cannot undo or redo actions that occurred prior to you closing Studio.

### Procedure

---

1. Select the Edit menu.
2. Select Undo, to undo the last action.
3. Select Redo, to redo the last action.

### Results

---

You can also undo and redo actions using the following keyboard shortcuts:

- Ctrl + Z: Undo last action
- Ctrl + Y: Redo last action

## Updating a Changed XML Schema

---

If you created a project that uses an XML Schema and the XML Schema changes, you can attempt to update the existing XML Schema with the new XML Schema.

### About this task

---

Updating to a new XML Schema means that any of the project entities that interface with the XML Schema might be affected by the change. The following project entities can be affected by XML Schema change:

- Maps that refer to the XML Schema, both stand-alone maps and the inline maps in activities.
- Variables that refer to the XML Schema.
- XPath expressions in orchestrations.
- XPath expressions used in job keys.
- Some Endpoint configurations.

- Conditions defined in orchestrations.

During the update process, Studio reports which project entities are affected by the change before the change is committed.

For example, an XML Schema defines an input parameter to the Map Variables activity. In the From Orchestration pane of the Map Variables activity there are links between the nodes of the input parameter to the nodes of the output parameters. When the XML Schema that defines the input parameter is updated to the new XML Schema, those links might no longer be valid if the input nodes have been renamed or removed in the new XML Schema. You must recreate the links in order for the orchestration to be valid again.

In some cases, Studio completely prevents the uploading a new XML Schema for the following reasons:

- The new XML Schema is invalid.
- Uploading the new XML Schema to replace the existing one, would result in an invalid project.

Note: Updating an existing XML Schema (as described in the following procedure) is different from loading multiple XML Schemas into a project by either dragging a file into the Project tab or right-clicking on the XML Schemas folder in the Project tab and selecting Add Document. Updating an existing XML Schema replaces the existing XML Schema in the project while uploading the same file into the Project tab creates two instances of the XML Schema in the project.

## Procedure

---

1. Open the XML Schema that is already used in the project that is to be replaced by the new XML Schema. Open the graphical representation:
  - a. Open the Project tab and double-click the XML Schema in the XML Schemas directory. The nodes of the XML Schema display in the XML Schema tab.
  - b. In the XML Schema tab, click any node of the XML Schema.
2. Select a new XML Schema to replace the existing XML Schema, using one of the following options:
  - o In the graphic representation, you can drag an XML Schema file from the local file system onto the XML Schema open in the XML Schema tab.
  - o Select the File > Update option on the Studio toolbar menu. The Update the Current Schema Document dialog box displays. In the Location field, specify the location of the new XML Schema from an external web location or from the file system.
3. Click OK. The Updating the XML Schema Affects the Listed Dependant Project Entities dialog box displays and any project entities that are possibly affected by the replacement of the original XML Schema with the new XML Schema are listed.
4. Optional: In the dialog box, click any of the listed dependent entities to view the affected entity in Studio.
5. Click Update. Studio attempts to update the project with the new XML Schema and the result of the attempted update depends on the following conditions:
  - o If any of the changes in the XML Schema would result in a corrupted project after the update or the new XML Schema is invalid, an Error dialog box displays describing the problem with the XML Schema. Click OK. The update is canceled, the XML Schema reverts to the original XML Schema, and the project is not changed.
  - o If the changes to the XML Schema would not result in a corrupted project and the XML Schema is valid, the update occurs and the original XML Schema is replaced by the new XML Schema. Some of the project entities might be invalid after the update and might require clean up. For example, links in the Map Inputs and Map Outputs panes might need to be recreated after the update. To find the validation errors, open an orchestration and select Orchestration > Validate from the Studio toolbar menu.
6. Click Close.

## Using the HTTP Post Utility

---

This utility provides a simple HTTP client interface that enables you to post messages/requests to HTTP servers, which is useful for orchestrations that have an **HTTP Receive Request** activity as the starter activity.

### About this task

---

To use this utility, either Studio or the Integration Appliance must be a web server capable of receiving messages from any http client interface.

### Procedure

---

1. From the Windows Start menu, choose Programs > IBM > Cast Iron Studio > HTTP Post Utility. A web browser opens and displays the Post a Document page.  
Note: If you are using the HTTP Post Utility with Internet Explorer 8, you must click the Information Bar and select Allow Blocked Content to avoid duplicate forms being displayed.
2. In the URL of Inbound Connector field, specify the hostname of the HTTP server, followed by the HTTP path.
3. In the Document to Post field, you have two options:
  - Click Browse and open an existing file.
  - Enter the message into the text field.
4. Click Submit to post the message.

## Orchestrations

---

- [Configuring an orchestration to orchestration connection](#)

You can configure a Web Service endpoint to call another Web Service orchestration stored in the Integration Appliance, in the same project.

- [Creating an orchestration](#)

There are three steps to creating a completed orchestration: Create the new orchestration, rename the orchestration, and build the orchestration.

- [Renaming an orchestration](#)

Orchestrations are given default names when they are created. You can rename it from the Project tab.

- [Building an orchestration](#)

Studio provides visual cues in the workspace so that it is easier to see and control the placement of activities in an orchestration. When you drag-and-drop activities from the Studio Toolbox to the workspace, a green circle icon displays the

target location in the orchestration where the activity is to be placed. When adding activities to the branches of logic activities, Studio highlights the target branch.

- [Verifying orchestrations](#)

Studio can simulate the Cast Iron® operating system (CIOS) runtime so that you can test orchestrations within a project and resolve any issues before deploying the project to the Integration Appliance.

- [Using SSL in Studio](#)

The Secure Sockets Layer (SSL) is the standard security technology for establishing an encrypted link between a server and a client. The encrypted link ensures that all data passed between the server and clients remain private and unchanged. To create an SSL connection a server requires an SSL certificate. This section provides an overview of using SSL in Studio, discusses Transport Layer Security (TLS) and SSL security, discusses certificates and supplies the procedures you need to properly import Certificate Authority (CA) and end-entity certificates and private keys for use when verifying SSL client authentication.

- [Importing an end-entity certificate](#)

An end-entity certificate is a digitally-signed statement issued by a Certificate Authority to a person or system. It binds a public key to some identifying information and is used for encryption, authentication, digital signatures and other purposes. The term “end-entity” is used to distinguish it from a Certificate Authority certificate. The signer of the statement is the issuer and the entity discussed in the certificate is the subject.

- [Importing a Certification Authority \(CA\) Certificate](#)

Abbreviated as CA, a Certification Authority is a trusted third-party organization or company that issues certificates used to create digital signatures and public-private key pairs. Because they guarantee that the two parties exchanging information are really who they claim to be, CA's are a critical component in data security and electronic commerce. Although the relationship between CA's is most commonly hierarchical, CA certificates can also be used to establish trust relationships between CA's in two different public key infrastructure (PKI) hierarchies. A PKI is the set of people, policies, procedures, hardware, and software used in creating, distributing, managing and using digital IDs. In all of these cases, the CA certificate is critical to defining the certificate path and usage restrictions for all end-entity certificates issued for use in the PKI.

- [SSL server authentication](#)

SSL server authentication verifies that sites you communicate with are who they claim to be. Authentication confirms a server's identity through standard techniques of public-key cryptography to ensure that a server's certificate and public ID are valid and have been issued by a certificate authority listed in the client's list of trusted CA's.

- [Testing an SSL server connection](#)

After creating an endpoint for the server using SSL, you are ready to test the SSL server connection.

- [SSL client authentication](#)

Client authentication is similar to server authentication except that the server requests a certificate from the client to verify that the client is who it claims to be. The certificate must be an **X.509** certificate and signed by a certificate authority trusted by the server. You can only use client authentication when a server requests a certificate from a client. Not all servers support client authentication.

- [Using the Log Viewer](#)

Orchestration monitoring data is displayed in the Log Viewer in a table or text format.

- [Viewing an orchestration](#)

You can use orchestration view icons on the workspace, and View options from the Studio toolbar menu to manipulate your orchestration view in the workspace.

- [Validating an orchestration](#)

An orchestration must be valid (complete and correct) before you can publish it to the Integration Appliance. Use the validation feature in Studio to validate your orchestration.

- [Working with activities in an orchestration](#)

You can cut, copy, and paste activities, drag activities in an orchestration and add and delete new activities.

- [Printing an orchestration](#)

You can print an orchestration directly or view a print preview of an orchestration.

- [Processing orchestration jobs sequentially](#)

You can use the Process Orchestration Jobs Sequentially option when an orchestration contains activities that can conflict with each other when multiple instances of the orchestration are running. An instance of an orchestration is also known as an orchestration job.

- [Enabling persistence](#)

The Orchestration pane contains an Enable Persistence check box that by default is selected. The setting of the Enable Persistence check box affects the way orchestration jobs are restarted after a failure.

- [Adding a global exception handler to an orchestration](#)

During run time if any of the activities of the orchestration throws an exception, and a global exception handler has been enabled, the global CatchAll branch is run.

- [Saving an image of an orchestration](#)

You can save a graphical image of the current orchestration as a .jpg file.

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_orchestrations.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_orchestrations.html)

## Configuring an orchestration to orchestration connection

---

You can configure a Web Service endpoint to call another Web Service orchestration stored in the Integration Appliance, in the same project.

### About this task

---

You can configure an Orchestration to Orchestration connection by specifying the transport protocol to the endpoint location as local:// instead of the conventional http://.

You apply this option to either call (invoke) or provide endpoint type.

Note:

When an orchestration that has Web Services Provide service starter activity with Transport type set to Local, referred to as sub-orchestration, then persistence setting for the main orchestration and the sub-orchestration should be same within the same project.

For example, if the persistence is enabled for the main orchestration, then it should be enabled for the sub-orchestration also. If the persistence is disabled in the main orchestration, then it should be disabled for the sub-orchestration and vice-versa.

### Procedure

---

1. Â Open a new or existing Web Service endpoint.
2. In the Type section, select either the Invoke option or Provide option. Invoke is selected by default.
  - o If you select the Invoke option, complete the following steps:
    - a. From the Location drop-down list, select Local
    - b. From the Orchestration drop-down list, select the orchestration you want to call.
    - c. From the WS Provide Activity drop-down list, select an activity.  
Note: This activity is displayed only if the selected orchestration has a Web Services Provide Service starter activity and Local as the relevant endpoint. If you select an orchestration that does not have a Web Services Provide Service starter activity, then the WS Provide Activity menu is empty.
  - o If you select the Provide option, complete the following steps:
    - a. From the Transport drop-down list, select Local.
    - b. In the Path field, enter the path which is used to call the Provide activity.

## Creating an orchestration

---

There are three steps to creating a completed orchestration: Create the new orchestration, rename the orchestration, and build the orchestration.

### Procedure

---

1. Complete one of these three steps to create a new Orchestration:
  - o To create an orchestration from the toolbar menu, select Project > New Orchestration. A new orchestration is opened in the workspace. The new orchestration name is added to the Orchestrations folder in the Project tab.
  - o Click the New Orchestration button  in the Project tab.
  - o Right-click the Orchestration folder and select New Orchestration. A new orchestration opens in the main Studio pane. The new orchestration with a default name is added to the Orchestrations folder in the Project tab.
2. Optional: Change the default name.
3. Press Return.

## Renaming an orchestration

---

Orchestrations are given default names when they are created. You can rename it from the Project tab.

### Procedure

---

1. Click the Project tab.
2. Open the Orchestrations folder.
3. Either
  - o Right-click the orchestration you want to rename and select Rename.
  - o Click three times on the orchestration name in the Project tab.
4. Enter a new name for the orchestration. The orchestration name must not exceed 42 characters and must not contain any reserved characters. For a list of reserved characters see [About Valid Names](#).
5. The orchestration name is changed.

## Building an orchestration

---

Studio provides visual cues in the workspace so that it is easier to see and control the placement of activities in an orchestration. When you drag-and-drop activities from the Studio Toolbox to the workspace, a green circle icon displays the target location in the orchestration where the activity is to be placed. When adding activities to the branches of logic activities, Studio highlights the target branch.

### Procedure

---

1. Drag the appropriate activities from the Activities tab onto the orchestration
2. Configure the activities. You must add at least one inbound activity (or one schedule), and one outbound activity in order to complete an orchestration. See the Basic Validation Requirements section of [Validating the Orchestration](#) for more information.

3. After the orchestration is built, set the orchestration options in the Properties pane. For more information see [Processing Orchestration Jobs Sequentially](#) and Enabling Persistence.
4. Save the orchestration, then validate it.
5. Fix any validation issues displayed in the Validation Results dialog box.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_building\\_an\\_orchestration.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_building_an_orchestration.html)

## Verifying orchestrations

---

Studio can simulate the Cast Iron® operating system (CIOS) runtime so that you can test orchestrations within a project and resolve any issues before deploying the project to the Integration Appliance.

### Before you begin

---

When initiating a test run, you can start a single orchestration, or all the orchestrations in a project. Studio runs one orchestration job for each orchestration. You can start and stop orchestrations, and view orchestration monitoring logs from the Studio toolbar or from the Verify tab.

If the orchestration is invalid, a message dialog is displayed showing possible resolutions. In the workspace, Studio highlights each activity in the orchestration as the activity is processing the data. As Studio runs the orchestration, the Verify tab shows a tree-view of the orchestration job details including; activity name, processing status, variable/parameter names, and variable/parameter data. If an error occurs, Studio highlights the node where the error occurred. Clicking the node links you to the location of the error, where you can resolve any issues before running another instance of the orchestration. ▾

When you click a node in the tree-view, Studio displays in the Properties Pane the Checklist task that corresponds to the node. For example, when you click an activity node, the Configure panel for the activity is displayed in the Properties Pane. When you click the Map Outputs node, the Map Outputs panel is displayed in the Properties Pane. If you click a mapping variable or parameter, the data is displayed in the Variable/Parameter Message Data section of the Verify tab.

Although Studio only runs one orchestration job for each orchestration, you can start the same orchestration multiple times. The Verify tab shows the results for each run of the same orchestration under a separate instance. For example, *Instance #1* and *Instance #2*. An orchestration job must be complete before you can run another instance of the same orchestration.

Note: Studio does not persist the results of the runtime test. When you close the orchestration tab, you lose the runtime results for the orchestration.

### About this task

---

Depending on the activities in the orchestration, Studio may require more input to run the orchestration job. For example, an orchestration with a database activity requires that you generate database assets before running the orchestration in Studio, just as you must do in the WMC before running the orchestration on the Integration Appliance. If the activities in the orchestration use the Secure Sockets Layer (SSL), you may need to understand SSL concepts and you may need to import certificates before verifying the orchestration. See [Using SSL in Studio](#) for more information.

If the orchestration contains an HTTP Receive Request activity, you must post a message to the specified URL. Use the HTTP Post Utility to post a message. If the orchestration contains an FTP Poll activity, you must place a file in the specified location, as prompted by Studio, before the orchestration can run.

Since you can use the Verify tab to simulate the runtime on the Integration Appliance, you can also specify Kerberos Protocol settings in Studio to test the settings before deploying to the Integration Appliance. Specifying these setting in Studio does not impact the runtime on the Integration Appliance. You must specify the Kerberos Protocol settings in the WMC to allow the Integration Appliance to authenticate the server that the Integration Appliance is communicating with. For more information about specifying Kerberos Protocol settings for the Integration Appliance, see the WMC Online Help.

## Procedure

---

To specify Kerberos Protocol settings in Studio:

1. In Studio, select Edit > Preferences... . The Preferences dialog is displayed.
2. In the navigation pane, select SSL > Kerberos.
3. Specify the Kerberos Server Name.
4. Specify the Kerberos Realm.
5. Click OK.

## Example

---

You can now test the orchestration, using the Kerberos Protocol, within Studio.

Table 1. Navigating the Verify Tab toolbar

I c o n	Description
▶	Starts the open orchestration. The orchestration must be valid before Studio can run an orchestration job. ▶
▶	Starts all the valid orchestrations in the project that are not already running. If an orchestration is already running when you click this icon, Studio does not rerun the orchestration. ▶
■	Stops the running orchestration job immediately. Studio does not allow the orchestration job to complete before stopping. ■
■	Stops all running orchestration jobs immediately. Studio does not allow the orchestration jobs to complete before stopping. ■
⌚	Shows orchestration monitoring data in a table or text format. For more information about the Log Viewer, see <a href="#">Using the Log Viewer</a> .
✎	In the Workspace, highlights the activities in the execution path of the orchestration job, so you can follow the logic Studio used to complete the orchestration job. Different instances can have a different path depending on the inputs and orchestration logic. Click this icon to toggle between providing and not providing a highlighted path.
⊕	Assigns the results from the selected instance to the Map Inputs and Map Outputs, so that when you run a test from the Properties Pane, Studio populates the inputs and outputs with the results of the completed orchestration job.
✖	Deletes one or more selected instances from the orchestration details tree. To delete multiple instances hold the Shift key or Ctrl key, select the instances you want to delete, and click the icon.
⊕	Expands all the nodes under the selected node in the orchestration details tree.
⊖	Collapses all the nodes under the selected node in the orchestration details tree.
⊕	Expands a single node under the selected node in the orchestration details tree.
⊖	Collapses a single node under the selected node in the orchestration details tree.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Verifying\\_Orchestrations.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Verifying_Orchestrations.html)

## Using SSL in Studio

---

The Secure Sockets Layer (SSL) is the standard security technology for establishing an encrypted link between a server and a client. The encrypted link ensures that all data passed between the server and clients remain private and unchanged. To create an SSL connection a server requires an SSL certificate. This section provides an overview of using SSL in Studio, discusses Transport Layer Security (TLS) and SSL security, discusses certificates and supplies the procedures you need to properly import Certificate Authority (CA) and end-entity certificates and private keys for use when verifying SSL client authentication.

## SSL and Transport Layer Security

---

TLS 1.0 represents an upgrade of SSL 3.0. As an example, the TLS handshake protocol for establishing client/server authentication and encryption differs from the SSL handshake protocol. Additionally, TLS is now more extensible. Although they cannot interoperate, TLS provides a mechanism by which a TLS 1.0 implementation can revert to an SSL 3.0 implementation.

The TLS protocol uses public-key and symmetric-key cryptographic technology. Public-key cryptography uses a public key and a private key. Information encrypted with one key can be decrypted only with the other key. For example, information encrypted with the public key can be decrypted only with the private key.

Each server's public key is published, while the private key is kept secret. To send a secure message to the server, the client encrypts the message by using the server's public key. When the server receives the message, it decrypts the message with its private key.

Symmetric-key cryptography uses the same key to encrypt and decrypt messages. The client randomly generates a symmetric key to be used for encrypting all session data. The key is then encrypted with the server's public key and sent to the server.

TLS provides three basic security services:

- Message privacy — Achieved through a combination of public-key and symmetric-key encryption. All traffic between a client and a server is encrypted using a key and an encryption algorithm negotiated during session setup.
- Message integrity — Ensures that session traffic does not change en route to its final destination. TLS and SSL use a combination of public/private keys and hash functions to ensure message integrity.
- Mutual authentication — Exchange of identification through public-key certificates. Client and server identities are encoded in public-key certificates, which contain the following components:
  - Subject's distinguished name
  - Issuer's distinguished name
  - Subject's public key
  - Issuer's signature
  - Validity period
  - Serial number

You can also use secure HTTP (HTTPS) to ensure that a client's security information is not compromised when downloaded from a server.

## Certificates

---

SSL uses digital certificates to authenticate the identity of the server and optionally the client. Digital certificates are issued by a Certificate Authority (CA), a trusted agency that is authorized to issue, renew and revoke digital certificates after verifying the identity and legitimacy of the requesting party. A CA certificate, which may be a root CA certificate or a subordinate CA certificate, includes the CA's signature and the period of validity. A CA guarantees the connection between a key and another CA or end-entity. A end-entity is a person, a role, an organization, a pseudonym or a piece of hardware or software.

Encryption and authentication are performed by means of a public and a private key. The public key is embedded into a certificate, known as a site or server certificate. The certificate contains several items of information, including the name of the CA that issued the certificate, the name and public key of the server or client, the CA's signature and the certificate's date and serial number. The private key is created when you create a self-signed certificate or a CA certificate request and is used to decrypt messages from clients.

A SSL or TLS session is established in the following sequence:

1. The client and the server exchange hello messages to negotiate the encryption algorithm and hashing function (for message integrity) to be used for the session.
2. The client requests an *ITU-T standard X.509* certificate from the server to prove its identity. Optionally, the server can request a certificate from the client. Certificates are verified by checking the certificate format, the validity dates and by verifying that the certificate includes the signature of a trusted certificate authority (or is self-signed).
3. The client randomly generates a set of keys that is used for encryption. The keys are encrypted with the server's public key and securely communicated to the server.

**Parent topic:** [Orchestrations](#)

[Feedback](#) | [Notices](#)

## Importing an end-entity certificate

---

An end-entity certificate is a digitally-signed statement issued by a Certificate Authority to a person or system. It binds a public key to some identifying information and is used for encryption, authentication, digital signatures and other purposes. The term "end-entity" is used to distinguish it from a Certificate Authority certificate. The signer of the statement is the issuer and the entity discussed in the certificate is the subject.

### About this task

---

To import an end-entity certificate and private key, you must import a file in PKCS#12 format using the `keytool -importkeystore` command. PKCS #12, the successor to PFX from Microsoft, defines a file format commonly used to store **X.509** private keys with accompanying public key certificates, protected with a password-based symmetric key. PKCS #12 format files typically have a file extension of .pfx or .p12.

The following steps provide an example of how to import an end-entity certificate:

### Procedure

---

1. Navigate to the Studio security directory. For example. C:\Program Files\IBM\WebSphere Cast Iron Studio 6.0\security.
2. Copy the PKCS #12 format file into Studio security directory, for example C:\Program Files\IBM\WebSphere Cast Iron Studio 6.0\security\certificate.p12.
3. Import the certificate and private key into the Studio keystore using the `keytool -importkeystore` command. For example:  
`keytool -importkeystore -deststorepass "keystore admin" -destkeystore certs -srckeystore certificate.p12 -srcstoretype PKCS12 -srcstorepass <certificatePswd> -srcalias <certificateAlias>`.

### Results

---

At the conclusion of these steps, the certificate is imported into your Studio security directory. For more information about the `keytool -importkeystore` command, see:

<http://www.ibm.com/developerworks/java/jdk/security/60/secguides/keytoolDocs/keytool.html#importKeyStore>.

## Importing a Certification Authority (CA) Certificate

---

Abbreviated as CA, a Certification Authority is a trusted third-party organization or company that issues certificates used to create digital signatures and public-private key pairs. Because they guarantee that the two parties exchanging information are really who they claim to be, CA's are a critical component in data security and electronic commerce. Although the relationship between CA's is most commonly hierarchical, CA certificates can also be used to establish trust relationships between CA's in two different public key infrastructure (PKI) hierarchies. A PKI is the set of people, policies, procedures, hardware, and software used in creating, distributing, managing and using digital IDs. In all of these cases, the CA certificate is critical to defining the certificate path and usage restrictions for all end-entity certificates issued for use in the PKI.

### About this task

---

Perform the following steps to import a CA certificate.

### Procedure

---

1. Open a command window.
2. Navigate to the server, and locate the certificate file `ca-cert` stored in the server.
3. Copy the `ca-cert` file and then navigate to the workstation where Studio is installed.
4. Using the command window, paste the CA certificate copy in the home directory of Studio: `C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x`.
5. Navigate to the security directory of Studio: `C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x\security`.
6. Run the following command to import the CA certificate file into Studio: `..\jre\bin\keytool.exe -import -v -keystore cacerts -storepass changeit -file ..\castiron_ca_cert.pem -alias alias_name` Where `alias_name` is the alias of the server CA certificate.
7. When you are prompted for a yes or no, type yes (`Y`) and press **Enter**.
8. Exit the command window.

## Results

---

At the conclusion of these steps, the certificate is imported into your Studio security directory. For more information about the `keytool -import` command, see [keytool - Key and Certificate Management Tool](#).

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SSL\\_import\\_a\\_certif\\_authority\\_certif.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SSL_import_a_certif_authority_certif.html)

## SSL server authentication

---

SSL server authentication verifies that sites you communicate with are who they claim to be. Authentication confirms a server's identity through standard techniques of public-key cryptography to ensure that a server's certificate and public ID are valid and have been issued by a certificate authority listed in the client's list of trusted CA's.

Communication with "trusted" servers that possess authentication certificates issued by a certificate authority is critical to establishing a secure environment. Authentication certificates are digitally signed documents which bind the public key to the identity of the private key owner. Authentication happens at connection time and is independent of the application or application protocol. With SSL, authentication is performed by an exchange of certificates, which are blocks of data in a format described in the [X.509 ITU-T standard](#). **X.509** certificates are issued and digitally signed by a certificate authority.

However using SSL does not guarantee that the client is communicating with the correct server. Consider the following scenario, in which "Server1" and "Server2" both have valid certificates from a CA that the client ("Client") trusts. Client wants a secure session with Server1, but Server2 wants to eavesdrop on their communication and is physically located in a place that makes it possible to do so:

1. Client sends a request for an SSL session to Server1. Instead, the request (and all subsequent traffic) goes through Server2. Instead of forwarding Client's request to Server1, Server2 responds directly to the request by sending its own certificate to Client.
2. Client receives Server2's certificate and checks its list of trusted CAs. Since Server2's certificate is signed by the same CA as Server1's certificate, Client accepts the certificate and creates a secure session with Server2.
3. Having completed the secure session with Client, Server2 requests and creates its own SSL session with Server1. From this point, Client sends encrypted information to Server2. Server2 decrypts the information, re-encrypts it, then sends it to Server1. It does the same for information flowing in the opposite direction. The result is that Server2 is able to read it and even change it, even though all data is encrypted as it flows over the Internet.

SSL server authentication is designed to prevent this outcome. When server authentication is enabled, the client, after ensuring that the server's certificate can be trusted, checks that the Internet name in the certificate matches the Internet name of the server. If they match, the SSL negotiation continues. If not, the connection ends.

With server authentication enabled, the security scenario outlined above would proceed as follows:

1. Client sends a request for an SSL session to Server1. The request (and all subsequent traffic) actually goes through Server2. Instead of forwarding Client's request to Server1, Server2 responds directly to Client's request by sending its own certificate to Client.

2. Client receives Server2's certificate and checks its list of trusted CAs. Since Server2's certificate is signed by the same CA as Server1's certificate, Client accepts the certificate and creates a secure session with Server2.
3. After the secure session has been completed, but before any real data has been sent or received, Client compares the Internet name in the certificate it received with the name of the server it wants to talk to. Since they do not match, Client knows that the connection should not continue and disconnects it.

## Testing an SSL server connection

---

After creating an endpoint for the server using SSL, you are ready to test the SSL server connection.

### About this task

---

Perform the following procedure to test the SSL connection to the server:

### Procedure

---

1. Import the server CA certificate using the instructions in [Importing a Certification Authority \(CA\) Certificate](#).
2. Open the endpoint for the server.
3. For FTPS, SSL email and SSL database connections, verify the following login credentials for the server connection: server, Port, User, and Password.
4. For HTTP and Web Services connections using SSL, if the HTTP or Web Services server requires client authentication, configure a Client Certificate Alias Name as described in [Creating or editing an HTTP endpoint](#).
5. Click **Test Connection**.
6. If the connection is successful, use this endpoint in Studio orchestrations, then use the **Verify** tab features to evaluate the orchestration.

**Parent topic:** [Orchestrations](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

## SSL client authentication

---

Client authentication is similar to server authentication except that the server requests a certificate from the client to verify that the client is who it claims to be. The certificate must be an **X.509** certificate and signed by a certificate authority trusted by the server. You can only use client authentication when a server requests a certificate from a client. Not all servers support client authentication.

When a server requests a certificate, the client has the option to send a certificate or attempt to connect without it. The server allows the connection if the client's certificate can be trusted. When a client attempts to connect without a certificate, the server might grant the client access but at a lower security level, as illustrated by the following sequence of events:

1. The client sends a request for an SSL session to the server.
2. The client receives the server's certificate and checks its list of trusted CA's. Since the server's certificate is signed by a trusted certificate authority, the client accepts the certificate. The server then asks the client for a certificate that identifies the client.

3. The client responds by sending a certificate or by trying to establish a session without one.
4. If the client sends a certificate, the server checks its list of trusted certificates. If the client can be trusted, the secure session is established. If the client does not send a certificate, normally the server terminates the session.

## Using the Log Viewer

---

Orchestration monitoring data is displayed in the Log Viewer in a table or text format.

By default, the following orchestration monitoring data is displayed by the Log Viewer, in a table:

Time

Provides a timestamp of when the specified event occurred.

Level

Specifies the logging level for a specific event. Logging levels include: Off, Severe, Warning, Info, and All.

Type

Identifies the type of the activity that generated the event. For example, Scheduler, Mime, JMS, or HTTP.

Message

Provides details about a specific event.

You can filter the log events displayed in the table by specifying the logging level or an activity type from the Level and Type list. When filtering the log events by type, you can press the Shift key to select or clear multiple types.

To toggle between the text or table format, select or clear the View as Text option.

Click Clear to delete all orchestration monitoring data.

You cannot restore orchestration monitoring data to the log once the log has been cleared.

**Parent topic:** [Orchestrations](#)

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Using\\_the\\_Log\\_Viewer.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Using_the_Log_Viewer.html)

## Viewing an orchestration

---

You can use orchestration view icons on the workspace, and View options from the Studio toolbar menu to manipulate your orchestration view in the workspace.

### About this task

---

The workspace denotes source and target endpoints by using blue and green separating lines, respectively. With the endpoints displayed, the workspace uses data flow lines to associate an endpoint with a specific activity so that you can associate an activity with its endpoint.

You can manipulate the orchestration view in the workspace using the following icons:

#### Orientation of Orchestration

You can choose to view the orchestration in a horizontal  or vertical  view.

#### Expand or Collapse Orchestration Activities

Expands  or collapses the activities in an orchestration.

#### Orientation of Endpoints

You can choose to view the endpoints in a horizontal  or vertical  view, relative to the orchestration.

#### Show/Hide Endpoints

You can choose whether to display endpoints for the orchestration in the workspace. Show/Hide endpoints that are oriented horizontally . Show/Hide endpoints that are oriented vertically .

#### Expand or collapse Orchestration

Expands , or collapses  the entire orchestration, not just the activities.

#### Animate Graph

 Animates the actions that occur in the workspace. By default, orchestration graphics in the workspace are animated and Studio smoothly transitions any modifications you make to an orchestration. Click the icon to disable the animations and have the actions occur more crisply. For example, when you add an activity to the orchestration, the new activity snaps into place.

Â

#### Navigate Satellite View

 You can view your entire orchestration and select a specific area to view.

#### Zoom Out

 Minimizes the view of an orchestration. Â

#### Zoom In

 Enlarges the view of an orchestration.

#### Restore view to 100%

 Resets the zoom out and zoom in changes you made to the orchestration view.

#### Fit to view

 Resizes the orchestration to fit in the workspace.

**Table 1.** Studio toolbar menu options. You can control the magnification level to view an orchestration by selecting one of the following options from the View option of the toolbar menu. Â

Option	Description
Zoom In	Increase the magnification level to view the orchestration.
Zoom Out	Decrease the magnification level to view the orchestration.
Zoom 100%	Returns the view of the orchestration to the normal magnification level.
View as Tree Flow or View as Flow	The View as Tree Flow option lists the activities of the orchestration in a top-to-bottom view. During run time, the flow starts at the top activity and continues downward. This view is useful for displaying large orchestrations.  The View as Flow option lists the activities of the orchestration in a left-to-right view. During run time, the flow starts at the activity on the left side of the view and continues to the right. This is the default view.
Status View	Check box that defines if a status bar is displayed at the end of the main Studio pane. The status bar shows descriptions of the menu options.

You can also right-click anywhere in the orchestration (when the orchestration is displayed as a flow) and select one of the following options from the shortcut menu:

- Zoom In
- Zoom Out
- Zoom 100%

## Procedure

1. To view a top-level scaled-down overview of the orchestration for navigating large orchestrations, Double-click the overview  icon. The top-level scaled-down overview of the orchestration is displayed in a small pane in the Orchestration tab.
2. Move the cursor into the small pane to change the section of the orchestration displayed in the larger detailed pane of the Orchestration tab.
3. Double-click in the small pane to remove the small top-level overview of the orchestration.

**Parent topic:** [Orchestrations](#)

## Validating an orchestration

---

An orchestration must be valid (complete and correct) before you can publish it to the Integration Appliance. Use the validation feature in Studio to validate your orchestration.

### Before you begin

---

To be valid an orchestration must meet the following requirements:

- Have a starter activity or a Pick activity as the first activity. Starter activities are denoted in the Activities tab with the blue orchestration icon and a downward arrow . The first activity in each branch of the Pick activity must be a starter activity.  
Note: All starter activities are represented in Studio by the inbound icon , except for the Schedule Job activity.
- Variables must be initialized before they are used. This includes variables that are initialized in the branches of an If.. Then activity. The variable must be initialized in all branches.

### Procedure

---

1. Select the Project tab, and expand the Orchestration folder.
2. Select and open an orchestration from the Orchestration folder. A graphical representation of the orchestration is displayed in the Orchestration tab. Â
3. Validate your orchestration using one of the following options:
  - o Select Orchestration > Validate from the menu toolbar. The Validation Results dialog box is displayed.
  - o Press ALT-F8. The Validation Results dialog box is displayed.
  - o Click an orchestration in the Project tab. If the orchestration is invalid, the Validation Results popup is displayed next to the Project tab and the invalid orchestration icon is displayed next to the orchestration in the Project tabThe Validation Results dialog box lists the problem areas in the orchestration. Problems prefaced by a blue icon are informational; you will have to navigate to that area to fix the problem. Problems prefaced by a red icon are errors. Click the error message in the dialog box to open the appropriate panel to fix the error.

Validation ensures that all the basic requirements for an orchestration have been met. You must resolve all validation issues before publishing the orchestration to the Integration Appliance.

### Example

---

To validate all the orchestrations in the project complete the following steps:

1. In the Project tab, click Revalidate Project . All the orchestrations in the project are validated. If an orchestration is invalid the invalid orchestration icon is displayed next to the orchestration in the Project tab. If the orchestration is invalid, click on the orchestration to view the errors in the Validation Results list.
2. Select the Validate Project toolbar button. All the orchestrations in the project are validated. If an orchestration is invalid the invalid orchestration icon is displayed next to the orchestration in the Project tab. If the orchestration is invalid, click on the orchestration to view the errors in the Validation Results list.

### What to do next

---

Validation icons are displayed throughout the orchestration providing visual clues to potential problem areas or to provide further information.

In Studio, the following validation icons are displayed:

Click warning icons to learn what information is required to complete the configuration of the entity in the pane. For example, in an activity's checklist, the warning icon appears next the endpoint if an endpoint has not yet been specified.

Click information icons to learn details about a entity in the pane, for example why a button has been disabled.

 Checkmark icon

Checkmark icon is displayed when all the information for a entity in the pane has been specified. For example, in an activity's checklist, the checkmark icon appears next to the endpoint if a valid endpoint has been specified.

A warning icon  displays in the upper-right corner of many panes (for example, the Endpoint configuration pane). You can click this icon to toggle the warning icons ON or OFF displayed in the pane. If turned OFF, the warning icons are not displayed in the pane.

## Working with activities in an orchestration

---

You can cut, copy, and paste activities, drag activities in an orchestration and add and delete new activities.

### About this task

You can cut, copy, paste, delete, and rename activities using any of the following methods:

- Keyboard shortcuts
- Right-click an activity and select an option from the drop-down list
- Select an activity and then select an option from the Edit toolbar menu
- Select an activity and then select a toolbar button.

Keyboard shortcuts and their menu option equivalents are listed in the following table.

Table 1. Keyboard shortcuts and their menu option equivalents

Keyboard Shortcuts	Right-Click Menu Options	Toolbar Menu Options	Toolbar Buttons	Action
CTRL + X	Cut	Edit > Cut		Removes the activity and saves a copy of the activity in the clipboard that can be used later by a paste action.
CTRL + C	Copy	Edit > Copy		Saves a copy of an activity into the clipboard that can be used later by a paste action.
CTRL + V	Paste	Edit > Paste		Copies the stored activity from the clipboard into the orchestration.
Delete	Delete	Edit > Delete		Removes the activity. The activity is not saved in the clipboard.
F2	Rename	Edit > Rename		Opens a field so you can rename an activity in an orchestration.

Note: The keyboard shortcuts and menu options listed in the preceding table are only available when the orchestration is viewed as a flow and not when the orchestration is viewed as a tree. For more information, see [Viewing an Orchestration](#).

You can cut, copy, or paste activities within the same orchestration and between orchestrations in the same project.

You can drag an activity from one location in an orchestration to another location in orchestration by selecting the activity and dragging it to the new location.

You can make a copy of an activity, by selecting the activity you want to copy, hold down the CTRL key, and then drag the activity to new location. A copy of the activity is created in the new location.

Note: Drag functionality is only available when the orchestration is viewed as a flow and not when the orchestration is viewed as a tree. For more information, see [Viewing an Orchestration](#).

## Procedure

---

1. Drag an activity from the Activities tab onto any green target in the orchestration.
2. Complete the properties of the activity in the Properties pane.
3. Optional: To rename the activity, select the Edit > Rename option in the toolbar menu. The activity name field becomes active. You can also use one of the alternate methods mentioned in Table 1.

## What to do next

---

To delete an activity, select the Edit > Delete option in the toolbar menu. You can also use one of the alternate methods mentioned in Table 1.

**Parent topic:** [Orchestrations](#)

## Printing an orchestration

---

You can print an orchestration directly or view a print preview of an orchestration.

## Procedure

---

1. Select the Project tab and expand the Orchestrations folder.
2. To open an orchestration, double-click an orchestration in the Orchestrations folder. The Orchestration is displayed.
3. Optional: To view a print preview press CTRL+SHIFT+P.
4. To print the orchestration, press CTRL+P.

## Processing orchestration jobs sequentially

---

You can use the Process Orchestration Jobs Sequentially option when an orchestration contains activities that can conflict with each other when multiple instances of the orchestration are running. An instance of an orchestration is also known as an orchestration job.

## About this task

---

For example, an orchestration could contain a Pick activity that contains branches for the Get Inserted Rows, Get Updated Rows, and Get Deleted Rows activities. The following steps show an example run time scenario for this orchestration with the Process Orchestration Jobs Sequentially check box not selected:

1. An insertion into the database occurs, triggering the first instance of the orchestration to be created.
2. The first instance of the orchestration starts processing the insert branch of the Pick activity.
3. Before Get Inserted Rows activity completes in the first orchestration instance, a deletion in the database occurs triggering a second instance of the orchestration to be created.
4. The second instance of the orchestration starts processing the delete branch of the Pick activity.

This is undesirable behavior because first instance of the orchestration (that is processing the Get Inserted Rows activity) should complete before the second instance of the orchestration starts to process the Get Inserted Rows activity to avoid a potential primary key exception in the database. These database actions should occur sequentially. To force the instances of the orchestration to run sequentially, select the Process Orchestration Jobs Sequentially check box for the orchestration. With this option set, the instances of the orchestration are run one at a time and conflicts, like primary key exceptions, are avoided.

Complete the following steps to set all jobs to run in a single instance check box.

Note: Selecting this option decreases the performance of the project.

## Procedure

---

1. Select the Project tab and expand the Orchestrations folder.
2. To open an orchestration, double-click an orchestration in the Orchestrations folder. The orchestration is displayed.
3. If the orchestration options are not displayed the bottom part of the orchestration tab, select Orchestration > Properties from the toolbar menu.
4. Select the Process Orchestration Jobs Sequentially check box. This option is automatically selected if the orchestration contains shared variables.

**Parent topic:** [Orchestrations](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_Processing\\_Orchestration\\_Jobs\\_Sequentially.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Processing_Orchestration_Jobs_Sequentially.html)

## Enabling persistence

---

The Orchestration pane contains an Enable Persistence check box that by default is selected. The setting of the Enable Persistence check box affects the way orchestration jobs are restarted after a failure.

### About this task

---

The effect of setting of the Enable Persistence check box is described by the following two options:

Enable Persistence check box is selected

During run time if an orchestration job is running and a failure occurs that causes the job to stop, when the orchestration is restarted, the original job continues processing where it stopped and no in-flight messages are lost.

Enable Persistence check box is cleared

During run time if an orchestration job is running and a failure occurs that causes the job to stop, when the orchestration is restarted, the current job does not complete and the in-flight messages are lost.

When the Enable Persistence check box is cleared the run time performance is improved.

Note:

When an orchestration that has Web Services Provide service starter activity with Transport type set to Local, referred to as sub-orchestration, then persistence setting for the main orchestration and the sub-orchestration should be same within the same project.

For example, if the persistence is enabled for the main orchestration, then it should be enabled for the sub-orchestration also. If the persistence is disabled in the main orchestration, then it should be disabled for the sub-orchestration and vice-versa.

Note:

You should enable persistence for the FTP Poll Directory activity:

- If you have an orchestration job with a FTP Poll Directory activity that is processing large input files. Otherwise, you can experience problems like "Variable 'Lotdata' is too large, please turn on persistence for this orchestration".
- If you disable persistence and have an orchestration job with a FTP Poll Directory activity with the Keep in place option selected, and during run time if a failure occurs that causes the job to stop, when the orchestration is restarted it processes the file again. The state of the job is lost and Integration Appliance does not know that it has already processed the file.

The following activities require that persistence be enabled when the Exactly Once option is selected in the Delivery Rules for the activity:

#### Database

- Poll Table
- Get Inserted Row
- Get Updated Rows
- Get Deleted Rows
- Insert Rows
- Update Rows
- Delete Rows
- Call Procedure

#### Email

- Get Email

#### FTP

- Poll Directory

#### JMS

- Subscribe Message
- Poll Message

#### MQ

- Poll Message

#### SAP

- Receive IDOC
- Send IDOC

#### SFDC

- Poll Deleted Objects
- Poll Updated Objects

#### Domino®

- Get Created Documents
- Get Deleted Documents
- Get Updated Documents

## Procedure

---

1. To change the setting of the Enable Persistence check box, select Orchestration > Properties from the toolbar menu. The Orchestration pane is displayed.
2. Select Enable Persistence check box.

**Parent topic:** [Orchestrations](#)

---

## Adding a global exception handler to an orchestration

---

During run time if any of the activities of the orchestration throws an exception, and a global exception handler has been enabled, the global CatchAll branch is run.

## About this task

The following figure shows an example orchestration:

In this example, if either the Database Get Inserted or the Database Insert Rows activities fail and throw an exception, the If..Then activity in the CatchAll branch is run.

## Procedure

1. Right-click the start icon of the orchestration and from the menu, and select the Add CatchAll Branch option. The CatchAll branch is added to the orchestration and the following variables are automatically created:
  - o faultName - During run time, the faultName variable contains the name of the exception thrown by an activity in the orchestration.
  - o faultData - During run time, the faultData variable contains the error message associated with the exception. This additional information is only currently returned for the Web Services activities. For Web Services activities, the faultData variable contains the fault.
  - o faultInfo - During run time, the faultInfo variable returns the following nodes:
    - name - During run time, the faultInfo/name node contains the name of the exception thrown by an activity in the orchestration. The faultInfo/name node is an xsd:QName type.
    - message - During run time, the faultInfo/message node contains the error message associated with the exception. The faultInfo/message node is an xsd:string type.
    - activityId - During run time, the faultInfo/activityId node contains the activity ID that uniquely identifies the activity where the exception occurred. The faultInfo/activityId node is an xsd:int type.
    - activityName - During run time, the faultInfo/activityName node contains the activity name where the exception occurred. The faultInfo/activityName node is an xsd:string type.
    - faultTime - During run time, the faultInfo/faultTime node contains the time the error occurred. The faultInfo/faultTime node is an xsd:dateTime type.

Note: The exception name returned by an activity in the faultName variable and the faultInfo/name node may change in a future release.
2. Configure the CatchAll branch by dragging activities from the Activities tab to the CatchAll branch, as shown in the preceding figure.

## Results

Note: The scope of the faultName, faultData, and faultInfo variables is limited to the CatchAll branch. This scope limitation means that the value of these variables is only guaranteed to be valid within the CatchAll branch. For example, if you add a If...Then activity that tests the value of the faultName variable, the If...Then activity must be placed inside the CatchAll branch as shown in the preceding figure.

## Saving an image of an orchestration

---

You can save a graphical image of the current orchestration as a .jpg file.

### Procedure

---

1. To create, or open, an existing orchestration double-click an orchestration in the Orchestrations folder of the Project tab. A graphical representation of the orchestration is displayed.
2. Click an activity in the orchestration and select the Orchestration > Save as an Image option from the Studio toolbar menu. The Save Orchestration Flow to an Image dialog box is displayed.
3. Browse for a directory location.
4. In the File Name field, enter the complete name of the file including the jpg extension. For example: *ProcessPO.jpg*.
5. Click Save. The image file is saved to the file system.

**Parent topic:** [Orchestrations](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Saving\\_an\\_Image\\_of\\_an\\_Orchestration.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Saving_an_Image_of_an_Orchestration.html)

## Connection Activities

---

- [Creating an endpoint](#)

You can create an endpoint from either the Activities tab or the Project tab. Use the Activities tab when you are in the process of building an orchestration and want to use the endpoint straight away. Use the Project tab to configure a set of endpoints for later use.

- [Downloading plug-in connectors](#)

Plug-in connectors are additional connectors that you can download into Studio and access like a built-in connector. When you download a plug-in connector, the connector is displayed in the Activities tab with all the other built-in connectors. You can now drag the plug-in connector activities into the Studio workspace to create an orchestration.

- [Uninstalling Plug-in Connectors](#)

Plug-in connectors are additional connectors that you can download into Studio and access like a built-in connector. They can be uninstalled from the same location as they are downloaded.

- [Using an existing endpoint](#)

You can define an endpoint and reuse it for connection activities within the same project.

- [Polling interval behavior](#)

Some starter activities poll for a change in state at the specified polling interval. Once the poll occurs and the change of state is detected, an orchestration job is started to start processing.

- [Using the Shift-JIS encoding](#)

During run time, if the Shift-JIS encoding is specified, the Integration Appliance will not convert some of the double-byte characters.

---

# Creating an endpoint

---

You can create an endpoint from either the Activities tab or the Project tab. Use the Activities tab when you are in the process of building an orchestration and want to use the endpoint straight away. Use the Project tab to configure a set of endpoints for later use.

## Creating an endpoint from the Activities tab

---

1. Drag a connection activity from the Activities tab to the orchestration. The **Checklist** is displayed in the lower left side of the pane. The summary information is displayed, on the right.
2. By default, the Activity Name displayed is the name of the connection activity; for example, `FTP Poll Directory`. To change the name, enter the new name in the field.
3. Select `Pick Endpoint` from the **Checklist**. The endpoint pane is displayed to the right.
4. Click `New`. The Create Endpoint dialog is displayed.

Note: The dialog contents vary depending on what type of connection activity you create.

## Creating an endpoint by right-clicking in the Project tab

---

1. Right-click on the endpoints folder in the Project tab.
2. Select `Create Endpoint > EndpointType`, where `EndpointType` is type of endpoint. A new endpoint is created and displayed under the endpoints folder in the Project tab with a default name. An Endpoint tab is displayed in the main Studio pane.
3. Change the default name.
4. Press `Return`.
5. Configure the endpoint by specifying values in the Endpoint tab.

Note: The fields in the tab are identical to the fields displayed for the same type of endpoint created from the Activities tab.

## Creating an endpoint by clicking the New Endpoint icon in the Project tab

---

1. Click the Project tab.
2. In the Project tab, click the New Endpoint icon. A list with all types of endpoints is displayed.
3. Select an Endpoint type.
4. Change the default name.
5. Press `Return`.

## Creating an endpoint by right-clicking in the Project tab

---

1. Right-click on the endpoints folder in the Project tab.
2. Select `Create Endpoint EndpointType`, where `EndpointType` is type of endpoint. A new endpoint is created and displayed under the endpoints folder in the Project tab with a default name. An Endpoint tab is displayed in the main Studio pane.
3. Change the default name.
4. Press `Return`.
5. Configure the endpoint by specifying values in the Endpoint tab.

Note: The fields in the tab are identical to the fields displayed for the same type of endpoint created from the Activities tab.

# Downloading plug-in connectors

---

Plug-in connectors are additional connectors that you can download into Studio and access like a built-in connector. When you download a plug-in connector, the connector is displayed in the Activities tab with all the other built-in connectors. You can now drag the plug-in connector activities into the Studio workspace to create an orchestration.

## About this task

---

When you download plug-in connectors you can view available and installed plug-in connectors. Click the Available tab to view the names and versions of all the plug-in connectors that are available for download. Click the Installed tab to view the names and versions of all the plug-in connectors that you have already downloaded and installed on Studio. You can check for updates to these lists on startup or at one of the following intervals: daily, weekly, on alternative weeks, monthly, or never. Select the update interval and click Check Now to refresh the lists.

To download a plug-in connector complete the following steps:

## Procedure

---

1. Select Solutions > Plugin Connectors. The Login window is displayed.  
Note: If you are already logged into the IBM® Cast Iron® services, the Plugin Connector window is displayed and you can omit steps 2 and 3.
2. Specify the user name and password that IBM Support has provided you with. If you do not have login information, request a login from IBM Support.
3. Click OK. The Plugin Connectors window is displayed.
4. In the Available tab, select a connector.
5. Click Install. The plug-in connector is displayed in the Installed tab.

**Parent topic:** [Connection Activities](#)

## Uninstalling Plug-in Connectors

---

Plug-in connectors are additional connectors that you can download into Studio and access like a built-in connector. They can be uninstalled from the same location as they are downloaded.

## Procedure

---

1. Select Solutions > Plugin Connectors. The Login window is displayed.  
Note: If you are already logged into the IBM® Cast Iron® services, the Plugin Connector window is displayed and you can omit steps 2 and 3.
2. Specify the user name and password that IBM Support has provided you with. If you do not have login information, request a login from IBM Support.
3. Click OK. The Plugin Connectors window is displayed.
4. In the Installed tab, select a connector.
5. Click Uninstall. The plug-in connector is no longer displayed in the Studio Activities tab.

## Using an existing endpoint

---

You can define an endpoint and reuse it for connection activities within the same project.

## Procedure

1. Select the connection activity from within the orchestration.
2. Click Pick Endpoint from the Checklist.
3. Click Browse. The Project Explorer dialog box displays.
4. Select an endpoint from the list and click OK. The endpoint information is displayed.

**Parent topic:** [Connection Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn\\_Using\\_an\\_Existing\\_Endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn_Using_an_Existing_Endpoint.html)

## Polling interval behavior

Some starter activities poll for a change in state at the specified polling interval. Once the poll occurs and the change of state is detected, an orchestration job is started to start processing.

For example, during run time, the **FTP Poll Directory** activity polls for the existence of the specified file or files on the FTP server at the specified location and polling interval.

You specify the polling interval for the starter activity in the **Delivery Rules** task of the **Checklist** for the activity. The polling interval determines how often a poll occurs to check for a change in state. Once an orchestration that starts with a polling starter activity is published and deployed, the first poll occurs when the orchestration is deployed and the second poll occurs at the next time interval in the polling schedule. For example, if the polling interval is 10 minutes and the orchestration is deployed at 10:14 PM, the first poll occurs at 10:14 PM and the second poll occurs at 10:20 PM, which is the next interval of 10 minutes, as shown in the following figure:

The intervals start at the beginning of the hour, 10:00 PM in this example.

Note: When specifying the polling interview in days, the Integration Appliance uses UTC time zone and not the local time zone to determine when to poll. When the Polling Interval is set to days in the **Delivery Rules** task, the Integration Appliance polls at the start of the day (00:00) using the UTC time zone and not the local time zone specified for the Integration Appliance. For example, if your Integration Appliance is set to Pacific Standard Time (PST) which is 8 hours behind Coordinated Universal Time (UTC) and the Polling Interval was set to 1 day, the poll occurs at 00:00 in the UTC time zone which is equivalent to 4:00 PM (16:00 in 24 hour time) in the PST time zone.

The following starter activities poll for a change in state:

- Database Get Inserted Rows
- Database Get Updated Rows
- Database Get Deleted Rows
- Database Poll Table
- Get Email
- FTP Poll Directory
- MQ Poll Queue

## Using the Shift-JIS encoding

---

During run time, if the Shift-JIS encoding is specified, the Integration Appliance will not convert some of the double-byte characters.

### About this task

The Integration Appliance does not convert the double-byte characters listed in the following table: ^

Hexadecimal Shift-JIS Character Code	Hexadecimal Unicode Character Code	Description
0x815C	U+2014	Em Dash
0x8160	U+301C	Wave Dash
0x8161	U+2016	Double Vertical Line
0x817C	U+2212	Minus Sign
0x8191	U+00A2	Cent Sign
0x8192	U+00A3	Pound Sign
0x81CA	U+00AC	Not Sign

Use the CP943 encoding instead of the Shift-JIS encoding.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_TIPsandPIPs.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_TIPsandPIPs.html)

## About the Template Integration Project (TIP) Configuration Editor

---

Use the TIP Configuration Editor to drag objects from Studio into the TIP Configuration Editor workspace to create and modify Template Integration Projects (TIPs), which you can upload to the Cast Iron® solutions repository for other users to access.

When you have created a TIP, you can use the Configuration Wizard to configure the project for your integration scenario.

When you close the TIP Configuration Editor all changes are saved. However, if you close the project in Studio before you save your changes in the TIP Configuration Editor, the changes you made in the TIP Configuration Editor are not saved.

You can launch the TIP Configuration Editor from the Studio menu. Select Tools > TIP Configuration Editor.

## TIP Configuration Editor Workspace

---

The TIP Configuration Editor workspace contains the Edit and Preview tabs.

In the Edit tab, you can use the interface to build the pages for each step in the TIP. You can use this interface to drag images directly into the Description and Summary Content fields. By selecting the Show Markup option at the bottom of the tab, you can edit the underlying HTML source for the page.

You can view the page for the TIP step in the Configuration Wizard use the Preview option.

## TIP Configuration Editor Modes

---

The TIP Configuration Editor has a compact mode, which shows only a panel with the Steps list. Click the compact mode icon, in the upper right corner of the Steps list, to collapse or expand the TIP Configuration Editor. When you select the Sync Selection option at the end of the Steps list, the Studio application is opened and automatically navigates to the entity corresponding to the step in the TIP Configuration Editor that you are editing.

**Parent topic:** [Template Integration Process \(TIPs\)](#)

#### [Feedback | Notices](#)

## Creating a Template Integration Project (TIP)

You can create, and modify, Template Integration Projects (TIPs) using the TIP Configuration Editor to drag objects from Studio into the TIP Configuration Editor.

### About this task

You can upload to the Cast Iron® solutions repository for other users to access. After using the TIP Configuration Editor to create a TIP, you can use the Configuration Wizard to configure the project for your integration scenario.

Important: Only the creator of a TIP can modify the TIP. However, after you upload your TIP to the Cast Iron solutions repository and it is certified by IBM®, you no longer have the ability to delete your TIP from the Cast Iron solutions repository.

### Procedure

1. From the Studio menu, select Tools > TIP Configuration Editor. The TIP Configuration Editor window shows.
2. Define the steps for the TIP using one of the following methods:

Adding one of the TIP Configuration Editor's predefined step types:

- a. Click Add. The Select Type window opens.
- b. Select the appropriate option and click OK. The new step is displayed beneath the highlighted step in the Steps list. You can shuffle the order of the steps by selecting the step and moving it to the appropriate locations on the list.

Dragging a Studio object into the TIP Configuration Editor:

- a. Select a Studio object.
- b. Drag the object to the appropriate position on the Steps list. You can shuffle the order of the list by selecting a step and moving it to the required position on the list.
- c. Optional: You can drag images directly into the Description and Summary Content fields of the various steps.

Deleting a step:

- a. Select a step in the Steps list. Your selection is indicated by bold type
- b. Click Delete.

Renaming a step:

- a. Double-click a step in the Steps list. The step name becomes an editable field.
- b. Enter the required name of the step.

Or

- a. Select a step in the Steps list. Your selection is indicated by bold type.
- b. In the Edit tab, edit the value in the Name field.

3. In the Edit tab, define properties for each step:

- a. Select a step in the Steps list. Your selection is indicated by bold type. The Edit tab opens a form showing the properties for the selected step.
- b. Optional: Select the Show Markup option to view the HTML markup for the Description and Summary Content sections of the form. Right-click these sections to see a list of available HTML styles.

In the HTML source view, you can add images to the Description and Summary Content fields by dropping an image into either field. The image is converted to a file with a .b64 extension, which can be referenced as a relative path.

For example: ``.

Referencing images outside of the project structure is supported by using fully-qualified HTTP paths. For example: ``

Note: Selecting the Show Markup option only shows the HTML markup for the selected step.

- c. Complete the form.
- d. Preview the results in the Preview tab.

4. Click Close. The TIP Configuration Editor saves all changes and closes.

**Parent topic:** [Template Integration Process \(TIPs\)](#)

## Verifying a Template Integration Project (TIP)

---

You can verify a Template Integration Project (TIP) from the Studio menu using the same process as for verifying an orchestration.

### About this task

---

### Procedure

---

1. From the Studio menu, select Solutions > TIP Configuration Editor. The Configuration Wizard is displayed.
2. If the TIP does not have a Verify Orchestration step, add one before the Finish step. To add a Verify Orchestration step, select Tools > Edit Configuration Wizard and add a Verify Orchestration step.
3. Click Next to step through the orchestration.
4. When you reach the Verify Orchestration step, click Start Orchestration.

**Parent topic:** [Template Integration Process \(TIPs\)](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/TIPPIP\\_Verifying\\_TIPs.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/TIPPIP_Verifying_TIPs.html)

# Searching for Template Integration Projects (TIPs)

---

Template Integration Projects (TIPs) are stored in the Cast Iron® solutions repository. Through the Configuration Wizard, TIPs guide you through the configuration steps for an integration scenario. TIPs can be downloaded to your local machine. The login window is pre-populated with the User Name and Password to make it easier for you to download the TIPs, without registration.

## Procedure

---

1. From the Solutions menu, select Search For TIPs. The Login window is displayed with the pre-populated User Name and Password. These credentials have the access privilege only to download TIPs.  
Note: You can also log on by clicking the Login link present on the right-hand side, near the memory bar.
2. If you already have the credentials to log on, specify the user name and password. You can specify default login settings for the central repository in the Preferences dialog.
3. Click OK. The Search window is displayed and a confirmation message displays at the end of the main Studio window.
4. In the Search window, choose Keywords, Filter, or My TIPs as the method by which you want to search for TIPs.
  - o If you select the Keywords search option, the Keywords field is displayed.
    - a. Enter a search keyword.
    - b. Click Go. The results are displayed in the Results table and a "Searching ... completed" message is displayed at the end of the Search window. For example, if you enter the keyword USECASES, all TIPs under the USECASES category in the Cast Iron solutions repository are returned.
  - o If you select Filter search option, the filter options: Source Endpoint, Target Endpoint, Integration Patterns, and Searchable Keywords are displayed.
    - a. You must specify a value for at least one filter option. The options lists provide valid values.
    - b. Click Query. The results are displayed in the Results table and a "Searching ... completed" message is displayed at the end of the Search window.
  - o If you select My TIPs, all TIPs that you have created are displayed in the Results table.
5. In the Results table, select a TIP. The details for the project are displayed in the details section.
6. Optional: You can rate the TIP that you have selected.
  - a. Click the Edit Review link. The Publish Review window is displayed.
  - b. Move the slider until the appropriate number of stars are highlighted. Rate the TIP on a scale between 1-5, 5 being the highest rating.
  - c. In the My Title field, add a brief description for your review.
  - d. In the My Summary field, add more details about your review of the project.
  - e. Click OK. Studio submits the review to the Cast Iron solutions repository.
7. In the Search window, click Download. The Select directory where to save the TIP window is displayed.
8. Specify the download directory and click Open. The project is saved to the directory you specified and Studio opens the Configuration Wizard for the project.

# Rating and Reviewing Template Integration Projects (TIPs)

---

You can rate and provide a review for all Template Integration Projects (TIP) that you download.

## About this task

---

Ratings are given on a scale of 1-5, where 5 is the highest rating. When you submit your rating and review for a TIP, Studio uploads the information to the Cast Iron® solutions repository. Your rating is combined with any other ratings that have been submitted by other reviewers and the average is displayed in the Details pane of the specific TIP.

You can rate and review TIPs using the Configuration Wizard to complete TIP configurations or by accessing the Publish Review dialog box.

## Procedure

---

When you open a TIP in the Configuration Wizard, the last step provides an opportunity to rate and review the TIP.

1. Select Solutions > Start Configuration Wizard. The Configuration Wizard opens.
2. Complete each step of the wizard or just click Finish to go directly to the rating and review page.
3. In the rating and review page, move the My Rating slider until the appropriate number of stars are highlighted. Ratings are on a scale between 1 and 5; 1 is the lowest, and 5 is the highest rating.
4. In the My Title field, add a brief description for your review.
5. In the My Summary field, add more details about your review of the project.
6. Click Submit Review. Studio submits the review to the Cast Iron solutions repository.
7. Click Close.

- [Rating and Reviewing Template Integration Projects \(TIPs\) using the Publish Review Dialog box](#)

You can rate and provide a review for all Template Integration Projects (TIPs) that you download.

**Parent topic:** [Template Integration Process \(TIPs\)](#)

## Uploading Template Integration Projects (TIPs) to the Cast Iron solutions repository

---

You can upload Template Integration Projects (TIPs) that you have created to the Cast Iron® solutions repository.

### Procedure

---

1. From the Studio menu, select Solutions > Upload Project to Repository. The Upload Project Wizard opens.
2. Enter the following summary information:

<b>Option</b>	<b>Description</b>
<b>Parameter</b>	Description
<b>Name</b>	Name of TIP.
<b>Path</b>	Specify the location in the Cast Iron solutions repository to which Studio uploads the TIP.
<b>Category</b>	Specify the type of TIP created: <ul style="list-style-type: none"> <li>o Usecases</li> <li>o Best Practices</li> <li>o Utilities</li> <li>o General</li> </ul>
<b>Description</b>	Enter a brief description of the TIP.

3. Click Next.
4. Enter source and target endpoint information for the project:

<b>Option</b>	<b>Description</b>
<b>Source Endpoint Parameter</b>	Description
<b>Name</b>	Name of source endpoint.
<b>Description</b>	Enter a brief description of the source endpoint.
<b>Version</b>	Specify a version number for the source endpoint configuration.
<b>Option</b>	<b>Description</b>
<b>Target Endpoint Parameter</b>	Description
<b>Name</b>	Name of target endpoint.
<b>Description</b>	Enter a brief description of the target endpoint.
<b>Version</b>	Specify the version number of the target endpoint configuration.

5. Click Next.
6. Enter details about project patterns:

<b>Option</b>	<b>Description</b>
<b>Parameters</b>	Description
<b>Name/Description</b>	Name/Value pair for project patterns  Click the appropriate field to specify the name and description for the project pattern.  Click Add to specify additional patterns.  Click Delete to remove specified patterns.
<b>Searchable Tags</b>	You can use this string value later to search for the project.
<b>Creator</b>	Identify the person or entity that created the project. For example: John Smith or IBM®.
<b>Version</b>	Specify the version of the TIP you are uploading to the Cast Iron solutions repository.

7. Click Finished. Studio uploads the TIP to the Cast Iron solutions repository.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/TIPPIP\\_Uploader\\_TIPs.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/TIPPIP_Uploader_TIPs.html)

## Transform Activities

---

- [Map Variables Activity](#)

You can create a new Map Variables activity in an orchestration.

- [Read MIME activity](#)

During run time, the **Read MIME** activity reads the MIME header and the body of the message. The **Read MIME** activity breaks up the attachments contained in the body of the message and places the result into the parts XML output parameter, as shown in the figure below.

- [Write MIME activity](#)

During run time the **Write MIME** activity constructs a MIME header and the body of the message from multiple attachments contained in the parts XML input parameter and optionally the **mimeheader** input parameter, as shown in the figure below.

- [Read XML activity](#)

The **Read XML** activity takes an XML document and parses it to a defined schema. XML data is returned from this activity as the output parameter and the data can be used in subsequent activities.

- [Write XML activity](#)

The **Write XML** activity takes a complex (XML) variable and outputs a string in the XML format containing the data held in the complex variable. This string can then be written to a file or a database.

- [Validate XML activity](#)

During run time, the **Validate XML** activity determines if the input XML data is valid to the specified XML Schema or WSDL.

- [Read JSON activity](#)

The **Read JSON** activity takes a JSON or XML message and parses it to a defined schema to generate an output structure that can be used by the orchestration. At runtime this activity parses the JSON message and generates equivalent XML that can be mapped to other Studio activities.

- [Write JSON activity](#)

The **Write JSON** activity takes a structure equivalent to JSON as input and outputs a string in the JSON format containing the data held in the complex variable. This string can then be written to a file or posted using HTTP.

- [Validate JSON activity](#)

During run time, the **Validate JSON** activity determines if the input JSON or XML data is valid to the specified XML schema.

- [Read Flat File activity](#)

The Read Flat File activity converts flat file data (non-XML data) to XML data by applying the specified Flat File Schema. XML data is returned from this activity as the output parameter.

- [Write Flat File activity](#)

The Write Flat File activity converts data from an orchestration into flat file data (non-XML data) that is valid to the specified Flat File Schema.

- [Overview of OData Activities](#)

- [Apply XSLT activity](#)

You can use the Apply XSLT activity to transform XML data, stored in one XML variable, to XML data, stored in another XML variable, using the specified XSLT stylesheet.

---

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_transformactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_transformactivities.html)

# Map Variables Activity

---

You can create a new Map Variables activity in an orchestration.

## About this task

---

Using the Map Variables activity you can transform and initialize variables. You can transform the data from one or more source variables to the data stored in one or more destination variables. For more information see [About Maps](#).

You can create a new Map Variables activity by completing one of the following procedures:

## Procedure

---

1. Open or [create an orchestration](#)
2. If the activity is mapping variables that conform to a particular XML Schema or DTD, upload the XML Schema or DTD file into your project using [Uploading Files into a Project](#).
3. Open the Activities tab.
4. Drag the Map Variables activity from the Activities tab onto the orchestration.
5. If not already selected, click Design The Mapping Editor is displayed in the lower part of the pane.
6. [Add variables](#) to the From Orchestration pane.
7. [Add variables](#) to the To Orchestration pane.
8. Drag a source node from the From Orchestration pane to a destination node in the To Orchestration pane. If the mapping is valid, a link (line) displays from the source node to the destination node, indicating that a mapping rule has been established. Repeat this step until all the required nodes have been mapped.
9. If possible, test your mappings to ensure that the output is what you expect. For more information, see [Testing maps](#).

Note: The Extensible Markup Language (XML) specification prohibits the use of non-printing unicode control characters. The accepted character range is:

```
Char      :=      #x9 | #xA | #xD | [#x20-#xD7FF] | [#xE000-#xFFFF] | [#x10000-#x10FFFF]
```

Note: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Map\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Map_Activity.html)

## Read MIME activity

---

During run time, the **Read MIME** activity reads the MIME header and the body of the message. The **Read MIME** activity breaks up the attachments contained in the body of the message and places the result into the parts XML output parameter, as shown in the figure below.

For example, an orchestration could contain a **Get Email** activity, that during run time gets an email message from a POP3 endpoint and places the resulting email message in two variables, one XML variable that contains the mail header and another string variable that contains the body of the email message. The next activity in the orchestration could be a **Read MIME** activity that maps the contents of the mail header and the body variables to its input parameters. If the mail message contains attachments, the **Read MIME** activity then breaks up the attachments contained in the body of the message and places the result into the parts XML output parameter.

- [Adding a Read MIME activity to an orchestration](#)

Perform the steps in this section to add a **Read MIME** activity to an orchestration.

- [Mapping the input of the activity](#)

In this task, you map the XML variable containing the MIME header part of the mail header and the string variable containing the body of the message to the mimeheader and body input parameters of the **Read MIME** activity, respectively. Variables must be mapped to the mime header and body input parameters—both input parameters are required. The mime header input parameter is of type XML and the body input parameter is of type string.

- [Mapping the output to an activity](#)

In this task, you map the elements of the parts XML output parameter to variable(s).

**Parent topic:** [Transform Activities](#)

## Adding a Read MIME activity to an orchestration

Perform the steps in this section to add a **Read MIME** activity to an orchestration.

### Procedure

1. Create or open an orchestration. A graphical representation of the orchestration displays.
2. Select the **Activities** tab and expand the **Transform** folder.
3. Drag the **Read MIME** activity onto the orchestration. Place the **Read MIME** activity after the activity that gets the message, for example a Get Email activity.
4. Select the **Read MIME** activity and configure it as described in the next section.

**Parent topic:** [Read MIME activity](#)

[Feedback | Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add\\_Read\\_MIME\\_to\\_Orchestration.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add_Read_MIME_to_Orchestration.html)

## Mapping the input of the activity

In this task, you map the XML variable containing the MIME header part of the mail header and the string variable containing the body of the message to the mimeheader and body input parameters of the **Read MIME** activity, respectively. Variables must be mapped to the mime header and body input parameters—both input parameters are required. The mime header input parameter is of type XML and the body input parameter is of type string.

### About this task

The following table defines the elements in the mimeheader input parameter:

Table 1.

Element Name	Default
mimeVersion	Currently not used.
contentType/mainType	Currently not used. The <b>Read MIME</b> activity determines if the message is multipart or not by parsing the message using the specified boundary delimiter
contentType/subType	Currently not used.
contentType charset	Currently not used.
contentType/attribute/name	The attribute element contains a set of attributes as name/value pairs. You can specify the <b>boundary</b> attribute that specifies the <b>boundary</b> delimiter between the multipart entities of the message. If you specify the <b>boundary</b> attribute, it overrides the default <b>boundary</b> set in the message itself. If no <b>boundary</b> attribute is specified in the message itself or using the attribute element, an exception is thrown during run time.
contentType/attribute/value	Currently not used.
contentTransferEncoding	Currently not used.
otherMimeTypeHeaders	Currently not used.

The message body can contain one or more MIME parts separated by the boundary value specified in the **contentType/attribute** element of the mimeheader input parameter. Each part contains a MIME header that describes various attributes of the associated part body. How the individual part is parsed depends on the values assigned to the following parameters in the entityMimeType of the entity body:

- Content-Type header
- Charset attribute within the Content-Type header
- Content-Transfer-Encoding

How the part body is parsed depends on the settings of Content-Transfer-Encoding and Content-Type:

Content-Type is equal to "text":

- If the Content-Type is "text" and the Content-Transfer-Encoding is "7-bit" or "8-bit" or "binary", the part body is converted to an UTF8 encoded string and copied into the **entityBody** element of the **parts** output parameter.
- If the Content-Type is "text" and the Content-Transfer-Encoding is "quoted-printable", the part body is quoted-printable decoded, converted to an UTF8 encoded string based on the charset attribute and copied into the **entityBody** element of the **parts** output parameter.
- If the Content-Type is "text" and the Content-Transfer-Encoding is "base64", the part body is base64 decoded, converted to an UTF8 encoded string based on the charset attribute and copied into the **entityBody** element of the **parts** output parameter.

If not explicitly specified in the part MIME header, charset defaults to UTF8. The only exception to this default behavior is when the Content-Disposition is equal to "attachment" and the Content-Type is equal to "text." In this case, the part is not be treated as text since the charset of the data cannot be known. In addition, the Content-Transfer-Encoding is set to "binary."

Content-Type is not equal to â€œtext:â€

- If the Content-Type is not equal to â€œtextâ€ and the Content-Transfer-Encoding is â€œ7bitâ€/â€œ8bitâ€ or â€œbinary,â€ the part body is converted to an UTF8 encoded string and copied into the **entityBody** element of the **parts** output parameter.
- If the Content-Type is not equal to â€œtextâ€ and the Content-Transfer-Encoding is â€œquoted-printable,â€ the part body is quoted-printable decoded, base64 encoded, and copied into the **entityBody** element of the **parts** output parameter.
- If the Content-Type is not equal to â€œtextâ€ and the Content-Transfer-Encoding is â€œbase64,â€ the part body is copied as is (base64 data) into the **entityBody** element of the **parts** output parameter.

**Parent topic:** [Read MIME activity](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Map\\_Activity\\_Input\\_Read\\_MIME.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Map_Activity_Input_Read_MIME.html)

## Mapping the output to an activity

---

In this task, you map the elements of the parts XML output parameter to variable(s).

The entity/entityBody element of the parts output parameter contains the body and the attachments of the mail message. To access the body and the attachments of the mail message, you must iterate through the instances of the entity element using the For Each or While Loop activities

The order of the attachments and the body in the entity element depend on the email client that sent the message and the type of message (either plain text or HTML). For example, for a plain text email message sent from a Microsoft Outlook client, the parts output parameter consists of the following entity elements:

- The first **entityBody** element contains the body of the message.
- If an attachment was included in the message, the second **entityBody** element contains the first attachment.
- If a second attachment was included in the message, the third entityBody element contains the second attachment.

...and so on with the rest of the attachments.

You may need to decode the attachments before parsing the contents of the attachment. For example, an attachment that is encoded with the base64 encoding must be decoded before the contents of the attachment can be parsed by the Read Flat File activity. Another attachment might be text and therefore can be parsed without decoding.

Note: The Email and MIME activities can only process 8-bit or binary data using the UTF8 charset. Only MIME 1.0 compliant email messages are supported. The **Read MIME** activity can only parse email messages that have come from a MIME 1.0 compliant Email Server. If the message you are parsing in the **Read MIME** activity does not come from the Get Email activity but from another activity such as the HTTP Receive Request activity, you must create a Flat File Schema to parse the MIME header from the payload.

**Parent topic:** [Read MIME activity](#)

## Write MIME activity

---

During run time the **Write MIME** activity constructs a MIME header and the body of the message from multiple attachments contained in the parts XML input parameter and optionally the **mimeheader** input parameter, as shown in the figure below.

For example, an orchestration could contain a **Write MIME** activity, that during run time constructs a MIME header and a body of a message and places the result in two orchestration variables. The orchestration then invokes a **Send Email** activity that takes these two orchestration variables as input and builds a mail message and then sends that mail message to the specified SMTP endpoint.

The steps for adding and configuring a **Write MIME** activity in an orchestration are described in: [Adding a Write MIME activity to an orchestration](#).

- [Adding a Write MIME activity to an orchestration](#)

Perform the steps in this section to add a Write MIME activity to an orchestration.

- [Mapping the input of the activity](#)

In this task, you map the XML variables containing the MIME header and the parts (contains the attachments) to the **mimeheader** and **parts** input parameters of the **Write MIME** activity, respectively. Variable(s) must be mapped to the **parts** input parameter—this input parameter is required. The **mimeheader** input parameter is optional. If you do not map to or define default values for the elements of the **mimeheader** input parameter, default values are provided in the following table.

- [Mapping the output to an activity](#)

In this task, you map the **mimeheader** (of type XML) and **body** (of type string) output parameters to variable(s).

**Parent topic:** [Transform Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write\\_Mime\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write_Mime_activity.html)

## Adding a Write MIME activity to an orchestration

Perform the steps in this section to add a Write MIME activity to an orchestration.

### Procedure

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the **Activities** tab and expand the **Transform** folder.
3. Drag the Write MIME activity onto the orchestration. Place the Write MIME activity before the activity that pushes the message to an endpoint during run time. For example, place the Write MIME activity before the Send Email activity in the orchestration.

During run time, Send Email activity sends the email message to the POP3 server.

4. Select the **Write MIME** activity and configure it as described in the next section.

**Parent topic:** [Write MIME activity](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add\\_Write\\_MIME\\_to\\_Orchestration.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add_Write_MIME_to_Orchestration.html)

## Mapping the input of the activity

---

In this task, you map the XML variables containing the MIME header and the parts (contains the attachments) to the mimeheader and parts input parameters of the **Write MIME** activity, respectively. Variable(s) must be mapped to the parts input parameter—this input parameter is required. The mimeheader input parameter is optional. If you do not map to or define default values for the elements of the **mimeheader** input parameter, default values are provided in the following table.

### About this task

---

If the mimeheader input parameter is not listed in the **To Activity** pane of the **Map Inputs** pane, select **Map > Show Optional Parameters** from the toolbar menu or right-click in the **To Activity** pane and select the **Show Optional Parameters** option. If the **Map > Show Optional Parameters** option is not selectable in the toolbar menu, click on a element in the **Map Inputs** pane to make this option active.

The following table defines the elements in the mimeheader input parameter:

Table 1.

Child Element of the mimeheader Input Parameter	Default Value
mimeVersion	The standard MIME Version of 1.0 is assigned. The resulting MIME header is equal to the following setting: MIME-Version: 1.0.
contentType	The value of the Content-Type setting in the resulting MIME header is equal to the following setting: Content-Type: multipart/mixed.
contentType/attribute/name	The attribute element contains a set of attributes as name/value pairs. The boundary between attachments can be specified using a boundary attribute element. If a boundary attribute is not specified a default value is generated.
contentTransferEncoding	The value of the Content-Transfer-Encoding in the resulting MIME header is equal to the following setting: Content-Transfer-Encoding: 7-bit. NOTE: The Content-Transfer-Encoding you specify in this element for the main MIME header cannot be more restrictive than Content-Transfer-Encoding of the entity MIME headers. For example if you specify that the Content-Transfer-Encoding for the main MIME header is 7-bit but the Content-Transfer-Encoding specified in the entity MIME headers is 8-bit, the Content-Transfer-Encoding of the main MIME header is changed to 8-bit.

If you do not specify values for some of the child elements of the parts input parameter, defaults are described in the following table.

Table 2.

Child Element of the parts Input Parameter	Default Value
mimeVersion	The standard MIME Version of 1.0 is assigned. The resulting MIME header contains the following setting: MIME-Version: 1.0.
contentType	The value of the Content-Type in the resulting MIME header contains the following setting: Content-Type: text/plain; charset=US-ASCII.
contentTransferEncoding	The value of the Content-Transfer-Encoding in the resulting MIME header depends on the Content-Type setting. If the Content-Type is equal to multipart, the resulting MIME header contains the following setting: Content-Transfer-Encoding: 7-bit. If the Content-Type is equal to text and charset is equal to not-us-ascii (where not-us-ascii is any type except US-ASCII) the resulting MIME header contains the following setting: Content-Transfer-Encoding: quoted-printable. If the Content-Type is equal to non-text, the resulting MIME header contains the following setting: Content-Transfer-Encoding: base64. NOTE: If the Content-Disposition is equal to attachment, the entity part is not treated as text.

The parts input parameter can contain one or more parts. Each part contains a MIME header that describes various attributes of the associated part body. How the individual MIME part is serialized depends on the values assigned to the following parameters in the mine header:

- Content-Type header
- Charset attribute within the Content-Type header
- Content-Transfer-Encoding

How the part body is serialized depends on the settings of Content-Transfer-Encoding and Content-Type:

Content-Type is equal to "text":

- If the Content-Type is "text" and the Content-Transfer-Encoding is "7-bit"/"8-bit" or "binary," the part body is converted from UTF8 charset to the charset specified and copied into the body output parameter.
- If the Content-Type is "text" and the Content-Transfer-Encoding is "quoted-printable," the part body is converted from UTF8 charset to the charset specified, quoted-printable encoded and copied into the body output parameter.
- If the Content-Type is "text" and the Content-Transfer-Encoding is "base64," the part body is converted from UTF8 charset to the charset specified, base64 encoded, and copied into the body output parameter.

If not explicitly specified in the part MIME header, charset defaults to "UTF8." The only exception to this default behavior is when the Content-Disposition is equal to "attachment" and the Content-Type is equal to "text." In this case, the part is not treated as text since the charset of the data cannot be known. In addition for this case, the Content-Transfer-Encoding is set to "binary."

Content-Type is not equal to "text":

- If the Content-Type is not equal to "text" and the Content-Transfer-Encoding is "7bit"/"8bit" or "binary," the part body is copied to the body output parameter as is.
- If the Content-Type is not equal to "text" and the Content-Transfer-Encoding is "quoted-printable," the part body is base64 decoded, quoted-printable encoded and copied into the body output parameter.
- If the Content-Type is not equal to "text" and the Content-Transfer-Encoding is "base64," the part body is copied as is (base64 data) into the body output parameter.

See [Creating a Standalone Map](#) for general instructions on mapping.

## Read XML activity

---

The **Read XML** activity takes an XML document and parses it to a defined schema. XML data is returned from this activity as the output parameter and the data can be used in subsequent activities.

### About this task

---

The input parameter of the **Read XML** activity expects XML text. This data can be obtained from various endpoint activities such as the FTP Poll Directory activity reading a file containing XML data or HTTP Receive Request activity. The input data must be a well formed XML document or the activity will error. You must create an XML variable (see the **Variables** tab) before you can use an XML Schema in the Configure task. The XML variable can be defined by adding an XML schema to the project or by using an existing variable.

Note: If no function is defined in the Map Outputs for the Read XML activity and there is a straight mapping, in the From Activity to the To Orchestration, the XML data is passed to the output activity without validating against the schema that is specified in the XML variable.

Note: If there are any functions or other changes to the mappings in the Map Outputs for the Read XML activity, and the content does not match the schema, then an empty XML document is provided as the output of the Read XML activity.

To add a **Read XML** activity to an orchestration:

### Procedure

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the **Activities** tab and expand the **Transform** folder.
3. Drag the **Read XML** activity onto the orchestration. Place it to the right of an activity from which the orchestration will obtain the XML data (for example, an FTP Poll Directory).
4. Select the **Read XML** activity and configure it as described in [Read XML activity configuration](#).
  - [Read XML activity configuration](#)  
You can specify the XML Schema to apply to the **Read XML** input parameter.
  - [Read XML map inputs](#)  
You can map a string variable that contains the XML data to the input parameter of the **Read XML** activity called XMLText.
  - [Read XML map output](#)  
You can map the OutputXml output parameter that contains the XML data (stored as a string) to a variable valid to the specified XML Schema.

**Parent topic:** Transform Activities

## Read XML activity configuration

---

You can specify the XML Schema to apply to the **Read XML** input parameter.

### About this task

---

You must create an XML variable that defines the schema before starting this task.

### Procedure

---

1. In the XML Variable that defines the XML schema to parse, click **Browse**. The **Select a Variable to Parse** dialog box is displayed.
2. Select the appropriate XML Variable and click **OK**.
3. Specify how to read the data passed into the XMLText input parameter during run time by selecting one of the appropriate options:
  - a. Select the **Data is text-Needs no decoding** option if the incoming data is text and does not need decoding.
  - b. Select the **Decode data using encoding type** option if incoming data is binary data that needs to be decoded using the specified encoding type. Set the encoding type by selecting a default encoding type from the **Decode data using encoding type** list or enter your encoding type by clicking in the **Decode data using encoding type** field and typing in your encoding type.
4. Click **OK**.

**Parent topic:** [Read XML activity](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read\\_xml\\_Activity\\_conf.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read_xml_Activity_conf.html)

## Read XML map inputs

---

You can map a string variable that contains the XML data to the input parameter of the **Read XML** activity called XMLText.

### About this task

---

XMLText is an input parameter of type string or base64Binary. During run time the string variable must contain well formed XML data before the **Read XML** activity is run. The Encoding input parameter is optional. (You are not required to map this input parameter). If the Encoding input parameter is not listed in the **To Activity** pane of the **Map Inputs** pane, select **Map > Show Optional Parameters** from the toolbar menu or right-click the **To Activity** pane and select the **Show Optional Parameters** option. If the **Map > Show Optional Parameters** option is not selectable in the toolbar menu, click a node in the **Map Inputs** pane to make the option active. The Encoding input parameter specifies how the incoming data is decoded when read.

## Procedure

---

1. If no decoding is required, specify the string: text.
2. If decoding is required, specify the encoding type to be used to decode the incoming data. For example: UTF-8, US-ASCII, ISO-8859-1, EBCDIC-XML-US, or SHIFT\_JIS.

## Example

---

Optionally, you can override the Encoding setting you specified in the Configure task of the Checklist dynamically during run time, using the Encoding input parameter. For example, if you set the Encoding to UTF-8 in the Configure task but during run time you passed in the Encoding setting of Shift\_JIS, the Encoding setting specified dynamically during run time overrides the original setting specified in the **Configure** pane. In this example, the Encoding is set to Shift\_JIS. There is one exception to the dynamic overriding behavior: if the **XMLText is text-Needs no decoding or encoding** option is selected in the **Configure** task, the Encoding dynamically set during run time is ignored and no decoding occurs.

**Parent topic:** [Read XML activity](#)

## Read XML map output

---

You can map the OutputXml output parameter that contains the XML data (stored as a string) to a variable valid to the specified XML Schema.

See [Creating a Standalone Map](#) for general instructions on mapping.

During run time, an orchestration could invoke the following sequence of activities:

1. A FTP Poll Directory activity assigns the contents of a flat file to a String variable called **XMLRawContent**.
2. A **Read XML** activity assigns the contents of the **XMLRawContent** variable to the string input parameter called XMLText.
3. The **Read XML** activity converts XMLText to XML data and passes the XML data back to the orchestration via the output parameter. The contents of the output parameter are assigned to the variable valid to the XML Schema. The data XML input document can now be used and mapped within the orchestration.

**Parent topic:** [Read XML activity](#)

## Write XML activity

---

The **Write XML** activity takes a complex (XML) variable and outputs a string in the XML format containing the data held in the complex variable. This string can then be written to a file or a database.

## About this task

---

The string is returned as an output parameter. The data from the orchestration must come from a complex variable which, on the variables tab, is indicated by the XML icon. You must create the input XML variable that defines the schema.

To add a **Write XML** activity to an orchestration:

## Procedure

---

1. Create or open an orchestration. For more information, see [Building an orchestration](#). A graphical representation of the orchestration is displayed.
2. Select the **Activities** tab and expand the **Transform** folder.
3. Drag the **Write XML** activity onto the orchestration.
4. Select the **Write XML** activity and configure it as described in [Write XML activity configuration](#).
  - [Write XML activity configuration](#)  
For this task, you specify the XML Schema for the inbound data. The inbound data must be defined by an XML variable that defines the schema. You specify the XML Schema that applies to the input parameter.
  - [Write XML map inputs](#)  
You can map the data from variables of the orchestration to the InputXML parameter defined by the XML Schema specified in the Configure task.
  - [Write XML map output](#)  
You can map the XMLText output parameter that contains the XML data to a string variable.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write\\_xml\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write_xml_Activity.html)

## Write XML activity configuration

---

For this task, you specify the XML Schema for the inbound data. The inbound data must be defined by an XML variable that defines the schema. You specify the XML Schema that applies to the input parameter.

## Procedure

---

1. In the XML variable that defines the XML schema to serialize, click **Browse**. The **Select a Variable to Serialize** dialog box is displayed.
2. Select the appropriate XML variable and click **OK**.
3. Specify how the data defined by the OutputXML output parameter is to be encoded:
  - a. Select the **Data is text-Needs no decoding or encoding** option if the data is text and does not require encoding.
  - b. Select the **Decode or encode data using encoding type** option if outgoing data is binary data that requires encoding using the specified encoding type.
4. Set the encoding type using one of the following options:
  - a. From the **Decode or encode data using encoding type** list, select one of the default encoding types.
  - b. Click directly in the **Decode or encode data using encoding type** field and enter your encoding type.
5. Click **OK**.

## Write XML map inputs

---

You can map the data from variables of the orchestration to the InputXML parameter defined by the XML Schema specified in the Configure task.

### About this task

---

The Encoding input parameter is optional. You are not required to map this input parameter. If the Encoding input parameter is not listed in the **To Activity** pane of the **Map Inputs** pane, select **Map > Show Optional Parameters** from the toolbar menu or right-click in the **To Activity** pane and select the **Show Optional Parameters** option. If the **Map > Show Optional Parameters** option is not selectable in the toolbar menu, click on a node in the **Map Inputs** pane to make this option active. The Encoding input parameter specifies how outgoing data should be encoded for this procedure.

### Procedure

---

1. If no decoding is required, specify the string: **text**.
2. If encoding is required, specify the encoding type that should be used to encode the outgoing data, for example: UTF-8, US-ASCII, ISO-8859-1, EBCDIC-XML-US, or SHIFT\_JIS.

### Example

---

Optionally, you can override the Encoding setting you specified in the Configure task of the **Checklist** dynamically during run time, using the Encoding input parameter. For example, if you set the Encoding to UTF-8 in the Configure task but during run time you passed in the Encoding setting of **Shift\_JIS**. The Encoding setting specified dynamically during run time overrides the original setting specified in the **Configure** pane. In this example, the Encoding is set to **Shift\_JIS**. There is one exception to the dynamic overriding behavior: if the **Data is text-Needs no decoding or encoding** option is selected in the Configure task, the Encoding that is dynamically set during run time is ignored. See [Creating an orchestration](#) for more information.

## Validate XML activity

---

During run time, the **Validate XML** activity determines if the input XML data is valid to the specified XML Schema or WSDL.

The **Validate XML** activity has the following limitations:

- The **Validate XML** activity only supports the validation of the selected root element of an XML Schema. The validation of XML Schema fragments is not supported. If the XML Schema contains more than one root (or global element), you must select one of the root elements.
- The **Validate XML** activity does not support the validation of XML data against a DTD.

Note: You must upload an XSD file (ends in the .xsd extension) that contains the XML Schema into the project before configuring the **Validate XML** activity. Upload the XML Schema into the project that is used to validate the XML data during run time.

The following table describes the result when an error or warning occurs when the **Validate XML** activity is parsing XML data against an XML Schema.

Table 1.

Error/Warning Type	Description	Example	Result
Fatal Error	Parsing of the XML data fails because of a severe problem and the parsing cannot continue. For example, the XML data is not valid to the XML Schema.	The XML data is not valid to the XML Schema. For example, the XML Schema defines that there should be a root element called <code>&lt;d&gt;</code> but the XML data contains the root element called <code>&lt;a&gt;</code> .	When a fatal error occurs, the current orchestration job stops processing— even the processing of the Validate XML activity does not complete. In addition, the activities in the orchestration after the Validate XML activity are not processed. The value returned from the Validate XML activity for the success output parameter is false but since the activity never completes, nothing is returned.
Error (recoverable)	An error occurs during the parsing of XML data but it does not prevent the parsing of rest of the XML data.	An XML element in an integer but a string is provided as a value: <code>&lt;a&gt;&lt;count&gt;two&lt;/count&gt;&lt;/a&gt;</code>	If only recoverable errors or warnings occur during parsing, the processing of the Validate XML activity completes and the activities in the orchestration after the Validate XML activity are processed. The value of false is returned from the success output parameter.
Warning	A warning occurs during the parsing of XML data but it does not prevent the parsing of rest of the XML data	Â	If only warnings occur during parsing, the processing of the Validate XML activity completes and the activities in the orchestration after the Validate XML activity are processed. The value of true is returned from the success output parameter.

## Adding a Validate XML activity to an orchestration

---

Perform the steps in this section to add a **Validate XML** activity to an orchestration.

### Procedure

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the **Activities** tab and expand the **Transform** folder.
3. Drag the Validate XML activity onto the orchestration.
4. Select the Validate XML activity.

**Parent topic:** [Validate XML activity](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add\\_Validate\\_XML\\_Activity\\_to\\_Orchestration.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add_Validate_XML_Activity_to_Orchestration.html)

## Configuring a Validate XML activity

---

Perform the steps in this section to configure a **Validate XML** activity.

### Procedure

---

1. Click **Configure** from the **Checklist**.
2. In the **XML Schema** field, click **Browse**. The **Browse For Schema Type Element** dialog box displays. Select the XML schema to parse against during run time. You must select a root or global element and not a schema fragment. The selected XML schema defines the nodes that make up the **InputXml** input parameter in the Map Inputs task.
3. Select or clear the **Continue Parsing XML Data after First Recoverable Error** check box. (This check box defines the run-time behavior when a recoverable error occurs).

### Results

---

If the **Continue Parsing XML Data after First Recoverable Error** check box is selected and only recoverable errors and warnings occur but no fatal errors, the processing of the **Validate XML** activity completes after the first recoverable error and the value **false** is returned from the **success** output parameter. Only the first error is returned in the **errors** output parameter. The activities in the orchestration after the **Validate XML** activity are processed.

If the **Continue Parsing XML Data after First Recoverable Error** check box is cleared and only recoverable errors and warnings occur but no fatal errors, the processing of the **Validate XML** activity processes all the recoverable errors and the value **false** is returned from the **success** output parameter. Messages about all the recoverable errors are returned in the repeating **Message** node of the **errors** output parameter. The activities in the orchestration after the **Validate XML** activity are processed.

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Map\\_Activity\\_Input\\_ValidateXML.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Map_Activity_Input_ValidateXML.html)

## Mapping the output to an activity - Validate XML

Do the steps in this section to map the output to an activity for **Validate XML**.

To map the output of the activity:

1. Select the **Map Outputs** task in the **Checklist**. The output parameters for the activity are displayed in the **From Activity** pane as described in the following table:

Table 1.

o u t p u t N o d e	Description
s u c c e ss	During run time, if the parsing was successful, the value of <b>true</b> is returned. If parsing was unsuccessful, the value of <b>false</b> is returned. If fatal errors occur during parsing, the value of <b>false</b> is returned. If recoverable errors occur during parsing, the value of <b>false</b> is returned. If only warnings occur during parsing, the value of <b>true</b> is returned. In addition, if no warnings or errors occur during parsing, the value of <b>true</b> is returned. Map from the <b>success</b> output parameter to a variable of type string. In XPATH expressions, compare the value of the string variable against the string values of <b>true</b> and <b>false</b> .
er ro rs /e rr or T y p e	The type of error/warning for the last error or warning that occurred during run time.

O u t p u t  N o d e	Description
er ro rs / M e ss a g e	A repeating structure that contains a string that describes each error and warning that occurred during run time. All parsing warnings, fatal errors, and recoverable errors are returned.

2. Map the desired output parameters to variable(s). See [Creating a Standalone Map](#) for general instructions on mapping. You are not required to map output parameters for this activity.

## Read JSON activity

The **Read JSON** activity takes a JSON or XML message and parses it to a defined schema to generate an output structure that can be used by the orchestration. At runtime this activity parses the JSON message and generates equivalent XML that can be mapped to other Studio activities.

### About this task

The input parameter of the **Read JSON** activity expects sample JSON or equivalent sample XML text. (Equivalent JSON or XML text is available from the JSON/REST API documentation). The input data must be a well formed JSON or XML message or the activity fails. If you do not use a schema, you must create a JSON variable (see the **Variables** tab) before you can use an XML schema in the Configure task. The variable can be defined by adding an XML schema to the project or by utilizing an existing variable. Once the JSON/REST sample is provided, the activity generates an equivalent structure for JSON/XML. The XML is mapped to the activity output which can be used by the orchestration. At runtime this activity consumes the JSON message and generates equivalent XML that can be mapped to other studio activities.

To add a **Read JSON** activity to an orchestration:

### Procedure

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the **Activities** tab and expand the **Transform** folder.
3. Drag the **Read JSON** activity onto the orchestration. Place it to the right of an activity from which the orchestration will obtain the JSON data (for example, an FTP Poll Directory).
4. Select the **Read JSON** activity and configure it as described in [Read JSON activity](#).

- [Read JSON activity configuration](#)

You can apply a sample JSON or XML message to the **Read JSON** input parameter. Use of a schema is optional for this step.

- [Read JSON map inputs](#)

You can map a string variable that contains JSON data to the input parameter of the **Read JSON** activity called JSONText.

- [Read JSON map output](#)

You can map the OutputJSON output parameter that contains the JSON data (stored as a string) to a variable valid to the specified XML schema.

 Last updated: Wednesday, 15 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read\\_json\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read_json_Activity.html)

## Read JSON activity configuration

---

You can apply a sample JSON or XML message to the **Read JSON** input parameter. Use of a schema is optional for this step.

### About this task

---

If you're applying a JSON or XML message to the **Read JSON** input parameter, do the following steps:

Note: Because not all JSON messages contain a root node, Studio, by default, adds a virtual root element to all JSON messages during a write JSON activity. (Virtual nodes facilitate handling of rootless messages in Studio). To determine if a root node is present, view the message in the Configure panel. If the message does not contain a root element, Studio will automatically generate one during the write JSON activity and display it in the root element file. To remove the root element, delete it from the Configure panel so the output message matches the required structure.

### Procedure

---

1. Click Configure from the Checklist. The Configure window is displayed.
2. In the Configure window, copy the JSON or XML message into the text area and click Generate Output Map. If you're specifying an XML schema to apply to the Read JSON input parameter, do the following additional steps: (a) In the Select XML Schema pane click the Select XML Schema button to browse for the XML schema, then (b) select the XML schema to parse against during run time and click OK. (You must select a root or global element and not a schema fragment).
3. Specify how to read the data passed into the JSONText input parameter during run time by selecting one of the appropriate options:
  - a. Select the **Data is text-Needs no decoding** option if the incoming data is text and does not need decoding.
  - b. Select the **Decode data using encoding type** option if incoming data is binary data that needs to be decoded using the specified encoding type. Set the encoding type by selecting a default encoding type from the **Decode data using encoding type** list or enter your encoding type by clicking in the **Decode data using encoding type** field and typing in your encoding type.
4. Click **OK**.

## Read JSON map inputs

---

You can map a string variable that contains JSON data to the input parameter of the **Read JSON** activity called **JSONText**.

### About this task

---

**JSONText** is an input parameter of type string or base64Binary. During run time the string variable must contain well formed JSON data before the **Read JSON** activity is run. The Encoding input parameter is optional. (You are not required to map this parameter). If the Encoding input parameter is not listed in the **To Activity** pane of the **Map Inputs** pane, select **Map > Show Optional Parameters** from the toolbar menu or right-click the **To Activity** pane and select the **Show Optional Parameters** option. If the **Map > Show Optional Parameters** option is not selectable in the toolbar menu, click a node in the **Map Inputs** pane to make the option active. The Encoding input parameter specifies how the incoming data is decoded when read.

### Procedure

---

1. If no decoding is required, specify the string: text.
2. If decoding is required, specify the encoding type to be used to decode the incoming data. For example: UTF-8, US-ASCII, ISO-8859-1, EBCDIC-XML-US, or SHIFT\_JIS.

### Example

---

Optionally, you can override the Encoding setting you specified in the **Configure** task of the Checklist dynamically during run time, using the Encoding input parameter. For example, if you set the Encoding to UTF-8 in the Configure task but during run time you passed in the Encoding setting of Shift\_JIS, the Encoding setting specified dynamically during run time overrides the original setting specified in the **Configure** pane. In this example, the Encoding is set to Shift\_JIS. There is one exception to the dynamic overriding behavior: if the **JSONText is text-Needs no decoding or encoding** option is selected in the **Configure** task, the Encoding dynamically set during run time is ignored and no decoding occurs.

**Parent topic:** [Read JSON activity](#)

---

[Feedback](#) | [Notices](#)

## Read JSON map output

---

You can map the **OutputJSON** output parameter that contains the JSON data (stored as a string) to a variable valid to the specified XML schema.

See [Creating a Standalone Map](#) for general instructions on mapping.

During run time, an orchestration could invoke the following sequence of activities:

1. An HTTP Receive activity assigns the received body to a String variable called **JSONRawContent**.
2. A **Read JSON** activity assigns the contents of the **JSONRawContent** variable to the string input parameter called **JSONText**.
3. The **Read JSON** activity converts JSON data to XML data and passes the XML back to the orchestration via the output parameter. The contents of the output parameter are assigned to the variable valid to the XML schema. The data JSON input document can now be used and mapped within the orchestration.

**Parent topic:** [Read JSON activity](#)

---

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/read\\_json\\_map\\_output.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/read_json_map_output.html)

## Write JSON activity

---

The **Write JSON** activity takes a structure equivalent to JSON as input and outputs a string in the JSON format containing the data held in the complex variable. This string can then be written to a file or posted using HTTP.

### About this task

---

The JSON string is returned as an output parameter. (This is only applicable if you use a schema). The orchestration data must come from a complex variable which is indicated by the XML icon on the Variables tab. You configure the activity by pasting a JSON or XML sample message (available in the JSON/REST API documentation) in the Configure panel. This generates a compatible input structure for mapping the input data, which is then converted to a JSON message.

To add a **Write JSON** activity to an orchestration:

### Procedure

---

1. Create or open an orchestration. For more information, see [Building an orchestration](#). A graphical representation of the orchestration is displayed.
2. Select the **Activities** tab and expand the **Transform** folder.
3. Drag the **Write JSON** activity onto the orchestration.
4. Select the **Write JSON** activity and configure it as described in [Write JSON activity configuration](#).

- [Write JSON activity configuration](#)

During this procedure, you apply a sample JSON or XML message to the Write JSON input parameter. If you prefer, you can also use a schema for this task.

- [Write JSON map inputs](#)

You can map data from variables in the orchestration to the InputJSON parameter defined by the XML schema specified in the Configure task or use sample JSON/REST XML and the Configure panel to generate the input structure.

- [Write JSON map output](#)

You can map the JSONText output parameter that contains the JSON data to a string variable.

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write\\_json\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write_json_Activity.html)

## Write JSON activity configuration

---

During this procedure, you apply a sample JSON or XML message to the Write JSON input parameter. If you prefer, you can also use a schema for this task.

### About this task

---

Note: Because not all JSON messages contain a root node, Studio, by default, adds a virtual root element to all JSON messages during a write JSON activity. (Virtual nodes facilitate handling of rootless messages in Studio). To determine if a root node is present, view the message in the Configure panel. If the message does not contain a root element, Studio will automatically generate one during the write JSON activity and display it in the root element file. To remove the root element, delete it from the Configure panel so the output message matches the required structure.

## Procedure

---

1. Click Configure from the Checklist. The Configure window is displayed.
2. In the Configure window, you can either use an XML Schema or JSON or XML message to generate map.
  - a. If you are specifying an XML schema to apply to the Write JSON input parameter, do the following: In the Select XML Schema field, click the Select XML Schema button to browse and select XML schema. Select the XML schema to parse during run time and click OK.
  - b. If you want to use the JSON or XML message, copy the JSON or XML message into the Use JSON or XML message to generate the output schema text area.
3. Choose a Virtual Root Configuration.
  - a. When you use JSON or XML message to generate map, if more than one element present in JSON, then by default, Remove root Element is checked automatically.
  - b. When you use XML Schema to generate map, Remove root Element is not checked by default.

Note: If the Remove Root Element is checked, the first root element is skipped and the JSON text is created properly with the remaining elements. You can specify a Root Element Name. However if the Remove Root Element is not checked, then for all the complex types will not get the root element names and hence will be displayed as null.
4. Specify how the data defined by the OutputJSON output parameter is to be encoded:
  - a. Select the **Data is text-Needs no decoding or encoding** option if the data is text and does not require encoding.
  - b. Select the **Encode data using encoding type** option if outgoing data is binary data that requires encoding using the specified encoding type.
5. Set the encoding type using one of the following options:
  - a. From the Encode data using encoding type list, select one of the default encoding types.
  - b. Click directly in the Encode data using encoding type field and enter your encoding type.
  - c. Click OK.
6. Click Generate Map.

## Write JSON map inputs

---

You can map data from variables in the orchestration to the InputJSON parameter defined by the XML schema specified in the Configure task or use sample JSON/REST XML and the Configure panel to generate the input structure.

### About this task

---

The Encoding input parameter is optional and you are not required to map it. If the Encoding input parameter is not listed in the **To Activity** pane of the Map Inputs pane, select **Map > Show Optional Parameters** from the toolbar menu or right-click in the **To Activity** pane and select the **Show Optional Parameters** option. If the **Map > Show Optional Parameters** option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The Encoding input parameter specifies how outgoing data should be encoded for this procedure.

## Procedure

---

1. If no decoding is required, specify the string: **text**.
2. If encoding is required, specify the encoding type to be used to encode the outgoing data, for example: UTF-8, US-ASCII, ISO-8859-1, EBCDIC-XML-US, or SHIFT\_JIS.

## Example

---

Optionally, you can override the Encoding setting you specified in the **Configure** task of the **Checklist** dynamically during run time using the Encoding input parameter. For example, if you set the Encoding to UTF-8 in the **Configure** task but during run time you passed in the Encoding setting of **Shift\_JIS**. The Encoding setting specified dynamically during run time overrides the original setting specified in the **Configure** pane. In this example, the Encoding is set to **Shift\_JIS**. There is one exception to the dynamic overriding behavior: if the **Data is text-Needs no decoding or encoding** option is selected in the **Configure** task, the Encoding that is dynamically set during run time is ignored. See [Creating an orchestration](#) for more information.

## Validate JSON activity

---

During run time, the **Validate JSON** activity determines if the input JSON or XML data is valid to the specified XML schema.

The **Validate JSON** activity has the following limitations:

- The **Validate JSON** activity only supports the validation of the selected root element of an XML schema. The validation of XML schema fragments is not supported. If the XML schema contains more than one root (or global element), you must select one of the root elements.
- The **Validate JSON** activity does not support the validation of JSON or XML data against a DTD.

Note: You must upload an XSD file (ends in the .xsd extension) that contains the XML schema into the project before configuring the **Validate JSON** activity. Upload the XML schema into the project that is used to validate the JSON data during run time.

The following table describes the result when an error or warning occurs when the **Validate JSON** activity is parsing JSON or XML data against an XML schema.

Table 1.

Error/Warning Type	Description	Example	Result
--------------------	-------------	---------	--------

Error/Warning Type	Description	Example	Result
Fatal Error	Parsing of the JSON data fails because of a severe problem and the parsing cannot continue. For example, the JSON or XML data is not valid to the XML schema.	The JSON or XML data is not valid to the XML schema. For example, the XML schema defines that there should be a root element called <code>&lt;d&gt;</code> but the JSON or XML data contains the root element called <code>&lt;a&gt;</code> .	When a fatal error occurs, the current orchestration job stops processing even the processing of the Validate JSON activity does not complete. In addition, the activities in the orchestration after the Validate JSON activity are not processed. The value returned from the Validate JSON activity for the success output parameter is false but since the activity never completes, nothing is returned.
Error (recoverable)	An error occurs during the parsing of JSON data but does not prevent parsing of the remaining data.	A JSON element in an integer but a string is provided as a value: <code>&lt;a&gt;&lt;count&gt;two&lt;/count&gt;&lt;/a&gt;</code>	If only recoverable errors or warnings occur during parsing, the processing of the Validate JSON activity completes and the activities in the orchestration after the Validate JSON activity are processed. The value of false is returned from the success output parameter.
Warning	A warning occurs during the parsing of JSON data but does not prevent parsing of the remaining data	Â	If only warnings occur during parsing, the processing of the Validate JSON activity completes and the activities in the orchestration after the Validate JSON activity are processed. The value of true is returned from the success output parameter.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Validate\\_json\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Validate_json_activity.html)

## Adding a Validate JSON activity to an orchestration

---

Perform the steps in this section to add a **Validate JSON** activity to an orchestration.

### Procedure

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the **Activities** tab and expand the **Transform** folder.
3. Drag the Validate JSON activity onto the orchestration.
4. Select the Validate JSON activity.

---

[Feedback](#) | [Notices](#)

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add\\_Validate\\_JSON\\_Activity\\_to\\_Orchestration.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add_Validate_JSON_Activity_to_Orchestration.html)

## Configuring a Validate JSON activity

---

Perform the steps in this section to configure a **Validate JSON** activity.

### Procedure

---

1. Click **Configure** from the **Checklist**. The Configure window is displayed.
2. In the **XML Schema** field, click **Browse**. The **Browse For Schema Type Element** dialog box displays. Select the XML schema to parse against during run time. You must select a root or global element and not a schema fragment. The selected XML schema defines the nodes that make up the **InputJSON** input parameter in the Map Inputs task.
3. Select or clear the **Continue Parsing JSON Data after First Recoverable Error** check box. (This check box defines the run-time behavior when a recoverable error occurs).

### Results

---

If the **Continue Parsing JSON Data after First Recoverable Error** check box is selected and only recoverable errors and warnings occur but no fatal errors, processing of the **Validate JSON** activity completes after the first recoverable error and the value **false** is returned from the success output parameter. Only the first error is returned in the **errors** output parameter. The activities in the orchestration after the **Validate JSON** activity are processed.

If the **Continue Parsing JSON Data after First Recoverable Error** check box is cleared and only recoverable errors and warnings occur but no fatal errors, the processing of the **Validate JSON** activity processes all the recoverable errors and the value **false** is returned from the **success** output parameter. Messages about all the recoverable errors are returned in the repeating **Message** node of the **errors** output parameter. The activities in the orchestration after the **Validate JSON** activity are processed.

**Parent topic:** [Validate JSON activity](#)

---

## Mapping the input to an activity - Validate JSON

---

Do the steps in this section to map the input to an activity for Validate JSON.

### Procedure

---

1. Select the **Map Inputs** task in the **Checklist**. The XML schema you selected in the Configuring a Validate JSON activity procedure above becomes the input parameter for the activity. The input parameters for the activity are displayed in the **From Orchestration** pane.
2. Map the nodes of the XML schema of the input parameter. See [Creating a Standalone Map](#) for general instructions on mapping.

**Parent topic:** [Validate JSON activity](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/mapping\\_activity\\_input\\_validatejson.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/mapping_activity_input_validatejson.html)

## Mapping the output to an activity - Validate JSON

---

Do the steps in this section to map the output to an activity for **Validate JSON**.

To map the output of the activity:

1. Select the **Map Outputs** task in the **Checklist**. The output parameters for the activity are displayed in the **From Activity** pane as described in the following table:

Table 1.

O u t p u t N o d e	Description
s u c c e ss	During run time, if the parsing was successful, the value of <b>true</b> is returned. If parsing was unsuccessful, the value of <b>false</b> is returned. If fatal errors occur during parsing, the value of <b>false</b> is returned. If recoverable errors occur during parsing, the value of <b>false</b> is returned. If only warnings occur during parsing, the value of <b>true</b> is returned. In addition, if no warnings or errors occur during parsing, the value of <b>true</b> is returned. Map from the <b>success</b> output parameter to a variable of type string. In XPATH expressions, compare the value of the string variable against the string values of <b>true</b> and <b>false</b> .
er ro rs /e rr or T y p e	The type of error/warning for the last error or warning that occurred during run time.
er ro rs / M e ss a g e	A repeating structure that contains a string that describes each error and warning that occurred during run time. All parsing warnings, fatal errors, and recoverable errors are returned.

2. Map the desired output parameters to variable(s). See [Creating a Standalone Map](#)for general instructions on mapping. You are not required to map output parameters for this activity.

## Read Flat File activity

---

The Read Flat File activity converts flat file data (non-XML data) to XML data by applying the specified Flat File Schema. XML data is returned from this activity as the output parameter.

### About this task

---

The input parameter of the Read Flat File activity expects flat file data. Flat file (non-XML) data includes comma-separated values (.csv) and other types of delimited files, as well as fixed-length text files that comprise many EDI systems. Flat File data can be obtained from various endpoint activities, such as the FTP Poll Directory activity, HTTP Receive Request activity, or Get Email activity.

For an example of using a Read Flat File activity in an orchestration, see "*Developing a Simple Project*" in the *Getting Started Guide*.

You must [create the Flat File Schema](#) before you can select a Flat File Schema in the Select a Flat File Schema field of the Configure task.

To add a Read Flat File activity to an orchestration:

### Procedure

---

1. Create or open an orchestration. For more information, see [Creating an orchestration](#). A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the Transform folder.
3. Drag the Read Flat File activity onto the orchestration. Place it to the right of an endpoint activity from which the orchestration will obtain the flat file data (for example, an **FTP Poll Directory** activity).
4. Select the Read Flat File activity and configure it as described in [Configuring a Flat File activity](#).
  - [Read Flat File activity configuration](#)  
You can specify the Flat File Schema to apply to the Read Flat File input parameter.
  - [Read Flat File map inputs](#)  
You can map a string variable that contains the flat file data to the input parameter of the Read Flat File activity called Data.
  - [Read Flat File map outputs](#)  
You can map the Xml output parameter that contains the XML data (stored as a string) to a variable valid to the specified Flat File Schema.

## Read Flat File activity configuration

---

You can specify the Flat File Schema to apply to the Read Flat File input parameter.

## Before you begin

---

You must [create the Flat File Schema](#) before starting this task.

## About this task

---

To complete the Configure task:

### Procedure

---

1. In the Select a Flat File Schema field, click Browse.... The Project Explorer dialog box is displayed.
2. Select the appropriate Flat File Schema from the Flat File Schema folder and click OK.
3. Specify how to read the data passed into the Data input parameter during run time, by selecting one of the appropriate options:
  - a. Select the Data is text-Needs no decoding option, if the incoming data is text and does not need decoding.
  - b. Select the Decode data using encoding type option, if incoming data is binary data that needs to be decoded using the specified encoding type. Set the encoding type using one of the following options:
    - From the Decode data using encoding type list, select one of the default encoding types.
    - Enter your encoding type by clicking in the Decode data using encoding type field and typing in your encoding type.
4. Click OK.

### Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read\\_Flat\\_File\\_Activity\\_Configuration.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read_Flat_File_Activity_Configuration.html)

## Read Flat File map inputs

---

You can map a string variable that contains the flat file data to the input parameter of the Read Flat File activity called Data.

## About this task

---

Data is an input parameter of type string or base64Binary. During run time the string variable must contain flat file data before the Read Flat File activity is run. For more information see the following Runtime Example.

The Encoding input parameter is optional. You are *not* required to map this input parameter. If the Encoding input parameter is not listed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click a node in the Map Inputs pane to make this option active.

The Encoding input parameter specifies how the incoming data is decoded when read:

### Procedure

---

- If no decoding is required, specify the string: `text`.
- If decoding is required, specify the encoding type that should be used to decode the incoming data. For example: `UTF-8`, `US-ASCII`, `ISO-8859-1`, `EBCDIC-XML-US`, or `SHIFT_JIS`.

## Example

---

Optionally, you can override the Encoding setting you specified in the Configure task of the Checklist dynamically during run time, using the Encoding input parameter. For example, if you set the Encoding to `UTF-8` in the Configure task but during run time you passed in the Encoding setting of `Shift_JIS`. The Encoding setting specified dynamically during run time overrides the original setting specified in the Configure pane. In this example, the Encoding would be set to `Shift_JIS`. There is one exception to the

dynamic overriding behavior if the Data is text-Needs no decoding or encoding option is selected in the Configure task, the Encoding dynamically set during run time is ignored and no decoding occurs.

See [Creating a map](#) for general instructions on mapping.

**Parent topic:** [Read Flat File activity](#)

## Read Flat File map outputs

---

You can map the Xml output parameter that contains the XML data (stored as a string) to a variable valid to the specified Flat File Schema.

### About this task

---

See [Creating a Map](#) for general instructions on mapping.

Runtime Example

During run time, an orchestration could invoke the following sequence of activities:

### Procedure

---

1. A FTP Poll Directory activity assigns the contents of a flat file to a String variable called *flatFileRawContent*.
2. A Read Flat File activity assigns the contents of the *flatFileRawContent* variable to the string input parameter called Data.
3. The Read Flat File activity converts flat file data to XML data and passes the XML data back to the orchestration via the output parameter. The contents of the output parameter are assigned to the variable valid to the Flat File Schema.

### What to do next

---

For an example of using a Read Flat File activity in an orchestration, see "Developing a Simple Project" in the *Getting Started Guide*.

**Parent topic:** [Read Flat File activity](#)

---

## Write Flat File activity

---

The Write Flat File activity converts data from an orchestration into flat file data (non-XML data) that is valid to the specified Flat File Schema.

### About this task

---

The flat file data is returned as a string output parameter. The data from the orchestration can come from multiple variables of different types. For example, the data from the orchestration could contain two sets of XML data valid to two different XML Schemas and a string.

Flat file (non-XML) data includes comma-separated values (.csv) and other types of delimited files, as well as fixed-length text files that comprise many EDI systems.

You must create the Flat File Schema before you can select a Flat File Schema in the Select a Flat File Schema field of the Configure task. See [Creating a flat file schema](#) for more information.

To add a Write Flat File activity to an orchestration:

## Procedure

---

1. Create or open an orchestration. For more information, see [Creating an orchestration](#). A graphical representation of the orchestration is displayed.
  2. Select the Activities tab and expand the Transform folder.
  3. Drag the Write Flat File activity onto the orchestration
  4. Select the Write Flat File activity and configure it as described in [Write Flat File activity configuration](#).
- [Write Flat File activity configuration](#)  
You can specify the Flat File Schema that must be applied to the outbound data.
  - [Write Flat File map inputs and outputs](#)  
You can map the data from variables of the orchestration to the Xml input parameter defined by the Flat File Schema specified in Configure task.

**Parent topic:** [Transform Activities](#)

---

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/XML\\_to\\_Flat\\_File\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/XML_to_Flat_File_Activity.html)

## Write Flat File activity configuration

---

You can specify the Flat File Schema that must be applied to the outbound data.

### Before you begin

---

You must first [create the Flat File Schema](#) before starting this task.

### About this task

---

You can specify the Flat File Schema to apply to the input parameter. To complete the Configure task:

## Procedure

---

1. In the Select a Flat File Schema field, click Browse.... The Project Explorer dialog box is displayed.
2. Select the appropriate Flat File Schema from the Flat File Schema folder and click OK.
3. Specify how to write the data returned by the Data output parameter during run time, by selecting one of the appropriate options:
  - a. Select the Data is text-Needs no decoding or encoding option, if the outgoing data is text and therefore does not require encoding.
  - b. Select the Decode or encode data using encoding type option, if outgoing data is binary data that requires encoding using the specified encoding type. Set the encoding type using one of the following options:
    - From the Decode or encode data using encoding type list, select one of the default encoding types.
    - Click directly in the Decode or encode data using encoding type field and enter your encoding type.
4. Click OK.

**Parent topic:** [Write Flat File activity](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write\\_Flat\\_File\\_Activity\\_Configuration.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write_Flat_File_Activity_Configuration.html)

## Write Flat File map inputs and outputs

---

You can map the data from variables of the orchestration to the XML input parameter defined by the Flat File Schema specified in Configure task.

### About this task

---

The Encoding input parameter is optional. You are not required to map this input parameter. If the Encoding input parameter is not listed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active.

The Encoding input parameter specifies how outgoing data should be encoded:

### Procedure

---

- If no encoding is required, specify the string: `text`.
- If encoding is required, specify the encoding type that should be used to encode the outgoing data, for example: `UTF-8`, `US-ASCII`, `ISO-8859-1`, `EBCDIC-XML-US`, or `SHIFT_JIS`.

### Example

---

Optionally, you can override the Encoding setting you specified in the Configure task of the Checklist dynamically during run time, using the Encoding input parameter. For example, if you set the Encoding to `UTF-8` in the Configure task but during run time you passed in the Encoding setting of `Shift_JIS`. The Encoding setting specified dynamically during run time overrides the original setting specified in the Configure pane. In this example, the Encoding would be set to `Shift_JIS`. There is one exception to the dynamic overriding behavior, if the Data is `text`-Needs no decoding or encoding option is selected in the Configure task, the Encoding dynamically set during run time is ignored.

See [Creating a map](#) for general instructions on mapping.

**Parent topic:** [Write Flat File activity](#)

## Write Flat File map outputs

---

You can map the Data output parameter that contains the flat file data to a string variable.

### About this task

---

See [Creating a Map](#) for general instructions on mapping.

## Overview of OData Activities

---

OData (Open Data Protocol) allows the creation and consumption of queryable and interoperable RESTful APIs in a simple and standard way. It is an OASIS standard that defines the best practice for building and consuming RESTful APIs. OData helps you focus on your business logic while building RESTful APIs without having to worry about the approaches to define request and response headers, status codes, HTTP methods, URL conventions, media types, payload formats and query options.

Cast Iron version 7.5.1.0 supports exposing data from back end systems as OData APIs. Only GET and DELETE methods are supported in this version which means external clients can make GET and DELETE calls to OData API running on Cast Iron. The version of OData supported is 4.0.

OData activities work in conjunction with HTTP/ReST activities in Cast Iron. That means the output of the HTTP activities is given as input to OData activity and then the output of the OData activity is passed back as input to the HTTP activities.

Cast Iron supports two OData activities:

- **Read OData:** Takes input the URL information, payload, http headers and query parameters and gives the output in XML format. This XML output is used to perform the business logic on the backend systems involving CRUD operations using connector activities.
- **Write OData:** Takes input the business data which is created as part of the business logic execution and serializes into OData format (XML or JSON)

Note: It is recommended to use Cast Iron version 7.5.1.0 ifix005 or later versions.

- [Configuring OData Activities](#)
- [Read OData Activity](#)
- [Write OData Activity](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 9 November 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/OData\\_Overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/OData_Overview.html)

## Configuring OData Activities

---

**When exposing backend data as OData APIs using Cast Iron:**

1. In this case **HTTP Receive Request** and **HTTP Send Response** activities are used to expose OData APIs.
2. The output of this HTTP Receive activity (uri, method, host, accept and content-type other http headers, payload) is passed as input to the Read OData activity.
3. Steps for configuring Read OData Activity
  - a. Create or open an orchestration. A graphical representation of the orchestration is displayed.
  - b. Select the Activities tab and expand the Transform folder.
  - c. Drag the Read OData Activity onto the orchestration.
  - d. In the checklist, click Configure.
  - e. Select the version for OData version.
  - f. Select Input Data. You can select either one of Existing XML Schema or New XML Schema to support multiple Entities.
  - g. If you have selected Existing XML Schema, click Browse to select the existing XML Schema.
  - h. If you have selected New XML Schema to support multiple Entities, paste the New XML Schema Content and click Generate Maps.
  - i. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the readODataOutputPayload parameter in the From Activity panel.
  - j. Populate the map input properties by referring to the [Read OData Activity](#).
  - k. Create a map between the output parameters and orchestration variables.

Note:

- o The output of Read OData Activity is used to perform business logic on the endpoint/backend systems using connectors available in Cast Iron.
- o The output from this business logic activities (http response code, payload) and Read OData Activity (serviceName, protocol, host, method, accept, content-type, resourcePath, entities, additionalPath, fieldName, primaryKeys and

- additionalConfiguration) is given as input to the Write OData Activity.
- The value of serviceName in the map input of Read OData Activity must have a same value as that of the value of **URL (Path after hostname)** property in HTTP Receive Request Activity.
  - The format of primaryKeys property in the map input of Read OData Activity is described in [Read OData Activity](#).

#### 4. Steps for configuring Write OData Activity

- a. Create or open an orchestration. A graphical representation of the orchestration is displayed.
- b. Select the Activities tab and expand the Transform folder.
- c. Drag the Write OData Activity onto the orchestration.
- d. In the checklist, click Configure.
- e. Select the version for OData version.
- f. Select Input Data. You can select either one of Existing XML Schema or New XML Schema to support multiple Entities.
- g. If you have selected Existing XML Schema, click Browse to select the existing XML Schema.
- h. If you have selected New XML Schema to support multiple Entities, paste the New XML Schema Content and click Generate Maps.
- i. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Write OData Activity are displayed as nodes under the writeODataInput parameter in the To Activity panel.
- j. Populate the map input properties by referring to the [Write OData Activity](#).
- k. Create a map between the output parameters and orchestration variables.

Note: The output of the Write OData activity containing response payload, http status code and headers is passed to the HTTP Send Response activity.

Note:

- As of now Cast Iron exposes OData APIs for only DELETE and GET HTTP methods.
- Only the following OData query parameters are supported as of Cast Iron version 7.5.1 ifix005.
  - \$count - allows clients to request a count of the matching resources included with the resources in the response. Accepts a Boolean value of true or false.
  - \$skip - requests the number of items in the queried collection that are to be skipped and not included in the result.
  - \$top - requests the number of items in the queried collection to be included in the result.
  - \$format - allows clients to request a response in a particular format.
  - \$select - allows clients to request a specific set of properties for each entity or complex type.
  - \$filter - allows clients to filter a collection of resources that are addressed by a request URL. Only 'fieldName eq value' is supported as of 7.5.1 ifix005.
- Business object structures containing simple datatype fields are only supported. Business object structure containing child complex types is not supported.
- OData APIs exposed in Cast Iron 7.5.1 ifix005 supports Salesforce Lightning Connect.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/OData\\_configuring\\_OData\\_activities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/OData_configuring_OData_activities.html)

## Read OData Activity

This activity takes the OData URL along with query parameters, payload, http headers as input and creates output giving details of the object being used, the primary key details, the payload if present. This output is used as part of business logic execution along with other activities in the orchestration.

### Configuration Properties for the Read OData activity

Table 1. Configure panel properties

Field Name	Description
OData version	The OData version to be used by this activity. The same version need to use across all the activities in a single orchestration. The only version supported currently is 4.0.

Field Name	Description
Select Input data	<p>Select one of the options on how to provide the business data structure to the Read OData activity. The OData API is created based on this business structure(s) provided.</p> <ul style="list-style-type: none"> <li><b>Existing XML Schema:</b> Select this option to browse an existing schema available in the orchestration. Only one object can be selected with this option which means the OData API will be supporting only one top level object. This option is used if OData API need to be exposed by Cast Iron orchestrations.</li> <li><b>Endpoint URL (OData API):</b> Select this option to talk to an external OData API application. In this case Cast Iron is acting as client. The service root URL of the external application need to be provided. This option is not supported as of version 7.5.1 and will be added in future versions.</li> <li><b>New XML schema to support multiple Entities:</b> Select this option to support multiple top level objects in the OData API. An XML schema containing one or more global elements need to be pasted in the text area provided. This option is used if OData API need to be exposed by Cast Iron orchestrations. For example, refer to the sample XML schema given below.</li> </ul>

A sample XML schema containing account and product objects is given as an example.

```
<?xml version="1.0" encoding="UTF-8"?>
<schema xmlns="http://www.w3.org/2001/XMLSchema" elementFormDefault="qualified"
  xmlns:ras="http://www.sample.com/xmlns/prod/sample"
  targetNamespace="http://www.sample.com/xmlns/prod/sample">
  <element name="account" type="ras:AccountObject"/>
  <element name="product" type="ras:ProductObject"/>
  <complexType name="AccountObject">
    <sequence maxOccurs="1" minOccurs="1">
      <element maxOccurs="1" minOccurs="0" name="accountId" type="int"/>
      <element maxOccurs="1" minOccurs="0" name="accountName" type="string"/>
      <element maxOccurs="1" minOccurs="0" name="valid" type="boolean"/>
    </sequence>
  </complexType>
  <complexType name="ProductObject">
    <sequence maxOccurs="1" minOccurs="1">
      <element maxOccurs="1" minOccurs="1" name="pid" type="int"/>
      <element maxOccurs="1" minOccurs="0" name="productName" type="string"/>
      <element maxOccurs="1" minOccurs="0" name="description" type="string"/>
      <element maxOccurs="1" minOccurs="0" name="stock" type="int"/>
    </sequence>
  </complexType>
</schema>
```

Table 2. Map input properties

Field Name	Description
serviceName	This is the name of the OData ReST API and it will be part of the URL. The value of this property must be same as the value of "URL (Path After Hostname)" property in the Configure panel of HTTP "Receive Request" activity. When URL with this name (for example: http://host/serviceName) is hit, it gives the service document in the response.
protocol	The protocol supported by your OData ReST API. This value need to be defaulted to one of the two supported values (HTTP or HTTPS).
host	The host on which the API is running. The value for this property must be mapped from the output of HTTP "Receive Request" activity.
method	The http method of the request. The value for this property must be mapped from the output of HTTP "Receive Request" activity.
uri	The uri of the http request. The value for this property must be mapped from the output of HTTP "Receive Request" activity.
Accept	The Accept header value. The value of this property can be set to default value or mapped from the output of HTTP "Receive Request" activity. Supported values are application/json and application/xml.

Field Name	Description
Content-Type	The Content-Type header value. The value of this property can be set to default value or mapped from the output of HTTP "Receive Request" activity. Supported values are application/json and application/xml.
PrimaryKeys	<p>The fields which need to be marked as primary keys in the selected business data structures. This property is string array type and can take multiple values to support composite primary keys.</p> <p>The syntax of the field values is given below.</p> <p>syntax: objectName:fieldName</p> <p>For example: For the schema provided above, the values can be account:accountId or product:pid</p>
readODataInputPayload	The OData request payload which needs to be passed for POST, PUT and PATCH http methods. The value of this property must be mapped from the body property of the HTTP "Receive Request" output.
readODataHttpHeadersInput	The properties can be mapped from the header output of the HTTP "Receive Request" activity.

Some of the properties in the response are same as the properties available in the input. Other Map Output properties are explained below:

Table 3. Map output properties

Field Name	Description
isMetadataDocumentRequest	When this property is true, it indicates that the request call (/serviceName/\$metadata) is for metadata document and response metadata document is available in the property "metadataDocument"
metadataDocument	This property contains the metadata document when /serviceName/\$metadata call is made.
isServiceDocumentRequest	When this property is true, it indicates that the request call (/serviceName) is for service document and response service document is available in the property "serviceDocument"
serviceDocument	This property contains the service document when /serviceName call is made.
resourcePath	This property contains the url path of the call.
entities	This property is of type string array and contains the entity set name(s) requested in the url. For example, if the serviceName is /test and selected business data structure is account (from above schema) then the url to get all the account details is http://hostname/test/accounts. In this example the entity set name is accounts.
fieldName	If the request for a field name present in a business data structure then the name of the field will be present in this property. For example if the URL requested is http://hostname/test/accounts(5)/accountName, the value of fieldName will be accountName.
additionalpath	If there is any additional token like \$value or \$count in the request url, then this value will be present in this property.
primaryKeys	<p>If the request url contains primary keys, then that information is present in this field.</p> <p>URL examples:</p> <p>http://hostname/test/accounts(5)</p> <p>http://hostname/test/salesorder(orderid='so1',name='ask')</p> <p>The primaryKeys structure will contain field name, value, and the data type of the primary key.</p>
readODataHttpHeadersOutput	Contains header information which was sent as part of the request.
readODataQueryParametersOutput	Contains the standard query parameters defined by OData and any additional query parameters.
readODataOutputPayload	If the payload is sent as part of the request (for POST and PUT operations), the payload is parsed and is populated in the response business data structure.

## Write OData Activity

This activity takes the output of Read OData activity as input along with other details like payload, http status code etc and generates the output which needs to be passed back as response.

### Configuration Properties for the Write OData activity

Table 1. Configure panel properties

Field Name	Description
OData version	The OData version to be used by this activity. The same version need to use across all the activities in a single orchestration. The only version supported currently is 4.0.
Select Input data	<p>Select one of the options on how to provide the business data structure to the Read OData activity. The OData API is created based on this business structure(s) provided.</p> <ul style="list-style-type: none"> <li><b>Existing XML Schema:</b> Select this option to browse an existing schema available in the orchestration. Only one object can be selected with this option which means the OData API will be supporting only one top level object. This option is used if OData API need to be exposed by Cast Iron orchestrations.</li> <li><b>Endpoint URL (OData API):</b> Select this option to talk to an external OData API application. In this case Cast Iron is acting as client. The service root URL of the external application need to be provided. This option is not supported as of version 7.5.1 and will be added in future versions.</li> <li><b>New XML schema to support multiple Entities:</b> Select this option to support multiple top level objects in the OData API. An XML schema containing one or more global elements need to be pasted in the text area provided. This option is used if OData API need to be exposed by Cast Iron orchestrations. For example, refer to the sample XML schema given below.</li> </ul>

A sample XML schema containing account and product objects is given as an example.

```
<?xml version="1.0" encoding="UTF-8"?>
<schema xmlns="http://www.w3.org/2001/XMLSchema" elementFormDefault="qualified"
  xmlns:ras="http://www.sample.com/xmlns/prod/sample"
  targetNamespace="http://www.sample.com/xmlns/prod/sample">
  <element name="account" type="ras:AccountObject"/>
  <element name="product" type="ras:ProductObject"/>
  <complexType name="AccountObject">
    <sequence maxOccurs="1" minOccurs="1">
      <element maxOccurs="1" minOccurs="0" name="accountId" type="int"/>
      <element maxOccurs="1" minOccurs="0" name="accountName" type="string"/>
      <element maxOccurs="1" minOccurs="0" name="valid" type="boolean"/>
    </sequence>
  </complexType>
  <complexType name="ProductObject">
    <sequence maxOccurs="1" minOccurs="1">
      <element maxOccurs="1" minOccurs="1" name="pid" type="int"/>
      <element maxOccurs="1" minOccurs="0" name="productName" type="string"/>
      <element maxOccurs="1" minOccurs="0" name="description" type="string"/>
      <element maxOccurs="1" minOccurs="0" name="stock" type="int"/>
    </sequence>
  </complexType>
</schema>
```

Table 2. Map input properties

Field Name	Description

Field Name	Description
serviceName	This is the name of the OData ReST API and it will be part of the URL. The value of this property must be same as the value of "URL (Path After Hostname)" property in the Configure panel of HTTP "Receive Request" activity. When URL with this name (for example: http://host/serviceName) is hit, it gives the service document in the response.
protocol	The protocol supported by your OData ReST API. This value need to be defaulted to one of the two supported values (HTTP or HTTPS).
host	The host on which the API is running. The value for this property must be mapped from the output of HTTP "Receive Request" activity.
method	The http method of the request. The value for this property must be mapped from the output of HTTP "Receive Request" activity.
Accept	The Accept header value. The value of this property can be set to default value or mapped from the output of HTTP "Receive Request" activity. Supported values are application/json and application/xml.
Content-Type	The Content-Type header value. The value of this property can be set to default value or mapped from the output of HTTP "Receive Request" activity. Supported values are application/json and application/xml.
resourcePath	This property contains the url path of the call and is mapped from the output of Read OData Activity.
entities	This property is of type string array and contains the entity set name(s) requested in the url and is mapped from the output of Read OData Activity. For example, if the serviceName is /test and selected business data structure is account (from above schema) then the url to get all the account details is http://hostname/test/accounts. In this example the entity set name is accounts.
fieldName	If the request for a field name present in a business data structure then the name of the field will be present in this property. The value of this property is mapped from the output of Read OData Activity. For example if the URL requested is http://hostname/test/accounts(5)/accountName, the value of fieldName will be accountName.
additionalpath	If there is any additional token like \$value or \$count in the request url, then this value will be present in this property and is mapped from the output of Read OData Activity.
primaryKeys	If the request url contains primary keys, then that information is present in this field and the value is mapped from the output of Read OData Activity.  URL examples:  http://hostname/test/accounts(5)  http://hostname/test/salesorder(orderid='so1',name='ask')  The primaryKeys structure will contain field name, value, and the data type of the primary key.
status	Contains the HTTP status code which is returned in the response for DELETE operation.
writeODataInput	The business object structure that has to be serialized and returned in the response.
writeODataQueryParametersInput	The query parameters that needs to be applied on the response data. The values are mapped from the Read OData output.
writeODataHttpHeadersInput	The Http headers that needs to be applied on the response data. The values are mapped from the Read OData output.

Table 3. Map output properties

Field Name	Description
writeODataOutput	The data that needs to be sent as a response. It contains the HTTP status code, HTTP message, and response payload.
writeODataHttpHeadersOutput	This property contains the HTTP headers that needs to be sent as response.

## Mapping of XML Schema and OData Entity Data Model (EDM) datatypes

---

Following is the mapping between XML Schema and OData EDM datatypes:

Table 1. XML Schema and OData EDM datatypes mapping

XML Schema datatypes	OData EDM datatypes	Remarks
string	Edm.String	
boolean	Edm.Boolean	
hexBinary	Edm.Binary	
base64Binary	Edm.Binary	
byte	Edm.SByte	
short	Edm.Int16	
int	Edm.Int32	
integer	Edm.Int64	
long	Edm.Int64	
float	Edm.Single	
double	Edm.Double	
decimal	Edm.Decimal	
unsignedInt	Edm.Int64	
unsignedShort	Edm.Int32	
unsignedByte	Edm.Int16	
date	Edm.Date	The format while mapping this data must be YYYY-MM-dd. For example, 2015-11-25
dateTime	Edm.DateTimeOffset	The format while mapping this data must be YYYY-MM-dd'T'HH:mm:ss. For example, 2015-11-25T20:15:45
time	Edm.TimeOfDay	The format while mapping this data must be HH:mm:ss. For example, 20:15:45
duration	Edm.Duration	The format while mapping this data must be PnYnMnDTnHnMs. For example, PT1004199059S, PT130S, PT2M10S, P1DT2S

Note: Any other datatype will be treated as a string in Cast Iron.

**Parent topic:** [Overview of OData Activities](#)

## Apply XSLT activity

---

You can use the Apply XSLT activity to transform XML data, stored in one XML variable, to XML data, stored in another XML variable, using the specified XSLT stylesheet.

### About this task

---

The Apply XSLT activity transforms XML data, stored in one XML variable, to XML data, stored in another XML variable, using the specified XSLT stylesheet. The XSLT stylesheet is created outside Studio.

For example, if you have a XSLT stylesheet that converts XML data, valid to one XML Schema, to XML data, valid to a second XML Schema, you can create an Apply XSLT activity that calls this XSLT stylesheet to do this conversion in your orchestration during run time.

To create an Apply XSLT activity:

### Procedure

---

1. [Upload](#) the XSLT stylesheet into the project.
2. [Upload](#) the XML Schemas or DTD files that define the input and output XML variables.
3. [Create](#) the following two XML variables:
  - o a variable to hold the input XML data based on a XML Schema or DTD.
  - o a variable to hold the output XML data based on a different XML Schema or DTD.
4. Add the Apply XSLT activity to your orchestration:
  - a. [Create](#) or open an orchestration. A graphical representation of the orchestration is displayed.
  - b. Select the Activities tab and expand the Transform folder.
  - c. Drag the Apply XSLT activity onto the orchestration
5. Configure the Apply XSLT activity:
  - a. In the Pick Stylesheet task, for the Stylesheet field click Browse. The Project Explorer is displayed.
  - b. Select the appropriate stylesheet and click OK. The stylesheet is displayed.
  - c. In the Checklist, select Set Input & Output.
  - d. In the Input pane, select Browse. The Select Variable pane is displayed.
  - e. Select a variable and click OK.
  - f. In the Output pane, select Browse. The Select Variable pane is displayed.
  - g. Select a variable and click OK.

**Parent topic:** [Transform Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Custom\\_XSLT\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Custom_XSLT_Activity.html)

## Logic Activities

---

- [Logic activities overview](#)  
Logic activities control the flow of a orchestration.
- [Terminate activity](#)  
The Terminate activity stops all further orchestration job processing in the current branch.
- [Pick activity](#)  
The Pick activity determines what starter activity to launch based on the action that has occurred during run time.
- [If..Then activity](#)  
The If..Then activity tests the Where expression in the If branches to determine what branch of the If..Then activity to run.

- [Try activity](#)  
The Try... activity attempts to run the activity or activities in the main Try branch.
- [Group activity](#)  
Use this activity to group a set of activities in an orchestration. As a group, you can name, add comments, and collapse the block of activities as one entity.
- [While Loop activity](#)  
The While Loop activity initiates and continually processes any associated activities for as long as the specified condition evaluates to true.
- [For Each activity](#)  
The For Each activity iterates through recurring elements of a variable, performing other activities during each iteration cycle.
- [Split activity](#)  
The Split activity is a variation of the For Each activity that can be used to break up very large messages to improve performance
- [Break Loop activity](#)  
During run time, when a Break Loop activity is processed, the processing flow breaks out of the current looping activity and continues to the next activity in the orchestration
- [Continue activity](#)  
The Continue activity jumps to the next item to process in the loop and is typically placed after an If or an If..Then activity.
- [Adding branches to the If..Then activity](#)  
The If..Then activity supports multiple branches to handle different conditions.
- [Moving branches](#)  
You can change the position of a branch within an If..Then activity or a Pick activity.
- [Defining conditions](#)  
You can specify conditions in If..Then and While Loop activities to define a criteria that must be met before the orchestration continues with that branch.
- [Basic condition syntax](#)  
There are various types of conditions that you can use to evaluate an XPath expression.
- [bpws:getVariableData function](#)  
Use the bpws:getVariableData function to create conditions to access variable data.
- [Basic XPath expressions](#)  
XPath expressions are used in orchestrations and flat file schema definitions when you need to identify one or more nodes in a message or variable in order to access data or determine whether a condition has been met.
- [Testing XPath expressions](#)  
Use the XPath Evaluator to test XPath expressions against test XML documents.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_logicactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_logicactivities.html)

## Logic activities overview

Logic activities control the flow of a orchestration.

Logic activities provide the functionality described in the following table:

Activity	Description
Break Loop	Breaks out of a For Each, Split, or While Loop activity.
Continue	Jumps to the next item to process in a For Each, Split, or While Loop activity.
For Each	Iterates through repeating nodes of a variable, performing one or more activities during each iteration cycle.

Activity	Description
If..Then	Routes messages based on conditions to different branches.
Pick	Receives messages from one or more activities and selects one of them to start an orchestration.
Split activity	Iterates through repeating sections of a variable, performing one or more activities during each iteration cycle. The Split activity is a variation of the For Each activity that can be used to break up very large messages to improve performance.
Terminate	Stops all further processing of the current orchestration job.
Try activity...	Attempts to run the activity or activities in the main Try branch. If any exception occurs when running the activity or activities in the main Try branch, the CatchAll branch is run.
While Loop	Initiates and continually processes any children activities for as long as a specified condition is true.

## Terminate activity

The Terminate activity stops all further orchestration job processing in the current branch.

### About this task

This activity is commonly used in the If and Else branches of an If..Then activity to stop orchestration processing after an error occurs.

**Parent topic:** [Logic Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_Terminate\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Terminate_Activity.html)

## Pick activity

The Pick activity determines what starter activity to launch based on the action that has occurred during run time.

### About this task

For example, a Pick activity could contain three branches, one that contains a Get Inserted Rows activity, one that contains a Get Deleted Rows activity, and the other that contains a Get Updated Rows activity. If an update event occurs on the database, an instance of the orchestration is created and branch that contains the Get Updated Rows activity is called.

When you add a Pick activity to an orchestration, two Receive branches are automatically added. You can add additional receiveEvent nodes to the Pick activity. A Pick activity is always a starter activity and in each branch of a Pick activity the first activity must be a starter activity.

The Receive branch contains a receiveEvent node and an empty placeholder. Each message is defined in a Receive branch that can contain other activities to handle that specific message.

Delete Receive branches if you do not want a receive operation to be a part of the Pick activity. Deleting the Receive node removes the entire Receive branch.

Attention: If a variable is not initialized in every branch of a Pick activity, the variable cannot be used outside the scope of a Pick activity. Attempting to use a variable outside the Pick activity that is not initialized in every branch results in an invalid orchestration. For example, a Pick activity has two branches, one that contains a Get Updated Rows activity and one that contains a Get Inserted Rows activity. The Get Updated Rows activity returns the data to a variable named updateResult while the Get Inserted Rows activity returns the data to a variable named insertResult. These variables can only be used within the Pick activity and cannot be used in the activities that follow after the Pick activity in the orchestration. If the output of each activity is based on the same schema, you can however define one variable that both activities initialize. If all branches in a Pick activity initialize the variable, the scope of the variable includes all activities after the Pick activity and is not limited to the scope of the Pick activity.

To use a Pick activity complete the following steps:

## Procedure

---

1. Drag the Pick activity from the Logic folder in the Activities tab onto the orchestration.
2. Select an inbound activity or the Schedule Job activity and drag it onto the receiveEvent placeholder.
3. To add an activity to the branch, drag the activity onto the empty placeholder.

## Adding, editing, or deleting condition branches

---

The Pick activity can have several branches to process complex conditions

### To add a branch to the Pick activity:

1. Click the Pick node.
2. Select Add Receive Branch from the list.

### To edit a branch or activity name complete the following steps:

1. Select an activity or branch.
2. Select Edit from the list. The name is displayed in a box.
3. Select the current name, then enter the new one.
4. Press Enter.

### To delete an activity or branch complete the following steps:

1. Select an activity or branch.
2. Select Delete from the list.

Note: If you delete a condition branch, all activities within the condition branch are also deleted.

**Parent topic:** [Logic Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_Pick\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Pick_Activity.html)

## If..Then activity

---

The If..Then activity tests the Where expression in the If branches to determine what branch of the If..Then activity to run.

## About this task

By default, each If..Then activity includes an If branch and an Else branch. You can [add if additional branches](#) to an If..Then activity.

When the Where expression in the If branch is equal to true, processing proceeds down that If branch of the orchestration. If an If..Then activity contains multiple If branches, the Where expressions in the If branches are tested in sequential order. When none of the Where expressions in the If branches are satisfied, processing proceeds down the Else branch.

You also have the option of [copying a branch](#) or [Else](#) branch from another If..Then activity.

To use an If..Then activity complete the following steps:

### Procedure

1. Open the Activities tab and the Logic folder.
2. Drag the If..Then activity onto the orchestration.
3. Add more If branches as required.
4. Configure the If and Else branches.

## Configure an IF branch

1. Select the If branch. The Expression Builder opens.
2. [Define conditions](#) for the branch.
3. Drag an activity from the Activities tab onto the empty placeholder.

## Configuring an Else branch

1. Drag an activity from the Activities tab onto the empty placeholder.

## Copying and pasting If nodes

1. Click the If branch and select Copy from the list.
2. Click on the If..Then activity in the orchestration and select Paste from the list.  
Note: If and Else branches cannot be pasted outside of an If..Then activity. You cannot replace an If branch with an Else branch.

## Copying and pasting Else nodes

Else branches can be pasted into a If..Then activity only if the If..Then activity does not already contain an Else branch.

1. Click the Else branch and select Copy from the list.
2. Click the If..Then activity and select Paste from the list.

## Adding branches

1. Click the If..Then activity and select Add If.
2. [Define the conditions](#) and the activities for the branch.

## Editing an activity or branch

1. Select the activity or branch to edit existing properties.
2. Select Edit from the list.

## Deleting an activity or branch

1. Select the activity or branch to edit existing properties.
2. Select Delete from the list.  
Note: If you delete a condition branch, all activities within the condition branch are also deleted.

**Parent topic:** [Logic Activities](#)

## Try activity

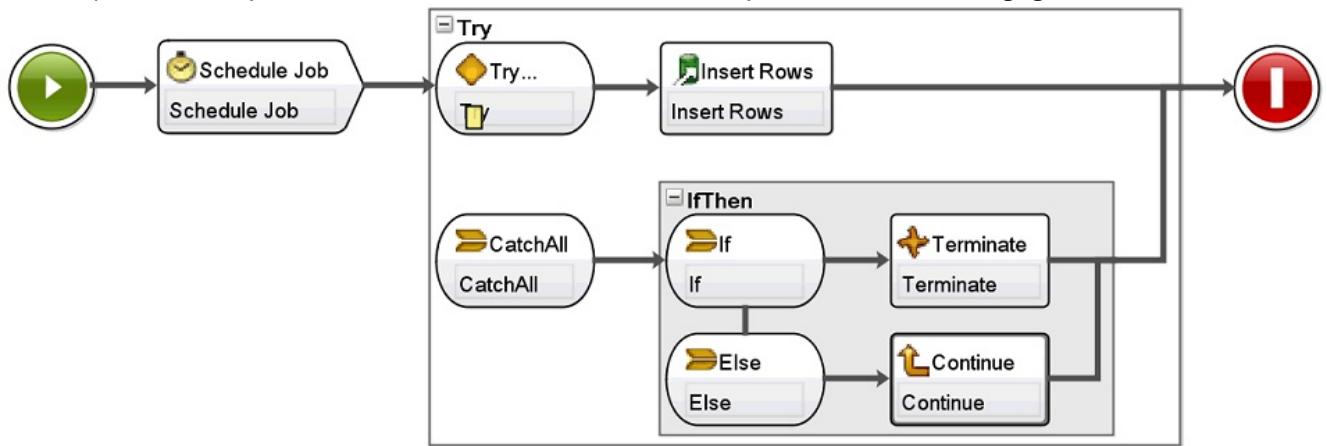

The Try... activity attempts to run the activity or activities in the main Try branch.

### About this task

If any exception occurs while running the activity or activities in the main Try branch, the CatchAll branch is run.

Right-clicking the mouse on the background creates a new CatchAll branch.

For example, the main Try branch can call the Database Insert Rows activity as shown in the following figure:

If the Database Insert Rows activity fails and throws an exception, the activity or activities in the CatchAll branch are run. In this example orchestration, when an exception is thrown by the Database Insert Rows activity, the Terminate activity runs thus terminating the current orchestration job.

**To add and configure a Try... activity, complete the following steps:**

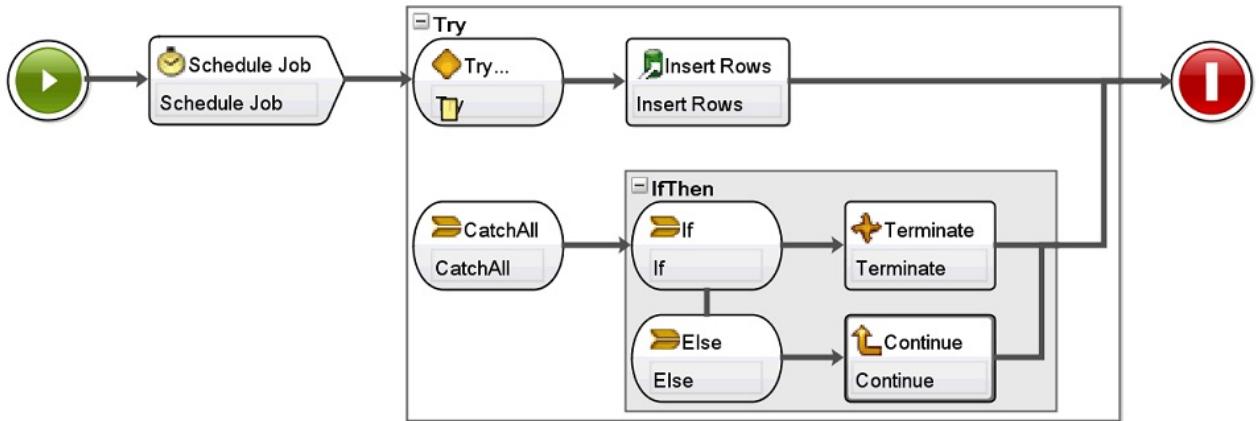

### Procedure

1. Open the Activities tab and the Logic folder.
  2. Drag the Try... activity onto the orchestration. The Try... activity is displayed with the following branches:
    - o Try... branch
    - o CatchAll branch
- When the first CatchAll branch is created, the following variables are automatically created:
- o faultName - During run time, the faultName variable contains the name of the exception thrown by an activity in the Try branch.
  - o faultData - During run time, the faultData variable contains the error message associated with the exception. This additional information is only currently returned for the Web Services activities. For Web Services activities, the faultData variable contains the fault.
  - o faultInfo - During run time, the faultInfo variable returns the following nodes:
    - name - During run time, the faultInfo/name node contains the name of the exception thrown by the activity in the Try branch. The faultInfo/name node is a xsd:QName type.
    - message - During run time, the faultInfo/message node contains the error message associated with the exception. The faultInfo/message node is a xsd:string type.
    - activityId - During run time, the faultInfo/activityId node contains the activity ID that uniquely identifies the activity where the exception occurred. The faultInfo/activityId node is a xsd:int type.
    - activityName - During run time, the faultInfo/activityName node contains the activity name where the exception occurred. The faultInfo/activityName node is a xsd:string type.
    - faultTime - During run time, the faultInfo/faultTime node contains the time the error occurred. The faultInfo/faultTime node is a xsd:dateTime type.

Note: The exception name returned by an activity in the faultName variable and the faultInfo/name node might change in a future release.

3. Configure the Try... and CatchAll branches by dropping activities from the Activities tab to the branches of the Try... activity as shown in the preceding and following figures.

Attention: The scope of the faultName, faultData, and faultInfo variables is limited to the CatchAll branch of the Try... activity. This scope limitation means that the value of these variables is only guaranteed to be valid within the CatchAll branch. For example, if you add an If...Then activity that tests the value of the faultName variable, the If..Then activity must be placed inside the CatchAll branch of the Try... activity as shown in the following figure:

## Group activity

---

Use this activity to group a set of activities in an orchestration. As a group, you can name, add comments, and collapse the block of activities as one entity.

### About this task

---

When you add a CatchAll branch to the group, the CatchAll branch runs as an exception occurs in the group of activities.

To use the Group activity complete the following steps:

### Procedure

---

1. In the Studio toolbox, click the Activities tab.
2. Expand the Logic directory.
3. Drag the Group activity onto the orchestration.
4. Optional: Add a CatchAll branch.
  - a. Right-click the Group activity. An option menu opens.
  - b. Select Add CatchAll Branch. The CatchAll branch is displayed in the Group activity.

**Parent topic:** [Logic Activities](#)

---

[Feedback | Notices](#)

## While Loop activity

---

The While Loop activity initiates and continually processes any associated activities for as long as the specified condition evaluates to true.

### About this task

---

To define a While Loop activity complete the following steps:

### Procedure

---

1. Drag a While Loop activity from the Logic folder of the Activities tab onto the orchestration. The [Expression Builder](#) is displayed.
2. Use the Expression Builder to [define conditions](#) in the While Loop activity. You must define a condition that evaluates to false to ensure that the loop ends. The variables needed to iterate through the conditions you specify are automatically created.
3. Drag an activity from the Activities tab onto the empty placeholder inside of the While Loop activity, typically, For Each, While Loop, or Split. Use the Break Loop or Continue activities to control iterations in these activities

**Parent topic:** [Logic Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_While\\_Loop\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_While_Loop_Activity.html)

## For Each activity

---

The For Each activity iterates through recurring elements of a variable, performing other activities during each iteration cycle.

### About this task

---

When you drop a For Each activity onto an orchestration, Studio creates the following two variables:

- loopvalue\_X - During run time, as the For Each activity loops through a set of recurring elements, the loopvalue\_X variable contains the value of the current element.
- loopcounter\_X - During run time, as the For Each activity loops through a set of recurring elements, the loopcounter\_X variable contains the current count of the number of iteration cycles that have been processed by the For Each activity.

Where X is equal to the number of For Each activities that have been dropped on the orchestration. For example, when the first For Each activity is dropped on an orchestration, the variables called loopvalue\_1 and loopcounter\_1 are created.

Attention: Do not use the loopvalue\_X and loopcounter\_X variables outside of the For Each activity. The scope of these variables are limited to the For Each activity.

Â

To use a For Each activity complete the following steps:

### Procedure

---

1. Open the Activities tab and the Logic folder.
2. Drag the For Each activity onto the orchestration.
3. In the Variable Name field, select a variable containing the recurring element that you want to loop through in the For Each activity.

4. In the Element Name field click [...] to browse for the recurring element that you want to loop through in the For Each activity. The Select Recurring Element window is displayed.
5. Select a recurring element and click OK.

## Results

---

An [XPath expression](#) that refers to the recurring element is displayed in the Element Name field. The Variable Name field is automatically populated with the loopvalue\_X variable created for this For Each activity. You can edit the generated XPath expression in the Element Name field.

You can add other activities within the For Each loop. Use the Break Loop and Continue activities to control iterations of the For Each loop.

**Parent topic:** [Logic Activities](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_For\\_Each\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_For_Each_Activity.html)

## Split activity

---

The Split activity is a variation of the For Each activity that can be used to break up very large messages to improve performance.

During runtime, the Split activity iterates through recurring elements of a variable, processing activities on each iteration. . With the Split activity, you define how many recurring elements are returned with each loop, while the For Each activity always returns one recurring element each loop.

**To use a Split activity complete the following steps:**

1. Open the Activities tab.
2. Open the Logic folder in the Activities tab.
3. Drag the Split activity onto the orchestration.
4. Complete the properties fields displayed in the Summary pane.

You can add other activities within the Split loop as required. Use the Break Loop or Continue activities to control iterations of the Split loop.

## Properties

---

Complete these fields for the Split activity:

Field	Description
Activity Name	Specifies the name of the activity.
Variable Name	Displays a list of defined variables for an orchestration. Select a variable that contains the recurring element to loop through.
Element Name	Specifies the recurring element to loop through. Click [...] to browse for a recurring element. The Select Recurring Element dialog box is displayed. Select a recurring element and click OK. An <a href="#">XPath expression</a> that refers to the recurring element is displayed in the Element Name field. You can edit the generated XPath expression in the Element Name field.
Return __ Recurring Elements Per Loop	Specifies the number of recurring elements to returned with each loop. The recurring elements are stored in the loopvalue_X variable.
Variable to Store the Result	

Field	Description
Variable Name	Specifies the variable that holds the set of recurring elements returned with each loop. The Variable Name field is populated with the loopvalue_X variable which is created automatically for this activity. Attention: Do not use the loopvalue_X variable outside of the Split activity. The scope of these variables are limited to the Split activity.

[Feedback](#) | [Notices](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_Split\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Split_Activity.html)

## Break Loop activity

During run time, when a Break Loop activity is processed, the processing flow breaks out of the current looping activity and continues to the next activity in the orchestration

### About this task

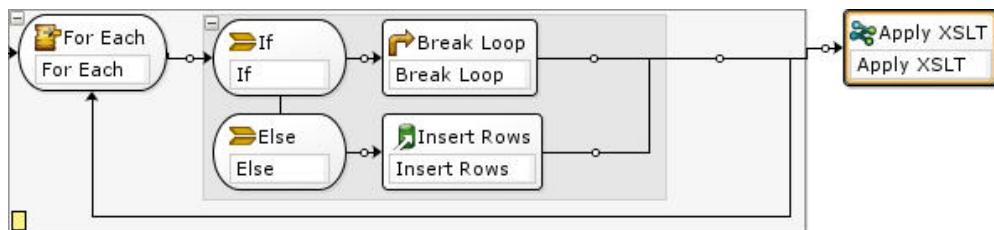

The Break Loop activity can only be used in any of the following looping activities: For Each, Split, and While Loop, as shown in the following examples.

To use a Break activity:

### Procedure

1. Open the Activities tab and the Logic folder.
2. Drag a For Each, Split, or While Loop activity onto the orchestration.
3. Drop the Break Loop activity into the looping activity, as shown in the following example:
  - o To break out of a loop when a condition is true, see Example 1.
  - o To break out of a loop after a single iteration, see Example 2.

### Example 1 - Break out of a loop when a condition is true

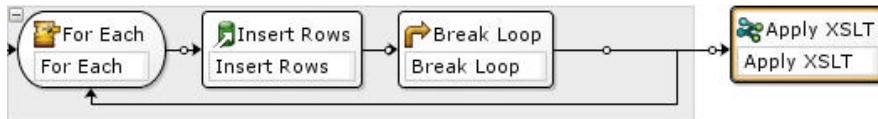

1. Drag an If..Then activity into the looping activity you set up, as shown in the preceding figure.
2. Drag an action activity (for example: the Insert Rows activity) onto the empty placeholder to the right of the Else node.
3. Configure the action activity.
4. Click the If node and enter a condition in the Expression Builder.
5. Drag a Break Loop activity onto the empty placeholder to the right of the If node.

### At run time:

- If the condition in the If activity evaluates to true, the Break Loop exits out of the looping activity.
- If the condition in the If activity evaluates to false, the Else branch is started and the action activity (for example: the Insert Rows activity) is run.

### Example 2 - Break out of a loop after a single iteration runs

1. Drag an action activity (for example, the Insert Rows activity) onto the empty placeholder inside of the looping activity you selected.
2. Configure the action activity.
3. Drag a Break Loop activity onto the empty placeholder inside of the looping activity.

#### At run time:

- The action activity (for example: the Insert Rows activity) runs only once before the Break Loop exits out of the looping activity.

## Continue activity

The Continue activity jumps to the next item to process in the loop and is typically placed after an If or an If..Then activity.

### About this task

The Continue activity can only be used inside one of the following looping activities: For Each, Split, and While Loop activities.

To use a Continue activity complete the following steps:

### Procedure

1. Open the Activities tab and the Logic folder.
2. Drag a For Each, Split, or While Loop activity onto the orchestration.
3. Set up the looping activity to continue processing as shown in the following example.

Example - Continue processing when a condition is true

- a. Drag an If..Then activity into the looping activity you set up in step 1.
- b. Drag an action activity (for example: an Insert Rows activity) onto the empty placeholder to the right of the If node.
- c. Configure the action activity.
- d. Click the If node and enter a condition in the [Expression Builder](#).
- e. Drag a Continue activity onto the empty placeholder to the right of the Else node.

#### At Run Time:

- o If the condition in the If evaluates to true, the action activity runs.
- o If the condition in the If evaluates to false, the Continue activity in the Else branch runs and jumps to the next item in the looping activity.

# Adding branches to the If..Then activity

---

The If..Then activity supports multiple branches to handle different conditions.

## About this task

---

To add additional If and Else branches complete the following steps:

## Procedure

---

1. Select the If..Then activity in the orchestration
2. Right-click and select one of these options:
  - o Add If â€“ to add another branch with a condition.
  - o Add Else â€“ to add a final, catch-all branch to use when a message does not match any of the conditions in the If statements. (This option is only available if there is no Else branch displayed.)
  - o Double-click the If icon and enter a name for the branch.
  - o Use the Expression Builder to [define the conditions](#) for the branch.

# Moving branches

---

You can change the position of a branch within an If..Then activity or a Pick activity.

## About this task

---

To move a branch within an If..Then activity or a Pick activity complete the following steps:

## Procedure

---

1. Select the branch you want to move. For an If..Then activity, select one of the If nodes; for a Pick activity, select one of the receiveEvent nodes.
2. To move the branch use one of the following actions:
  - o Select Orchestration > Go Up or Orchestration > Go Â Down from the toolbar menu.
  - o Right-click the branch and select Go Up or Go Down from the list.

**Parent topic:** [Logic Activities](#)

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_Moving\\_Branches.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Moving_Branches.html)

# Defining conditions

---

You can specify conditions in If..Then and While Loop activities to define a criteria that must be met before the orchestration continues with that branch.

In most cases, conditions test the value of data in a message or in other variables defined within the orchestration. Use the Expression Builder to define conditions.

## Expression Builder

---

The Expression Builder is used to define conditions for If..Then and While Loop activities. It is displayed beneath the orchestration, in the Property pane, when you select an If..Then or While Loop activity in the orchestration.

These conditions are boolean expressions that describe the criteria against which the Integration Appliance compares a message. During runtime, the result of this comparison determines the execution path through the orchestration. For a complete list of operators that you can use in the Expression Builder, see [Valid Operators for Conditions](#). For more information about the order precedence of the conditions in the Expression Builder, see <http://www.w3.org/TR/xpath#booleans>.

The Expression Builder allows you to add, delete, and edit conditions as well as change their processing order.

To add a condition:

1. Click Add. A new condition displays beneath the existing list of conditions.
2. To or the new condition with the previous condition in the link, right-click and select or from the list.

To delete a condition:

- Select the condition, then click Delete.

To edit a condition:

- Select any field in the Expression Builder and make your edits. If the Expression Builder is not displayed, click Use Builder. You can edit left-hand expressions, select operators, and right-hand expressions.

-OR-

- Click Advanced to directly edit XPath expression that defines the condition. For more information, see [Basic Condition Syntax](#), [Basic XPath Expressions](#), and [bpws:getVariableData Function](#)

Note: Use the XPath Evaluator to [test XPath expressions](#).

To change the processing order of the conditions:

- Select a condition in the Expression Builder and click the up or down arrows.

**Parent topic:** [Logic Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Defining\\_Conditions.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Defining_Conditions.html)

## Basic condition syntax

---

There are various types of conditions that you can use to evaluate an XPath expression.

The most common operator used to evaluate an expression is = (equals), but you can use any valid XPath operator. See [Basic XPath Expressions](#) for a list of valid XPath operators.

The following examples demonstrate how to use various conditions to evaluate an XPath expression.

### Example 1: Using string literals

---

String literals must be enclosed in quotation marks as shown in this example:

```
bpws:getVariableData('PatientInfo')/PV1/Department = 'ICU'
```

## Example 2: Accessing variable data

---

Use the [bpws:getVariableData function](#) to access variable data

### Using string literals in the getVariableData function:

The following example evaluates string nodes from two variables. The variable names in the bpws:getVariableData function are string literals.

```
bpws:getVariableData('PatientInfo')/PV1/Department = bpws:getVariableData('Orders')/PID/PtDept
```

### Using numeric literals in the getVariableData function:

To evaluate numeric literals you must cast either one or both sides of the expression. For example:

```
number(bpws:getVariableData('PatientInfo')/PV1/Department) = bpws:getVariableData('Orders')/PID/PtDept
```

Â - OR -

```
number(bpws:getVariableData('PatientInfo')/PV1/Department) =  
number(bpws:getVariableData('Orders')/PID/PtDept)
```

## Example 3: Numeric literals

---

Numeric literals do not require quotation marks. Placing quotes around a numeric literal transforms it into a string literal.

### Valid numeric expression example:

```
number(bpws:getVariableData('PurchaseOrder')/PurchaseOrder/POTotal) >= 5000.00
```

### Invalid numeric expression example:

```
number(bpws:getVariableData('PurchaseOrder')/PurchaseOrder/POTotal) >= '5000.00'
```

**Parent topic:** [Logic Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Basic\\_Condition\\_Syntax.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Basic_Condition_Syntax.html)

## bpws:getVariableData function

---

Use the bpws:getVariableData function to create conditions to access variable data.

It can be combined with an XPath expression identifying specific nodes within the variable.

For example:

- To access the data in the POTotal node in a variable named PurchaseOrder, you would enter:  
`bpws:getVariableData('PurchaseOrder')/PurchaseOrder/POTotal`
- To access the data in a primitive variable named ItemCount, enter: `bpws:getVariableData('ItemCount')`

**Parent topic:** [Logic Activities](#)

---

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_bpws\\_getVariableData\\_Function.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_bpws_getVariableData_Function.html)

## Basic XPath expressions

---

XPath expressions are used in orchestrations and flat file schema definitions when you need to identify one or more nodes in a message or variable in order to access data or determine whether a condition has been met.

XPath is an XML standard that defines a grammar to identify nodes or sets of nodes (called node sets) in XML documents.

You can edit the default XPath expressions, generated in the following panes:

- In the Configure panes of the [For Each](#) and [Split activity](#) activities, an XPath expression is generated to define the recurring element. You can edit the default XPath expression displayed in the Element Name field.
- In the Configure panes of the [While Loop](#) and [If..Then](#) activities, an XPath expression is generated in the Expression Builder to define the conditions. You can edit the default XPath expression displayed by clicking Advanced.

XPath 2.0 is supported.

## Selecting nodes by path

---

XPath describes the location of XML elements and attributes as a path similar to URLs or directories on your local file system. Each element or attribute is a node in a tree that begins with the root node. The root node contains the entire tree, so any node within the tree can be found by following a path down the branches.

The basic syntax is:

```
/root-node/child-node/.../final-element-node  
/root-node/child-node/.../final-element-node/@attribute-node
```

You determine this path from the XML Schema that describes the messages.

XPath uses the @ symbol as a shorthand to identify attributes. Paths without @, or the attribute:: prefix, identify elements by default. For example:

Â /PackingSlip/PONumber/Item

identifies the Item element found inside PONumber in the PackingSlip root node.

## Node names and XML namespaces

---

Node names can also appear with namespaces, such as tns:OrderNumber or \*:Item. The portion of the name up to the colon is a prefix identifying a namespace and the colon is the delimiter between the namespace and the node's local name.

Namespaces are an XML standard used to uniquely identify elements or attributes when documents share content from several schemas. Cast Iron® Studio automatically assigns and manages namespaces for the XML Schemas used in configuration documents. Â

Note: Each schema within a WSDL definition can be defined by a namespace.

## Select nodes conditionally with predicates

---

You might occasionally want to select a node only if some condition is met. These selection conditions are known as predicates.

You define predicates inside brackets, such as:

```
/PV1/PatientDepartment[text()='Nursery']
```

This expression selects the PatientDepartment node only if the data in the node is Nursery.

```
/Order/OrderDetail/Item[5]
```

This expression selects the fifth Item node within OrderDetail.

## Valid operators for conditions

---

XPath expressions can also be boolean conditions that evaluate to true or false. These expressions can be used to select specific nodes or simply to identify a condition that must be met. You can use the [Expression Builder](#) to help you define conditions. XPath operators that can appear in expressions include:

- = equals
- != not equals
- < less than
- > greater than
- <= less than or equals
- >= greater than or equals

## Functions in XPath expressions

---

XPath also contains functions that allow you to manipulate data from nodes. This can be useful in building subject lines that contain some constant text plus dynamic data from messages. XPath functions can also be used to handle requirements such as trimming space or ensuring that a job key is a string datatype. Some of the common XPath functions include:

concat()

you can combine any number of strings and the data from nodes in the order you specify the parameters. You can specify XPath paths as parameters. Specify constant text strings within quote marks. For example:

```
concat('New Order # ',/Orders/Order/OrdNumber)
```

count()

you can count the number of nodes in the parameter you specify. Typically the parameter is an XPath path expression that identifies several nodes, such as all the Item nodes that are children of PODetail. For example:

```
count (/Orders/Order)
```

normalize-space()

trims all leading and trailing space characters from the input parameter and also normalizes all space within the input to single space characters and single line feeds. For example:

```
normalize-space (/Job/Address/Line1)
```

number()

converts the parameter to a number datatype. This function can be used to ensure that strings are treated as numbers. For example:

```
number (/PurchaseOrder/POTotal)
```

string()

converts the parameter to a string datatype. This function can be used to ensure that numeric or date nodes are treated as strings. For example:

```
string (/PurchaseOrder/VendorID)
```

translate()

replaces individual characters with other characters in the first parameter you specify. The second parameter is the character or characters to replace and the third parameter is the replacement characters. This function can be useful for ensuring that job keys are all uppercase, for example.

```
translate (/Issue/ShortDescr,  
'abcdefghijklmnopqrstuvwxyz',  
'ABCDEFGHIJKLMNOPQRSTUVWXYZ')
```

For a complete list of XPath functions, see the XPath Specification (<http://www.w3.org/TR/xpath>).

## Testing XPath expressions

---

You can [test your XPath Expressions](#) against XML test data using the XPath Evaluator.

**Parent topic:** [Logic Activities](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Basic\\_XPath\\_Expressions.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Basic_XPath_Expressions.html)

## Testing XPath expressions

---

Use the XPath Evaluator to test XPath expressions against test XML documents.

To bring up the XPath Evaluator window, select Tools > XPath Evaluator option from the Studio toolbar menu.

You can use the XPath Evaluator to test XPath expressions against XML files. You can edit the default XPath expressions, generated in the following panes:

- In the Configure panes of the [For Each](#) and [Split](#) activities, an XPath expression is generated to define the recurring element. You can edit the default XPath expression displayed in the Element Name field.
- In the Configure panes of the [While Loop](#) and [If..Then](#) activities, an XPath expression is generated in the Expression Builder to define the conditions. You can edit the default XPath expression displayed clicking Advanced.

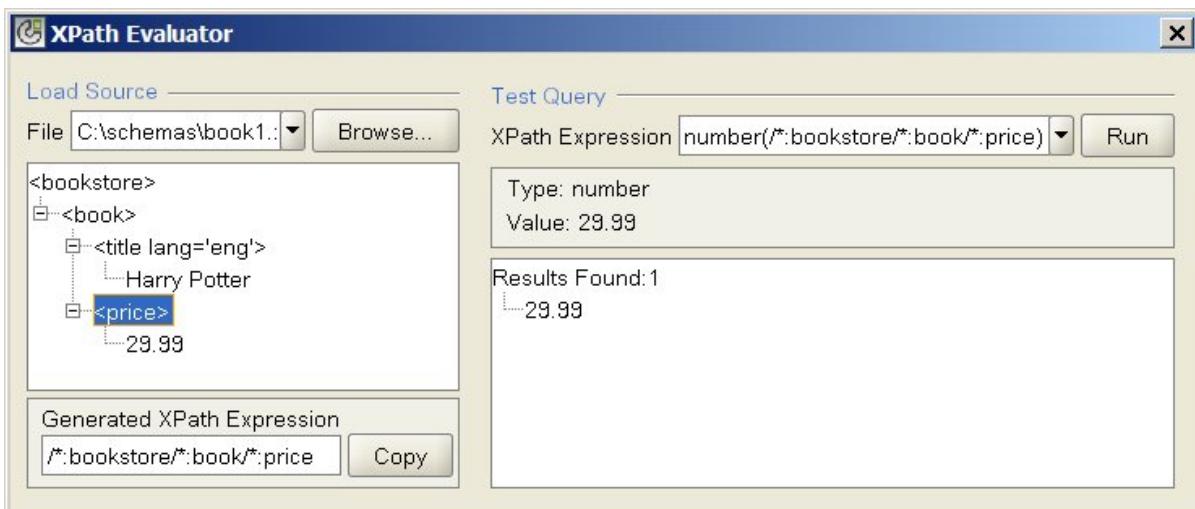

Note: XPath 2.0 is supported.

The following table describes the functionality of the XPath Evaluator dialog box.

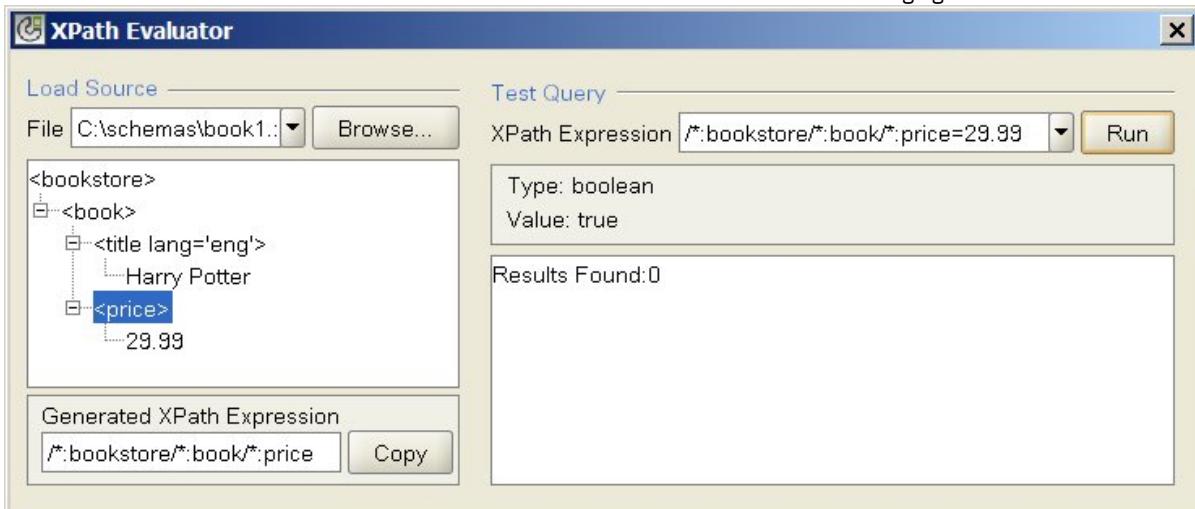

Field	Name Description
File	Specifies the directory location of the selected test XML file. Select the down arrow to select from the set of previously loaded XML files.
Browse..	Click Browse... to load the contents of the XML file from the file system.
Load Source	A graphical representation of the source XML elements to test against. Selecting a node in this text box generates an XPath expression that finds all occurrences of this element when this XPath expression is evaluated against the specified XML data.
Generated XPath Expression	XPath expression that is generated when an XML element is selected in the Load Source text box.
Copy	Copy the XPath Expression from the Generated XPath Expression field to the XPath Expression field.
XPath Expression	Specifies the XPath Expression used to evaluate or test against the XML data.
Run	Select Run to evaluate the XPath expression against the source XML test data. The results of the evaluation are displayed in the text box on the right side of the pane.

To evaluate an XPath expression complete the following steps:

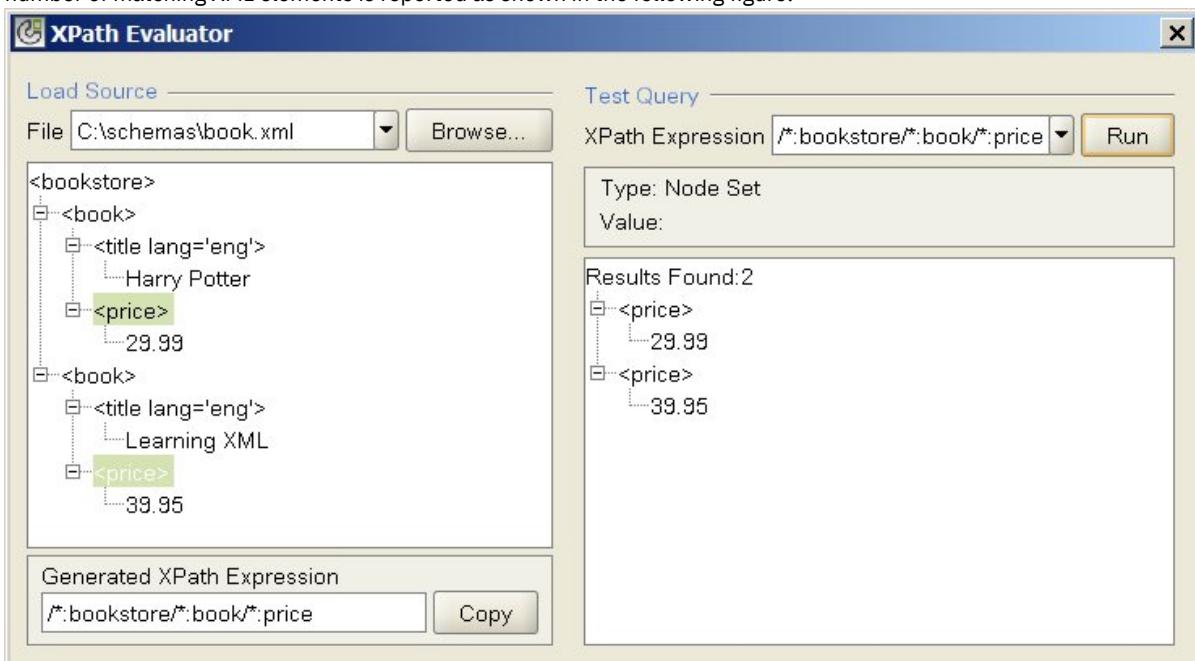

1. Select the Tools > XPath Evaluator option from the Studio toolbar menu. The XPath Evaluator window opens.
2. Click Browse... to load a test XML file from the file system. A graphical representation of the text XML elements shows in the Load Source text box.
3. To specify an XPath expression, choose from one of the following options:
  - Enter an XPath expression directly into the XPath Expression field.
  - Select an XML element in the Load Source text box and click Copy to copy the XPath expression from the Generated XPath Expression field to the XPath Expression field.
4. Click Run. The result of running the XML data against the XPath expression is displayed in the right bottom pane. The following types can be returned:
  - **number** – the value of the number is returned in the Value field as shown in the following figure:

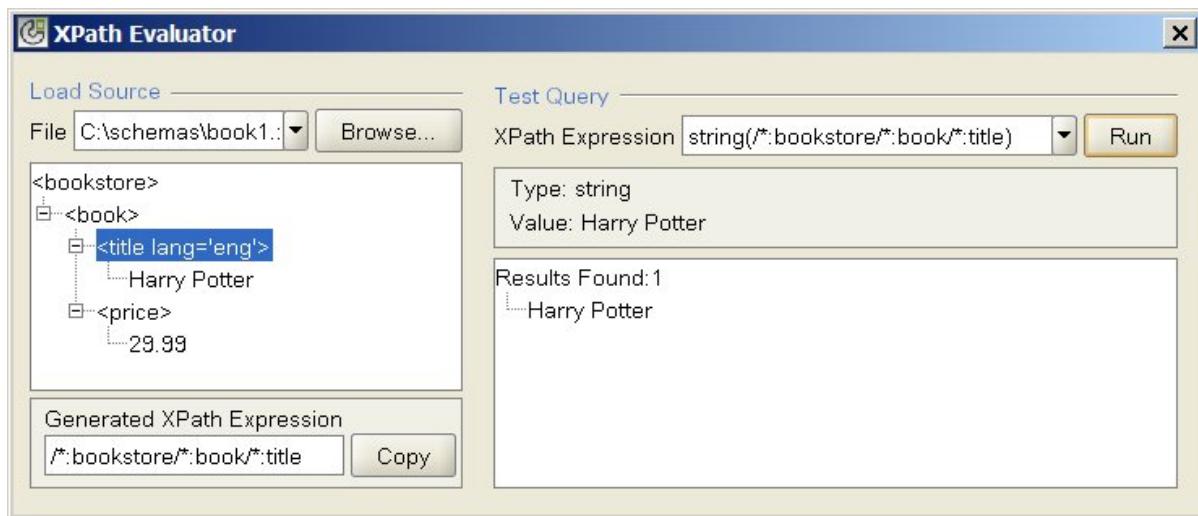

- o **boolean** – the value of the boolean is returned in the Value field as shown in the following figure:

- o **Node Set** – the XML elements that match those displayed in the XPath expression, the Value field is blank, and the number of matching XML elements is reported as shown in the following figure:

- o **string** – the value of the boolean is returned in the Value field as shown in the following figure:

## Create Job Keys Activity

---

The Create Job Keys activity sets the values of job keys dynamically during run time.

### About this task

---

After the orchestration job has run on the Integration Appliance, you can view the values of the job keys in the Jobs detail pane of the Web Management Console (WMC). In addition, you can search for orchestration jobs using the primary key in the WMC. For more information see the WMC online help.

To create and configure a Create Job Keys activity complete the following steps:

## Procedure

---

1. Create a Job Key by using the [Creating Job Keys](#) topic before configuring the Create Job Keys activity.
2. Add the Create Job Keys activity to your orchestration:
  - a. Create an orchestration using the [Creating an orchestration](#) topic, or open an existing orchestration. A graphical representation of the orchestration is displayed.
  - b. Select the Activities tab and expand the Utilities folder.
  - c. Drag the Create Job Keys activity onto the orchestration.
3. Configure the Create Job Keys activity:
  - a. In the Checklist, select Map Inputs.
  - b. You can either set the default value of your job keys or map variables to the job keys, as described in steps 4 and 5.
4. Set a default value for the job keys:
  - a. In the To Activity pane of the Map Outputs task, right-click the job key and select Define Default Value from the list. The Define Default Value dialog box is displayed.
  - b. Enter the required value in the Default Value field.
  - c. Click OK.

During run time, the values of the job keys are set to the values specified in the Default Value field.
5. Map variables to the job keys:
  - a. In the From Orchestration pane, click Add. The Add Variable dialog box is displayed. If any job keys have been created, they are displayed in the To Activity pane.
  - b. Select variables. These variables supply the values of the job keys during run time.
  - c. Click OK.
  - d. Create mappings for each job key. From the From Orchestration pane, drag each variable to the corresponding job key in the To Activity pane.

During run time, the value of the job keys are set to the values of the corresponding variables.

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_Log\\_Keys\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Log_Keys_Activity.html)

## Creating Job Keys

---

You can associate job keys (or identify keys) with a specific orchestration job.

### About this task

---

You create job keys from the Job Identification pane in Studio. To launch the Job Identification pane, select Orchestration > Properties option from the Studio toolbar menu. In the Job Identification pane, define the name and type of the job key. You can also specify one job key as the Primary key.

During run time, a Create Job Keys activity dynamically sets the values of the job keys when an orchestration job runs on the Integration Appliance. After the orchestration job has completed, you can view the values of the job keys from the Web Management Console (WMC). In the WMC, you can also search for the value of a key. All orchestration jobs that contain keys with that value are displayed.

Note: When designing your orchestration, typically it is best to add only one Create Job Keys activity to an orchestration. If the first Create Job Keys activity in an orchestration has a map to the job key, during run time, the second Create Job Keys activity in an orchestration does not reset the value of the job key that was set by first Create Job Keys activity. The action of the second Create Job Keys activity is ignored.

## Procedure

---

1. Create or open an orchestration. See [Creating an orchestration](#) for more information. A graphical representation of the orchestration is displayed.
2. Select Orchestration > Properties to open the Orchestration pane.
3. Click Add. A new key with default values is added to the Keys list.
4. Enter the configuration information for new job keys as described in the following table.

Field / Column	Description
<b>Name (Required)</b>	Specifies the name of the job key
<b>Type (Required)</b>	Specifies the type of the job key
<b>Primary</b>	Specifies that the key is the Primary key. You can only select one key as the Primary key

## What to do next

---

To remove a key, select the key you want to remove and click Remove.

**Parent topic:** [Utilities Activities](#)

---

## Log Message activity

---

You can use the Log Message activity to specify the alert levels and message text, which is displayed in the Integration Appliance orchestration monitoring logs and system logs.

### About this task

---

Use this task to configure the Log Message activity. You can view the Integration Appliance orchestration monitoring logs and system logs from the Web Management Console.

### Procedure

---

1. In the Studio toolbox, click the Activities tab.
2. Expand the Utilities folder contents, and drag the Log Message activity onto the orchestration. The Utilities Log Message Checklist is displayed.
3. In the Checklist, click Summary.
4. Optional Change the description in the Activity Name field.
5. Click Map Inputs. The Map Inputs workspace is displayed. The default parameters: level and message are displayed in the To Activity column.
6. Click Select Inputs. The variables associated with the orchestration are displayed  
*Tip:* If required, you can create a custom mapping variable in Source or Destination column by completing the steps in [Creating Variables](#).
7. Choose a variable, and click OK. The variable and parameters are displayed in the From Orchestration column.
8. To link the activities, drag a variable from the From Orchestration list onto a parameter listed in the To Activity list. If a link can be established, a line connects the two.
9. Repeat this procedure to link other orchestration variables to this activity.

## Schedule Job activity

---

The Schedule Job activity is a starter activity that creates an instance of an orchestration at the specified date and time.

### About this task

---

Use this task to add a Schedule Job activity to an orchestration.

### Procedure

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activity tab and expand the Utilities folder.
3. Drag a Schedule Job activity onto the orchestration.
4. Specify the Schedule setting in the Configure pane as described in the following table:

Option	Description
<b>5 seconds</b>	Specifies the orchestration to run once every five seconds.
<b>10 seconds</b>	Specifies the orchestration to run once every ten seconds.
<b>20 seconds</b>	Specifies the orchestration to run once every twenty seconds.
<b>30 seconds</b>	Specifies the orchestration to run once every thirty seconds.
<b>60 seconds</b>	Specifies the orchestration to run once every sixty seconds.
<b>5 Minutes</b>	Specifies the orchestration to run once every five minutes.
<b>Hour</b>	Specifies the orchestration to run once an hour at the specified time.
<b>Day</b>	Specifies the orchestration to run once a day at the specified time. The time is based on a 24-hour clock in the GMT timezone.
<b>Week</b>	Specifies the orchestration to run once a week on the specified day (Sunday - Saturday) and at the specified time (24-hour clock) based on the GMT timezone.
<b>Month</b>	Specifies the orchestration to run once a month on the specified date (1 - 31) and time (24-hour clock) based on the GMT timezone.
<b>Year</b>	Specifies the orchestration to run once a year on the specified date (month and day) and time (24-hour clock) based on the GMT timezone.

Note: The Schedule Job activity starts the orchestration on the specified time and date based on the GMT timezone. You must adjust the specified time and date for your timezone.

5. To map the output of the activity:
    - a. Select the Map Outputs task in the Checklist. The time output parameter is displayed in the From Activity pane. This is an optional parameter that during run time returns the date and time (in the XML Schema xsd:dateTime data type) that the orchestration started processing.
    - b. If desired, map the time output parameter parameters to variable(s). See [Creating a Map](#) for general instructions on mapping.
- Note: To create an orchestration that starts on two different dates, for example: February 13, 2011 and April 21, 2011. Drop a Pick activity on the orchestration as the starter activity and drop into the Pick branches, two Schedule Job

activities, one that starts on February 13, 2011 and the other on April 21, 2011.

## Configuring an Archive activity

---

### About this task

---

To configure an Archive activity, complete the following steps:

## Procedure

---

1. Select the Configure task from the Checklist. The Configure task is displayed.
2. Select a format type as described in the following table:

Format	Archived?	Compressed?	Description
TAR	Yes	No	Specifies that input files and directories are archived using the tar format before being returned in the archive output parameter as a single value. The returned value is compatible with the archive format produced by the UNIX tar -cf command. This option returns a value that is compatible with a file that ends in the .tar extension.

<b>Format</b>	<b>Archived?</b>	<b>Compressed?</b>	<b>Description</b>
TAR+GZIP	Yes	Yes	Specifies that input files and directories are archived using the tar format and then compressed using the gzip format, before being returned in the archive output parameter as a single value. The returned value is compatible with the archive format produced by the UNIX tar -cf command and the compression format produced by the GNU gzip command. This option returns a value that is compatible with a file that ends in the .tar.gz extension.
ZIP	Yes	Yes	Specifies that input files and directories are compressed and archived using the .zip format before being returned in the archive output parameter as a single value. The returned value is compatible with the compression and archive format produced by proprietary compression products. This option returns a value that is compatible with a file that ends in the .zip extension.
GZIP	No	Yes	Specifies that a single input file is compressed using the gzip format, before being returned in the archive output parameter. The returned value is compatible with the compression format produced by the GNU gzip command. This option returns a value that is compatible with a file that ends in the .gz extension.

## What to do next

# Archive activity map input

---

## About this task

---

To map the input of the Archive activity complete the following steps:

## Procedure

---

1. Select the Map Inputs task in the Checklist. The Map Inputs task is displayed. The archiveEntries input parameter is displayed in the To Activity pane.
2. Map variables to the nodes of the archiveEntries input parameter. See [Creating a Map](#) for general instructions on mapping. The archiveEntries/entry node is a recurring node and each entry represents either a single file or directory in the archive. The nodes of the archiveEntries/entry node are described in the following table:

Node Name	Required	xsd Type	Description
name	Yes	string	Specifies the name of the directory or file to be added to the archive. If the file or directory is located in a sub-directory, the value of the name node must contain the directory path of the file in addition to the file name. For example, to specify the file called file1.txt located in the directory called cat, specify the value: cat/file1.txt.
datetime	No	dateTime	Specifies the creation date and time of the file or directory to be added to the archive.
isdirectory	No	boolean	Specifies if the current entity is a directory or a file: <ul style="list-style-type: none"><li>o true specifies the entity is a directory</li><li>o false specifies the entity is a file</li></ul>
content	No	base64Binary	Specifies the contents of the file or directory.
size	No	decimal	Specifies the size of the file or directory.
userid	No	string	Specifies the user ID of the file or directory.
groupid	No	string	Specifies the group ID of the file or directory.
permissions	No	string	Specifies the permissions of the file or directory.

## What to do next

---

[Map the output](#) of the activity.

**Parent topic:** [Archive activity](#)

---

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/archive\\_activity\\_mapping\\_input.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/archive_activity_mapping_input.html)

## Archive activity map output

---

### About this task

---

To map the output of the activity complete the following steps:

### Procedure

---

1. Select the Map Outputs task in the Checklist. The Map Outputs task is displayed. The archive output parameter is displayed in the From Activity pane. The archive output parameter contains the archived files and directories.
2. Map a variable to the archive output parameter. See [Creating a Map](#) for general instructions on mapping. For example, you could map the archive output parameter to a variable you created called *outdata*. You could then map the *outdata* variable to the data input parameter of the FTP Put File activity. During run time, the FTP Put File activity creates an archive file on an FTP server.

**Parent topic:** [Archive activity](#)

---

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/archive\\_activity\\_mapping\\_output.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/archive_activity_mapping_output.html)

## Unarchive Activity

---

The Unarchive activity extracts the input files and directories from the passed in archive during run time. At run time, the Unarchive activity determines the archive/compression types and unarchives/decompresses the archive appropriately

### About this task

---

The supported unarchive and decompression formats are listed in the following table:

Deco mpr essi on/ Unar chiv e For mats	Description
tar	During run time, if the Unarchive activity determines that the archive type is tar, the passed in archive is extracted into its component parts (files and directories) and passed back from the activity using the archiveEntries output parameter. The extraction done during run time by the Unarchive activity is equivalent to extraction done on the command line using the UNIX tar -xf command.
untar and gunzi p	During run time, if the Unarchive activity determines that the archive type is tar and the compression type is gzip, the passed in archive is first decompressed from the gzip format and then extracted into its component parts (files and directories) and passed back from the activity using the archiveEntries output parameter. The extraction done during run time by the Unarchive activity is equivalent to extraction done on the command line using the UNIX tar -xf command to files that end in the .tar extension. The decompression done during run time by the Unarchive activity is equivalent to the decompression done on the command line using the GNU gunzip command to files that end in the .gz extension.

<b>Decompression/ Unarchive Formats</b>	<b>Description</b>
zip	During run time, if the Unarchive activity determines that the archive/compression type is zip, the passed in archive is decompressed and extracted into its component files and directories, and passed back from the activity using the archiveEntries output parameter. The decompression and extraction done during run time by the Unarchive activity is equivalent to the decompression and extraction done using proprietary compression products to files that end in the .zip extension.
gunzip	During run time, if the Unarchive activity determines that the compression type is gzip, the passed in archive is decompressed from the gzip format and passed back from the activity using the archiveEntries output parameter. The decompression done during run time by the Unarchive activity is equivalent to the decompression done on the command line using the GNU gunzip command to files that end in the .gz extension.

During run time, if the passed in archive format is unsupported, the Unarchive activity produces an ActivityFailedException error and issues the following message:

Invalid or unsupported archive format

During run time, if the passed in archive is incorrectly formed, the Unarchive activity produces an ActivityFailedException error and issues the following message:

Error while reading archive

To add and configure an Unarchive activity in an orchestration complete the steps in the following procedures:Â

- [Adding an Unarchive activity](#)
- [Unarchive activity map input](#)
- [Unarchive activity map output](#)

**Parent topic:** Archives Activities

## Unarchive activity map input

---

### About this task

---

To map the input of the Unarchive activity complete the following steps:

### Procedure

---

1. Select the Map Inputs task in the Checklist. The Map Inputs task is displayed. The archive input parameter is displayed in the To Activity pane.
2. Map variables to the nodes of the archive input parameter. The variable should contain the archive to extract the input files and directories from. See [Creating a Map](#) for general instructions on mapping.

**Parent topic:** [Unarchive Activity](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/unarchive\\_activity\\_mapping\\_input.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/unarchive_activity_mapping_input.html)

## Unarchive activity map output

---

### About this task

---

To map the output of the Unarchive activity complete the following steps:

### Procedure

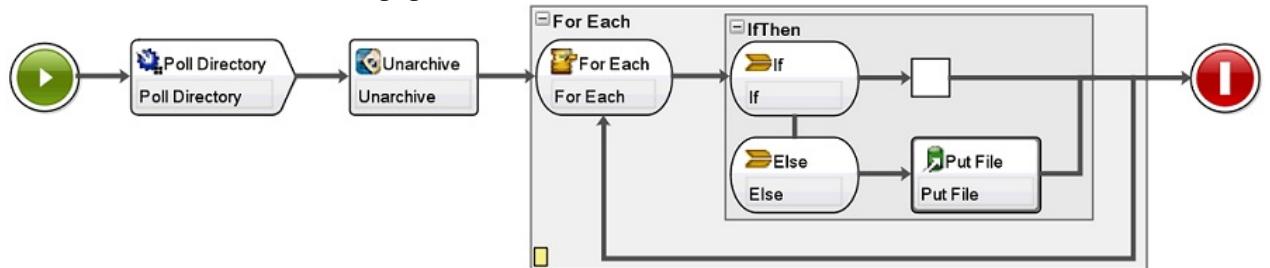

---

1. Select the Map Outputs task in the Checklist. The Map Inputs task is displayed.  
The archiveEntries output parameter is displayed in the From Activity pane. The archiveEntries/entry node is a recurring node and each entry represents either a single file or directory in the archive. The nodes of the archiveEntries/entry node are described in the following table:

Node Name	Required	xsd Type	Description
-----------	----------	----------	-------------

Node Name	Required	xsd Type	Description
name	Yes	string	Specifies the name of the directory or file that was extracted from the archive. If the file or directory is located in a sub-directory the value returned by the name node during run time includes the relative directory path of the file or directory. For example, if the archive contains the file called file1.txt located in the directory called cat, the value: cat\file1.txt is returned.
datetime	No	dateString	Specifies the creation date and time of the file or the directory in the archive.
isdirectory	No	boolean	Specifies if the current entity is a directory or a file: <ul style="list-style-type: none"> <li>◦ true specifies the entity is a directory</li> <li>◦ false specifies the entity is a file</li> </ul>
content	No	base64Binary	Specifies the contents of the file or directory.
size	No	long	Specifies the size of the file or directory.
userid	No	string	Specifies the user ID of the file or directory.
groupid	No	string	Specifies the group ID of the file or directory.
permissions	No	string	Specifies the permissions of the file or directory.

2. Map variables to the archiveEntries output parameter. See [Creating a Map](#) for general instructions on mapping. For example, you could map the archiveEntries output parameter to an *archiveEntries* variable and then add an For Each activity after the Unarchive activity to iterate through the instances of the *archiveEntries* variable. Each instance of the *archiveEntries* variable represents a file or a directory. You could add a If..Then activity to the For Each loop that tests the value of the *isdirectory* node and if the entity is not a directory, place the extracted file on an FTP Server using the FTP Put File activity. This example orchestration is shown in the following figure:

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_cryptoserviceactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_cryptoserviceactivities.html)

## Overview of the PGP activities

---

WebSphere® Cast Iron® Studio supports PGP encryption and decryption. You can import, store, and retrieve keys and certificates that are used for PGP activities.

PGP has its own keystore for managing keys. The keystore location depends on the tool used. The public and the secret key ring of PGP is for cryptography. Cryptoservice uses the PGP keys to encrypt and decrypt content.

Cryptoservice comes with a utility to extract the PGP keys and store the same in the PKCS12 keystore.

For Cast Iron Studio, you must use the command line utility to import the extracted PKCS12 to the Studio keystore.

For the On-Premise Appliance, you must import the extracted PKCS12 to the Appliance keystore from the Web Management Console.

After completing the procedures mentioned above, you can encrypt and decrypt content.

- To encrypt content, you must encode the human readable content to base64, and then pass the base64 content to PGP Encrypt activity. Then, configure the inputs and provide the public key to the activity, which in turn would return the encrypted data.
- To decrypt the content you must pass the encrypted data to the PGP Decrypt activity, and configure the input with the private keys and password. The output is base64. You must decode the base64 data to get the original content.

## Using the PGP Encrypt activity

---

During run time, the PGP Encrypt activity encrypts content. Complete the following steps to add and map inputs and output of the PGP Encrypt activity in an orchestration:

**Parent topic:** [Cryptoservice Activities](#)

### Adding the PGP Encrypt activity

---

#### About this task

To add the PGP Encrypt activity in the orchestration, complete the following steps:

#### Procedure

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the Cryptoservice folder.
3. Drag the PGP Encrypt activity onto the orchestration. The Summary of the activity configuration checklist is displayed.

#### What to do next

Map the inputs of the PGP Encrypt activity.

### Mapping the inputs of the activity

#### About this task

To map the inputs of the PGP Encrypt activity, complete the following steps:

#### Procedure

1. Select the Map Inputs task in the Checklist. The Map Inputs task is displayed. The `cryptoserviceEntry` input parameter is displayed in the To Activity pane.
2. Map the variables to the nodes of the `cryptoserviceEntry` input parameter. The nodes of the `cryptoserviceEntry/entry` node are described in the following table:

Table 1. Nodes of `cryptoserviceEntry`

Node name	Required	xsd Type	Description
content	Yes	base64Binary	Indicates the actual base64Binary content that must be encrypted.
keyhandle	Yes	String	Indicates the name of the GPG key that is used to encrypt the content.
password	Optional	String	Indicates the password that must be used to decrypt keyhandle.
armored	Optional	Boolean	Indicates the value that must be set for ASCII Armored output. The default value is False.

Note: 128-bit encryption level requires an 8-byte key, which must be a 32-character hexadecimal string.

### Mapping the output of the activity

---

#### About this task

To map the output of the activity, complete the following steps:

#### Procedure

1. Select the Map Outputs task in the Checklist. The Map Outputs task is displayed. The PGP Encrypt output parameter is displayed in the From Activity pane. The PGP output parameter contains a variable that stores the encrypted content, which

can be used in the orchestration.

2. Map a variable from the PGP Encrypt output parameter to another variable or activity in the orchestration.

---

[Feedback](#) | [Notices](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PGP\\_Encrypt.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PGP_Encrypt.html)

## Using the PGP Decrypt activity

---

During run time, the PGP Decrypt activity decrypts content received from another activity or variable in the orchestration. Complete the following steps to add and map inputs and output of the PGP Decrypt activity in an orchestration

**Parent topic:** [Cryptoservice Activities](#)

### Adding the PGP Encrypt activity

---

#### About this task

To add the PGP Decrypt activity in the orchestration, complete the following steps:

#### Procedure

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the Cryptoservice folder.
3. Drag the PGP Decrypt activity onto the orchestration. The Summary of the activity configuration checklist is displayed.

#### What to do next

Map the inputs of the PGP Decrypt activity.

### Mapping the inputs of the activity

#### About this task

To map the inputs of the PGP Decrypt activity, complete the following steps:

#### Procedure

1. Select the Map Inputs task in the Checklist. The Map Inputs task is displayed. The `cryptoserviceEntry` input parameter is displayed in the To Activity pane.
2. Map the variables to the nodes of the `cryptoserviceEntry` input parameter. The nodes of the `cryptoserviceEntry/entry` node are described in the following table:

Table 1. Nodes of `cryptoserviceEntry`

Node name	Required	xsd Type	Description
content	Yes	base64Binary	Indicates the actual base64Binary content that must be encrypted.
keyhandle	Yes	String	Indicates the name of the GPG key that is used to encrypt the content.
password	Yes	String	Indicates the password that must be used to decrypt keyhandle.
armored	Optional	Boolean	Indicates the value that must be set for ASCII Armored output. The default value is False.

Note: 128-bit encryption level requires an 8-byte key, which must be a 32-character hexadecimal string.

## What to do next

Map the output of the PGP Decrypt activity.

## Mapping the output of the activity

---

### About this task

To map the output of the activity, complete the following steps:

### Procedure

1. Select the Map Outputs task in the Checklist. The Map Outputs task is displayed. The PGP Decrypt output parameter is displayed in the From Activity pane. The PGP Decrypt output parameter contains a variable that stores the decrypted content, which can be used in the orchestration.
2. Map a variable from the PGP Decrypt output parameter to another variable or activity in the orchestration.

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PGP\\_Decrypt.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PGP_Decrypt.html)

## Importing PGP keys

---

The `commandLine` utility that is discussed in this topic, extracts the private and public keys from the secure and public ring files, from the PGP/GPG keystore.

### Procedure

To extract the keys from the PGP/GPG keystore, the `commandLine` utility uses the following parameters:

1. `commandLine` utility accepts the following parameters to extract the private and public keys:

```
extractPKCS12AndPublicKey.bat -privateKeyRingFile <file name of the secret key ring file> -  
publicKeyRingFileName <file name of the pub key ring file> -passphrase <password for the gpg  
keys> -keyStoreLocation <keyStore Location> -keyStorePassword <keystore password> -  
privateCertificateName <private certificate name> -issuerName <name of the certificate issuer> -  
certificateStartDate <start date> -certificateExpiryDate <end date> -algorithmName  
SHA256withRSA
```

For example:

```
extractPKCS12AndPublicKey.bat -privateKeyRingFile C:\Users\IBM_ADMIN\Documents\gpg\secring.gpg  
-publicKeyRingFile C:\Users\IBM_ADMIN\Documents\gpg\pubring.gpg -passphrase castiron -  
keyStoreLocation C:\mykeystore.p12 -keyStorePassword changeit -privateCertificateName myKey -  
issuerName "C=US, ST=CA, L=Mountain View, O=Cast Iron Systems, CN=Cast Iron Appliance  
VMWSULXJE23SK6HO" -certificateStartDate 01-01-2013 -certificateExpiryDate 01-01-2015 -algorithm  
SHA256withRSA
```

2. `commandLine` utility accepts the following parameters to import the private and public keys to a Studio keystore file:

```
importPKCS12IntoJKS.bat -privateCertificateName <private certificate name> -  
pkcsKeyStoreLocation < PKCS12 keystore store that we created in step1 > -pkcsKeyStorePassword  
< password for the keystore>
```

For example:

```
importPKCS12IntoJKS.bat -privateCertificateName myKey -pkcsKeyStoreLocation C:\mykeystore.p12 -  
pkcsKeyStorePassword changeit
```

Note: Step 2 is not required for the appliance. You can import the generated PKCS12 keystore to the appliance through the Security menu on the Web Management Console dashboard. For more information about importing certificates, see Cast

## Troubleshooting and support

---

Troubleshooting techniques and self-help information help you identify and solve problems quickly. This topic provides potential solutions for issues you would have with the Cryptographic activities.

### **OutOfMemoryError exception thrown**

---

**Problem:** The following exception is thrown when you use the PGP Encrypt activity, for FTP transfer of .zip file or a .tar.gz file:

Internal error: java.lang.OutOfMemoryError: Java heap space (data size is over 10MB)

**Cause:** Insufficient default heap allocation when starting Cast Iron Studio.

**Solution:** Increase the heap allocation when starting Cast Iron Studio, by giving the following command: CastIronStudio.exe -J-Xmx1024m.

## Data Quality Activities

---

- [About Data Quality Activities](#)

Use the Data Quality activities in Studio to migrate or load data into a new system and/or synchronize data between existing systems.

- [Filter and Profile Activity](#)

This activity filters data based on the Boolean expression you create and generates a profile summary of the cleansed data.

- [Creating Profile Summaries](#)

Use the Profile Summaries pane to specify parameters that determine the data that the Integration Appliance profiles.

- [Filtering Expressions](#)

A filter expression is an XPath query that specifies conditions (boolean expressions) that the Integration Appliance uses to route data to different outputs. You can create a filter expression using the Filter and Profile activity.

- [Lookup Activity](#)

Use the Lookup Activity to retrieve rows of data from a selected database endpoint and use values from those rows to replace or add values to the current recurring element, based on an exact or approximate match of values from the current recurring element that is used as a key to perform the lookup.

- [Sort Activity](#)

This activity allows you to sort inputs.

- [Merge Activity](#)

Use the Merge activity allows to join two sorted inputs. Both the left and right inputs must be sorted on a specified sort key

before you can merge or join inputs. You must specify at least one sort key for both the left and right inputs. The Merge activity resolves any duplicates.

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_dataqualityactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_dataqualityactivities.html)

## About Data Quality Activities

---

Use the Data Quality activities in Studio to migrate or load data into a new system and/or synchronize data between existing systems.

From the Activities tab in the Studio toolbox, select the Data Quality directory. The Data Quality activities include:

- Filter and Profile — Filters data based on the Boolean expression you create and generates a profile summary of the cleansed data.
- Lookup — Retrieves rows of data from the database endpoint, which you select.
- Sort — Sorts the inputs based on sort keys you specify.
- Merge — Joins two sorted inputs.

The Integration Appliance has a Local Staging Database where you can stage the data. The Local Staging Database can be used to share data between jobs to facilitate an iterative data cleansing process. You can view and edit data in the Local Staging Database through the Web Management Console (WMC).

From the WMC, you can complete the following operations against the Local Staging Database:

- Start and Stop the database server
- Connect to the Local Staging Database
- Create tables
- Drop tables
- View tables and sort by columns
- Add rows
- Delete rows

For more information about performing these operations, see the WMC Online Help.

## Configuring the Filter and Profile activity

---

### About this task

---

To configure the Filter and Profile activity complete the following steps:

### Procedure

---

1. In the Activities tab, open the Data Quality directory to find the Filter and A Profile activity.
2. Add the activity to an orchestration. The Checklist and Summary for the activity are displayed beneath the orchestration.
3. From the Checklist, select Configure and specify the following information:
  - a. The variable name of the variable that contains the recurring element, which the activity loops through.
  - b. The element name of the recurring element in the variable, which the activity loops through.

Click the browse button to open the Select Recurring Element window, where you can view all the elements in the variable you selected. A
4. From the Checklist, select Filter Expression and [create](#) an expression that the Integration Appliance uses to filter data.  
Note: The Integration Appliance can only create a profile for data that passes the filter expression. To profile all data, complete one of the following tasks:
  - o Click Advanced and enter the following expression: `true()`
- OR
- o Enter the expression: `1 = 1`
5. From the Checklist, select Profile Summary to [define](#) parameters for the data you want to summarize.
6. Map the [output](#) of the activity.

## Creating Profile Summaries

---

Use the Profile Summaries pane to specify parameters that determine the data that the Integration Appliance profiles.

### About this task

---

To create a profile summary complete the following steps:

### Procedure

---

1. In the Activities tab, open the Data Quality directory to find the Filter andÂ Profile activity.
2. Add the activity to an orchestration. The Checklist and Summary for the activity are displayed beneath the orchestration.
3. From the Checklist, select Profile Summary. The Profiles Summaries pane is displayed.
4. Click Add.
5. Specify values for the following parameters:

Profile Summary Parameter	Description
XPath	The XPath expression, relative to the recurring element you selected, that specifies the data to profile
Name	The name of the profile. The default is the XPath expression you selected.
Datatype	<p>Specifies the data type as either text or number. By default, the data type is text.</p> <p>For a numeric data type, the following general statistics are generated: min, max, mean, count, sum, standardDeviation, variance.</p> <p>For a text data type, the following general statistics are generated: min, max.</p> <p>For both data types, histograms can be generated to show frequency counts for specific values or value ranges.</p>
Histogram?	Specifies whether or not to generate a histogram. The default is <code>false</code> and a histogram is not generated. To generate a histogram, select the Histogram? field and select Generate Histogram. The value <code>true</code> is displayed in the field.
Max. Bins	Specifies the maximum number of bins for the histogram. Important: Only specify a value for this parameter if the datatype is specified as number. The default value is 0, indicating that no maximum exists.
Max. Values	Specifies the maximum number of values to use for the histogram. The default value is 0, indicating that no maximum exists.
Min. Freq.	Specifies the minimum frequency for values to be included in the histogram. This is a number between 0-1, indicating the ratio of the number of occurrences of a given value to all values. The default is 0.0
Chart	<p>Generates a PDF of the chart type you specify:</p> <ul style="list-style-type: none"><li>o bar</li><li>o pie</li><li>o none</li></ul> <p>By default, the Integration Appliance does not generate a chart.</p>

## Filtering Expressions

---

A filter expression is an XPath query that specifies conditions (boolean expressions) that the Integration Appliance uses to route data to different outputs. You can create a filter expression using the Filter and Profile activity.

### About this task

---

Use the Studio Builder tool to:

- Create a filter expression
- Add conditions
- Delete conditions
- Edit conditions
- Specify the processing order of conditions
- [Creating a filter expression](#)
- [Adding a filter expression condition](#)
- [Deleting a filter expression condition](#)
- [Editing a filter expression condition](#)
- [Changing the processing order of filter expression conditions](#)

**Parent topic:** [Data Quality Activities](#)

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/filtering\\_expressions.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/filtering_expressions.html)

## Creating a filter expression

---

### About this task

---

To use the Builder to create a filter expression complete the following steps:

### Procedure

---

1. In the orchestration, select the Filter and Profile activity to open the Checklist.
2. In the Checklist, select Filter Expression. The Builder is displayed in the Filter Expression pane.
3. Click the Left Hand Expression field to enter a parameter or click (...) for the elements of a selected variable to be displayed.  
Click (B) to select a new variable.
4. Click the Op list to select an operator for the condition.

For a complete list of operators that you can use in the Builder, see [Valid Operators for Conditions](#)

5. Click the Right Hand Expression field to enter a parameter or click (...) for the elements of a selected variable to be displayed.  
Click (B) to select a new variable.

## Adding a filter expression condition

---

### About this task

To add a condition complete the following steps:

### Procedure

1. Click Add. Fields for a new condition are displayed. By default, the new condition is inclusive, using AND logic.
2. Optional: In the first column, select OR from the list to use OR logic.
3. Specify the Left Hand Expression.
4. Specify the operator for the condition
5. Specify the Right Hand Expression.

# Lookup Activity

---

Use the Lookup Activity to retrieve rows of data from a selected database endpoint and use values from those rows to replace or add values to the current recurring element, based on an exact or approximate match of values from the current recurring element that is used as a key to perform the lookup.

To use the fuzzy lookup capability, you must use the Local Staging Database on the Integration Appliance. For non-fuzzy lookups, you can use any database endpoint that Studio supports.

Note: When the Lookup activity is run from Studio, lookup results are not cached.

Lookup activity requires a parameterized SQL query, an XPath query that indicates the recurring element, and an XPath query that indicates which value to use as the key for the lookup. A set of lookup values specifies how column values from the database result set should be mapped to elements or attributes of the current context node.

To complete a fuzzy lookup and approximately match the key, the Lookup activity uses the edit distance algorithm.

For example:

In the following table Names you want to perform a query on the last name Stark. The database contains the following records:

FirstName	LastName
Tony	Stark
Bruno	Star
Georgia	States
Howard	Stark

Issue the following query: `select * from Names where Col_LastName='Stark'`

In this example, the `key_length = length('Stark')` = 5

For comparing against the threshold, use the value `(1 - (edit_distance / key_length))`

The edit distance is `edit_distance('Stark', 'Stark')` = 0 and `edit_distance('Stark', 'Star')` = 1

- To pick up only Stark use threshold `(1 - (0/5)) = 1`
- To pick up both Stark and Star, but not States use threshold `(1 - (1/5)) = 0.8`
- [Using the Lookup activity](#)
- [Mapping Lookup activity outputs](#)

**Parent topic:** [Data Quality Activities](#)

---

[Feedback](#) | [Notices](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/lookup\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/lookup_activity.html)

## Using the Lookup activity

---

### About this task

To use the Lookup activity complete the following steps:

### Procedure

1. In the Activities tab, open the Data Quality directory to find the Lookup activity.
2. Add the activity to an orchestration. The Checklist and Summary for the activity are displayed beneath the orchestration.
3. In the Checklist, select Pick Endpoint and select a database endpoint. For instructions on creating or editing a database endpoint, see [Creating or Editing a Database Activity Endpoint](#)  
Note: To complete a fuzzy lookup you must select the Local Staging Database. To access the Local Staging Database:
  - a. From the Database Type list, select Local. Staging opens in the Database Name field.
  - b. In the Network Location Server field, specify the data IP address of the Integration Appliance, where the Local Staging Database is started. The Port is fixed at 1526.
  - c. Enter a User Name and Password.  
Important: This login information must be for a user with Administrator or Publisher privileges on the Integration Appliance.
  - d. Specify any additional parameters. For more details about the database parameters. see [Creating or Editing a Database Activity Endpoint](#).
  - e. Click OK. The Database endpoint is displayed in the Endpoints directory of the Studio toolbox.
4. From the Checklist, select Configure and specify the following information:
  - a. The variable name of the variable that contains the recurring element, which the activity loops through.
  - b. The element name of the recurring element in the variable, which the activity loops through.

Click the browse button ( ...) to open the Select Recurring Element window, where you can view all the elements in the variable you selected.

5. In the Checklist, select Enter Query

a. Specify the query for the lookup table.

- For fuzzy lookups, you must specify exactly one parameter.
- For non-fuzzy lookups, you can specify one or more parameters.

b. From the Encoding list, select the encoding type.

c. Click Validate Query

Note: If using a Local database endpoint, you must start the Local Staging Database on the Integration Appliance before you can view columns or validate queries. To start the Local Staging Database, in the Web Management Console (WMC), select Staging > Staging Database Start/Stop.

d. Click View Columns and select a table to view detailed column information for the table you select. The Hide Buffer and Control Table option is the default selection.

6. In the Checklist, select Setup Input Parameters. The query you entered in the previous step is displayed.

Specify the input XPath for each input parameter in the XPath column. The input XPath is an XPath expression that is relative to the recurring element which specifies the lookup key value that the query uses.

7. In the Checklist, select Setup Result Set.

a. Specify the output XPath for each row in the result set. The output XPath specifies the element or attribute relative to the recurring element that will hold the output value. Â

b. Use the at-sign ( @ ) at the beginning of the XPath expression to specify an attribute.

- If the name of the element or attribute already exists, Studio replaces the existing value. Otherwise, Studio creates a new named element or attribute.
- If the lookup fails to find a match, the row is sent to the badXML element.

8. In the Checklist, select Delivery Rules and specify the following delivery rules:

Delivery Rule	Description
Activity Timeout	Specifies in seconds the length of time that the Integration Appliance waits for the endpoint to respond. The default setting is 300 seconds.
Fuzzy lookup	Determines if the lookup is fuzzy. Select this option to perform a fuzzy lookup. Important: You can only perform a fuzzy lookup against a Local Database Endpoint. Note: Before you run the orchestration, use the Database Asset generation tool, in the WMC, to create an index table.
Output at most __ match(es) per fuzzy Â lookup	Specifies the maximum number of matches to output per fuzzy lookup.
The similarity threshold __ for a fuzzy lookup	Specifies the similarity threshold Â for determining a match during a fuzzy lookup (between 0 - 1). Â 1 = an exact match.
Ignore case (for fuzzy lookup only)	Select for your lookup to be case-insensitive.
Ignore leading and trailing white spaces	When selected, the Lookup activity ignores any white space that occurs before and after the data. For non-fuzzy lookups, you can only apply this option to the input value. For fuzzy lookups, you can apply this option to both the input value and the lookup table key.
Preload cache	Select this option to preload the lookup cache.
Cache at most __ lookup results	Specifies the maximum number of lookup results to cache.

## What to do next

Map the [output](#) of the activity.

## Sort Activity

---

This activity allows you to sort inputs.

### About this task

---

Important: Use the Sort activity to sort data before attempting to merge data with the Merge activity.

To sort inputs complete the following steps:

### Procedure

---

1. In the Activities tab, open the Data Quality directory to find the Sort activity.
2. Add the activity to an orchestration. The Checklist and Summary for the activity show beneath the orchestration.
3. From the Checklist, select Configure and specify the following information:
  - a. The variable name of the variable that contains the recurring element, which the activity loops through.
  - b. The element name of the recurring element in the variable, which the activity loops through. Click the browse button ( ...) to open the Select Recurring Element window, where you can view all the elements in the variable you selected.
4. From the Checklist, select Sort Properties and specify the following information:
  - a. Optional: Select Remove Duplicates, so that the activity sends duplicates to the remainderXml element.
  - b. Click Add. A new row is displayed in the Sort Keys table.
  - c. In the XPath column, specify the recurring element.
  - d. Select the Sort Type field and from the list. Choose either ascending or descending sort order for the list. The default sort type is ascending.
  - e. Select the Datatype field and from the list, choose either the text or number data type. The default data type is text.
  - f. Optional: Select the Ignore Case option. If you select this option, the case of the data is ignored during the sort process.
  - g. Optional: Select the Ignore Leading and Trailing Whitespace option. By default, the sort process reads any white space around data. If you select this option, the activity ignores white spaces that can affect the sort results.
5. In the Checklist, select Map Outputs. The following elements are displayed in the From Activity pane: sortedXml and remainderXml.

- a. Click Select Outputs... and select the output variables for the map. For instructions about creating variables, see [Creating variables](#).
- b. As appropriate, map the output parameters to the variables. For mapping instructions, see [Creating a map](#).

[Feedback](#) | [Notices](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/sort\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/sort_activity.html)

## Merge Activity

Use the Merge activity allows to join two sorted inputs. Both the left and right inputs must be sorted on a specified sort key before you can merge or join inputs. You must specify at least one sort key for both the left and right inputs. The Merge activity resolves any duplicates.

Use an XPath query to specify the recurring element for each input. There are six types of merges:

Merge Type	Description
Merge and remove duplicates	Removes the duplicates that occur in both the left and right inputs. Studio sends any duplicates to the RemainderXML element.
Merge and keep left duplicates	Sends duplicates from the left input to the RemainderXML element.
Merge and keep all duplicates	Keeps duplicates from both inputs.
Inner join	Joins inputs on the specified keys. Any row that does not participate in the join is sent to the RemainderXML element.
Left outer join	Joins the inputs on the specified keys. Rows from the left input are kept in the merged output even if they do not participate in the join. Studio sends any rows from the right input that do not participate in the join to the RemainderXML element.
Full outer join	Joins the inputs on the specified keys. Rows that are not involved with the join are kept in the merged output.

Merge Examples:

Table 1 are the Left and Right inputs for this example. Table 2 are the expected results for each type of merge operation that the Merge activity supports.

In the following example, x is the key variable. Studio sends entries that are merged or joined to the mergeXML element and sends any entries that do not participate in a merge or join to the RemainderXML element.

Table 1. Left and Right Inputs

Left Inputs	Right Inputs
<pre>&lt;entries&gt; &lt;entry x="1" y="10"/&gt; &lt;entry x="2" y="20"/&gt; &lt;entry x="2" y="21"/&gt; &lt;entry x="3" y="30"/&gt; &lt;/entries&gt;</pre>	<pre>&lt;entries&gt; &lt;entry x="0" z="0"/&gt; &lt;entry x="2" z="22"/&gt; &lt;entry x="2" z="23"/&gt; &lt;entry x="4" z="40"/&gt; &lt;/entries&gt;</pre>

Table 2. Merge Results for Each Merge Type

Merge Type	Merge Results
------------	---------------

Merge Type	Merge Results
Merge Â and remove duplicates	<pre>&lt;entries&gt; &lt;entry x="0" z="00"&gt; &lt;entry x="1" y="10"&gt; &lt;entry x="3" y="30"&gt; &lt;entry x="4" z="40"&gt; &lt;/entries&gt;</pre>
Merge and keep left duplicates	<pre>&lt;entries&gt; &lt;entry x="0" z="00"&gt; &lt;entry x="1" y="10"&gt; &lt;entry x="2" y="20"&gt; &lt;entry x="2" y="21"&gt; &lt;entry x="3" y="30"&gt; &lt;entry x="4" z="40"&gt; &lt;/entries&gt;</pre>
Merge and keep all duplicates	<pre>&lt;entries&gt; &lt;entry x="0" z="00"&gt; &lt;entry x="1" y="10"&gt; &lt;entry x="2" y="20"&gt; &lt;entry x="2" y="21"&gt; &lt;entry x="2" z="22"&gt; &lt;entry x="2" y="23"&gt; &lt;entry x="3" y="30"&gt; &lt;entry x="4" z="40"&gt; &lt;/entries&gt;</pre>
Inner join	<pre>&lt;entries&gt; &lt;entry x="2" y="20" z="22"&gt; &lt;entry x="2" y="20" z="23"&gt; &lt;entry x="2" y="21" z="22"&gt; &lt;entry x="2" y="21" z="23"&gt; &lt;/entries&gt;</pre>
Left outer join	<pre>&lt;entries&gt; &lt;entry x="1" y="10"&gt; &lt;entry x="2" y="20" z="22"&gt; &lt;entry x="2" y="20" z="23"&gt; &lt;entry x="2" y="21" z="22"&gt; &lt;entry x="2" y="21" z="23"&gt; &lt;entry x="3" y="30"&gt; &lt;/entries&gt;</pre>
Full outer join	<pre>&lt;entries&gt; &lt;entry x="0" z="00"&gt; &lt;entry x="1" y="10"&gt; &lt;entry x="2" y="20" z="22"&gt; &lt;entry x="2" y="20" z="23"&gt; &lt;entry x="2" y="21" z="22"&gt; &lt;entry x="2" y="21" z="23"&gt; &lt;entry x="3" y="30"&gt; &lt;entry x="4" z="40"&gt; &lt;/entries&gt;</pre>

- Merging two sorted inputs

**Parent topic:** Data Quality Activities

[Feedback | Notices](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/merge\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/merge_activity.html)

## Merging two sorted inputs

## About this task

---

To merge two sorted inputs complete the following steps:

### Procedure

---

1. In the Activities tab, open the Data Quality directory to find the Merge activity.
2. Add the activity to an orchestration. The Checklist and Summary for the activity are displayed beneath the orchestration.
3. From the Checklist, select Configure and specify the following information:
  - a. The variable name of the left variable that contains the recurring element, which the activity loops through.
  - b. The element name of the recurring element in the left variable, which the activity loops through. Click the browse button (...) to open the Select Recurring Element window, where you can view all the elements in the variable you selected. Â
  - c. The variable name of the right variable that contains the recurring element, which the activity loops through.
  - d. The element name of the recurring element in the right variable, which the activity loops through. Click the browse button (...) to open the Select Recurring Element window, where you can view all the elements in the variable you selected. Â
4. From the Checklist, select Merge Properties and specify the following information:
  - a. Select a [merge type](#) for the list.
  - b. In the Left Sort Key section, click Add. A new row is displayed in the Sort Keys table.
  - c. In the XPath column, specify the recurring element.
  - d. Select the Sort Type field and from the list. Choose either the ascending or descending to sort the list. The default sort type is ascending.
  - e. Select the Datatype field and from the list, choose either the text or number data type. The default data type is text.
  - f. Repeat steps (b - e) for the Right Sort Keys.
  - g. Optional: Select the Ignore Case option. If you select this option, the case of the data is ignored during the merge process.
  - h. Optional: Select the Ignore Leading and Trailing Whitespace option. By default, the merge process reads any white space around data. If you select this option, the activity ignores white spaces that can affect the merge results.
5. In the Checklist, select Map Outputs. The following elements are displayed in the From Activity pane: mergedXml and remainderXml.
  - a. Click Select Outputs... and select the output variables for the map. For instructions about creating variables, see [Creating variables](#).
  - b. As appropriate, map the output parameters to the variables. For mapping instructions, see [Creating a map](#).

## Database Activities

---

- [Creating or Editing a Database Activity Endpoint](#)  
Endpoints provide the database connection information that Studio and the Integration Appliance use to connect to a database. Â
- [Browsing Database Tables](#)  
Use the Browse Database Tables dialog box to dynamically select a table from the current list of tables in the database specified by the Endpoint.
- [Character Encodings](#)  
Set the character encoding at the database level, the table level, or the column or parameter level.
- [Database Entities and Activities](#)
- [Defining Columns for Old Values in Updates](#)
- [MaxPooledStatements Parameter](#)  
The MaxPooledStatements parameter is automatically defined and set with a default value for all types of Database Endpoints.
- [Oracle, Sybase, DB2, and Informix Parameters](#)  
In the Additional Parameters table of the Database Endpoint, define the connection parameters for Oracle, Sybase, DB2Â®, or

Informix® databases.

- [Retry Options For Inbound Database Activities](#)

Â This section contains the procedure for configuring the retry options for the following inbound database activities: **Get Inserted Rows** activity, **Get Updated Rows** activity, **Get Deleted Rows** activity, and **Poll Table** activity.

- [Retry Options For Outbound Database Activities](#)

This section contains the procedure for configuring the retry options for the following outbound database activities: **Execute Query** activity, **Insert Rows** activity, **Update Rows** activity, **Delete Rows** activity, and **Call Procedure** activity

- [SequeLink Parameters](#)

- [Single-Table Inbound Database Activities](#)

During run time, single-table inbound database activities poll if a database operation has occurred on any rows in the specified columns of a database table at the specified time interval.

- [Single-Table Outbound Database Activities](#)

This section contains the procedures for configuring the following single-table outbound database activities.

- [Specifying Delivery Rules for Database Activities](#)

Specify how messages will be delivered at the Delivery Rules pane.

- [Viewing Column Details](#)

The View Column dialog box allows you to see detailed column information for tables as you enter a SQL statement in the **Enter Query** task of the **Checklist** for the **Execute Query** activity. This task describes how to access the View Column Details dialog box.

- [Working with Database Parameters](#)

Parameters supply database-specific connection information for an endpoint.

- [Call Procedure Activity](#)

During run time, the Call Procedure activity runs a stored procedure in a database. The stored procedure must be written and installed in the database before you can complete the configuration of the Call Procedure activity in Studio.

- [Execute Query Activity](#)

During run time, the Execute Query activity runs a select SQL statement.

- [Poll Table Activity](#)

The Poll Table activity checks if a database operation (insert or update) has occurred on any rows of a database table by checking the status of a special flag column at the specified time interval.

- [Testing an SSL Database Connection](#)

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_databasesactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_databasesactivities.html)

## Creating or Editing a Database Activity Endpoint

---

Endpoints provide the database connection information that Studio and the Integration Appliance use to connect to a database. Â

### Select or edit a database endpoint

---

1. In the Create Endpoint or Edit Endpoint pane, configure the fields as described in the following tables.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

2. Click Test Connection to confirm that you can connect to the database. Click OK.

### Database options

---

Table 1. Database options

Field	Description
-------	-------------

Field	Description
Database Type	<p>Specifies the database type. If you select the Generic JDBC driver or MySQL, you must install the module providers into Studio. To add JDBC drivers into Studio, you add them to the Web Management console and then complete the following steps in the WMC.</p> <ol style="list-style-type: none"> <li>1. Go to Settings.</li> <li>2. Select Design.</li> <li>3. Select Libraries Environment and set it to the environment that you loaded the compressed files into.</li> <li>4. Restart Studio.</li> </ol> <p>Note: For JDBC drivers to access database endpoints for Cast Iron® Generic JDBC support, the JDBC driver must be:</p> <ul style="list-style-type: none"> <li>• Type 4.</li> <li>• Must implement the JDBC 2.0 or greater specification.</li> <li>• Must provide support for the DataSource feature API.</li> </ul> <p>Additional Parameters may be required for a Generic JDBC Driver. You should check the documentation for the driver you intend to use to see if any additional parameters are required.</p> <p>For more information about installing the JDBC libraries into the WMC, see the WMC Online help.</p>
Database Name	Specifies the name of the Database to which you want to connect. If connecting to Oracle RAC, see <a href="#">For Oracle RAC</a> . Note: For AS/400 DB2® databases, this is the collection name defined during installation.
Network Location: Server	Specifies the name or IP address of the machine where the database server resides. For Informix®, log into the Informix Server Administrator and select the Configuration > SQLHOST menu option to find the hostname. For Sequelink, enter the name or the IP address of the Sequelink server.
Network Location: Port	Specifies the port number of the database server listener. For Sequelink, enter the port number of the Sequelink server listener.
User Name	Specifies the username that the Integration Appliance uses to connect to the database. Note: For DB2, the user must have the permissions to create a package.
Password	Specifies the password associated with the specified username.
Additional Parameters	Specifies the database-specific information for an endpoint. See <a href="#">Working with Database Parameters</a> for details. By default, the MaxPooledStatements parameter is automatically defined and set with a default value for all types of Database Endpoints.

Note: For some of the fields in the endpoint, you can define configuration properties to supply the values for these fields.  The

icon displays when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.

## For Informix Databases

### To find the port number for an Informix database:

1. In an editor, open the following file: \$INFORMIXSERVER/etc/sqlhosts
2. Note the `servicename` found in the SERVER column.
3. In an editor, open the appropriate file for your system:
  - UNIX - /etc/services
  - Windows - \Winnt\system32\drivers\etc\services
4. In the file, search for the `servicename` to find the associated port number.

## For DB2 AS/400 Databases

For some EBCDIC-US columns on DB2 AS/400, Studio cannot determine the correct size and type.

### To pass an EBCDIC-US encoded parameter:

1. In Studio, open the orchestration containing a Database Connector activity.
2. Change CHAR type columns to VARBINARY type. The EBCDIC-encoded columns display as CHAR type columns in the data type of the outbound connector.

3. Use a map before the Database Connector to pad an EBCDIC-encoded parameter with spaces, so that the value of the parameter equals the length of the column.

For example, if the column length is 10 and the value is "abc", pad the column with 7 spaces.

If the EBCDIC-encoded value is not padded with spaces, the Database Connector pads the value with NULL. This can create inconsistent data and errors can occur.

#### To read an EBCDIC-US encoded column from a result set:

1. In Studio, open the orchestration containing the Database Connector Parameterized Query operation.

When you use a parameterized query to select an EBCDIC-encoded column from a database, the Database Connector returns values padded with spaces if the value is shorter than the column length.

For example, if the column length is 10 and the value is "abc", the Database Connector pads the column with 7 spaces.

2. Create a map after the Parameterized Query operation to trim the padded spaces from the XML result set.

## For Oracle RAC:

---

IBM Cast Iron supports additional properties in the connection string that enable Oracle RAC connectivity. Use the following additional Â propertiesÂ to connect with Oracle RAC:

1. `AlternateServers=(servername1[:port1]  
[;property=value[;...]],  
servername2[:port2]  
[;property=value[;...]],...)`

Where:

*servername* is the IP address of the server

*port* is the port number of the server

*property=value* enter the ServiceName which is used as the Database Name. Entering a SID is optional.

2. `LoadBalancing=true|false`

Determines whether the driver will use client load balancing in its attempts to connect to a list of database servers, primary and alternate. The list of alternate servers is specified by the `AlternateServers` property. If set to true, client load balancing is used and the driver attempts to connect to the list of database servers, primary and alternate servers, in a random order. If set to false (the default), client load balancing is not used and the driver connects to each server based on their sequential order (primary server first, then, alternate servers in the order they are specified).

3. Use the service name in the Database Name of the end-point.

## Connection Pool, Encoding, TimeOut, and Security Options

---

Default values are provided for the connection pool options. Change them as needed.

Table 2.

Field	Description
Connection Pool Options	Â
Initial Pool Size	Specifies the initial number of database connections that the Integration Appliance opens and places in the connection pool.
Minimum Connections	Specifies the number of database connections that the Integration Appliance always keeps open in the connection pool. Specifying 0 is supported.
Maximum Connections	Specifies the maximum number of database connections that the Integration Appliance can have open in the connection pool. Specifying 0 means the number of connections is unbounded.

Field	Description
Maximum Idle Time	Specifies the amount of time (in minutes) that a database connection can be open and idle before being closed by the Integration Appliance. Specifying 0 means that the connections are closed when they are returned to the pool - no idle time.
Reclaim Connections	<p>Specifies how often the Integration Appliance checks the connection pool to determine if any connections should be closed. For example, if the Reclaim Connections is set to 6 minutes, the Integration Appliance checks the connection pool every six minutes to determine if the total number of open connections in the pool are greater than the minimum number of connections. If the number of open connections are greater than the specified minimum number, the Integration Appliance closes any excess connections (over the number of Minimum Connections) for any connections that have exceeded the Maximum Idle Time.</p> <p>For example, the Minimum Connections is set to 2, Maximum Connections is set to 6, the Reclaim Connections is 6 minutes, and the Maximum Idle Time set to 2 minutes. A total of five connections are currently open in the connection pool. When the Reclaim Connections of 6 minutes is reached, the Integration Appliance checks the connection pool and determines that one connection has been idle for 3 minutes, one connection has been idle for 4 minutes, and three connections are still active. The Integration Appliance closes the two idle connections. After another 6 minutes, the Integration Appliance checks the connection pool again.</p>
Default Encoding	Â
Encoding Â	<p>Specifies the default character Encoding to use when connection to this database. To set the encoding type, choose from one of the following options:</p> <ul style="list-style-type: none"> <li>• From the Encoding drop-down list, select a default encoding type. Â</li> <li>• Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.</li> </ul> <p>Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see <a href="#">Using the Shift-JIS encoding</a>.</p>
Quoted Identifiers	Â
Delimit the identifiers for tables, columns, and objects with quotes	Specifies if quotes are used around the identifiers for database tables, columns, and objects in the generated SQL statements that the Integration Appliance and Studio uses to communicate with the database. Quoting an identifier makes the identifier case-sensitive. For example, the identifier string: myTable could refer to table named mytable or MYTABLE but the identifier string with quotes: "myTable" only refers to a table named myTable. Quoting an identifier also allows characters not normally found in database names such as spaces.
Security	Â
Enable Encryption	Specifies that the connection should use SSL.
Validate Server Certificate	Specifies that the client should validate the database server certificate. See <a href="#">Testing an SSL Database Connection</a> .
Require Client Authentication	Specifies that the client present a certificate to the database server.
Connection Timeout	Â

Field	Description
Time out after ___ second(s) when establishing a connection to the Endpoint.	<p>Specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. For a database activity, the amount of time the Integration Appliance attempts to establish a connection to the database before timing out. A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the Endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an Endpoint and the time it takes the Endpoint to respond. You set the activity timeout in <b>Retry</b> task of any of the following database activities:</p> <ul style="list-style-type: none"> <li>• Execute Query Activity, see <a href="#">Execute Query Activity</a>.</li> <li>• Single-Table Inbound Database Activities, see <a href="#">Single-Table Inbound Database Activities</a>.</li> <li>• Single-Table Outbound Database Activities, see <a href="#">Single-Table Outbound Database Activities</a>.</li> <li>• Poll Table Activity Call, see <a href="#">Poll Table Activity</a>.</li> <li>• Procedure Activity, see <a href="#">Call Procedure Activity</a>.</li> </ul>

**Parent topic:** [Database Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db\\_creating\\_editing\\_a\\_database\\_activity\\_endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db_creating_editing_a_database_activity_endpoint.html)

## Browsing Database Tables

Use the Browse Database Tables dialog box to dynamically select a table from the current list of tables in the database specified by the Endpoint.

Studio connects to the database to get the current list of tables from the database.

To select a table choose one of the following options:

- Click on a table in the list and click OK.
- Double-click on a table in the list.

 **To change the list of selectable tables, use the following options:**

- To see tables associated with a different schema, select a schema from the Filter by User Schema list.
- To see tables for all schemas, click Clear.
- To filter out any buffer or control tables created using the Web Management Console (WMC) that are used internally by the Integration Appliance during run time check Hide Buffer and Control Tables. The column names in these tables are prefaced by convention with the string: IH:

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Browsing\\_Database\\_Tables.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Browsing_Database_Tables.html)

## Character Encodings

Set the character encoding at the database level, the table level, or the column or parameter level.

For example, the default encoding for your database might be set to UTF-8 but one table in that database might explicitly set the encoding to SHIFT-JIS. One column in this table might have the encoding explicitly set to ISO-8859-1 while all the other columns do not specify the encoding, so they inherit the default encoding of SHIFT-JIS from the table.

The Integration Appliance can convert from type of encoding to another during run time. For example, the orchestration might read in input data from a table with the encoding set to ISO-8859-1 and then write out that data to a column set to UTF-8.

## To set character encodings:

---

- At the **Database** level - Select the encoding type from the Encoding list of the Edit Endpoint or Create Endpoint dialog box.
- At the **Table** level - Select the encoding type from the Encoding list in the Pick Table pane.
- At the **Column** level - Click on the Encoding field for the desired column in the Pick Table pane and select from the list.

See the following below for descriptions of the default character encoding types.

Note: You must leave the encoding field blank for the following binary Datatypes:

- Blob
- Binary
- Varbinary

## To set the encoding type, choose from one of the following options:

---

- From the Encoding list, select a default encoding type. Â
- Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.

Some of the default encoding types are listed in the following table:

Table 1.

Encoding	Description
UTF-8	UTF-8 is a standard character encoding for Unicode or ISO-10646. Both of these standards assign a single unique number to each character used in modern languages. This is the default encoding.
US-ASCII	Also known as ASCII, this is the basic character encoding used on Windows and UNIX computers.
ISO-8859-1	Also known as Latin1, this encoding includes ASCII plus characters for many Western European languages.
EBCDIC-XML-US	This is the basic character encoding used on IBMÂ® computers. EBCDIC-US, like ASCII, is a US-based character encoding.
SHIFT-JIS	Also known as Katakana, specifies the Japanese language. Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see <a href="#">Using the Shift-JIS encoding</a> .

## Database Entities and Activities

---

The following table shows the relationship between the database entities and the different types of database activities. In addition, this table describes how the database entity is created in the database.

Note: For DB2Â® UDB, the asset generation script limits the names of buffer and control tables to nine characters.

Note: For Generic JDBC Driver connections: The scripts used to generate assets are only a template based on the information available from the database. The scripts should be analyzed to confirm that the SQL syntax and datatypes are supported for the target database. If they are not, the scripts must be modified and run via another mechanism to create the required assets for the database.

Â

<b>Database Entity</b>	<b>Associated Activity Description</b>	<b>How created?</b>
Buffer Tables	<p>Used with the inbound single-table activities: <b>Get Inserted Rows</b>, <b>Get Updated Rows</b>, and <b>Get Deleted Rows</b>. The buffer tables contain the result of a database operation.</p> <p>For example, a <b>Get Inserted Rows</b> activity is polling for an insert on the database. When the insert occurs in the database, the buffer tables are populated with data that was inserted.</p>	<p>The buffer tables used with inbound single-table activities are created using the following procedure:</p> <ol style="list-style-type: none"> <li>1. In the Web Management Console (WMC), go to the Assets screen and execute the scripts.</li> <li>2. From the WMC, deploy the project.</li> </ol>
Control Tables	<p>Used with the following activities when messages are specified to be delivered exactly once:</p> <ul style="list-style-type: none"> <li>• <b>Insert Rows</b></li> <li>• <b>Update Rows</b></li> <li>• <b>Delete Rows</b></li> <li>• <b>Call Procedure</b></li> </ul> <p>Control tables are not needed if another delivery option is specified. Specify a delivery option in the <b>Deliver Rules</b> task of the <b>Checklist</b> for an activity.</p>	<p>The control tables used with activities are created using the following procedure:</p> <ol style="list-style-type: none"> <li>1. In the Web Management Console (WMC), go to the Assets screen and execute the scripts.</li> <li>2. From the WMC, deploy the project.</li> </ol>
Triggers	Used with inbound single-table activities, <b>Get Inserted Rows</b> , <b>Get Updated Rows</b> , and <b>Get Deleted Rows</b> , to populate the buffer table.	<p>The triggers used with inbound single-table activities are created using the following procedure:</p> <ol style="list-style-type: none"> <li>1. In the Web Management Console (WMC), go to the Assets screen and execute the scripts.</li> <li>2. From the WMC, deploy the project.</li> </ol>
Stored Procedures	Stored procedures are required with the <b>Call Procedure</b> activity.	<p>The stored procedure must be written and installed in the database before you can complete the configuration of the <b>Call Procedure</b> activity in Studio. The stored procedure is not created using the WMC. The database administrator must create the stored procedure directly in the database.</p>
Sequence	Used with inbound single-table activities, <b>Get Inserted Rows</b> , <b>Get Updated Rows</b> , and <b>Get Deleted Rows</b> , for the Oracle database only.	<p>Oracle only - The sequences used with inbound single-table activities are created using the following procedure:</p> <ol style="list-style-type: none"> <li>1. Publish a project with an orchestration that contains the inbound single-table activity to the Integration Appliance from Studio.</li> <li>2. Use the Web Management Console (WMC) to create the sequences in the Oracle database used by the orchestration.</li> <li>3. From the WMC, deploy the project.</li> </ol>

# Defining Columns for Old Values in Updates

## About this task

The **Get Updated Rows** (inbound) and **Update Rows** (outbound) activities can store both the new value and the original values of the specified columns during run time. For example an **Get Updated Rows** activity could be configured to stored both the original value of `Name` column and the new value of the `Name` column. Figure 1 shows the transfer of example data when the **Get Updated Rows** activity is processed by the Integration Appliance after an update trigger event occurs:

Figure 1. Update old columns

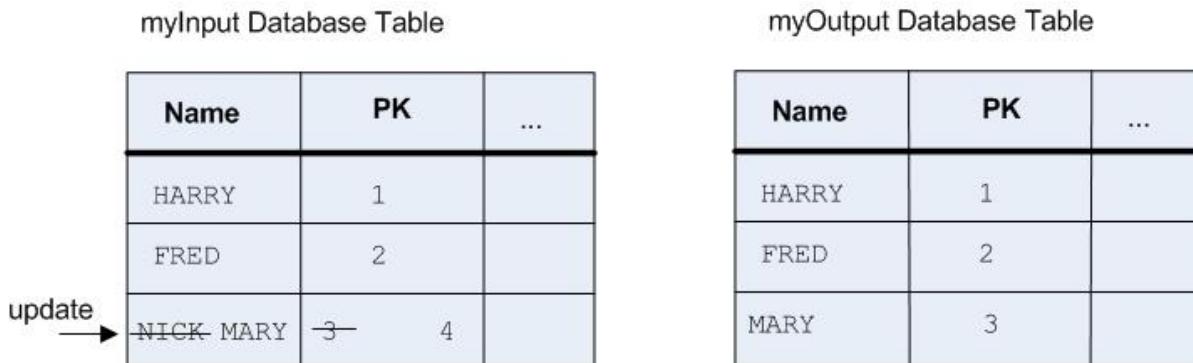

Â

In the Old Value Columns for Updates dialog box, select the columns that you want to store the original values. The Old Value Columns for Updates dialog box is available by clicking Old Values in the **Pick Table** task of the **Checklist** for the **Get Updated Rows** and **Update Rows** activities. By default the name of the column used to store the original values is the original column name prefixed with the string: `old_`. For example if the original column name is called `FirstName`, by default the column used to store the original value of the update operation is called `old_FirstName`. This default name can be changed.

For some projects, you might want to also store the original values of the Primary Keys. For example, if your application actually changes primary key values during update operations as shown in Figure 2.

Figure 2. Example 1

The purpose of the example orchestration is to keep the `myInput` database table in sync with the `myOutput` database table. The example orchestration contains a **Get Updated Rows** activity that polls for update events in the `myInput` table and an **Update Rows** activity that updates the `myOutput` table.

During run time, an update operation on the `myInput` database table occurs, changing both the value of the `Name` column and the primary key value for that row. This update operation is done outside of the integration project. In order for the orchestration to keep the `myInput` database table in sync with the `myOutput` database table, it needs access to the original primary key so it knows which row in the `myOutput` database table to update with the new primary key and the new value for the `Name`.

The old primary key can be saved to a variable by the **Get Updated Rows** activity to be used later by the **Update Rows** activity when updating the `myOutput` database table as shown in Figure 3.

Figure 3. Example 2

myInput Database Table

Name	PK	...
HARRY	1	
FRED	2	
NICK MARY	3	4

The **Update Rows** activity does a update operation to keep the tables in sync.

myOutput Database Table

Name	PK	...
HARRY	1	
FRED	2	
NICK MARY	3	4

## MaxPooledStatements Parameter

---

The MaxPooledStatements parameter is automatically defined and set with a default value for all types of Database Endpoints.

Attention: Changing the default setting of the MaxPooledStatements parameter can cause reduced performance.

The MaxPooledStatements parameter specifies the maximum number of prepared statements that are cached by the Database Endpoint. When the value of MaxPooledStatements parameter is greater than zero, the Database Endpoint creates a prepared statement pool to store PreparedStatement objects for later reuse. The performance cost of creating new PreparedStatement objects can be expensive, so storing and reusing existing PreparedStatement objects from a pool can result in a performance gain.

[Oracle, Sybase, DB2, and Informix Parameters](#)

[SequeLink Parameters](#)

---

[Feedback](#) | [Notices](#)

Last updated: Wednesday, 15 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MaxPooledStatements\\_Parameter.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MaxPooledStatements_Parameter.html)

## Oracle, Sybase, DB2, and Informix Parameters

---

In the Additional Parameters table of the Database Endpoint, define the connection parameters for Oracle, Sybase, DB2®, or Informix® databases.

:

### Oracle

---

If the **Call Procedure** activity calls an Oracle stored procedure that returns a result set, you must define an Endpoint solely for that connector and add the parameter procedureretresult. The value for this parameter must be 1.

If an Oracle database table name starts with a number, Studio throws an Invalid Trigger Specification error.

If the project uses database links with the Oracle 8.1.6 database, you must define the supportLinks parameter and assign it a value of true in the Database Endpoint. By default, the [MaxPooledStatements parameter](#) is automatically defined and set with a default value for an Oracle Database Endpoint. Â

## DB2

---

For the DB2 database, you must define the following two parameters:

- LocationName - Enter the location name defined during installation for the AS/400 DB2 database. Not required for UDB.
- PackageCollection - The value of this field depends on the system type of the DB2 database:
  - AS/400 Â - Enter the collection name.
  - UDB Â - Enter the name of the DB2 Database.

Note: The DB2 user must have the permissions to create a package.

By default, the [MaxPooledStatements parameter](#) is automatically defined and set with a default value for a DB2 Database Endpoint.

## Informix

---

You must define the InformixServer parameter.

To find the Informix Server name search the onconfig file for DBSERVERNAME and specify its value for the InformixServer parameter.

By default, the [MaxPooledStatements parameter](#) is automatically defined and set with a default value for an Informix Database Endpoint.

## Sybase

---

For a Sybase Endpoint, the OverwriteCharLimits parameter is automatically defined and set to the value of 32768. This parameter defines the size of character columns, for example: vchars and chars.

By default, the [MaxPooledStatements parameter](#) is automatically defined and set with a default value for a Sybase Database Endpoint. Â

## Retry Options For Inbound Database Activities

---

Â This section contains the procedure for configuring the retry options for the following inbound database activities: **Get Inserted Rows** activity, **Get Updated Rows** activity, **Get Deleted Rows** activity, and **Poll Table** activity.

### Specify the retry options for inbound database activities

---

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to a database. The following table describes the retry options for connecting to a database:

Table 1.

Field	Description
Retry --- second(s) between each retry.	<p>Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the database.</p>
2) Try to connect --- times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the database before issuing an error.</p> <ul style="list-style-type: none"> <li>o If this parameter is set to "0", Studio does not try to reconnect.</li> <li>o If this parameter is set to a value less than "0", Studio retries the connection indefinitely.</li> </ul> <p>If an orchestration that starts with an inbound database activity is deployed and the Integration Appliance cannot connect to the specified database, the Integration Appliance logs the connections errors as Warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system log, resets the connection error count to zero, and continues to attempt to establish a connection to the database.</p> <p>For example: the retry count is set to 3. The first, second, and third connection errors are shown in the system log as Warnings. The Integration Appliance logs the fourth connection error as an Error and resets the connection error count to zero. Therefore, the fifth connection error generates a Warning in the system log. The Integration Appliance continues to attempt to establish a connection to the database.</p> <p>Â</p>
Activity Timeout --- seconds when the Endpoint does not respond to a request.	<p>Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For example, the amount of time the Integration Appliance waits for a response from the database after requesting that database polls for an INSERT trigger event, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the Endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. Set the connection timeout in Database Endpoint tab. For more information about connection timeouts, see <a href="#">Creating or Editing a Database Activity Endpoint</a>.</p>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db\\_retry\\_options\\_for\\_inbound\\_database\\_activities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db_retry_options_for_inbound_database_activities.html)

## Retry Options For Outbound Database Activities

---

This section contains the procedure for configuring the retry options for the following outbound database activities: **Execute Query** activity, **Insert Rows** activity, **Update Rows** activity, **Delete Rows** activity, and **Call Procedure** activity

### Specify the retry options for outbound database activities

---

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to a database. The following table describes the retry options for connecting to a database:

Table 1.

Field	Description
Retry	Â
1) Wait --- second(s) between each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the database.
2) Try to connect --- times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the database before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains the outbound database activity and the Integration Appliance cannot connect to the specified database, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job.</p> <p>For example, the retry count is set to 3. The first, second, and third connection errors are shown in the system log as Warnings. The Integration Appliance logs the fourth connection error as an Error and stops processing the current orchestration job.</p> <p>Note: For the Database Execute Query activity, if you set this parameter to zero, the Integration Appliance retries the connection indefinitely.</p>
Activity Timeout	Â
3) Time out after --- seconds when the Endpoint does not respond to a request.	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For example, the amount of time that the Integration Appliance waits for a response from the database after requesting an Insert, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the Endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. Set the connection timeout in the Database Endpoint tab. For more information about connection timeouts, see <a href="#">Creating or Editing a Database Activity Endpoint</a> .

## Sequelink Parameters

---

The various parameters for a Sequelink Endpoint are listed in this section. Some parameters require that a **Parameter Value** is specified. You can also add additional parameters.

Note: When you specify SequeLink Server as the **Database Type** for an endpoint, the parameters listed in this section in bold display in the Additional Parameters table of the Endpoint pane.

## MaxPooledStatements

---

By default, the **MaxPooledStatements** parameter is automatically defined and set with a default value for a SequeLink Database Endpoint. Â

## ServerDataSource

---

This parameter is required. You must enter the Data Source Name in the **Parameter Value** field. The Data Source Name is specified in the Data Source Settings in the Sequelink Manager.

## BaseDatabaseType

---

Enter the string: OTHERS.

## DBLogonId

---

Enter the name of the user account to use to access this database. This is an optional parameter that duplicates the User Name property of the endpoint. Use this parameter if your SequeLink Server requires it. You must also complete the DBPassword parameter.

## DBPassword

---

Enter the password for the account specified in DBLogonId. This is an optional parameter that duplicates the Password property of the endpoint. Use this parameter if your SequeLink Server requires it.

## HLogonID

---

Enter the login or user name to use to access the host where the SequeLink Server is installed. This is an optional parameter that is only required if the SequeLink Server requires host authentication. You must also specify the HPassword parameter.

## HPassword

---

Enter the password to use to access the host where the SequeLink Server is installed. This is an optional parameter that is only required if the SequeLink Server requires host authentication.

[Feedback | Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn\\_ref\\_SequeLink\\_Parameters.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn_ref_SequeLink_Parameters.html)

## Single-Table Inbound Database Activities

---

During run time, single-table inbound database activities poll if a database operation has occurred on any rows in the specified columns of a database table at the specified time interval.

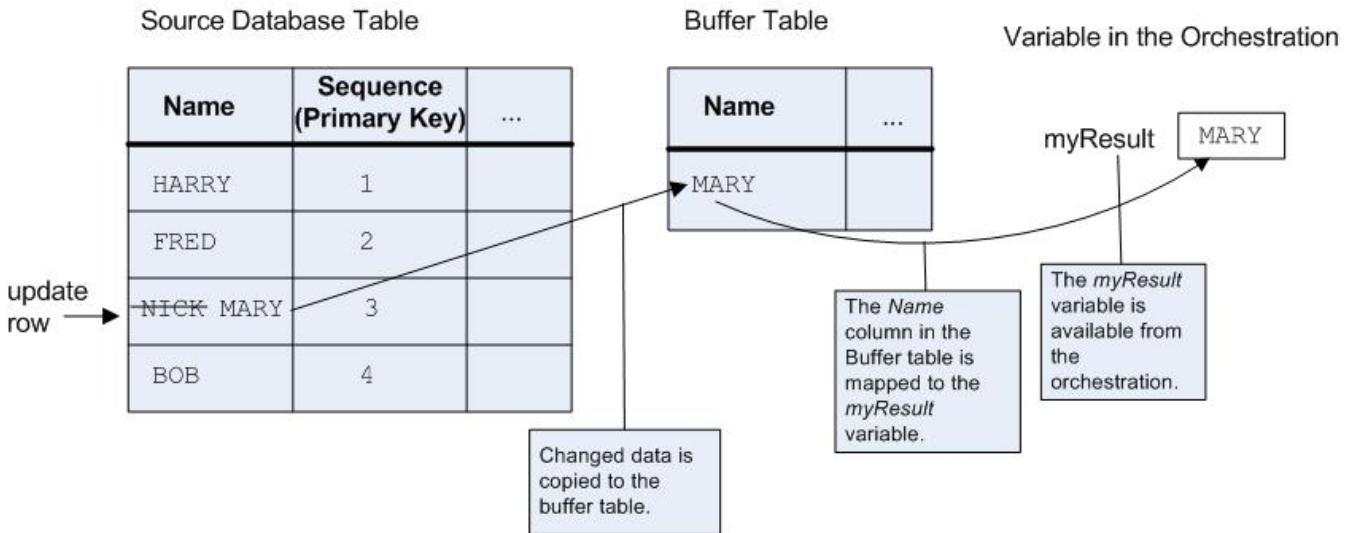

This section contains the procedures for configuring the following single-table inbound database activities:

- **Get Inserted Rows** - During run time, the **Get Inserted Rows** activity polls for rows being added to the buffer table from an INSERT trigger event. The Get Inserted Rows activity then maps the buffer data to variable or variables. Â Â

- **Get Updated Rows** - During run time, the **Get Updated Rows** activity polls for rows being added to the buffer table from a UPDATE trigger event. The Get Updated Rows activity then maps the buffer data to variable or variables.
- **Get Deleted Rows** - During run time, the **Get Deleted Rows** activity polls for rows being added to the buffer table from a DELETE trigger event. The Get Deleted Rows activity then maps the buffer data to variable or variables.

[Figure 1](#) shows the transfer of example data in the UPDATE trigger event and the **Get Updated Rows** activity:

Figure 1. UPDATE trigger example

After publishing your orchestration with an inbound database activity to the Integration Appliance, you must create the buffer table and triggers using the Web Management Console (WMC) before the orchestration is deployed. For the Oracle database, you must also create a sequence using the WMC.

## No Activity for that Operation Run-time Error

If an orchestration accesses a buffer table containing a row for an activity that is currently not present in the orchestration, the orchestration fails and following error is reported during run time:

The buffer table contains the *OperType* operation  
but there is no activity in the orchestration for that operation.

Where *OperType* is type of operation; for example, INSERT. The values of the IH\_OPERATION\_NAME column in the buffer table for the orchestration must be consistent with the database activities in the orchestration. For example, if a row in the buffer table contains the value: INSERT in the IH\_OPERATION\_NAME column but the orchestration does not contain a **Get Inserted Rows** activity, this error is reported. Each orchestration must have a separate buffer table. In addition, the triggers in the source table must be consistent with database operations specified in the buffer table. For example if the orchestration only contains a single inbound **Get Updated Rows** activity, the source database table must only contain a UPDATE trigger.

## Add a single-table inbound database activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the Database folder.
3. Drag the desired single-table inbound database activity (**Get Inserted Rows**, **Get Deleted Rows**, or **Get Updated Rows**) onto the orchestration.
4. Select the activity.

## Create, select, or edit a database endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint, see [Creating or editing an HTTP endpoint](#).

## Select the columns in the source database table that during run time the Integration Appliance polls for changes

---

1. Click Pick Table from the **Checklist**. The Pick Table pane is displayed.
2. Click Browse... to select the database table that is to be the source for inbound messages. The Browse Database Tables dialog box is displayed.
3. Select a table from the list and click OK. Column information for the selected table is displayed in the Pick Table pane.
4. If the character encoding for this table is different from the encoding for the database, enter another encoding using one of the following options:
  - o From the Encoding list, select one of the default encoding types. Â
  - o Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.This sets the encoding for all the columns of the resulting buffer table.

Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see [Using the Shift-JIS encoding](#).
5. By default all columns in the source table are selected. Clear the Use check box to remove a column from resulting buffer table. Click Use All to reselect all the columns.
6. Click in the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click the Column Name heading of the column. An arrow is displayed to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with **a** and continuing to **z**. A down arrow indicates the column is sorted by reverse alphabetic order starting with **z** and continuing to **a**. Click the arrow to reverse the alphabetic order.
7. For the **Get Updated Rows** activity only - if you want the resulting buffer table to contain both the new values and the original values of the updated columns follow these steps:
  - a. Click Old Values. The Old Value Columns for Updates dialog box displays.
  - b. Select the Store check box for the database columns that you want to save the original values.
  - c. You can change the default names assigned to columns to store the original values. Double-click the appropriate Column Name to Store Old Value cell.
  - d. Click OK. Â The selected columns are displayed in the From Activity of the Map Outputs pane prefixed with the string: `old_`. You can map both the new and original values from the Map Outputs pane. Â

Note: For more information see [Defining Columns for Old Values in Updates](#).
8. If necessary, change the settings of the Data Type, Encoding, or Nullable values. Click the field to make a new selection.
  - o Data Type - Defaults to the data type for the column in the source database table. If the required data type for the column in the buffer table is different from the data type of the source table, select a different data type by clicking in the Data Type cell and selecting another Data Type from the list. You must select an appropriate data type for those data types that are marked UNSUPPORTED.

Note: For the XMLTYPE data type in an Oracle database and the MONEY data types in a SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.  
Attention: You must select a compatible data type with the source data type to avoid invalid data during run time. For example, do not select the SMALLINT data type for the buffer table if the source data type is INTEGER because during run time a large number stored in an INTEGER column will not convert correctly to the SMALLINT data type.
  - o Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable.
  - o Encoding - Defaults to current default encoding that was set either at the database level or the table level. If the required encoding for the column is different from the current default encoding, select another encoding by clicking in the Encoding cell and selecting another Encoding from the list. Â
  - o Nullable - Defaults to the nullable setting for the column in the source database table. The Use check box must be selected for those columns where `nullable=false`. A column marked `nullable=false` cannot contain a null during run time.
9. Click Reset to reset all column properties to their defaults. This also resets the Use check box for all columns.
10. Click Refresh to update the list of columns in reference to the latest state of the source database. Recent changes to the source is updated in this pane.
11. Configure the [Specifying Delivery Rules for Database Activities](#).

Note: If you select the Exactly once option in the **Delivery Rules** task, you must create control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.  
Note: If you select the Exactly Once option, you must enable persistence. For more information, see [Enabling persistence](#).
12. Configure the retry options. For more information, see [Retry Options For Inbound Database Activities](#).

## Map the output of the activity

---

1. Select the **Map Outputs** task in the **Checklist**.

The output parameters for the activity are displayed under the rows element in the From Activity pane. The output parameters displayed in the From Activity pane correspond to the columns you selected in the **Pick Table** task. If the Batch option was selected in **Delivery Rules**, the multiple occurrences symbol displays next to the row element.

Note: For the **Get Updated Rows** activity only, if some columns were selected in the Old Values Columns for Updates dialog box (in the **Pick Table** task), these additional output parameters (by default prefixed with the string: `old_`) also display under the rows element. You must map all the old value columns visible in the Map Outputs pane.

2. Map the required output parameters to variable or variables. See [Creating a map](#) for general instructions on mapping. You are not required to map the output parameters for these activities.

Note: After publishing your orchestration with an inbound database activity to the Integration Appliance, you must create the buffer table using the Web Management Console (WMC) before the orchestration is deployed.

**Parent topic:** [Database Activities](#)

---

[Feedback](#) | [Notices](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db\\_singletable\\_inbound\\_database\\_activities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db_singletable_inbound_database_activities.html)

## Single-Table Outbound Database Activities

---

This section contains the procedures for configuring the following single-table outbound database activities.

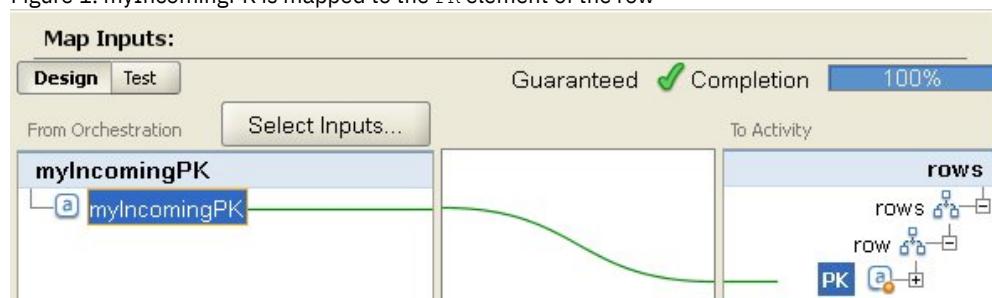

These activities include:

- **Insert Rows** - This activity takes data from variable or variables that are mapped to the input parameters of the activity and inserts this data as rows into the specified database table.
- **Update Rows** - This activity takes data from variable or variables that are mapped to the input parameters of the activity and updates the rows of the specified database table with this new data.
- **Delete Rows** - This activity takes data from variable or variables that are mapped to the input parameters of the activity and deletes rows of the specified database table based on this data.

For the **Update Rows** and the **Delete Rows** activities, the Integration Appliance integrates the database table to determine which columns in the table are primary key columns. When the **Update Rows** or the **Delete Rows** activities are started during run time, the Integration Appliance uses the value of the incoming variable that contains the primary key number to determine which rows to update or delete.

For example, the `PK` column is defined in the database as being a primary key column for the database table. The **Use** check box is selected for the `PK` column in the **Pick Table** task of the **Checklist** for the **Delete Rows** activity. In the Map Inputs pane of the **Delete Rows** activity, the variable called `myIncomingPK` is mapped to the `PK` element of the row as shown in [Figure 1](#):

Figure 1. `myIncomingPK` is mapped to the `PK` element of the row

During run time, if the value of the `myIncomingPK` variable is equal to 3 the row with the `PK` equal to 3 is deleted as shown in [Figure 2](#):

Figure 2. The row with the primary key equal to 3 is deleted

## Variables in the Orchestration

myIncomingPK

3

The row with  
the primary  
key equal to 3  
is deleted  
from the table.

Name	PK	...
HARRY	1	
FRED	2	
MARY	3	

The PK column is  
defined as a  
primary key  
column in the  
database.

If no primary key columns are specified in the **Pick Table** task of the **Checklist**, specify at least one column to act like the primary key. Specify acting primary key column or columns using the Configure Primary Keys dialog box, available by clicking Keys in the **Pick Table** task of the **Checklist** for the **Delete Rows** and **Update Rows** activities. If no primary keys are specified in the database table or selected as acting primary keys in the Configure Primary Keys dialog box, all the rows of the database table are affected by the delete or the update operation.

You can also use the Configure Primary Keys dialog box to specify additional columns to act as primary key columns. For example for the table in the preceding figure, you could define that the `Name` column should act like primary key column in addition to the `PK` primary column that was defined in the database as being a primary key column.

## Add a single-table outbound database activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the Database folder.
3. Drag the wanted single-table outbound database activity (**Insert Rows**, **Delete Rows**, or **Update Rows**) onto the orchestration.
4. Select the activity.

## Create, select, or edit a database endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - o Create an endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an HTTP endpoint, see [Creating or editing an HTTP endpoint](#).

## Select the columns in the source database table that during run time the Integration Appliance polls for changes

1. Click Pick Table from the **Checklist**. The Pick Table pane is displayed.
2. Click Browse... to select the database table that is to be the source for inbound messages. The Browse Database Tables dialog box is displayed.
3. Select a table from the list and click OK. Column information for the selected table is displayed in the Pick Table pane.
4. If the character encoding for this table is different from the encoding for the database, enter another encoding using one of the following options:
  - o From the Encoding list, select one of the default encoding types. Â
  - o Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.

This sets the encoding for all the columns of the resulting buffer table.

Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see [Using the Shift-JIS encoding](#).

5. By default all columns in the source table are selected. Clear the Use check box to remove a column from resulting buffer table. Click Use All to reselect all the columns.

6. Click in the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click the Column Name heading of the column. An arrow is displayed to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with **a** and continuing to **z**. A down arrow indicates the column is sorted by reverse alphabetic order starting with **z** and continuing to **a**. Click the arrow to reverse the alphabetic order.
7. For the **Get Updated Rows** activity only - if you want the resulting buffer table to contain both the new values and the original values of the updated columns follow these steps:
  - a. Click Old Values. The Old Value Columns for Updates dialog box displays.
  - b. Select the Store check box for the database columns that you want to save the original values.
  - c. You can change the default names assigned to columns to store the original values. Double-click the appropriate Column Name to Store Old Value cell.
  - d. Click OK. The selected columns are displayed in the From Activity of the Map Outputs pane prefixed with the string: `old_`. You can map both the new and original values from the Map Outputs pane.

Note: For more information see [Defining Columns for Old Values in Updates](#).
8. If necessary, change the settings of the Data Type, Encoding, or Nullable values. Click the field to make a new selection.
  - o Data Type - Defaults to the data type for the column in the source database table. If the required data type for the column in the buffer table is different from the data type of the source table, select a different data type by clicking in the Data Type cell and selecting another Data Type from the list. You must select an appropriate data type for those data types that are marked UNSUPPORTED.
  - Note: For the XMLTYPE data type in an Oracle database and the MONEY data types in a SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.
  - Attention: You must select a compatible data type with the source data type to avoid invalid data during run time. For example, do not select the SMALLINT data type for the buffer table if the source data type is INTEGER because during run time a large number stored in an INTEGER column will not convert correctly to the SMALLINT data type.
  - o Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable.
  - o Encoding - Defaults to current default encoding that was set either at the database level or the table level. If the required encoding for the column is different from the current default encoding, select another encoding by clicking in the Encoding cell and selecting another Encoding from the list.
  - o Nullable - Defaults to the nullable setting for the column in the source database table. The Use check box must be selected for those columns where `nullable=false`. A column marked `nullable=false` cannot contain a null during run time.
9. Click Reset to reset all column properties to their defaults. This also resets the Use check box for all columns.
10. Click Refresh to update the list of columns in reference to the latest state of the source database. Recent changes to the source are updated in this pane.
11. Configure the [Specifying Delivery Rules for Database Activities](#).

Note: If you select the Exactly once option in the **Delivery Rules** task, you must create control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.

Note: If you select the Exactly Once option, you must enable persistence. For more information, see [Enabling persistence](#).

12. Configure the retry options. For more information, see [Retry Options For Inbound Database Activities](#).

## Specify the target database table for the activity

---

1. Click Pick Table from the **Checklist**. The Pick Table pane is displayed.
2. Click Browse... to select the target database table. The Browse Database Tables dialog box is displayed.
3. Select a table from the list and click OK. Column information for the selected table is displayed in the Pick Table pane.
4. If the character encoding for this table is different from the encoding for the database, enter another encoding using one of the following options:
  - o From the Encoding list, select one of the default encoding types.
  - o Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.

This sets the encoding for all the columns of the resulting buffer table.

Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see [Using the Shift-JIS encoding](#).
5. By default all columns in the source table are selected. Clear the Use check box to remove a column from resulting buffer table. If a column is not selected, it is not displayed in the Map Inputs pane and is not updated at run time. Click Use All to reselect all the columns.
6. Click in the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click the Column Name heading of the column. An arrow is displayed to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with **a** and continuing to **z**. A down arrow indicates the column is sorted by reverse alphabetic order starting with **z** and continuing to **a**. Click the arrow to reverse the alphabetic order.
7. If necessary, change the settings of the Data Type, Encoding, or Nullable values. Click the field to make a new selection.
  - o Data Type - Defaults to the data type for the column in the source database table. If the wanted data type for the column in the buffer table is different from the data type of the source table, select a different data type by clicking in

the Data Type cell and selecting another Data Type from the list. You must select an appropriate data type for those data types that are marked UNSUPPORTED.

Note: For the XMLTYPE data type in an Oracle database and the MONEY data types in a SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.

Attention: You must select a compatible data type with the source data type to avoid invalid data during run time. For example, do not select the SMALLINT data type for the buffer table if the source data type is INTEGER because during run time a large number stored in an INTEGER column is not converted correctly to the SMALLINT data type.

- o Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable.
- o Encoding - Defaults to current default encoding that was set either at the database level or the table level. If the wanted encoding for the column is different from the current default encoding, select another encoding by clicking in the Encoding cell and selecting another Encoding from the list. Â
- o Nullable - Defaults to the nullable setting for the column in the source database table. The Use check box must be selected for those columns where nullable=false. A column marked nullable=false cannot contain a null during run time.

8. Click Reset to reset all column properties to their defaults. This also resets the Use check box for all columns.

9. Click Refresh to update the list of columns in reference to the latest state of the source database. Recent changes to the source are updated in this pane.

10. For the **Update Rows** activity only - Select the Insert row if row does not already exist check box, if during run time you want the **Update Rows** activity to first try and update the specified row but if the row does not exist, insert the row into the database table. Â

11. For the **Update Rows** activity only - if you want to save both the new values and the original values in the database, follow these steps:

- a. Click Old Values. The Old Value Columns for Updates dialog box is displayed.
- b. Select the Store check box for the database columns that you want to save the original values.
- c. You can change the default names assigned to columns that store the original values during run time. Double-click in the appropriate Column Name to Store Old Value cell.
- d. Click OK. Â The selected columns are displayed in the To Activity of the Map Outputs pane prefixed with the string: old\_. You can map to both the new and original values from the Map Outputs pane. Â

Note: For more information see [Defining Columns for Old Values in Updates](#).

12. For the **Update Rows** or **Delete Rows** activities only - To specify acting primary key columns in addition to any primary key columns already defined by the database, follow these steps: Â

- a. Click Keys. The Configure Primary Keys dialog box is displayed.
- b. To specify a column as an acting primary key column, click the column then click >>.
- c. Click OK.

Note: If no primary keys columns (as defined by the database) were specified in the **Pick Table** task of the **Checklist**, you must specify at least one column as an acting primary key column.

Repeat this step to specify more acting primary key columns.

13. Configure the [Specifying Delivery Rules for Database Activities](#).

Note: If you select the Exactly once option in the **Delivery Rules** task, you must create control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.

Note: If you select the Exactly Once option, you must enable persistence. For more information, see [Enabling persistence](#).

14. Configure the retry options. For more information, see [Retry Options For Outbound Database Activities](#).

## Map the input of the activity

---

1. Select the **Map Inputs** task in the **Checklist**.

The input parameters for the activity are displayed under the row element in the To Activity pane. The input parameters displayed in the From Activity pane correspond to the columns you selected in the **Pick Table** task. If the Batch Multiple Rows Per Message check box was selected in **Delivery Rules**, the multiple occurrences symbol displays next to the row element.

Note: For the **Get Updated Rows** activity only, if columns were selected in the Old Values Columns for Updates dialog box (in the **Pick Table** task), these additional output parameters (by default prefixed with the string: old\_) also display under the rows element. Â

2. Map all the input parameters. See [Creating a map](#) for general instructions on mapping. You must map all the input parameters of the activity.

## Map the output of the activity

---

1. Select the **Map Outputs** task in the **Checklist**.

The GetRowsCount check box determines what is displayed in the Map Outputs pane:

- o If the Get Row Counts check box is cleared in the **Delivery Rules**, the Map Outputs pane is blank.
- o If the Get Row Counts check box is selected in the **Delivery Rules**, the Map Outputs pane displays the rowCount element. Â If the Batch Multiple Rows Per Message check box is selected in the **Delivery Rules**, the multiple

occurrences symbol is displayed next to the rowCount element.

2. If the RowCount output parameter is displayed, map the RowCount output parameter if wanted. See [Creating a map](#) for general instructions on mapping. You are not required to map the output parameters of the activity. Â

**Parent topic:** [Database Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db\\_singletable\\_outbound\\_database\\_activities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db_singletable_outbound_database_activities.html)

## Specifying Delivery Rules for Database Activities

---

Specify how messages will be delivered at the Delivery Rules pane.

The delivery rules for inbound and outbound activities differ, as described in the following sections.

### Specify the delivery rules for inbound database activities

---

1. Select the **Delivery Rules** task from the **Checklist**.
2. Configure the Delivery rules as described in the following table which describes the delivery rules for the inbound database activities (**Get Inserted Rows**, **Get Updated Rows**, **Get Deleted Rows**, and **Poll Table**):

Table 1.

Name	Description
Polling Interval	Specifies the time interval to poll for changes in database. For example, the <b>Get Inserted Rows</b> activity polls for INSERT trigger events at the specified time internal. For more information, see <a href="#">Polling interval behavior</a> .
Fetch size	Specifies how many rows the activity should retrieve from the buffer table at one time. The default is 500 rows per poll. The range is 1 - 10,000. Note: To improve performance, set the Fetch Size to the maximum number of rows you expect to retrieve from the buffer table.
Batch	Specifies the number of rows to batch into a single message. By default, batching is turned off (the Batch check box is not selected). To turn on batching, select the Batch check box then specify the number of rows to batch. The range is 1 - 10,000. If the Batch check box is selected in <b>Delivery Rules</b> , then the multiple occurrences symbol displays next to the row element in the From Activity pane of the <b>Map Outputs</b> task of the inbound activity.
Deliver Messages	Select from one of the following options in the Deliver messages pull-down menu: <ul style="list-style-type: none"><li>o <b>At least once</b> - Specifies the message will be delivered at least once, but can be delivered more than once. This delivery option is typically used when the receiving system can detect or tolerate duplicate messages.</li><li>o <b>Exactly once</b> - Specifies the message will be delivered once and only once. Â If the Exactly once option is selected and the database is Sybase, the OverwriteCharLimits parameter must be set in the endpoint. For more information, see <a href="#">Oracle, Sybase, DB2, and Informix Parameters</a>. Note: If you select the Exactly once option, you must create some control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project. Note: If you select the Exactly Once option, you must enable persistence. For more information, see <a href="#">Enabling persistence</a>.</li></ul>
Delete rows after they have been processed	This check box is displayed only for the <b>Custom Poll</b> activity. The Delete rows after they have been processed check box is used by the Integration Appliance to determine the action for a delete request while running a <b>Poll Table</b> activity: <ul style="list-style-type: none"><li>o If the check box is enabled, during run time the Integration Appliance sets the flag column to M and then deletes the row.</li><li>o If the check box is cleared, during run time the Integration Appliance sets the flag column to M and then P but the row is not deleted.</li></ul>

## Specify the delivery rules for outbound database activities

---

1. Select the **Delivery Rules** task from the **Checklist**.
2. Configure the Delivery rules as described in the following table, which describes the deliver rules for the outbound database activities (**Insert Rows**, **Update Rows**, **Delete Rows**, **Call Procedure**):

Table 2.

Name	Description
Deliver Messages	Select from one of the following options in the Deliver messages menu: <ul style="list-style-type: none"><li>○ <b>At least once</b> - Specifies the message will be delivered at least once, but can be delivered more than once. This delivery option is typically used when the receiving system can detect or tolerate duplicate messages.</li><li>○ <b>Exactly once</b> - Specifies the message will be delivered only once.</li></ul> <p>Note: If you select the <b>Exactly once</b> option, you must create some control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.</p>
Batch __ rows at a time	Specifies if the database operations on rows should be batched and how many rows to process by the database operation at one time. For example, if the size of the batch is set to 20 but 100 rows are processed by a database insert, 5 messages of size 20 are sent from the Integration Appliance to the database and then the final database commit message is sent. <p>If the Batch __ rows at a time check box is selected in <b>Delivery Rules</b>, the multiple occurrences symbol displays next to the row element in the To Activity pane of the <b>Map Inputs</b> task of the outbound activity.</p>
Get Row Counts	Not available for the <b>Call Procedure</b> activity - This check box specifies that during run time the activity returns how many rows were processed per transaction. If the Get Rows Counts check box is selected, the rowCount is available in the From Activity pane of the Map Outputs pane of the outbound activity.

## Viewing Column Details

---

The View Column dialog box allows you to see detailed column information for tables as you enter a SQL statement in the **Enter Query** task of the **Checklist** for the **Execute Query** activity. This task describes how to access the View Column Details dialog box.

### Procedure

---

1. Create or open an **Execute Query** activity.
2. Select the **Enter Query** task from the **Checklist**. The Enter Query pane is displayed.
3. Click View Columns. The View Columns dialog box is displayed.
4. To change the data viewed in the View Columns dialog box, select from the following options:
  - To see detailed column information, select a table in the list. Column names, datatypes, sizes, and nullable properties display in the right pane.
  - To see tables in a different schema, select a schema from the Filter by User Schema list.
  - To see tables for all schemas, click Clear.
  - To filter out any buffer or control tables created by the Web Management Console (WMC) that are used internally by the Integration Appliance, select the Hide Buffer and Control Tables option.

Note: This filter only hides buffer and control tables that use the standard names generated in scripts from Studio.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn\\_db\\_Viewing\\_Column\\_Details.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn_db_Viewing_Column_Details.html)

## Working with Database Parameters

---

Parameters supply database-specific connection information for an endpoint.

### About this task

---

You can add and delete database parameters and edit parameter values as described in the following procedures.

To add a parameter to the endpoint:

### Procedure

---

1. In the Project tab, click an Endpoint.
2. Click Add. The Database Endpoint Parameters dialog box is displayed.
3. Type the name of a new parameter in the Parameter Name field.
4. Type a value for the parameter in the Parameter Value field.
5. Click OK.

### Results

---

To delete a parameter from the endpoint:

1. In the Project tab, click an Endpoint.
2. Click the Parameter Name of the parameter to be deleted.
3. Click Delete.

To edit a parameter value:

1. In the Project tab, click an Endpoint.
2. Click the Parameter Value to be changed, and enter a new value in the field.
3. Press Enter.

**Parent topic:** [Database Activities](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn\\_db\\_Working\\_with\\_DB\\_Parms.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn_db_Working_with_DB_Parms.html)

## Call Procedure Activity

---

During run time, the Call Procedure activity runs a stored procedure in a database. The stored procedure must be written and installed in the database before you can complete the configuration of the Call Procedure activity in Studio.

Note: Function name overloading for stored procedures in the Informix® database is not supported. Stored procedures cannot have the same name in Informix even if their signatures are unique.

The steps for adding and configuring a Call Procedure activity to an orchestration are described in the following procedures:

- [Add a Call Procedure activity to the orchestration](#)
- [Create, select, or edit a database endpoint](#)

- Configure a Call Procedure activity
- Map the input of the activity
- Map the output of the activity

## Add a Call Procedure activity to the orchestration

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration opens.
2. Select the Activities tab and expand the Database folder.
3. Drag the Call Procedure activity onto the orchestration.
4. Select the Call Procedure activity.

## Create, select, or edit a database endpoint

---

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:
  - Select an existing endpoint:
    - a. Select Browse. The Project Explorer opens.
    - b. Select an existing endpoint and click OK. Skip to the [Configure a Call Procedure activity](#) activity procedure.
  - Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer opens.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane shows.
  - Create a new endpoint:
    - a. Select New. The Create Endpoint pane opens.
2. [Create or edit a database endpoint](#)

## Configure a Call Procedure activity

---

1. Click Stored Procedure from the Checklist. The Stored Procedure pane opens.
2. Click Browse... The Browse Stored Procedures dialog box shows.
3. To see all the stored procedures in the database and not just those visible with the selected user schema, click Clear.
4. Select a Stored Procedure from the list.
5. Click OK. Parameter information for the selected stored procedure displays in the Stored Procedure pane.  
Note: Deleting stored procedure call parameters from the middle of the parameter list is not supported. If you want to specify parameters in a different order than they are displayed in the list, you can create a wrapper stored procedure (for example, *WrapperStoredProcedure1*) that doesn't have gaps in parameters (that is, contains the exact subset of the parameters needed), then have the new stored procedure call the underlying stored procedure (for example: *BackendStoredProcedure1*) using the `@parameter = value` form supported by the Microsoft SQL Server. You can then have your orchestration use the wrapper stored procedure with only the parameters needed. Alternatively, you can provide the full set of parameters without omissions and default values in Studio for the original underlying stored procedure (for example, *BackendStoredProcedure1*). Note that while deleting stored procedure call parameters from the middle of a parameter list is not supported, parameters displayed at the end of a parameter list can be deleted.
6. To change the current character encoding (originally obtained from the database endpoint), select a different [encoding](#) option from the Encoding list. This changes the default character encoding for all the input parameters of the stored procedure.
7. By default, all the input and output (`IN`, `INOUT`, `RETURN`, `OUT`) parameters of the stored procedure are selected. You do not need to include all the input and output parameters defined for a stored procedure. Clearing the Use check box for an output parameter (`INOUT`, `RETURN`, `OUT`) means that the output parameter is not available in the Map Inputs task. Clearing the Use check box for an input parameter (`IN`, `INOUT`) means that the input parameter is not available in the Map Inputs task. Clear the Use check box only for input parameters that you do not need to specify input values at run time. Some input parameters of the stored procedure may have default values.

Most databases only return a single return parameter. For these databases, if the Use check box is selected for the return parameter, the return value is returned in the single results/result/RETURN\_VALUE node in the From Activity pane of the Map Outputs task. The Informix database, however, supports multiple return parameters and for the Informix database, the return parameters are returned in the repeating results/result/result/resultsSets/any node. Even if one parameter is returned from the stored procedure, the return parameter is returned in the results/result/result/resultsSets/any node. Use the [CopyOf function](#) in the map to copy the contents of the result node (including the child node called resultSet) to a variable. In order for the CopyOf function to correctly copy the values of the source nodes to the destination nodes, the XML Schema of the destination variable must match the XML Schema of the source node. For more information, see [CopyOf function](#).

8. Click the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click in the Column Name heading of the column. An arrow shows to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with a and continuing to z. A down arrow indicates the column is sorted by reverse alphabetic order starting with z and continuing to a. Click the arrow to reverse the alphabetic order.

9. If necessary, change the settings of the Data type, Encoding, or Nullable values for each query input parameter. Click the field to make a new selection:

- o Data Type - Defaults to the Data Type of the parameter. Select an alternate data type for the parameter by clicking in the Data Type cell and selecting another Data Type from the list. from the corresponding cell. You must change any data types that are UNSUPPORTED.  
Note: (for MONEY and XMLTYPE data types) For the XMLTYPE data type in an Oracle database and the MONEY data types in an SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.
- o Encoding - Defaults to current default encoding that was set either at the database level or the table level. If the required encoding for the parameter is different from the current default encoding, select another encoding by clicking in the Encoding cell and selecting another [Encoding](#) from the list.
- o Size – Size of the column defined in the table. This size is retrieved from the database table and is not configurable.

10. Click Reset to reset all parameter properties to their defaults. This also selects the Use option for all parameters.

11. Configure [Delivery Rules](#).

Note: If you select the Exactly once option in the Delivery Rules task, you must create control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.

Note: If you select the Exactly once option, you must enable persistence. For more information, see [Enabling Persistence](#).

12. Configure the [Retry Options](#).

Â

## Map the input of the activity

---

1. Select the Map Inputs task in the Checklist. The input parameters for the activity are displayed under the calls element in the To Activity pane. The input parameters displayed in the To Activity pane correspond to the IN and INOUT parameters you selected in the Stored Procedure task. If the Batch Multiple Rows Per Message check box is selected in the Delivery Rules, the multiple occurrences icon displays next to the call element.
2. Map all the displayed input parameters. See [Creating a map](#) for general instructions on mapping.

## Map the output of the activity

---

1. Select the Map Outputs task in the Checklist. The output parameters for the activity are displayed under the results element in the From Activity pane. The output parameters displayed in the From Activity pane correspond to the OUT, RETURN, and INOUT parameters you selected in the Stored Procedure task.

If the Batch Multiple Rows Per Message check box is selected in the Delivery Rules, the multiple occurrences icon displays next to the result element.

A repeating node called resultSet displays in the From Activity pane of the Call Procedure activity even if the stored procedure has no return parameters. During run time, if the stored procedure started from the activity returns a result set, this result set is returned from the activity in the resultSet node. For example, if the stored procedure starts a select statement, the result set from the select statement is returned in the resultSet node. Use the [CopyOf function](#) in the map to copy the contents of the result node (including the child node called resultSet) to a variable. Â

Attention: In order for the CopyOf function to correctly copy the values of the source nodes to the destination nodes, the XML Schema of the destination variable must match the XML Schema of the source node. For more information, see [CopyOf function](#).

2. Map the required output parameters to variables. See [Creating a map](#) for general instructions on mapping. You are **not required** to map output parameters for this activity.

Â

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db\\_call\\_procedure\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db_call_procedure_activity.html)

# Execute Query Activity

---

During run time, the Execute Query activity runs a select SQL statement.

The Execute Query activity supports parameterized queries - a query that contains input, or input and output parameters. When input parameters are specified in a query, the value of the parameter is supplied at run time. The ? character in the following example select statement specifies that there is one input parameter:

```
select * from myUserSchema.mySourceTable where myUserSchema.mySourceTable.myColumn=?
```

In the preceding select statement, the \* character, specifies that the query returns the column or columns found in the *mySourceTable* table as the output parameter or parameters. For example, if the *mySource table* contains two columns, one of type CHAR and one of type VARCHAR, the Execute Query activity returns two output parameters, one of type CHAR and the other of type VARCHAR.

Note: Only the select SQL statement is supported in the Execute Query activity. The insert SQL statement is not supported in the Execute Query activity.

The steps for adding and configuring an Execute Query activity to an orchestration are described in the following procedures:

- [Add an Execute Query in the orchestration](#)
- [Create, select, or edit a database endpoint](#)
- [Specify the query SQL statement](#)
- [Configure the input parameters for the query](#)
- [Configure output parameters](#)
- [Specify retry options for the query](#)
- [Map the input of the activity](#)
- [Map the output of the activity](#)

## Add an Execute Query in the orchestration

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration displays.
2. Select the Activities tab and expand the Database folder.
3. Drag the Execute Query activity onto the orchestration.
4. Select the Execute Query activity

## Create, select, or edit a database endpoint

---

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:
  - Select an existing endpoint:
    - a. Select Browse. The Project Explorer opens.
    - b. Select an existing endpoint and click OK. Skip to the [Specify the query SQL statement](#) procedure.
  - Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer opens.
    - b. Select an existing endpoint and click OK
    - c. Click Edit. The Edit Endpoint pane opens.
  - Create an endpoint: Select New. The Create Endpoint pane opens.
2. [Create or edit a database endpoint](#)

## Specify the query SQL statement

---

1. Select the Enter Query task from the Checklist. The Enter Query pane opens.
  2. Enter the query in the white space displayed in the pane. Do not place semicolons at the end of your query.
  3. Click [View Columns](#) to review column details for a selected table to assist you in building your SQL statement by entering valid table names and columns.
  4. Select an alternate character [encoding](#) setting for the input and output parameters if the wanted encoding differs from the default encoding for the database using one of the following options:
    - From the Encoding list, select one of the default encoding types.
    - Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.
- Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see [Using the Shift-JIS encoding](#).
5. Click Validate Query. This action checks if your query is valid and populates input and output parameters in the Map Inputs and Map Outputs tasks.
  6. Enter a value into the MaxRows field. The MaxRows field specifies the maximum number of rows to return from the query during run time.

Note: If the same query is started multiple times on the same data, the same set of rows are returned. For example if MaxRows is equal to 1, the same row (the first row) is always returned each time the query is started - there is no iteration though the set of rows.

## Configure the input parameters for the query

---

1. Select the Setup Input Parameters task from the Checklist. The Setup Input Parameters pane shows the input parameter or parameters of the query.
2. Click [View Columns](#) to review column details for a selected table to assist you in building your SQL statement by entering valid table names and columns.
3. Click in the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click the Column Name heading of the column. An arrow is displayed to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with a and continuing to z. A down arrow indicates the column is sorted by reverse alphabetic order starting with z and continuing to a. Click the arrow to reverse the alphabetic order.
4. If necessary, change the settings of the Data type, Encoding, or Nullable values for each query input parameter. Click the field to make a new selection:
  - o Parameter Name - You can change the default name to a more meaningful name. Parameters are listed in the order they are specified in the query.
  - o Data Type - Select a data type for this parameter.  
Note: **(for MONEY and XMLTYPE data types)** For the XMLTYPE data type in an Oracle database and the MONEY data types in a SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.
  - o Encoding - Select an alternate character [encoding](#) setting for the parameter if the required encoding differs from the default encoding for the database.
  - o Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable.
5. Click Reset Values to interrogate the database and get the data types and size from the database. This overrides the data type and size set manually in the pane.

## Configure output parameters

---

1. Select the Setup Result Set task from the Checklist. The Setup Result Set pane opens and the defaults for the ouput parameter or parameters of the query are listed.
2. Click [View Columns](#) to review column details for a selected table to assist you in building your SQL statement by entering valid table names and columns.
3. If necessary, change the settings of the Data type, Encoding, or Nullable values for each query output parameter:
  - o Parameter Name - You can change the default name to a more meaningful name. Parameters are listed in the order they are specified in the query.
  - o Data Type - Select a data type for this parameter.
  - o Encoding - Select an alternate character encoding setting for the parameter if the required encoding differs from the default encoding for the database.
  - o Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable.
4. Click Reset Values to interrogate the database and get the data types and size from the database. This overrides the data type and size set manually in the pane.

## Specify retry options for the query

---

To specify the retry options for the query:

1. Configure the [Retry Options](#).  
Note: For the **Database Execute Query** activity, if you set the retry option to zero, the Integration Appliance retries the connection indefinitely.

## Map the input of the activity

---

1. Select the Map Inputs task in the Checklist. The input parameters specified for the query are the input parameters for the activity. The input parameters of the activity are displayed under the parameters element in the To Activity pane.
2. You must map all the input parameters of the activity. See [Creating a map](#) for general instructions on mapping.

## Map the output of the activity

---

1. Select the Map Outputs task in the Checklist. The columns returned by select statement are the elements displayed under the rows/row element in the From Activity pane.
2. You are not required to map the output parameters of the activity. See [Creating a map](#) for general instructions on mapping.

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db\\_execute\\_query\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db_execute_query_activity.html)

## Poll Table Activity

---

The Poll Table activity checks if a database operation (insert or update) has occurred on any rows of a database table by checking the status of a special flag column at the specified time interval.

During run time, for the insert and update operations, the Poll Table activity returns the data that has changed in your database table and directly maps that data to variables in the orchestration while the Get Inserted Rows and Get Updated Rows activities returns the changed data into a buffer table and that buffer table is mapped to a variable in the orchestration.

Note: Use the Poll Table activity instead of the Get Inserted Rows, Get Deleted Rows, and Get Updated Rows activities only when you must avoid adding triggers to your database.

Before configuring the Poll Table activity in Studio, you must first either create two additional database columns in your source database table or use two appropriate existing database columns from your database table. The following database columns are required in your source database table:

- A sequence column of `INTEGER` type - This column contains the primary keys (a sequence of unique numbers: 1, 2, 3 ...)
- A flag column of `CHAR(1)` type - This column contains a flag that the Integration Appliance uses during run time to determine if the Integration Appliance should process the row.

Before an orchestration with a Poll Table activity is run on the Integration Appliance, you must also populate these columns in your database table. Set the flag column to `P` if you do not want the Integration Appliance to process the row during run time. Set the flag column to `null` if you want the Integration Appliance to process the row during run time.

In the following example database table, all the values in the Flag column are set initially to `P`, as shown in the following figure:

Initial state of your source database table with additional columns required by the **Poll Table** activity.

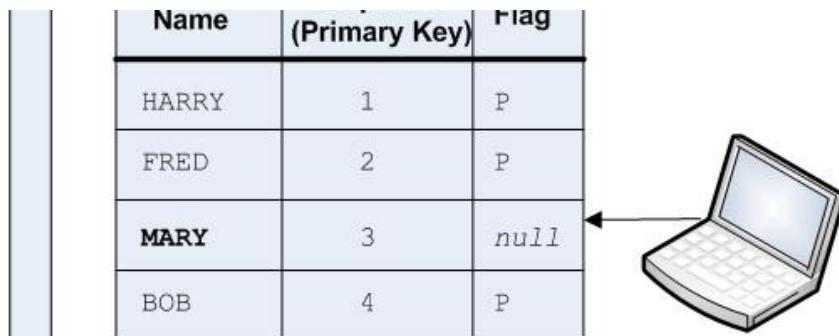

Name	Sequence (Primary Key)	Flag
HARRY	1	P
FRED	2	P
NICK	3	P
BOB	4	P

**Time (in minutes)**      1) Orchestration with **Poll Table** activity is deployed.  
This **Poll Table** activity is set to poll for a change in the database table every 1 minute.

-1-

- 2) The **Poll Table** activity polls for a change in the database table by looking for a null in the Flag column. No change, the activity does not process any data, the polling continues.
- 3) An update is done to the 3<sup>rd</sup> row in the database table from outside source as shown in the following figure.  
**NOTE:** The outside source must also change the Flag value for the 3<sup>rd</sup> row from P to null.

	Sequence	
--	----------	--

- 2- 4) The **Poll Table** activity polls for a change in the database table by checking if the value of the Flag column is set to null for any of the rows. In this example, the Integration Appliance processes the 3<sup>rd</sup> row and returns the 3<sup>rd</sup> row as data that is mapped to the specified variable(s).
- In addition, the Integration Appliance changes the Flag column for the 3<sup>rd</sup> row to P for processed.

A large grey arrow points downwards from the previous section towards this one. To its right is a table with four rows, identical to the one above it, representing the state of the database after processing the third row.

Name	Sequence (Primary Key)	Flag
HARRY	1	P
FRED	2	P
MARY	3	P
BOB	4	P

- 5) The next activity after the **Poll Table** activity in the orchestration is executed in the Integration Appliance.

Attention: You must manage the state of the flag column. After processing a row, the Integration Appliance changes the flag column to P for processed as described in the following example scenario:

1. A row is inserted into the database. The flag column is set to *null* for the row.
2. The Poll Table activity runs for the first time and sets the flag value to P for this row.
3. The same row is updated, and the Poll Table activity runs again. The row is not returned in the return data of the activity because the Integration Appliance checked the flag column and the flag indicated that this row had already been processed.

In order for a row to be processed again by the Integration Appliance, you must reset the flag column back to *null* before an orchestration job with a Poll Table activity accessing the same source database table is run.

The steps for adding and configuring a Poll Table activity to an orchestration are described in the following procedures:

- Add a Poll Table activity in the orchestration
- Create, select, or edit a database endpoint
- Specify the columns of the source table to poll for database operations
- Select the Sequence and Flag columns
- Map the output of the activity

## Add a Poll Table activity in the orchestration

1. [Create](#) or open an orchestration. A graphical representation of the orchestration opens.
2. Select the Activities tab and expand the Database folder.
3. Drag the Poll Table activity onto the orchestration.
4. Select the Poll Table activity.

## Create, select, or edit a database endpoint

---

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer opens.
    - b. Select an existing endpoint and click OK. Skip to the [Specify the columns of the source table to poll for database operations](#) procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer opens.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane shows.
  - o Create a new endpoint:
    - a. Select New. The Create Endpoint pane opens.
2. [Create or edit a database endpoint](#).

## Specify the columns of the source table to poll for database operations

---

1. Click Pick Endpoint from the Checklist. The Pick Endpoint pane opens.
2. Click Browse. The Select a Single Source Table dialog box opens.
3. Select a table that during run time, the Poll Table activity polls for database operations.
4. Select a user schema from the Filter by User Schema list.
5. Select Hide Buffer and Control Tables to filter out any buffer or control tables used by the Integration Appliance.  
Note: This filter only hides buffer and control tables that use the standard names generated in scripts from Studio.
6. Select a single table from the list:
  - o Click >> to add a table.
  - o Click << to remove a table.
7. If you only want to poll for database operations on primary key columns of the source table, select the Select Only the Primary Keys from Table check box.
8. Click OK. The columns of the table show in the Pick Table pane. (If you selected the Select Only the Primary Keys from Tables check box only the primary key columns display.)
9. If the character encoding for this table is different from the encoding for the database, enter another [encoding](#) using one of the following options:
  - o From the Encoding list, select one of the default encoding types.
  - o Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.
10. Select the columns in the table that during run time you want the PPoll Table activity to poll for database operations (insert, delete, or update). By default all columns are selected. Clear the Use check box for unwanted columns. Click Use All to reselect all the columns.
11. Click the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click in the Column Name heading of the column. An arrow shows to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with a and continuing to z. A down arrow indicates the column is sorted by reverse alphabetic order starting with z and continuing to a. Click the arrow to reverse the alphabetic order.
12. If necessary, change the settings of the Data type, Encoding, or Nullable values for each query input parameter. Click the field to make a new selection:
  - o Data Type - Defaults to the data type for the column in the source database table. If the required data type for the column in the buffer table is different from the data type of the source table, select a different data type by clicking in the Data Type cell and selecting another Data Type from the list. You must select an appropriate data type for those data types that are marked [UNSUPPORTED](#).  
Note: (for MONEY and XMLTYPE data types) For the XMLTYPE data type in an Oracle database and the MONEY data types in a SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.
  - o Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable
  - o Encoding - Defaults to current default encoding that was set either at the database level or the table level. If the required encoding for the column is different from the current default encoding, select another encoding by clicking in the Encoding cell and selecting another [Encoding](#) from the list.
  - o Nullable - Defaults to the nullable setting for the column in the source database table. If nullable = false, then the column must be included in the message. The Use check box must be selected for those columns where nullable=false. A column marked nullable=false cannot contain a null during run time.

## Select the Sequence and Flag columns

---

1. Select Choose Columns from the Checklist.
2. Select a Sequence Column from the list. This is the sequence column of  $\text{INTEGER}$  type containing the primary keys (a sequence of unique numbers: 1, 2, 3 ...) that you either added to your source database table or determined that you could use

an existing column in your source database table.

3. Select a Flag Column from the list. A flag column of CHAR type containing a flag that the Integration Appliance sets to *P* when the Integration Appliance has processed the row. The Integration Appliance uses sequence and flag columns to check for duplicate messages. In addition, both columns and the setting of the Delete rows after they have been processed check box in the Delivery Rules pane are used by the Integration Appliance to determine the action for a delete request:

- o If the Delete rows after they have been processed check box is selected, the Integration Appliance sets the flag to *M* and then deletes the row.
- o If the Delete rows after they have been processed check box is cleared, the Integration Appliance sets the flag to *M* and then *P* but the row is not deleted. In order for a row to be processed again by the Integration Appliance, you must reset the flag column back to *null* before an orchestration job with a Poll Table activity accessing the same source database table is run.

4. Configure the [Delivery Rules](#).

Note: If you select the Exactly once option in the Delivery Rules task, you must create control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.

Note: If you select the Exactly Once option, you must enable persistence. For more information, see [Enabling Persistence](#).

5. Configure the [Retry Options](#).

## Map the output of the activity

---

1. Select the Map Outputs task in the Checklist. The output parameters for the activity are displayed under the row element in the From Activity pane. The output parameters displayed in the From Activity pane correspond to the columns you selected in the Pick Table task. If the Batch option was selected in Delivery Rules, the multiple occurrences symbol displays next to the row element.

Note: During run time, the rows output parameter of the Poll Table activity is not populated with the sequence and flag column values. Only the columns selected in the Pick Table task are returned.

2. Map the required output parameters to variables. See [Creating a map](#) for general instructions on mapping. You are not required to map the output parameters for these activities.

## Testing an SSL Database Connection

---

### About this task

---

After creating an endpoint for a database, you must import the CA certificate for the database into Studio and then test the SSL connection to the database. Perform the following procedure to import the database's CA certificate and then test the SSL connection to the database:

### Procedure

---

1. Open a command window.
2. Navigate to the database server, and locate the certificate file ca-cert stored in the server.
3. Copy this file and then navigate to the workstation where Studio is installed.
4. Using the command window, paste the ca-cert copy in the home directory of Studio: C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x
5. Navigate to the security directory of Studio: C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x\security
6. Run the following command to import the ca-cert file into Studio: ..\jre\bin\keytool.exe -import -v -keystore cacerts -storepass changeit -file ..\castiron\_ca\_cert.pem -alias alias\_name Where alias is the alias of the database CA certificate.
7. When you are prompted for a yes or no, type yes (Y) and press Enter.
8. Exit the command window.
9. Open the endpoint for the database server.

10. Verify the following login credentials for the database connection: database server, Port, User, and Password.
11. Click Test Connection
12. If the connection is successful, use this endpoint in Studio orchestrations, then use the Verify tab features to evaluate the orchestration.

## Overview of Box.com connector

---

The Box.com connector connects with Box.com cloud storage SaaS platform and enables the communication with Box.com from IBM Cast Iron platform. This allows users to manage their files and folders on Box.com from IBM Cast Iron platform.

Box.com is a cloud platform that helps users to securely store, share, and manage all their company's files. Whether a user needs to secure confidential business information, develop a custom mobile application, or simplify paper-based office processes, Box.com can help users do more with their content.

You can perform the following activities using Box.com connector:

- Outbound activities:
  - Create Folders
  - Update Folders
  - Delete Folders
  - Get Folder Details
  - Copy Folders
  - Create a Shared Link for a Folder
  - Upload Files
  - Download Files
  - Update Files
  - Delete Files
  - Get File Details
  - Copy Files
  - Create a Shared Link for a File
  - Search Files
  - Create Users
  - Update Users
  - Delete Users
  - Get User Details
  - Create Groups
  - Update Groups
  - Delete Groups
  - Get Group Details
  - Add Users to Groups
  - Delete Users from Groups
  - Create Folder Permissions
  - Delete Folder Permissions
  - Create Documents for HTML View
  - Update HTML View Documents
  - Get HTML View Documents
  - Get Document as Extension
  - View Document as HTML
  - View Box.com File as HTML

The Box.com API version currently supported by this connector is 2.0.

## Creating or editing an endpoint for Box.com activity

---

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to a Box.com. Box.com uses OAuth 2.0 authentication mechanism to authenticate and authorize users to perform operations.

- [Selecting or editing a Box.com endpoint](#)

**Parent topic:** [Box.com Activities](#)

## Selecting or editing a Box.com endpoint

---

To select or edit a Box.com endpoint, perform the following steps:

1. In the **Create Endpoint** or **Edit Endpoint** pane, configure the Box.com endpoint as described in the following table.

**Note:** Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

1. Click **Test Connection** to confirm that the connection details are valid and you are able to connect to the Box.com successfully.
2. Click **OK**.

*Table: Connection properties*

Field Name	Description
OAuth Access Token	OAuth access token generated from Box.com for authentication.
OAuth Refresh Token	OAuth refresh token generated from Box.com while generating OAuth Access token.
Application Client ID	Application client ID of the content API application created in Box.com for OAuth.
Application Client Secret	Application client secret of the content API application created in Box.com for OAuth
Content API URL	URL of Box.com content API with API version. This is prepopulated on the endpoint panel. Change it to specify a different content API URL.
Upload API URL	URL for the Box.com upload API with API version.
View API URL	URL of the Box.com view API with API version. This is prepopulated on the endpoint panel. Change it to specify a different view API URL.
View API Key	API key of the view API application created in Box.com.
Box FTP URL	Specifies the FTP host name of Box.com. This is prepopulated on the endpoint panel. Change it to specify a different Box.com FTP host.
User Name	Specifies the username to connect to Box.com. This is same as the Box.com user ID.
Password	Specifies the password associated with username to connect to Box.com.

**Note:** To generate the access token, refer to the Box.com documentation relating to "OAuth2 Authentication Support in Box.com REST API".

**Parent topic:** [Creating or editing an endpoint for Box.com activity](#)

## Mapping the inputs of the activity

---

To map the inputs of the activity, perform the following step:

- Click the **Map Input** link in the **Configure Activity** section displayed under the orchestration.

**Mandatory fields:** The activity has following mandatory fields:

Name	Type	Required	Description
name	String	Yes	This is used to enter the name of the folder to be created at Box.com.
parent	Object	Yes	The parent object having parent folder details.
id	String	Yes	This is used to set the ID of the parent folder in which a new folder is to be created.

**Note:** The id of base folder at box.com is 0 (zero).

**Optional fields:** This activity does not have any optional fields.

**Parent topic:** [Create Folders activity](#)

---

To map the inputs of the activity, perform the following step:

- Click the **Map Input** link in the **Configure Activity** section displayed under the orchestration.

**Mandatory fields:** The activity has the following mandatory field:

Name	Type	Required	Description
folderId	String	Yes	This is used to specify the ID of the folder to be updated at Box.com.

**Optional fields:** The activity has following optional fields:

Name	Type	Required	Description
name	String	No	This is used to specify a new name of the folder.
description	String	No	This is used to specify the description of the folder.
Parent	String	No	The parent object having parent folder details.
id	String	No	This is used to specify the ID of the parent folder.
shared_link	Object	No	An object representing this item's shared link and associated permissions.
is_password_enabled	Boolean	No	This is used to set the password for shared link. By default, the value of this flag is false.
access	String	No	The level of access required for this shared link. Can be open, company, collaborators, or null to get default share level.
permissions	Object	No	The permissions object.
can_download	Boolean	No	This is used to set whether the shared link should allow download.
can_upload	Boolean	No	This is used to set whether the shared link should allow upload.
can_rename	Boolean	No	This is used to set whether the shared link should allow renaming of folder.
can_delete	Boolean	No	This is used to set whether the shared link should allow should allow deletion of folder.
can_share	Boolean	No	This is used to set whether by using shared link the accessed folder could be shared again.
can_invite_colleague	Boolean	No	This is used to set whether collaborators can be invited using the shared link.
can_set_share_access	Boolean	No	This is used to set whether share access can be added using the shared link.
folder_upload_email	String	No	This is used to specify the email-to-upload address for this folder.
access	String	No	This is used to specify the level of access for folder. Following value can be set as open or collaborators to set level of access.
sync_state	String	No	This is used to set whether Box Sync clients synchronize this folder.
tags	Object	No	The tags object to include array of string.
element	String	No	This is array of string used to specify tags associated with the folder.

## Mapping the inputs of the activity

---

To map the inputs of the activity, perform the following step:

- Click the **Map Input** link in the **Configure Activity** section displayed under the orchestration.

**Mandatory fields:** The activity has following mandatory fields:

Name	Type	Required	Description
id	String	Yes	The ID of the folder to be copied at Box.com.
parent	Object	Yes	The parent object having the destination folder details.
id	String	Yes	The ID of the destination folder where the copy of folder is to be created.

**Optional fields:** The activity has following optional fields:

Name	Type	Required	Description
name	String	No	The new name of the folder to be copied.

**Parent topic:** [Copy Folders activity](#)

## Mapping the inputs of the activity

---

To map the inputs of the activity, perform the following step:

- Click the **Map Input** link in the **Configure Activity** section displayed under the orchestration.

**Mandatory fields:** The activity has following mandatory fields:

Name	Type	Required	Description
folderId	String	Yes	The ID of the folder at Box.com for which a shared link is to be created.
shared_link	OBJEC	Yes	An object representing this item's shared link and associated permissions.

T			
access	STRING	Yes	The level of access required for this shared link. Can be open, company, collaborators, or null to get default share level.
permissions	OBJECT	Yes	The permissions object.
can_download	BOOLEAN	Yes	This is used to set whether the shared link should allow download.
can_upload	BOOLEAN	Yes	This is used to set whether the shared link should allow upload.
can_rename	BOOLEAN	Yes	This is used to set whether the shared link should allow renaming of folder.
can_delete	BOOLEAN	Yes	This is used to set whether the shared link should allow deletion of folder.
can_share	BOOLEAN	Yes	This is used to set whether by using shared link the accessed folder can be shared again.
can_invite_colleague	BOOLEAN	Yes	This is used to set whether colleagues can be invited by using the shared link.
can_set_share_access	BOOLEAN	Yes	This is used to set whether share access can be added by using the shared link.

**Optional fields:** The activity does not have any optional fields.

--------	--------	-----	--

**Optional fields:** The activity has following optional fields:

Name	Type	Required	Description
name	String	No	The new name for the file.
description	String	No	The new description for the file.
shared_link	Object	No	An object representing this item's shared link and associated permissions.
access	String	No	The level of access required for this shared link. Can be open, company or collaborators.
unshared_at	String	No	This is used to specify the timestamp till the shared link remains valid.
permissions	Object	No	The permission object to specify permission associated.
can_download	Boolean	No	This is used to set whether the shared link should allow download.
can_preview	Boolean	No	This is used to set whether the file can be previewed.
parent	Object	No	The parent object.
id	String	No	The ID of the parent folder.
item_status	String	No	Whether this item is deleted or not.
tags	Object	No	Object having array of strings.
elements	String	No	All tags applied to this file.

## Mapping the inputs of the activity

---

To map the inputs of the activity, perform the following step:

- Click the **Map Input** link in the **Configure Activity** section displayed under the orchestration.

**Mandatory fields:** The activity has following mandatory fields:

Name	Type	Required	Description
query	String	Yes	The search criteria to search for files in Box.com.

**Optional fields:** The activity has following optional fields:

Name	Type	Required	Description
fields	String	No	The fields that user wants to get in search results.
scope	String	No	The scope for which you want to limit your search to.
file_extensions	String	No	Limit searches to specific file extensions.
created_at_range	String	No	The date for when the item was created. (ISO-8601)
updated_at_range	String	No	The date for when the item was last updated. (ISO-8601)
size_range	String	No	Filter by a file size range.
owner_user_ids	String	No	Search by item owners.
ancestor_folder_ids	String	No	Limit searches to specific parent folders.
content_types	String	No	Limit searches to specific Box designated content types.
type	String	No	The type you want to return in your search. Can be file, folder, or a web link.
limit	Decimal	No	Number of search results to return.

offset	Decimal	No	The search result at which to start the response.
--------	---------	----	---

**Mandatory fields:** The activity has following mandatory fields:

Name	Type	Required	Description
login	String	Yes	This is used to specify email address of the user to be created at Box.com.
name	String	Yes	This is used to specify the name of the user to be created at Box.com.

**Optional fields:** The activity has following optional fields:

Name	Type	Required	Description
role	String	No	This is userâ€™s enterprise role. Can be coadmin or user.
language	String	No	The language of this user ( <a href="#">ISO 639-1 Language Code</a> ).
is_sync_enabled	Boolean	No	Whether or not this user can use Box Sync.
job_title	String	No	The userâ€™s job title.
phone	String	No	The userâ€™s phone number.
address	String	No	The userâ€™s address.
space_amount	Float	No	The userâ€™s total available space amount in bytes.
tracking_codes	Object	No	An array of key/value pairs set by the userâ€™s administrator.
can_see_managed_users	Boolean	No	Whether this user can see other enterprise users in its contact list.
status	Status	No	Can be â€˜activeâ€™, â€˜inactiveâ€™, â€˜cannot_delete_editâ€™, or â€˜cannot_delete_edit_uploadâ€™.
timezone	String	No	The time zone of this user.
is_exempt_from_device_limits	Boolean	No	Whether to exempt this user from Enterprise device limits.
is_exempt_from_login_verification	Boolean	No	Whether or not this user must use two-factor authentication.

## Mapping the inputs of the activity

---

To map the inputs of the activity, perform the following step:

- Click the **Map Input** link in the **Configure Activity** section displayed under the orchestration.

**Mandatory fields:** The activity has following mandatory fields:

Name	Type	Required	Description
inputType	STRING	Yes	This has following values: <ul style="list-style-type: none"><li>Select CURRENT_USER to get the current user details.</li><li>Select SPECIFIC_USERS to get the details of any specific user. userId becomes mandatory if this option is selected.</li><li>Select ALL_USERS to get details of all users.</li></ul>

**Optional fields:** The activity has following optional fields:

Name	Type	Required	Description
userId	STRING	No	The ID of the user for which details need to be fetched.
fields	STRING	No	The fields that are required to be displayed in the response.
includeEmailAlias	BOOLEAN	No	A collection of email aliases is returned.
includeUserGroups	BOOLEAN	No	A collection of the groups of user is returned.
limit	DECIMAL	No	The maximum number of items to return in a page.
offset	DECIMAL	No	The value at which to begin the response.

# Adding the Get Group Details activity in the orchestration

---

To add the Get Group Details activity in the orchestration, perform the following steps:

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the **Activities** tab and expand the Box.com folder.
3. Drag the Box.com connector “Get Group Details” activity into the orchestration.
4. Select the “Get Group Details” activity in the orchestration. The checklist is displayed for “Get Group Details” activity.

**Parent topic:** [Get Group Details activity](#)

## Creating, selecting, or editing a Box.com endpoint

---

To create, select, or edit a Box.com endpoint, perform the following steps:

1. Click the **Pick Endpoint** task from the checklist and select one of the following actions:
  - a. Select an existing endpoint:
    - i. Select **Browse**. The Project Explorer is displayed.
    - ii. Select an existing endpoint and click **OK**. Go to the [Configuring the activity](#) procedure.
  - b. Select an existing endpoint and edit the endpoint:
    - i. Select **Browse**. The Project Explorer is displayed.
    - ii. Select an existing endpoint and click **OK**.
    - iii. Click **Edit**. The **Edit Endpoint** panel is displayed.
  - c. Create a new endpoint:
    - Select **New**. The **Create Endpoint** panel is displayed.

1. [Create or edit a Box.com endpoint](#).

## Mapping the inputs of the activity

---

To map the inputs of the activity, perform the following step:

- Click the **Map Input** link in the **Configure Activity** section displayed under the orchestration.

**Mandatory fields:** The activity has following mandatory fields:

Name	Type	Required	Description
inputType	String	Yes	This has following two values: <ul style="list-style-type: none"><li>Select ALL_GROUPS to fetch details of all groups.</li><li>Select SINGLE_GROUP to fetch details of specific group. The groupId becomes mandatory if this option is selected.</li></ul>

**Optional fields:** The activity has following optional fields:

Name	Type	Required	Description
fields	String	No	The fields that are required to be displayed in the response.
groupId	String	No	The ID of the group of which the details are to be fetched.
includeGroupMemberships	Boolean	No	This Boolean field is used to get all the group memberships of a user.
includeGroupPermissions	Boolean	No	This Boolean field is used to get the permissions associated with a group
limit	Decimal	No	The maximum number of items to be returned in response.
offset	Decimal	No	The value at which to begin the response.

## Adding the Delete Folder Permissions in the orchestration

---

To add the Delete Folder Permissions activity in the orchestration, perform the following steps:

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the **Activities** tab and expand the Box.com folder.
3. Drag the Box.com connector "Delete Folder Permissions" activity into the orchestration.
4. Select the "Delete Folder Permissions" activity in the orchestration. The checklist is displayed for "Delete Folder Permissions" activity.

**Parent topic:** [Delete Folder Permissions activity](#)

## Creating, selecting, or editing a Box.com endpoint

---

To create, select, or edit a Box.com endpoint, perform the following steps:

1. Click the **Pick Endpoint** task from the checklist and select one of the following actions:
  - a. Select an existing endpoint:
    - i. Select **Browse**. The Project Explorer is displayed.
    - ii. Select an existing endpoint and click **OK**. Go to the [Configuring the activity](#) procedure.
  - b. Select an existing endpoint and edit the endpoint:
    - i. Select **Browse**. The Project Explorer is displayed.
    - ii. Select an existing endpoint and click **OK**.
    - iii. Click **Edit**. The **Edit Endpoint** panel is displayed.
  - c. Create a new endpoint:
    - Select **New**. The **Create Endpoint** panel is displayed.
1. [Create or edit a Box.com endpoint](#).

## Mapping the inputs of the activity

---

To map the inputs of the activity, perform the following step:

- Click the **Map Input** link in the **Configure Activity** section displayed under the orchestration.

**Mandatory fields:** The activity has following mandatory fields:

Name	Type	Required	Description
InputType	String	Yes	This has following two values: <ul style="list-style-type: none"><li>Select ALL_DOCUMENTS to fetch all the documents created in Box.com.</li><li>Select SPECIFIC_DOCUMENT to fetch any particular document from Box.com. documentId field is mandatory if this option is selected.</li></ul>

**Optional fields:** The activity has following optional fields:

Name	Type	Required	Description
documentId	String	No	This is used to provide the ID of the specific document of which HTML content is to be retrieved.
fields	String	No	The names of the specific fields to be retrieved along with document content.
limit	Decimal	No	This is used to specify the maximum number of items to return in a page.
created_before	String	No	This is used to specify the timestamp to retrieve the documents created before it.
created_after	String	No	This is used to specify the timestamp to retrieve the documents created after it.

## Overview of Cassandra Connector

---

Apache Cassandra™, an Apache Software Foundation project, is a massively scalable NoSQL database. Cassandra is designed to handle big data workloads across multiple data centers with no single point of failure, providing enterprises with extremely high database performance and availability.

Cassandra does not use master/slave architecture, but instead uses a peer-to-peer implementation, which avoids the pitfalls, latency problems, single point of failure issues, and performance headaches associated with master/slave setups.

Cassandra™'s architecture makes it perfect for full cloud deployments as well as hybrid implementations that store some data in the cloud and other data on-premises.

A NoSQL database (sometimes called as Not Only SQL) is a database that provides a mechanism to store and retrieve data other than the tabular relations used in relational databases. These databases are schema-free, support easy replication, have simple API, eventually consistent, and can handle huge amounts of data.

You can perform the following activities using Cassandra connector:

- Insert Rows
- Update Rows
- Delete Rows
- Execute Query

The Cassandra version currently supported by this connector is 2.0.14.

## Creating or editing an endpoint for Cassandra activity

---

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to Cassandra platform. Cassandra uses internal authentication mechanism so as to authorize users to perform operations. Internal authentication equates to having user login accounts and their passwords being managed inside Cassandra.

### Selecting or editing a Cassandra endpoint

---

1. In the Create Endpoint or Edit Endpoint pane, configure the Cassandra endpoint as described in the following table.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the Cassandra successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
Server Details	
Node Names	Specifies the list of Nodes in the cluster for Cassandra instance
Port Number	Specifies the list of Ports in the cluster for Cassandra instance.
Authentication	
User Name	Specifies the Authentication user name used for accessing the Cassandra instance. Username should be same for all the nodes.
Password	Specifies the Authentication password used for accessing the Cassandra instance. Password should be same for all the nodes.
Additional Parameters	
Write Consistency Level	<p>The consistency level determines the number of replicas on which the write must succeed before returning an acknowledgment to the client application. Following are the Write Consistency Level supported:</p> <ul style="list-style-type: none"> <li>• ALL</li> <li>• EACH_QUORUM</li> <li>• QUORUM</li> <li>• LOCAL_QUORUM</li> <li>• ONE</li> <li>• TWO</li> <li>• THREE</li> <li>• LOCAL_ONE</li> <li>• ANY</li> </ul> <p>User can change the value by selecting any of the write consistency level.</p>
Read Consistency Level	<p>The consistency level specifies how many replicas must respond to a read request before returning data to the client application.</p> <p>Following are the Read Consistency Level supported:</p> <ul style="list-style-type: none"> <li>• ALL</li> <li>• EACH_QUORUM</li> <li>• QUORUM</li> <li>• LOCAL_QUORUM</li> <li>• ONE</li> <li>• TWO</li> <li>• THREE</li> <li>• LOCAL_ONE</li> <li>• ANY</li> </ul> <p>User can change the value by selecting any of the Read consistency level.</p>
Connection Pool Options	
Core Connections per Host	The core number of connections per host. Default value is 8 for Local Host Distance and 2 for Remote Host Distance.
Max Connections per Host	The maximum number of connections per host. Default value is 8 for Local Host Distance and 2 for Remote Host Distance.
Heartbeat Interval (seconds)	Default: 30 seconds. The driver provides application-side keep alive in the form of a connection heartbeat by sending a dummy request. The feature is enabled by default.
Pool Time Out (milli seconds)	The time duration for which the driver is blocked to wait for the connection availability from host pool. If this option is set to zero, the driver won't wait at all.
Security	

Field Name	Description
Enable Encryption	Specifies that the connection should use SSL.

Note: In addition with the above parameters; there is also a provision for Secure Connector configuration to connect the Endpoint with Cassandra instance.

## Data Types Supported by the Cassandra Connector

---

Following Data Types are supported by the Cassandra Connector:

- Ascii
- bigint
- Blob
- boolean
- Counter
- Decimal
- Double
- Float
- Inet
- Int
- List
- Map
- Set
- text
- timestamp
- timeuuid
- tuple
- uuid
- varchar
- varint

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Cassandra\\_creating\\_an\\_endpoint\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Cassandra_creating_an_endpoint_activity.html)

## Using the Cassandra Insert Rows Activity

---

Use the Insert Rows Activity to insert records in the existing tables in Cassandra.

### About this task

---

Use this task to insert rows in the Cassandra. The call to this Activity is a synchronous call where the input data is sent to the Activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Cassandra folder contents.
2. Drag the Insert Rows activity icon onto the orchestration. Select the activity. The Cassandra Insert Activity Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Cassandra endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.

8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Under Configure, click PickTable and provide Keyspace name. Click Browse to dynamically select a table from the current list of tables in the database specified by the Endpoint.

To select a table, choose one of the following options:

- o Click on a table in the list and click OK.
- o Provide the table name in the "Filter Table" section and click on search button.

Note: In the Pick Table section the checkbox "Update row if row already exists (not applicable for batch)" helps to update the existing values in the table. If the checkbox is checked then, if a record with same key already exists, it would get updated. The same is not applicable when batch is enabled in delivery rules section.

11. Review that all the columns of selected table are displayed in the grid.
  12. Encoding UTF-8 is a standard character encoding for Unicode. This is the default encoding.
  13. If in case you have added/updated/deleted the existing columns in the table, use Refresh button to get the updated column details for the selected table.
- Note:
- o To insert only one row in the database, directly select the Map Inputs section.
  - o To insert multiple records, the user needs to select the option of Delivery Rules and enable the checkbox for Batch.

14. Under Delivery Rules, select Enable Batch checkbox and define the number of rows you want to insert at a time.

- a. Once the checkbox is selected, the Batch Type will be populated in the drop down section which is as follows:
- LOGGED
  - UNLOGGED

- b. Select any one of the above batch type.

- c. The default value in the "Write Consistency Level" dropdown is the one which is selected while creating the endpoint in the test connection. User can change the value by selecting any of the consistency level.

15. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected table of the Insert Rows Activity are displayed as nodes under the request input parameter in the To Activity panel.

For Column type map<?,?>, the schema would contain key, value as a recursive element node.

The sample input request for Map data type:

```
<to_do>
    <key>Delivery</key>
    <value>Cassandra</value> </to_do> <to_do>
        <key>QA</key>
        <value>SharePoint</value>
    </to_do>
```

For Column type set<?> and List<?> the schema would contain a recursive element node.

The sample input request for Set, List data type:

```
<email>john_0@abc.com</email>
<email>john_1@abc.com</email>
<email>john_2@abc.com</email>

<projects>Cassandra</projects>
<projects>MailChimp</projects>
<projects>SharePoint</projects>
```

16. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by mapping the element with an input node. During run time if no value is provided for a mandatory element, the Activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.

18. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Cassandra Insert Rows activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Object Name (For example: Filter) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

## Using the Cassandra Update Rows Activity

---

Use the Update Rows Activity to update records in Cassandra.

### About this task

---

Use this task to update records in the Cassandra instance. The call to this Activity is a synchronous call where the input data is sent to the Activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Cassandra folder contents.
2. Drag the Update Rows activity icon onto the orchestration. Select the activity. The Cassandra Update Rows Activity Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Cassandra endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Under Configure, click PickTable and provide Keyspace name. Click Browse to dynamically select a table from the current list of tables in the database specified by the Endpoint.

To select a table, choose one of the following options:

- o Click on a table in the list and click OK.
  - o Provide the table name in the “Filter Table” section and click on search button.
11. Review that all the columns of selected table are displayed in the grid.
  12. Encoding UTF-8 is a standard character encoding for Unicode. This is the default encoding.
  13. If in case you have added/updated/deleted the existing columns in the table, use Refresh button to get the updated column details for the selected table.  
Note:
    - o To update only one row in the database, directly select the Map Inputs section.
    - o To update multiple records, the user needs to select the option of Delivery Rules and enable the checkbox for Batch.
  14. Under Configure, click Delivery Rules. select Enable Batch checkbox and define the number of rows you want to update at a time.
    - a. Once the checkbox is selected, the Batch Type will be populated in the drop down section which is as follows:
      - LOGGED
      - UNLOGGED
      - COUNTER
    - b. Select any one of the above batch type.
    - c. The default value in the “Write Consistency Level” dropdown is the one which is selected while creating the endpoint in the test connection. User can change the value by selecting any of the consistency level.
  15. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected table of the Update Rows Activity are displayed as nodes under the request input parameter in the To Activity panel.

For Column type map<??>, the schema would contain key, value and update option.

The valid UpdateOption for map would be:

- o Add: To add the key value pair.
- o Remove: To remove the specified key. In case of remove, the value element should not be set to any value or mapping.

The sample input request for Map data type:

```
<to_do>
<key>Staging</key>
<value>Box.com</value>
<updateOption>Add</updateOption>
</to_do>
```

For Column type set<?> and List<?> the schema would contain a recursive element value and UpdateOption.

The valid UpdateOption values for Column Type List<?> are as follow:

- o Append: To append a single value at the end of the existing list.
- o Prepend: To prepend a single value at the beginning of the existing list.
- o Discard: To discard a single value from an existing list.
- o Append All: To append a collection of values at the end of the existing list.
- o Prepend All: To prepend a collection of values at the beginning of the existing list.
- o Discard All: To discard a collection of values from an existing list.

The valid UpdateOption values for Column Type Set<?> are as follow:

- o Add: To add a single value in an existing set.
- o Remove: To remove a single value from an existing set.
- o Add All: To add a collection of values in an existing set.
- o Remove All: To remove a collection of values from an existing set.

The sample input request for List, Set data type:

```
<email>
<value>john_3@abc.com</value>
<value>john_4@abc.com</value>
<value>john_5@abc.com</value>
<updateOption>Append</updateOption>
</email>

<projects>
<value>Salesforce.com</value>
<value>Box.com</value>
<value>SL</value>
<updateOption>Add All</updateOption>
</projects>
```

16. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by mapping the element with an input node. During run time if no value is provided for a mandatory element, the Activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.

18. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Cassandra Update Rows activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Object Name (For example: Filter) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

## Using the Cassandra Delete Rows Activity

Use the Delete Rows Activity to delete records from Cassandra.

### About this task

Use this task to Delete Row from the Cassandra instance as well as to delete the single column data from the database. The call to this Activity is a synchronous call where the input data is sent to the Activity for processing and the response is sent back to the orchestration.

### Procedure

1. In an active orchestration, open the Activities tab and expand the Cassandra folder contents.
2. Drag the Delete Rows activity icon onto the orchestration. Select the activity. The Cassandra Delete Rows Activity Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Cassandra endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Under Configure, click Pick Table and provide Keyspace name. Click Browse and select the respective table.

To select a table, choose one of the following options:

- o Click on a table in the list and click OK.
- o Provide the table name in the "Filter Table" section and click on search button.

11. Encoding UTF-8 is a standard character encoding for Unicode. This is the default encoding.

Note:

- o To delete only one row in the database, directly select the Map Inputs section.
- o To delete multiple records, the user needs to select the option of Delivery Rules and enable the checkbox for Batch.

12. Under Configure, click Delivery Rules. Select Enable Batch checkbox and define the number of rows you want to delete at a time.

- a. Once the checkbox is selected, the Batch Type will be populated in the drop down section which is as follows:

- LOGGED
- UNLOGGED
- COUNTER

- b. Select any one of the above batch type.

- c. The default value in the "Write Consistency Level" dropdown is the one which is selected while creating the endpoint in the test connection. User can change the value by selecting any of the consistency level.

13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected table of the Delete Rows Activity are displayed as nodes under the request input parameter in the To Activity panel.

Following are the two cases for Delete:

- o Row Level Delete: Delete entire row based on the primary key value only
  - o Column Level Delete: Delete values of a column from the rows based on the primary key and column name values
- Note: The user has to specify the column names in the recurring "columnsToDelete" node. If "columnsToDelete" is empty, then entire row would be deleted based on the primary key values, else it would be considered as column level delete.
14. Create a map between the orchestration variables and the input parameter of the activity.
- Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by mapping the element with an input node. During run time if no value is provided for a mandatory element, the Activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.
- 289

## Results

---

You have configured the Cassandra Delete Rows activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Object Name field in the To Activity pane of Map Inputs, and select Expand Occurrences.

## Using the Cassandra Execute Query Activity

---

Use the Execute Query Activity to retrieve the records from Cassandra.

### About this task

---

Use this task to retrieve records from the Cassandra instance. The call to this Activity is a synchronous call where the input data is sent to the Activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Cassandra folder contents.
2. Drag the Execute Query activity icon onto the orchestration. Select the activity. The Cassandra Execute Query Activity Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Cassandra endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Under Configure, click Enter Query and provide the query in the white space displayed in the pane. Do not place semicolons at the end of your query.  
Note: Only the select SQL statement is supported in the Execute Query Activity.
11. Validate the Query using ValidateQuery button.
12. The default value in the Consistency Level dropdown is the one which is selected while creating the endpoint in the test connection. User can change the value by selecting any of the consistency level.
13. Under Configure, select the Setup Input Parameters task. The Setup Input Parameters pane shows the input parameter or parameters of the query. If no query parameter is provided in where clause then Setup Input Parameter section will be empty.
14. Under Configure, select the Setup Result Set task. The Setup Result Set pane opens and the defaults for the output parameter or parameters of the query are listed.  
Note:
  - o The column names mentioned in the select clause will get displayed in the Setup Result Set section.
  - o If `~*` is mentioned in the select clause then all the column names from the table will get displayed in Setup Result Set section.
15. Select the Map Inputs in the Checklist. The XML Schemas generated from the Setup input parameter of the Execute Query Activity are displayed as nodes under the request input parameter in the To Activity panel.
16. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by mapping the element with an input node. During run time if no value is provided for

a mandatory element, the Activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
18. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Cassandra Execute Query activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Object Name field in the To Activity pane of Map Inputs, and select Expand Occurrences.

## Creating or editing an endpoint for Coupa activity

---

Endpoints provide the configuration information that the Studio, the Integration Appliance and the cloud based Cast Iron Live platform use to connect to a Coupa. Coupa uses token based authentication mechanism to authenticate and authorize users to perform operations.

Selecting or editing a Coupa endpoint

To select or edit a Coupa endpoint:

1. In the **Create Endpoint** or **Edit Endpoint** pane, configure the Coupa endpoint as described in the following table.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

1. Click **Test Connection** to confirm that the connection details are valid and you are able to connect to the Coupa successfully.
2. Click **OK**.

*Table: Connection properties*

Field Name	Description
Host Name	Coupa host name
API Key	API key generated from Coupa

**Note:** To generate the API key, refer to the Coupa documentation relating to "Coupa API authentication".

*Table: Proxy Connection properties*

Field Name	Description
Proxy Host	Host name of the proxy server
Proxy Port	Port number needed to connect to the proxy server
Proxy User Name	User name needed to connect to the proxy server
Proxy Password	Password needed to connect to the proxy server

**Parent topic:** [Coupa Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Coupa\\_creating\\_or\\_editing\\_an\\_endpoi.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Coupa_creating_or_editing_an_endpoi.html)

## Custom Fields support

Coupa supports custom fields. Provision is given in the connector to create, update and retrieve objects having custom fields.

For Create and Update activities, in the MapInputs, each object and its child nodes will have additional nodes for custom fields so that user can provide values for them.

For Query and Retrieve activities, the response object will have additional nodes to identify the custom fields.

The format of custom fields for these activities is as shown below:

```
<customFields>
<customFieldName>dept-id</customFieldName>
<customFieldValue>HR</customFieldValue>
</customFields>
```

## Objects Supported by the Coupa Connector

The below objects are supported by Coupa Connector:

X = Operation is supported for the object

Coupa Master Data Objects	Coupa R22			
Create	Retrieve	Update	Query	
Accounts	X	X	X	X
Addresses	X	X	X	X
Budget Lines	X	X	X	X
Currencies	Â	X	Â	X
Exchange Rates	X	X	Â	X
Catalog Items	X	X	X	X
Supplier Items	X	X	Â	X
Suppliers	X	X	X	X
Users	X	X	X	X
Contracts	X	X	X	X
Departments	X	X	X	X
Remit To Addresses	X	X	X	X
Account Validation Rules	X	X	X	X
Content Groups	X	X	Â	X
Lookup Values	X	X	X	X

Coupa Transactional Data Objects	Coupa R22			
Create	Retrieve	Update	Query	
Approvals*	Â	Â	Â	Â
Expense Reports	X	X	X	X
Inventory Transactions	X	X	Â	X
Invoices	Â	X	X	X
Invoice Payments	Â	Â	X	Â
Purchase Orders	Â	X	X	X
Requisitions	X	X	Â	X
Purchase Order Revisions	Â	X	Â	X
Expenses Lines	Â	X	Â	X

**\*Note:** Metadata is not retrieved for Approval object, hence the object is not supported in the connector.

## Using the Coupa Create activity

Use the Coupa Create activity to create objects in the Coupa instance.

Use this task to create objects in the Coupa instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active orchestration, open the **Activities** tab and expand the **Coupa** folder contents.
2. Drag the **Create** activity icon onto the orchestration. The Coupa Create Object **Checklist** is displayed.
3. In the **Checklist**, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the **Checklist**, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Coupa endpoint.
7. Optional: You can create the endpoint by clicking **New** and specifying the required connection details. Click **OK** to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the **Checklist**, click **Configure**.
10. Click **Browse** to select the object type. The **Browse Coupa** window is displayed.
11. In **Browse Coupa**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
12. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the **Checklist**, click **Retry**. Review the default settings and make the required changes.
14. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Create Objects** activity are displayed as nodes under the request input parameter in the **To Activity** panel.
15. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Coupa Create Objects activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the **cObject** in the **To Activity** pane of **Map Inputs**, and select **Expand Occurrences**.

## Using the Coupa Query activity

---

Use the Coupa Query activity to filter and fetch objects in the Coupa instance.

Use this task to filter and fetch objects in the Coupa instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active orchestration, open the **Activities** tab and expand the **Coupa** folder contents.
2. Drag the **Query** activity icon onto the orchestration. The Coupa Query Object **Checklist** is displayed.
3. In the **Checklist**, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the **Checklist**, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Coupa endpoint.
7. Optional: You can create the endpoint by clicking **New** and specifying the required connection details. Click **OK** to save and use the endpoint for this configuration.

8. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the **Checklist**, click **Configure**.
10. Click **Browse** to select the object type. The **Browse Coupa** window is displayed.
11. In **Browse Coupa**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
12. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the **Checklist**, click **Retry**. Review the default settings and make the required changes.
14. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Query Objects** activity are displayed as nodes under the request input parameter in the **To Activity** panel.
15. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

*Table: Map Inputs parameters*

Field Name	Description
limit	The parameter is used to paginate the results. It will limit the number of records retrieved to the specified value. The maximum number of results returned are 50 at a time even if the <b>limit</b> value is given more than 50.
offset	The parameter is used to paginate the results. The records are retrieved starting from the specified offset.
operators	The search criteria. Multiple criteria can be specified by expanding occurrences for <b>operators</b> .
standardFieldName	The standard field name to be used in the criteria. Either of <b>standardFieldName</b> or <b>customFieldName</b> should be specified. Only first level field names should be specified.
customFieldName	The custom field name to be used in the criteria. Either of <b>standardFieldName</b> or <b>customFieldName</b> should be specified. Only first level field names should be specified.
operator	The operator to be applied.
value	The value of the field used in the search

You have configured the Coupa Query Objects activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the **To Activity** pane of **Map Inputs**, and select **Expand Occurrences**. Only multiple objects of the same type are supported.

**Parent topic:** [Coupa Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Coupa\\_using\\_the\\_coupa\\_query\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Coupa_using_the_coupa_query_activity.html)

## Using the Coupa Retrieve activity

---

Use the Coupa Retrieve activity to retrieve objects in the Coupa instance.

Use this task to retrieve all objects based on ID in the Coupa instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active orchestration, open the **Activities** tab and expand the **Coupa** folder contents.

2. Drag the **Retrieve** activity icon onto the orchestration. The Coupa Retrieve Object **Checklist** is displayed.
3. In the **Checklist**, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the **Checklist**, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Coupa endpoint.
7. Optional: You can create the endpoint by clicking **New** and specifying the required connection details. Click **OK** to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the **Checklist**, click **Configure**.
10. Click **Browse** to select the object type. The **Browse Coupa** window is displayed.
11. In **Browse Coupa**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
12. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the **Checklist**, click **Retry**. Review the default settings and make the required changes.
14. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Retrieve Objects** activity are displayed as nodes under the request input parameter in the **To Activity** panel.
15. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

*Table: Map Inputs parameters*

Field Name	Description
retrieveAll	If the user wants to fetch all the records of a particular object type, then he should set this parameter to <b>true</b> . Default value is <b>false</b> . The parameter is ignored if value for <b>id</b> is specified.
limit	Applicable only if <b>retrieveAll</b> is <b>true</b> . The parameter is used to paginate the results. It will limit the number of records retrieved to the specified value. The maximum number of results returned are 50 at a time even if the <b>limit</b> value is given more than 50.
offset	Applicable only if <b>retrieveAll</b> is <b>true</b> . The parameter is used to paginate the results. The records are retrieved starting from the specified offset.
id	The object id for which data has to be retrieved. This parameter is given preference over <b>retrieveAll</b> , the value of <b>retrieveAll</b> is ignored if <b>id</b> is specified.
supplierId	The associated supplier id. Applicable only for <b>RemitToAddress</b> object.

You have configured the Coupa Retrieve Objects activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the **ID** field in the object in the **To Activity** pane of **Map Inputs**, and select **Expand Occurrences**.

**Parent topic:** [Coupa Activities](#)

---

[Feedback | Notices](#)

## Using the Coupa Update activity

---

Use the Coupa Update activity to update objects in the Coupa instance. Coupa does not support “Delete” operation via the API, so the activity can be used to deactivate objects by setting the status to “inactive”.

Use this task to update objects in the Coupa instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

1. In an active orchestration, open the **Activities** tab and expand the **Coupa** folder contents.
2. Drag the **Update** activity icon onto the orchestration. The Coupa Update Object **Checklist** is displayed.
3. In the **Checklist**, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the **Checklist**, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Coupa endpoint.
7. Optional: You can create the endpoint by clicking **New** and specifying the required connection details. Click **OK** to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the **Checklist**, click **Configure**.
10. Click **Browse** to select the object type. The **Browse Coupa** window is displayed.
11. In **Browse Coupa**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
12. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the **Checklist**, click **Retry**. Review the default settings and make the required changes.
14. Select the **Map Inputs** in the **Checklist**. The XML Schemas generated from the selected object of the **Update Objects** activity are displayed as nodes under the request input parameter in the **To Activity** panel.
15. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the **Map Outputs** in the **Checklist**. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Coupa Update Objects activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the **cObject** in the **To Activity** pane of **Map Inputs**, and select **Expand Occurrences**.

## Domino Activities

---

- [Overview of the Domino connector](#)
- [Creating or editing an endpoint for a Domino activity](#)

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a IBM® Lotus® Domino® server. Lotus Domino server provides services like email server, application server, web server, database server, and

directory server. Business data on the server is stored as documents in the Domino databases (.nsf files). Domino connector provides bidirectional connectivity to work with these documents.Â

- [Creating a Domino document](#)

Use the Create Document activity to create a document in the Domino server.

- [Updating a Domino document](#)

Use the Update Document activity to update a document in the Domino database. Each updated document must be uniquely identifiable by its UniversalID or NotesID.

- [Retrieving a Domino document](#)

Using the Retrieve Activity, you can retrieve a document from a Domino database. Each retrieved document is uniquely identified by its UniversalID or NotesID. The retrieval is done based on the input, that is, either the UniversalID or the NotesID.

- [Querying Domino documents](#)

The Query Document activity is used to query documents from the database in the LotusÂ® DominoÂ® server that matches the values that are specified in the document fields.

- [Querying views for Domino documents](#)

The Query Views activity is used to query views from the database in the LotusÂ® DominoÂ® server that matches the values that are specified in the document fields that are present in the view.

- [Deleting a Domino document](#)

Use the Delete Activity to delete a document from the Domino database. Each deleted document must be uniquely identifiable by its UniversalID or NotesID.

- [Getting events from Domino server](#)

The Get Events activity is used to get events from the database in the IBM DominoÂ® server that matches the values that are specified in the input fields of Map Inputs.

- [Getting invitations from Domino server](#)

The Get Invitations activity is used to get invitations from the database in the IBM DominoÂ® server that matches the values that are specified in the input fields of Map Inputs.

- [Getting notices from Domino server](#)

The Get Notices activity is used to get notices from the database in the IBM DominoÂ® server that matches the values that are specified in the input fields of Map Inputs.

- [Processing calendar events in Domino server](#)

The Process Calendar Events activity is used to process an action on an existing calendar event in a database in the IBM DominoÂ® server that matches the values that are specified in the input fields that are present in the Map Inputs.

- [Processing calendar notices in Domino server](#)

The Process Calendar Notices activity is used to process an action on an existing calendar Notice in a database of the IBM DominoÂ® server that matches the values that are specified in the input fields present in Map Inputs.

- [Creating calendar events in Domino server](#)

The Create Calendar Events activity is used to create the calendar events from the database in the IBM DominoÂ® server that matches the values that are specified in the input fields of Map Inputs.

- [Updating calendar events in Domino server](#)

The Update Calendar Events activity is used to update the calendar events from the database in the IBM DominoÂ® server that matches the values that are specified in the input fields of Map Inputs.

- [Deleting calendar events from Domino server](#)

The Delete Calendar Events activity is used to delete calendar events from the database in the IBM DominoÂ® server that matches the values that are specified in the input fields of Map Inputs.

- [Specifying Retry and Delivery Options for Domino activities](#)

Specifying the Retry and Delivery parameters is one of the tasks to configure a Domino activity configuration.

- [Prerequisites to use Domino inbound activities](#)

- [Get Created Documents activity](#)

Use the Get Created Documents activity to get the documents (which are of interest) that were created on the Domino server.

The activity polls the event table in the Domino server for new events periodically and process them.

- [Get Updated Documents activity](#)

Use the Get Updated Documents activity to get the documents (which are of interest) that got updated on the Domino server.

The activity polls the event table in the Domino server for new events periodically and process them.

- [Get Deleted Documents activity](#)

Use the Get Deleted Documents activity to get the documents (which are of interest) that were deleted on the Domino server.

The activity polls the event table in the Domino server for new events periodically and process them.

- [Handling Date/Time and Time zone data types](#)

In the Lotus Domino form, a field of Date/Time type can be configured to represent only a date value, time value, or both date and time values. This configuration is done while creating/editing the form in Domino Designer. So, when a document is created for such a form, the value can be a date, time, or a datetime.

- [Rich text support for Domino connector](#)

The Domino connector supports RichText type in forms. Fields of RichText type can store both text and attachments as part of the document. The connector supports attachments only for the Retrieve and Query Document activities. Text content can be used for the Create, Update, Retrieve, and Query Document activities.

- **Troubleshooting and support**

Troubleshooting techniques and self-help information help you identify and solve problems quickly. This topic provides potential solutions for issues you would have with the Domino connector.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_dominoactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_dominoactivities.html)

## Overview of the Domino connector

---

The Domino® connector enables a two-way communication between Cast Iron® and IBM Domino server. The business data can be Domino documents such as a calendar entry, a to-do item, or a note.

You can perform the following activities using the Domino connector:

- Outbound Activities
  - [Create Documents](#)
  - [Update Documents](#)
  - [Delete Documents](#)
  - [Query Documents](#)
  - [Query Views](#)
  - [Retrieve Documents](#)
  - [Get Events](#)
  - [Get Invitations](#)
  - [Get Notices](#)
  - [Process Calendar Events](#)
  - [Process Calendar Notices](#)
  - [Create Calendar Events](#)
  - [Update Calendar Events](#)
  - [Delete Calendar Events](#)
- Inbound/Starter Activities
  - [Get Created Documents](#)
  - [Get Updated Documents](#)
  - [Get Deleted Documents](#)

The Calendar Service is an addition to the family of REST services in the IBM Domino Server, from V9.0.1. Using Calendar Service you can perform create/retrieve/update/delete operations on the Calendar Events, Invitations, and Notices. An event in Domino stands for a Meeting, Recursive Meeting, All Day Event, Appointment, Recursive Appointment, and a Reminder. A Notice can be an Invitation for a Calendar Event or an update information of a Calendar Event.

The Domino connector supports the REST Based APIs of Calendar Service of IBM Domino Server from V7.0.0.1. The activities listed below are added to support this service :

- Create Calendar Events
- Update Calendar Events
- Delete Calendar Events
- Get Events
- Get Invitations
- Get Notices
- Process Calendar Events
- Process Calendar Notices

The versions of IBM Domino supported by the connector depend on the support lifecycle of IBM Domino. You can configure the connector with all the versions of IBM Domino that are currently supported. The IBM Domino versions that are currently supported are 8.0.x, 8.5.x, 9.0, and 9.0.1. The Domino connector cannot be used to connect to a Lotus Notes® client directly. It always connects to the IBM Domino server.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_Overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_Overview.html)

## Creating or editing an endpoint for a Domino activity

---

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a IBM® Lotus® Domino® server. Lotus Domino server provides services like email server, application server, web server, database server, and directory server. Business data on the server is stored as documents in the Domino databases (.nsf files). Domino connector provides bidirectional connectivity to work with these documents.Â

### Selecting or editing a Domino endpoint

---

1. In the Create Endpoint or Edit Endpoint pane, configure the Domino server as described in the following table. In addition to these fields, the endpoint pane contains Connection pool options and Remote Endpoint Configuration.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the Domino server successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
<b>Domino Server Configuration</b>	
Host Name	Specifies the host name or IP address of the machine on which Domino server is running.
DIIOP Port	Specifies the Domino Internet Inter ORB Protocol (DIIOP) port that allows Java, applets or applications to access Domino data remotely using CORBA. The default value is 63148.
User Name	Specifies the user name to connect to the Domino server.
Password	Specifies the password associated with the user name to connect to the Domino server.
Note: For outbound activities such as Create, Update, Retrieve, Query, and Delete, you can dynamically specify a different Domino server during Map Inputs. The server details in the Map Inputs section holds preference to the regular endpoint declaration.	
<b>Connection Pool options</b>	
Minimum Connections	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
Maximum Connections	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
Maximum Idle Time	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool â€œno idle time. The default value is 120 minutes.
Maximum Wait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
Reclaim Connections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.
Â	Note: The Connection pool properties need to be configured as per the load (number of concurrent requests) on the endpoint.

Field Name	Description
<b>Remote Endpoint Configuration</b>	
Endpoint Runs Behind Firewall	Enables the secure connector name property so that secure connector can be used if the Lotus Domino server is running behind a firewall.
Secure Connector Name	Specifies the name of the secure connector that is used to connect to the Lotus Domino server running behind a firewall. For example, if an orchestration containing Domino activity is deployed on to Cast Iron Live (cloud), then the secure connector needs to be configured.

**Parent topic:** [Domino Activities](#)

[Feedback](#) | [Notices](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_creating\\_an\\_endpoint\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_creating_an_endpoint_activity.html)

## Creating a Domino document

Use the Create Document activity to create a document in the Domino® server.

### Using the create activity

1. Right-click **Orchestration** in the **Project** pane and click **New Orchestration** to create or open an orchestration. The orchestration pane is displayed.
2. Select the **Activities** tab and expand the **Domino** folder.
3. Drag **Create Document** activity from the **Domino** folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
4. The **Checklist** pane lists the tasks (**Summary**, **Pick Endpoint**, **Configure**, **Map inputs**, **Map outputs**) that you must complete to configure the outbound activity.
5. Click **Pick Endpoint**, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#)

6. Click **Configure** from the Checklist. The Configure pane is displayed.
  - Click **Browse** to select an existing database from the **Browse Domino databases** pane. The **Browse Domino databases** display all the databases for the selected endpoint.
  - Click **Next** to select an existing form from the **Browse Domino Forms** pane. The **Browse Domino Forms** displays all the forms present in the selected database of the Domino server.

Note: The Next button is enabled only after selecting the database name.

### Specifying the map inputs for create activity

1. Click **Map Input** from the **Checklist** pane.

The input parameters for the specific Domino activity are displayed under the **To Activity** pane.

Note: You *must* map all the required input parameters of the activity, whose data comes from previous activity.

Note: To populate dynamically added fields of the Domino document, which are not part of the map inputs structure, use the **AdditionalFields** property and provide the field names and field values in **FieldDetails** section.

For Form Types that are same across multiple databases, you can now specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this you must specify the database name in the **databaseName** optional parameter (described in the table given below). If the **databaseName** parameter is populated with a value, the outbound operation will be performed on the database specified in the **databaseName** parameter. If there is no value specified, the database name specified during configuration will be used to perform the outbound operation.

The optional input parameter is described in the following table:

Table 1. Database name optional parameter

Parameter Name	Description
databaseName	Specifies the database name that can be dynamically added in map inputs to enable a single orchestration to perform outbound operations across multiple databases having the same Form Type.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in the endpoint page, add the new optional parameters in `dominoConnectionProperties` of map inputs. The parameters of `dominoConnectionProperties` are described in the following table:

Table 2. Optional connection parameters

Parameters	Description
dominoConnectionProperties parameters	
hostName	Specifies the host name or IP address of the machine on which Domino server is running.
diiopPort	Specifies the Domino Internet Inter ORB Protocol (DIIOP) port that allows Javaâ„¢ applets or applications to access Domino data remotely using CORBA. The default value is 63148.
username	Specifies the user name to connect to the Domino server.
password	Specifies the password associated with the user name to connect to the Domino server.
connectionPool parameters	
minimumConnections	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
maximumConnections	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
maxIdleTime	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool â€”no idle time. The default value is 120 minutes.
maxWait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
reclaimConnections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.

## Specifying the map outputs create activity

- Click **Map output** from the **Checklist** pane.

The output parameters for the Domino activity are displayed under the **From Activity** pane.

The response of the `AdditionalFields` property is also displayed in the From Activity pane.

Some of the common output parameters are defined in the following table.

Parameter Name	Description
UniversalID	A UniversalID of a document is a read/write property that uniquely identifies a document across all replicas of a database. In character format, the UniversalID is a 32-character combination of hexadecimal digits (0-9, A-F). The UniversalID is also known as the uniqueID or UNID. The datatype is string.

Note sID	A NotesID of a document is a read only property and has a hexadecimal value of up to 8 characters, which uniquely identifies a document within a particular database. A note ID represents the location of a document within a specific database file. So the documents that are replicas of one another generally have different note IDs. A note ID does not change, unless the document is deleted.
Form	A form provides the structure for creating and displaying documents, which are the design elements that store data in the database. When you enter the information in a form and save it, the information is saved as a document. When you open the document, the document uses the form as a template to provide the structure for displaying the data. Note: Changing a form (for example, by adding a field) does not change documents previously created with that form until they are modified and saved, either manually or automatically by an agent. Removing a field from a form does not remove the value of that field from previously created documents.
ParentDo cume ntUN ID	A parentdocumentUNID of a document is a read-only property. It is defined as the universal ID of a document's parent, if the document is a response document. If a document does not have a parent, it returns an empty string (""). The datatype is string.

Note: You can map the output parameters of the activity based on requirement.

## Summary flag (field flag) behavior

When a document is created for a form containing fields of type Authors, Readers, or Names; and data is set for these fields in the Map Input, the summary flag is set with proper permissions based on the Domino field type. This feature is supported from Domino server version 8.5.3 onwards.

For example:

1. If a Domino field of type Authors is set with a value CN=SYSTEM/O=IBM, the summary flag will be **SUMMARY READ/WRITE-ACCESS NAMES "CN=SYSTEM/O=IBM"**.
2. If a Domino field of type Readers is set with a value CN=SYSTEM/O=IBM, the summary flag will be **SUMMARY READ-ACCESS NAMES "CN=SYSTEM/O=IBM"**.
3. If a Domino field of type Names is set with a value CN=SYSTEM/O=IBM, the summary flag will be **SUMMARY NAMES "CN=SYSTEM/O=IBM"**.

**Parent topic:** [Domino Activities](#)

[Feedback](#) | [Notices](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_create\\_outactivity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_create_outactivity.html)

## Updating a Domino document

Use the Update Document activity to update a document in the Domino® database. Each updated document must be uniquely identifiable by its UniversalID or NotesID.

### Using the update activity

1. Right-click **Orchestration** in the **Project** pane and click **New Orchestration** to create or open an orchestration. The orchestration pane is displayed.
2. Select the **Activities** tab and expand the **Domino** folder.
3. Drag **Update Activity** from the **Domino** folder onto the orchestration. The graphical representation of the orchestration, along with the Checklist pane is displayed.
4. The **Checklist** pane lists the tasks (**Summary**, **Pick Endpoint**, **Configure**, **Map Inputs**, **Map Outputs**) that you must complete to configure an outbound activity.
5. Click **Pick Endpoint**, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#)

- Click Configure from the Checklist. The Configure pane is displayed.
  - Click Browse to select an existing database from the Browse Domino databases pane. The Browse Domino databases display all the databases for the selected endpoint.
  - Click Next to select an existing form from the Browse Domino Forms pane. The Browse Domino Forms displays all the forms present in the selected database of the Domino server.

Note: The Next button is enabled only after you select the database name.

## Specifying the map inputs for update activity

---

The input parameters for update activity are either UniversalID or NotesID and all the business data fields (specific to the selected form) must be updated.

- Click **Map Input** from the **Checklist** pane.

The input parameters for the specific Domino activity are displayed under the **To Activity** pane. The input parameters are defined in the following table.

Parameter Name	Description
UniversalID	A UniversalID of a document is a read/write property that uniquely identifies a document across all replicas of a database. In character format, a UniversalID is a 32-character combination of hexadecimal digits (0-9, A-F). A UniversalID is also known as the unique ID or UNID. The data type is string.
NotesID	A NotesID of a document is a read only property and has a hexadecimal value of up to 8 characters, which uniquely identifies a document within a particular database. A NotesID represents the location of a document within a specific database file. So the documents that are replicas of one another generally have different note IDs. A NotesID does not change, unless the document is deleted.

Note: You *must* map the input parameters of the activity.

Note: To populate dynamically added fields of the Domino document, which are not part of the map inputs structure, use the `AdditionalFields` property and provide the field names and field values in `FieldDetails` section.

For Form Types that are same across multiple databases, you can now specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this, you must specify the database name in the `databaseName` optional parameter (described in Table 1). If the `databaseName` parameter is populated with a value, the outbound operation is performed on the database specified in the `databaseName` parameter. If there is no value specified, the database name that is specified during configuration is used to perform the outbound operation.

## Optional parameters for a Domino activity

---

The following are the optional parameters that are defined for update activity.

Table 1. Optional parameters

Parameter Name	Description
MarkAsRead	Specifies if the document is to be marked as read during an update operation. It is of type Boolean.
MakeResponse	Specifies if the document is to be made available as the response of the saved document even if another user modifies and saves the document. It is of type Boolean.
ForceSave	Specifies if the document is to be force saved during a conflict of an update operation. It is of type Boolean.
databaseName	<code>databaseName</code> is the name of the database in which the document is updated. If a value is set for this parameter, then the value of the database in the configure panel is overwritten. This parameter is useful when documents with the same structure (Form) must be updated in multiple databases, using the same orchestration.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in the endpoint page, add the new optional parameters

in dominoConnectionProperties of map inputs. The parameters for dominoConnectionProperties are described in the following table:

Table 2. Optional connection parameters

Parameters	Description
dominoConnectionProperties parameters	
hostName	Specifies the host name or IP address of the machine on which Domino server is running.
diiopPort	Specifies the Domino Internet Inter-ORB Protocol (DIIOP) port that allows Javaâ„¢ applets or applications to access Domino data remotely using CORBA. The default value is 63148.
username	Specifies the user name to connect to the Domino server.
password	Specifies the password that is associated with the user name to connect to the Domino server.
connectionPool parameters	
minimumConnections	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
maximumConnections	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
maxIdleTime	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool â€”no idle time. The default value is 120 minutes.
maxWait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
reclaimConnections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.

## Specifying the map outputs for a Domino activity

- Click **Map output** from the **Checklist** pane.

The output parameters for the Domino activity are displayed under the **From Activity** pane.

Note: You can map the output parameters of the activity that is based on your requirement.

## Summary flag (field flag) behavior

When a document is updated for a form containing fields of type Authors, Readers, or Names; and data is set for these fields in the Map Input, the summary flag is set with proper permissions based on the Domino field type. This feature is supported from Domino server version 8.5.3 onwards.

For example:

- If a Domino field of type `Authors` is set with a value `CN=SYSTEM/O=IBM`, the summary flag will be `SUMMARY READ/WRITE-ACCESS NAMES "CN=SYSTEM/O=IBM"`.
- If a Domino field of type `Readers` is set with a value `CN=SYSTEM/O=IBM`, the summary flag will be `SUMMARY READ-ACCESS NAMES "CN=SYSTEM/O=IBM"`.
- If a Domino field of type `Names` is set with a value `CN=SYSTEM/O=IBM`, the summary flag will be `SUMMARY NAMES "CN=SYSTEM/O=IBM"`.

**Parent topic:** [Domino Activities](#)

Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_update\\_outactivity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_update_outactivity.html)

## Retrieving a Domino document

---

Using the Retrieve Activity, you can retrieve a document from a Domino® database. Each retrieved document is uniquely identified by its UniversalID or NotesID. The retrieval is done based on the input, that is, either the UniversalID or the NotesID.

### Using the retrieve activity

---

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Retrieve Activity from the Domino folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. The Checklist pane lists the tasks(Summary, Pick Endpoint, Configure, Map inputs, Map outputs) that you must perform to complete the configuration of the outbound activity.
5. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

6. Click Configure from the Checklist. The Configure pane is displayed.
  - o Click Browse to select an existing database from the Browse Domino databases pane. The Browse Domino databases display all the databases for the selected endpoint.
  - o Click Next to select an existing form from the Browse Domino Forms pane. The Browse Domino Forms displays all the forms present in the selected database of the Domino server.  
Note: The Next button is enabled only after you select the database name.
  - o Fields with canonical names accept fields that may have canonical names such as John Smith/IBM/COUNTRY as values, which are separated by commas. Specify the canonical names in this field if you want to convert the values in these fields to internet mail addresses, such as johnsmith@country.ibm.com. Some of the field name examples are To, From, CC, Chair, Required Attendees, and so on.

### Specifying the map inputs for the retrieve activity

---

The input parameter for Retrieve activity is either UniversalID or NotesID. When both are given, UniversalID is used to retrieve the Domino document.

1. Click Map Input from the Checklist pane.

The input parameters for the specific Domino activity are displayed under the To Activity pane. Some of the common input parameters are defined in the following table.

Parameter Name	Description
UniversalID	The UniversalID parameter is a read/write property that uniquely identifies a document across all replicas of a database. In character format, the unique ID parameter is a 32-character combination of hexadecimal digits (0-9, A-F). The UniversalID is also known as the unique ID or UNID. The data type is string.
NotesID	The Notes® ID of a document is a read only property and has a hexadecimal value of up to 8 characters, which uniquely identifies a document within a particular database. The Notes ID represents the location of a document within a specific database file. So the documents that are replicas of one another generally have different Notes IDs. A Notes ID does not change, unless the document is deleted.

Note: You *must* map the input parameters of the activity.

For Form Types that are same across multiple databases, you can now specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this, you must specify the database name in the `databaseName` optional parameter (described in Table 1). If the `databaseName` parameter is populated with a value, the outbound operation is performed on the database specified in the `databaseName` parameter. If there is no value specified, the database name that is specified during configuration is used to perform the outbound operation.

#### Optional parameters

The optional input parameter is described in the following table:

Table 1. Optional parameters

Parameter name	Description
databaseName	databaseName is the name of the database from which the document is retrieved. If a value is set for this parameter, then the value of the database in the configure panel is overwritten. This parameter is useful when documents with the same structure (Form) must be retrieved from multiple databases, using the same orchestration.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in the endpoint page, add the new optional parameters in `dominoConnectionProperties` of map inputs. The parameters of `dominoConnectionProperties` are described in the following table:

Table 2. Optional connection parameters

Parameters	Description
dominoConnectionProperties parameters	
hostName	Specifies the host name or IP address of the machine on which Domino server is running.
diiopPort	Specifies the Domino Internet Inter-ORB Protocol (DIIOP) port that allows Java® applets or applications to access Domino data remotely using CORBA. The default value is 63148.
username	Specifies the user name to connect to the Domino server.
password	Specifies the password that is associated with the user name to connect to the Domino server.
connectionPool parameters	
minimumConnections	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
maximumConnections	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
maxIdleTime	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool –no idle time. The default value is 120 minutes.
maxWait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
reclaimConnections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.

## Specifying the map outputs for the retrieve activity

1. Click Map output from the Checklist pane.

The output parameters for the Domino activity are displayed under the From Activity pane.

Note: You can map the output parameters of the activity that is based on your requirement.

Note: Dynamically added fields present in the Domino document and not generated in the map input/output structures are handled by the Domino connector. While retrieving documents using this activity, the data for these fields are available in the map outputs section under `AdditionalFields`.

**Parent topic:** [Domino Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_retrieve\\_outactivity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_retrieve_outactivity.html)

## Querying Domino documents

---

The Query Document activity is used to query documents from the database in the Lotus® Domino® server that matches the values that are specified in the document fields.

You can specify one or more of the following criteria in the input data that is sent with the outbound request.

- Document business data: When you specify the document business data in the Map Input section, the connector reads all the valid data from the map input. The connector searches the database for documents that match these valid data. All the matching documents that can be represented using the map output schema are returned as a response.
- `ParentDocumentUNID`: When you specify a valid `ParentDocumentUNID` in the Map Input section, the connector queries all the child documents to this parent document. All the matching documents, which can be represented using the map output schema are returned as a response.
- No data set: When you do not provide a data in the map input, the connector queries the documents that can be represented using the map output schema.

You can search for documents based on two types of search methods:

1. **Database Search method:** Given selection criteria for a document, returns all documents in a database that meet the criteria. By default, the activity uses the Database Search method to search for documents. To explicitly set the search to this type, set the value of `searchType` optional parameter to `NORMAL_SEARCH` in the map input section. This method supports the search of documents that are based on the following types of search criteria:
  - a. **Single values:** You can specify a single value in the search criteria. For example, the connector can query documents that are based on the single word, number, or date that is specified in the search field. You can find more information about the search values that can be specified in the Number and Date type fields in the following points.
    - **Numbers:** You can specify a double digit number or an integer value as the search criteria in the Numbers type field. You can use this search function to query documents where a Number type field equals to a certain value. For example, to query documents where employee salary equals to 1234 . 56, enter the value 1234 . 56 in the `EmployeeSalary` field.
    - **Date:** You can specify a date as the search criteria in any Date type field. For example, to query documents where birthday equals to 1982/11/22, specify the value 1982/11/22 in the `Birthday` field.
  - b. **Multiple values:** You can specify multiple values as the search criteria for any Lotus® Domino® field types. This feature can be used to find the documents with the specified values at run time. For example, you can configure the connector to retrieve documents that match the words that are specified in the search criteria.
  - c. **Text search for rich text contents:** You can specify the texts to search documents that have rich text contents at run time. The connector conducts a search by using the texts that are specified in the `RichText` field and all matching documents are retrieved by the connector. The connector supports both single and multiple text content searches for the `RichText` field. You can also provide wildcard suffixes, such as \* for searching documents in the `RichText` field.
  - d. **Search using multiple fields:** You can specify search values in more than one field. In this configuration, the activity uses the logical AND operator to group the search strings. For instance, you can specify a single value, multiple values, `RichText`, or `ParentDocumentUNID` in different fields. The activity returns only the search content that matches all the specified criteria.
2. **Database FTSearch/Indexed Search method:** Conducts a full text search of all the documents in a database. When the database is fully indexed, the indexed search method is faster compared to the Database Search method. The method sorts the output data by relevance score. When the collection is sorted by relevance, the highest relevance appears first. To explicitly set the search to this type, set the value of `searchType` optional parameter to `FULL_TEXT_SEARCH` in the map input section.

a. **Search using multiple fields:** The indexed search method also supports search using multiple fields. You can specify the search values in more than one field. In this configuration, the connector uses the logical AND operator to group the search strings. For instance, you can specify a single value, multiple values, or `ParentDocumentUNID` in different fields. The connector returns a logical AND operation of all the specified search criteria, returning exact and close matches for string type fields and exact matches for numeric type fields.

Note: The indexed search method does not work for `RichText`, `Attachments`, and `Date` fields.

## Using the Query Document activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Query Activity from the Domino folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

5. Click Configure from the Checklist. The Configure pane is displayed.
  - o Click Browse to select an existing database from the **Browse Domino database** pane. The Browse Domino databases display all the databases for the selected endpoint.
  - o Click Next to select an existing form from the **Browse Domino Forms** pane. The Browse Domino Forms displays all the forms present in the selected database of the Domino server.  
Note: The Next button is enabled only after you have selected the database name.
  - o Fields with canonical names accept fields that may have canonical names such as `John Smith/IBM/COUNTRY` as values, which are separated by commas. Specify the canonical names in this field if you want to convert the values in these fields to internet mail addresses, such as `johnsmith@country.ibm.com`. Some of the field name examples are To, From, CC, Chair, Required Attendees, and so on.
6. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Query Documents activity are displayed as nodes under the request input parameter in the To Activity panel.

For Form Types that are same across multiple databases, you can specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this, you must specify the database name in the `databaseName` optional parameter (described in Table 1). If the `databaseName` parameter is populated with a value, the outbound operation is performed on the database specified in the `databaseName` parameter. If there is no value specified, the database name that is specified during configuration is used to perform the outbound operation.

The optional input parameter is described in the following table:

Table 1. Optional input parameter

Parameter name	Description
<code>databaseName</code>	<code>databaseName</code> is the name of the database from which the document is queried. If a value is set for this parameter, then the value of the database given in the configure panel will be overwritten. This parameter is useful when documents with the same structure (Form) need to be queried from multiple databases, using the same orchestration.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in the endpoint page, add the new optional parameters in `dominoConnectionProperties` of map inputs. The parameters of `dominoConnectionProperties` are described in the following table:

Table 2. Optional connection parameters

Parameters	Description
dominoConnectionProperties parameters	
<code>hostName</code>	Specifies the host name or IP address of the machine on which Domino server is running.
<code>diiopPort</code>	Specifies the Domino Internet Inter-ORB Protocol (DIIOP) port that allows Java® applets or applications to access Domino data remotely using CORBA. The default value is 63148.

Parameters	Description
username	Specifies the user name to connect to the Domino server.
connectionPool parameters	
minimumConnections	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
maximumConnections	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
maxIdleTime	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool â€“no idle time. The default value is 120 minutes.
maxWait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
reclaimConnections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.
password	Specifies the password that is associated with the user name to connect to the Domino server.

7. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

8. Select the search type to be used for the activity:

Table 3. Search type

Parameter Name	Description
searchType	Specifies the search type to be used for this activity. The values are: <ul style="list-style-type: none"> <li>◦ NORMAL_SEARCH: Uses Domino Database Search method.</li> <li>◦ FULL_TEXT_SEARCH: Uses Domino Database FTSearch method.</li> </ul> When no value is specified NORMAL_SEARCH is used.

9. Select the Map Outputs in the checklist. The XML schemas generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.

Note: Dynamically added fields present in the Domino document and not generated in the map input/output structures are handled by the Domino connector. While retrieving documents using this activity, the data for these fields are available in the map outputs section under AdditionalFields.

`queryUsingTimestamp` is the parameter that is used to query documents that are based on time stamps. The `timestamp` property is a recursive property. You can define `groupFields`, `name`, `operator`, and `value` under the `timestamp` property.

The optional output parameters are described in the following table:

Parameter Name	Description	
queryUsingTimestamp	The following are the <code>timestamp</code> properties: Table 4. <code>timestamp</code> properties	
Property	Values	
groupFields	You can specify multiple values such as: AND, OR, (,), AND (, OR (, ) AND, ) OR, ) AND (, and ) OR (. Note: You can have multiple conditions. <code>groupFields</code> must be used when you have multiple conditions.	
name	Specify one of these values: <code>createdTimestamp</code> or <code>lastModifiedTimestamp</code>	

Property	Values
operator or	Specify one of these values: GREATER_THAN, GREATER_THAN_OR_EQUAL_TO, EQUAL_TO, LESS_THAN, LESS_THAN_OR_EQUAL_TO, and NOT_EQUAL_TO
value	Specify the date and time values. For example, 26-09-2013 12:05:00 PM EST. Note: If you do not mention the timezone, by default, the timezone of the server is considered.

Note:

- o Querying documents that are based on the NOT\_EQUAL\_TO operator (!=) is not supported in Full Text Search.
- o Querying documents using time is not supported in Full Text Search. For example, [\_RevisionDate] = 05/06/2013 09:30:00.
- o Querying documents using the EQUAL\_TO operator with timestamp does not work with the Normal Search type. For example, @Modified = [05/06/2013 09:14:22].
- o Querying documents using Full Text Search as the Search Type, you can query documents that are only based on Date; and not DateTime. For example, lastModfiedDateTime >= 05/20/2013 20:00:00 is not supported in Full Text Search.

10. Create a map between the output parameters and orchestration variables.

You have configured the Domino Query Documents activity.

**Parent topic:** [Domino Activities](#)

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_query\\_outactivity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_query_outactivity.html)

## Querying views for Domino documents

The Query Views activity is used to query views from the database in the Lotus® Domino® server that matches the values that are specified in the document fields that are present in the view.

### Using the Query Document activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Query Views from the Domino® folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

5. Click Configure from the Checklist. The Configure pane is displayed.

Note: The Next button is enabled only after you have selected the database name.

- o Click Browse to select an existing database from the **Browse Domino Database** pane. The Browse Domino databases display all the databases for the selected endpoint.
- o Click Browse to select an existing view from the **Browse Domino Views** pane. The Browse Domino Views display all the views for the selected endpoint and in the selected database.
- o Click Next to select an existing form from the **Browse Domino Forms** pane. The Browse Domino Forms displays all the forms related to the documents in that view.

6. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Query Views activity are displayed as nodes under the request input parameter in the To Activity panel.

For Form Types that are same across multiple databases, you can specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this, you must specify the database name in the `databaseName` optional parameter (described in Table 1). If

the `databaseName` parameter is populated with a value, the outbound operation is performed on the database that is specified in the `databaseName` parameter. If there is no value specified, the database name that is specified during configuration is used to perform the outbound operation.

The optional input parameter is described in the following table:

Table 1. Database name optional parameter

Parameter Name	Description
<code>databaseName</code>	Specifies the database name that can be dynamically added in map inputs to enable a single orchestration to perform outbound operations across multiple databases that have the same Form Type.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in the endpoint panel, add the new optional parameters in `dominoConnectionProperties` of map inputs. The parameters for `dominoConnectionProperties` are described in the following table:

Table 2. Optional connection parameters

Parameters	Description
dominoConnectionProperties parameters	
<code>hostName</code>	Specifies the host name or IP address of the machine on which the Domino server is running.
<code>diiopPort</code>	Specifies the Domino Internet Inter-ORB Protocol (DIIOP) port that allows Javaâ„¢ applets or applications to access Domino data remotely using CORBA. The default value is 63148.
<code>username</code>	Specifies the user name to connect to the Domino server.
<code>password</code>	Specifies the password that is associated with the user name to connect to the Domino server.
connectionPool parameters	
<code>minimumConnections</code>	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
<code>maximumConnections</code>	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
<code>maxIdleTime</code>	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool â€”no idle time. The default value is 120 minutes.
<code>maxWait</code>	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
<code>reclaimConnections</code>	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.

- Map the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

- Specify the values as described in Table 3:

Table 3. Search type

Parameter Name	Description
<code>KeyValues</code>	Specify the value for which you want to run a search.

Parameter Name	Description
ExactMatch	Specify the value as <code>False</code> to return all possible values related to the search term. For an exact match to be returned, specify the value as <code>True</code> .
SearchFormula	Specify a formula for a detailed search as per your requirement.

9. Select the Map Outputs in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.

Note: Dynamically added fields present in the Domino document and not generated in the map input/output structures are handled by the Domino connector. While retrieving documents using this activity, the data for these fields are available in the map outputs section under `AdditionalFields`.

10. Create a mapping between the output parameters and orchestration variables.

You have configured the Domino Query Views activity.

## Deleting a Domino document

Use the Delete Activity to delete a document from the Domino® database. Each deleted document must be uniquely identifiable by its `UniversalID` or `NotesID`.

### Using the delete activity

- Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
- Select the Activities tab and expand the Domino folder.
- Drag Delete Activity from the Domino folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
- The Checklist pane lists the tasks(Summary, Pick Endpoint, Configure, Map inputs, Map outputs) that you must perform to complete the configuration of the outbound activity.
- Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

- Click Configure from the Checklist. The Configure pane is displayed.
  - Click Browse to select an existing database from the Browse Domino databases pane. The Browse Domino databases display all the databases for the selected endpoint.
  - Click Next to select an existing form from the Browse Domino Forms pane. The Browse Domino Forms displays all the forms present in the selected database of the Domino server.

Note: The Next button is enabled only after you have selected the database name.

### Specifying the map inputs for the delete activity

- Click Map Input from the **Checklist**.

The input parameters for the specific Domino activity are displayed under the To Activity pane. Some of the common input parameters are defined in the following table.

Parameter Name	Description

Universal ID	The UniversalID parameter is a read/write property that uniquely identifies a document across all replicas of a database. In character format, the unique ID parameter is a 32-character combination of hexadecimal digits (0-9, A-F). The UniversalID is also known as the unique ID or UNID. The data type is string.
NotesID	The Notes® ID of a document is a read only property and has a hexadecimal value of up to 8 characters, which uniquely identifies a document within a particular database. The NotesID represents the location of a document within a specific database file. So the documents that are replicas of one another generally have different Notes IDs. A Notes ID does not change, unless the document is deleted.

Note: You must map the input parameters of the activity.

For Form Types that are same across multiple databases, you can now specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this, you must specify the database name in the `databaseName` optional parameter (described in Table 1). If the `databaseName` parameter is populated with a value, the outbound operation is performed on the database specified in the `databaseName` parameter. If there is no value specified, the database name that is specified during configuration is used to perform the outbound operation.

### Optional parameters

The optional input parameters are described in the following table:

Table 1.

Input Parameters	Description
<code>forceDelete</code>	This property specifies if the document is to be deleted during a conflict of delete operation. It is of type boolean.
<code>databaseName</code>	<code>databaseName</code> is the name of the database from which the document is deleted. If a value is set for this parameter, then the value of the database given in the configure panel will be overwritten. This parameter is useful when documents with the same structure (Form) need to be deleted from multiple databases, using the same orchestration.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in the endpoint page, add the new optional parameters in `dominoConnectionProperties` of map inputs. The parameters of `dominoConnectionProperties` are described in the following table:

Table 2. Optional connection parameters

Parameters	Description
dominoConnectionProperties parameters	
<code>hostName</code>	Specifies the host name or IP address of the machine on which Domino server is running.
<code>diiopPort</code>	Specifies the Domino Internet Inter-ORB Protocol (DIIOP) port that allows Java™ applets or applications to access Domino data remotely using CORBA. The default value is 63148.
<code>username</code>	Specifies the user name to connect to the Domino server.
<code>password</code>	Specifies the password that is associated with the user name to connect to the Domino server.
connectionPool parameters	
<code>minimumConnections</code>	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
<code>maximumConnections</code>	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
<code>maxIdleTime</code>	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool —no idle time. The default value is 120 minutes.

Parameters	Description
maxWait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
reclaimConnections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.

## Specifying the map outputs for the delete activity

1. Click Map output from the Checklist.

The output parameters for the Domino activity are displayed under the From Activity pane.

Note: You can map the output parameters of the activity that is based on your requirement.

## Getting events from Domino server

The Get Events activity is used to get events from the database in the IBM® Domino® server that matches the values that are specified in the input fields of Map Inputs.

### Using the Get Events activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Get Events from the Domino® folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

5. Click Configure from the Checklist. The Configure pane is displayed.
  - o Click the Request Response Format list to select the XML, JSON, or iCAL format.
  - o Click Browse to select an existing database from the **Browse Domino Database** pane. The Browse Domino databases display all the databases for the selected endpoint.
6. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Get Events activity are displayed as nodes under the request input parameter in the To Activity panel.

Table 1. Map Input Parameters

Parameter	Description
since	Retrieves all the events from the timestamp mentioned in this field. For example, 2014-09-17T07:00:00Z
before	Retrieves all the events from the timestamp mentioned in this field. For example, 2014-09-17T07:00:00Z. The before parameter is always used with the since parameter.
id	Accepts a event ID as the input and returns the details of that event. For example, 0941088CD074C75065257CA8001AB24C-Lotus_Auto_Generated.
AllEvents	Accepts True values and return all the events in that database.

7. Map the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
8. Select the Map Outputs in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
9. Create a mapping between the output parameters and orchestration variables.

You have configured the Domino Get Events activity.

## Processing calendar events in Domino server

---

The Process Calendar Events activity is used to process an action on an existing calendar event in a database in the IBM Domino® server that matches the values that are specified in the input fields that are present in the Map Inputs.

### Using the Process Calendar Events activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Process Calendar Events from the Domino® folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

5. Click Configure from the Checklist. The Configure pane is displayed.
  - Click the Request Response Format list to select the XML, JSON, or iCAL format.
  - Click Browse to select an existing database from the **Browse Domino Database** pane. The Browse Domino databases display all the databases for the selected endpoint.
6. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Process Calendar Events activity are displayed as nodes under the request input parameter in the To Activity panel.

The input parameters are described in the following table:

Table 1. Input parameters

Parameter Name	Description
UNID	Indicates the event ID that will be used to process the calendar events.
process Action	Accepts values such as Accept, Tentative, Decline, Counter, Delegate, Delete, and Request-Info. You can select these values from the drop-down list of the ProcessAction field of Map Inputs.

7. Map the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
8. Select the Map Outputs in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
9. Create a mapping between the output parameters and orchestration variables.

You have configured the Domino Process Calendar Events activity.

# Creating calendar events in Domino server

---

The Create Calendar Events activity is used to create the calendar events from the database in the IBM® Domino® server that matches the values that are specified in the input fields of Map Inputs.

## Using the Create Calendar Events activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.

3. Drag Create Calendar Events from the Domino® folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
  4. Click Pick Endpoint, and then select a Domino endpoint.
- For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).
5. Click Configure from the Checklist. The Configure pane is displayed.
    - o Click the Event Type list to select one of the following type of event to be created:
      - Meeting
      - Recursive Meeting
      - All Day Event
      - Appointment
      - Recursive Appointment
      - Reminder
    - o Click the Request Response Format list to select the XML, JSON, or iCAL format.
    - o Click Browse to select an existing database from the **Browse Domino Database** pane. The Browse Domino databases display all the databases for the selected endpoint.
  6. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Create Calendar Events activity are displayed as nodes under the request input parameter in the To Activity panel.
  7. Map the orchestration variables and the input parameter of the activity.  
 Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
  8. Select the Map Outputs in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
  9. Create a mapping between the output parameters and orchestration variables.

You have configured the Domino Create Calendar Events activity.

## Updating calendar events in Domino server

The Update Calendar Events activity is used to update the calendar events from the database in the IBM Domino® server that matches the values that are specified in the input fields of Map Inputs.

### Using the Update Calendar Events activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Update Calendar Events from the Domino® folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

5. Click Configure from the Checklist. The Configure pane is displayed.
  - o Click the Event Type list to select one of the following event types to be updated:
    - Meeting
    - Recursive Meeting
    - All Day Event
    - Appointment

- Recursive Appointment
  - Reminder
  - Click the Request Response Format list to select the XML, JSON, or ICAL format.
  - Click Browse to select an existing database from the **Browse Domino Database** pane. The Browse Domino databases display all the databases for the selected endpoint.
6. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Update Calendar Events activity are displayed as nodes under the request input parameter in the To Activity panel.
7. Map the orchestration variables and the input parameter of the activity.  
 Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
8. Select the Map Outputs in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
9. Create a mapping between the output parameters and orchestration variables.

You have configured the Domino Update Calendar Events activity.

## Deleting calendar events from Domino server

The Delete Calendar Events activity is used to delete calendar events from the database in the IBM Domino® server that matches the values that are specified in the input fields of Map Inputs.

### Using the Delete Calendar Events activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Delete Calendar Events from the Domino® folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

5. Click Configure from the Checklist. The Configure pane is displayed.
  - Click the Event Type list to select one of the following types:
    - Meeting
    - Recursive Meeting
    - All Day Event
    - Appointment
    - Recursive Appointment
    - Reminder
  - Click the Request Response Format list to select the XML, JSON, or ICAL format.
  - Click Browse to select an existing database from the **Browse Domino Database** pane. The Browse Domino databases display all the databases for the selected endpoint.
6. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Delete Calendar Events activity are displayed as nodes under the request input parameter in the To Activity panel.

Table 1. Map Input Parameter

Parameter	Description
-----------	-------------

Parameter	Description
UNID	Indicates the ID of the calendar event that must be deleted from the server.

7. Map the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

8. Select the Map Outputs in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.

9. Create a mapping between the output parameters and orchestration variables.

You have configured the Domino Delete Calendar Events activity.

## Specifying Retry and Delivery Options for Domino activities

Specifying the Retry and Delivery parameters is one of the tasks to configure a Domino® activity configuration.

### About this task

This section contains the procedures for configuring the Domino outbound and inbound activities.

### Procedure

To specify the retry options for inbound and outbound Domino activities:

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry options for connecting to a Domino server as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ second(s) between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Domino server.

Retry Fields	Description
Try to connect ____ times before failing.	<p>Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the Domino server before issuing the following errors:</p> <ul style="list-style-type: none"> <li>o When you set this parameter to "0", Studio does not try to reconnect.</li> <li>o When you set this parameter to a value less than "0", Studio retries the connection indefinitely.</li> </ul> <p>If an orchestration that starts with an inbound Domino activity is deployed and the Integration Appliance cannot connect to the specified Domino server, the Integration Appliance logs the connection errors as warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system log, resets the connection error count to zero, and continues to attempt to establish a connection to the Domino server.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

**Parent topic:** [Domino Activities](#)

## Domino inbound activities

### Procedure

To specify the delivery rules options for Domino inbound activities:

1. Select the Delivery Rules task from the Checklist. The delivery rules pane is displayed.
2. Configure the delivery rules options to select the activity's behavior as described in the following table:

Table 2. Delivery Rules options

Delivery Rules Fields	Description
Polling Interval	Specifies the time interval to poll event view in Adapter for Lotus® Domino(WALD) inbound event table of the Domino server. (For example, the Get created documents activity polls for create trigger events at the specified time internal.) Time can be selected in the format days, hours, minutes, and seconds.
Fetch size	Specifies how many events the activity must retrieve from the WALD inbound event table of the Domino server in each poll cycle.
Delivery Messages	
ATMOS_T_ONC_E	A non-persistent mode in which a document is either processed once or not processed at all.
ATLEA_ST_ON_CE	A persistent mode, in which a Domino document is not lost. As a result, there are chances that the orchestration can process the document once or more than once.

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_Specifying\\_Retry\\_Parameters\\_for\\_Domino\\_Activities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_Specifying_Retry_Parameters_for_Domino_Activities.html)

# Prerequisites to use Domino inbound activities

---

This section contains the prerequisites for configuring the Domino® inbound activities:

## Configuring the Domino server

---

1. Copy the native library mentioned in the following table from <STUDIO\_ROOT>/etc/domino/<platform> directory to the Domino servers root directory. The native library is selected based on the platform on which Domino server is running.

Library file	Supported operating systems
waldinbound.dll	Windows 32 bit
waldinbound.dll	Windows 64 bit
libwaldinbound_r.a	AIX® 32 bit
libwaldinbound.so	Redhat 32 bit
libwaldinbound.so	Suse 32 bit
libwaldinbound.so	Solaris 32 bit

2. Search for notes.ini file in the Domino server. Open the file and add an entry at the end of the file.

```
EXTMGR_ADDINS=waldinbound
```

3. Copy the inbound event database (filename : waldinbound.nsf) from the (<STUDIO ROOT>/etc/domino/) to the Domino server's data directory (<DominoRoot>/data).
4. Open the inbound event database (waldinbound.nsf) by using Lotus Notes® and configure the event activity.
5. The following are the steps for configuring WALD inbound event table.
  - o Select the EventTriggerConfigurationView. If there is an entry, edit it. If there is no entry, create a new configuration.
  - o Enter a value for connector ID. This is optional.
  - o Enter the database name and form (both are case sensitive) for which events need to be generated for the field 'Monitored documents'. The same database and form will be selected during discovery of the inbound activity. The syntax is shown below.
    - DatabaseName:formName
    - SampleDatabase.nsf:Employee
    - TestDatabase.nsf:Form1:TestDatabase.nsf:Form2. (For this, events will be generated for both Form1 and Form2.)
6. Select the event type interested.  
Note: The selected event type corresponds to the starter activities (Get Created Documents or Get Updated Documents or Get Deleted Documents).
7. Save the configuration (Ctrl + S). Events from the selected databases and forms get triggered and are available in the EventView of the inbound event database.
8. Restart Domino server. Test from Lotus Notes by using sample data and make sure that the events are getting generated for the configuration.
9. Configure the starter activity in Studio. Then create or update or delete a document (based on the configuration chosen in EventTriggerConfigurationView) for the configured Domino databases, which triggers an event. The event is picked by the Domino starter activity and processed.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_activityImplementation\\_for\\_inbound\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_activityImplementation_for_inbound_activity.html)

## Get Created Documents activity

---

Use the Get Created Documents activity to get the documents (which are of interest) that were created on the Domino® server. The activity polls the event table in the Domino server for new events periodically and process them.

Note: Before you configure and use the get created documents activity, refer to [Prerequisites to use Domino inbound activities](#) on the Domino server.

## Adding an inbound Domino activity to the orchestration

---

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Get Created Documents activity from the Domino folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
4. The Checklist pane lists the tasks (Summary, Pick Endpoint, Configure, Map outputs) that you must perform to complete the configuration of the inbound activity.

## Naming or renaming a Domino activity

---

1. Click Summary from the Checklist pane. The Summary pane is displayed.
  - o Specify the name of the activity in the Activity Name text box.

## Specifying the endpoint for a Domino activity

---

1. Click Pick Endpoint from the Checklist pane. The Pick Endpoint pane is displayed.
2. Click one of the following options:
  - o Browse... - To select an existing endpoint from the Project Explorer. The Project Explorer shows all the Domino endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint pane. To edit the endpoint properties, click Edit.
  - o New... - To create a new endpoint. The Create Endpoint window is displayed.
  - o Edit... - To edit an existing endpoint. The Edit Endpoint window is displayed.

Note: Any changes that you make to the endpoint, including configuration properties, affects all orchestrations that use that endpoint. The edits are global, not local.

## Specifying the database and form for a Domino activity

---

1. Click Configure from the Checklist pane. The Configure pane is displayed.
  - o Click Browse to select an existing database from the Browse Domino databases pane. The Browse Domino databases display all the databases for the selected endpoint.
  - o Click Next to select an existing Form from the Browse Domino Forms pane. The Browse Domino Forms displays all the forms in the project available for the activity.  
Note: The Next button is enabled only after you have selected the database name.
  - o Optional: Specify the names of the Additional Databases from which you would like to poll the documents of the form that is selected in the Form field. The databases must be separated by commas. For example, Admin.nsf, names.nsf,. The databases will be polled one after the other. All the databases that are specified in the Additional Database field must have a Form similar to the one configured in the Browse Domino Forms.
  - o Optional: Fields with canonical names accept fields that may have canonical names such as John Smith/IBM/COUNTRY as values, which are separated by commas. Specify the canonical names in this field if you want to convert the values in these fields to internet mail addresses, such as johnsmith@country.ibm.com. Some of the field name examples are: To, From, CC, Chair, Required Attendees, and so on.

## Specifying the map outputs for a Domino activity

---

1. Click Map output from the Checklist pane.

The output parameters for the Domino activity are displayed under the From Activity pane.

Note: You can map the output parameters of the activity that is based on your requirement.

Note: Dynamically added fields present in the Domino document and not generated in the map input/output structures are handled by the Domino connector. While retrieving documents using this activity, the data for these fields are available in the map outputs section under AdditionalFields.

**Parent topic:** [Domino Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_insert\\_inbound\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_insert_inbound_activity.html)

## Get Updated Documents activity

---

Use the Get Updated Documents activity to get the documents (which are of interest) that got updated on the Domino® server. The activity polls the event table in the Domino server for new events periodically and process them.

Note: Before you configure and use the get updated documents activity, refer to [Prerequisites to use Domino inbound activities](#) on the Domino server.

### Adding an inbound Domino activity to the orchestration

---

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Get Updated Documents activity from the Domino folder onto the orchestration. The graphical representation of the orchestration along with the Checklist pane is displayed.
4. The Checklist pane lists the tasks (Summary, Pick Endpoint, Configure, Map outputs) that you must perform to complete the configuration of the inbound activity.

### Naming or renaming a Domino activity

---

1. Click Summary from the Checklist pane. The Summary pane is displayed.
  - o Specify the name of the activity in the Activity Name text box.

### Specifying the endpoint for a Domino activity

---

1. Click Pick Endpoint from the Checklist pane. The Pick Endpoint pane is displayed.
2. Click one of the following options:
  - o Browse... - To select an existing endpoint from the Project Explorer. The Project Explorer displays all the Domino endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint pane. To edit the endpoint properties, click Edit.
  - o New... - To create a new endpoint. The Create Endpoint window is displayed.
  - o Edit... - To edit an existing endpoint. The Edit Endpoint window is displayed.

Note: Any changes that you make to the endpoint, including configuration properties, affects all orchestrations that use that endpoint. The edits are global, not local.

### Specifying the database and form for a Domino activity

---

1. Click Configure from the Checklist pane. The Configure pane is displayed.
  - o Click Browse to select an existing database from the Browse Domino databases pane. The Browse Domino databases display all the databases for the selected endpoint.
  - o Click Next to select an existing Form from the Browse Domino Forms pane. The Browse Domino Forms displays all the forms in the project available for the activity.  
Note: The Next button is enabled only after you select the database name.
  - o Optional: Specify the names of the Additional Databases from which you would like to poll the documents of the form that is selected in the Form field. The databases must be separated by commas. For example, Admin.nsf, names.nsf,. The databases will be polled one after the other. All the databases that are specified in the Additional Database field must have a Form similar to the one configured in the Browse Domino Forms.
  - o Optional: Fields with canonical names accept fields that may have canonical names such as John Smith/IBM/COUNTRY as values, which are separated by commas. Specify the canonical names in this field if you want to convert the values in these fields to internet mail addresses, such as johnsmith@country.ibm.com. Some of the field name examples are To, From, CC, Chair, Required Attendees, and so on.

### Specifying the map outputs for a Domino activity

---

1. Click Map output from the Checklist pane.

The output parameters for the Domino activity are displayed under the From Activity pane.

Note: You can map the output parameters of the activity that is based on your requirement.

Note: Dynamically added fields present in the Domino document and not generated in the map input/output structures are handled by the Domino connector. While retrieving documents using this activity, the data for these fields are available in the map outputs section under AdditionalFields.

## Handling Date/Time and Time zone data types

---

In the Lotus Domino form, a field of Date/Time type can be configured to represent only a date value, time value, or both date and time values. This configuration is done while creating/editing the form in Domino Designer. So, when a document is created for such a form, the value can be a date, time, or a datetime.

For example, if a form representing a Calendar has the following fields:

Table 1. Example

Fields	Domino Data type
startDate	Date/Time (represents only date)
startTime	Date/Time (represents only time)
endDate	Date/Time (represents only date)
endTime	Date/Time (represents only time)
bothDateAndTime	Date/Time (represents both date and time)
timeZone	Time zone
Subject	Text
Body	Text

If a valid document is created for this form, then:

- startDate and endDate will only accept a date value
- startTime and endTime will only accept a time value
- bothDateAndTime will only accept date and time
- timeZone will only accept a time zone value

From Cast Iron version 6.1.0.9 onwards, Date/Time data type is handled as described in the following points:

1. A Domino field of type Date/Time is represented as xsd:string in the map input and map output of the activity.

2. The only supported syntax of the input values for the Date/Time fields in map input are:
  - a. If the field represents only date: `MM/dd/yyyy`. Example : 05/27/2012.
  - b. If the field represents only time (24 hour format): `HH:mm:ss`. Example: 22:15:30.
  - c. If the field represents both date and time (24 hour format): `MM/dd/yyyy HH:mm:ss`. Example: 05/31/2012 23:59:59.
3. The output from the activity also follows the same syntax as the Date/Time fields, in most cases.
4. The preceding syntax is used by the map input and output irrespective of:
  - a. The date and time format of the operating system on which the Domino server is running.
  - b. The date and time format settings configured when creating the form in Domino designer.
5. The Time zone value is also represented as `xsd:string` in the map input and output. The following technote from Lotus Domino gives more information about the syntax: <http://www-01.ibm.com/support/docview.wss?uid=swg21163045>. For more information about Time zone in Lotus Domino, see Lotus Domino documentation.

Note:

1. In the Cast Iron 6.1.0.6 version and the earlier versions, the Domino Date/Time field was generated as `xsd:date`, which was not able to handle all combinations of the input values.
2. Old projects developed using the 6.1.0.6 version or earlier versions that are already running, will work fine with same old behavior, that is, Date/Time represented as `xsd:date`.
3. For all the orchestrations created newly using the 6.1.0.9 version and later versions, Date/Time field will be generated as `xsd:string`.
4. If the old projects require the new behavior, that is, to generate Date/Time as `xsd:string`, then the objects need to be refreshed from the Configure panel of the activity in the Studio 6.1.0.9 version or later versions. Mapping must be validated after this change.

## Rich text support for Domino connector

The Domino connector supports RichText type in forms. Fields of RichText type can store both text and attachments as part of the document. The connector supports attachments only for the Retrieve and Query Document activities. Text content can be used for the Create, Update, Retrieve, and Query Document activities.

The following figure describes the structure of the RichText field when a form is discovered and the map input and ouput are generated.

## Troubleshooting and support

---

Troubleshooting techniques and self-help information help you identify and solve problems quickly. This topic provides potential solutions for issues you would have with the Domino® connector.

### New fields added to the calendar object

---

From Cast Iron® version 6.3.0.2 onwards, you can get the invitee details, date/time, and the room details, in response to retrieving and querying a calendar entry using the Domino connector.

### Static subform behavior

---

In the earlier versions of Domino connector (before v7.0.0.0), the fields present in a subform (statically embedded in the main form) were generated as strings in Map Inputs/Map Outputs, irrespective of the datatypes that are defined for the fields. This issue is fixed in v7.0.0.0 and the data type of the fields are generated correctly.

## [Selecting or editing a Dropbox endpoint](#)

---

1. In the Create Endpoint or Edit Endpoint pane, Configure the Dropbox Connection details as described in the following table.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the Dropbox server successfully.

3. Click OK.

*Table: Connection properties*

Field Name	Description
------------	-------------

URL	URL Endpoint to connect and generate Access Token.
Oauth2 Access Token	Access Token as specified by user for OAuth based authentication.
Proxy Host	Proxy host name of the Proxy Server to connect. (Optional)
Proxy Port	Proxy password of the Proxy Server to connect. (Optional)
Proxy Username	Proxy Username of the Proxy Server to connect. (Optional)
Proxy Password	Proxy Password of the Proxy Server to connect. (Optional)

Note: To generate the access token, check Dropbox Create an App from the App console of Dropbox. You could also follow the Dropbox documentation.

## Creating, selecting, or editing a Dropbox endpoint

---

Click Pick Endpoint task from the Checklist and select one of the following actions:

1. Select an existing endpoint:
  - a. Select Browse. The Project Explorer is displayed.
  - b. Select an existing endpoint and click OK.
2. Select an existing endpoint and edit the endpoint:
  - a. Select Browse. The Project Explorer is displayed.
  - b. Select an existing endpoint and click OK.
  - c. Click Edit. The Edit Endpoint panel is displayed.
- c. Create a new endpoint: Select New. The Create Endpoint panel is displayed.

Upload File

Name	T y p e r e d	R e q ui r e d	Description
isChu nkedU pload	B o o l e a n	Y e s	To be set to true if chunked upload.
chunk detail s- >uplo adId	I n t e g e r	N o	If Chunked upload is true then upload id can be given. The unique ID of the in-progress upload on the server. If left blank, the server will create a new upload session.
Chunk detail s â†’ offset	s tr i n g	N o	If Chunked upload is true then offset can be given.
path	s y tr e i n g	y es	The full path to the file you want to write to. This parameter should not point to a folder. This is valid only for non chunked upload.
overw rite	B o o l	N o	This value, either true (default) or false, determines whether an existing file will be overwritten by this upload. If true, any existing file will be overwritten. If false, the other parameters determine whether a conflict occurs and how that conflict is resolved.

	e a n	This is valid only for non chunked upload.
autore name	b o o l e a n	<p>This value, either true (default) or false, determines what happens when there is a conflict. If true, the file being uploaded will be automatically renamed to avoid the conflict. (For example, test.txt might be automatically renamed to test (1).txt.) The new name can be obtained from the returned metadata. If false, the call will fail with a 409 (Conflict) response code.</p> <p>This is valid only for non chunked upload.</p>
locale	s t r i n g	<p>The metadata returned on successful upload will have its size field translated based on the given locale.</p> <p>This is valid only for non chunked upload.</p>
parent rev	s n t r o i n g	<p>If present, this parameter specifies the revision of the file you're editing. If parent_rev matches the latest version of the file on the user's Dropbox, that file will be replaced. Otherwise, a conflict will occur. If you specify a parent_rev and that revision doesn't exist, the file won't save (error 400). You can get the most recent rev by performing GetFileDetails activity.</p> <p>This is valid only for non chunked upload.</p>
textContent	s t r i n g	If fileType is textContent then data need to be provided here to upload the same content. Need to be provided for both chunked and non chunked upload
binary Content	b i n a r y	If fileType is binaryContent then data need to be provided here to upload the same content. Need to be provided for both chunked and non chunked upload
fileType	s y t r e i n g	Specify the fileType to get the data in specified format. Drop down displayed to select either binaryContent or textContent.

## Mapping the outputs of the Activity

Create a map between the dropbox output parameters and the orchestration variables. The expected response is generated on a successful mapping.

Name	D at	R e	Description

	a t y p e	q u i r e	d
Chunkdetails â†'upload_id	st ri n g	Y e s	The unique ID of the in-progress upload on the server. If left blank, the server will create a new upload session.
Chunkdetails â†'offset	St ri n g	N o	The byte offset of this chunk, relative to the beginning of the full file. The server will verify that this matches the offset it expects. If it does not, the server will return an error with the expected offset.
Chunkdetails â†'expires	St ri n g	y e s	Expiry time at which the chunked data might expire. This will be a quite a long time for user to commit the chunk data.
revision	in te g er	N o	A deprecated field that semi-uniquely identifies a file. Use rev instead.
bytes	in te g er	y e s	The file size in bytes.
thumb_exists	b o ol e an	y e s	True if the file is an image that can be converted to a thumbnail via the /thumbnails call.
rev	st ri n g	y e s	A unique identifier for the current revision of a file. This field is the same rev as elsewhere in the API and can be used to detect changes and avoid conflicts.
modified	st ri n g	y e s	The last time the file was modified on Dropbox, in the standard date format (not included for the root folder).
mime_type	st ri n g	y e s	The response type for example â€œapplication/pdfâ€
path	st ri n g	y e s	Returns the canonical path to the file or folder.
is_dir	b o ol e an	y e s	Whether the given entry is a folder or not.
size	st ri n g	y e s	A human-readable description of the file size (translated by locale).

root	string	yes	The root or top-level folder depending on your access level. All paths returned are relative to this root level. Permitted values are either dropbox or app_folder.
client_mtime	string	yes	For files, this is the modification time set by the desktop client when the file was added to Dropbox, in the standard date format. Since this time is not verified (the Dropbox server stores whatever the desktop client sends up), this should only be used for display purposes (such as sorting) and not, for example, to determine if a file has changed or not.
icon	string	yes	The name of the icon used to illustrate the file type in Dropbox's icon library.

---

Table 1. Get File Details Activity

Name	Type	Required	Description
Path	String	Yes	The path to the file.
file_l	Integer	No	Default is 10,000 (max is 25,000). When listing a folder, the service won't report listings containing more than the

limit	n t e g e r	o	specified amount of files and will instead respond with a 406 (Not Acceptable) status response.
hash	S t r i n g	N o	Each call to /metadata on a folder will return a hash field, generated by hashing all of the metadata contained in that response. On later calls to /metadata, you should provide that value via this parameter so that if nothing has changed, the response will be a 304 (Not Modified) status code instead of the full, potentially very large, folder listing. This parameter is ignored if the specified path is associated with a file or if list=false.
list	b o o l e a n	N o	The strings true and false are valid values. true is the default. If true, the folder's metadata will include a contents field with a list of metadata entries for the contents of the folder. If false, the contents field will be omitted.  This field has no effect on Get File Details Activity.
include_deleted	B o o l e a n	N o	Only applicable when list is set. If this parameter is set to true, then contents will include the metadata of deleted children. Note that the target of the metadata call is always returned even when it has been deleted (with is_deleted set to true) regardless of this flag.
rev	s t r i n g	N o	If you include a particular revision number, then only the metadata for that revision will be returned.
locale	S t r i n g	N o	The metadata returned will have its size field translated based on the given locale.
include_media_info	b o o l e a n	N o	If true, each file will include a photo_info dictionary for photos and a video_info dictionary for videos with additional media info. If the data isn't available yet, the string pending will be returned instead of a dictionary.
include_member_sharing	b o o l e a n	N o	If true, metadata for a shared folder will include a list of members and a list of groups.

Copy File Activity

Name	Type	Required	Description
root	String	yes	required The root relative to which from_path and to_path are specified. Valid values are auto (recommended), sandbox, and dropbox.
from_copy_ref	String	No	Specifies a copy_ref generated from a previous /copy_ref call. Must be used instead of the from_path parameter.
from_path	String	No	Specifies the file or folder to be copied from relative to root.
to_path	String	yes	required Specifies the destination path, including the new name for the file or folder, relative to root.
locale	string	No	The metadata returned will have its size field translated based on the given locale.

# Mapping the outputs of the Activity

---

Create a map between the Dropbox output parameters and the orchestration variables. The expected response is generated on a successful mapping.

Name	Data type	Required	Description
revision	integer	No	A deprecated field that semi-uniquely identifies a file. Use rev instead.

	r		
bytes	integer	yes	The file size in bytes.
thumb_exists	boolean	yes	True if the file is an image that can be converted to a thumbnail via the /thumbnails call.
rev	string	yes	A unique identifier for the current revision of a file. This field is the same rev as elsewhere in the API and can be used to detect changes and avoid conflicts.
modified	string	yes	The last time the file was modified on Dropbox, in the standard date format (not included for the root folder).
path	string	yes	Returns the canonical path to the file or folder.
is_dir	boolean	yes	Whether the given entry is a folder or not.
size	string	yes	A human-readable description of the file size (translated by locale).
root	string	yes	The root or top-level folder depending on your access level. All paths returned are relative to this root level. Permitted values are either dropbox or app_folder.
icon	string	yes	The name of the icon used to illustrate the file type in Dropbox's icon library.

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Dropbox\\_Connector\\_click\\_on\\_map\\_input\\_link\\_in\\_con7.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Dropbox_Connector_click_on_map_input_link_in_con7.html)

## Mapping the outputs of the Activity

Create a map between the Dropbox output parameters and the orchestration variables. The expected response is generated on a successful mapping.

Name	Datatype	Required	Description
revision	integer	No	A deprecated field that semi-uniquely identifies a file. Use rev instead.
bytes	integer	yes	The file size in bytes.
thumb_exists	boolean	yes	True if the file is an image that can be converted to a thumbnail via the /thumbnails call.
rev_striking	string	yes	A unique identifier for the current revision of a file. This field is the same rev as elsewhere in the API and can be used to detect changes and avoid conflicts.
modified	string	yes	The last time the file was modified on Dropbox, in the standard date format (not included for the root folder).
mime_type	string	yes	The response type for example "application/pdf"

<code>_type</code>			
<code>path</code>	<code>string</code>	<code>yes</code>	Returns the canonical path to the file or folder.
<code>is_dir</code>	<code>boolean</code>	<code>yes</code>	Whether the given entry is a folder or not.
<code>size</code>	<code>string</code>	<code>yes</code>	A human-readable description of the file size (translated by locale).
<code>root</code>	<code>string</code>	<code>yes</code>	The root or top-level folder depending on your access level. All paths returned are relative to this root level. Permitted values are either <code>dropbox</code> or <code>app_folder</code> .
<code>client_modifying_time</code>	<code>string</code>	<code>yes</code>	For files, this is the modification time set by the desktop client when the file was added to Dropbox, in the standard date format. Since this time is not verified (the Dropbox server stores whatever the desktop client sends up), this should only be used for display purposes (such as sorting) and not, for example, to determine if a file has changed or not.
<code>icon</code>	<code>string</code>	<code>yes</code>	The name of the icon used to illustrate the file type in Dropbox's icon library.

Search Files Activity

Name	Type	Required	Description
query	String	Yes	The search string. This string is split (on spaces) into individual words. Files and folders will be returned if they contain all words in the search string.
path	string	Yes	The path to the folder you want to search from.
file_limit	integer	No	The maximum and default value is 1,000. No more than file_limit search results will be returned.
include_deleted	boolean	no	If this parameter is set to true, then files and folders that have been deleted will also be included in the search.
locale	string	no	The metadata returned will have its size field translated based on the given locale.
include_membership	boolean	No	If true, metadata for a shared folder will include a list of members and a list of groups.

## Mapping the outputs of the Activity

---

Create a map between the Dropbox output parameters and the orchestration variables. The expected response is generated on a successful mapping.

Name	Data type	Required	Description
revision	integer	No	A deprecated field that semi-uniquely identifies a file. Use rev instead.
bytes	integer	yes	The file size in bytes.

	r		
thumb_exists	boolean	yes	True if the file is an image that can be converted to a thumbnail via the /thumbnails call.
rev	string	yes	A unique identifier for the current revision of a file. This field is the same rev as elsewhere in the API and can be used to detect changes and avoid conflicts.
modified	string	yes	The last time the file was modified on Dropbox, in the standard date format (not included for the root folder).
mime_type	string	yes	The response type for example "application/pdf"
path	string	yes	Returns the canonical path to the file or folder.
is_dir	boolean	yes	Whether the given entry is a folder or not.
size	string	yes	A human-readable description of the file size (translated by locale).
root	string	yes	The root or top-level folder depending on your access level. All paths returned are relative to this root level. Permitted values are either dropbox or app_folder.
icon	string	yes	The name of the icon used to illustrate the file type in Dropbox's icon library.

Create a map between the Dropbox output parameters and the orchestration variables. The expected response is generated on a successful mapping.

N	D	R	Description
a	a	e	
m	t	q	
e	a	u	
t	t	i	
y	y	r	
p	p	e	
e	e	d	
u	s	y	The url field contains the actual shared link URL
r	r	e	
l	n	s	
g	g		
e	s	y	The expires field returns the link's expiration.
x	r	e	
p	n	s	
i	i		
r	r		

e s	v i s i b il it y	Dropbox for Business users can set restrictions on shared links; the visibility field indicates what (if any) restrictions are set on this particular link. Possible values include: "PUBLIC" (anyone can view), "TEAM_ONLY" (only the owner's team can view), "PASSWORD" (a password is required), "TEAM_AND_PASSWORD" (a combination of "TEAM_ONLY" and "PASSWORD" restrictions), or "SHARED_FOLDER_ONLY"

## Copy Folder Activity

Name	Type	Required	Description
root	String	yes	required The root relative to which from_path and to_path are specified. Valid values are auto (recommended), sandbox, and dropbox.
from_copy_ref	String	No	Specifies a copy_ref generated from a previous /copy_ref call. Must be used instead of the from_path parameter.
from_path	String	No	Specifies the folder to be copied from relative to root.
to_path	String	yes	required Specifies the destination path, including the new name for the folder, relative to root.
locale	string	No	The metadata returned will have its size field translated based on the given locale.

## Mapping the outputs of the Activity

---

Create a map between the Dropbox output parameters and the orchestration variables. The expected response is generated on a successful mapping.

Name	Data type	Required	Description
revision	integer	No	A deprecated field that semi-uniquely identifies a file. Use rev instead.
bytes	integer	yes	The file size in bytes.
thumb_exists	boolean	yes	True if the file is an image that can be converted to a thumbnail via the /thumbnails call.
rev	string	yes	A unique identifier for the current revision of a file. This field is the same rev as elsewhere in the API and can be used to detect changes and avoid conflicts.
modified	string	yes	The last time the file was modified on Dropbox, in the standard date format (not included for the root folder).
mime_type	string	yes	The response type for example "application/pdf"
path	string	yes	Returns the canonical path to the file or folder.
is_dir	boolean	yes	Whether the given entry is a folder or not.
size	string	yes	A human-readable description of the file size (translated by locale).
root	string	yes	The root or top-level folder depending on your access level. All paths returned are relative to this root level. Permitted values are either dropbox or app_folder.
is_deleted	boolean	yes	To check if the file is deleted or not.
icon	string	yes	The name of the icon used to illustrate the file type in Dropbox's icon library.

## Mapping the outputs of the Activity

---

Create a map between the Dropbox output parameters and the orchestration variables. The expected response is generated on a successful mapping.

Name	D	R	Description
name	dat	re	

	<b>ty p e</b>	<b>ui re d</b>	
rev_ision	in te ge r	N o	A deprecated field that semi-uniquely identifies a file. Use rev instead.
bytes	in te ge r	y e s	The file size in bytes.
thumb_exists	b oo le an	y e s	True if the file is an image that can be converted to a thumbnail via the /thumbnails call.
rev_stri ng	s t ri ng	y e s	A unique identifier for the current revision of a file. This field is the same rev as elsewhere in the API and can be used to detect changes and avoid conflicts.
modified	s t ri ng	y e s	The last time the file was modified on Dropbox, in the standard date format (not included for the root folder).
mime_type	s t ri ng	y e s	The response type for example "application/pdf"
path	s t ri ng	y e s	Returns the canonical path to the file or folder.
is_dir	b oo le an	y e s	Whether the given entry is a folder or not.
size	s t ri ng	y e s	A human-readable description of the file size (translated by locale).
root	s t ri ng	y e s	The root or top-level folder depending on your access level. All paths returned are relative to this root level. Permitted values are either dropbox or app_folder.
client_mod_time	s t ri ng	y e s	For files, this is the modification time set by the desktop client when the file was added to Dropbox, in the standard date format. Since this time is not verified (the Dropbox server stores whatever the desktop client sends up), this should only be used for display purposes (such as sorting) and not, for example, to determine if a file has changed or not.
icon	s t ri ng	y e s	The name of the icon used to illustrate the file type in Dropbox's icon library.

## Mapping the outputs of the Activity

---

Create a map between the Dropbox output parameters and the orchestration variables. The expected response is generated on a successful mapping.

Name	Data type	Required	Description
has_more	boolean	No	If true, then there are more entries available
cursor	integer	yes	A string that encodes the latest information that has been returned.
Entries->thumb_exists	boolean	yes	True if the file is an image that can be converted to a thumbnail via the /thumbnails call.
Entries->rev	string	yes	A unique identifier for the current revision of a file. This field is the same rev as elsewhere in the API and can be used to detect changes and avoid conflicts.
Entries->modified	string	yes	The last time the file was modified on Dropbox, in the standard date format (not included for the root folder).
Entries->modifier	string	yes	For files within a shared folder, this field specifies which user last modified this file.
Entries->path	string	yes	Returns the canonical path to the file or folder.
Entries->is_dir	boolean	yes	Whether the given entry is a folder or not.
Entries->'size'	string	yes	A human-readable description of the file size (translated by locale).
Entries->'root'	string	yes	The root or top-level folder depending on your access level. All paths returned are relative to this root level. Permitted values are either dropbox or app_folder.
Entries->'read_only'	boolean	yes	For shared folders, this field specifies whether the user has read-only access to the folder. For files within a shared folder, this specifies the read-only status of the parent shared folder.
Entries->'icon'	string	yes	The name of the icon used to illustrate the file type in Dropbox's icon library.
Entries->'bytes'	integer	yes	A deprecated field that semi-uniquely identifies a file. Use rev instead.
Entries->revision	integer	yes	The file size in bytes.
reset	string	yes	If true, clear your local state before processing the delta entries. reset is always true on the initial call to /delta

ng | s | (i.e. when no cursor is passed in). Otherwise, it is true in rare situations, such as after server or account maintenance, or if a user deletes their app folder.

## Mapping the outputs of the Activity

Create a map between the Dropbox output parameters and the orchestration variables. The expected response is generated on a successful mapping.

Name	Data type	Required	Description
uid	Integer	No	The user's unique Dropbox ID.
referral_link	integer	yes	The user's referral link.
display_name	string	yes	The user's display name.
locale	string	yes	Locale preference set by the user (e.g. en-us).
email_verifeid	string	yes	Provided the email id verified or not
Team->Teamid	string	No	The ID of the team the user belongs to.
Team â†' name	string	No	The name of the team the user belongs to.
quota_info->datastores	integer	No	No. of datastores
quota_info->quota	string	yes	The user's total quota allocation (bytes). If the user belongs to a team, the team's total quota allocation (bytes).
quota_info->shared	string	yes	The user's used quota in shared folders (bytes). If the user belongs to a team, this includes all usage contributed to the team's quota outside of the user's own used quota (bytes).
quota_info->normal	boolean	yes	The user's used quota outside of shared folders (bytes).
ispaired	string	yes	If true, there is a paired account associated with this user.
country	integer	yes	The user's two-letter country code, if available.
Namedetails â†' familiar name	string	yes	The locale-dependent familiar name for the user.
Name details â†' surname	string	yes	The user's surname.
Name details â†' given name	string	yes	The user's given name.

Email	String	yes	Email id of the user

## Creating, selecting, or editing a Dropbox endpoint

---

Click Pick Endpoint task from the Checklist and select one of the following actions:

1. Select an existing endpoint:
  - a. Select Browse. The Project Explorer is displayed.
  - b. Select an existing endpoint and click OK.
2. Select an existing endpoint and edit the endpoint:
  - a. Select Browse. The Project Explorer is displayed.
  - b. Select an existing endpoint and click OK.
  - c. Click Edit. The Edit Endpoint panel is displayed.
- c. Create a new endpoint: Select New. The Create Endpoint panel is displayed.

**Parent topic:** Add the Preview File Activity in the orchestration

## Mapping the outputs of the Activity

---

Create a map between the Dropbox output parameters and the orchestration variables. The expected response is generated on a successful mapping.

Name	Type	Required	Description
revision	integer	No	A deprecated field that semi-uniquely identifies a file. Use rev instead.

bytes	integer	yes	The file size in bytes.
thumboo_lean	bool	yes	True if the file is an image that can be converted to a thumbnail via the /thumbnails call.
revstring	string	yes	A unique identifier for the current revision of a file. This field is the same rev as elsewhere in the API and can be used to detect changes and avoid conflicts.
modified	string	yes	The last time the file was modified on Dropbox, in the standard date format (not included for the root folder).
mime_type	string	yes	The response type for example "application/pdf"
path	string	yes	Returns the canonical path to the file or folder.
is_dir	boolean	yes	Whether the given entry is a folder or not.
size	string	yes	A human-readable description of the file size (translated by locale).
root	string	yes	The root or top-level folder depending on your access level. All paths returned are relative to this root level. Permitted values are either dropbox or app_folder.
client_modification_time	string	yes	For files, this is the modification time set by the desktop client when the file was added to Dropbox, in the standard date format. Since this time is not verified (the Dropbox server stores whatever the desktop client sends up), this should only be used for display purposes (such as sorting) and not, for example, to determine if a file has changed or not.
icon	string	yes	The name of the icon used to illustrate the file type in Dropbox's icon library.

## Creating or editing an endpoint for Eloqua Bulk API activity

---

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to Eloqua platform. Eloqua Bulk API uses OAuth 2.0 authentication mechanism so as to authorize users to perform operations.

### Selecting or editing an Eloqua Bulk API endpoint

To select or edit an Eloqua Bulk API endpoint:

1. In the **Create Endpoint** or **Edit Endpoint** pane, configure the Eloqua Bulk API endpoint as described in the following table.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

2. Click **Test Connection** to confirm that the connection details are valid and you are able to connect to the Eloqua Bulk API successfully.

3. Click **OK**.

*Table: Connection properties*

Field Name	Description
OAuth Access Token	OAuth access token generated from Eloqua Bulk API for authentication.
OAuth Refresh Token	OAuth refresh token generated from Eloqua Bulk API while generating OAuth Access token.

Application Client ID	The Client Identifier issued to the application during registration.
Application Client Secret	The Client Secret issued to the application during registration.
Application Redirect URL	The Redirect URL issued to the application during registration.

**Note:** To generate the access token, refer to the Oracle Eloqua Bulk API documentation relating to "OAuth2 Authentication Support in Eloqua Bulk REST API".

## Using the Eloqua Bulk API Create Import Definition activity

Use the Create Import Definition activity to create an import definition in Eloqua.

Use this task to create an import definition in Eloqua. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Create Import Definition activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Create Import Definition** activity icon onto the orchestration. The Eloqua Bulk API Create Import Definition checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Create Import Definition activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **name:** Name of the definition. Useful for reusing definitions.
- **identifierFieldName:** Specifies which field to use to match the imported data to existing Eloqua data.
- **fields:** It has following fields :
  - **sourceField:** It would be one of the column names from source data.
  - **EloquaDestinationField:** Eloqua column name to which sourceField data would map.

**Optional Fields:** The activity has following optional fields:

- **autoDeleteDuration:** Time until the definition is deleted.
- **dataRetentionDuration:** Time until the staged data is deleted.
- **isUpdatingMultipleMatchedRecords:** Specifies whether Eloqua should update multiple records if multiple records match the identifierFieldName.
- **updateRule:** The following rule types are available:
  - **always:** Always update.

- **ifNewIsNotNull:** Update if the new value is not blank.
- **ifExistingIsNull:** Update if the existing value is blank.
- **useFieldRule:** Use the rule defined at the field level.
- **syncActions:** Specifies additional operations to perform during the import. It has following fields :
  - **action:** It specifies what action to perform. The action can be add, remove, or setStatus.
  - **destination:** It specifies where the action should take place. For add or remove actions, this would be the URI of a list or email group. For setStatus, it might be the URI of an AppCloud Action or Decision service.
  - **status:** Specifies to what the status should be set for a setStatus action. The following status is available: subscribed, unsubscribed, active, complete, pending, errored, yes, and no.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Eloqua Bulk API Create Import Definition activity.

**Parent topic:** [Eloqua Bulk API Activities](#)

## Using the Eloqua Bulk API Create Export Definition activity

Use the Create Export Definition activity to create an export definition in Eloqua.

Use this task to create an export definition. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Create Export Definition activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Create Export Definition** activity icon onto the orchestration. The Eloqua Bulk API Create Export Definition checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of Create Export Definition activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **name:** Name of the definition. Useful for reusing definitions.

- **fields:** It has following fields:
  - **sourceField:** It would be one of the column names from source data.
  - **EloquaDestinationField:** Eloqua column name to which sourceField data would map.

**Optional Fields:** The activity has following optional fields:

- **autoDeleteDuration:** Time until the definition is deleted.
- **dataRetentionDuration:** Time until the staged data is deleted.
- **maxRecords:** Specifies the maximum number of records to export.
- **Filters:** Specifies query criteria used to filter . Filter use the comparison, logic, and existence operators to filter import data based on Eloqua field values. It has following fields:
  - **Filter:** It allows creating filter statements by using the following options:
    - **ename:** It is used to select the data that you want to export.
    - **operator:** It is used to specify a condition.
    - **value:** Value for filter.
  - **AdditionalFilters:** This is used to add more than one filter.
    - **Operator:** The Eloqua Bulk API also supports complex filters that filter based on multiple criteria using the AND, OR, and NOT operators.
    - **Filter:** Use same parameters as defined in the **Filter** section.
- **syncActions:** It specifies additional operations to perform during the export. It has following fields :
  - **action:** It specifies what action to perform. The action can be add, remove, or setStatus.
  - **destination:** It specifies where the action should take place. For add or remove actions, this would be the URI of a list or email group. For setStatus, it might be the URI of an AppCloud Action or Decision service.
  - **status:** Specifies to what the status should be set for a setStatus action. The following status is available:
    - subscribed
    - unsubscribed
    - active
    - complete
    - pending
    - errored
    - yes
    - no

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Eloqua Bulk API Create Export Definition activity.

## Using the Eloqua Bulk API Get Import Definition activity

Use the Get Import Definition activity to retrieve all import definitions from Eloqua.

Use this task to retrieve all import definitions from Eloqua. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Get Import Definition activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Get Import Definition** activity icon onto the orchestration. The Eloqua Bulk API Get Import Definition checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Get Import Definition activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has the following mandatory field:

- **selectionType:** Following options are available to retrieve Import Definitions:
  - SPECIFIC\_ID
  - ALL\_IDs

**Optional Fields:** The activity has following optional fields:

- **id:** The ID of the Import Definition to retrieve.

Note: ID becomes mandatory when you select SPECIFIC\_ID in selectionType.

- **limit:** Specifies maximum number of records to return.
- **offset:** Specifies an offset that allows to retrieves the next batch of records.
- **order:** Ordering options available are:
  - Ascending
  - Descending
- **orderBy:** Following ordering options are available to order the records:
  - uri
  - id
  - name
  - dataRetentionDuration
  - maxRecords
  - autoDeleteDuration
  - kbUsed
  - createdBy
  - createdAt
  - updatedBy
  - updatedAt
- **Filters:** Specifies query criteria used to filter . Filter uses the comparison, logic, and existence operators to filter import data based on Eloqua field values. It has following fields:
  - **Filter:** It allows creating filter statements by using the following options:
    - elename: It is used to select the data that you want to import.
    - operator: It is used to specify a condition.
    - value: Value for filter.
  - **AdditionalFilters:** This is used to add more than one filter by using the following options:
    - Operator: The Eloqua Bulk API also supports complex filters, that filter based on multiple criteria using the AND, OR, and NOT operators.
    - Filter: Use same parameters as defined in **Filter** section.
- **Note:** Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Eloqua Bulk API Get Import Definition activity.

## Using the Eloqua Bulk API Push Data for Import activity

---

Use the Push Data for Import activity to submit the data for existing Import definition into staging area of Eloqua system.

Use this task to submit the data for existing Import definition into staging area of Eloqua system. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Push Data for Import activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Push Data for Import** activity icon onto the orchestration. The Eloqua Bulk API Push Data for Import checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Push Data for Import activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **id:** The ID of the definition.
- **inputType:** Select type of the data source. Eloqua Bulk API supports two data types for input:
  - JSON
  - CSV

**Optional Fields:** The activity has the following optional field:

- **ImportData:** The data which is used to import into Eloqua system.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.

2. Create a map between the output parameters and orchestration variables.

You have configured the Eloqua Bulk API Push Data for Import activity.

## Using the Eloqua Bulk API Synchronize Data activity

---

Use the Synchronize Data activity to trigger synchronization on the import or export operation.

Use this task to trigger synchronization on the import or export operation. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Synchronize Data activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Synchronize Data** activity icon onto the orchestration. The Eloqua Bulk API Synchronize Data checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Synchronize Data activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **id:** ID of the existing import or export definition.
- **operationType:** Following operation types are available to Sync:
  - Import: It sends data from staging area into Eloqua system.
  - Export: It sends data from Eloqua system into staging area.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Eloqua Bulk API Synchronize Data activity.

## Using the Eloqua Bulk API Get Synchronization Status Details activity

Use the Get Synchronization Status Details activity to retrieve the synchronization logs and error details from Eloqua.

Use this task to retrieve the synchronization status along with logs and rejected record details. Sync log retrieves the logs for the specified sync and rejected logs retrieves raw data about validation failures during the specified sync action. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Get Synchronization Status Details activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Get Synchronization Status Details** activity icon onto the orchestration. Select the activity. The Eloqua Bulk API Get Synchronization Status Details checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.

Note: Additional configuration is not required for this activity.

1. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of Get Synchronization Status Details activity are displayed as nodes under the request input parameter in the **To Activity** panel.
2. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has the following mandatory field:

- **selectionType:** Following options are available to retrieve status detail of Import/Export definitions.
  - SPECIFIC\_ID
  - ALL\_IDS

**Optional Fields:** The activity has following optional fields:

- **id:** The ID of the Import/Export Definition.

Note: ID becomes mandatory if you select SPECIFIC\_ID in selectionType.

- **showlogs:** It is used to retrieve logs. Valid terms are: True, False.
- **showRejectedRecords:** It is used to retrieve rejected records. Valid terms are: True, False.
- **limit:** Specifies maximum number of records to return.
- **offset:** Specifies an offset that allows to retrieves the next batch of records.
- **order:** Ordering options available are:
  - Ascending
  - Descending
- **orderBy:** Following ordering options are available to order the records:
  - uri
  - id
  - name
  - dataRetentionDuration
  - maxRecords
  - autoDeleteDuration
  - kbUsed
  - createdBy
  - createdAt
  - updatedBy
  - updatedAt

- **Filters:** Specifies query criteria used to filter . Filter use the comparison, logic, and existence operators to filter import data based on Eloqua field values. It has following fields:
- **Filter:** It allows creating filter statements by using the following options:
  - - **ename:** It is used to select the data that you want to retrieve.
    - **operator:** It is used to specify a condition.
    - **value:** Value for filter.
  - **AdditionalFilters:** This is used to add more than one filter by using the following options:
    - **Operator:** The Eloqua Bulk API also supports complex filters that filter based on multiple criteria using the AND, OR, and NOT operators.
    - **Filter:** Use same parameters as defined in the **Filter** section.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Eloqua Bulk API Get Synchronization Status Details activity.

## Using the Eloqua Bulk API Get Export Definition activity

Use the Get Export Definition activity to retrieve all export definitions from Eloqua.

Use this task to retrieve all export definitions from Eloqua. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Get Export Definition activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Get Export Definition** activity icon onto the orchestration. The Eloqua Bulk API Get Export Definition checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Get Export Definition activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has the following mandatory field:

- **selectionType:** It is used to retrieve Export Definitions. Available terms: SPECIFIC\_ID, ALL\_IDS.

**Optional Fields:** The activity has following optional fields:

- **id:** The ID of the Export Definition to retrieve.

Note: ID becomes mandatory when you select SPECIFIC\_ID in selectionType.

- **limit:** Specifies maximum number of records to return.
- **offset:** Specifies an offset that allows to retrieves the next batch of records.
- **order:** Term to be ordered in Ascending or Descending order.
- **orderBy:** Term to be ordered based on: uri, id, name, dataRetentionDuration, maxRecords, autoDeleteDuration, kbUsed, createdBy, createdAt, updatedBy, and updatedAt.
- **Filters:** Specifies query criteria used to filter . Filter uses the comparison, logic, and existence operators to filter import data based on Eloqua field values. It has following fields:
  - **Filter:** It allows creating filter statements by using the following options:
    - **ename:** It is used to select the data that you want to retrieve.
    - **operator:** It is used to specify a condition.
    - **value:** Value for filter.
  - **AdditionalFilters:** This is used to add more than one filter.
    - **Operator:** The Eloqua Bulk API also supports complex filters that filter based on multiple criteria using the AND, OR, and NOT operators.
    - **Filter:** Use same parameters as defined in the **Filter** section.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

## Using the Eloqua Bulk API Get Data for Export Definition activity

---

Use the Get Data for Export Definition activity to retrieve the data corresponding to a particular export definition in Eloqua.

Use this task to retrieve the data corresponding to a particular export definition. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Get Data for Export Definition activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Get Data for Export Definition** activity icon onto the orchestration. The Eloqua Bulk API Get Data for Export Definition checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.

7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Get Data for Export Definition activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has the following mandatory field:

- **id:** Retrieves the data for the particular definition with the specified ID.

**Optional Fields:** The activity has following optional fields:

- **dataFormat:** It is used to retrieve the data in selected format. Eloqua Bulk API supports two data formats:
- **JSON:** It is used to retrieve data in JSON format.
- **CSV:** It is used to retrieve data in CSV format.

Note: In both cases, (JSON/ CSV) exported data is encoded Base64 string.

- **limit:** Specifies maximum number of records to return.
- **offset:** Specifies an offset that allows to retrieves the next batch of records.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Eloqua Bulk API Get Data for Export Definition activity.

## Using the Eloqua Bulk API Update Import Definition activity

Use the Update Import Definition activity to update import definition in Eloqua.

Use this task to update import definition in Eloqua. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Update Import Definition activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Update Import Definition** activity icon onto the orchestration. The Eloqua Bulk API Update Import Definition checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.

6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Update Import Definition activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **id:** The ID of the existing import definition.
- **name:** Name of the definition.
- **identifierFieldName:** Specifies which field to use to match the imported data to existing Eloqua data.
- **fields:** It has following fields :
  - **sourceField:** It would be one of the column names from source data.
  - **EloquaDestinationField:** Eloqua column name to which sourceField data would map.

**Optional Fields:** The activity has following optional fields:

- **autoDeleteDuration:** Time until the definition is deleted.
- **dataRetentionDuration:** Time until the staged data is deleted.
- **isUpdatingMultipleMatchedRecords:** Specifies whether Eloqua should update multiple records if multiple records match the identifierFieldName.
- **updateRule:** The following rule types are available:
  - **always:** Always update.
  - **ifNewIsNotNull:** Update if the new value is not blank.
  - **ifExistingIsNull:** Update if the existing value is blank.
  - **useFieldRule:** Use the rule defined at the field level.
- **syncActions:** Specifies additional operations to perform during the import. It has following fields:
  - **action:** It specifies what action to perform. The action can be add, remove, or setStatus.
  - **destination:** It specifies where the action should take place. For add or remove actions, this would be the URI of a list or email group. For setStatus, it might be the URI of an AppCloud Action or Decision service.
  - **status:** Specifies to what the status should be set for a setStatus action. The following status is available:
    - subscribed
    - unsubscribed
    - active
    - complete
    - pending
    - errored
    - yes
    - no

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Eloqua Bulk API Update Import Definition activity.

## Using the Eloqua Bulk API Update Export Definition activity

---

Use the Update Export Definition activity to Update export definition in Eloqua.

Use this task to update export definition in Eloqua. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Update Export Definition activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Update Export Definition** activity icon onto the orchestration. The Eloqua Bulk API Update Export Definition checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant **Eloqua Bulk API** endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of Update Export Definition activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has following mandatory fields:

- **id:** The ID of the existing export definition.
- **name:** Name of the definition.
- **fields:** It has following fields :
  - **sourceField:** It would be one of the column names from source data.
  - **EloquaDestinationField:** Eloqua column name to which sourceField data would map.

**Optional Fields:** The activity has following optional fields:

- **autoDeleteDuration:** Time until the definition is deleted.
- **dataRetentionDuration:** Time until the staged data is deleted.
- **maxRecords:** Specifies the maximum number of records to export.
- **Filters:** Specifies query criteria used to filter . Filter use the comparison, logic, and existence operators to filter import data based on Eloqua field values. It has following fields:
  - **Filter:** It used to create filter statements.
    - **ename:** It is used to select the data that you want to export.
    - **operator:** It is used to specify a condition.
    - **value:** Value for filter.
  - **AdditionalFilters:** This is used to add more than one filter.
    - **Operator:** The Eloqua Bulk API also supports complex filters that filter based on multiple criteria using the AND, OR, and NOT operators.
    - **Filter:** Use same parameters as defined in the **Filter** section.
- **syncActions:** It specifies additional operations to perform during the export. It has following fields :
  - **action:** It specifies what action to perform. The action can be add, remove, or setStatus.
  - **destination:** It specifies where the action should take place. For add or remove actions, this would be the URI of a list or email group. For setStatus, it might be the URI of an AppCloud Action or Decision service.
  - **status:** Specifies to what the status should be set for a setStatus action. The following status is available:
- **subscribed**

- unsubscribed
- active
- complete
- pending
- errored
- yes
- no

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Eloqua Bulk API Update Export Definition activity.

## Using the Eloqua Bulk API Delete Import Definition activity

Use the Delete Import Definition activity to delete an import definition in Eloqua.

Use this task to delete an import definition in Eloqua. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Eloqua Bulk API Delete Import Definition activity:

1. In an active orchestration, open the **Activities** tab and expand the **Eloqua Bulk API** folder contents.
2. Drag the **Delete Import Definition** activity icon onto the orchestration. The Eloqua Bulk API Delete Import Definition checklist is displayed.
3. In the checklist, click **Summary**.
4. Review the contents of the **Activity Name** field, and make the required changes.
5. In the checklist, click **Pick Endpoint**.
6. Click **Browse** and use the **Project Explorer** dialog box to select the relevant Eloqua Bulk API endpoint.
7. To make required changes to the selected endpoint configuration, click **Edit** to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
8. In the checklist, click **Configure**.
9. Click **Browse** to select the object type. The **Browse Eloqua Bulk API** window is displayed.
10. In **Browse Eloqua Bulk API**, you can either filter the object type by specifying the object type in the **Search for an object type** field, or select the object type from the object type list. Click **OK**. The object field preferences are displayed.
11. In **Object Field Preferences**, select the fields that you would like to map by selecting the corresponding field name check boxes.
12. In the checklist, click **Retry**. Review the default settings and make the required changes.
13. Select the **Map Inputs** in the checklist. The XML schemas generated from the selected object of the Delete Import Definition activity are displayed as nodes under the request input parameter in the **To Activity** panel.
14. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** The activity has the following mandatory field:

- **id:** The ID of the import definition that you want to delete.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select **Map Outputs** in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the **From Activity** panel.
2. Create a map between the output parameters and orchestration variables.

You have configured the Eloqua Bulk API Delete Import Definition activity.

## Overview of Eloqua ReST API Connector

---

Eloqua is a marketing automation SaaS company which develops automated marketing and demand generation software and services for business-to-business marketers to improve the quality and quantity of customers' sales leads and streamline their sales processes. Eloqua automates, executes, and measures key marketing and lead management processes along every step of the sales funnel — from lead generation to close. The Eloqua platform is based on a Service-Oriented Architecture (SOA), in which all objects can use Web Services to access bi-directional data-level integration.

IBM Cast Iron Connector for Eloqua uses the Direct Web Service APIs that are offered by Eloqua, which enables users to interact with the platform. The connector enables you to create, retrieve and modify various types of objects that are available on the platform.

You can perform the following activities using Eloqua ReST API connector:

- Outbound Activities:
  - Create
  - Retrieve
  - Update
  - Delete

The Eloqua ReST API version currently supported by this connector is 1.0.

**Parent topic:** [Eloqua ReST API Activities](#)

>Last updated: Monday, 6 March 2017

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Eloq\\_REST\\_API\\_Overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Eloq_REST_API_Overview.html)

## Creating or editing an endpoint for Eloqua ReST API activity

---

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to Eloqua platform. Eloqua ReST API uses OAuth 2.0 authentication mechanism so as to authorize users to perform operations.

### Selecting or editing an Eloqua ReST API endpoint

---

To select or edit an Eloqua ReST API endpoint:

1. In the Create Endpoint or Edit Endpoint pane, configure the Eloqua ReST API endpoint as described in the following table.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the Eloqua ReST API successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
Login URL	Login URL to connect with Eloqua endpoint.
OAuth Access Token	OAuth access token generated from Eloqua ReST API for authentication.
OAuth Refresh Token	OAuth refresh token generated from Eloqua ReST API while generating OAuth Access token.
Application Client ID	The Client Identifier issued to the application during registration.
Application Client Secret	The Client Secret issued to the application during registration.
Application Redirect URL	The Redirect URL issued to the application during registration.

Note:

- To generate the access token, refer to the [Oracle Eloqua ReST API documentation](#) relating to "OAuth2 Authentication Support in Eloqua ReST API".
- The Login URL has default value as `https://login.eloqua.com/id`. It is editable and the URL format is `https://<host>:<port>/id` - You can change the host, port and protocol (http/https) as needed if not using the default.
- In the Map Input section of each activity, relevant fields of endpoint panel are available to override at runtime. You can provide data to various groups of parameters like Proxy Details, Connection Details or Authentication Details to override. Providing only partial field data in a selected group is not allowed to override.

### Objects Supported by the Eloqua ReST API Connector

---

Eloqua ReST API connector supports the following Eloqua objects:

Table 2. Operations supported by the Eloqua objects

Eloqua Objects	Create	Retrieve	Update	Delete
Accounts	Yes	Yes	Yes	Yes
Campaigns	Yes	Yes	Yes	Yes
Contacts	Yes	Yes	Yes	Yes
Contact Lists	Yes	Yes	Yes	Yes
Contact Segments	Yes	Yes	Yes	Yes

Eloqua Objects	Create	Retrieve	Update	Delete
Custom Object Data	Yes	Yes		

## Custom Objects/Custom Fields Support

---

Eloqua supports most of the special characters in the Name for the Custom Objects or its Fields. However, since the connector uses XML based input/output, only those Custom Objects would be supported whose names/fields contain following specific special characters:

- . (Dot)
- - (Hyphen)
- \_ (Underscore)
- Space “ in case of space it will be replaced by double underscore.

Note:

- Eloqua ReST API Connector supports Custom objects/fields if names begin with a letter (alphabet) and can be followed by alphanumeric characters or followed by specific special characters Dot (.), Hyphen(-), Underscore(\_), and Space (.). Custom Objects having any other special characters in name/fields would be skipped in the Connector.
- Eloqua ReST API Connector does not support Custom objects if their object/field names contains two consecutive underscore.

## Using the Eloqua ReST API Create activity

---

Use the Create activity to create an Account, Campaign, Contact, Contact List, Contact Segment and Custom Object Data in Eloqua.

### About this task

---

Use this task to create objects in the Eloqua. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Eloqua REST API folder contents.
2. Drag the Create activity icon onto the orchestration. Select the activity. The Eloqua REST API Create Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Eloqua REST API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse Eloqua REST API window is displayed.
11. In Browse Eloqua REST API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes.

14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Eloqua REST Create Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the eObject field in the object in the To Activity pane of Map Inputs, and select Expand Occurrences.

## Using the Eloqua ReST API Delete activity

---

Use the Delete activity to delete an Account, Campaign, Contact, Contact List and Contact Segment in Eloqua.

### About this task

---

Use this task to Delete objects in the Eloqua ReST instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Eloqua REST API folder contents.
2. Drag the Delete activity icon onto the orchestration. The Eloqua REST API Delete Object Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Eloqua REST API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse Eloqua REST API window is displayed.
11. In Browse Eloqua REST API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes.
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Update Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Eloqua REST Delete Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the eObject in the To Activity pane of Map Inputs, and select Expand Occurrences.

## Using the Eloqua ReST API Retrieve activity

---

Use the Retrieve activity to retrieve an Account, Campaign, Contact, Contact List, Contact Segment and Custom Object Data in Eloqua.

### About this task

---

Use this task to retrieve all objects based on ID in the Eloqua REST instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Eloqua REST API folder contents.
2. Drag the Retrieve activity icon onto the orchestration. Select the activity. The Eloqua REST API Retrieve Object Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Eloqua REST API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse Eloqua REST API window is displayed.
11. In Browse Eloqua REST API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes.
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a

mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.

### Input XML

In the input XML of the Eloqua REST Retrieve Object, two options are provided to the user:

- **RetrieveAll** - It is a Boolean field. If the user wants to fetch all the records of a particular object type, then he should set this parameter as `true`.
- **ID** - If the user sets the RetrieveAll value as `false`, then the user must specify the ID of the record to be fetched. This ID is passed in the ID field. The user can provide multiple IDs to be fetched.  
Note: RetrieveAll and ID are not applicable for Custom object retrieve. If the user wants to fetch custom object then he/she should provide value in at least one of the searchURL parameters.

Table 1. URL parameters for Retrieve

Field Name	Description
depth	The REST API can retrieve entities at three different levels of depth "Complete", "Minimal", and "Partial".
count	Maximum number of entities to return. The value can be any whole number between 1 and 1000.
page	Specifies which page of entities to return, and can be any positive whole number. The Count parameter determines the size (number of results) per page.
orderBy	Specifies the name of the property to order the results by, The orderBy format is ASC   DESC.
lastUpdatedAt	Filter the result based on the lastUpdatedAt value.
id	Identifier for the entity on which to perform the operation. This value is actually part of the base URL, and not a URL parameter.
Search	Specifies the search criteria used to retrieve entities.
viewId	Filter the result based on the viewId value.

17. Create a map between the output parameters and orchestration variables.

## Results

You have configured the Eloqua REST API Retrieve Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the ID field in the object in the To Activity pane of Map Inputs, and select Expand Occurrences.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_emailactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_emailactivities.html)

## Creating or editing an email endpoint

---

Studio and the Integration Appliance use the connection information that email endpoints provide to connect to POP3 or SMTP servers.

Note: For some email systems, the POP3 server and the SMTP server can have the same name, for example: mail.acmecompany.com.

Note: *Email connector base library is changed from V7.5 and because of this user might see a difference in the way attachments were retrieved separately using ReadMime and other activities. User has to re verify the values obtained from the headers and use / map them appropriately if they see any difference in the output*

## Creating or editing an email endpoint

---

1. In the Create Endpoint or Edit Endpoint pane, configure the fields as described in the following table.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

2. When complete, click Test Connection to confirm that you can connect to the POP3 or SMTP server. The **Get Email** activity connects to a POP3 server while the **Send Email** activity connects to a SMTP server.

3. Click OK.

Table 1.

Field Name	Description
Location	Â
Get Email From Server	<b>Get Email</b> activity - The <b>Get Email</b> From Server option is automatically selected for an email endpoint used with the <b>Get Email</b> activity. During run time, the <b>Get Email</b> activity gets email from the specified POP3 server.
Send Email To Server	<b>Send Email</b> activity - The <b>Send Email</b> To Server option is automatically selected for an endpoint used with the <b>Send Email</b> activity. During run time, the <b>Send Email</b> activity sends email to the specified SMTP server.
Host Name	<b>Get Email</b> activity - The Host Name or IP address for the POP3 server. <b>Send Email</b> activity - The Host Name or IP address for the SMTP server.
Port	Specify the port number to access the POP3 or SMTP Server. By default, the port for a POP3 server is 110. Â
Login	Â
User Name and Password not required	<b>Get Email</b> activity - This is option not available for an endpoint of a <b>Get Email</b> activity. You must specify a User Name and Password for an email endpoint used with the <b>Get Email</b> activity.  <b>Send Email</b> activity - Select this option if you want connect to the SMTP server using an anonymous login instead of a username and password. Â Select this option only if SMTP server supports anonymous logins (where a user account is not required).

Field Name	Description
Log In to the Server Using a User Name and Password	<p><b>Get Email</b> activity - This option is automatically selected for an email endpoint used with the <b>Get Email</b> activity. To connect to the POP3 server using a user account, you must enter values into the User Name and Password fields to specify the account used to connect to the POP3 Server.</p> <p><b>Send Email</b> activity - Select this option to connect to the SMTP server using a user account. If this option is selected, you must enter values into the User Name and Password fields for the account used to connect to the SMTP Server.</p>
User Name Â	<p><b>Get Email</b> activity - Enter the User Name for the account used to connect to the POP3 Server.</p> <p><b>Send Email</b> activity - Enter the User Name for the account used to connect to the SMTP Server.</p>
Password Â	<p><b>Get Email</b> activity - Enter the Password for the account used to connect to the POP3 Server.</p> <p><b>Send Email</b> activity - Enter the Password for the account used to connect to the SMTP Server.</p>
<b>Security</b>	Â
Normal Email	Specifies that email runs without SSL.
Email over SSL	Specifies that email runs with SSL. For more information, see <a href="#">Testing an SSL email connection</a> .
Implicit or Explicit	Implicit means that SSL is turned as soon as a connection is made. Explicit requires that the client issue a command to the server requesting that SSL be used.
Client Certificate Alias Name Â	Specifies the client alias used to access the trusted certificate in the keystore. Â Must be enabled for client authorization by the server. By default, when you select the Client Certificate Alias Name option, Studio provides the following name: Factory Supplied Identity. The alias name you specify in this field should match the value you created when creating the certificate in the keystore.

Field Name	Description
Additional Parameters	<p>Specifies additional parameters for SMTP processing. The following table lists the parameters:</p> <p>smtpNewConnEveryTime  <b>Default:</b> false  <b>Description:</b> Specifies creation of a new connection everytime. If set to true, does not use a connection pool</p> <p>smtpPoolMinConnections  <b>Default:</b> 1  <b>Description:</b> Connection pool option - Minimum Connections</p> <p>smtpPoolMaxConnections  <b>Default:</b> 25  <b>Description:</b> Connection pool option - Maximum Connections</p> <p>smtpPoolMaxIdleTime  <b>Default:</b> 7200  <b>Description:</b> Connection pool option - Maximum Idle Time  Â in seconds</p> <p>smtpPoolMaxWaitTime  <b>Default:</b> 300  <b>Description:</b> Connection pool option - Max Wait Time in seconds</p> <p>smtpPoolReclaimConnections  <b>Default:</b> 60  <b>Description:</b> Connection pool option - Reclaim Connections Time in seconds</p>
Â	<p>When using <b>Get Email</b>, choose a polling frequency so that the email server does not close the connection between polls (GetMail activity &gt; Delivery Rules). Some email servers will lock the account or not permit log in if there are frequent openings and closings of connections. Read your email providers documentation to ensure that you set the properties correctly for your email server. To enable a connection pool, you must first set <code>smtpNewConnEveryTime</code> to false, and then set the required connection pool properties.</p>
<b>Connection Timeout</b>	Â
Time out after ___ second(s)  when establishing a connection to the endpoint.	<p>Specifies the number of seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For email activities, the amount of time the Integration Appliance attempts to establish a connection to the SMTP or the POP3 server before timing out.</p> <p>A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an endpoint and the time it takes the endpoint to respond.</p> <p>You set the activity timeout in <b>Retry</b> task of the <a href="#">Get Email activity</a> or <a href="#">Send Email activity</a>.</p>

file:///dcs/markdown/workspace/Transform/out.html

## Get Email activity

The **Get Email** activity is a starter activity. When an orchestration that starts with an **Get Email** activity is deployed to the Integration Appliance, the Integration Appliance polls the POP3 server for email message or messages for the specified account at the specified interval.

Note: The Get Email activity requires the POP3 server to support the TOP and UIDL commands. While these are optional in the POP3 protocol, most servers will support these.

The polled POP3 server and email account is defined in the email endpoint associated with the **Get Email** activity.

During run time, the **Get Email** activity polls a POP3 server for incoming email messages of a particular email account, as shown in the following diagram.

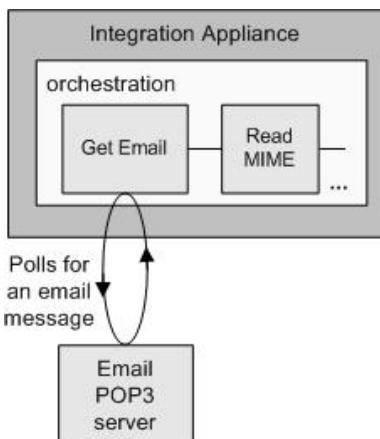

Figure 1.

If any email messages are found the following action occurs for each email message: The regular expression defined for the **Subject** field is checked against the subject of the incoming mail message and the regular expression defined for the **From** field is checked against the sender email account of the incoming mail message. If both regular expressions match, an orchestration job is created to process the email, and the mail is marked for deletion on POP3 Server. When the process is completed, the email is deleted from the POP3 server. For more information about regular expression matching, see the [Configuring the activity](#) procedure.

Note: Two **Get Email** activities should not poll from the same POP3 server at the same time using the same email account even if the regular expressions specified in the **Configure** task of the activity are different. If two **Get Email** activities are attempting to get email using the same email account, when the first **Get Email** activity process the email from the POP3 server and removes the email from the server, the second **Get Email** activity keeps retrying to retrieve the email from the POP3 server and the following exception may be thrown:

```
Protocol exception: com.jscape.inet.pop.PopException:  
Error in TOP 671 0: -ERR The requested message is no  
longer available; it may have been deleted.
```

## Accessing an email message attachment

To access the attachment of a incoming email message, you must add a **Read MIME** activity in the orchestration after the **Get Email** activity as shown in the preceding figure. In addition, you must map the two output parameters of the **Get Email** activity to variables in the orchestration and then map those variables to the input parameters of the **Read MIME** activity. During run time, the **Read MIME** activity reads the MIME Header and the body of the message and then breaks up the attachments contained in the body of the message and places the result into the parts XML output parameter. For more information, see **Read MIME Activity**.

## Adding a Get Email activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the **Activities** tab and expand the Email folder.
3. Drag the **Get Email** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

## Creating, selecting, or editing an email endpoint

1. Click Pick Endpoint task from the **Checklist** and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Complete the [Configuring the activity](#) steps.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The **Edit Endpoint** pane is displayed.
  - o Create a new endpoint: Select New. The **Create Endpoint** pane is displayed.
2. Create or edit an email endpoint. For more information, see [Creating or editing an email endpoint](#).

## Configuring the activity

---

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields in this pane as described in the following table. In this task, you specify the regular expressions used to match against the Subject and From fields of polled email messages. A regular expression must be specified for both of these fields, even if the regular expression is equal to \*, which means that all strings match. In order for a incoming mail to be processed, both the Subject and the From strings of the mail must match their respective regular expressions. In each of the regular expression fields, the following wildcards are supported:
  - o \* (asterisk) - for zero or more characters
  - o ? (question mark) - for zero or one character

Table 1.

Field	Description
Subject matches	Enter a regular expression that matches the subjects of email messages that start an orchestration job to process the email message. In the regular expression, you can specify a combination of characters and wildcards.
From matches	Enter a regular expression defines the sender email address of the email messages that start an orchestration job to process the email message. In the regular expression, you can specify a combination of characters and wildcards.

The following table shows some example regular expressions and the result of matching the regular expressions to sample text.

Table 2.

Regular Expression	Sample Text	Result
*test*	test	matches
*test*	ttttesttt	matches
test	test	matches
test	ttttesttt	does not match, has to exactly match the regular expression string: test
test	est	does not match, has to exactly match the regular expression string: test
?est	test	matches
?est	best	matches
?est	est	matches

## Specifying the delivery rules

---

1. Select the **Delivery Rules** task from the **Checklist**. The Delivery Rules pane is displayed.
2. Specify the time interval to poll the POP3 server for new email messages:
  - a. Select a time unit from the menu: seconds, minutes, hours, or days.
  - b. Specify the amount of time using one of the following input options:
    - By clicking in the Poll for changes every field and entering a new value.
    - Using the up and down arrows.

For more information, see [Polling interval behavior](#).

## Specifying the retry options

---

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.

2. Configure the retry options for connecting to a POP3 server. The following table defines the retry options for a connection to an POP3 server:

Table 3.

Field	Description
Retry	Â
1) Wait _____ second(s) between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the POP3 server.
2) Try to connect ____ times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the POP3 server before issuing an error.</p> <p>If an orchestration that starts with a <b>Get Email</b> activity is deployed and the Integration Appliance cannot connect to the specified POP3 server, the Integration Appliance logs the connections errors as warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system log, resets the connection error count to zero, and continues to attempt to establish a connection to the POP3 server.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as Warnings. The Integration Appliance logs the fourth connection error as an error and resets the connection error count to zero. Therefore, the fifth connection error generates a warning in the system log. The Integration Appliance continues to attempt to establish a connection to the POP3 server.</p>

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane.
2. In this task, you map the **mailheader** (of type XML) and **body** (of type string) output parameters to variables. You must map the output parameters of the activity in order for the orchestration to be valid. See [Creating a map](#) for general instructions on mapping. The **mailheader** output parameter contains meta information about the email message, for example the email addresses that the message is being sent to and the MIME header of the message itself. The **body** output parameter contains the body of the email message and associated attachments.

CAUTION:

The order of the attachments and the body in the body output depend on the email client that sent the message and the type of message (plain text or HTML.).

Note: When using a non-English payload, the **mailheader**, **mimeHeader** and **otherheaders** need to be mapped into the orchestration in the **getEmail** activity, and mapped from the orchestration back into the **sendMail** activity.

**Parent topic:** [Email Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/email\\_get\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/email_get_activity.html)

## Send Email activity

An orchestration that contains the **Send Email** activity is acting as an email client during run time.

The **Send Email** activity connects to the SMTP server, and sends a message to the server as shown in the following figure.

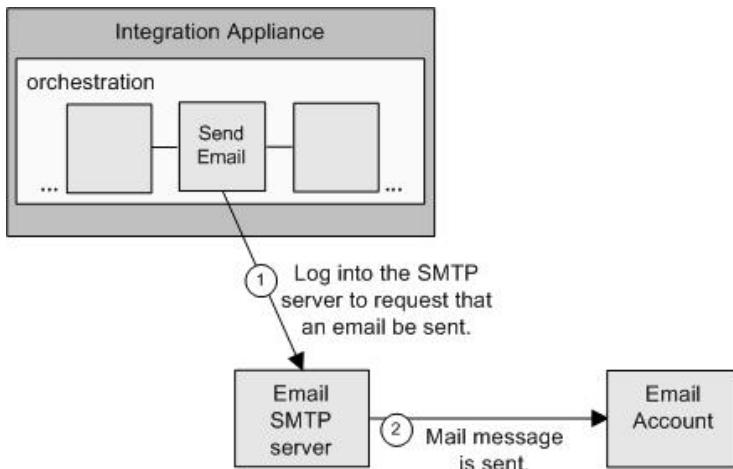

Figure 1.

The steps for adding and configuring a **Send Email** activity are described in the following procedures.

## Adding a Send Email activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the **Email** folder.
3. Drag the **Send Email** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

## Creating, selecting, or editing an email endpoint

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:
  - Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Complete the [Configuring the activity](#) steps.
  - Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an email endpoint. For more information, see [Creating or editing an email endpoint](#).

## Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields in this pane as described in the following table:

Table 1.

Field	Description
From Address	Specifies the sender address for the email message. You must specify the email address using the standard email format: <code>email@domain.extension</code> . This field is required.
To	Specifies the recipient's addresses for the email message. You must specify the email addresses using the standard email format: <code>email@domain.extension</code> . One or more addresses can be specified. Separate the addresses with commas or semicolons. You must specify at least one address. This field is required.
CC	Specifies the carbon copy's addresses for the email message. You must specify the email addresses using the standard email format: <code>email@domain.extension</code> . One or more addresses can be specified. Separate the addresses with commas or semicolons. This field is optional.
Subject	Specifies the subject of the email message.

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an SMTP Server. The following table describes the retry options for connecting to an SMTP Server:

Table 2.

Field	Description
Retry	Â
1) Wait --- second(s) ) between each retry.	<p>Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the SMTP Server.</p>
2) Try to connect --- times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the SMTP Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an <b>Send Email</b> activity and the Integration Appliance cannot connect to the specified SMTP Server, the Integration Appliance logs the connections errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

Â

## Mapping the input of the activity

1. Select the **Map Inputs** task in the **Checklist**. The input parameters of the activity are displayed in the To Activity pane.
2. In this task, you map variables to the following input parameters of the activity:
  - o The **body** input parameter contains the body of the email message and associated attachments. The **body** input parameter is of type string. You must map a variable or assign a default value to the **body** input parameter.
  - o The optional **mailheader** input parameter contains meta information about the email message, for example the email addresses that the message is being sent to and the **mimeHeader** of the message itself. The **mailheader** input parameter is optional, you do not have to map a variable or assign default values to the **mailheader** input parameter.

If the optional **mailheader** input parameter is not listed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active.

You can optionally override the settings you specified in the **Configure** task of the **Checklist** dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the setting for the From Address field by mapping a variable to the from node of the **mailheader** input parameter. During run time, the value of the variable is the from address in the sent email message.

Table 3.

Nodes of the mailheader Input Parameter	Description	Overrides what settings in the Configuring task? Â
from	<p>Specifies the sender address for the email message. You must specify the email address using the standard email format: <code>email@domain.extension</code>.</p>	The <b>from</b> node of the <b>mailheader</b> input parameter overrides the <b>From Address</b> field specified in the <b>Configure</b> task.

Nodes of the mailheader Input Parameter	Description	Overrides what settings in the Configuring task? Â
to	Specifies the recipient addresses for the email message. You must specify the email addresses using the standard email format: email@domain.extension. One or more addresses can be specified. Separate the addresses with commas or semicolons.	The <b>to</b> node of the <b>mailheader</b> input parameter overrides the <b>To</b> field specified in the <b>Configure</b> task.
cc	Specifies the carbon copy addresses for the email message. You must specify the email addresses using the standard email format: email@domain.extension. One or more addresses can be specified. Separate the addresses with commas or semicolons.	The <b>cc</b> node of the <b>mailheader</b> input parameter overrides the <b>CC</b> field specified in the <b>Configure</b> task.
subject	Specifies the subject of the email message.	The <b>subject</b> node of the <b>mailheader</b> input parameter overrides the <b>Subject</b> field specified in the <b>Configure</b> task.
mimeHeader	Specifies the MIME header of the email message.	None.
otherHeaders	Specifies an element that contains a set of MIME headers as name/value pairs not already specified in the <b>mimeHeader</b> node. For example the MIME header: Content-Location is not specified in the MIME header, so the following headerItem node could be equal to the following values: <b>otherheaders/headerItem/name</b> is equal to Content-Location <b>otherHeaders/headerItem/value</b> is equal to the value of the Content-Location MIME header, for example the string: RN-Preamble Multiple MIME headers can be specified, so this is a recurring node.	None.

Note: You can use the **Write MIME** activity to build the contents of the **mimeHeader** node of the optional **mailheader** input parameter. For example, you could add a **Write MIME** activity to the orchestration before the **Send Email** activity and have the **Write MIME** activity populate the contents of the **mimeHeader** XML variable and then pass the **mimeHeader** variable to the **Send Email** activity.

See [Creating a map](#) for more information

Note: When using a non-English payload, the **mailheader**, **mimeHeader** and **otherheaders** need to be mapped into the orchestration in the **getEmail** activity, and mapped from the orchestration back into the **sendMail** activity.

# Testing an SSL email connection

---

After creating an endpoint for an email server, you must import the CA certificate for the email server into Studio and then test the SSL connection to the email server.

## About this task

---

Complete the following procedure to import the email servers CA certificate and then test the SSL connection to the email server:

## Procedure

---

1. Open a command window.
2. Navigate to the email server, and locate the certificate file ca-cert stored in the server.
3. Copy this file and then navigate to the workstation where Studio is installed.
4. Using the command window, paste the ca-cert copy in the home directory of Studio: C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x
5. Browse to the security directory of Studio: C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x\security
6. Run the following command to import the ca-cert file into Studio: ..\jre\bin\keytool.exe -import -v -keystore cacerts -storepass changeit -file ..\castiron\_ca\_cert.pem -alias alias\_name Where alias\_name is the alias of the email servers CA certificate.
7. When you are prompted for a yes or no, enter 'Y'.
8. Exit the command window.
9. Open the endpoint for the email server.
10. Verify the following login credentials for the email connection: Email server, Port, User, and Password.
11. Click Test Connection.
12. If the connection is successful, use this endpoint in Studio orchestrations, then use the Verify tab features to evaluate the orchestration.

## Preparing Data for the Force.com Bulk API connector

---

The Force.com Bulk API connector supports both XML and CSV input data. Following are the details to prepare data for these formats.

### Preparing data for XML input

---

If you are using the XML data as input to the Force.com Bulk API connector, you can either create an XML schema, which can be mapped to the Force.com Bulk API activity or directly map from the previous activity's result to Force.com Bulk API activities.

### Preparing data for CSV input

Force.com Bulk API connector supports CSV input data from connector version 2.2. If you have the CSV data, you can directly map the CSV content to Force.com Bulk API activities. To do so, Force.com Bulk API connector activities expose two new fields, `object` and `data`, in the Map Inputs section. You must map the CSV content to `data` field and provide the selected object name in the `object` field.

Following is the sample for the CSV data, for Account object.

Name,BillingStreet,BillingCity,BillingState,BillingCountry  
XYZ,vvnagara,Bangalore,KA,India

Note:

1. In the CSV data, the first line must contain comma separated field names of the selected object, and from the second line, the actual data must be populated.
2. The order of the data fields must match that of the header field names.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SFDCBulkAPI\\_preparing\\_data.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SFDCBulkAPI_preparing_data.html)

## Creating a Force.com Bulk API endpoint

---

Force.com Bulk API endpoints contain the connection information that studio and the Integration Appliance use to connect to the Salesforce.com server. You can create multiple endpoints that refer to separate instances.

### About this task

---

Use this task to create or edit an Force.com Bulk API endpoint.

Note:

Any changes you make to the Force.com Bulk API endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

## Procedure

---

1. Drag an activity from the Force.com Bulk API folder in the Activities tab to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. Browse - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
  - b. New - To create a new endpoint. The Create Endpoint window opens.
  - c. Edit - To edit the existing endpoint. The Edit Endpoint window opens.
4. Complete the fields defined in the following table:

Table 1. Connection Details

Field Name	Description
Connection Details	
User Name	Specifies the user name to connect to the Salesforce.com server.
Password	Specifies the password associated with the user name to connect to the Salesforce.com server.
URI	Specifies the host URI of the Salesforce.com instance

5. When finished, click Test Connection to confirm that you can connect to the Force.com Bulk API system.
6. Click OK.

## Specifying the Retry options for Force.com Bulk API activities

---

Specifying the Retry parameters is one of the tasks to configure an Force.com Bulk API activity.

### About this task

---

Use this task to configure the retry options for configuring Force.com Bulk API activities. The Force.com Bulk API connector uses a single login session for all connections to a Force.com Bulk API endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

## Procedure

---

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry and timeout options for connecting to an Force.com Bulk API instance, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ second(s) between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Force.com Bulk API instance.

Retry Fields	Description
Try to connect ____ times before failing.	<p>Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the Force.com Bulk API instance before issuing an error and stopping the processing of the current orchestration job.</p> <p>Note: If you deploy an orchestration that contains the Force.com Bulk API activity and the Integration Appliance cannot connect to the specified Force.com Bulk API instance, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>
<b>Activity Timeout</b>	
Timeout after ____ second(s) when the endpoint does not respond to a request.	Specifies the number of seconds the Integration Appliance waits before timing out, when the endpoint does not respond to a request. The default is 300 seconds.

## Using the Force.com Bulk API Batch Insert activity

Use the Force.com Bulk API Batch Insert activity to insert or create a large number of objects in Salesforce.com.

### About this task

Use this task to insert or create a large number of objects in Salesforce.com. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

1. In an active orchestration, open the Activities tab and expand the Force.com Bulk API folder contents.
2. Drag the Batch Insert activity icon onto the orchestration. The Force.com Bulk API Batch Insert Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Force.com Bulk API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating a Force.com Bulk API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Force.com Bulk API window is displayed.

11. In Browse Force.com Bulk API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Force.com Bulk API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Batch Insert activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Force.com Bulk API Batch Insert activity.

## Using the Force.com Bulk API Batch Update activity

---

Use the Force.com Bulk API Batch Update activity to update a large number of objects in Salesforce.com.

### About this task

---

Use this task to update a large number of objects in Salesforce.com. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Force.com Bulk API folder contents.
2. Drag the Batch Update activity icon onto the orchestration. The Force.com Bulk API Batch Update Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Force.com Bulk API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating a Force.com Bulk API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Force.com Bulk API window is displayed.
11. In Browse Force.com Bulk API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Force.com Bulk API activities](#).

14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Batch Update activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

## Using the Force.com Bulk API Batch Upsert activity

---

Use the Force.com Bulk API Batch Upsert activity to update and insert a large number of objects in Salesforce.com.

### About this task

---

Use this task to update and insert a large number of objects in Salesforce.com. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Force.com Bulk API folder contents.
2. Drag the Batch Upsert activity icon onto the orchestration. The Force.com Bulk API Batch Upsert Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Force.com Bulk API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating a Force.com Bulk API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Force.com Bulk API window is displayed.
11. In Browse Force.com Bulk API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Force.com Bulk API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Batch Upsert activity are displayed as nodes under the request input parameter in the To Activity panel.  
Note: The *externalIDFieldName* identifies whether a record must be updated or inserted. If you specify a value for the *externalIDFieldName*, then the record is updated in Salesforce.com. If there is no value set for *externalIDFieldName*, a record is inserted in Salesforce.com.
15. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Force.com Bulk API Batch Upsert activity.

## Using the Force.com Bulk API Batch Delete activity

---

Use the Force.com Bulk API Batch Delete activity to delete a large number of objects in Salesforce.com.

### About this task

---

Use this task to delete a large number of objects in Salesforce.com. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Force.com Bulk API folder contents.
2. Drag the Batch Delete activity icon onto the orchestration. The Force.com Bulk API Batch Delete Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Force.com Bulk API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating a Force.com Bulk API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Batch Delete activity are displayed as nodes under the request input parameter in the To Activity panel.  
Note: The input data for the delete activity is a list of IDs and the object name. All the objects that match the object name and ID are deleted from Salesforce.com.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

## Results

## Using the Force.com Bulk API Get Batch Status activity

---

Use the Force.com Bulk API Get Batch Status activity to get the status of an individual batch or the status of all the batches that are part of the job in Salesforce.com.

### About this task

---

Use this task to get the status of an individual batch or the status of all the batches that are part of the job in Salesforce.com. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Force.com Bulk API folder contents.
2. Drag the Get Batch Status activity icon onto the orchestration. The Force.com Bulk API Get Batch Status Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Force.com Bulk API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating a Force.com Bulk API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get Batch Status activity are displayed as nodes under the request input parameter in the To Activity panel.  
Note: The Bulk API activities return JobInfo, which contains JobId. The job ID can be used to invoke the `getBatchStatus` or `getBatchResult` activities.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

### Results

# Using the Force.com Bulk API Get Batch Results activity

---

Use the Force.com Bulk API Get Batch Results activity to retrieve the batch result to check the status of individual records, when a batch is completed in Salesforce.com.

## About this task

---

Use this task to retrieve the batch result to check the status of individual records, when a batch is completed in Salesforce.com. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Force.com Bulk API folder contents.
2. Drag the Get Batch Results activity icon onto the orchestration. The Force.com Bulk API Get Batch Results Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Force.com Bulk API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating a Force.com Bulk API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get Batch Results activity are displayed as nodes under the request input parameter in the To Activity panel.  
Note: The Bulk API activities return JobInfo, which contains JobId. The job ID can be used to invoke the `getBatchStatus` or `getBatchResult` activities.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Force.com Bulk API Get Batch Results activity.

# FTP Activities

---

- [Creating or Editing an FTP endpoint](#)  
FTP endpoints provide the connection information that Studio and the Integration Appliance use to connect to FTP Servers.
- [Configuring the FTP endpoint for the Parse Directory Listing Example](#)  
To run the Parse Directory Listing Example in your environment, configure the values of the configuration properties used by the FTP Endpoint to point to your FTP Server. In addition, your FTP Server must produce the directory listing in the same format as expected by the Flat File Schema.

- [FTP Poll Directory activity](#)  
During run time, the **FTP Poll Directory** activity connects to FTP Server and polls for the existence of the specified file or files at the specified location. After reading the contents of the file or files and mapping the contents into variable or variables of the orchestration, the **FTP Poll Directory** activity may delete the file or files, move the file or files, or leave the file or files in the directory of the FTP Server.
- [FTP Put File activity](#)  
During run time, the **FTP Put File** activity takes data from variables of the orchestration, places the data into a file, and connects to an FTP Server and places the file in the specified directory location.
- [FTP Get File activity](#)  
During run time, the **FTP Get File** activity connects to an FTP Server and attempts to get a single file at the specified location. You can configure the **FTP Get File** activity to return the contents of the file into a variable of the orchestration. In addition, you can configure the **FTP Get File** activity to return the timestamp of the file returned by the FTP Server into a variable of the orchestration.
- [FTP Delete File activity](#)  
Use the the **FTP Delete File** activity to delete specific files from the specific directories, during run time.
- [FTP List Files activity](#)  
During run time, the **FTP List Files** activity connects to an FTP Server and generates a list of files from the specified directory location using the specified regular expression. The **FTP List Files** activity returns the list of files to the orchestration using either the directoryListing or fileListing output parameter.
- [FTP Rename File activity](#)  
Use the **FTP Rename File** activity to rename and/or move a file to a different directory, during run time.
- [Parse directory listing example](#)  
This example gets a directory listing from and FTP directory using the **FTP List Files** activity, parses the long directory listing using Flat File Scheme, iterates through the list of files, based on the properties of each file.
- [Testing an FTPS server connection](#)  
After successfully running a "test connection", you can use Studio verify tools on FTPS orchestrations before publishing a project.

<file:///dcs/markdown/workspace/Transform/out.html>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_FTPactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_FTPactivities.html)

## Creating or Editing an FTP endpoint

FTP endpoints provide the connection information that Studio and the Integration Appliance use to connect to FTP Servers.

1. In the Create Endpoint or Edit Endpoint pane, configure the fields as described in the following table.  
 Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project as the edits are global, not local.
2. When you had entered the field values, click Test Connection to confirm that you can connect to the FTP Server.
3. Click OK.

Table 1.

Field Name	Description
Location	A
Host Name	Specifies the Host Name or IP address for the FTP Server.
Port	Specifies the port number for the specified host name. The default is 21, the standard port for FTP traffic. The default port for SFTP traffic is 22.
Login	<b>Description</b>

<b>Field Name</b>	<b>Description</b>
Log into the Server as an Anonymous User	This option is only available with the Normal FTP option. Select this option only if the FTP Server allows anonymous logins (where a user account is not required).
Log into the Server with User Name and Password	Select this option to specify a user account to log in into the FTP Server. Enter the user name and password for the account used to connect to the FTP Server.
<b>Security</b>	<b>Description</b>
Normal FTP	Select the Normal FTP option for an unsecured connection.
Secure FTP	Select the Secure FTP option to secure the communication between the Integration Appliance and the FTP Server by sending and receiving the data over SSH. The SSH File Transfer Protocol (SFTP) is a network protocol that provides file transfer over a reliable data stream. Note: Certificate authentication for SFTP is not supported.
FTPS	Select the FTPS option to secure the communication between the Integration Appliance and the FTP Server using the SSL protocol. The SSL protocol supports mutual authentication between the Integration Appliance and FTP Server using an authenticated and encrypted connection. Choose one of the following authentication modes: <ul style="list-style-type: none"> <li>• Implicit</li> <li>• Explicit (SSL) - Starts an FTP session and uses SSL security to authenticate an endpoint and encrypts data before transfer.</li> <li>• Explicit (TLS) - Starts an FTP session and uses TLS security to authenticate the endpoint and encrypts data before transfer.</li> </ul> <p>Important: Before you can deploy a project using FTPS, you must upload and register a certificate on the Integration Appliance. For more information about uploading and registering a certificate, see the CLI Command Reference.</p>
Client Certificate Alias Name	When the FTPS server is configured to authenticate a client, select this option and specify a client certificate alias name. By default, when you select the Client Certificate Alias Name option, Studio provides the following name: Factory Supplied Identity  The client certificate alias name that you specify in this field should match the value you specified for the client certificate name using the Cast Iron® command line interface (CLI), when you uploaded or imported the certificate. In the CLI, if you mapped the client certificate name to the default alias name, accept the default name that Studio provides and configure the Connection Timeout for the endpoint.
<b>FTP Mode</b>	<b>Description</b>
Active FTP	Select this option to enable the Active mode. When you enable the Active mode option, you can specify the external IP and port range for incoming connections. By default, this option is not selected and the FTP endpoint supports passive mode transfers. Note: Active mode is not supported for SFTP.
External IP	(Optional) Specifies the client IP address from which the FTP Server will respond to connection attempts.
Port Range/Start Port	(Optional) Specifies the lowest port number of the predetermined range assigned to incoming connections. If you enter a start port number, you must also enter the end port number. Important: This number cannot be less than 1024.
Port Range/End Port	(Optional) Specifies the highest port number of the predetermined range assigned to incoming connections. If you enter an end port number, you must also enter the start port number. Important: This number cannot be greater than 65535.
<b>Connection Timeout</b>	<b>Description</b>

Field Name	Description
Time out after ____ second(s) when establishing a connection to the Endpoint.	<p>The number of seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For an FTP activity, the amount of time the Integration Appliance attempts to establish a connection to the FTP Server before timing out. A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an endpoint and the time it takes the endpoint to respond. You set the activity timeout in <b>Retry</b> task of the following FTP activities:</p> <ul style="list-style-type: none"> <li>• FTP Poll Directory activity</li> <li>• FTP Put File activity</li> <li>• FTP Get File activity</li> <li>• FTP Delete File activity</li> <li>• FTP List Files activity</li> <li>• FTP Rename File activity</li> </ul>

Note: For some of the fields in the endpoint, you can define configuration properties to supply the values for these fields. The  icon is displayed when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.

## Configuring the FTP endpoint for the Parse Directory Listing Example

---

To run the Parse Directory Listing Example in your environment, configure the values of the configuration properties used by the FTP Endpoint to point to your FTP Server. In addition, your FTP Server must produce the directory listing in the same format as expected by the Flat File Schema.

### About this task

---

Complete following steps only if you plan on running the Parse Directory Listing Example:

- [To edit and test the FTP configuration properties of the FTTParseDirListingExample in Studio](#)
- [To configure the root directory of the FTP Server](#)
- [To determine if your FTP Server generates the file listing in the same format as the Flat File Schema included in this example](#)
- [To run the FTTParseDirListingExample](#)

To only view and learn more about the example, complete the procedure in the [Parse Directory Listing Example](#) section.

#### **Edit and test the FTP configuration properties of the FTTParseDirListingExample in Studio:**

---

### Procedure

1. Open **FTTParseDirListingExample**. For instructions see steps 1-2 in [Parse Directory Listing Example](#).
2. From the toolbar menu, select Project > Configuration Properties. The Configuration Properties dialog box is displayed.
3. Edit the values of the properties to reflect your FTP Server.
4. In the Project tab, double-click the FTP Endpoint. The FTP Endpoint tab is displayed.
5. To verify that you entered the correct FTP information, click Test. If Studio connects to your FTP Endpoint, an Information dialog box is displayed with the message that you have successfully connected to the endpoint.
6. In the Project tab, double-click on the **processBids** orchestration. The **processBids** orchestration tab is displayed.

## What to do next

---

Configure the root directory of the FTP Server:

1. Add the additional directories to your FTP Server. Mirror the directory structure and also provided in the `FTPServerDirStructure` directory. If you accepted the defaults during the installation of Studio, this directory is located in the following location:  
`C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\FTPParseDirListing\FTPServerDirStructure`  
During run time, the Parse Directory Listing Example expects the root directory of the FTP Server to contain the following directory structure:

```
\input  
\processFailed  
\processWidgetRUs  
\processAcmeInc  
\processNewCompany
```

2. Move a copy of the `bid*.txt` files to the `\input` directory on your FTP Server. If you accepted the defaults during the installation of Studio, these files provided in the following directory location: `C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\FTPParseDirListing\FTPServerDirStructure\input`

Before running the example, a copy of the following files must be located in the `\input` directory of the FTP Server.

- o `bidAcmeInc.txt`
- o `bidCrankCo.txt`
- o `bidWidgetRUs.txt`
- o `bidBudgetManufacture.txt`
- o `bidSamAndSons.txt`

Determine if your FTP Server generates the file listing in the same format as the Flat File Schema included in this example:

1. Open **FTPParseDirListingExample**. For instructions see steps 1-2 in [Parse Directory Listing Example](#).
2. In the Project tab, double-click the **processBids** orchestration. The **processBids** orchestration tab is displayed.
3. Click the **FTP List Files** activity labeled `List Files Full Dir Listing`.
4. Click Test.
5. Determine if the format of the directory listing matches the following directory listing:

```
-rw-r--r-- 1 551 551 65 May 3 11:39 bidAcmeInc.txt  
-rw-r--r-- 1 551 551 43 May 3 11:39 bidBudgetManufacture.txt  
-rw-r--r-- 1 551 551 0 May 3 11:39 bidCrankCo.txt  
-rw-r--r-- 1 551 551 73 May 3 11:39 bidSamAndSons.txt  
-rw-r--r-- 1 551 551 33 May 3 11:39 bidWidgetRUs.txt
```

If the directory format is different, you can alter the Flat File Schema called **parseDirListing**.

### CAUTION:

Changing the nodes of the Flat File Schema may affect other entities in the orchestration. You may need to update the orchestration to reflect these changes.

For more information, see [Flat File Schema Editor Overview](#).

To open the Flat File Schema used in this example, in the Project tab, double-click on the `parseDirListing` in the Flat File Schema folder. Copy and paste the output of the Test button of the **FTP List Files** activity to a file and then open the file in the Test tab of the Flat File Schema Editor. Change the nodes of the Flat File Schema to reflect the directory listing. The size node is used by the "If size less or equal 0" branch of the **If..Then** activity. Make sure a value is provided for the size node during run time.

### Run the **FTPParseDirListingExample**:

1. From Studio, publish the **FTPParseDirListingExample** project. From the Studio toolbar, select File > Publish Project... .
2. From the Web Management Console (WMC), deploy the **FTPParseDirListingExample** project. For more information, see the WMC Online help or Step 11: Publish and Deploy the Completed Integration Project in the [Developing the BookOrder Project](#) section of the [Getting Started Guide](#).

**Parent topic:** [FTP Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring\\_the\\_FTP\\_Endpoint\\_for\\_the\\_Parse\\_Directory\\_Listing\\_Example.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring_the_FTP_Endpoint_for_the_Parse_Directory_Listing_Example.html)

## FTP Poll Directory activity

During run time, the FTP Poll Directory activity connects to FTP Server and polls for the existence of the specified file or files at the specified location. After reading the contents of the file or files and mapping the contents into variable or variables of the orchestration, the **FTP Poll Directory** activity may delete the file or files, move the file or files, or leave the file or files in the directory of the FTP Server.

The FTP Poll Directory activity is a starter activity. When an orchestration that starts with an **FTP Poll Directory** activity is deployed to the Integration Appliance, the Integration Appliance polls for file or files to be added to a specific directory on the FTP Server. When a file or files is shown on the FTP Server, an orchestration job is started to processes the file or files and the rest of the activities in the orchestration. For more information, see [Polling Interval Behavior](#). For an example of an orchestration using the **FTP Poll Directory** activity, see the [Getting Started Guide](#).

Depending on your application requirements, you can process a list of files in an FTP directory using one of the following methods:

- For some cases, you can use only the **FTP Poll Directory** activity to process a set of files found in an FTP directory.
- In other cases, you must use the **FTP List Files** activity in conjunction with the **FTP Get File**, **FTP Put File**, **FTP Delete File**, and **FTP Rename File** activities.

Use the **FTP Poll Directory** activity to process a set of files found in an FTP directory when the following conditions are true:

- **The FTP Poll Directory activity supports the format of the directory listing of your FTP Server.** - The format of directory listings are different for the FTP Servers supported on different operating systems. The **FTP Poll Directory** activity supports many types of FTP Servers but if the directory listing format your FTP Server cannot be parsed by the **FTP Poll Directory** activity, use the **FTP List Files** activity with a Flat File Schema and the **FTP Get File**, **FTP Put File**, **FTP Delete File**, and **FTP Rename File** activities, to provide the same functionality as the **FTP Poll Directory** activity as shown in the Parse Directory Listing Example: [Parse directory listing example](#).
- **After reading each file in the list, each file in the list can be post-processed with the same action.** - For example, while processing a set of files from a FTP directory, if each file in the list can be moved to the same directory, you can use the **FTP Poll Directory** activity to process the set of files. If however, you need to process a different action based on the properties of a file, you must use the **FTP List Files** activity in conjunction with the **FTP Get File**, **FTP Put File**, **FTP Delete File**, and **FTP Rename File** activities. For example, if you must move files to different directories based on the filename, use the **FTP List Files** activity in conjunction with the **FTP Get File**, **FTP Put File**, **FTP Delete File**, and **FTP Rename File** activities as shown in the Parse Directory Listing Example: [Parse directory listing example](#).

## Symbolic links

The support for symbolic links by the **FTP Poll Directory** activity during run time is dependent on the following factors: ^

- The types of symbolic links supported by operating system that hosts the FTP Server.
- The types of symbolic links supported by the FTP Server itself.
- The types of symbolic links supported by the **FTP Poll Directory** activity, as listed in the following table:

Table 1.

Symbolic Links to...	Hard Symbolic Links	Soft Symbolic Links	Notes^
Files	Not Supported	Not Supported	The <b>FTP Poll Directory</b> activity does not interpret symbolic links to files as files and therefore symbolic links to files are not processed by the <b>FTP Poll Directory</b> activity during run time.
Directories	Supported	Supported	

To determine the specific symbolic link support for a specific FTP Server on a specific operating system, see your operating system and FTP Server documentation.

## Persistence

You should enable persistence for the FTP Poll Directory activity:

- If you have an orchestration job with a FTP Poll Directory activity that is processing large input files. Otherwise, you can experience problems like "Variable 'Lotdata' is too large, please turn on persistence for this orchestration".
- If you disable persistence and have an orchestration job with a FTP Poll Directory activity with the Keep in place option selected, and during run time if a failure occurs that causes the job to stop, when the orchestration is restarted it processes the file again. The state of the job is lost and Integration Appliance does not know that it has already processed the file.

For more information, see [Enabling persistence](#).

## Processing subdirectories with the Microsoft FTP Endpoint

---

For the Microsoft IIS (Internet Information Services) FTP Endpoint, the run time behavior of the **FTP Poll Directory** activity when processing subdirectories and the files in subdirectories depends on the regular expression specified in the File Named field of the Configure task of the activity, as described in the following cases:

- When the regular expression is equal to the string: \*, the orchestration job processes the subdirectories in the specified directory.
- When the regular expression is equal to the string: \*\*, the orchestration job does not process the subdirectories in the specified directory.
- When the regular expression is blank, the orchestration job does not process the subdirectories in the specified directory

## Adding an FTP Poll Directory activity to the orchestration

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the FTP folder.
3. Drag the **Poll Directory** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

## Creating, selecting, or editing an FTP endpoint

---

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:
  - Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.  
CAUTION:  
Specifying a new FTP endpoint with a different directory structure than the original FTP endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the "Configure the activity" procedure.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.  
CAUTION:  
Specifying a new FTP endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the "Configure the activity" procedure. Click Edit. The Edit Endpoint pane is displayed.
  - Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an FTP endpoint.

## Configuring the activity

---

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields in this pane as described in the following table:

Table 2.

Field	Description

Field	Description
File Named	<p>Specifies a pattern or regular expression that defines the filename or filenames to get from the FTP Server. The processing of the regular expression is done by the FTP Server. For more information, see the FTP Server documentation on regular expressions . Typically, FTP Servers support the following wildcards in their regular expressions:</p> <ul style="list-style-type: none"> <li>◦ * - zero or more characters</li> <li>◦ ? - zero or one character</li> </ul> <p>Note: Because the processing of the regular expression is done on the FTP Server, the case sensitivity is determined by FTP Server. If the FTP Server is case sensitive, the file matching done by the FTP Poll Directory activity is also case sensitive.</p>
In Directory	<p>Specifies the directory where the Integration Appliance looks for files on the FTP Server. You can specify a directory using one of the following options:</p> <ul style="list-style-type: none"> <li>◦ Directly enter directory path by clicking in the field and typing in one of the following directory paths: <ul style="list-style-type: none"> <li>▪ Relative directory path, for example: input. (Assumes that FTP home has been configured for the user account that connects to the FTP Server. See "Note" for more information.)</li> <li>▪ Complete directory path, for example on a UNIX machine: /home/user/input.</li> </ul> </li> <li>◦ Click Browse... to populate the drop-down list of available directories. Select the appropriate directory from the drop-down list.</li> </ul> <p>Note: <b>UNIX:</b> If you specify a relative directory path when connecting to an FTP Server on a UNIX machine, verify that the FTP home directory has been correctly specified in the /etc/password file for the user account connecting to the FTP Server.</p>
Test	<p>After a regular expression has been specified in the File Named field and the directory to look for files on the FTP Server has been specified in the In Directory field, click Test to test the regular expression against the set of files in the specified directory on the FTP Server. A dialog box will appear listing any matching files.</p>
Of Type	<p>Specifies how to read in the contents of the file - either as binary data or encoded text. If the Text option is selected, set the encoding type using one of the following options:</p> <ul style="list-style-type: none"> <li>◦ From the encoded with drop-down list, select one of the default encoding types.</li> <li>◦ Enter your encoding type directly by clicking in the encoded with field and typing in your encoding type.</li> </ul> <p>Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see <a href="#">Using the Shift-JIS encoding</a>.</p>
Â	<p><b>CAUTION:</b>  You must specify the Transfer as Text (ASCII) option for FTP activities when retrieving text files and placing text files on an FTP Server for Endpoints that manipulate text data while transferring data from/to the FTP endpoint in ASCII mode. For example, mainframe and DOS FTP Endpoints manipulate ASCII data when passing data in ASCII mode. For example, if your orchestration retrieves ASCII files using the FTP Poll Directory activity and places ASCII files using the FTP Put File activity to a mainframe FTP Server, you must specify the options in the following tasks in Studio:</p> <ul style="list-style-type: none"> <li>◦ In the Configure task of an FTP Poll Directory activity, for the Of Type field select the Text option.</li> <li>◦ In the Delivery Rules task of an FTP Poll Directory activity, for the File Transfer Type field select the Transfer as Text (ASCII) option.</li> <li>◦ In the Configure task of an FTP Put File activity, for the Of Type field select the Text option.</li> <li>◦ In the Delivery Rules task of an FTP Put File activity, for the File Transfer Type field select the Transfer as Text (ASCII) option.</li> </ul>
After reading the file	<p><b>Delete it</b> - Delete the file after the file has been read.</p> <p><b>Move to directory</b> - Move the file to the specified directory after the file has been read.</p> <p>Specify the directory that the file is moved to during run time, using one of the following options:</p> <ul style="list-style-type: none"> <li>◦ Directly enter a directory path by clicking in the field and typing in one of the following directory paths: <ul style="list-style-type: none"> <li>▪ Relative directory path, for example: input/. (Assumes that FTP home has been configured for the user account that connects to the FTP Server. See "Note" for more information.)</li> <li>▪ Complete directory path, for example on a UNIX machine: /home/user/input/.</li> </ul> </li> <li>◦ Click Browse... to populate the drop-down list of available directories. Select the appropriate directory from the drop-down list.</li> </ul>

Field	Description
Â	<p>Attention: Specify the directory separator after the last listed directory name. For example, to move a file to the processed/acme directory in a relative path, specify the following directory in the Move to directory field: processed/acme/</p> <p>Optional - Specify the format of the file name after it has been renamed. From the Pattern drop-down list, select the desired pattern. To specify the character used to separate the sub-fields in the file name, enter a character in the Pattern Separator field. Specify the run time behavior when a file with the same file name exists:</p> <ul style="list-style-type: none"> <li>○ Select the Overwrite check box to specify that the existing file should be overwritten if a file with the same name already exists.</li> <li>○ Clear the Overwrite check box to specify that the existing file should not be overwritten if a file with the same name already exists.</li> </ul> <p>Note: The first time the <b>FTP Poll Directory</b> activity polls during run time, if the activity is unable to move the file because the specified move to directory does not exist, a warning is logged (not an error) to the Web Management Console (WMC) and the file stays in place. For all subsequent polls, the activity does not attempt to move the same file and an info level message is logged to the WMC stating that the file has already been processed.</p> <p><b>Keep in place</b> - Leave the file in the input directory after the file has been read.</p>
<b>Advanced Options</b>	<p><b>Description</b></p> <p>Duplicate List Size</p> <p>Size of the internal list used by the Integration Appliance to keep track of which files on the FTP Server have been polled or not. The default value is 10000. You should only specify a size larger than the default.</p>

## Specifying the delivery rules

1. Select the Delivery Rules task from the **Checklist**. The Delivery Rules pane is displayed.
  2. Specify the time interval to poll for the files on the FTP Server:
    - a. Select a time unit from the drop-down menu: seconds, minutes, hours, or days.
    - b. Specify the amount of time by clicking in the Polling Interval field and entering a value or using the up and down arrows.

For more information, see [Polling interval behavior](#).
  3. If security is not enabled for the FTP endpoint, the Transfer as Text (ASCII) and Transfer as Binary (BINARY) options are enabled in the Delivery Rules task. If security is enabled for the FTP Endpoint, the file transfer type is always binary.
- Select the type of file transfer between the Integration Appliance and the FTP Server from one of the following options:
- **Transfer as Text (ASCII)** - Only seven bits of each character in the file is transferred from the FTP Server to the Integration Appliance. This option is used for transferring ASCII files such as HTML and text files. **WARNING:** Using this option with binary files can result in a loss of data.
  - **Transfer as Binary (BINARY)** - All eight bits of each byte in the file is transferred from the FTP Server to the Integration Appliance. Â This option is used for transferring binary files.
- Note: Setting the transfer mode in the Delivery Rules task is equivalent to setting the transfer mode via a command line session with an FTP Server using the following commands:
- ascii
  - binary

Note: Cast Iron FTP connector SFTP endpoint supports only client side SFTP protocol version 3. Hence, the SFTP protocol does not support ASCII/text mode file transfer. Make sure to set the File Transfer Type to Transfer as Binary (BINARY) in the Checklist > Delivery Rules.

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an FTP Server. The following table defines the retry options for a connection to an FTP Server:

Table 3.

Field	Description
Retry	<p>Â</p> <p>1) Wait — second(s) between each retry.</p>
2) Try to connect __ times before failing .	<p>The number of seconds that the Integration Appliance waits before trying to establish a connection to the FTP Server.</p> <p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the FTP Server before issuing an error. If an orchestration that starts with an <b>FTP Poll Directory</b> activity is deployed and the Integration Appliance cannot connect to the specified FTP Server, the Integration Appliance logs the connection errors as warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system log, resets the connection error count to zero, and continues to attempt to establish a connection to the FTP Server.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and resets the connection error count to zero. Therefore, the fifth connection error generates a warning in the system log. The Integration Appliance continues to attempt to establish a connection to the FTP Server.</p>

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane as listed in the following table:

Table 4.

Output Parameter	Description
filename	Provides the name of the file found on the FTP Server.
data	Provides the contents of the file.
timestamp	Provides the date and time as a string in the XML Schema dataType format (YYYY-MM-DDhh:mm:ss, where YY is the year, MM is the month, DD is the day, hh is the timezone, mm is the minutes, and ss is the seconds.) Note: If the timestamp output parameter is mapped in the <b>Map Outputs</b> task but the MDTM (return the modification time of a file) functionality is not available or is not enabled for the FTP Server, during run time the orchestration will stop processing due to this error. A warning is generated and the Epoch date (1/1/1970) is returned in the timestamp output parameter.

2. You are not required to map the output parameters of the activity. See [Creating a map](#) for general instructions on mapping. Â

---

[Feedback](#) | [Notices](#)

 Last updated: Sunday, 09 September 2018  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ftp\\_poll\\_directory\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ftp_poll_directory_activity.html)

# FTP Put File activity

---

During run time, the **FTP Put File** activity takes data from variables of the orchestration, places the data into a file, and connects to an FTP Server and places the file in the specified directory location.

For an example of using the **FTP Put File** activity, see the [Getting Started Guide](#).

## Transfer interruption

---

The file transfer done by the **FTP Put File** activity during run time is non-transactional and therefore is not guaranteed. For example, if an **FTP Put File** activity transfers a file from the Integration Appliance to an FTP server and the transfer of the file is interrupted because the Integration Appliance is rebooted, it is not guaranteed that the entire file is transferred.

## Symbolic link

---

The FTP Put File activity supports symbolic links to directories if the symbolic links to directories are supported by the operating system that hosts the FTP Server and the symbolic links to directories are supported by the FTP Server itself. To determine the specific symbolic link support for a specific FTP Server on a specific operating system, see your operating system and FTP Server documentation.

## Adding an FTP Put File activity to the orchestration

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the FTP folder.
3. Drag the **Put File** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

## Creating, selecting, or editing an FTP endpoint

---

1. Click Pick Endpoint task from the **Checklist** and choose one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.  
Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the "To configure the activity" procedure.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.  
Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the "Configure the activity" procedure.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an FTP endpoint: [Creating or Editing an FTP endpoint](#)

## Specifying the delivery rules

---

1. Select the **Delivery Rules** task from the **Checklist**. The Delivery Rules pane is displayed. If security is not enabled for the FTP endpoint, the Transfer as Text (ASCII) and Transfer as Binary (BINARY) options are enabled. If security is enabled for the FTP endpoint, the file transfer type is always binary.
  2. Select the type of file transfer between the Integration Appliance and the FTP Server from one of the following options:
    - o **Transfer as Text (ASCII)** - This option is used for transferring files such as HTML, XML, and other text files. Line endings are converted as required and other text file conventions are followed.  
**CAUTION:**  
Using this option with binary files can result in a loss of data.
    - o **Transfer as Binary (BINARY)** - This option is used for transferring binary files. Using this option the Integration Appliance transfers data with no conversions.
- Note: Cast Iron FTP connector SFTP endpoint supports only client side SFTP protocol version 3. Hence, the SFTP protocol does not support ASCII/text mode file transfer. Make sure to set the File Transfer Type to Transfer as Binary (BINARY) in the

## Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure the fields in this pane as described in the following table:

Table 1.

Field	Description
<b>Save</b>	
File Named	This field is not used for this activity. You specify the name of the output file using the <b>filename</b> input parameter of the <b>Map Input</b> task.
In Directory	<p>Specifies the directory on the FTP server where the Integration Appliance places the file generated in this activity. You can specify a directory using one of the following options:</p> <ul style="list-style-type: none"> <li>○ Directly enter directory path by clicking in the field and typing in one of the following directory paths:           <ul style="list-style-type: none"> <li>■ Relative directory path, for example: /output. (Assumes that FTP home has been configured for the user account that connects to the FTP Server. See "<b>Note</b>" for more information.)</li> <li>■ Complete directory path, for example on a UNIX machine: /home/user/output.</li> </ul> </li> <li>○ Click <b>Browse...</b> to populate the drop-down list of available directories. Select the appropriate directory from the drop-down list.</li> </ul> <p><b>Note:</b> <b>UNIX:</b> If you specify a relative directory path when connecting to an FTP Server on a UNIX machine, verify that the FTP home directory has been correctly specified in the /etc/password file for the user account connecting to the FTP Server.</p>
Of Type	<p>Specifies how to read in the contents of the file - either as binary data or encoded text. If the Text option is selected, set the encoding type using one of the following options:</p> <ul style="list-style-type: none"> <li>○ From the encoded with drop-down list, select one of the default encoding types.</li> <li>○ Enter your encoding type directly by clicking in the encoded with field and typing in your encoding type.</li> </ul> <p><b>Note:</b> Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see <a href="#">Using the Shift-JIS encoding</a>.</p>
Â	<p>Attention: You must specify the Transfer as Text (ASCII) option for FTP activities when retrieving text files and placing text files on an FTP Server for Endpoints that manipulate text data while transferring data from/to the FTP Endpoint in ASCII mode. For example, mainframe and DOS FTP Endpoints manipulate ASCII data when passing data in ASCII mode.</p> <p>For example, if your orchestration retrieves ASCII files using the <b>FTP Poll Directory</b> activity and places ASCII files using the <b>FTP Put File</b> activity to a mainframe FTP Server, you must specify the options in the following tasks in Studio:</p> <ul style="list-style-type: none"> <li>○ In the <b>Configure</b> task of an <b>FTP Poll Directory</b> activity, for the Of Type field select the Text option.</li> <li>○ In the <b>Delivery Rules</b> task of an <b>FTP Poll Directory</b> activity, for the File Transfer Type field select the Transfer as Text (ASCII) option.</li> <li>○ In the <b>Configure</b> task of an <b>FTP Put File</b> activity, for the Of Type field select the Text option.</li> <li>○ In the <b>Delivery Rules</b> task of an <b>FTP Put File</b> activity, for the File Transfer Type field select the Transfer as Text (ASCII) option.</li> </ul>
<b>Options</b> - Select one of the following options to define the behavior when a file of the same name already exists in the specified output directory:	
Overwrite Existing File if Duplicate File Name is Found	Specifies if the file already exists, destroys the contents of the original file with new data returned from the activity.
Append to Existing File	Specifies if the file already exists, keeps the original data in the file and appends the new data (returned from the activity) to the end of the file.

Field	Description
Raise Error if File with Duplicate Name is Found	<p>Specifies if the file already exists, keeps the original data in the file, throws an error, and does nothing with the new data returned from the activity.</p> <p>Note: When you select this option, the FTP Put File activity checks if the file exists on the server before uploading the file. In some FTP servers you may not have the permission to check if the file exists before uploading it. This is also referred to as Blind FTP. In such cases, the file is overwritten, even if you have selected the Raise Error if File with Duplicate Name is Found option.</p>

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an FTP Server. The following table describes the retry options for connecting to an FTP Server:

Table 2.

Field	Description
Retry	
1) Wait --- second(s) ) between each retry.	The number of seconds that the Integration Appliance waits before trying to establish a connection to the FTP Server.
2) Try to connect --- times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the FTP Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an <b>FTP Put File</b> activity and the Integration Appliance cannot connect to the specified FTP Server, the Integration Appliance logs the connections errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors are shown in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

## Mapping the input of the activity

1. Select the **Map Inputs** task in the **Checklist**. The Retry pane is displayed. The input parameters of the activity are displayed in the To Activity pane.
2. You are not required to map all the input parameters of the activity. The following parameters are the required:
  - o filename
  - o data

All other parameters are optional. See [Creating a map](#) for general instructions on mapping. Â

If the input parameter listed in the following table are not displayed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active.

You can optionally override the settings you specified in the **Configure** and **Pick Endpoint** task of the **Checklist** dynamically during run time, using the input parameters defined in the following table.

For example, the directory on the FTP Server where the Integration Appliance places the file generated in this activity, could be set in the **Configure** task to the directory called output. During run time, the directory name: outputXML could be passed into the activity using the directory input parameter. The directory name specified dynamically during run time overrides the original setting specified in the Configure pane. In this example, the file would be placed in the outputXML directory.

Table 3.

<b>Input Parameter Name/Node</b>	<b>Description</b>	<b>Overrides the Setting In Task?</b>
directory	Specifies the directory on the FTP server where the Integration Appliance places the file generated in this activity.	The directory input parameter overrides the In Directory field of the <b>Configure</b> task.
encoding	Specifies how the outgoing data is written out to the file: <ul style="list-style-type: none"> <li>• If no encoding is required, specify the string: <code>binary</code>.</li> <li>• If encoding is required, specify the encoding type that should be used to encode the outgoing data, for example: <code>UTF-8</code>, <code>US-ASCII</code>, <code>ISO_8859-1</code>, <code>EBCDIC-US</code>, or <code>SHIFT-JIS</code>.</li> </ul>	The encoding input parameter overrides the encoding specified in the Of Type field of the <b>Configure</b> task but if the Binary option is selected in the Of Type field of the <b>Configure</b> task, the encoding specified by the encoding input parameter is ignored.
overwrite	Specifies the behavior when a existing file of the same name already exists in the specified output directory. Specify one of the following values: <ul style="list-style-type: none"> <li>• <b>y</b> - Specifies if the file already exists, destroy the contents of the original file with new data returned from the activity.</li> <li>• <b>a</b> - Specifies if the file already exists, keep the original data in the file and append the new data (returned from the activity) to the end of the file.</li> <li>• <b>n</b> - Specifies if the file already exists, keep the original data in the file and do nothing with the new data returned from the activity.</li> </ul>	The overwrite input parameter overrides the Options field of the <b>Configure</b> task.
connection/timeout	Specifies the connection timeout - the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For the <b>FTP Put File</b> activity, the amount of time the Integration Appliance attempts to establish a connection to the FTP Server before timing out.	The <b>timeout</b> node of the connection input parameter overrides the Connection Timeout - Time out after <u>  </u> second(s) when establishing a connection to the Endpoint field of the FTP endpoint.
connection/host	Specifies the Host Name or IP address for the FTP server.	The <b>host</b> node of the connection input parameter overrides the Host Name field of the FTP endpoint.
connection/port	Specifies the port number for the specified host name. The standard port for FTP traffic is 21. The default port for SFTP traffic is 22.	The <b>port</b> node of the connection input parameter overrides the Port field of the FTP endpoint.
connection/username	Specify a user name for the account used to connect to the FTP Server.	The <b>username</b> node of the connection input parameter overrides the User Name field of the FTP endpoint.
connection/password	Specify a password for the account used to connect to the FTP Server.	The <b>password</b> node of the connection input parameter overrides the Password field of the FTP endpoint.

**Parent topic:** [FTP Activities](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ftp\\_put\\_file\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ftp_put_file_activity.html)

## FTP Get File activity

During run time, the **FTP Get File** activity connects to an FTP Server and attempts to get a single file at the specified location. You can configure the **FTP Get File** activity to return the contents of the file into a variable of the orchestration. In addition, you can configure the **FTP Get File** activity to return the timestamp of the file returned by the FTP Server into a variable of the orchestration.

The **FTP Get File** activity differs from the **FTP Poll Directory** activity in the following ways:

- The **FTP Get File** activity does not poll for a file or files in the specified directory. Instead the **FTP Get File** activity checks for the file a single time and if the file is not found, it throws an error and the orchestration job continues to processing.
- The **FTP Get File** activity is not a starter activity, so it cannot be the first activity in an orchestration.
- The **FTP Get File** activity does not move or delete files on the FTP server.

## Symbolic link

The support for symbolic links by the **FTP Get File** activity during run time is dependant on the following factors:

- The types of symbolic links supported by operating system that hosts the FTP Server.
- The types of symbolic links supported by the FTP Server itself.
- The types of symbolic links supported by the **FTP Get File** activity, as listed in the following table:

Table 1.

Symbolic Links to...	Hard Symbolic Links	Soft Symbolic Links	Notes®
Files	Not Supported	Not Supported	The <b>FTP Get File</b> activity does not interpret symbolic links to files as files and therefore symbolic links to files are not processed by the <b>FTP Get File</b> activity during run time.
Directories	Supported	Supported	

To determine the specific symbolic link support for a specific FTP Server on a specific operating system, see your operating system and FTP Server documentation.

## Adding an FTP Get File activity in the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the FTP folder.
3. Drag the **Get File** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

## Creating, selecting, or editing an FTP endpoint

1. Click Pick Endpoint task from the **Checklist** and choose from one of the following actions:
  - Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.  
Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the Configuring the activity procedure.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.

- Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the "Configure the activity" procedure.
- Click Edit. The Edit Endpoint pane is displayed.
  - Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an FTP endpoint: [Creating or Editing an FTP endpoint](#)

## Specifying the delivery rules

- Select the **Delivery Rules** task from the **Checklist**. The Delivery Rules pane is displayed. If security is not enabled for the FTP endpoint, the Transfer as Text (ASCII) and Transfer as Binary (BINARY) options are enabled. If security is enabled for the FTP endpoint, the file transfer type is always binary.
- Select the type of file transfer between the Integration Appliance and the FTP Server from one of the following options:
  - Transfer as Text (ASCII)** - Only seven bits of each character in the file is transferred by the Integration Appliance to the FTP Server. This option is used for transferring ASCII files such as HTML and text files.  
CAUTION:  
Using this option with binary files can result in a loss of data.
  - Transfer as Binary (BINARY)** - All eight bits of each byte in the file is transferred by the Integration Appliance to the FTP Server. This option is used for transferring binary files.

Note: Setting the transfer mode in the Delivery Rules task is equivalent to setting the transfer mode via a command line session with an FTP Server using the following commands:

- ascii
- binary

Note: Cast Iron FTP connector SFTP endpoint supports only client side SFTP protocol version 3. Hence, the SFTP protocol does not support ASCII/text mode file transfer. Make sure to set the File Transfer Type to Transfer as Binary (BINARY) in the Checklist > Delivery Rules.

## Configuring the activity

- Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
- Configure all the fields in this pane as described in the following table:

Table 2.

Field	Description
File Name	This field is not used for this activity. You specify the name of the output file using the filename input parameter of the <b>Map Input</b> task.
From Directory	Specifies the directory on the FTP server where the Integration Appliance places the file generated in this activity. You can specify a directory using one of the following options: <ul style="list-style-type: none"> <li>Directly enter directory path by clicking in the field and typing in one of the following directory paths:               <ul style="list-style-type: none"> <li>Relative directory path, for example: /output. (Assumes that FTP home has been configured for the user account that connects to the FTP Server. See "<b>Note</b>" for more information.)</li> <li>Complete directory path, for example on a UNIX machine: /home/user/output.</li> </ul> </li> <li>Click Browse... to populate the drop-down list of available directories. Select the appropriate directory from the drop-down list.</li> </ul> Note: <b>UNIX:</b> If you specify a relative directory path when connecting to an FTP Server on a UNIX machine, verify that the FTP home directory has been correctly specified in the /etc/password file for the user account connecting to the FTP Server.
Of Type	Specifies how to read in the contents of the file - either as binary data or encoded text. If the Text option is selected, set the encoding type using one of the following options: <ul style="list-style-type: none"> <li>From the encoded with drop-down list, select one of the default encoding types.</li> <li>Enter your encoding type directly by clicking in the encoded with field and typing in your encoding type.</li> </ul>

Field	Description
Â	<p>Attention: You must specify the Transfer as Text (ASCII) option for FTP activities when retrieving text files and placing text files on an FTP Server for Endpoints that manipulate text data while transferring data from/to the FTP Endpoint in ASCII mode. For example, mainframe and DOS FTP Endpoints manipulate ASCII data when passing data in ASCII mode.</p> <p>For example, if your orchestration retrieves ASCII files using the <b>FTP Poll Directory</b> activity and places ASCII files using the FTP Put File activity to a mainframe FTP Server, you must specify the options in the following tasks in Studio:</p> <ul style="list-style-type: none"> <li>o In the <b>Configure</b> task of an <b>FTP Poll Directory</b> activity, for the Of Type field select the Text option.</li> <li>o In the <b>Delivery Rules</b> task of an <b>FTP Poll Directory</b> activity, for the File Transfer Type field select the Transfer as Text (ASCII) option.</li> <li>o In the <b>Configure</b> task of an <b>FTP Put File</b> activity, for the Of Type field select the Text option.</li> <li>o In the <b>Delivery Rules</b> task of an <b>FTP Put File</b> activity, for the File Transfer Type field select the Transfer as Text (ASCII) option.</li> </ul>

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an FTP Server. The following table defines the retry options for a connection to an FTP Server:

Table 3.

Field	Description
Retry	Â
1) Wait --- second(s) ) between each retry.	The number of seconds that the Integration Appliance waits before trying to establish a connection to the FTP Server.
2) Try to connect --- times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the FTP Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an <b>FTP Get File</b> activity and the Integration Appliance cannot connect to the specified FTP Server, the Integration Appliance logs the connections errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

## Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The input parameters of the activity are displayed in the To Activity pane.
2. The filename parameter is the only parameter you are required to provide a value in the activity. All other parameters are optional. The filename parameter specifies the name of the file to get from the FTP Server. You provide a value for the filename parameter by either by creating a link from the filename input parameter to a variable or by defining a default value for the filename input parameter.

If the optional input parameter listed in the following table are not displayed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active.

You can optionally override the settings you specified in the **Configure** and **Pick Endpoint** task of the **Checklist** dynamically during run time, using the input parameters defined in the following table.

For example, the directory on the FTP Server where the Integration Appliance gets the file, could be set in the **Configure** task to the directory called input. During run time, the directory name: inputXML could be passed into the activity using the directory input parameter. The directory name specified dynamically during run time overrides the original setting specified in the Configure pane. In this example, the Integration Appliance attempts to get the file from the inputXML directory.

Table 4.

Input Parameter Name/ Node	Description	Overrides the Setting in Task?
directory	Specifies the directory on the FTP server where the Integration Appliance places the file generated in this activity.	The directory input parameter overrides the From Directory field of the <b>Configure</b> task.
encoding	<p>Specifies how the outgoing data is written out to the file:</p> <ul style="list-style-type: none"> <li>• If no encoding is required, specify the string: <code>binary</code>.</li> <li>• If encoding is required, specify the encoding type that should be used to encode the outgoing data, for example: <code>UTF-8</code>, <code>US-ASCII</code>, <code>ISO_8859-1</code>, <code>EBCDIC-US</code>, or <code>SHIFT-JIS</code>.</li> </ul>	The encoding input parameter overrides the encoding specified in the Of Type field of the <b>Configure</b> task but if the Binary option is selected in the Of Type field of the <b>Configure</b> task, the encoding specified by the encoding input parameter is ignored.
connection/time out	Specifies the connection timeout – the number of seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For the <b>FTP Get File</b> activity, the amount of time the Integration Appliance attempts to establish a connection to the FTP Server before timing out.	The timeout node of the connection input parameter overrides the Connection Timeout - Time out after ___ second(s) when establishing a connection to the Endpoint field of the FTP endpoint.
connection/host	Specifies the Host Name or IP address for the FTP server.	The <b>host</b> node of the connection input parameter overrides the Host Name field of the FTP endpoint.
connection/port	Specifies the port number for the specified host name. The standard port for FTP traffic is 21. The default port for SFTP traffic is 22.	The <b>port</b> node of the connection input parameter overrides the Port field of the FTP endpoint.
connection/user name	Specify a user name for the account used to connect to the FTP Server.	The <b>username</b> node of the connection input parameter overrides the User Name field of the FTP endpoint.
connection/password	Specify a password for the account used to connect to the FTP Server.	The <b>password</b> node of the connection input parameter overrides the Password field of the FTP endpoint.

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane as described in the following table:

Table 5.

Output Parameter Name	Description

<b>Output Parameter Name</b>	<b>Description</b>
data	Contains the contents of the file.
timestamp	Contains the timestamp for the file returned from the FTP Server, typically the creation date or last modified date of the file.

2. Map the desired output parameters to variables.

**Parent topic:** [FTP Activities](#)

[Feedback | Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ftp\\_get\\_file\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ftp_get_file_activity.html)

## FTP Delete File activity

Use the the **FTP Delete File** activity to delete specific files from the specific directories, during run time.

Typically the **FTP Delete File** activity is used in conjunction with the **FTP List Files** activity as shown in the following example orchestration:

- The **Schedule Job** activity creates an orchestration job every hour.
- The **FTP List Files** activity generates a list of files found in the \temp directory located in the root directory of the FTP Server and stores the result into a string.
- The **Read Flat File** activity parses the list of files and stores the result into a repeating XML structure.
- The **For Each** activity iterates through repeating structure that contains the list of files:
  - If file ends in the .tmp extension, the **FTP Delete File** activity deletes the specified file.

For an example project that uses an **FTP Delete File** activity, see [Parse directory listing example](#).

## Symbolic link

The **FTP Delete File** activity supports symbolic links to directories if the following conditions are true:

- If symbolic links to directories are supported by operating system that hosts the FTP Server.
- If symbolic links to directories are supported by the FTP Server itself.

To determine the specific symbolic link support for a specific FTP Server on a specific operating system, see your operating system and FTP Server documentation.

## Adding an **FTP Delete File** activity in the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the FTP folder.
3. Drag the **Delete File** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

## Creating, selecting, or editing an **FTP endpoint**

1. Click Pick Endpoint task from the **Checklist** and choose from one of the following actions:
  - Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.  
Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the "Configure the activity" procedure.
    - b. Select an existing endpoint and click OK. Go to the "Configuring the activity" procedure.

- o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.  
Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the "Configuring the activity" procedure.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an FTP endpoint: [Creating or Editing an FTP endpoint](#)

## Configuring the activity

---

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure the fields in this pane as described in the following table:

Table 1.

Field	Description
Look for	A
File Name	This field is not used for this activity. You specify the name of the file to delete using the filename input parameter of the <b>Map Input</b> task.
In Directory	<p>Specifies the directory on the FTP server where the Integration Appliance deletes the specified file. You can specify a directory using one of the following options:</p> <ul style="list-style-type: none"> <li>o Directly enter directory path by clicking in the field and typing in one of the following directory paths:           <ul style="list-style-type: none"> <li>■ Relative directory path, for example: /process. (Assumes that FTP home has been configured for the user account that connects to the FTP Server. See "Note" for more information.)</li> <li>■ Complete directory path, for example on a UNIX machine: /home/user/process.</li> </ul> </li> <li>o Click Browse... to populate the drop-down list of available directories. Select the appropriate directory from the drop-down list.</li> </ul> <p>During run time, the value specified in the In Directory field of the <b>Configure</b> task is overwritten if a value is provided for the optional directory input parameter using one of the following options:</p> <ul style="list-style-type: none"> <li>o The directory input parameter is mapped to a variable.</li> <li>o A default value is provided for the directory input parameter.</li> </ul> <p>For more information, see the "Mapping the input of the activity" procedure.</p> <p>Note: <b>UNIX:</b> If you specify a relative directory path when connecting to an FTP Server on a UNIX machine, verify that the FTP home directory has been correctly specified in the /etc/password file for the user account connecting to the FTP Server.</p>

## Specifying the retry options

---

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an FTP Server. The following table describes the retry options for connecting to an FTP Server:

Table 2.

Field	Description
Retry	A
1) Wait --- second(s) ) between each retry.	The number of seconds that the Integration Appliance waits before trying to establish a connection to the FTP Server.

Field	Description
2) Try to connect --- times before failing.	<p>Specifies the maximum number of times the Integration Appliance attempts to establish a connection to the FTP Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an <b>FTP Delete File</b> activity and the Integration Appliance cannot connect to the specified FTP Server, the Integration Appliance logs the connection errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors are shown in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

## Mapping the input of the activity

1. Select the **Map Inputs** task in the **Checklist**. The Retry pane is displayed. The input parameters of the activity are displayed in the To Activity pane.
2. You must map a variable to the filename input parameter. All other input parameters are optional. The filename parameter specifies the name of the file to delete on the FTP Server.

If the input parameter listed in the following table are not displayed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active.

You can optionally override the settings you specified in the **Configure** and **Pick Endpoint** task of the **Checklist** dynamically during run time, using the input parameters defined in the following table.

For example, the directory on the FTP Server where the Integration Appliance deletes the file could be set in the **Configure** task to the directory called process. During run time, the directory name: processXML could be passed into the activity using the directory input parameter. The directory name specified dynamically during run time overrides the original setting specified in the Configure pane. In this example, the file would be deleted from the processXML directory.

Table 3.

Input Parameter Name/Node	Description	Overrides the Setting in Task?
directory	Specifies the directory on the FTP server where the Integration Appliance places the file generated in this activity.	The directory input parameter overrides the In Directory field of the <b>Configure</b> task.
connection/timeout	Specifies number of seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For the <b>FTP Delete File</b> activity, the amount of time the Integration Appliance attempts to establish a connection to the FTP Server before timing out. Â	The <b>timeout</b> node of the connection input parameter overrides the Connection Timeout -Time out after ___ second(s) when establishing a connection to the Endpoint field of the FTP endpoint. Â
connection/host	Specifies the Host Name or IP address for the FTP server.	The <b>host</b> node of the connection input parameter overrides the Host Name field of the FTP endpoint.
connection/port	Specifies the port number for the specified host name. The standard port for FTP traffic is 21. The default port for SFTP traffic is 22.	The <b>port</b> node of the connection input parameter overrides the Port field of the FTP endpoint.

Input Parameter Name/Node	Description	Overrides the Setting in Task?
connection/username	Specify a user name for the account used to connect to the FTP Server.	The <b>username</b> node of the connection input parameter overrides the User Name field of the FTP endpoint.
connection/password	Specify a password for the account used to connect to the FTP Server.	The <b>password</b> node of the connection input parameter overrides the Password field of the FTP endpoint.

Parent topic: [FTP Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/FTP\\_Delete\\_File\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/FTP_Delete_File_Activity.html)

## FTP List Files activity

During run time, the **FTP List Files** activity connects to an FTP Server and generates a list of files from the specified directory location using the specified regular expression. The **FTP List Files** activity returns the list of files to the orchestration using either the **directoryListing** or **fileListing** output parameter.

If the List Only Files (NLST) check box is cleared, a full directory listing including directory permissions, timestamps, and ownership is returned in the **directoryListing** output parameter as a single string. When a full directory listing is returned as a string, you must parse the directory listing using a Flat File Schema with the **Read Flat File** activity. If the List Only Files (NLST) check box is selected and the **FTP List Files** activity supports the format of the directory listing for your FTP Server, a repeating structure of just filenames (if supported by the FTP server) is returned in the **fileListing** output parameter. When a repeating structure of filename is returned, you do not need to parse the directory listing and can just iterate through the list using a **For Each** or **While Loop** activity. The FTP server you are connecting to must support the NLST command. The response provided by the FTP server is returned.

For some cases, you must use the **FTP List Files** activity in conjunction with the **FTP Get File**, **FTP Put File**, **FTP Delete File**, and **FTP Rename File** activities. to process a set of files found in an FTP directory, while in other cases you can just use the **FTP Poll Directory** activity.

Use the **FTP List Files** activity in conjunction with the **FTP Get File**, **FTP Put File**, **FTP Delete File**, and **FTP Rename File** activities, to process a set of files found in an FTP directory if any of the following conditions are true:

- **The FTP Poll Directory activity does not support the format of the directory listing of your FTP Server** - The format of directory listings are different for the FTP Servers supported on different operating systems. The **FTP Poll Directory** activity supports many types of FTP Servers but if the directory listing format of your FTP Server cannot be parsed by the **FTP Poll Directory** activity, use the **FTP List Files** activity and the **FTP Get File**, **FTP Put File**, **FTP Delete File**, and **FTP Rename File** activities, to provide the same functionality as the **FTP Poll Directory** activity as shown in the Parse Directory Listing Example: [Parse directory listing example](#).
- **Each file in the list must be post-processed with a different action.** - For example, if you must move files to a different directories based on the filename, use the **FTP List Files** activity in conjunction with the **FTP Get File**, **FTP Put File**, **FTP Delete File**, and **FTP Rename File** activities as show in the Parse Directory Listing Example: [Parse directory listing example](#). However, if each file can be post-processed using the same action, you can use the **FTP Poll Directory** activity to process the set of files.

## Symbolic links

---

The support for symbolic links by the **FTP List Files** activity during run time is dependant on the following factors: Â

- The types of symbolic links supported by operating system that hosts the FTP Server.
- The types of symbolic links supported by the FTP Server itself.
- The types of symbolic links supported by the **FTP List Files** activity, as listed in the following table:

Table 1.

Symbolic Links to...	Hard Symbolic Links	Soft Symbolic Links	NotesÂ®
Files	Not Supported	Not Supported	The <b>FTP List Files</b> activity does not interpret symbolic links to files as files and therefore symbolic links to files are not processed by the <b>FTP List Files</b> activity during run time.
Directories	Supported	Supported	Â

To determine the specific symbolic link support for a specific FTP Server on a specific operating system, see your operating system and FTP Server documentation.

## Processing subdirectories with the Microsoft FTP Endpoint

---

For the Microsoft IIS (Internet Information Services) FTP Endpoint, the run time behavior of the **FTP List Files** activity when processing subdirectories and the files in subdirectories depends on the regular expression specified in the File Named field of the **Configure** task of the activity, as described in the following cases:

- When the regular expression is equal to the string: \*, the orchestration job processes the subdirectories in the specified directory.
- When the regular expression is equal to the string: \*\*, the orchestration job does not process the subdirectories in the specified directory.
- When the regular expression is blank, the orchestration job does not process the subdirectories in the specified directory.

## Adding an **FTP List Files** activity to the orchestration

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the FTP folder.
3. Drag the **List Files** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

## Creating, selecting, or editing an FTP endpoint

---

1. Click Pick Endpoint task from the **Checklist** and choose from one of the following actions:
  - Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.  
Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described below in the "Configuring the activity" procedure.
    - b. Select an existing endpoint and click OK. Skip to the "Configuring the activity" procedure.
  - Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.  
Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described below in the "Configuring the activity" procedure.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an FTP endpoint: [Creating or Editing an FTP endpoint](#).

## Configuring the activity

---

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields in this pane as described in the following table:

Table 2.

Field	Description
In Directory	<p>Specifies the directory on the FTP server where the Integration Appliance generates a list of files in the directory. You can specify a directory using one of the following options:</p> <ul style="list-style-type: none"> <li>o Directly enter directory path by clicking in the field and typing in one of the following directory paths: <ul style="list-style-type: none"> <li>■ Relative directory path, for example: /process. (Assumes that FTP home has been configured for the user account that connects to the FTP Server. See the note below for more information.)</li> <li>■ Complete directory path, for example on a UNIX machine: /home/user/process.</li> </ul> </li> <li>o Click Browse... to populate the drop-down list of available directories. Select the appropriate directory from the drop-down list.</li> </ul> <p>Note: <b>UNIX:</b> If you specify a relative directory path when connecting to an FTP Server on a UNIX machine, verify that the FTP home directory has been correctly specified in the /etc/password file for the user account connecting to the FTP Server.</p>
File Named	Specifies a glob pattern that defines the file names you need to get from the FTP Server. The processing of the glob pattern is done by the FTP Server. For more information, see the FTP Server documentation on glob pattern.
List Only Files (NLST)	The List Only Files (NLST) check box determines the type of directory listing returned by the Test button and during run time. In addition, this check box defines if the fileListing or the directoryListing output parameter is displayed in the <b>Map Outputs</b> task and returned by the activity during run time.
Â	If the List Only Files (NLST) check box is selected, just the filenames (if supported by the FTP server) are returned when the Test button is clicked, as shown in <a href="#">Figure 1</a> . In addition, when the List Only Files (NLST) check box is selected, the fileListing output parameter is listed in the Map Outputs task. During run time, the set of files are returned in the fileName repeating node of the fileListing output parameter. The FTP server you are connecting to must support the NLST command. The response provided by the FTP server is returned.
Â	If the List Only Files (NLST) check box is cleared, a full directory listing including directory permissions, timestamps, and ownership are returned when the Test button is clicked, as shown in <a href="#">Figure 2</a> . In addition, when the List Only Files (NLST) check box is selected, the directoryListing output parameter is listed in the <b>Map Outputs</b> task. During run time, the full directory listing is provided as a single string and returned using the directoryListing output parameter.

Figure 1. Example listing when List Only Files (NLST) is selected.

```
bidAcmeInc.txt
bidBudgetManufacture.txt
bidCrankCo.txt
bidSamAndSons.txt
bidWidgetRUs.txt
```

Figure 2. Example listing when List Only Files (NLST) is cleared.

```
-rw-r--r--Â 1 551Â Â Â Â 551Â Â Â Â 65 May 3 11:39 bidAcmeInc.txt
-rw-r--r--Â 1 551Â Â Â Â 551Â Â Â Â 43 May 3 11:39 bidBudgetManufacture.txt
-rw-r--r--Â 1 551Â Â Â Â 551Â Â Â Â 0 May 3 11:39 bidCrankCo.txt
-rw-r--r--Â 1 551Â Â Â Â 551Â Â Â Â 73 May 3 11:39 bidSamAndSons.txt
-rw-r--r--Â 1 551Â Â Â Â 551Â Â Â Â 33 May 3 11:39 bidWidgetRUs.txt
```

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.

2. Configure the retry options for connecting to an FTP Server. The following table defines the retry options for a connection to an FTP Server:

Table 3.

Field	Description
Retry ____ second(s) ) between each retry.	The number of seconds that the Integration Appliance waits before trying to establish a connection to the FTP Server.
2) Try to connect --- times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the FTP Server before issuing an error.</p> <p>If an orchestration that starts with an <b>FTP List Files</b> activity is deployed and the Integration Appliance cannot connect to the specified FTP Server, the Integration Appliance logs the connection errors as warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system log, resets the connection error count to zero, and continues to attempt to establish a connection to the FTP Server.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and resets the connection error count to zero. Therefore, the fifth connection error generates a warning in the system log. The Integration Appliance continues to attempt to establish a connection to the FTP Server.</p>

## Mapping the input of the activity

- Select the **Map Inputs** task in the **Checklist**. The Retry pane is displayed. The input parameters of the activity are displayed in the To Activity pane.
- It is optional to map the input parameters of the **FTP List Files** activity. The **FTP List Files** activity has the following optional input parameters: Â Â Â
  - o directory
  - o connection

If the input parameter listed in the following table are not displayed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active.

You can optionally override the settings you specified in the **Configure** and **Pick Endpoint** task of the **Checklist** dynamically during run time, using the input parameters defined in the following table.

For example, the directory on the FTP Server where the Integration Appliance gets the list of files, could be set in the **Configure** task to the directory called input. During run time, the directory name: inputXML could be passed into the activity using the directory input parameter. The directory name specified dynamically during run time overrides the original setting specified in the Configure pane. In this example, the list of files is generated from the inputXML directory.

Table 4.

Input Parameter Name/Node	Description	Overrides the Setting in Task?
directory	Specifies the directory on the FTP server where the Integration Appliance generates a list of files in this activity.	The directory input parameter overrides the In Directory field of the <b>Configure</b> task.

Input Parameter Name/Node	Description	Overrides the Setting in Task?
connection/timeout	Specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For the <b>FTP Delete File</b> activity, the amount of time the Integration Appliance attempts to establish a connection to the FTP Server before timing out. Â	The <b>timeout</b> node of the connection input parameter overrides the Connection Timeout -Time out after ____ second(s) when establishing a connection to the Endpoint field of the FTP endpoint. Â
connection/host	Specifies the Host Name or IP address for the FTP server.	The <b>host</b> node of the connection input parameter overrides the Host Name field of the FTP endpoint.
connection/port	Specifies the port number for the specified host name. The standard port for FTP traffic is 21. The default port for SFTP traffic is 22.	The <b>port</b> node of the connection input parameter overrides the Port field of the FTP endpoint.
connection/username	Specify a user name for the account used to connect to the FTP Server.	The <b>username</b> node of the connection input parameter overrides the User Name field of the FTP endpoint.
connection/password	Specify a password for the account used to connect to the FTP Server.	The <b>password</b> node of the connection input parameter overrides the Password field of the FTP endpoint.

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The directoryListing or fileListing output parameters is displayed in the From Activity pane.
2. Map the directoryListing or fileListing output parameter to a variable. See [Creating a map](#) for general instructions on mapping.

During run time, the **FTP List Files** activity returns the list of files to the orchestration using the directoryListingÂ or fileListing output parameter.

If the List Only Files (NLST) check box is cleared in the **Configure** task, a full directory listing including directory permissions, timestamps, and ownership is returned in the directoryListing output parameter as a single string. When a full directory listing is returned as a string, you must parse the directory listing using a Flat File Schema with the Read Flat File activity. You can create a Flat File Schema using the Flat File Schema Editor. For an example orchestration parsing a directory listing using a Flat File Schema, see the Parse Directory Listing Example: [Parse directory listing example](#).

If the List Only Files (NLST) check box is selected and the **FTP List Files** activity supports the format of the directory listing for your FTP Server, a repeating structure of just filenames (if supported by the FTP server) is returned in the fileListing output parameter. When a repeating structure of filename is returned, you do not need to parse the directory listing and can just iterate through the list using a **For Each** or **While Loop** activity.

**Parent topic:** [FTP Activities](#)

---

[Feedback | Notices](#)

 Last updated: Wednesday, 15 June 2016

## FTP Rename File activity

---

Use the **FTP Rename File** activity to rename and/or move a file to a different directory, during run time.

The directory that the **FTP Rename File** activity renames is shown in the following supported cases:

- Move the file to a new directory and rename the file. For example a file named BidAcmeInc.xml is moved from the directory called input directory to the process directory and renamed to NewBidAcmeInc.xml.
- Move the file to a new directory but keep the existing file name. For example a file named BidAcmeInc.xml is moved from the directory called input directory to the process directory.
- Rename the file and keep it in the original directory. For example a file named BidAcmeInc.xml is renamed to NewBidAcmeInc.xml in the input directory.

For an example project that uses an FTP Rename File activity, see the Parse Directory Listing Example: [Parse directory listing example](#).

## Symbolic link

---

The FTP Rename File activity supports symbolic links to directories if the following conditions are true:

- If symbolic links to directories are supported by operating system that hosts the FTP Server.
- If symbolic links to directories are supported by the FTP Server itself.

To determine the specific symbolic link support for a specific FTP Server on a specific operating system, see your operating system and FTP Server documentation.

## Adding an FTP Rename File activity in the orchestration

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the FTP folder.
3. Drag the **Rename File** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

## Creating, selecting, or editing an FTP endpoint

---

1. Click Pick Endpoint task from the **Checklist** and choose from one of the following actions:
  - Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.  
Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the "Configuring the activity" procedure.
    - b. Select an existing endpoint and click OK. Go to the "Configuring the activity" procedure
  - Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.  
Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the "Configuring the activity" procedure.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an FTP endpoint: [Creating or Editing an FTP endpoint](#)

## Configuring the activity

---

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure the fields in this pane as described in the following table:  
**Table 1.**

Field	Description
Rename	Â
File Named	This field is not used for this activity. You specify the name of the file to rename using the fromFilename input parameter of the <b>Map Input</b> task.
From Directory	<p>Specifies the directory on the FTP server where the Integration Appliance deletes the specified file. You can specify a directory using one of the following options:</p> <ul style="list-style-type: none"> <li>o Directly enter directory path by clicking in the field and typing in one of the following directory paths: <ul style="list-style-type: none"> <li>■ Relative directory path, for example: /process. Â (Assumes that FTP home has been configured for the user account that connects to the FTP Server. See "<b>Note</b>" for more information.)</li> <li>■ Complete directory path, for example on a UNIX machine: /home/user/process.</li> </ul> </li> <li>o Click Browse... to populate the drop-down list of available directories. Select the appropriate directory from the drop-down list.</li> </ul> <p><b>Note: UNIX:</b> If you specify a relative directory path when connecting to an FTP Server on a UNIX machine, verify that the FTP home directory has been correctly specified in the /etc/password file for the user account connecting to the FTP Server.</p>
New Path	<p>This field is not used for this activity. You specify the full path including the new filename and the new directory on the FTP server, where the Integration Appliance puts the file that has been moved using the toPathinput parameter of the Map Input task.</p> <p><b>Note: UNIX:</b> If you specify a relative directory path when connecting to an FTP Server on a UNIX machine, verify that the FTP home directory has been correctly specified in the /etc/password file for the user account connecting to the FTP Server.</p>
<b>Options</b> - Select one of the following options to define the behavior when a existing file of the same name already exists in the specified output directory:	
Overwrite Existing File if Duplicate File Name is Found	Specifies if the file already exists, destroys the contents of the original file with new data returned from the activity.
Raise Error if File with Duplicate Name is Found	Specifies if the file already exists, keeps the original data in the file, throws an error, and does nothing with the new data returned from the activity.

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an FTP Server. The following table describes the retry options for connecting to an FTP Server:

Table 2.

Field	Description
Retry	Â
1) Wait --- second(s) ) between each retry.	The number of seconds that the Integration Appliance waits before trying to establish a connection to the FTP Server.

Field	Description
2) Try to connect --- times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the FTP Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an <b>FTP Rename File</b> activity and the Integration Appliance cannot connect to the specified FTP Server, the Integration Appliance logs the connection errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

## Mapping the input of the activity

- Select the **Map Inputs** task in the **Checklist**. The Retry pane is displayed. The input parameters of the activity are displayed in the To Activity pane.
- You must map a variable to the following input parameters:
  - fromFilename - During a rename action, this parameter specifies the original name of the file to rename.
  - toPath - During a rename action, this parameter specifies the path including both the new directory name and the new name of the file. For example to specify that the file be moved to the /output directory of the root of the FTP Server using the fileNewName.txt filename, specify the following value for toPath: /output/fileNewName.txt

All other input parameters are optional. See Creating a Map for general instructions on mapping. ^

If the input parameter listed in the following table are not displayed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active.

You can optionally override the settings you specified in the **Configure** and **Pick Endpoint** task of the **Checklist** dynamically during run time, using the input parameters defined in the following table.

For example, the directory on the FTP Server where the Integration Appliance places the file generated in this activity, could be set in the **Configure** task to the directory called output. During run time, the directory name: outputXML could be passed into the activity using the directory input parameter. The directory name specified dynamically during run time overrides the original setting specified in the Configure pane. In this example, the file would be placed in the outputXML directory.

Table 3.

Input Parameter Name/ Node	Description	Overrides the Setting in Task?
fromDirectory	Specifies the directory on the FTP server where the Integration Appliance gets the list of files.	The directory input parameter overrides the In Directory field of the <b>Configure</b> task.
overwritetime	Specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For the <b>FTP List Files</b> activity, ^ the amount of time the Integration Appliance attempts to establish a connection to the FTP Server before timing out.	The <b>timeout</b> node of the connection input parameter overrides the Connection Timeout -Time out after ___ second(s) when establishing a connection to the Endpoint field of the FTP endpoint.

<b>Input Parameter Name/Node</b>	<b>Description</b>	<b>Overrides the Setting in Task?</b>
connection/timeout	Specifies the Host Name or IP address for the FTP server.	The <b>timeout</b> node of the connection input parameter overrides the Connection Timeout -Time out after ___ second(s) when establishing a connection to the Endpoint field of the FTP endpoint. Â
connection/host	Specifies the port number for the specified host name. The standard port for FTP traffic is 21. The default port for SFTP traffic is 22.	The <b>host</b> node of the connection input parameter overrides the Host Name field of the FTP endpoint.
connection/port	Specifies the port number for the specified host name. The standard port for FTP traffic is 21. The default port for SFTP traffic is 22.	The <b>port</b> node of the connection input parameter overrides the Port field of the FTP endpoint.
connection/username	Specify a user name for the account used to connect to the FTP Server.	The <b>username</b> node of the connection input parameter overrides the User Name field of the FTP endpoint.
connection/password	Specify a password for the account used to connect to the FTP Server.	The <b>password</b> node of the connection input parameter overrides the Password field of the FTP endpoint.

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The directoryListing or fileListing output parameters is displayed in the From Activity pane.
2. Map the directoryListingÂ or fileListing output parameter to a variable. See Creating a Map for general instructions on mapping.

During run time, the **FTP List Files** activity returns the list of files to the orchestration using the directoryListingÂ or fileListing output parameter.

If the List Only Files (NLST) check box is cleared in the **Configure** task, a full directory listing including directory permissions, timestamps, and ownership is returned in the directoryListing output parameter as a single string. When a full directory listing is returned as a string, you must parse the directory listing using a Flat File Schema with the **Read Flat File** activity. You can create a Flat File Schema using the Flat File Schema Editor. For an example orchestration parsing a directory listing using a Flat File Schema, see the Parse Directory Listing Example: [Parse directory listing example](#).

If the List Only Files (NLST) check box is selected and the **FTP List Files** activity supports the format of the directory listing for your FTP Server, a repeating structure of just filenames is returned in the fileListing output parameter. When a repeating structure of filename is returned, you do not need to parse the directory listing and can just iterate through the list using a **For Each** or **While Loop** activity.

**Parent topic:** [FTP Activities](#)

Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/FTP\\_Rename\\_File\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/FTP_Rename_File_Activity.html)

## Parse directory listing example

This example gets a directory listing from an FTP directory using the **FTP List Files** activity, parses the long directory listing using Flat File Schema, iterates through the list of files, based on the properties of each file.

### About this task

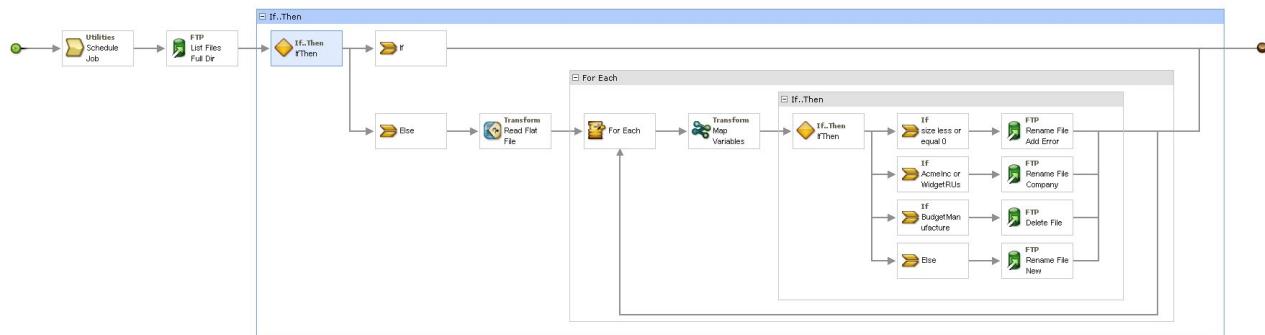

Based on the properties of each file, one of the following actions occurs:

- Move the file to a new directory using the **FTP Rename File** activity.
- Rename the file using the **FTP Rename File** activity.
- Delete the file using the **FTP Delete File** activity.

To open, view, and learn more about the **FTPParseDirListingExample**:

### Procedure

1. Extract the **FTPParseDirListingExample** project:
  - a. Find the Default Create Path defined in Studio, the directory that new projects are created in. To view the current Default Create Path, select File > Preferences... from the Studio toolbar menu. The Preferences window is displayed. The current Default Create Path displays at the end of the pane. By default, the Default Create Path is located in the following directory: C:\Documents and Settings\ *myLogin*\My Documents Where *myLogin* represents your Windows login name.
  - b. Find the **FTPParseDirListingExample.zip** file that contains the files that make up the **FTPParseDirListingExample** project. If you accepted the defaults during the installation of Studio, this file is located in the following directory: C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\FTPParseDirListing
  - c. Copy the **FTPParseDirListingExample.zip** file from the **FTPParseDirListing** directory to the Default Create Path directory.
  - d. Extract the contents of **FTPParseDirListingExample.zip** file into the Default Create Path directory.
2. Open the **FTPParseDirListingExample** project:
  - a. Select File > Open Project... from the Studio toolbar menu. The Open dialog box is displayed.
  - b. Browse for and open the **FTPParseDirListingExample** directory.
  - c. Click on the **FTPParseDirListingExample.sp3** file and click Open. The project is displayed.
3. In the Project tab, double-click the **processBids** orchestration. The **processBids** orchestration tab displays the activities of the orchestration, as shown in the following figure:

directory listing. For this example, clear the List Only Files (NLST) check box.

6. Expand the **If...Then** activity. During run time, this activity checks the value of the fullDirectoryListing string variable and if the value is empty, the **If** path is run and the orchestration ends. If the fullDirectoryListing string is not empty, the **Else** path is run and the orchestration parses the directory.
7. Click the **Read Flat File** activity. Click the **Map Inputs** task in the **Checklist**. During run time, the long directory listing created in the **FTP List Files** activity, is passed to the **Read Flat File** activity via the **Data** input parameter.
8. Click the **Map Outputs** task in the **Checklist**. During run time, the **Read Flat File** activity parses the directory string into the repeating node structure displayed in the **Map Outputs** task.
9. Click the **For Each** activity. During run time, the **For Each** activity iterates through the repeating node structure that stores the directory listing. Each iteration is equivalent to a single file and the properties of that file.
10. Click the **Map Variables** activity. During run time, the **Map Variables** activity converts the size of the current file into a decimal number.
11. Click on the **If..Then** activity. During run time, the **If..Then** activity starts the following **If..Then** branches.

## Results

---

- If the size of the file is equal to 0, the **FTP Rename File activity** moves the file to the /processFailed directory and renames the file by adding the ERROR prefix to the file name.
- If the file name contains a string representing one of the approved supplies (AcmeInc or WidgetRUs), the **FTP Rename File activity** based on the file name, moves the file to the appropriate directory either /processAcmeInc or /processWidgetRUs.
- If the file name contains the string representing the Budget Manufacture supplier, the **FTP Delete File activity** removes the file because Budget Manufacture is on the unapproved supplier list.
- If the file is not processed by any of the three previous conditions, the **Else** clause is called and the **FTP Rename File activity** moves the file to the /processNewCompany directory.

To run the Parse Directory Listing Example, see the procedures provided in the [Configuring the FTP Endpoint for the Parse Directory Listing Example](#) section.

## Testing an FTPS server connection

---

After successfully running a "test connection", you can use Studio verify tools on FTPS orchestrations before publishing a project.

### About this task

---

If you configure an endpoint that represents an FTPS server, you can use it in a Studio project to create orchestrations. You will not, however, be able to verify the orchestration behavior in Studio until you import a copy of the FTPS certificate into Studio, as detailed in this help topic.

Note: The following procedure refers to a FTPS server named: <ftps> in a domain named "<domain.com>".

To test an FTPS Server connection:

### Procedure

---

1. Open a command window.
2. Navigate to the FTPS host, and locate the certificate file ca-cert stored in the FTP server <ftps>, in this directory:  
/var/www/covalent/servers/<ftps.domain.com>/ssl/caerts/castiron\_ca\_cert.pem
3. Substitute the actual server and domain name of your FTPS installation.

4. Copy this file and navigate to the Studio workstation.
5. Using the command window, paste the ca-cert copy in the home directory of Studio: C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x
6. Navigate to the security directory of Studio: C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x\security
7. Run the following command to import the ca-cert file into Studio: ..\jre\bin\keytool.exe -import -v -keystore cacerts -storepass changeit -file ..\castiron\_ca\_cert.pem -alias alias\_name
8. When you are prompted for a yes or no, type yes (Y) and press Enter.
9. Exit the command window.
10. Restart Studio.
11. Open the endpoint for this FTPS server.
12. Verify the following login credentials for the FTPS connection: FTP server, Port, User, and Password.
13. Click Test Connection. If the connection is successful, use this endpoint in Studio orchestrations, then use the Verify tab features to evaluate the orchestration.

## HTTP Activities

---

- [Creating or editing an HTTP endpoint](#)

HTTP endpoints provide the connection information that Studio and the Integration Appliance use to connect to an HTTP server. An HTTP endpoint also specifies the connection information so the Integration Appliance can act as HTTP listener. Â

- [HTTP Receive Request activity](#)

Use the **HTTP Receive Request** activity to configure the Integration Appliance to act as an HTTP listener

- [Decompression with the HTTP Receive Request activity](#)

The **HTTP Receive Request** activity supports decompression with the gzip format only. The **HTTP Receive Request** activity does not support the deflate format or the common UNIX file compression format called compress.

- [HTTP Send Response activity](#)

The **HTTP Send Response** activity sends a reply back to the sender of an HTTP request.

- [Compression/Decompression with the HTTP Send Response activity](#)

During runtime, the **HTTP Send Response** activity sends an HTTP response compliant with the HTTP/HTTPS 1.0 protocol to the HTTP client.

- [HTTP Post Request activity](#)

The **HTTP Post Request** activity sends a **Post Request** to the specified location (the HTTP endpoint) and receives an HTTP response back from that location.

- [HTTP Get Request activity](#)

The **HTTP Get Request** activity sends a **Get Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.

- [HTTP Head Request activity](#)

The **HTTP Head Request** activity sends a **Head Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.

- [HTTP Invoke Request activity](#)

The **HTTP Invoke Request** activity sends a HTTP request to the specified location, the HTTP endpoint, and receives a HTTP response back from that location.

- [HTTP Put Request activity](#)

The **HTTP Put Request** activity sends a **Put Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.

- [HTTP Delete Request activity](#)

The **HTTP Delete Request** activity sends a **Delete Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.

- [Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity](#)

During runtime, the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity sends a HTTP request compliant with the HTTP/HTTPS 1.1 protocol to the HTTP Server.

- **Troubleshooting and support**

Troubleshooting techniques and self-help information help you identify and solve problems quickly. Here, you can find potential solutions for issues you would have with the HTTP connector.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_HTTPactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_HTTPactivities.html)

## Creating or editing an HTTP endpoint

---

HTTP endpoints provide the connection information that Studio and the Integration Appliance use to connect to an HTTP server. An HTTP endpoint also specifies the connection information so the Integration Appliance can act as HTTP listener. Â

1. In the Create Endpoint or Edit Endpoint pane, configure the fields as described in the following table.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project as the edits are global, not local.

2. When finished, if available click Test Connection to confirm that you can connect to the HTTP server.

Note: The Test Connection button is only available when configuring an endpoint for the HTTP Post Request activity - when Location is set to the Remote Server option.

3. Click OK.

Table 1.

Field Name	Description
<b>Location</b>	Â
Integration Appliance Receives Request	This option specifies that the Integration Appliance is acting as an HTTP listener. For an HTTP endpoint used with the <b>HTTP Receive Request</b> activity, Location is automatically set to the Integration Appliance Receives Request option. Â
Remote Server	This option specifies that the Integration Appliance is sending and receiving requests from a remote HTTP server. For an HTTP endpoint used with the <b>HTTP Post Request</b> activity, Location is automatically set to the Remote Server option.
Host Name	Required for the Remote Server option only - Specify the host name or IP address for the HTTP server that this endpoint connects to.
Port	For the <b>HTTP Receive Request</b> activity - Specify the port number of the Integration Appliance acting as an HTTP listener. For the <b>HTTP Post Request</b> activity - Specify the port number of the remote HTTP server. Â
<b>Login</b>	<b>Description</b>
Log into the Server as an Anonymous User	Available for the Remote Server option only. Select this option to connect to the HTTP server anonymously (where a user account is not required).
Log into the Server with User Name and Password	Available for the Remote Server option only. Select this option to connect to the HTTP server using a user account. Enter the User Name and Password.

Field Name	Description
Authentication	<p>Allows you to select the type of authentication that the Integration Appliance uses when connecting to a remote server. From the list, select one of the following authentication options:</p> <ul style="list-style-type: none"> <li>• <b>Basic</b> - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure. Note: Basic authentication is now made available for HTTP Receive Request activity.</li> <li>• <b>Digest</b> - Encrypts the user name and password you specify before sending the user name and password to the server. This authentication option is more secure than Basic authentication.</li> <li>• <b>NTLM</b> - Requires an instance of NTCredentials to be available for the domain name of the server. This authentication is the most secure authentication option. When you choose the NTLM authentication option, the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server. Note: Do not prefix the user name with the domain.</li> <li>• <b>Kerberos</b> - The Kerberos protocol requires a trusted third party which is referred to as the Kerberos server. The Kerberos server name and realm are configured on the WMC Security:Kerberos panel instead of on the HTTP or Web Services end point.</li> </ul>
Realm / Domain	<p>If you select the Basic or Digest authentication option, specify a realm.</p> <p>If you select the NTLM authentication option, specify a domain.</p>
User Name	Available for the Remote Server option only - Specify the User Name for the account used to connect to the HTTP Server.
Password	Available for the Remote Server option only - Specify the Password for the account used to connect to the HTTP Server.
Log into the Server using OAuth 2.0	Description
Grant Type	<p>Cast Iron OAuth2.0 client supports two grants to request an access token. The authorization request can be made directly to the resource owner or through the authorization server.</p> <p>Select one of the following grant types:</p> <ul style="list-style-type: none"> <li>• <b>password</b> - Requires either a combination of Authorization Server URL, Username and password or just the Access Token. If the Access Token is temporary, the authorization server URL, username and password must be provided so as to regenerate the expired access token</li> <li>• <b>authorization_code</b> - Requires an Access Token and/or the combination of Refresh Token and Authorization Server URL in order to refresh temporary access tokens post expiry.</li> </ul>
Scope	Specify the scope of the access request using the scope request parameter. The authorization server uses this to inform the client about the scope of the access token issued.
Username	Specify the user name used to log on to the resource server. For resource owner password credential grant, the user name will be used as a part of the access token request.
Password	Specify the password used to logon to the resource server. For resource owner password credential grant, the password will be used as a part of the access token request.
Client ID	Specify the client ID issued by the authorization server during registration. Client ID is a unique string containing the registration information provided to the client by the authorization server. The client ID is not a secret; it is exposed to the resource owner and must not be used only for client authentication.
Client Secret	Specify the client secret. The client secret is confidential.
Access Token	Specify the Access Token. Access tokens are credentials representing the authorization issued to the client. Tokens represent specific scopes and the duration of access.
Auth Server URL	Specify the Authorization Server URL. Authorization Server URL is the URL for the authorization server or token endpoint responsible for issuing and refreshing access tokens.
Refresh Token	Specify the refresh token. Refresh tokens are used to obtain access tokens when the current access token has expired.
For more information about OAuth 2.0, see <a href="http://tools.ietf.org/html/rfc6749">http://tools.ietf.org/html/rfc6749</a> .	

<b>Field Name</b>	<b>Description</b>
<b>Security</b>	<b>Description</b>
None	Select the None option if no security is required.
HTTPS	<p>Select the HTTPS option to enable secure HTTP over SSL. Â</p> <ul style="list-style-type: none"> <li>Available for the Integration Appliance Receives Request option only - When server authentication is required, select the Server Certificate Alias Name check box to specify that the Integration Appliance acting as a server should provide a certificate to the client. If selected, the name of the certificate must be provided. A certificate specified at the endpoint level with this check box takes precedence over certificates specified on the <b>Security &gt; Certificates &gt; Settings &gt; Server SSL</b> over data NIC entry in the WMC.</li> <li>Available for the Remote Server option only - When client authentication is required, select the Client Certificate Alias Name check box to specify that the Integration Appliance acting as a client should provide a certificate to the HTTP Server. If selected, the name of the certificate must be provided. (For information about how to import a client certificate and private key for use with client authentication, see <a href="#">Importing an end-entity certificate</a>). A certificate specified at the endpoint level with this check box takes precedence over certificates specified on the <b>Security &gt; Certificates &gt; Settings &gt; Client SSL</b> entry in the WMC</li> </ul>
Protocol Version	Select the protocol used for secure HTTP over SSL. By default, the protocol version used is <code>SSL_TLSv2</code> .
<b>Connection Pool Options</b>	
Maximum Connections	Specifies the maximum number of HTTP server connections that the Integration Appliance can keep open in the connection pool. The default value is 25.
<b>Connection Timeout - The following Connection field is available for the Remote Server option only.</b>	
Time out after ___ seconds when establishing a connection to the Endpoint.	The number of seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the endpoint to respond to the connection request. For an HTTP activity, the amount of time the Integration Appliance attempts to establish a connection to the HTTP Server before timing out. A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an endpoint and the time it takes the endpoint to respond. You set the activity timeout in the <b>Retry</b> task of the HTTP Post Request Activity.
<b>Proxy - The following Proxy fields are available for the Remote Server option only.</b>	
<b>Login</b>	<b>Description</b>
Log into the Server as an Anonymous User	Available for the Remote Server option only. Select this option to connect to the HTTP server anonymously (where a user account is not required).
Log into the Server with User Name and Password	Available for the Remote Server option only. Select this option to connect to the HTTP server using a user account. Enter the User Name and Password.

Field Name	Description
Authentication	<p>Allows you to select the type of authentication that the Integration Appliance uses when connecting to a remote server. From the drop-down list, select one of the following authentication options:</p> <ul style="list-style-type: none"> <li>• <b>Basic</b> - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure.</li> <li>• <b>Digest</b> - Encrypts the user name and password you specify before sending the user name and password to the server. This authentication option is more secure than Basic authentication.</li> <li>• <b>NTLM</b> - Requires an instance of NTCredentials to be available for the domain name of the server. This authentication is the most secure authentication option as the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server.</li> </ul> <p>Note: Do not prefix the user name with the domain.</p>
Realm / Domain	If you select the Basic or Digest authentication option, specify a realm. If you select the NTLM authentication option, specify a domain.
User Name	Available for the Remote Server option only - Specify the User Name for the account used to connect to the HTTP Server.
Password	Available for the Remote Server option only - Specify the Password for the account used to connect to the HTTP Server.
Security	Description
None	Select the None option if no security is required.
<b>Connection Timeout - The following Connection field is available for the Remote Server option only.</b>	
Time out after ___ second(s) when establishing a connection to the Endpoint.	Specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For an HTTP activity, the amount of time the Integration Appliance attempts to establish a connection to the HTTP Server before timing out. A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an endpoint and the time it takes the endpoint to respond. You set the activity timeout in <b>Retry</b> task of the HTTP Post Request Activity.
Host	Specifies the host name of the proxy server. This field is required.
Port	Specifies the port number to use to connect to the proxy server. This field is required
Username	Specifies the username to use for proxy server authentication. This field is optional if your proxy server does not require authentication
Password	Specifies the password to use for proxy server authentication. This field is optional if your proxy server does not require authentication.

Note: For some of the fields in the endpoint, you can define configuration properties to supply the values for these fields. The  icon is displayed when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.

**Parent topic:** [HTTP Activities](#)

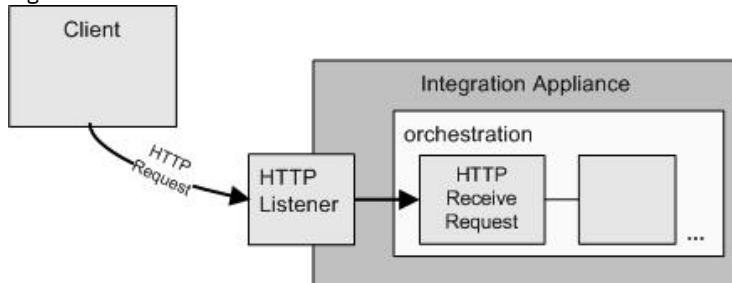

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http\\_create\\_edit\\_endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_create_edit_endpoint.html)

## HTTP Receive Request activity

Use the **HTTP Receive Request** activity to configure the Integration Appliance to act as an HTTP listener

The following figure shows the Integration Appliance acting as an HTTP listener.

Figure 1.

The **HTTP Receive Request** activity is a starter activity. When an orchestration that starts with an **HTTP Receive Request** activity is deployed to the Integration Appliance, the Integration Appliance acts as an HTTP listener waiting for HTTP requests. When a HTTP request is received, the following actions occur:

1. An orchestration job is started.
2. The **HTTP Receive Request** activity processes the incoming HTTP request and maps the HTTP request to the output parameters of the activity.
3. The output parameters are mapped to the specified orchestration variables. During design time in the **Map Outputs** task of the **Checklist**, the mapping between the output parameters and the orchestration variables is defined.
4. The remaining activities in the orchestration are processed. (In the graphical representation of the orchestration, the remaining activities are the activities located on the right side of the **HTTP Receive Request** activity).

By default, decompression is enabled for the **HTTP Receive Request** activity. For more information, see [Decompression with the HTTP Receive Request activity](#).

You cannot deploy two **HTTP Receive Request** activities to the appliance with the same endpoint details, URL and method.

### For single **HTTP Receive Request** activity

If you deploy only one **HTTP Receive Request** activity for a URL, the orchestration accepts all requests of those URLs starting with that *base URL*. For example, if you deploy `/customer` then it accepts requests for `/customer`, `/customer/21`, `/customer/21/dept`, and so on.

If you deploy an **HTTP Receive Request** activity for a URL with path parameters, then the orchestration accepts only those requests whose URLs match with the configured URL with values for path parameters. For example, if you deploy `/customer/{custid}` then it accepts requests such as `/customer/10`, `/customer/21`, `/customer/dept`. The following URLs are not accepted: `/customer`, `/customer/21/dept`, and so on.

### For multiple **HTTP Receive Request** activities

If you deploy two **HTTP Receive Request** activities that are configured with the same base URL, and one with path parameter, then the activities accept requests whose URLs strictly match with the configured URL. For example, if you deploy `/customer` and `/customer/{path parameter}`, and if `/customer` is invoked the request goes to the activity configured with `/customer`. If `/customer/007` is invoked, the request goes to the activity configured with `/customer/{path parameter}`. Also, if you invoke the following URLs: `/customer/dept/1` or `/customer/12/21`, none of the activities accept the requests.

Note: If you deploy two activities, the first one as `/customer/department` and the second one as `/customer/{path parameter}`, and if `/customer/department` is invoked, then the request goes to the activity which was deployed first (`/customer/department`). If `/customer/{path parameter}` is deployed first, then the request goes to `/customer/{path parameter}`.

Note: It is also recommended that you do not deploy the same URL for Web Services and HTTP.

*Base URL* - Part of the URL before path parameters. For example - If the configured URL is `/employee/manager/{id}`, then Base URL will be `/employee/manager`.

## Adding an HTTP Receive Request activity to the orchestration

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Receive Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed with the **Summary** task active in the properties pane. The Properties pane is located under the graphical representation of the orchestration in the Workspace.

## Creating, selecting, or editing an HTTP endpoint

---

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint, see [Creating or editing an HTTP endpoint](#).

## Configuring the activity

---

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field	Description
URL Path	<p>Specifies the resource path where the Integration Appliance listens for inbound HTTP requests, for example: /mypath. The string you specify in this field must exclude the string: http://, the hostname, and the port number of the Integration Appliance. The full URL that the Integration Appliance uses to listen for inbound HTTP requests is automatically constructed from the hostname of the Integration Appliance, the port number specified in the HTTP endpoint, and the path specified in this field. For example, if the full URL that the Integration Appliance listens for HTTP requests is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the HTTP <b>Receive Request</b> activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format, url/ {path}?name1=value1&amp;name2=value2. This allows you to map a string value to the "{path}" parameter and to specify query parameter names: name1 and name2 in this example. If you choose to declare multiple "{path}" parameters, it is recommended that each parameter has a unique name. Parameters with the same name are represented by only one node in the map. The path parameters are displayed under /httpheaders/pathParameters in Map Output. Query parameters are displayed under /httpheaders/queryParameters in Map output.</p> <p>Note: In the URL, any value assigned to a query parameter is not passed to the mapper. The value comes from the server based on the actual incoming request.</p> <p>Note: The path that the Integration Appliance listens for inbound HTTP requests is a resource path string that you specify and does not correspond to actual directory path on the Integration Appliance.</p>
Method	Specifies which HTTP method is accepted by the listening server.
Of Type	Specifies the expected message type of the HTTP request - either Text or Binary.
Requires a Reply	Specifies if a reply should be sent to the sender of the request. Note: If this check box is selected, you must add and configure a HTTP <b>Send Response</b> activity in your orchestration.

File Id	Description
Use Compression/Decompression	Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see <a href="#">Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity</a>

## Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you may be prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

## Specifying Swagger information

1. Select the Swagger task from the **Checklist** to set sample message.
2. Specify the Request sample (JSON) and Response sample (JSON) information. If you do not specify any request sample, the Swagger Output will display with empty sample objects.
3. Click on Generate Swagger button which will display the code in the Swagger Output textbox. You can also click Download Swagger to download and share the file, if required.

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 2.

Output Parameter	Description
httpheaders	Specifies the header of the HTTP request.
body	Specifies the body of the HTTP request message.

The following table defines the nodes of the optional httpheaders output parameter. ^

Table 3.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path of the incoming request, for example: /myPath.
httpheaders/method	Specifies the type of HTTP request.
httpheaders/host	Specifies the IP address or the host name of the client.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/<configured_header_name>	If you configured at least one request header in Request Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.

Nodes of the httpheaders Output Parameter	Description
httpheaders/pathParameters	If you configured path parameters in the URL in the Configure step, each is displayed here. If no path parameter is specified, this node does not display.
httpheaders/queryParameters	If you configured query parameters in the URL in Configure step, each is displayed here. If no query parameter is specified, this node does not display.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

Note: To test your orchestration that starts with the **HTTP Receive Request** activity, you can use the HTTP Post Utility included with the Studio installation, to send HTTP requests to the listening Integration Appliance during run time. You can access the HTTP Post Utility from the start menu, select Programs > IBM > Cast Iron Studio > HTTP Post Utility option. The URL you specify in the URL of the inbound connector field must contain the full URL, for example: <http://myAR:myPort/myPath>.

**Parent topic:** [HTTP Activities](#)

[Feedback](#) | [Notices](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http\\_receive\\_request\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_receive_request_activity.html)

## Decompression with the **HTTP Receive Request** activity

The **HTTP Receive Request** activity supports decompression with the gzip format only. The **HTTP Receive Request** activity does not support the deflate format or the common UNIX file compression format called compress.

The **HTTP Receive Request** activity only supports receiving HTTP requests using HTTP/HTTPS 1.0 protocol.

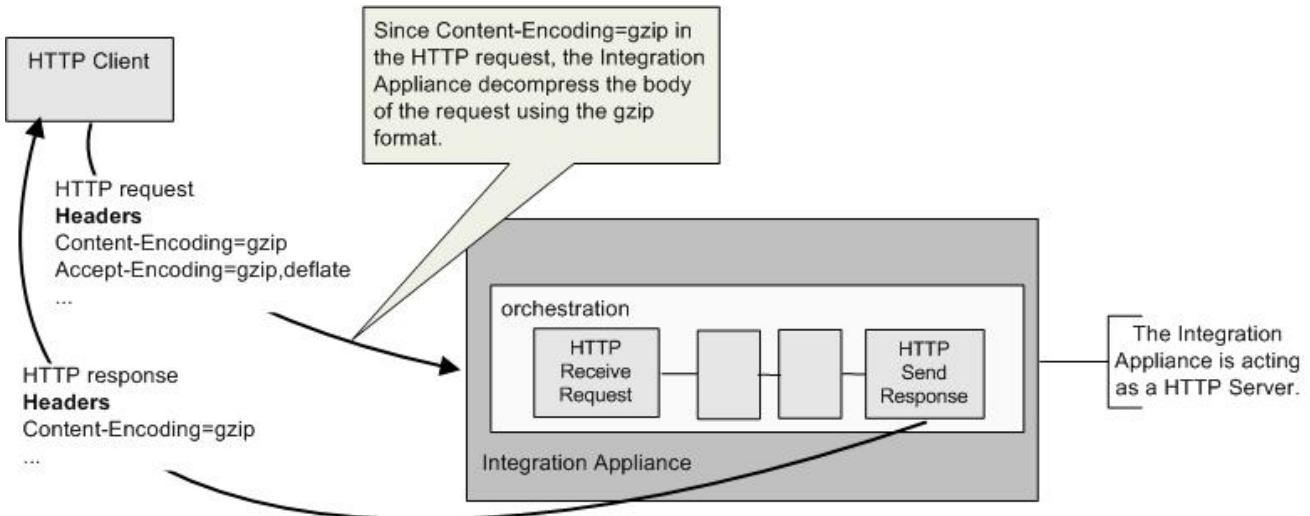

The decompression runtime behavior of the **HTTP Receive Request** activity when receiving a HTTP request is dependant on the following conditions:

- [The value of the Content-Encoding at the message level](#)
- [The setting of the Use Compression/Decompression check box at the activity level](#)

The affect of these conditions on the decompression runtime behavior of the **HTTP Receive Request** activity are described in the following sections and in the table provided in the [runtime Decompression Behavior](#) section.

### Content-Encoding value at the message level

The value of the Content-Encoding HTTP Header Parameter of the HTTP request can determine if the Integration Appliance decompresses the body of the HTTP request that is received from the HTTP Client as shown in the following figure.

The value of the Content-Encoding header is represented by the third column labeled **Content-Encoding Value** in the table provided in the [Run-time Decompression Behavior](#) section.

## Setting decompression at the activity level

By default, decompression is turned on at the activity level for the **HTTP Receive Request** activity. You can turn off decompression at the activity level by selecting the Use Compression/Decompression check box. The Use Compression/Decompression check box is available in the **Configure** task of the activity. The second column labeled Use Compression/Decompression Check Box in the table provided in the [runtime Decompression Behavior](#) section, represents the setting of the Use Compression/Decompression check box.

Â

## runtime decompression behavior

The following table describes the decompression runtime behavior when the Integration Appliance receives a HTTP request from the HTTP Client:

<b>Use Compression/Decompression Check Box (Activity Level) Â</b>	<b>Content-Encoding Value (Message Level)</b>	<b>Integration Appliance Decompression runtime Behavior</b>
selected	gzip	The Integration Appliance decompresses the body of the request using the gzip format. The value of Content-Encoding is set to gzip in the httpheaders output parameter returned from the activity.
selected	not set	The Integration Appliance sends the body of the request as is (unchanged). The value of Content-Encoding is not set in the httpheaders output parameter returned from the activity. Â Â
selected	identity	The Integration Appliance does not decompress the body of the request. The value of the Content-Encoding is set to identity in the httpheaders output parameter returned from the activity.
selected	any other string besides gzip or identity	The Integration Appliance sends the 415 (Unsupported Media Type) Response Code.
cleared	value is not significant	The Integration Appliance does not decompress the body of the request and the current value of Content-Encoding in the request is passed as is to the <b>httpheaders</b> output parameter of the activity. For example, if the value of the Content-Encoding is set to gzip but the Use Compression/Decompression check box is cleared, the Integration Appliance does not decompress the body of the request but Content-Encoding is set to gzip in the httpheaders output parameter of the activity.

Note: The Use Compression/Decompression check box will be deprecated in a future release. Use the Content-Encoding HTTP Parameter in the HTTP request to specify how to decompresses the body of the HTTP request.

**Parent topic:** [HTTP Activities](#)

file:///dcs/markdown/workspace/Transform/out.html

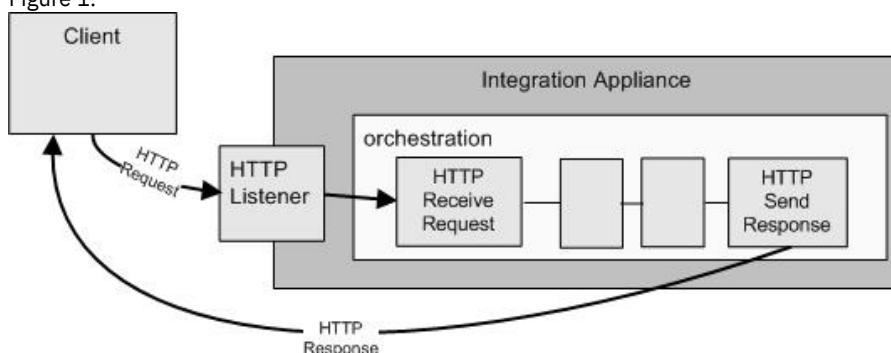

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/decompression\\_with\\_the\\_http\\_receive\\_request\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/decompression_with_the_http_receive_request_activity.html)

## HTTP Send Response activity

The **HTTP Send Response** activity sends a reply back to the sender of an HTTP request.

The following figure shows the **HTTP Send Response** activity sending a reply back to the sender of an HTTP request.

Figure 1.

The **HTTP Send Response** activity must be used in conjunction with an **HTTP Receive Request** activity in an orchestration as shown in the preceding figure. If you add a **HTTP Send Response** activity to orchestration, you must select the Requires a Reply check box in the **Configure** task of the **HTTP Receive Request** activity.

By default, compression is not enabled for the **HTTP Send Response** activity. For more information, see [Compression/Decompression with the HTTP Send Response activity](#).

### Adding an **HTTP Send Response** activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Send Response** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed with the **Configure** task active in the properties pane. The properties pane is located beneath the graphical representation of the orchestration.

### Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field	Description
To	Specifies the <b>HTTP Receive Request</b> activity associated with this <b>HTTP Send Response</b> activity. During run time, the associated <b>HTTP Receive Request</b> activity receives the request from the client and the <b>HTTP Send Response</b> activity sends the response back to the client. Note: This field is populated only if you select the Requires a Reply check box in the <b>Configure</b> task of the <b>HTTP Receive Request</b> activity.
Of Type	Specifies the message type of the HTTP response - either Text or Binary.

Field	Description
Use Compression/Decompression	Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see <a href="#">Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity</a> .

## Specifying the response headers

---

1. Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

## Mapping the input into the activity

---

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is mandatory and at least one variable must be mapped to it. The body input parameter contains the body of the HTTP response message sent back to the client.
2. To view the optional input parameter in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The httpheaders input parameter is displayed.

The following table defines the nodes of the optional httpheaders input parameter:

Table 2.

Nodes of the httpheaders Input Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/method	Specifies the type of HTTP response, for example: POST.
httpheaders/Via	Contains the time taken by each of the activities present between HTTP Receive and HTTP Send Response. For example, FTP Put(uploadfile):50ms;Send Email(postinfo):30ms;. There are two activities, FTP Put and Send Email, that are present between HTTP Receive and HTTP Send Response activities. So, when a job is processed, the <b>Via</b> header response will contain this value. It means that FTP Put activity takes 50 milliseconds and the Send Email activity takes 30 milliseconds, respectively, to complete the activity.
httpheaders/<configure d_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header name you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs for the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so this is a recurring node.

Nodes of the httpheaders Input Parameter	Description
httpheaders/otherHeaders/headers/holderItem/name	Specifies the name of the HTTP parameter.
httpheaders/otherHeaders/headers/holderItem/value	Specifies the value of the HTTP parameter.

3. Create a map between the orchestration variable or variables and the input parameter or parameters. See [Creating a map](#) for general instructions on mapping

## Using certificates with Microsoft Internet Explorer

---

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

**Parent topic:** [HTTP Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http\\_send\\_response\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_send_response_activity.html)

## Compression/Decompression with the HTTP Send Response activity

---

During runtime, the **HTTP Send Response** activity sends an HTTP response complaint with the HTTP/HTTPS 1.0 protocol to the HTTP client.

Note: The **HTTP Send Response** activity supports compression with the gzip format only. It does not support the deflate format or the common UNIX file compression format called compress.

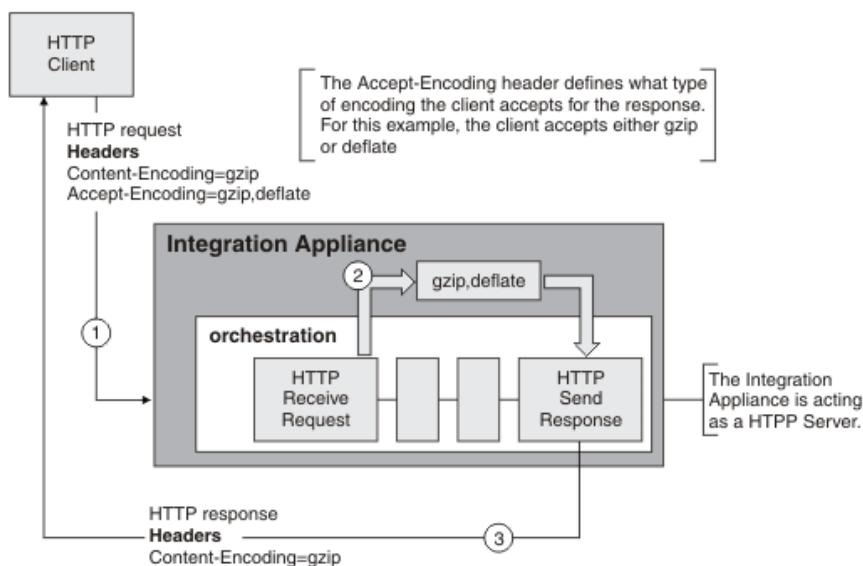

The compression runtime behavior of the **HTTP Send Response** activity is dependant on the following conditions:

- At the message level, the value of the Accept-Encoding header in the original HTTP request received by the **HTTP Receive Request** activity is passed to the **HTTP Send Response** activity to determine if the body of the HTTP response is compressed or not compressed as shown in the following figure.
- The setting of the Use Compression/Decompression check box at the activity level

The affect of these conditions on the compression runtime behavior of the **HTTP Send Response** activity are described in the following sections and in the table provided in the [runtime Compression Behavior](#) section.

## Accept-Encoding value at the message level

During runtime, a **HTTP Receive Request** activity receives a HTTP request from a HTTP client. In the same orchestration, a **HTTP Send Response** activity sends a HTTP response back to the original client. The value of the Accept-Encoding header in the original request received by the **HTTP Receive Request** activity is stored internally on the Integration Appliance. The stored value is passed to the **HTTP Send Response** activity and is used to determine if the body of the response is compressed or not and the encoding type, as shown in the following figure.

If values for the Content-Encoding or Accept-Encoding headers are explicitly set using the optional httpheaders input parameter of the **HTTP Send Response** activity, these new values override the default settings of these headers passed-in via the request. For example, if Accept-Encoding is set to gzip,deflate in the request but is explicitly set to identity in the httpheaders input parameter of the **HTTP Send Response** activity, the Integration Appliance does not compress the body of the response.

To explicitly set the Accept-Encoding header, provide the following values in a **headerItem** node in the **Map Inputs** task of the **HTTP Post Request** activity:

- `httpheaders/httpheaders/otherHeaders/headerItem/name` is set to the string: `Accept-Encoding`
- `httpheaders/httpheaders/otherHeaders/headerItem/value` is set to the encoding type, for example the string: `identity`.

## Setting Compression/Decompression at the activity level

By default, compression is turned on at the activity level for the **HTTP Send Response** activity. You can turn off compression at the activity level by clearing the Use Compression/Decompression check box. The Use Compression/Decompression check box is available in the **Configure** task of the activity. The second column labeled **HTTP Compression CLI Command** in the following table represents the setting of the Use Compression/Decompression check box.

## Runtime compression behavior

The following table describes the compression runtime behavior when the Integration Appliance sends a HTTP response to the HTTP Client:

Use Compression/Decompression Check Box (Activity Level)	Accept-Encoding Value of the HTTP Request (Message Level)	Integration Appliance Compression Runtime Behavior
selected	gzip or gzip,deflate	The Integration Appliance sends the body of the response compressed in the gzip format and the Content-Encoding header is set to gzip in the response.
selected	identity	The Integration Appliance sends the body of the response uncompressed and the Content-Encoding header is set to identity in the response.
selected	not set, or any other string except gzip or identity	The Integration Appliance sends the body of the response uncompressed and the Content-Encoding header is set to identity in the response.

<b>Use Compression/ Decompression Check Box (Activity Level) Â</b>	<b>Accept-Encoding Value of the HTTP Request (Message Level)</b>	<b>Integration Appliance Compression Runtime Behavior</b>
cleared	value is not significant	The Integration Appliance sends the body of the response as is (unchanged) and the Content-Encoding header is as is in the response. (The value of the Content-Encoding header in the request is passed unchanged to the response.)

Note: The Use Compression/Decompression check box will be deprecated in a future release. Use the Content-Encoding and Accept-Encoding HTTP Parameters in the HTTP request to specify how to decompresses the body of the HTTP request and compress the body of the HTTP response.

**Parent topic:** [HTTP Activities](#)

#### [Feedback | Notices](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/compression\\_with\\_the\\_http\\_send\\_response\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/compression_with_the_http_send_response_activity.html)

## HTTP Post Request activity

The HTTP **Post Request** activity sends a **Post Request** to the specified location (the HTTP endpoint) and receives an HTTP response back from that location.

### Adding an HTTP Post Request activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Post Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

### Creating, selecting or editing an HTTP endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint, see [Creating or editing an HTTP endpoint](#).

### Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description

Field or Check Box	Description
URL (Path after Hostname)	<p>Specifies the resource path that the <b>Post Request</b> activity sends the request to, for example: /mypath. The string you specify in this field must exclude the string: http://, the host name, and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint, and the path specified in this field. For example, if the full URL that the <b>Post Request</b> activity sends the request to is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the <b>Post Request</b> activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format:url/{path}?name1=value1&amp;name2=value2. This allows you to map a string value to the "{path}" parameter and to specify query parameter names: <i>name1</i> and <i>name2</i> in this example. If you choose to declare multiple "{path}" parameters, each parameter should have a unique name. Parameters with the same name are represented by only one node in the map. The path parameters are displayed under /httpheaders/pathParameters in Map Input. Query parameters are displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper or define a default value.</p>
Where Request Message is Of Type	Specifies the expected message type of the HTTP request - either Text or Binary. Â
Where Reply Message is Of Type	Specifies the message type of the HTTP reply - either Text or Binary. Â
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> <li>○ <b>Stop Processing the Orchestration Job</b> - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the <b>Post Request</b> activity and the activities after the <b>Post Request</b> activity in the orchestration are not processed and a failed exception is thrown.</li> <li>○ <b>Continue Processing and Return the HTTP Error code</b> - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the <b>Post Request</b> activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessag output parameters, respectively.</li> </ul>
Use Compression/Decompression	Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see <a href="#">Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity</a> .

## Specifying the request headers

---

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

## Specifying the response headers

---

1. Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A Custom Headers table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle, and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

## Specifying the retry options

---

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an HTTP Server. The following table defines the retry options for a connection to an HTTP Server:

Table 2.

Fields	Description
<b>Retry</b>	Â
1) Wait -- seconds between each retry.	The number of seconds that the Integration Appliance waits before trying to establish a connection to the HTTP Server.
2) Try to connect -- times before failing.	Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job.  If you deploy an orchestration that contains an <b>HTTP Post Request</b> activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connection errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and stops processing the current orchestration job.  For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
<b>Activity Timeout</b>	Â

Fields	Description
3) Time out after --- seconds when the Endpoint does not respond to a request.	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the <b>Post Request</b> activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in HTTP Endpoint tab. For more information about connection timeouts, see <a href="#">Creating or editing an HTTP endpoint</a> .

## Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is mandatory and at least one variable must be mapped to it. The body input parameter contains the body of the HTTP request message sent to the HTTP server.
2. To view the optional input parameters in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The httpheaders and httpConnParameter input parameters display.

The following table defines the nodes of the optional httpheaders input parameter:

Table 3.

Nodes of the httpheaders Input Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one request header in Request Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/pathParameters	If you configured path parameters in the URL in Configure step, each is displayed here. If no path parameter is specified, this node does not display.
httpheaders/queryParameters	If you configured query parameters in the URL in Configure step, each is displayed here. If no query parameter is specified, this node does not display.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

Note: If the Content-Length header is explicitly set using the httpheaders/otherHeaders/headerItem/name and httpheaders/otherHeaders/headerItem/value, during run time this value is ignored. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional httpConnParameter input parameter. You can optionally override the settings you specified in the **Pick Endpoint** task of the **Checklist** dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the httpConnParameter input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 4.

Nodes of the httpConnParameter Input Parameter	Description	Overrides what settings in the HTTP endpoint?
timeout	Specifies the amount of time in seconds before a timeout occurs.	Â

<b>Nodes of the httpConnParameter Input Parameter</b>	<b>Description</b>	<b>Overrides what settings in the HTTP endpoint?</b>
host	Specifies the host name or IP address of the remote HTTP server.	The <b>host</b> node of the httpConnParameter input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server.	The <b>port</b> node of the httpConnParameter input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The <b>isSecure</b> node of the httpConnParameter input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The <b>username</b> node of the httpConnParameter input parameter overrides the User Name field in the HTTP endpoint.
password	Specifies the password for the account used to connect to the HTTP Server.	The <b>password</b> node of the httpConnParameter input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and input parameter or parameters. See [Creating a map](#) for general instructions on mapping.

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 5.

<b>Output Parameter</b>	<b>Description</b>
httpheaders	Specifies the header of the HTTP response.
body	Specifies the body of the HTTP response message.
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time.
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the httpheaders output parameter:

Table 6.

<b>Nodes of the httpheaders Output Parameter</b>	<b>Description</b>
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies a set of name/value pairs that contain the HTTP parameters of the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so headerItem is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

## Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

**Parent topic:** [HTTP Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http\\_post\\_request\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_post_request_activity.html)

## HTTP Get Request activity

---

The HTTP **Get Request** activity sends a **Get Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.

### Adding an HTTP Get Request activity to the orchestration

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Get Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

### Creating, selecting, or editing an HTTP endpoint

---

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint. See [Creating or editing an HTTP endpoint](#).

### Configuring the activity

---

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description

Field or Check Box	Description
URL (Path after Hostname)	<p>Specifies the resource path that the <b>Get Request</b> activity sends the request to, for example: /mypath. The string you specify in this field must exclude the string: http://, the hostname, and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint and the path specified in this field. For example, if the full URL that the <b>Get Request</b> activity sends the request to is http://myAR:myPort/myPath, in this field, you only need to specify the string: /myPath. The specified path must be unique for the <b>Get Request</b> activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format: url/{path}?name1=value1&amp;name2=value2. This allows you to map a string value to the "{path}" parameter and to specify query parameter names: <i>name1</i> and <i>name2</i> in this example. If you choose to declare multiple "{path}" parameters, it is recommended that each parameter has a unique name. Parameters with the same name are represented by only one node in the map. The path parameters will be displayed under /httpheaders/pathParameters in Map Input. And query parameters will be displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper, or define a default value.</p>
Where Request Message is Of Type	Specifies the message type of the HTTP response - either Text or Binary.
Where Reply Message is Of Type	Specifies the message type of the HTTP reply - either Text or Binary..
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> <li>○ <b>Stop Processing the Orchestration Job</b> - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the HTTP <b>Get Request</b> activity and the activities after the HTTP <b>Get Request</b> activity in the orchestration are not processed and a failed exception is thrown.</li> <li>○ <b>Continue Processing and Return the HTTP Error code</b> - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the HTTP <b>Get Request</b> activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessage output parameters, respectively.</li> </ul>
Use Compression/Decompression	Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see <a href="#">Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity</a> .

## Specifying the request headers

---

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Duplicate header names are not allowed (ignoring the case difference) and if duplicated headers appear in the **Custom Headers** table, you are prompted to remove them. The selected HTTP headers are displayed under /httpheaders in Map Input.

## Specifying the response headers

---

1. Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A Custom Headers table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle, and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Duplicate header names are not allowed (ignoring the case difference) and if duplicated headers appear in the **Custom Headers** table, you are prompted to remove them. The selected HTTP headers are displayed under /httpheaders in Map Output.

## Specifying the retry options

---

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options to connect to an HTTP Server. The following table defines the retry options for connecting to an HTTP Server:

Field	Description
Retry	Â
1) Wait --- seconds between n each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the HTTP server.
2) Try to connect --- times before failing.	Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an HTTP <b>Get Request</b> activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
3) Time out after --- seconds when the Endpoi nt does not respond to a request.	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the HTTP <b>Get Request</b> activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in HTTP Endpoint tab. For more information about connection timeouts, see, <a href="#">Creating or Editing a Web Services Endpoint</a> .

## Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is optional. The body input parameter contains the body of the HTTP response message sent back to the HTTP server.
2. To view the optional input parameter in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The **httpheaders** and **httpConnParameter** input parameters are displayed.

The following table defines the nodes of the optional **httpheaders** input parameter:

Table 2.

Nodes of the httpheaders Input Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one request header in the Request Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/pathParameters	If you configured path parameters in the URL in the Configure step, each is displayed here. If no path parameter is specified, this node does not display.
httpheaders/queryParameters	If you configured query parameters in the URL in the Configure step, each is displayed here. If no query parameter is specified, this node does not display.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP parameters can be specified in the HTTP response, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP parameter.

Note: If the Content-Length header is explicitly set using the `httpheaders/otherHeaders/headerItem/name` and `httpheaders/otherHeaders/headerItem/value`, this value is ignored during run time. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional **httpConnParameter** input parameter. You can optionally override the settings you specified in the Pick Endpoint task of the Checklist dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the **httpConnParameter** input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 3.

Nodes of the httpConnParameter Input Parameter	Description	Overrides what settings in the HTTP endpoint?
timeout	Specifies the amount of time in seconds before a timeout occurs.	A
host	Specifies the host name or IP address of the remote HTTP server.	The host node of the <b>httpConnParameter</b> input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server.	The port node of the <b>httpConnParameter</b> input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The <b>isSecure</b> node of the <b>httpConnParameter</b> input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The <b>username</b> node of the <b>httpConnParameter</b> input parameter overrides the User Name field in the HTTP endpoint.

<b>Nodes of the httpConnParameter Input Parameter</b>	<b>Description</b>	<b>Overrides what settings in the HTTP endpoint?</b>
password	Specifies the password for the account used to connect to the HTTP Server.	The password node of the httpConnParameter input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and the input parameter or parameters. See [Creating a map](#) for general instructions on mapping

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 4.

<b>Output Parameter</b>	<b>Description</b>
httpheaders	Specifies the header of the HTTP request.
body	Specifies the body of the HTTP request message.
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time.
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the optional httpheaders output parameter. Â

Table 5.

<b>Nodes of the httpheaders Output Parameter</b>	<b>Description</b>
httpheaders/uri	Specifies the resource path of the incoming request, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

## Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

**Parent topic:** [HTTP Activities](#)

---

[Feedback](#) | [Notices](#)

## HTTP Head Request activity

The HTTP **Head Request** activity sends a **Head Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.

### Adding an HTTP Head Request activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Head Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

### Creating, selecting, or editing an HTTP endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint. See [Creating or editing an HTTP endpoint](#).

### Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description
URL (Path after Hostname)	<p>Specifies the resource path that the <b>Head Request</b> activity sends the request to, for example: /mypath. The string you specify in this field must exclude the string: http://, the hostname and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint and the path specified in this field. For example, if the full URL that the <b>Head Request</b> activity sends the request to is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the <b>Head Request</b> activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format: url/{path}?name1=value1&amp;name2=value2. This allows you to map a string value to the "{path}" parameter and to specify query parameter names: name1 and name2 in this example. If you choose to declare multiple "{path}" parameters, each parameter should have a unique name. Parameters with the same name are represented by only one node in the map. The path parameters are displayed under /httpheaders/pathParameters in Map Input. And query parameters will be displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper, or define a default value.</p>
Where Request Message is Of Type	Specifies the expected message type of the HTTP response - either Text or Binary.

Field or Check Box	Description
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> <li>○ <b>Stop Processing the Orchestration Job</b> - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the <b>Head Request</b> activity and the activities after the <b>Head Request</b> activity in the orchestration are not processed and a failed exception is thrown.</li> <li>○ <b>Continue Processing and Return the HTTP Error code</b> - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the <b>Head Request</b> activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessage output parameters, respectively.</li> </ul>
Use Compression/Decompression	<p>Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see <a href="#">Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity</a>.</p>

## Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you may be prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

## Specifying the response headers

1. Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A Custom Headers table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle, and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options to connect to an HTTP Server. The following table defines the retry options for connecting to an HTTP Server:

Field	Description

Retry	Â
1) Wait --- seconds between each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the HTTP server.
2) Try to connect --- times before failing.	Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an <b>HTTP Head Request</b> activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
3) Time out after --- seconds when the Endpoint does not respond to a request.	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the <b>HTTP Head Request</b> activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in <b>HTTP Endpoint</b> tab. For more information about connection timeouts, see, <a href="#">Creating or Editing a Web Services Endpoint</a> .

## Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is optional. The body input parameter contains the body of the HTTP response message sent back to the HTTP server.
2. To view the optional input parameter in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The **httpheaders** and **httpConnParameter** input parameters are displayed.

The following table defines the nodes of the optional **httpheaders** input parameter:

Table 2.

Nodes of the <b>httpheaders</b> Input Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one request header in Request Headers step, each one of them will be displayed here. <configured_header_name> will be replaced with the actual header names you selected or entered.
httpheaders/pathParameters	If you configured path parameters in the URL in the Configure step, each is displayed here. If no path parameter is specified, this node does not display.
httpheaders/queryParameters	If you configured query parameters in the URL in Configure step, each is displayed here. If no query parameter is specified, this node does not display.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs for the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so this is a Â recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP parameter.

Nodes of the httpheaders Input Parameter	Description
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP parameter.

Note: If the Content-Length header is explicitly set using the `httpheaders/otherHeaders/headerItem/name` and `httpheaders/otherHeaders/headerItem/value`, during run time this value is ignored. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional `httpConnParameter` input parameter. You can optionally override the settings you specified in the Pick Endpoint task of the Checklist dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the `httpConnParameter` input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 3.

Nodes of the httpConnParameter Input Parameter	Description	Overrides what settings in the HTTP endpoint?
timeout	Specifies the amount of time in seconds before a timeout occurs.	Ã¢
host	Specifies the host name or IP address of the remote HTTP server.	The host node of the <code>httpConnParameter</code> input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server.	The port node of the <code>httpConnParameter</code> input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The <code>isSecure</code> node of the <code>httpConnParameter</code> input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The <code>username</code> node of the <code>httpConnParameter</code> input parameter overrides the User Name field in the HTTP endpoint.
password	Specifies the password for the account used to connect to the HTTP Server.	The <code>password</code> node of the <code>httpConnParameter</code> input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and the input parameter or parameters. See [Creating a map](#) for general instructions on mapping

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 4.

Output Parameter	Description
httpheaders	Specifies the header of the HTTP request.
body	Specifies the body of the HTTP request message.
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time.
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the optional `httpheaders` output parameter. Ã¢

Table 5.

<b>Nodes of the httpheaders Output Parameter</b>	<b>Description</b>
httpheaders/uri	Specifies the resource path of the incoming request, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> will be replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

## Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

**Parent topic:** [HTTP Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http\\_head\\_request\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_head_request_activity.html)

## HTTP Invoke Request activity

The HTTP **Invoke Request** activity sends a HTTP request to the specified location, the HTTP endpoint, and receives a HTTP response back from that location.

### Adding an HTTP Invoke Request activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Invoke Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

### Creating, selecting, or editing an HTTP endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - o Select an existing endpoint and edit the endpoint:

- a. Select Browse. The Project Explorer is displayed.
  - b. Select an existing endpoint and click OK.
  - c. Click Edit. The Edit Endpoint pane is displayed.
- o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint, see [Creating or editing an HTTP endpoint](#).

## Configuring the activity

---

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description
URL (Path after Hostname)	<p>Specifies the resource path that the <b>Invoke Request</b> activity sends the request to, for example: /mypath. The string you specify in this field must exclude the string: http://, the host name, and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint, and the path specified in this field. For example, if the full URL that the <b>Invoke Request</b> activity sends the request to is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the <b>Invoke Request</b> activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format:url/{path}?name1=value1&amp;name2=value2. This allows you to map a string value to the "{path}" parameter and to specify query parameter names: <i>name1</i> and <i>name2</i> in this example. If you choose to declare multiple "{path}" parameters, it is recommended that each parameter has a unique name. Parameters with the same name are represented by only one node in the map. The path parameters are displayed under /httpheaders/pathParameters in Map Input. Query parameters are displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper, or define a default value.</p>
Where Request Message is Of Type	Specifies the expected message type of the HTTP request - either Text or Binary. Â
Where Reply Message is Of Type	Specifies the message type of the HTTP reply - either Text or Binary.

Field or Check Box	Description
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> <li>○ <b>Stop Processing the Orchestration Job</b> - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the <b>Invoke Request</b> activity and the activities after the <b>Invoke Request</b> activity in the orchestration are not processed and a failed exception is thrown.</li> <li>○ <b>Continue Processing and Return the HTTP Error code</b> - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the <b>Invoke Request</b> activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessage output parameters, respectively.</li> </ul>
Use Compression/Decompression	<p>Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see <a href="#">Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity</a>.</p>

## Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

## Specifying the response headers

1. Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an HTTP Server. The following table defines the retry options for a connection to an HTTP Server:

Table 2.

<b>Fields</b>	<b>Description</b>
<b>Retry</b>	<p>1) Wait --- seconds between each retry.</p> <p>The number of seconds that the Integration Appliance waits before trying to establish a connection to the HTTP Server.</p>
2) Try to connect --- times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an HTTP Post Request activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connection errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>
<b>Activity Timeout</b>	<p>3) Time out after --- seconds when the Endpoint does not respond to a request.</p> <p>Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the <b>Invoke Request</b> activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in HTTP Endpoint tab. For more information about connection timeouts, see <a href="#">Creating or editing an HTTP endpoint</a>.</p>

## Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is mandatory and at least one variable must be mapped to it. The body input parameter contains the body of the HTTP request message sent to the HTTP server.
2. To view the optional input parameters in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The httpheaders and httpConnParameter input parameters display.

The following table defines the nodes of the optional httpheaders input parameter:

Table 3.

<b>Nodes of the httpheaders Input Parameter</b>	<b>Description</b>
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/method	Specifies the type of HTTP request. If no value is mapped, the default method is POST.
httpheaders/<configured_header_name>	If you configured at least one request header in Request Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered
httpheaders/pathParameters	If you configured path parameters in the URL in Configure step, each is displayed here. If no path parameter is specified, this node does not display.

Nodes of the httpheaders Input Parameter	Description
httpheaders/queryParameters	If you configured query parameters in the URL in Configure step, each is displayed here. If no query parameter is specified, this node does not display.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

Note: If the Content-Length header is explicitly set using the httpheaders/otherHeaders/headerItem/name and httpheaders/otherHeaders/headerItem/value, during run time this value is ignored. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional httpConnParameter input parameter. You can optionally override the settings you specified in the **Pick Endpoint** task of the **Checklist** dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the httpConnParameter input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 4.

Nodes of the httpConnParameter Input Parameter	Description	Overrides what settings in the HTTP endpoint?
timeout	Specifies the amount of time in seconds before a timeout occurs.	Â
host	Specifies the host name or IP address of the remote HTTP server. Â	The <b>host</b> node of the httpConnParameter input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server. Â	The <b>port</b> node of the httpConnParameter input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The <b>isSecure</b> node of the httpConnParameter input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The <b>username</b> node of the httpConnParameter input parameter overrides the User Name field in the HTTP endpoint.
password	Specifies the password for the account used to connect to the HTTP Server.	The <b>password</b> node of the httpConnParameter input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and input parameter or parameters. See [Creating a map](#) for general instructions on mapping.

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 5.

Output Parameter	Description
httpheaders	Specifies the header of the HTTP response.
body	Specifies the body of the HTTP response message.
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time. Â
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the httpheaders output parameter:

Table 6.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/method	Specifies the type of HTTP response.
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies a set of name/value pairs that contain the HTTP parameters of the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so headerItem is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

## Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

**Parent topic:** [HTTP Activities](#)

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http\\_invoke\\_request\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_invoke_request_activity.html)

## HTTP Put Request activity

The **HTTP Put Request** activity sends a **Put Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.

### Adding an HTTP Put Request activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Put Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

### Creating, selecting, or editing an HTTP endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.

- o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint. See [Creating or editing an HTTP endpoint](#).

## Configuring the activity

---

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description
URL (Path after Hostname)	<p>Specifies the resource path that the <b>Put Request</b> activity sends the request to, for example: /mypath. The string you specify in this field must exclude the string: http://, the hostname and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint and the path specified in this field. For example, if the full URL that the <b>Put Request</b> activity sends the request to is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the <b>Put Request</b> activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format, "url/{path}?name1=value1&amp;name2=value2". This allows you to map a string value to the "{path}" parameter and to specify query parameter names: "name1" and "name2" in this example. If you choose to declare multiple "{path}" parameters, it is recommended that each parameter has a unique name. Parameters with the same name are represented by only one node in the map. The path parameters will be displayed under /httpheaders/pathParameters in Map Input. And query parameters will be displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper, or define a default value.</p>
Where Request Message is Of Type	Specifies the message type of the HTTP response - either Text or Binary.
Where Reply Message is Of Type	Specifies the message type of the HTTP reply - either Text or Binary..

Field or Check Box	Description
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> <li>○ <b>Stop Processing the Orchestration Job</b> - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the <b>Put Request</b> activity and the activities after the <b>Put Request</b> activity in the orchestration are not processed and a failed exception is thrown.</li> <li>○ <b>Continue Processing and Return the HTTP Error code</b> - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the <b>Put Request</b> activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessag output parameters, respectively.</li> </ul>
Use Compression/Decompression	<p>Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see <a href="#">Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity</a>.</p>

## Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

## Specifying the response headers

1. Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A Custom Headers table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle, and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you may be prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options to connect to an HTTP Server. The following table defines the retry options for connecting to an HTTP Server:

Field	Description

Retry	Â
1) Wait --- seconds between each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the HTTP server.
2) Try to connect --- times before failing.	Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an <b>HTTP Put Request</b> activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
3) Time out after --- seconds when the Endpoint does not respond to a request.	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the <b>HTTP Put Request</b> activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in <b>HTTP Endpoint</b> tab. For more information about connection timeout, see <a href="#">Creating or Editing a Web Services Endpoint</a> .

## Mapping the input into the activity

- Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is mandatory and at least one variable must be mapped to it. The body input parameter contains the body of the HTTP response message sent back to the HTTP server.
- To view the optional input parameter in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The **httpheaders** and **httpConnParameter** input parameters are displayed.

The following table defines the nodes of the optional **httpheaders** input parameter:

Table 2.

Nodes of the <b>httpheaders</b> Input Parameter	Description
<b>httpheaders/uri</b>	Specifies the resource path, for example: /myPath.
<b>httpheaders/&lt;configured_header_name&gt;</b>	If you configured at least one request header in Request Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
<b>httpheaders/pathParameters</b>	If you configured path parameters in the URL in Configure step, each is displayed here. If no path parameter is specified, this node does not display.
<b>httpheaders/queryParameters</b>	If you configured query parameters in the URL in Configure step, each one of them will be displayed here. If no query parameter is specified, this node does not display.
<b>httpheaders/otherHeaders/headerItem</b>	Specifies an element that contains a set of HTTP header parameters as name/value pairs for the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so this is a Â recurring node.
<b>httpheaders/otherHeaders/headerItem/name</b>	Specifies the name of the HTTP parameter.

Nodes of the httpheaders Input Parameter	Description
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP parameter.

Note: If the Content-Length header is explicitly set using the `httpheaders/otherHeaders/headerItem/name` and `httpheaders/otherHeaders/headerItem/value`, during run time this value is ignored. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional `httpConnParameter` input parameter. You can optionally override the settings you specified in the Pick Endpoint task of the Checklist dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the `httpConnParameter` input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 3.

Nodes of the httpConnParameter Input Parameter	Description	Overrides what settings in the HTTP endpoint?
timeout	Specifies the amount of time in seconds before a timeout occurs.	Â
host	Specifies the host name or IP address of the remote HTTP server.	The host node of the <code>httpConnParameter</code> input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server.	The port node of the <code>httpConnParameter</code> input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The <code>isSecure</code> node of the <code>httpConnParameter</code> input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The <code>username</code> node of the <code>httpConnParameter</code> input parameter overrides the User Name field in the HTTP endpoint.
password	Specifies the password for the account used to connect to the HTTP Server.	The <code>password</code> node of the <code>httpConnParameter</code> input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and the input parameter or parameters. See [Creating a map](#) for general instructions on mapping

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 4.

Output Parameter	Description
httpheaders	Specifies the header of the HTTP request.
body	Specifies the body of the HTTP request message.
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time.
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the optional `httpheaders` output parameter. Â

Table 5.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path of the incoming request, for example: /myPath.

Nodes of the httpheaders Output Parameter	Description
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

## Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

**Parent topic:** [HTTP Activities](#)

---

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http\\_put\\_request\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_put_request_activity.html)

## HTTP Delete Request activity

The HTTP **Delete Request** activity sends a **Delete Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.

### Adding an HTTP Delete Request activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Delete Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

### Creating, selecting, or editing an HTTP endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.

- o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint. See [Creating or editing an HTTP endpoint](#).

## Configuring the activity

---

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description
URL (Path after Hostname)	<p>Specifies the resource path that the <b>Delete Request</b> activity sends the request to, for example: /mypath. The string you specify in this field must exclude the string: http://, the hostname, and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint and the path specified in this field. For example, if the full URL that the <b>Delete Request</b> activity sends the request to is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the <b>Delete Request</b> activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format, "url/{path}?name1=value1&amp;name2=value2". This allows you to map a string value to the "{path}" parameter and to specify query parameter names: <i>name1</i> and <i>name2</i> in this example. If you choose to declare multiple "{path}" parameters, each parameter should have a unique name. Parameters with the same name are represented by only one node in the map. The path parameters are displayed under /httpheaders/pathParameters in Map Input. Query parameters are displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper, or define a default value.</p>
Where Request Message is Of Type	Specifies the message type of the HTTP response - either Text or Binary.
Where Reply Message is Of Type	Specifies the message type of the HTTP reply - either Text or Binary.

Field or Check Box	Description
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> <li>○ <b>Stop Processing the Orchestration Job</b> - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the <b>Delete Request</b> activity and the activities after the <b>Delete Request</b> activity in the orchestration are not processed and a failed exception is thrown.</li> <li>○ <b>Continue Processing and Return the HTTP Error code</b> - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the <b>Post Request</b> activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessage output parameters, respectively.</li> </ul>
Use Compression/Decompression	<p>Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see <a href="#">Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity</a></p>

## Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

## Specifying the response headers

1. Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A Custom Headers table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle, and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options to connect to an HTTP Server. The following table defines the retry options for connecting to an HTTP Server:

Field	Description

Retry	Â
1) Wait --- second s betwee n each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the HTTP server.
2) Try to connect --- times before failing.	Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an <b>HTTP Delete Request</b> activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
3) Time out after --- seconds when the Endpoi nt does not respond to a request.	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the <b>HTTP Delete Request</b> activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in HTTP Endpoint tab. For more information about connection timeouts, see, <a href="#">Creating or Editing a Web Services Endpoint</a> .

## Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is optional. The body input parameter contains the body of the HTTP response message sent back to the HTTP server.
2. To view the optional input parameter in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The **httpheaders** and **httpConnParameter** input parameters are displayed.

The following table defines the nodes of the optional **httpheaders** input parameter:

Table 2.

Nodes of the <b>httpheaders</b> Input Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one request header in Request Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/pathParameters	If you configured path parameters in the URL in Configure step, each is displayed here. If no path parameter is specified, this node does not display.
httpheaders/queryParameters	If you configured query parameters in the URL in Configure step, each one of them will be displayed here. If no query parameter is specified, this node does not display.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs for the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so this is a Â recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP parameter.

Nodes of the httpheaders Input Parameter	Description
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP parameter.

Note: If the Content-Length header is explicitly set using the `httpheaders/otherHeaders/headerItem/name` and `httpheaders/otherHeaders/headerItem/value`, during run time this value is ignored. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional `httpConnParameter` input parameter. You can optionally override the settings you specified in the Pick Endpoint task of the Checklist dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the `httpConnParameter` input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 3.

Nodes of the httpConnParameter Input Parameter	Description	Overrides what settings in the HTTP endpoint?
timeout	Specifies the amount of time in seconds before a timeout occurs.	Â
host	Specifies the host name or IP address of the remote HTTP server.	The host node of the <code>httpConnParameter</code> input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server.	The port node of the <code>httpConnParameter</code> input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The <code>isSecure</code> node of the <code>httpConnParameter</code> input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The <code>username</code> node of the <code>httpConnParameter</code> input parameter overrides the User Name field in the HTTP endpoint.
password	Specifies the password for the account used to connect to the HTTP Server.	The <code>password</code> node of the <code>httpConnParameter</code> input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and the input parameter or parameters. See [Creating a map](#) for general instructions on mapping

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 4.

Output Parameter	Description
httpheaders	Specifies the header of the HTTP request.
body	Specifies the body of the HTTP request message.
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time.
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the optional `httpheaders` output parameter. Â

Table 5.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path of the incoming request, for example: /myPath.

Nodes of the httpheaders Output Parameter	Description
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

## Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

**Parent topic:** [HTTP Activities](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http\\_delete\\_request\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_delete_request_activity.html)

## Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity

During runtime, the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity sends a HTTP request compliant with the HTTP/HTTPS 1.1 protocol to the HTTP Server.

Note: The **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity supports compression/decompression with the gzip or the deflate formats. It does not support the common UNIX file compression format called compress.

The compression/decompression runtime behavior of the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity is dependant on the following conditions:

- If the endpoint supports compression/decompression
- The values of the Content-Encoding and Accept-Encoding headers at the message level
- The setting of the Use Compression/Decompression check box at the activity level

The affect of these conditions on the compression/decompression runtime behavior of the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity are described in the following sections and in the tables provided in the [Runtime Compression/Decompression Behavior](#) section.

## Endpoint support for compression/decompression

The Integration Appliance determines whether or not the HTTP Endpoint supports compression when the Integration Appliance sends the first HTTP request in the compressed format to the HTTP Endpoint (the HTTP Server), if the HTTP Server returns an error code indicating that HTTP Server does not support compression or does not support the specified Content-Encoding type, the Integration Appliance re-sends the first request in uncompressed format and all subsequent requests to this Endpoint are sent in the uncompressed format. In addition, the HTTP response sent by the HTTP Server is not decompressed when received by Integration Appliance.

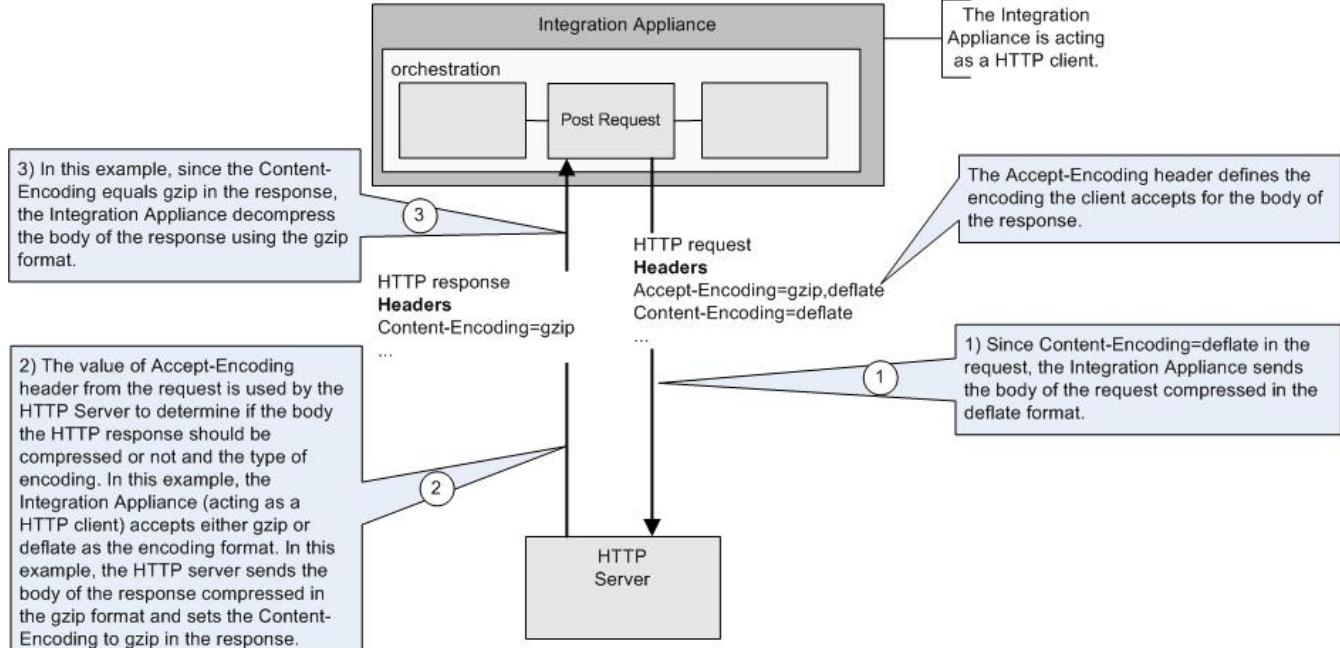

Endpoint support for compression/decompression is represented by the column labeled **Endpoint Supports Compression?** in the tables provided in the [Runtime Compression/Decompression Behavior](#) section.

## Content-Encoding and Accept-Encoding values at the message level

The value of the Content-Encoding header in the HTTP request determines if the body of the request is compressed and the type of encoding that is used. For example, if the Content-Encoding is equal to deflate, the Integration Appliance sends the body of the request compressed in the deflate format as shown in the second row of the first table labeled [Compression Behavior When Sending a Request](#) and in the following figure.

The value of the Accept-Encoding header in the request defines the types of encoding that the HTTP client accepts in the response. For example, if the Accept-Encoding is equal to **gzip,deflate** in the request, the HTTP server can send the body of the response compressed in gzip or deflate formats to the Integration Appliance (acting as a client) as shown in the following figure:

Figure 1.

By default, if nothing is mapped to the optional **httpheaders** input parameter in the **Map Inputs** task of the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity, a set of default headers are created. For example, the URL header is automatically set with the value provided in the Configure pane of the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity.

The values for the Accept-Encoding and Content-Encoding headers for the request can be explicitly set using name/value pairs in the optional **httpheaders** input parameter of the **Map Inputs** task in the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity. For example, to set the Content-Encoding to **deflate**, set the following name/value pair in the optional **httpheaders** input parameter:

- **httpheaders/httpheaders/otherHeaders/headerItem/name** is set to the string: Content-Encoding
- **httpheaders/httpheaders/otherHeaders/headerItem/value** is set to the encoding type, for example the string: deflate.

If unsupported values or no values are set for the Accept-Encoding and Content-Encoding headers of the request, default values are provided as shown in the following tables:

- [Compression behavior when sending a request](#)
- [Accept-Encoding Header value passed to the request](#)

The values of the Accept-Encoding and Content-Encoding headers in the request are used by the Integration Appliance and the HTTP server to determine the compression/decompression behavior.

## Setting compression/decompression at the activity level

By default, compression/decompression is not used for all HTTP activities. You can select compression or decompression at the activity level by using the Use Compression/Decompression check box that is displayed in the **Configure** task of the activity. The column labeled Use Compression/Decompression Check Box in the table shown in [Runtime Compression/Decompression Behavior](#) represents the setting of the Use Compression/Decompression check box.

Note: The Use Compression/Decompression check box will be deprecated in a future release for the HTTP activities. Use the Content-Encoding and Accept-Encoding HTTP Parameters in the HTTP request to specify how to decompresses the body of the HTTP request and compress the body of the HTTP response.

## **Runtime compression/decompression behavior**

---

The table provided in the [Compression behavior when sending a request](#) section describes the compression runtime behavior when the Integration Appliance sends a HTTP request to the HTTP server.

The table provided in the [Accept-Encoding Header value passed to the request](#) section describes the value of the Accept-Encoding header passed in the HTTP request.

The table provided in the [Decompression behavior when receiving a response](#) section describes the decompression runtime behavior when the Integration Appliance receives the HTTP response from the HTTP server.

## **Compression behavior when sending a request**

---

The following table describes the compression runtime behavior when the Integration Appliance sends a HTTP request to the HTTP server.

<b>Use Compression/ Decompression Check Box (Activity Level)</b>	<b>Content-Encoding Value in the HTTP Request (Message Level)</b>	<b>Endpoint Supports Compression?</b>	<b>Integration Appliance Compression Runtime Behavior When Sending a Request</b>
selected	gzip, not set, or any other string except deflate or identity	yes	The Integration Appliance sends the body of the request compressed in the gzip format. The Content-Encoding header is set to <b>gzip</b> in the request.
selected	deflate	yes	The Integration Appliance sends the body of the request compressed in the deflate format. The Content-Encoding header is set to <b>deflate</b> in the request.
selected	identity	yes	The Integration Appliance sends the body of the request uncompressed. The Content-Encoding header is set to <b>identity</b> in the request.
selected	value is not significant	no	The Integration Appliance sends the body of the request uncompressed. The Content-Encoding header is set to <b>identity</b> in the request.
cleared	value is not significant	value is not significant	The Integration Appliance sends the body of the request <b>as is</b> (unchanged). The current value of the Content-Encoding header is passed <b>as is</b> in the request.

Â

## **Accept-Encoding Header value passed to the request**

---

The following table describes the value of the Accept-Encoding header passed in the HTTP request.

<b>Use Compression/ Decompression Check Box (Activity Level)</b>	<b>Initial Accept-Encoding Value</b>	<b>Endpoint Supports Compression?</b>	<b>Accept-Encoding Value Passed in the HTTP Request to the Server</b>
selected	gzip	yes	The Accept-Encoding header is set to <b>gzip</b> in the request.
selected	deflate	yes	The Accept-Encoding header is set to <b>deflate</b> in the request.

<b>Use Compression/ Decompression Check Box (Activity Level)</b>	<b>Initial Accept-Encoding Value</b>	<b>Endpoint Supports Compression?</b>	<b>Accept-Encoding Value Passed in the HTTP Request to the Server</b>
selected	gzip,deflate	yes	The Accept-Encoding header is set to <b>gzip,deflate</b> in the request.
selected	deflate,gzip	yes	The Accept-Encoding header is set to <b>deflate,gzip</b> in the request.
selected	identity	yes	The Accept-Encoding header is set to <b>identity</b> in the request.
selected	not set, or any other string except deflate, gzip, or identity	yes	The Accept-Encoding header is set to <b>gzip,deflate</b> in the request.
selected	value is not significant	no	The current value of the Accept-Encoding header is passed <b>as is</b> in the request.
cleared	value is not significant	value is not significantÂ	The current value of the Accept-Encoding header is passed <b>as is</b> in the request.

## Decompression behavior when receiving a response

The following table describes the decompression runtime behavior when the Integration Appliance receives the HTTP response from the HTTP Server.

<b>Use Compression/ Decompression Check Box (Activity Level)</b>	<b>Content-Encoding Value in the HTTP Response (Message Level)</b>	<b>Endpoint Supports Compression?</b>	<b>Integration Appliance Decompression Runtime Behavior When Receiving a Response</b>
selected	gzip	yes	The Integration Appliance decompresses the body of the response using the gzip format.
selected	deflate	yes	The Integration Appliance decompresses the body of the response using the deflate format.
selected	identity	yes	The Integration Appliance does not decompress the body of the response.
selected	value not listed in the Accept-Encoding header	yes	The Integration Appliance logs an error that the response data was received in an unsolicited content encoding type.
selected	value is not significant	no	The Integration Appliance does not decompress the body of the response. The current value of the Content-Encoding header is passed as is in the response.
cleared	value is not significant	value is not significant	The Integration Appliance does not decompress the body of the response. Â The current value of the Content-Encoding header is passed as is in the response.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/compression\\_decompression\\_with\\_the\\_http\\_invoke\\_get\\_pos\\_head\\_put\\_delete\\_request\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/compression_decompression_with_the_http_invoke_get_pos_head_put_delete_request_activity.html)

## Troubleshooting and support

Troubleshooting techniques and self-help information help you identify and solve problems quickly. Here, you can find potential solutions for issues you would have with the HTTP connector.

## Inconsistent behaviour of query parameters

---

**Problem:** The behavior of the query parameters passed to the HTTP receiver varies with the input. This inconsistency occurs for HTTP Put, Get, Invoke, Header, and Delete outbound activities. For these activities the URL with query parameters can be set at two places:

- Checklist > Configure panel > URL (Path After Hostname)
- Checklist > Map Inputs panel > To Activity section > httpheaders > uri

However, the query parameters set in the steps mentioned above can be replaced or overwritten in the Map Inputs panel > To Activity section > httpheaders > queryParameters. The behavior of the query parameters passed to the HTTP Receiver varies with the input.

**Solution:** Consider the following points when setting values:

- If the value of the URL is mapped and the value of the parameters are empty, then the URL is passed as is to the HTTP Receiver.
- If the value of the URL and the value of the parameter in the map are also assigned, then the HTTP Receiver gets the values. The URL with parameter values are appended to the URL.
- If value of the URL is not mapped, the url is build dynamically using the parameter values in the input map.

### Example:

Configure panel URI: /xyz/test?query2=c&query3=c&query5=c&query6=c

Map Inputs URI: /xyz/test?query4=u&query3=u

Map Inputs Query Parameter: query2=m and query3=m

End URL: /xyz/test?query4=u&query3=m&query2=m&query5=&query6=

## HTTP connector uses ISO-8859-1 as default character encoding value.

---

HTTP connector now uses ISO-8859-1 as default character encoding in place of UTF-8.

You can use any one of the following method to change this character encoding value:

- **Method 1:** To resolve the issue, please follow steps below:

1. Go to the HTTP Send Response activity
2. Add response header "Content-Type"
3. In Map Inputs, To Activity body, right click on the body element and click on "Show Optional Parameters"
4. Expand the (optional)httpheaders, and assign default value below to the "Content-Type" element:

text/plain; charset=UTF-8

- **Method 2:** Introduced new JVM level configuration property. You can change this to the required value. If you set any value in the HTTP activity, that will take highest priority. Next priority is given to the JVM level property (if available). If nothing is set in either place, then default value "ISO-8859-1" is used for content encoding.

- **Studio**

Property name: "ContentEncoding"  
Default value: "ISO-8859-1"

Once the Studio is launched, run jConsole in bin directory of JDK. In New Connection screen, under Local Process, select the process corresponding to the Studio and click Connect. Under MBeans tab, navigate to HttpModule > HTTP Loopback > Attributes > ContentEncoding. Change the default value to the required value.

- **Appliance**

Property name: HTTP\_CHARACTER\_ENCODING  
Default value: ""

Setting this attribute on the appliance will require system shell access to enable/disable jmexport. In system shell, issue the following command to check if any value is set for the property:

```
ihconfutil lookup /var/sysconf sysconf.db HTTP_CHARACTER_ENCODING
```

User will get output like:

```
ContentEncodingv: []
```

Now, try to set the value true to this property.

```
ihconfutil add /var/sysconf sysconf.db HTTP_CHARACTER_ENCODING <new value>
```

Now verify the value set using:

```
ihconfutil lookup /var/sysconf sysconf.db HTTP_CHARACTER_ENCODING
```

This results in

```
ContentEncodingv: [<new value>]
```

The hierarchy in appliance is

1. Jconsole property
2. Config property
3. Default value

If you want to change the value at runtime without restarting appliance you can use jconsole for appliance, but if you want to set the value and make it permanent, then you have to set in config properties. If nothing is set for both properties default (ISO-8859-1) is used.

## Overview of InfoSphere MDM Cast Iron Connector

---

The InfoSphere® MDM Cast Iron® connector enables cloud integration with on-premises InfoSphere MDM.

Use the InfoSphere MDM Cast Iron connector to expose on-premises MDM business service as REST or web service provider services. Exposing the traditional MDM service for consumption in an enterprise SaaS integration enables reading, writing, searching, and processing notifications from your on-premises MDM.

InfoSphere MDM Cast Iron connector supports use of these MDM editions:

- IBM® InfoSphere Master Data Management Standard Edition 11.4.0
- IBM InfoSphere Master Data Management Advanced Edition 11.4.0

MDM Advanced Edition has many categories of web services, such as Party, Product, Custom Addition, Custom Extension, Custom Inquiry, and Party Maintenance. All of these web services are supported in InfoSphere MDM Cast Iron connector. In MDM standard edition, eSOA web services are supported in InfoSphere MDM Cast Iron connector.

The InfoSphere MDM Cast Iron connector supports both JSON and XML payload. The request to MDM can be either in JSON or XML. In the background at run time, the InfoSphere MDM Cast Iron connector makes a web service call to MDM and when the request is sent as a JSON payload, it is internally converted to XML before performing the web service call. The corresponding response is converted back to JSON before sending the response to the downstream activity.

- [Creating or editing an endpoint for MDM Connector activity](#)

The InfoSphere MDM and Cast Iron Connector endpoint provides information that Cast Iron Studio and the Integration Appliance use to connect to the InfoSphere MDM instance. MDM provides various services that can process create, retrieve, update, and delete operations for your on-premises MDM run time.

- [Updating modified MDM model or WSDL](#)

When working with multiple versions of InfoSphere MDM, there is a chance that the MDM model and WSDL will be modified.

- [Starting an MDM service activity](#)

Use these procedures to set your configuration properties and mapping details for an MDM service activity.

- [Troubleshooting and support](#)

Use this information to help identify and correct issues with the InfoSphere MDM and Cast Iron Connector.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MDM\\_overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MDM_overview.html)

## [Creating or editing an endpoint for MDM Connector activity](#)

---

The InfoSphere® MDM and Cast Iron® Connector endpoint provides information that Cast Iron Studio and the Integration Appliance use to connect to the InfoSphere MDM instance. MDM provides various services that can process create, retrieve, update, and delete operations for your on-premises MDM run time.

### About this task

---

Use this procedure to select or edit an InfoSphere MDM Cast Iron endpoint.

### Procedure

---

1. In the Create Endpoint or Edit Endpoint pane, click Browse to open the Project Explorer.
2. In the Project Explorer pane, select one of the following options for your WSDL file.
  - Select an existing WSDL file that is already uploaded into the project.
  - Select a WSDL file from the file system. Click Add and then browse for the WSDL file. Click Add again.
3. In Endpoint Connection Properties, provide values for these InfoSphere MDM run time connection properties.

Field name (Endpoint)	Description
Host Name	Host name of the MDM run time system
Port	Port value of the WC_defaulthost or WC_defaulthost_secure in the MDM run time; based on http or https.
User Name	MDM server user name
Password	MDM server password
Endpoint URL	Endpoint URL of the Soap request. By default this field contains the correct value. In eSOA, you can change the endpoint URL. If you do change the eSOA endpoint URL, make sure that you update this field.

4. Specify the security options.

When client authentication is required, select Client Certificate Alias Name and specify that the Integration Appliance that is acting as a client must provide a certificate to the HTTP Server. If selected, the name of the certificate must be provided. A certificate that is specified at the activity level with this check box takes precedence over a certificate that is specified in Security > Certificates > Settings > Client SSL in the WMC.

Note: This version of InfoSphere MDM connector supports SSL\_TLSv2 protocol version.

5. Provide values for these properties. Click Advanced Properties.

Field name (Advanced Properties)	Description
Connection Pool Options	<p>Specify the maximum number of connections.</p> <p>This value is the maximum number of connections that the Integration Appliance can open in the connection pool. Specifying 0 means that the number of connections is unlimited. By default, the Integration Appliance can have 25 connections open.</p>
Connection Timeout	<p>Specify the amount of time, in seconds, before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. For a web services activity, enter the amount of time that the Integration Appliance attempts to establish a connection to the web service before timing out.</p> <p>A connection timeout is different from an activity timeout. An activity timeout occurs after the connection to the Endpoint is established. An activity timeout specifies the amount of time, in seconds, before a timeout occurs between the activity that starts a request on an Endpoint and the time it takes the Endpoint to respond.</p> <p>Set the activity timeout in Retry task of the web services Invoke Service Activity.</p>
XML Schema Resolver	Determines the number of child levels that Cast Iron Studio allocates and displays for each XML schema (including WSDLs) in the opened project. For the details of each of the properties, see <a href="#">Other Preferences</a> .

## Adding an activity

---

Use this procedure to add an Invoke MDM Service activity in the orchestration.

### Procedure

---

1. Create or open an orchestration to view. A graphical representation of the orchestration displays.
2. Select the Activities tab and expand the InfoSphere MDM folder.
3. Drag the Invoke MDM Service activity onto the orchestration.
4. Select the activity to display the checklist.

## Creating an endpoint

---

Use this procedure to create, select, or edit an InfoSphere® MDM endpoint.

### Procedure

---

1. Click Pick Endpoint task from the checklist and choose from one of the following actions:
  - Select an existing endpoint.
    - a. Select Browse.
    - b. On the Project Explorer, select an existing endpoint and click OK. Continue with [Configuring the activity](#)
  - Select an existing endpoint and edit the endpoint.
    - a. Select Browse.
    - b. On the Project Explorer, select an existing endpoint and click OK.

- c. Click Edit and make your changes in the Edit Endpoint pane.
  - o Create a new endpoint.
    - a. Select New.
    - b. Add information in the Create Endpoint pane.
2. Continue with [Creating or editing an endpoint for MDM Connector activity](#).

**Parent topic:** [Starting an MDM service activity](#)

---

## Configuring the activity

---

Use this procedure to configure the Invoke MDM Service activity.

### Procedure

1. Select the Configure task from the checklist.
2. In the Configure pane, select a single MDM Service to start.
3. Select the Payload Type to specify what the input and output to the MDM service is. Options are XML or JSON String. If JSON string is selected, the Show JSON Schema option is enabled. Click Show JSON Schema to open the JSON Convertor dialog. Input the XML request and convert it to a JSON string.

## Specifying retry options

---

Use this procedure to specify retry options for the Invoke MDM Service activity.

### Procedure

1. Select Retry task from the checklist.
2. On the Retry pane, configure the retry options for connecting to an MDM Service. Retry options are described in this table.

Field	Description
Retry	Specifies the number of times that the Integration Appliance tries to run the service when it fails.
Wait ____ second(s) between each retry	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the MDM Service.
Try to connect ____ times before failing	Specifies the retry count, which is the maximum number of times the Integration Appliance attempts to establish a connection to the MDM Service before recording an error. When the count is reached, processing of the current orchestration job is stopped.

	<p>If you deploy an orchestration that contains an Invoke MDM Service activity and the Integration Appliance cannot connect to the specified MDM Service, the Integration Appliance logs the connection errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, the retry count is set to 3. The first, second, and third connection errors are shown in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>
Time out after ___ seconds when the Endpoint does not respond to a request	<p>Specifies the amount of time (in seconds) before a timeout occurs between the activity making a request on an endpoint and the time it takes the endpoint to respond. For the Invoke MDM Service activity, the timeout is the amount of time that the Integration Appliance waits for a response from the MDM Service after attempting to start the service before the Integration Appliance issues a timeout error.</p> <p>An activity timeout is different from a connection timeout in that an activity timeout occurs after the connection to the endpoint is established. A connection timeout specifies the amount of time, in seconds, before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request.</p> <p>Set the connection timeout in the Web Services Endpoint tab. For more information about connection timeouts, see <a href="#">Creating or editing an endpoint for MDM Connector activity</a>.</p>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MDM\\_specify\\_retryoptions.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MDM_specify_retryoptions.html)

## Mapping activity input

---

Use this procedure to map input to the Invoke MDM Service activity.

### About this task

The body input parameter that is listed in the To Activity pane of Map Input task for the selected operation can be either XML or JSON string based on the selected Payload Type.

Optional parameters are called ibmMDMConnectionProperties in the To Activity pane of the Map Inputs pane. To view the optional input parameters, select Map > Show Optional Parameters from the toolbar menu. You can also right-click in the To Activity pane and select Show Optional Parameters. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, clicking a node in the Map Inputs pane makes this option active.

You can override the setting of the Endpoint Connection Properties in the InfoSphere MDM Endpoint pane by setting the values for ibmMDMConnectionProperties. Typically, this value is overridden when the connection properties are dynamically passed from the upstream activity.

# Troubleshooting and support

---

Use this information to help identify and correct issues with the InfoSphere® MDM and Cast Iron® Connector.

## Studio hangs while working on MDM-AE WSDL

---

### Problem:

While working on the party WSDL (InfoSphere MDM Advanced Edition), Cast Iron Studio hangs when you select the operation.

### Cause:

The MDM WSDL is large and is recursive in nature. Thus, the studio runs out of memory and hangs while attempting to load operations in the WSDL.

### Solution:

Make sure that the XML Schema Resolver properties are set to tuned values while working with the WSDL. Start with reasonably low value and then increase the property value based on project requirements. Typically, values for the XML Schema Resolver properties can be set as follows.

- Number of child node levels allocated in the memory for the schema=6
- Number of recursive node levels=4
- Number of child node levels that are initially expanded when the schema displayed graphically=3
- Number of child node levels allocated in the memory for the substituted types of schema=7

Also, make sure that the studio heap size is set to 1024 MB for 32-bit systems or 2048 MB for 64-bit systems.

## Overview of Insightly connector

---

Insightly is a great tool to help small businesses deal with the vital task of managing leads, contacts, organizations, partners, vendors and suppliers. It has prebuild Integration with Box, Drop Box, One Drive, Google Drive, Intuit QuickBooks and Xero.

Insightly is a cloud based CRM.

Key Features of Insightly are as below:

- Lead Management
- Contact Management
- Calendering and Events
- Linking (Direct Relationships Between Contacts, Organizations, Opportunities, Projects)
- Mass Email and Email Templates

The connector connects with Insightly platform and enables the communication with Insightly from IBM Cast Iron platform and allows getting data into and sending data out. The connector uses the REST APIs provided by Insightly platform, which allows users to interact with the Insightly objects like Contacts, Organisations etc. It enables users to Create, Update, Retrieve and Delete various types of records available in the application system.

You can perform the following activities using the Insightly connector:

- Create Objects
- Retrieve Objects
- Update Objects
- Delete Objects
- Retrieve All Objects

## Creating or editing an endpoint for Insightly activity

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to Insightly platform. Insightly uses Basic API Key based authentication mechanism so as to authorize users to perform operations.

### Selecting or editing an Insightly endpoint

1. In the Create Endpoint or Edit Endpoint pane, configure the Insightly endpoint as described in the following table.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the Insightly successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
Host Name	Host Name for Insightly instance.
API Key	Authentication API Key for accessing Insightly instance.
Following parameters are required in endpoint test connection screen to make connection via Proxy:	
Host Name	Host Name of Proxy Network
Port	Port Number of the Proxy Network.
User Name	Specifies the user name for accessing service via proxy network.
Password	Specifies the password for accessing service via proxy network.

Note: In the Map Input section of each activity, relevant fields of endpoint panel are available to override at runtime. You can provide data to various groups of parameters like Proxy Details, Connection Details or Authentication Details to override. Providing only partial field data in a selected group is not allowed to override.

### Objects Supported by the Insightly Connector

Insightly connector supports the following Insightly objects:

Table 2. Operations supported by the Insightly objects

Insightly Objects	Create	Update	Delete	Retrieve	Retrieve All
Contacts	Yes	Yes	Yes	Yes	Yes
Organisation	Yes	Yes	Yes	Yes	Yes
Events	Yes	Yes	Yes	Yes	Yes
File Categories	Yes	Yes	Yes	Yes	Yes
Opportunities	Yes	Yes	Yes	Yes	Yes
Opportunity Categories	Yes	Yes	Yes	Yes	Yes
Projects	Yes	Yes	Yes	Yes	Yes
Task Categories	Yes	Yes	Yes	Yes	Yes
Tasks	Yes	Yes	Yes	Yes	Yes
Teams	Yes	Yes	Yes	Yes	Yes
Team Members	Yes	Yes	Yes	Yes	Yes
Notes	Yes	Yes	Yes	Yes	Yes
Lead Sources	Yes	Yes	Yes	Yes	Yes
Leads	Yes	Yes	Yes	Yes	Yes
Project Categories	Yes	Yes	Yes	Yes	Yes

<b>Insightly Objects</b>	<b>Create</b>	<b>Update</b>	<b>Delete</b>	<b>Retrieve</b>	<b>Retrieve All</b>
Lead Statuses	Yes	Yes	Yes		Yes
Emails			Yes	Yes	Yes
Countries					Yes
Currencies					Yes
Custom fields				Yes	Yes
Opportunity State Reasons					Yes
Pipelines				Yes	Yes
Pipeline Stages				Yes	Yes
Relationships					Yes
Tags				Yes	
Users				Yes	Yes
Contact Emails					Yes
Contact Notes					Yes
Contact Tasks					Yes
Lead Emails					Yes
Lead Notes					Yes
Lead Tasks					Yes
Opportunity Emails					Yes
Opportunity Notes					Yes
Opportunity Tasks					Yes
Organisation Emails					Yes
Organisation Notes					Yes
Organisation Tasks					Yes
Project Emails					Yes
Project Notes					Yes
Project Tasks					Yes

Note: The latest Insightly API version supported is v2.1.

## Custom Fields support

---

Insightly supports custom fields. Provision is given in the connector to create, update and retrieve objects having custom fields.

For Create and Update activities, in the Map Inputs, each object and its child nodes will have additional nodes for custom fields so that user can provide values for them.

For Retrieve activity, the response object will have additional nodes to identify the custom fields.

The format of custom fields for these activities is as shown below:

```
<customFields>
<customFieldName>secondemailid</customFieldName>
<customFieldValue>test.test@gmail.com</customFieldValue>
</customFields>
```

[Feedback | Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Insightly\\_creating\\_an\\_endpoint\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Insightly_creating_an_endpoint_activity.html)

## Using the Insightly Create Objects Activity

---

Use the Create Objects activity to create objects in Insightly.

### About this task

---

Use this task to create objects in Insightly. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created Insightly endpoint to the orchestration and select Create Objects activity. The Create Objects activity will be added to the orchestration. Select the activity. Insightly Create Objects Checklist is displayed.
3. In the Checklist, click Configure.
4. Click Browse to select the object type. The Browse Insightly window is displayed.
5. In Browse Insightly, you can select the object type from the object type list. Click OK.
6. In the Checklist, click Retry. Review the default settings and make the required changes.  
*Note:* For more information, see [Specifying Retry options for Insightly REST API activities](#).
7. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
8. Create a map between the orchestration variables and the input parameter of the activity.  
*Note:* Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
9. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
10. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the Insightly Create Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences.

**Parent topic:** [Insightly Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Insightly\\_create\\_objects\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Insightly_create_objects_activity.html)

## Using the Insightly Retrieve Objects Activity

---

Use the Retrieve Objects activity to fetch the details of objects from Insightly.

### About this task

---

Use this task to retrieve objects based on ID in the Insightly instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created Insightly endpoint to the orchestration and select Retrieve Objects activity. The Retrieve Objects activity will be added to the orchestration. Select the activity. The Insightly Retrieve Objects Checklist is displayed.
3. In the Checklist, click Configure.
4. Click Browse to select the object type. The Browse Insightly window is displayed.
5. In Browse Insightly, you can select the object type from the object type list. Click OK.
6. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
7. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying Retry options for Insightly REST API activities](#).
8. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
9. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
10. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Insightly Retrieve Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences.

## Using the Insightly Update Objects Activity

---

Use the Update Objects activity to update objects in Insightly.

## About this task

---

Use this task to update objects in the Insightly instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created Insightly endpoint to the orchestration and select Update Objects activity. The Update Objects activity will be added to the orchestration. Select the activity. Insightly Update Objects Checklist is displayed.
3. In the Checklist, click Configure.
4. Click Browse to select the object type. The Browse Insightly window is displayed.
5. In Browse Insightly, you can select the object type from the object type list. Click OK.
6. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Update Objects activity are displayed as nodes under the request input parameter in the To Activity panel.

7. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying Retry options for Insightly REST API activities](#).
8. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
9. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
10. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Insightly Update Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences.

## Using the Insightly Delete Objects Activity

---

Use the Delete Objects activity to delete objects in Insightly.

### About this task

---

Use this task to delete objects in the Insightly instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created Insightly endpoint to the orchestration and select Delete Objects activity. The Delete Objects activity will be added to the orchestration. Select the activity. Insightly Delete Objects Checklist is displayed.
3. In the Checklist, click Configure.
4. Click Browse to select the object type. The Browse Insightly window is displayed.
5. In Browse Insightly, you can select the object type from the object type list. Click OK.
6. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Delete Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
7. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying Retry options for Insightly REST API activities](#).
8. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
9. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
10. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Insightly Delete Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences.

## Using the Insightly Retrieve All Objects Activity

---

Use the Retrieve All Objects activity to fetch the details of objects from Insightly.

### About this task

---

Use this task to retrieve all object details in the Insightly instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created Insightly endpoint to the orchestration and select Retrieve All Objects activity. The Retrieve All Objects activity will be added to the orchestration. Select the activity. The Insightly Retrieve All Objects Checklist is displayed.
3. In the Checklist, click Configure.
4. Click Browse to select the object type. The Browse Insightly window is displayed.
5. In Browse Insightly, you can select the object type from the object type list. Click OK.
6. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve All Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
7. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying Retry options for Insightly REST API activities](#).
8. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
9. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
10. Create a map between the output parameters and orchestration variables.

#### Query Parameter

Below are the query parameters of the Retrieve All objects:

Table 1. Common Query parameters for all the Retrieve All Objects

Field Name	Description
top (n)	To fetch just the top n number of records.
skip (n)	To skip the first n number of records and fetch the rest of records.
filter	To fetch specific record/records based on the parameters: field_name, operator and value.
field_name	The standard field name to be used in the filter should be specified.
operator	The operator to be applied. (For e.g., the valid operators are eq, ne, gt, lt etc.)
value	The value for the field based on which result will be displayed.

Field Name	Description
orderby	The response can be displayed in ascending or descending order by defining field name and order.
field_name	The standard field name to be used to display the fields in order.
order	The order are ASC and DESC.

## Results

---

You have configured the Insightly Retrieve All Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences.

**Parent topic:** [Insightly Activities](#)

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Insightly\\_retrieve\\_all\\_objects\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Insightly_retrieve_all_objects_activity.html)

## Specifying the Retry options for Insightly connector activities

---

Specifying the Retry parameters is one of the tasks to configure an Insightly activity. The Insightly connector automatically retries to connect to Insightly while executing any connector activity for the specified number of times in case it receives 503 Service unavailable or 504 Gateway timeout status code.

### About this task

---

Use this task to configure the Retry options for Insightly API activities.

### Procedure

---

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry options and timeout options for connecting to an Insightly instance, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Insightly instance.
Retry __ times before failing.	Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the Insightly instance before issuing an error and stopping the processing of the current orchestration job. Note: If you deploy an orchestration that contains the Insightly REST API activity and the Integration Appliance cannot connect to the specified Insightly instance, the Integration Appliance logs the connection errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.

Retry Fields	Description
Stop processing rest of the records of the batch if failure detected even after the configured no. of retries.	<p>Specifies that if a batch of records is sent as input to an orchestration, and if failure is detected in between, then the remaining records should be processed or not.</p> <p>For example, if the retry count is set to 3 and a batch of 5 records is sent as input to the orchestration. If, after processing the 1st record of batch, the Integration Appliance cannot connect to the specified Insightly instance even after configured number of retries i.e. 3 retry attempts, then the processing of the remaining 4 records will not be done and execution will be terminated if this option is selected.</p> <p>For the similar settings, if this option is not selected, then the remaining 4 records would be attempted to be processed.</p>

## JDE Activities

---

- [Overview of the JD Edwards \(JDE\) connector](#)
- [Creating or editing an endpoint for a JDE activity](#)

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a JD Edwards EnterpriseOne transaction server (JDE server). Â

- [Importing JDE Libraries](#)  
You must import JDE instance-specific libraries on both Studio and the Integration Appliance before you can configure JDE endpoints, build orchestrations that use the JDE Connector, and deploy projects using the JDE Connector.
- [Installing JAR files to connect to the JDE server](#)  
You must copy the JDE JAR files on the same workstation as your Cast Iron Studio installation before you can connect to a JD Edwards EnterpriseOne transaction server (JDE server).
- [Using the JDE Invoke Business Function activity](#)  
Use the JDE Invoke Business Function activity to call a specific JDE business function. You can map the resulting output from this activity to an orchestration.
- [Using the JDE Poll Real-Time Events activity](#)  
Use the JDE Poll Real-Time Events activity to poll real-time events from JD Edwards EnterpriseOne transaction server. A real-time event is a business transaction that provides information from the JD Edwards EnterpriseOne server that can be used to interoperate with a vendor system. Real-time events can be generated wherever business functions run, such as HTML, WIN32, and enterprise servers. Real-time events are useful for producing notifications in real-time.
- [Specifying Retry and Delivery Options for JDE Activities](#)  
Specifying the Retry and Delivery parameters is one of the tasks to configure a JDE activity configuration.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_JDEactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_JDEactivities.html)

## Overview of the JD Edwards (JDE) connector

---

The JD Edwards (JDE) connector provides the ability for the appliance to interact with the JD Edwards EnterpriseOne server and perform certain business functions, without the need for special coding. The connector works with the JD Edwards EnterpriseOne server by sending requests to it and by monitoring and responding to events that occur in the JD Edwards EnterpriseOne server.

You can complete the following activities using the JDE connector:

- [Invoke Business Function](#)
- [Poll Real-Time Events](#)

The JDE connector supports the following versions of JDE Tools: 8.97, 8.98, and 9.1 (for Invoke Business Function). The connector is compatible with any version of JD Edwards EnterpriseOne that works with the supported versions of EnterpriseOne Tools.

The JDE connector requires JDE library files to connect to the JDE server. For more information, see [Installing JAR files to connect to the JDE server](#) and [Importing JDE Libraries](#).

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JDEnew\\_Overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JDEnew_Overview.html)

## Creating or editing an endpoint for a JDE activity

---

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a JD Edwards EnterpriseOne transaction server (JDE server). Â

1. In the Create Endpoint or Edit Endpoint pane, configure the JDE server as described in the following table. The endpoint pane contains Connection Information, Connection Pool Options and Remote Endpoint Configuration.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the JDE server successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
<b>Connection Information</b>	
Environment	Specifies the JD Edwards EnterpriseOne environment name.
Role	Specifies the name of the role that is associated with the user name used to access the JD Edwards EnterpriseOne environment.
User Name	Specifies the user name to connect to the JDE server.
Password	Specifies the password associated with the user name to connect to the JDE server.
<b>Connection Pool options</b>	
Minimum Connections	Specifies the lowest number of JDE server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
Maximum Connections	Specifies the maximum number of JDE server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
Maximum Idle Time	Specifies the amount of time in minutes that a JDE server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool â€“ no idle time. The default value is 120 minutes.

Field Name	Description
Maximum Wait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
Reclaim Connections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.
Note: The Connection pool properties need to be configured as per the load (number of concurrent requests) on the endpoint.	
<b>Remote Endpoint Configuration</b>	
Endpoint Runs Behind Firewall	Enables the secure connector name property so that secure connector can be used if the JDE server is running behind a firewall.
Secure Connector Name	Specifies the name of the secure connector that is used to connect to the JDE server running behind a firewall. For example, if an orchestration containing JDE activity is deployed on to Cast Iron Live (cloud), then the secure connector needs to be configured.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JDEnew\\_creating\\_an\\_endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JDEnew_creating_an_endpoint.html)

## Importing JDE Libraries

---

You must import JDE instance-specific libraries on both Studio and the Integration Appliance before you can configure JDE endpoints, build orchestrations that use the JDE Connector, and deploy projects using the JDE Connector.

### About this task

---

For information about installing the required library files on the Integration Appliance using the Web Management Console (WMC), see the WMC Online Help

### Procedure

---

To get copies of the required JDE provider modules:

1. Log on to the instance of your JDE system.
2. Import the following JDE files to the workstation where Studio is installed:
  - ApplicationAPIs\_JAR.jar
  - ApplicationLogic\_JAR.jar
  - Base\_JAR.jar
  - BizLogicContainer\_JAR.jar
  - BizLogicContainerClient\_JAR.jar
  - BusinessLogicServices\_JAR.jar
  - castor.jar
  - classes12.zip
  - commons-httpclient-3.0.jar
  - Connector.jar
  - EventProcessor\_EJB.jar
  - EventProcessor\_JAR.jar
  - Generator\_JAR.jar
  - JdbjBase\_JAR.jar
  - JdbjInterfaces\_JAR.jar
  - JdeNet\_JAR.jar
  - jmxremote.jar

- jmxremote\_optional.jar
- jmxri.jar
- log4j.jar
- ManagementAgent\_JAR.jar
- Metadata.jar
- MetadataInterface.jar
- ojdbc14.jar
- PMApi\_JAR.jar
- Spec\_JAR.jar
- System\_JAR.jar
- SystemInterfaces\_JAR.jar
- xalan.jar
- xerces.jar
- xmlparserv2.jar
- jdelog.properties
- tnsnames.ora
- jdbj.ini
- jdeinterop.ini

Note: You also need to add database driver JAR files. These JAR files depend on the JD Edwards Enterprise One server version and the database used. For more information about the required JAR list, contact the Oracle Support team.

3. After retrieving the required files, use the Add Providers dialog box to [install the JDE files](#) into Studio.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JDEnew\\_Importing\\_JDE\\_Libraries.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JDEnew_Importing_JDE_Libraries.html)

## Installing JAR files to connect to the JDE server

---

You must copy the JDE JAR files on the same workstation as your Cast Iron Studio installation before you can connect to a JD Edwards EnterpriseOne transaction server (JDE server).

### Before you begin

---

- The JAR files can be obtained from the JDE system administrator.
- The JAR files must be on the same computer as the studio installation.
- The JAR files must be from the same version as the JDE server you connect to.

For more information about importing the JAR files, see [Importing JDE Libraries](#).

### About this task

---

#### Procedure

---

1. Open studio and select Tools > Install Module Providers.
2. When the Add Provider(s) dialog box is displayed, click the plus (+) button under JDE. A field and a Browse button appears.
3. Click Browse, and use the browse dialog box to locate and select the JAR files.
4. Click Open to import the selected files.
5. When the JAR files are listed in the Add Provider(s) dialog box, click OK.

#### Results

---

A prompt is displayed to restart studio and activate the changes.

#### What to do next

---

You can now create JDE endpoints and orchestrations.

**Parent topic:** [JDE Activities](#)

---

[Feedback](#) | [Notices](#)

## Using the JDE Invoke Business Function activity

---

Use the JDE Invoke Business Function activity to call a specific JDE business function. You can map the resulting output from this activity to an orchestration.

### Before you begin

---

Ensure that you have:

- Imported the JDE library files required to connect to the JDE server. For more information, see [Installing JAR files to connect to the JDE server](#).
- Valid connection details to connect to the JDE server.

### About this task

---

Use this task to call a specific JDE business function from the JDE server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

- In an active orchestration, open the Activities tab and expand the JDE folder.
- Drag the Invoke Business Function activity icon onto the orchestration. The JDE Invoke Business Function Checklist is displayed.
- In the Checklist, click Summary.
- Review the contents of the Activity Name field, and make the required changes.
- In the Checklist, click Pick Endpoint.
- Click Browse and use the Project Explorer dialog box to select the relevant JDE endpoint.
- Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for a JDE activity](#).
- To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
- In the Checklist, click Configure.
- In the JDE Business Function panel, click Browse to browse for business function names.
- In Browse JDE Business Functions dialog, select one or more business functions from the Business Function List, and add it to the Selected Business Functions pane.
- The Business Function Container field gets populated based on the first business function selected and click OK. You can also type the desired business function container name.

The selected business functions are displayed in the Configure panel.

- In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery Options for JDE Activities](#).
- Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Invoke Business Function activity are displayed as nodes under the request input parameter in the To Activity panel.
- Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a

mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the JDE Invoke Business Function activity.

**Parent topic:** [JDE Activities](#)

---

## Using the JDE Poll Real-Time Events activity

---

Use the JDE Poll Real-Time Events activity to poll real-time events from JD Edwards EnterpriseOne transaction server. A real-time event is a business transaction that provides information from the JD Edwards EnterpriseOne server that can be used to interoperate with a vendor system. Real-time events can be generated wherever business functions run, such as HTML, WIN32, and enterprise servers. Real-time events are useful for producing notifications in real-time.

### Before you begin

---

Ensure that you have:

- Imported the JDE library files required to connect to the JDE server. For more information, see [Installing JAR files to connect to the JDE server](#).
- Valid connection details to connect to the JDE server.

### About this task

---

Use this task to poll real-time events from JD Edwards EnterpriseOne transaction server.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the JDE folder.
2. Drag the Poll Real-Time Events activity icon onto the orchestration. The JDE Poll Real-Time Events Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant JDE endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for a JDE activity](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. In the JDE Real-Time Events panel, click Browse to browse for real-time events. The Browse JDE Real-Time Events dialog is displayed.
11. In Browse JDE Real-Time Events dialog, select a real-time event from the list and click OK. The selected real-time event is displayed in the Configure panel.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery Options for JDE Activities](#).
13. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.

14. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the JDE Poll Real-Time Events activity.

**Parent topic:** [JDE Activities](#)

## Specifying Retry and Delivery Options for JDE Activities

---

Specifying the Retry and Delivery parameters is one of the tasks to configure a JDE activity configuration.

### About this task

---

This section contains the procedure for configuring the retry options for JDE outbound and inbound activities.

### Procedure

---

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry options for connecting to a JD Edwards EnterpriseOne transaction server as described in the following table.

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry .	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the JD Edwards EnterpriseOne transaction server.
Try to connect __ times before failing.	Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the JDE server before issuing an error and stopping the processing of the current orchestration job. Note: If you deploy an orchestration that contains the inbound or outbound JDE activity and the Integration Appliance cannot connect to the specified JDE server, the Integration Appliance logs the connection errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.

**Parent topic:** [JDE Activities](#)

## Specifying the delivery rules options for JDE inbound activities

---

### About this task

This section contains the procedure for configuring the delivery rule options for JDE inbound activities.

## Procedure

1. Select the Delivery Rules task from the Checklist. The delivery rules pane is displayed.
2. Configure the delivery rules options to select the activity's behavior as described in the following table.

Table 2. Delivery rules

Delivery Rules Fields	Description
Poll for changes every _____ days/hours/minutes/seconds	Specifies the time interval to poll for real-time events in the JD Edwards EnterpriseOne transaction server. Time can be selected in the format days, hours, minutes, or seconds.
Fetch _____ rows per poll	Specifies how many real-time events the activity should retrieve from the JD Edwards EnterpriseOne transaction server in each poll cycle.
Delivery Messages	
ATMOST_ONCE	A non-persistent mode in which a JDE real-time event is either delivered once or not delivered at all.
Wait time on JDE transaction server_____seconds	Specifies the time interval that the connector waits to get an event from the JD Edwards EnterpriseOne transaction server.

---

## JIRA Activities

---

- [Overview of JIRA connector](#)

- [Creating or editing an endpoint for JIRA activity](#)

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to JIRA platform. JIRA connector supports only Basic authentication mechanism so as to authorize users to perform operations. JIRA connector also supports HTTPS connection.

- [Using the JIRA Create Objects Activity](#)

Use the Create Objects activity to create an Attachment, Filter, Issue, IssueComment, IssueLink, IssueLinkType, IssueWorkLog, IssueVote, Version, ProjectRole and Watchers in JIRA.

- [Using the JIRA Retrieve Objects Activity](#)

Use the Retrieve Objects activity to fetch the details of an Attachment, Component, Filter, IssueLink, IssueLinkType, IssueType, Issue, IssueComment, IssueWorkLog, Version, ProjectRole, Group, Priority, Project, Resolution, User and Status from JIRA. Retrieve activity for Issue will retrieve custom fields data.

- [Using the JIRA Retrieve All Objects Activity](#)

Use the Retrieve All Objects activity to fetch the details of IssueComments, IssueLinkTypes, IssueTypes, IssueVotes, IssueWorkLogs, Priorities, Resolutions, Watchers and Statuses from JIRA.

- [Using the JIRA Update Objects Activity](#)

Use the Update Objects activity to update Filter, Issue, IssueComment, IssueLinkType, IssueWorkLog and Version in JIRA.

- [Using the JIRA Delete Objects Activity](#)

Use the Delete Objects activity to delete an Attachment, Component, Filter, Issue, IssueComment, IssueLink, IssueLinkType, IssueWorkLog, Version, Votes and Watchers in JIRA.

- [Using the JIRA Search Objects Activity](#)

Use the Search Objects activity to fetch the records which matches search string for Issue, User, UsersOverMultiProject, AssignableUser and UsersWithPermissions from JIRA. Search activity for Issue will get custom fields data.

- [Specifying the Retry options for JIRA REST API activities](#)

Specifying the Retry parameters is one of the tasks to configure a JIRA activity. The JIRA REST API connector uses a single login session for all connections to an JIRA REST API endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector

assumes the typical connector retry behavior after the initial attempt to reacquire a session fails. The retriable exceptions include 503 and 504 error codes.

---

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_JIRActivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_JIRActivities.html)

## Overview of JIRA connector

---

JIRA is a proprietary issue tracking product, developed by Atlassian, commonly used for bug tracking, issue tracking, and project management functions. JIRA is the tracker for teams planning and building great products. JIRA captures and organizes issue, assign work and follow team activity. Customizable reporting allows monitoring the progress of issues with detailed graphs and charts.

JIRA support both on premise and cloud environments.

JIRA connector interacts with restful Web Service API's, which allow you to access bi-directional data-level integration.

You can perform the following activities using the JIRA connector:

- Outbound activities:
  - Create Objects
  - Retrieve Objects
  - Update Objects
  - Delete Objects
  - Retrieve All Objects
  - Search Objects

The JIRA version currently supported by this connector is 6.4.7 (on premise)

**Parent topic:** [JIRA Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JIRA\\_Overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JIRA_Overview.html)

## Creating or editing an endpoint for JIRA activity

---

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to JIRA platform. JIRA connector supports only Basic authentication mechanism so as to authorize users to perform operations. JIRA connector also supports HTTPS connection.

### Selecting or editing an JIRA endpoint

---

1. In the Create Endpoint or Edit Endpoint pane, configure the JIRA endpoint as described in the following table.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the JIRA successfully.
3. Click OK.

Table 1. Connection properties

<b>Field Name</b>	<b>Description</b>
Host Name	Host Name for JIRA instance (on-premise or cloud).
Port Number	Port for JIRA instance
User Name	Authentication user name for accessing JIRA instance.
Password	Authentication password for accessing JIRA instance.
Following parameters are required in endpoint test connection screen to make connection via Proxy:	
Host Name	Host Name of Proxy Network
Port	Port Number of the Proxy Network.
User Name	User Name for accessing service via proxy network.
Password	Password for accessing service via proxy network.
Following parameters are required in endpoint test connection screen to make HTTPS connection:	
HTTPS	Checkbox to indicate weather HTTPS to be used

In addition with the above parameters, there is also a provision for Secure Connector configuration to connect the Endpoint with JIRA on-premise instance.

Note: In the Map Input section of each activity, relevant fields of endpoint panel are available to override at runtime. You can provide data to various groups of parameters like Proxy Details, Connection Details or Authentication Details to override. Providing only partial field data in a selected group is not allowed to override.

## Objects Supported by the JIRA Connector

---

JIRA connector supports the JIRA objects as detailed in the table below:

Table 2. Operations supported by the JIRA objects

<b>JIRA Objects</b>	<b>Create</b>	<b>Update</b>	<b>Delete</b>	<b>Retrieve All</b>	<b>Retrieve</b>	<b>Search</b>
Attachment	Yes		Yes		Yes	
Component			Yes		Yes	
Filter	Yes	Yes	Yes		Yes	
Issue	Yes	Yes	Yes		Yes	Yes
IssueComment	Yes	Yes	Yes	Yes	Yes	
IssueLink	Yes		Yes		Yes	
IssueLinkType	Yes	Yes	Yes	Yes	Yes	
IssueWorkLog	Yes	Yes	Yes	Yes	Yes	
IssueVote	Yes			Yes		
Version	Yes	Yes	Yes		Yes	
ProjectRole	Yes				Yes	
Votes			Yes			
Watchers	Yes		Yes	Yes		
Group					Yes	
IssueType				Yes	Yes	
Priority				Yes	Yes	
Project					Yes	
Resolution				Yes	Yes	
Status				Yes	Yes	
User					Yes	Yes
UserOverMultiProject						Yes
AssignableUser						Yes

JIRA Objects	Create	Update	Delete	Retrieve All	Retrieve	Search
UsersWithPermissions						Yes

## Custom Objects support

---

JIRA does not support custom objects.

## Custom Fields support

---

The JIRA UI allows user to add custom fields. These fields are associated only with JIRA "Issue" object. Support for custom fields is provided in the connector activities - Create, Update, Search and Retrieve for the Issue object.

In the MapInputs for Create and Update activities, the Issue object will have additional nodes for custom fields so that user can provide values for them.

For Search and Retrieve activities, the MapOutputs will have additional nodes to identify the custom fields.

The format of custom fields for these activities is as shown below:

```
<customFields>
<customFieldId>dept-id</customFieldId>
  <customFieldName>deptName</customFieldName>
<customFieldType>FreeTextField</customFieldType>
  <customFieldValue>HR</customFieldValue>
</customField>
```

Table 3. Operations supported by the JIRA objects

Custom field parameter	Description
customFieldId	The ID of the custom field created in JIRA UI. Between the custom field Name and ID, the precedence is given to "customFieldId". If there are multiple custom fields with same name, the customFieldId should be provided to differentiate the fields, else appropriate error gets displayed.
customFieldName	The name of the custom field which is provided in JIRA UI while creating it.
customFieldType	<p>The type of custom field, displayed only for Create/Update activities. Allowed values are:</p> <ul style="list-style-type: none"> <li>• DatepickerField</li> <li>• DateTimeField</li> <li>• FreeTextField</li> <li>• Checkboxes</li> <li>• Labels</li> <li>• MultiSelect</li> <li>• RadioButtons</li> <li>• SelectList</li> <li>• TextField</li> <li>• URLField</li> <li>• UserPicker</li> <li>• GroupPicker</li> <li>• MultiGroupPicker</li> <li>• MultiUserPicker</li> <li>• ProjectPicker</li> <li>• SingleVersionPicker</li> <li>• VersionPicker</li> </ul> <p>The type of JIRA custom field types not yet supported are:</p> <ul style="list-style-type: none"> <li>• CascadingSelectField</li> <li>• NumberField</li> </ul>
customFieldValue	The value of the custom field. This parameter is recurring to support multiple user input values. If multiple values are provided for a single input field, only the first value gets added.

Note:

1. The custom field is optional.
2. If the value is not provided for customFieldName/customFieldId, the other 2 parameter values will be ignored and issue will get created/updated successfully without modification in any custom field.
3. If customFieldName, customFieldId and customFieldType is provided, an appropriate error message gets displayed for the missing value for customFieldValue.

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JIRA\\_creating\\_an\\_endpoint\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JIRA_creating_an_endpoint_activity.html)

## Using the JIRA Create Objects Activity

---

Use the Create Objects activity to create an Attachment, Filter, Issue, IssueComment, IssueLink, IssueLinkType, IssueWorkLog, IssueVote, Version, ProjectRole and Watchers in JIRA.

### About this task

---

Use this task to create objects in the JIRA. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the JIRA folder contents.
2. Drag the Create Objects activity icon onto the orchestration. Select the activity. The JIRA Create Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant JIRA endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse JIRA window is displayed.
11. In Browse JIRA, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for JIRA REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the JIRA Create Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Object Name (For example: Attachment) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

JIRA also supports custom field value creation. Please refer section about [Custom Fields support](#) for more information.

## Using the JIRA Retrieve Objects Activity

---

Use the Retrieve Objects activity to fetch the details of an Attachment, Component, Filter, IssueLink, IssueLinkType, IssueType, Issue, IssueComment, IssueWorkLog, Version, ProjectRole, Group, Priority, Project, Resolution, User and Status from JIRA. Retrieve activity for Issue will retrieve custom fields data.

### About this task

---

Use this task to retrieve objects based on ID in the JIRA instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the JIRA folder contents.
2. Drag the Retrieve Objects activity icon onto the orchestration. Select the activity. The JIRA Retrieve Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant JIRA endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse JIRA window is displayed.
11. In Browse JIRA, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for JIRA REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the JIRA Retrieve Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Object Name (For example: Attachment) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

**Parent topic:** [JIRA Activities](#)

## Using the JIRA Retrieve All Objects Activity

---

Use the Retrieve All Objects activity to fetch the details of IssueComments, IssueLinkTypes, IssueTypes, IssueVotes, IssueWorkLogs, Priorities, Resolutions, Watchers and Statuses from JIRA.

### About this task

---

Use this task to retrieve all object details in the JIRA instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the JIRA folder contents.
2. Drag the Retrieve All Objects activity icon onto the orchestration. Select the activity. The JIRA Retrieve All Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant JIRA endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse JIRA window is displayed.
11. In Browse JIRA, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for JIRA REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the JIRA Retrieve All Objects activity.

**Parent topic:** [JIRA Activities](#)

---

[Feedback](#) | [Notices](#)

## Using the JIRA Update Objects Activity

---

Use the Update Objects activity to update Filter, Issue, IssueComment, IssueLinkType, IssueWorkLog and Version in JIRA.

### About this task

---

Use this task to update objects in the JIRA instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the JIRA folder contents.
2. Drag the Update Objects activity icon onto the orchestration. Select the activity. The JIRA Update Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant JIRA endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse JIRA window is displayed.
11. In Browse JIRA, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.  
*Note:* For more information, see [Specifying the Retry options for JIRA REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
*Note:* Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the JIRA Update Objects activity.

*Note:*

You can add more than one object as input to this activity. To add more than one object as input, right click the Object Name (For example: Filter) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

JIRA also supports updating custom field value. Please refer section about [Custom Fields support](#) for more information.

## Using the JIRA Delete Objects Activity

---

Use the Delete Objects activity to delete an Attachment, Component, Filter, Issue, IssueComment, IssueLink, IssueLinkType, IssueWorkLog, Version, Votes and Watchers in JIRA.

### About this task

---

Use this task to Delete objects in the JIRA instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the JIRA folder contents.
2. Drag the Delete Objects activity icon onto the orchestration. Select the activity. The JIRA Delete Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant JIRA endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse JIRA window is displayed.
11. In Browse JIRA, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for JIRA REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the JIRA Delete Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Object Name (For example: Filter) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

**Parent topic:** [JIRA Activities](#)

## Using the JIRA Search Objects Activity

---

Use the Search Objects activity to fetch the records which matches search string for Issue, User, UsersOverMultiProject, AssignableUser and UsersWithPermissions from JIRA. Search activity for Issue will get custom fields data.

## About this task

---

Use this task to Search objects in the JIRA instance by setting query parameters. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the JIRA folder contents.
2. Drag the Search Objects activity icon onto the orchestration. Select the activity. The JIRA Search Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant JIRA endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse JIRA window is displayed.
11. In Browse JIRA, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for JIRA REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables. **Query Parameter**

Below are the query parameters of the Search objects:

Table 1. Common Query parameters for all the Search Objects

Field Name	Description
startAt	The index of the first record to return (0-based)
maxResults	The maximum number of users to return (defaults to 50). The maximum allowed value is 1000. If you specify a value that is higher than this number, your search results will be truncated.

Table 2. Query parameters for Issue Objects

Field Name	Description
validateQuery	This parameter is used to validate the JQL query
responseFields	The list of fields to return for each issue. By default, all navigable fields are returned.
criteria	field, operator, value and logicalOperator is defined in criteria. Multiple criteria can be specified by expanding occurrences for the criteria node.
field	The standard field name to be used in the criteria should be specified.
operator	The operator to be applied. (For Ex: The valid operators are =, !=, <, >, <=, >=, ~, !~, IN, NOT IN, IS and IS NOT)
value	The value of the field used in the search
logicalOperator	The logical operator to be applied (For Ex: Valid logical operators are AND, OR, NOT and ORDER BY)
orderBy	field and order is defined in orderBy. Multiple orderby can be specified by expanding occurrences for the orderBy node

Field Name	Description
field	The standard field name to be used to display the fields in order
order	The order are ASC and DESC

Table 3. Common Query parameters for User Objects

Field Name	Description
includeActive	The parameter is used to include the active users
includeInactive	The parameter is used to include the inactive users

Table 4. Common Query parameters for UserWithPermission Objects

Field Name	Description
permissions	comma separated list of permissions for project or issue returned users must have

Note: Enumeration is not supported by connector so user has to enter the data in query parameters.

## Results

---

You have configured the JIRA Search Objects activity.

## Specifying the Retry options for JIRA REST API activities

---

Specifying the Retry parameters is one of the tasks to configure a JIRA activity. The JIRA REST API connector uses a single login session for all connections to an JIRA REST API endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails. The retriable exceptions include 503 and 504 error codes.

### About this task

---

This section contains the procedure for configuring the Retry options for JIRA REST API activities.

### Procedure

---

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry and timeout options for connecting to an JIRA instance, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the JIRA instance.

Retry Fields	Description
Retry __ times before failing.	<p>Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the JIRA instance before issuing an error and stopping the processing of the current orchestration job.</p> <p>Note: If you deploy an orchestration that contains the JIRA REST API activity and the Integration Appliance cannot connect to the specified JIRA instance, the Integration Appliance logs the connection errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>
Stop processing rest of the records of the batch if failure detected even after the configured no. of retries.	<p>Specifies that if a batch of records is sent as input to an orchestration, and if failure is detected in between, then the remaining records should be processed or not.</p> <p>For example, if the retry count is set to 3 and a batch of 5 records is sent as input to the orchestration. If, after processing the 1st record of batch, the Integration Appliance cannot connect to the specified JIRA instance even after configured number of retries i.e. 3 retry attempts, then the processing of the remaining 4 records will not be done and execution will be terminated if this option is selected.</p> <p>For the similar settings, if this option is not selected, then the remaining 4 records would be attempted to be processed.</p>

## JMS Activities

---

- [Creating or editing a JMS endpoint](#)

JMS endpoints provide information that Studio and the Integration Appliance use to connect to a JMS instance.

- [Specifying delivery rules and retry parameters for JMS activities](#)

The JMS Connector uses a single login session for all connections to a JMS endpoint. If a session expires, the connector automatically establishes a new session. The JMS Connector does not count the initial attempt to reacquiring the session as a retry attempt. The JMS Connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

- [Get Message activity](#)

You can use the Get Message activity to get a message from the queue. If there is no message present the activity can time out.

- [Poll Message activity](#)

The Poll Message activity is a starter activity that polls the configured queue for the message. This activity supports the ATLEAST ONCE and EXACTLY ONCE delivery semantics. The Poll Message Activity supports batching, if the batching option is selected.

- [Publish Message activity](#)

The Publish Message activity is an executable activity that allows you to publish data on the configured topic. This activity supports the ATLEAST ONCE and ATMOST ONCE delivery semantics.

- [Send Message activity](#)

The Send Message activity is an executable activity that sends message to the configured queue. The Send Message activity supports the AT LEAST and AT MOST ONCE delivery semantics. Request-reply use cases can use the Poll Message and Send Message activity; there is no separate activity for reply.

- [Subscribe Message activity](#)

The Subscribe Message activity is a starter activity that allows you to subscribe to a JMS topic. This activity supports the ATLEAST ONCE and EXACTLY ONCE delivery semantics.

- [Creating a JMS endpoint to a WebLogic server](#)

You can define a JMS endpoint to an existing WebLogic server, by completing the following steps in IBM Cast Iron Studio.

## Creating or editing a JMS endpoint

---

JMS endpoints provide information that Studio and the Integration Appliance use to connect to a JMS instance.

### About this task

---

Any changes you make to the endpoint, including configuration properties, affects all orchestrations that use that endpoint as the edits are global, not local.

### Procedure

---

1. Drag an activity from the JMS folder of the Activities tab onto the orchestration.
2. The Summary panel is displayed along with a Checklist, which outlines what you must do to configure the activity.
3. Click Pick Endpoint from the Checklist. The Pick Endpoint panel opens.
4. Click one of the following options:
  - Browse - To select an existing endpoint from the Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel. To edit the endpoint properties, click Edit.
  - New - To create a new endpoint. The Create Endpoint window opens.
  - Edit - To edit the existing endpoint. The Edit Endpoint window opens.  
Note: Editing an endpoint affects all orchestrations that use that endpoint in the project as the edits are global, not local.
5. In the Create Endpoint window, specify connection parameters or select a configuration property by clicking the icon to the right of the fields. Required fields are denoted by the following icon 

Connection Parameter Fields	Description
JNDI Initial Factory	Specifies the context factory class Studio retrieves from JNDI. Studio uses the class to lookup JMS connection factory and JMS destinations (Queue or Topic).
Provider URL	Specifies the URL of the JMS server.
Provider Package	An optional parameter, where you can specify a provider package name.
Factory Name	Use your own connection factory or use one of the default factories that comes preconfigured with the endpoint system: JBOSS, ActiveMQ, or WebLogic.

- Specify Provider login information, which includes user name and password.
- Specify Connection Pool Options.

Connection Pool Options	Description
Minimum Connections	Specifies the minimum number of connections that Studio uses to connect to a JMS instance. By default, there is a minimum of 1 connection.
Maximum Connections	Specifies the maximum number of connections that Studio uses to connect to a JMS instance. By default, there is a maximum of 25 connections.
Maximum Idle Time	By default, maximum idle time is 120 minutes.
Maximum Wait	By default, maximum wait time is 300 seconds.

6. Specify properties for the JNDI Provider, so you can set implementation specific JDNI initial context properties for tasks such as authentication.
  - a. Click  to add a field in the JNDI Provider table. A new row is displayed in the table.
  - b. Enter a property name and value.
7. Specify properties for the Connection Factory, so you can set implementation specific connection properties.
  - a. Click  to add a field in the Connection Factory table. A new row is displayed in the table.
  - b. Enter a property name and value.
8. Click Test Connection to confirm that the parameters you specified so that the project can access a JMS instance.  
Note: When you configure an endpoint using configuration properties, verify that the configuration properties have valid values. If the configuration property value is invalid or does not exist, the connection test fails.

## Specifying delivery rules parameters for JMS activities

---

Specifying the Delivery Rules parameters is one of the tasks you must complete to configure a JMS activity.

### About this task

---

For more information about the configuration tasks in the Checklist, see the help topic for the specific JMS activity.

### Procedure

---

1. In the Checklist, select Delivery Rules. The Delivery Rules panel opens.
2. For the Poll Message activity only, specify the polling interval. By default, the activity polls for changes every second.
3. Select Batch objects to process the job as a batch.
4. Select one of the following delivery options.

Note: The delivery options available depend on the JMS activity. Not all delivery options are available for every JMS activity.

Delivery Option	Description
ATLEAST_ONCE	A persistent mode, in which the JMS Provider insures that a message is not lost. As a result, there are chances that the client can receive multiple copies of a single message.Â
ALMOST_ONCE	In this non-persistent mode, a message may be lost, but JMS does not deliver multiple copies of a message.Â
EXACTLY_ONCE	In this persistent mode, JMS delivers a message once and only once.

**Parent topic:** [Specifying delivery rules and retry parameters for JMS activities](#)

## Specifying retry parameters for JMS activities

Specifying the Retry parameters is one of the tasks you must complete to configure a JMS activity.

### About this task

For more information about the configuration tasks in the Checklist, see the help topic for the specific JMS activity.

### Procedure

1. In the Checklist, select Retry. The Retry panel opens.
2. Configure the retry options for connecting to a JMS instance. The following table describes the retry options for connecting to a JMS instance:

Retry Fields	Description
Wait __ second(s) between each retry.	The number of seconds that the Integration Appliance waits before trying to establish a connection to the JMS instance. By default, this parameter is set to 30 seconds
Try to connect __ times before failing.	Specifies the retry count, the maximum number of times that the Integration Appliance attempts to establish a connection to the JMS instance before issuing an error and stopping the processing of the current orchestration job. By default this parameter is set to 5 attempts.Â

3. For the Get Message activity, specify a value for the Activity Timeout parameter.

**Parent topic:** [Specifying delivery rules and retry parameters for JMS activities](#)

## Get Message activity

---

You can use the Get Message activity to get a message from the queue. If there is no message present the activity can time out.

### About this task

---

The Get Message Activity supports batching, if the batching option is selected. When the batching option is selected, if there is more than one message in the queue, the activity processes all the messages at once, instead of processing them one at a time.

Important: This orchestration must already have a JMS endpoint representing the data source. Otherwise, input and output mapping is disabled.

- [Adding a JMS activity to an orchestration](#)
- [Changing the Activity Name](#)
- [Picking a JMS endpoint](#)
- [Configuring the Get Message activity](#)
- [Mapping the Inputs](#)

Inputs represent data that is transmitted from the orchestration (variables) to the JMS endpoint (parameters).

- [Mapping the Outputs](#)

Outputs represent data that is transmitted from the JMS activity (parameters) to the orchestration (variables).

**Parent topic:** [JMS Activities](#)

## Adding a JMS activity to an orchestration

---

### Procedure

---

1. In an active project, open the Activities tab and expand the JMS folder contents.
2. Drag the Get Message activity icon to the orchestration.
3. When the activity is displayed, the Get Message Checklist is displayed underneath.

**Parent topic:** [Get Message activity](#)

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS\\_Get\\_Changing\\_Activity\\_Name.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS_Get_Changing_Activity_Name.html)

## Picking a JMS endpoint

---

### Procedure

---

1. In the Checklist, click Pick Endpoint.
2. Click Browse and use the Project Explorer dialog box to select the relevant JMS endpoint.  
**Tip:** You can create the needed endpoint at this time by clicking New.
3. When you click OK, the endpoint-specific configuration options are displayed in a read-only state.  
**Note:** If changes are required to the selected endpoint configuration, click Edit to activate the options. Any changes you make globally affects all uses of the endpoint in active orchestrations.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS\\_Get\\_Picking\\_JMS\\_Endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS_Get_Picking_JMS_Endpoint.html)

## Configuring the Get Message activity

---

### Procedure

---

1. In the Checklist, click Configure.
2. In the Queue field, specify the provider-specific name of the queue to be polled.
3. Open the Message Data menu and choose the format the message takes, whether Bytes or Text.
4. In the Message Selector field, enter the text of a message header.

Using the JMS message selector a client can specify, by submitting the text of a message header, those messages it is interested in. Only messages whose headers and properties match the selector are delivered. Message selectors cannot reference message body values. The message selector string must follow JMS selector syntax.

5. In the Checklist, click Delivery Rules.
6. Click the Batch Objects checkbox to activate the option, which enables the activity to batch-process multiple messages.
7. Open the Deliver menu and choose either option: ATLEAST\_ONCE or ATMOST\_ONCE
8. In the Checklist, click Retry.
9. Review the default settings and make any needed changes.

For more information, see [Specifying retry parameters for JMS activities](#)

**Parent topic:** [Get Message activity](#)

## Mapping the Inputs

---

Inputs represent data that is transmitted from the orchestration (variables) to the JMS endpoint (parameters).

### Before you begin

---

If required, you can create a custom mapping variable in Source or Destination column by following the steps in [Creating variables](#).

### Procedure

---

1. In the Checklist, click Map Inputs. A set of options is displayed, and the To Activity list shows the JMS variables.
2. Click Select Inputs.

The Select Inputs dialog box lists all the variables.

3. Choose a variable, then click OK.
4. To link the activities, click and drag a variable from the From Orchestration list onto a parameter listed in the To Activity list.

If the link is viable, a line is displayed, linking the two.

5. Repeat this procedure to link other orchestration variables to JMS parameters.
6. To test the input links, click the Test button.

The Input Test Files table lists all linked variables/parameters.

7. In the Location column, click the small blue button.
8. Use the Browse dialog box to select an input test file.
9. Click Run Test. Test results are displayed in the columns underneath.

Tip: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#).

**Parent topic:** [Get Message activity](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS\\_Get\\_Mapping\\_Inputs.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS_Get_Mapping_Inputs.html)

## Mapping the Outputs

---

Outputs represent data that is transmitted from the JMS activity (parameters) to the orchestration (variables).

### Before you begin

---

If required, you can create a custom mapping variable in the Source or Destination column by following the steps in [Creating variables](#).

### Procedure

---

1. In the Checklist, click Map Outputs.
2. Review the parameters listed in the From Activity list.
3. If you want to create new orchestration variables that match the output parameters of the current activity, select a parameter and then click Copy.
4. In the Copy Parameters dialog box, choose one or more parameters, then click OK to add them to the To Orchestration list. The data type, schema, or schema fragment of the selected output parameter is applied to the new variable.
5. Click Select Inputs.

The Select Inputs dialog box lists all the variables associated with the other endpoint.

6. Choose one or more variables, then click OK to add them to this list.
7. Drag a parameter from the From Activity list onto a variable listed in the To Orchestration list.

If the link is viable, a line is displayed, linking the two.

8. Repeat this procedure to link other parameters and variables.
9. To test the output links, click the Test button. A variable is listed in an Input Test Files table.
10. In the Location column, click the small blue button.
11. Use the Browse dialog box to select an input test file.
12. Click Run Test. Test results are displayed in the columns underneath.

Tip: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#).

## Poll Message activity

---

The Poll Message activity is a starter activity that polls the configured queue for the message. This activity supports the ATLEAST ONCE and EXACTLY ONCE delivery semantics. The Poll Message Activity supports batching, if the batching option is selected.

### About this task

---

The EXACTLY ONCE delivery semantic is handled through the message acknowledgement. Since the JMS provider must never deliver a copy of an acknowledged message, the Poll Message activity leverages the provider for the EXACTLY\_ONCE delivery semantic. When the batching option is selected, if there is more than one message in the queue, the activity processes all the messages at once, instead of processing them one at a time.

Important: This orchestration must have a JMS endpoint representing the data source, otherwise, output mapping is disabled.

## Mapping the Inputs

---

Inputs represent data that is transmitted from the orchestration (variables) to the JMS endpoint (parameters).

### Before you begin

---

If required, you can create a custom mapping variable in Source or Destination column by following the steps in [Creating variables](#).

### Procedure

---

1. In the Checklist, click Map Inputs. A set of options is displayed, and the To Activity list shows the JMS variables.
2. Click Select Inputs.

The Select Inputs dialog box lists all the variables.

3. Choose a variable, then click OK.
4. To link the activities, click and drag a variable from the From Orchestration list onto a parameter listed in the To Activity list.  
If the link is viable, a line is displayed, linking the two.
5. Repeat this procedure to link other orchestration variables to JMS parameters.
6. To test the input links, click the Test button.

The Input Test Files table lists all linked variables/parameters.

7. In the Location column, click the small blue button.
8. Use the Browse dialog box to select an input test file.
9. Click Run Test. Test results are displayed in the columns underneath.

Tip: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#).

**Parent topic:** [Send Message activity](#)

## Subscribe Message activity

---

The Subscribe Message activity is a starter activity that allows you to subscribe to a JMS topic. This activity supports the ATLEAST ONCE and EXACTLY ONCE delivery semantics.

### About this task

---

This orchestration must already have a JMS endpoint representing the data source, otherwise, output mapping is disabled.

- [Adding a JMS activity to an orchestration](#)
- [Changing the Activity Name](#)
- [Picking a JMS endpoint](#)
- [Configuring the Subscribe Message activity](#)

- [Mapping the Outputs](#)

Outputs represent data that is transmitted from the JMS activity (parameters) to the orchestration (variables).

**Parent topic:** [JMS Activities](#)

**Related tasks:**

[Creating or editing a JMS endpoint](#)  
[Get Message activity](#)  
[Poll Message activity](#)  
[Publish Message activity](#)  
[Send Message activity](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS\\_Subscribe\\_Message\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS_Subscribe_Message_Activity.html)

## Adding a JMS activity to an orchestration

---

### Procedure

1. In an active project, open the Activities tab and expand the JMS folder contents.
2. Drag the Subscribe Message activity icon to the orchestration.
3. When the activity is displayed, the Subscribe Message Checklist is displayed underneath.

**Parent topic:** [Subscribe Message activity](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS\\_Subscribe\\_Add\\_an\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS_Subscribe_Add_an_Activity.html)

## Changing the Activity Name

---

### Procedure

1. In the Checklist, click Summary.
2. Review the contents of the Activity Name field and make any required changes.

**Parent topic:** [Subscribe Message activity](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS\\_Subscribe\\_Changing\\_Activity\\_Name.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS_Subscribe_Changing_Activity_Name.html)

## Picking a JMS endpoint

---

## Procedure

---

1. In the Checklist, click Pick Endpoint.
2. Click Browse and use the Project Explorer dialog box to select the relevant JMS endpoint.  
Tip: You can create the needed endpoint at this time by clicking New.
3. When you click OK, the endpoint-specific configuration options are displayed in a read-only state.  
Note: If changes are required to the selected endpoint configuration, click Edit to activate the options. Any changes you make globally affects all uses of the endpoint in active orchestrations.

**Parent topic:** [Subscribe Message activity](#)

---

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS\\_Subscribe\\_Picking\\_JMS\\_Endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS_Subscribe_Picking_JMS_Endpoint.html)

## Configuring the Subscribe Message activity

---

### Procedure

---

1. In the Checklist, click Configure.
2. In the Topic field, specify a provider-specific name that identifies a topic to the JMS system.
3. Open the Message Data menu and choose the format the message takes, whether Bytes or Text.
4. In the Message Selector field, enter the text of a message header.

Using a JMS message selector a client can specify, by submitting the text of a message header, those messages it is interested in. Only messages whose headers and properties match the selector are delivered. Message selectors cannot reference message body values. The message selector string must follow JMS selector syntax.

5. In the Client ID field, specify the unique client identifier assigned to this JMS connection.  
A client's identifier is configured in a client-specific ConnectionFactory and transparently assigned to the connection it creates. Alternatively, a client can set a connection's client identifier using a provider-specific value.
6. In the Checklist, click Delivery Rules.
7. Open the Deliver menu and choose either option: ATLEAST\_ONCE, ATMOST\_ONCE or EXACTLY\_ONCE
8. In the Checklist, click Retry.
9. Review the default settings and make any required changes.

For more information, see [Specifying retry parameters for JMS activities](#)

**Parent topic:** [Subscribe Message activity](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS\\_Subscribe\\_Configuring\\_Subscribe\\_Message\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS_Subscribe_Configuring_Subscribe_Message_Activity.html)

## Mapping the Outputs

---

Outputs represent data that is transmitted from the JMS activity (parameters) to the orchestration (variables).

## Before you begin

---

If required, you can create a custom mapping variable in the Source or Destination column by following the steps in [Creating variables](#)

## Procedure

---

1. In the Checklist, click Map Outputs.
2. Review the parameters listed in the From Activity list.
3. If you want to create new orchestration variables that match the output parameters of the current activity, select a parameter and then click Copy.
4. In the Copy Parameters dialog box, choose one or more parameters, then click OK to add them to the To Orchestration list. The data type, schema, or schema fragment of the selected output parameter is applied to the new variable.
5. Click Select Inputs.

The Select Inputs dialog box lists all the variables associated with the other endpoint.

6. Choose one or more variables, then click OK to add them to this list.
7. Drag a parameter from the From Activity list onto a variable listed in the To Orchestration list.

If the link is viable, a line is displayed, linking the two.

8. Repeat this procedure to link other parameters and variables.
9. To test the output links, click the Test button. A variable is listed in an Input Test Files table.
10. In the Location column, click the small blue button.
11. Use the Browse dialog box to select an input test file.
12. Click Run Test. Test results are displayed in the columns underneath.

Tip: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#).

**Parent topic:** [Subscribe Message activity](#)

---

## Creating a JMS endpoint to a WebLogic server

---

You can define a JMS endpoint to an existing WebLogic server, by completing the following steps in IBM Cast Iron Studio.

## Before you begin

---

Install the following JAR files in IBM Cast Iron Studio and the Integration Appliance run time:

- wlclient.jar
- wljmsclient.jar

## Procedure

---

1. In Studio, drag an activity from the JMS folder of the Activities tab onto the orchestration.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel opens.
3. To create an endpoint, click New. The Create Endpoint window opens.
4. In the Create Endpoint window, specify the following connection parameters.

Connection parameter fields	Description
JNDI Initial Factory	Specify the context factory class that Studio retrieves from JNDI: weblogic.jndi.WLInitialContextFactory

	This JNDI factory class is configured during the JMS WebLogic server installation
Provider URL	Specify the URL of the JMS server in the following format: t3://:7001 Where 7001 is the default port.
Provider Package	Optionally, you can specify a provider package name.
Factory Name	Use one of the supplied default factories that is configured with the WebLogic endpoint system: <code>weblogic.examples.jms.QueueConnectionFactory</code>

5. To validate the parameters you specified, click Test Connection.

Note: When you configure an endpoint by using configuration properties, verify that the configuration properties have valid values. If the configuration property value is invalid or does not exist, the connection test fails.

6. In the Checklist, click Configure.

7. In the Topic field, select the following topic from the Preconfigured or custom Topic/Queues list:

`weblogic.examples.jms.exampleQueue`

This topic is preconfigured to use a JMS WebLogic server.

8. Open the Message Data menu and choose the format the message takes, whether Bytes or Text.

9. In the Message Selector field, you can enter the text of a message header.

By submitting the text of a message header in a JMS message selector, a client can specify the messages it is interested in. Only messages with headers and properties that match the selector are delivered. Message selectors cannot reference message body values. The message selector string must comply with the JMS selector syntax.

Note: Message selector can be blank

10. In the Client ID field, specify the unique client identifier assigned to this JMS connection.

11. In the Checklist, click Delivery Rules.

12. Open the Deliver menu and choose the option: ATMOST\_ONCE

13. In the Checklist, click Retry.

14. If there are any problems, review the default settings and make the required changes.

# Overview of the Lightweight Directory Access Protocol (LDAP) connector

The LDAP connector enables a two-way communication between Cast Iron® and LDAP Servers . LDAP Server comprises of LDAP entries such as a user, systems, network, services etc., allowing sharing of information over internet. LDAP connector provides bidirectional connectivity to work with LDAP Entries present in LDAP Server.

You can perform the following activities using the LDAP connector:

## Outbound Activities :

1. Create Entry
2. Retrieve Entry
3. Search Entry
4. Delete Entry

## Creating or Editing Endpoint for LDAP connector

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a LDAP server.

### Selecting or editing a LDAP endpoint:

1. In the Create Endpoint or Edit Endpoint pane, configure the LDAP server as described in the following table.  
In addition to these fields, the endpoint pane contains Connection pool options and Remote Endpoint Configuration.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the LDAP server successfully.
3. Click OK.

LDAP Network Parameters	Description
Host	Specifies the host name or IP address of the machine on which LDAP server is running.
Port	Specifies the LDAP Sever port. The default value is 389.
Protocol version	LDAP Protocol version, LDAP Connector supports only Protocol v3
Base Dn	Point from where connector (LDAP browser) display LDAP tree (Directory Information Tree)
Authentication Parameters	Description
Authentication Type	Anonymous and Simple. User have to specify username and password for simple authentication.
Bind Dn or User	An Active Directory user account that has privileges to search/modify Directory tree.
Password	Specifies the Bind password associated with the user name to connect to the LDAP server.
Connection Pool options	Description
Minimum Connections	Specifies the lowest number of LADP server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The

	default value is 5.
Maximum Connections	Specifies the maximum number of LDAP server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
Maximum Idle Time	Specifies the amount of time in minutes that a LDAP server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool â€“no idle time. The default value is 120 minutes.
Maximum Wait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
Reclaim Connections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minutes.
<b>Remote Endpoint Configurations</b>	<b>Description</b>
Endpoint Runs Behind Firewall	Enables the secure connector name property so that secure connector can be used if the LDAP server is running behind a firewall.
Secure Connector Name	Specifies the maximum number of LDAP server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.

---

#### [Feedback](#) | [Notices](#)

>Last updated: Wednesday, 15 June 2016  
 file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/LDAP\\_create\\_endpoint\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/LDAP_create_endpoint_activity.html)

## Creating LDAP Entry Activity

---

Use create activity to create entry or entries on LDAP Server. A LDAP Entry consist of set of attributes which defines the Entry.

Using the create activity:

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the LDAP folder.
3. Drag Create Entry activity from the LDAP folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
4. The Checklist pane lists the tasks (Summary, Pick Endpoint, Configure, Map inputs, Map outputs) that you must complete to configure the activity.

- a. Click on Pick Endpoint to select an LDAP endpoint.

Note: For instructions on creating or editing a LDAP endpoint, see [Creating or Editing Endpoint for LDAP connector](#).

- b. Click Configure from the Checklist. The Configure pane is displayed. Complete the following steps to configure Create Entry activity:

- i. Click Browse button to select an Base-Dn from the Browse DIT pane. The Browse LDAP Entry panel displays all the entries from the selected LDAP server.

Note: If you have configured the Base-Dn property in the endpoint panel then Browse LDAP Entry displays children of Base-Dn alone or else it displays all the entries from the root of the LDAP directory.

- ii. Click Browse button to select an Object class(es) from the Browse LDAP Object Class pane. The Browse LDAP Object Class panel displays all the Object Classes on the selected LDAP Server. LDAP object class(es) defines the attributes of an Entry. An Entry object can have superset of attributes from 2 or more object classes. Select all the object classes which will collectively represent all attributes of the Entry you are going to create.

## Specifying the map inputs for create activity

---

Click Map Input from the Checklist pane. The input parameters for the specific LDAP activity are displayed under the To Activity pane. Note: Whole request object is an array type which allow users to create multiple entries by using same request and the additionalAttributes section by providing the Attribute names, its type and attribute values.

Table 1. Map Input Optional Parameter

Parameter Name	Description
baseDn	Point under which new entry to be created
RDN	Relative Distinguished Names(RDN). RDN of an object is the part of the name that is an attribute of the object itself (the part of the object name that identifies this object as unique from its siblings at its current level in the naming hierarchy)
objectClasses	To specify additional object classes and its attribute(s) which are not part of the map inputs structure during runtime, use ObjectClasses element to provide the Object class name(s). The element objectClasses is an array type so that you can specify multiple values.
entryAttributes	LDAP Entry Attributes type provides structured content type to create an Entry in the LDAP server. The Entry Attributes element type is created from the set of attributes derived using Object Class(es) specified in the configure panel
additionalAttributes	Additional Attributes type can be used when user wants to specify additional set attributes and their values outside the selected object classes during runtime. The element <b>additionalAttributes</b> is an array type so that user can specify multiple additional attributes. The element <b>additionalAttributes</b> is a complex type element through which user can specify attribute name, its type and values (values itself an array type allowing user to specify set of values for the given attribute)

## Specifying the map outputs create activity

---

Click Map output from the Checklist pane. The output parameters for the LDAP Create activity are displayed under the From Activity pane. Some of the common output parameters are defined in the following table

Table 2. Create Activity common output parameters

Parameter Name	Description
baseDn	Return Base Dn if successful
RDN	Return RDN if successful
resultCode	LDAP Result code
resultMessage	LDAP Result Message

Note: You can create multiple Entries using create entry activity.

**Parent topic:** [LDAP Connector Activities](#)

---

[Feedback](#) | [Notices](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/LDAP\\_connector\\_create\\_entry.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/LDAP_connector_create_entry.html)

## Delete LDAP Entry Activity

---

Use the Delete Activity to delete LDAP entries from the configured LDAP Sever.

Using the create activity:

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.

2. Select the Activities tab and expand the LDAP folder.
3. Drag Delete Entry activity from the LDAP folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
4. The Checklist pane lists the tasks (Summary, Pick Endpoint, Configure, Map inputs, Map outputs) that you must complete to configure the outbound activity.
  - a. Click on Pick Endpoint to select a LDAP endpoint.  
Note: For instructions on creating or editing a LDAP endpoint, see [Creating or Editing Endpoint for LDAP connector](#).
  - b. Click Configure from the Checklist. The Configure pane is displayed. Complete the following steps to configure Delete Entry activity.
    - i. Click Browse button to select an Base Dn from the Browse DIT pane. The Browse LDAP Entry panel displays all the entries from the selected LDAP server.  
Note: If you have configured the Base-Dn property in the endpoint panel then Browse LDAP Entry displays children of Base-Dn alone or else it displays all the entries from the root of the LDAP directory.

## **Specifying the map inputs for delete activity**

---

Click Map Input from the Checklist pane. The input parameters for the specific LDAP activity are displayed under the To Activity pane. Some of the common input parameters are defined in the following table.

**Table 1. Map Input Optional Parameter**

Parameter Name	Description
baseDn	Starting point of an LDAP tree under which connector searches for Entry matching to RDN mentioned by below field.
RDN	An attribute name value pair which uniquely identifies an Entry under immediate tree represented by Base Dn.

## **Specifying the map outputs delete activity**

---

Click Map output from the Checklist pane. The output parameters for the LDAP Delete activity are displayed under the From Activity pane. Some of the common output parameters are defined in the following table

**Table 2. Delete Activity common output parameters**

Parameter Name	Description
baseDn	Return Base Dn if successful
RDN	Return RDN if successful
resultCode	LDAP Result code
resultMessage	LDAP Result Message

Note : We can delete multiple Entries using delete entry activity

**Parent topic:** [LDAP Connector Activities](#)

---

## **Retrieve LDAP Entry Activity**

---

Using the Retrieve Activity, you can retrieve an entry from a LDAP Server. The retrieved entry is uniquely identified by its Dn.

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the LDAP folder.

3. Drag Retrieve Entry activity from the LDAP folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
4. The Checklist pane lists the tasks (Summary, Pick Endpoint, Configure, Map inputs, Map outputs) that you must complete to configure the outbound activity.
  - a. Click on Pick Endpoint to select a LDAP endpoint.  
Note: For instructions on creating or editing a LDAP endpoint, see [Creating or Editing Endpoint for LDAP connector](#).
  - b. Click Configure from the Checklist. The Configure pane is displayed.
    - i. Click Browse button to select an Base Dn from the Browse DIT pane. The Browse LDAP Entry panel displays all the entries from the selected LDAP server.  
Note: If you have configured the Base-Dn property in the endpoint panel then Browse LDAP Entry displays children of Base-Dn alone or else it displays all the entries from the root of the LDAP directory.
    - ii. Click Browse button to select an Object class(es) from the Browse LDAP Object Class pane. The Browse LDAP Object Class displays all the Object Classes on the selected endpoint.

## **Specifying the map inputs for retrieve activity**

---

Click Map Input from the Checklist pane. The input parameters for the specific LDAP activity are displayed under the To Activity pane.

**Table 1. Map Input Optional Parameter**

Parameter Name	Description
baseDn	Starting point of LDAP search
RDN	The Entry to be searched, input must be name value pair

## **Specifying the map outputs retrieve activity**

---

Click Map output from the Checklist pane. The output parameters for the LDAP Retrieve activity are displayed under the From Activity pane. Some of the common output parameters are defined in the following table:

**Table 2. Retrieve Activity common output parameters**

Parameter Name	Description
baseDn	The container Dn under which entry represented by RDN is created
RDN	Relative Distinguished Names(RDN). RDN of an object is the part of the name that is an attribute of the object itself (the part of the object name that identifies this object as unique from its siblings at its current level in the naming hierarchy)
objectClasses	Field contains structured content containing all attributes of the object classes selected in configure panel
entryAttributes	Field contains structured content containing all attributes of the object classes selected in configure panel
additionalAttributes	additionalAttributes field contains additional set attributes of the entry which cannot be represented by selected object classes (entryAttributes). Means, if the entry contains an attribute or set of attributes which are not in the entryAttribute field then those attribute(s) will be added to additionalAttributes. The field additionalAttributes is a complex type field which can contain attribute name, its type and values. (The value field is an array in turn to support multiple value for an attribute)

**Parent topic:** [LDAP Connector Activities](#)

>Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/LDAP\\_connector\\_retrieve\\_entry.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/LDAP_connector_retrieve_entry.html)

## Search LDAP Entry Activity

---

Search activity is used to search entries in LDAP Server that matches the values that are specified in the search criteria.

You can specify or configure the following search criteria in the configuration panel or input data that is sent with the outbound request.

### 1. Search Scope:

The Scope is the starting point of an LDAP search and the depth from the base DN to which the search should occur. There are three options (values) that can be assigned to the SCOPE parameter:

- Only Object:** This value is used to indicate searching only the entry at the base DN, resulting in only that entry being returned (keeping in mind that it also has to meet the search filter criteria.)
- Immediate Child:** This value is used to indicate searching all entries one level under the base DN - but not including the base DN and not including any entries under that one level under the base DN.
- Complete Sub tree:** This value is used to indicate searching of all entries at all levels under and including the specified base DN.

### 2. Search filter:

Search filters select the entries to be returned for a search operation. They are most commonly used with the LDAP search command-line utility and you can place multiple search filters.

## Using the Search Entry activity

---

- Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
- Select the Activities tab and expand the LDAP folder.
- Drag Search Entry activity from the LDAP folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
- The Checklist pane lists the tasks (Summary, Pick Endpoint, Configure, Map inputs, Map outputs) that you must complete to configure the outbound activity.
  - Click on Pick Endpoint to select a LDAP endpoint.  
Note: For instructions on creating or editing a LDAP endpoint, see [Creating or Editing Endpoint for LDAP connector](#).
  - Click Configure from the Checklist. The Configure pane is displayed.
    - Click Browse button to select an Base Dn from the Browse DIT pane. The Browse DIT panel displays all the entries from the selected LDAP server.  
Note: If you have configured the Base-Dn property in the endpoint panel then Browse LDAP Entry displays children of Base-Dn alone or else it displays all the entries from the root of the LDAP directory.
    - Click Browse button to select an Object class(es) from the Browse LDAP Object Class pane. The Browse LDAP Object Class displays all the Object Classes on the selected endpoint.
  - Select the scope of Search.
  - Input the LDAP filter to search and filter the result.

## Specifying the map inputs for search entry activity

---

Click Map Input from the Checklist pane. The input parameters for the specific LDAP activity are displayed under the To Activity pane.

Table 1. Map Input Optional Parameter

Parameter Name	Description
baseDn	Starting point of LDAP search
RDN	Relative DN
Search Scope	The Scope is the starting point of an LDAP search and the depth from the base DN to which the search should occur
Search Filter	Search filters select the entries to be returned for a search operation.

Note: Value provided in map will take highest priority.

## Specifying the map outputs search entry activity

Click Map output from the Checklist pane. The output parameters for the LDAP Search entry activity are displayed under the From Activity pane. Some of the common output parameters are defined in the following table:

Table 2. Retrieve Activity common output parameters

Parameter Name	Description
baseDn	The container Dn under which entry represented by RDN is created.
RDN	Relative Distinguished Names(RDN). RDN of an object is the part of the name that is an attribute of the object itself (the part of the object name that identifies this object as unique from its siblings at its current level in the naming hierarchy)
objectClasses	Lists all object classes of the search entry
entryAttributes	Field contains structured content containing all attributes of the object classes selected in configure panel.
additionalAttributes	additionalAttributes field contains additional set attributes of the entry which cannot be represented by selected object classes (entryAttributes). Means, if the entry contains an attribute or set of attributes which are not in the entryAttribute field then those attribute(s) will be added to additionalAttributes. The field additionalAttributes is a complex type field which can contain attribute name, its type and values. (The value field is an array in turn to support multiple value for an attribute)

## MailChimp Activities

- [Overview of MailChimp Connector](#)
- [Creating or editing an endpoint for MailChimp](#)

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to MailChimp platform. MailChimp connector supports both Basic authentication and OAuth2.0 authentication mechanism so as to authorize users to perform operations.
- [Using the MailChimp Create Objects Activity](#)

Use the Create Objects activity to create objects in MailChimp. Refer to the Objects supported by MailChimp Connector.
- [Using the MailChimp Update Objects Activity](#)

Use the Update Objects activity to update objects in MailChimp. Refer to the Objects supported by MailChimp Connector.
- [Using the MailChimp Delete Objects Activity](#)

Use the Delete Objects activity to delete objects from MailChimp. Refer to the Objects supported by MailChimp Connector.
- [Using the MailChimp Retrieve Objects Activity](#)

Use the Update Objects activity to update objects in MailChimp. Refer to the Objects supported by MailChimp Connector.
- [Using the MailChimp Retrieve All Objects Activity](#)

Use the Retrieve All Objects activity to retrieve objects in MailChimp. Refer to the Objects supported by MailChimp Connector.
- [Using the MailChimp Search Objects Activity](#)

Use the Search Objects activity to search objects in MailChimp. Refer to the Objects supported by MailChimp Connector.
- [Using the MailChimp Upsert Members Activity](#)

Use the Upsert Members activity to create or update Member in MailChimp.
- [Using the MailChimp Retrieve Reports Activity](#)

Use the Retrieve Reports activity to retrieve Click Report, Members Click Report, Email Activity Report, Campaign Recipient Report, Unsubscribed Member report from MailChimp.
- [Using the MailChimp Retrieve All Reports Activity](#)

Use the Retrieve All Objects activity to retrieve Campaign Feedback Report, Click Report, Click Reports, Domain Performance Report, Social Activity Report, Email Activity Report, Location Report, Recipients Report, Campaign Sub Report, and Unsubscribed Member Report from MailChimp.

- [Using the MailChimp Send Campaigns Activity](#)  
Use the Send Campaigns activity to Send a MailChimp campaign.
- [Using the MailChimp Cancel Campaigns Activity](#)  
Use the Cancel Campaigns activity to Cancel a Regular or Plain-Text Campaign after you send, before all of your recipients receive it. This feature is included with MailChimp Pro.
- [Using the MailChimp Batch Create Objects Activity](#)  
Use the Batch Create Objects activity to create objects in MailChimp asynchronously. Refer to the Objects supported by MailChimp Connector.
- [Using the MailChimp Batch Update Objects Activity](#)  
Use the Batch Update Objects activity to update objects in MailChimp asynchronously. Refer to the Objects supported by MailChimp Connector.
- [Using the MailChimp Batch Upsert Objects Activity](#)  
Use the Batch Upsert Objects activity to create or update Member objects in MailChimp.
- [Using the MailChimp Batch Retrieve Objects Activity](#)  
Use the Batch Retrieve Objects activity to retrieve objects in MailChimp asynchronously. Refer Objects Supported by the MailChimp Connector.
- [Using the MailChimp Get Batch Status Activity](#)  
Use the Get Batch Status activity to get summary of batch requests that have been made in MailChimp.
- [Using the MailChimp Get Batch Results Activity](#)  
Use the Get Batch Results activity to read Batch responses from MailChimp. There is no MailChimp API available. However this activity simplifies the user's complexity to parse the batch response. It reads archived gzipped response file and populates the result in Map Outputs. For supported Objects, refer Objects Supported by the MailChimp Connector.
- [Specifying the Retry options for MailChimp REST API activities](#)  
Specifying the Retry parameters is one of the tasks to configure a MailChimp activity. The MailChimp REST API connector uses a single login session for all connections to the MailChimp REST API endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails. The retrial exceptions include 503 and 504 for this error codes.

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_MailChimpactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_MailChimpactivities.html)

## Overview of MailChimp Connector

MailChimp is an Email Service Provider (ESP), which helps marketers to send bulk emails to clients, customers, and other interested parties. It helps businesses with their marketing emails and newsletters, automated messages, and targeted campaigns. It also manages their subscriber lists, tracks campaign performances.

MailChimp is a web-based application that works in most web browsers. There is no need to download or install software locally.

MailChimp connector interacts using restful Web Service API's, which allow users to access bi-directional data-level integration.

You can perform the following activities using MailChimp connector:

- Outbound activities:
  - Create Objects
  - Update Objects
  - Delete Objects
  - Retrieve Objects
  - Retrieve All Objects
  - Search Objects
  - Upsert Members
  - Retrieve Reports
  - Retrieve All Reports
  - Send Campaigns
  - Cancel Campaigns

- o Batch Create Objects
- o Batch Update Objects
- o Batch Upsert Objects
- o Batch Retrieve Objects
- o Get Batch Status
- o Get Batch Results

The MailChimp API version currently supported by this connector is 3.0.

## Creating or editing an endpoint for MailChimp

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to MailChimp platform. MailChimp connector supports both Basic authentication and OAuth2.0 authentication mechanism so as to authorize users to perform operations.

### Selecting or editing a MailChimp endpoint

1. In the Create Endpoint or Edit Endpoint pane, configure the MailChimp endpoint as described in the following table.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to MailChimp successfully.
3. Click OK.

Note:

- If radio button Log into server with Basic Authentication is clicked, User Name and API key are required.
- If radio button Log into server with OAuth2.0 Authentication is clicked, OAuth2.0 Access Token is required.

Table 1. Connection properties

Field Name	Description
API Version	MailChimp API Version
User Name	Authentication user name for accessing MailChimp instance.
API Key	Authentication API Key for accessing MailChimp instance
OAuth 2.0 Access Token	Access Token for accessing MailChimp instance.

Following parameters are required in endpoint test connection screen to make connection via Proxy:

Field Name	Description
Host name	Host Name of Proxy Network
Port	Port Number of Proxy Network
User Name	User Name for accessing service via proxy network
Password	Password for accessing service via proxy network

Note: In the Map Input section of each activity, relevant fields of endpoint panel are available to override at runtime. User can provide data to various groups of parameters like Proxy Details, Connection Details to override. Authentication type used will be as per the selection made by user on endpoint panel. Only parameters needed for selected type can be overridden. Providing only partial

parameter values in a selected group is not allowed. For example, if Basic authentication is selected in endpoint panel, API Key and username must be overridden, else access Token is overridden.

## Objects Supported by the MailChimp Connector

Following objects are supported by the MailChimp Connector:

Table 2. CRUD Operations supported by the MailChimp objects

MailChimp Objects	Create	Retrieve All	Retrieve	Update	Delete	Search
Campaign	Yes	Yes	Yes	Yes	Yes	Yes

#### Atomic Operations:

- Retrieve Reports:
  - Click Report
  - Members Click Report
  - Email Activities Report
  - Recipient Report
  - Unsubscribed Members Report
- Retrieve All Reports:
  - Campaign Feedback Report
  - Click Report
  - Members Click Report
  - Domain Performance Report
  - Social Activity Report
  - Email Activities Report
  - Location Report
  - Recipient Report
  - Campaign Sub Report
  - Unsubscribed Member Report
- Cancel Campaign
- Upsert Members
- Send Campaign
- Get Batch Status

#### Custom objects support

---

MailChimp does not support custom objects.

#### Custom fields support

---

MailChimp merge fields are treated as custom fields, which can be created by end user only using MailChimp UI. These fields are associated only with MailChimp â€˜Memberâ€™ object. Also the merge fields are associated with a specific List. Different MailChimp lists can have different merge fields. Custom fields are dynamically discovered on selection of a List.

In the Configure Panel, on selection of â€˜Memberâ€™ object List Name Browse button will be enabled in order to select the list\_id associated with merge fields. On selection of List Name, the merge fields will be populated in Map Inputs/Map Outputs Panel dynamically. List Name Browse Panel shows 50 Lists by default. â€˜Nextâ€™ and â€˜Previousâ€™ button is used to fetch the lists as per â€˜countâ€™ text field.

User has a provision to override the value of "list\_Id" in the Map Input. If two different lists have the same set of merge fields, then specifying either of the list\_id would suffice. However if the list\_id overridden has different merge fields then only the common fields would retain values and others would be ignored. In case there are some mandatory merge fields defined for overridden list\_id and these merge fields are not available for selected list\_id in configure panel, then execution will error out. Users must note this and provide appropriate "list\_Id" based on the merge fields it populated. Also note that if list\_id is provided in Map Input, it has more preference than the one selected in configure panel.

The connector activities of "Member" Object which support merge field for Map Input is provided below:

- Create Objects
- Update Objects
- Batch Create Objects
- Batch Update Objects
- Batch Upsert Objects
- Upsert Members

The connector activities of "Member" object which dynamically populates the merge field at Map Output are provided below:

- Search
- Retrieve All
- Retrieve
- Get Batch Results

Merge fields are associated with list\_id.

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MailChimp\\_creating\\_an\\_endpoint\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MailChimp_creating_an_endpoint_activity.html)

## Using the MailChimp Create Objects Activity

---

Use the Create Objects activity to create objects in MailChimp. Refer to the Objects supported by MailChimp Connector.

### About this task

---

Use this task to create objects in the MailChimp. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the MailChimp folder contents.
2. Drag the Create Objects activity icon onto the orchestration. Select the activity. The MailChimp Create Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MailChimp endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Object Type and List Name available. List Name Browse is enable only for Member Object Type.
11. Click Browse to select the object type. The Browse MailChimp window is displayed.
12. In the Object Type Browse MailChimp window, you can select the MailChimp object types from the object type list. Click OK.
13. If Member Object is selected, List Name Browse is enabled.

14. Click Browse to select a List. The Browse MailChimp window is displayed.
15. In the List Name Browse MailChimp, you can select the MailChimp List Name from the List Name/Id list. Click OK.
16. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MailChimp REST API activities](#).
17. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
18. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
19. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
20. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MailChimp Create Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Object Name (For example: Campaign) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

MailChimp also supports custom field value creation. Please refer section about [Custom fields support](#) for more information.

## Using the MailChimp Update Objects Activity

---

Use the Update Objects activity to update objects in MailChimp. Refer to the Objects supported by MailChimp Connector.

### About this task

---

Use this task to update objects in the MailChimp. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the MailChimp folder contents.
2. Drag the Update Objects activity icon onto the orchestration. Select the activity. The MailChimp Update Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MailChimp endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Object Type and List Name available. List Name Browse is enable only for Member Object Type.
11. Click Browse to select the object type. The Browse MailChimp window is displayed.
12. In the Object Type Browse MailChimp window, you can select the MailChimp object types from the object type list. Click OK.

13. If Member Object is selected, List Name Browse is enabled.
14. Click Browse to select a List. The Browse MailChimp window is displayed.
15. In the List Name Browse MailChimp, you can select the MailChimp List Name from the List Name/Id list. Click OK.
16. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MailChimp REST API activities](#).
17. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
18. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
19. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
20. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MailChimp Update Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Object Name (For example: Campaign) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

MailChimp also supports custom field value update. Please refer section about [Custom fields support](#) for more information.

## Using the MailChimp Delete Objects Activity

---

Use the Delete Objects activity to delete objects from MailChimp. Refer to the Objects supported by MailChimp Connector.

### About this task

---

Use this task to delete objects from MailChimp instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the MailChimp folder contents.
2. Drag the Delete Objects activity icon onto the orchestration. Select the activity. The MailChimp Delete Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MailChimp endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Object Type Browse is available.
11. Click Browse to select the object type. The Browse MailChimp window is displayed.

12. In the Object Type Browse MailChimp window, you can select the MailChimp object types from the object type list. Click OK.
13. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MailChimp REST API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MailChimp Delete Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type are supported.

## Using the MailChimp Retrieve Objects Activity

---

Use the Update Objects activity to update objects in MailChimp. Refer to the Objects supported by MailChimp Connector.

### About this task

---

Use this task to retrieve objects in MailChimp instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the MailChimp folder contents.
2. Drag the Retrieve Objects activity icon onto the orchestration. Select the activity. The MailChimp Retrieve Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MailChimp endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Object Type and List Name available. List Name Browse is enable only for Member Object Type.
11. Click Browse to select an object. The Browse MailChimp window is displayed.
12. In the Object Type Browse MailChimp window, you can select the MailChimp object types from the object type list. Click OK.
13. In the List Name Browse MailChimp, you can select the MailChimp List Object. Click OK.
14. In the Checklist, click Retry. Review the default settings and make the required changes.

15. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
16. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
18. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MailChimp Retrieve Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type are supported.

MailChimp also supports custom field value fetch. Please refer section about [Custom fields support](#) for more information.

## Using the MailChimp Retrieve All Objects Activity

---

Use the Retrieve All Objects activity to retrieve objects in MailChimp. Refer to the Objects supported by MailChimp Connector.

### About this task

---

Use this task to retrieve all objects in MailChimp instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the MailChimp folder contents.
2. Drag the Retrieve All Objects activity icon onto the orchestration. Select the activity. The MailChimp Retrieve All Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MailChimp endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Object Type and List Name Browse available. List Name Browse is enable only for Member Object.
11. Click Browse to select the object. The Browse MailChimp window is displayed.
12. In the Object Type Browse MailChimp window, you can select the MailChimp object types from the object type list. Click OK.
13. In the List Name Browse MailChimp window, you can select the MailChimp List Name. Click OK.
14. In the Checklist, click Retry. Review the default settings and make the required changes.

Note: For more information, see [Specifying the Retry options for MailChimp REST API activities](#).

15. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve All Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
16. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
18. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MailChimp Retrieve All Objects activity.

Note:

count and offset is used for pagination. By default count is 10 and offset as 0.

MailChimp also supports custom field value update. Please refer section about [Custom fields support](#) for more information.

## Using the MailChimp Search Objects Activity

---

Use the Search Objects activity to search objects in MailChimp. Refer to the Objects supported by MailChimp Connector.

### About this task

---

Use this task to Search objects in MailChimp instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the MailChimp folder contents.
2. Drag the Search Objects activity icon onto the orchestration. Select the activity. The MailChimp Search Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MailChimp endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Object Type and List Name Browse available. List Name Browse is enable only for Member object.
11. Click Browse to select the object. The Browse MailChimp window is displayed.
12. In the Object Type Browse MailChimp window, you can select the MailChimp object types from the object type list. Click OK.
13. In the List Name Browse MailChimp window, you can select the MailChimp List Name. Click OK.
14. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MailChimp REST API activities](#).
15. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Search Objects activity are displayed as nodes under the request input parameter in the To Activity panel.

16. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.

18. Create a map between the output parameters and orchestration variables.

#### Query Parameter

Below are the query parameters of the Search objects:

Table 1. Query Parameter

Field Name	Description
fieldFilter	It holds fieldSelectionOption and list of fields. This set of parameters are optional. If the values are not provided then entire object response will be displayed.
fieldSelectionOption	This parameter is used to manage the response fields. Allowed values are INCLUDE or EXCLUDE. User must specify this value. If "INCLUDE" option is given, only values for selected "fields" element will be present in response. If "EXCLUDE" option is given, values of selected "fields" element will be absent in response.
fields	This is list of standard object field names that can be present or absent in the response. User can be specify multiple fields by expanding occurrences.
criteria	It holds field, and value. This set of parameters are optional. If the values are not provided then entire object response will be displayed. Multiple criteria can be specified by expanding occurrences for the criteria node.
field	The standard object field name to be used in the criteria. User must specify this value.
value	The value of the field used in the search. User must specify this value.
count	It is used for pagination. By default count is 10.
offset	It is used for pagination. By default offset is 0.

## Results

You have configured the MailChimp Search Objects activity.

Note:

MailChimp also supports custom field value update. Please refer section about [Custom fields support](#) for more information.

## Using the MailChimp Upsert Members Activity

Use the Upsert Members activity to create or update Member in MailChimp.

### About this task

Use this task to Upsert Member in MailChimp instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the MailChimp folder contents.
2. Drag the Upsert Members activity icon onto the orchestration. Select the activity. The MailChimp Upsert Members Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MailChimp endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. List Name Browse available.
11. Click Browse to select List Name. The Browse MailChimp window is displayed.
12. In the List Name Browse MailChimp window, you can select the MailChimp List Name. Click OK.
13. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MailChimp REST API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Upsert Members activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MailChimp Upsert Members activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type are supported.

MailChimp also supports custom field value update. Please refer section about [Custom fields support](#) for more information.

## Using the MailChimp Retrieve All Reports Activity

---

Use the Retrieve All Objects activity to retrieve Campaign Feedback Report, Click Report, Click Reports, Domain Performance Report, Social Activity Report, Email Activity Report, Location Report, Recipients Report, Campaign Sub Report, and Unsubscribed Member Report from MailChimp.

### About this task

---

Use this task to retrieve all reports in MailChimp instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the MailChimp folder contents.

2. Drag the Retrieve All Reports activity icon onto the orchestration. Select the activity. The MailChimp Retrieve All Reports Checklist is displayed.
  3. In the checklist, click Summary.
  4. Review the contents of the Activity Name field, and make the required changes.
  5. In the checklist, click Pick Endpoint.
  6. Click Browse and use the Project Explorer dialog box to select the relevant MailChimp endpoint.
  7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
  8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
  9. In the checklist, click Configure.
  10. Object Type browse is available.
  11. Click Browse to select an object. The Browse MailChimp window is displayed.
  12. In the Object Type Browse MailChimp window, you can select the MailChimp object types from the object type list. Click OK.
  13. In the Checklist, click Retry. Review the default settings and make the required changes.
- Note: For more information, see [Specifying the Retry options for MailChimp REST API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve All Reports activity are displayed as nodes under the request input parameter in the To Activity panel.
  15. Create a map between the orchestration variables and the input parameter of the activity.
- Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
  17. Create a map between the output parameters and orchestration variables.

### Query Parameter

Below are the query parameters of the Retrieve All Reports:

Table 1. Query Parameter

Field Name	Description
fieldFilter	It holds fieldSelectionOption and list of fields. This set of parameters are optional. If the values are not provided then entire object response will be displayed.
fieldSelectionOption	This parameter is used to manage the response fields. Allowed values are INCLUDE or EXCLUDE. User must specify this value. If "INCLUDE" option is given, only values for selected "fields" element will be present in response. If "EXCLUDE" option is given, values of selected "fields" element will be absent in response.
fields	This is list of standard object field names that can be present or absent in the response. User can be specify multiple fields by expanding occurrences.
criteria	It holds field, and value. This set of parameters are optional. If the values are not provided then entire object response will be displayed. Multiple criteria can be specified by expanding occurrences for the criteria node.
field	The standard object field name to be used in the criteria. User must specify this value.
value	The value of the field used in the search. User must specify this value.
count	It is used for pagination. By default count is 10.
offset	It is used for pagination. By default offset is 0.

## Results

You have configured the MailChimp Retrieve All Reports activity.

Note:

- fieldFilter is optional. To support partial response, set "fieldSelectionOption" value as either "INCLUDE" or "EXCLUDE". "fields" should have element name to be excluded and included. Expand occurrence to have support multiple fields.
- "criteria" supports the filtering feature, where in field is name of the element and value is value to be looked for. Expand the occurrence of "criteria" for different set of filters.

- `count` and offset is used for pagination. By default count is 10 and offset as 0.

## Using the MailChimp Send Campaigns Activity

---

Use the Send Campaigns activity to Send a MailChimp campaign.

### About this task

---

Use this task to send a campaign in MailChimp instance in just one call. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the MailChimp folder contents.
2. Drag the Send Campaigns activity icon onto the orchestration. Select the activity. The MailChimp Send Campaigns Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MailChimp endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. This is atomic activity so you should see the message “No additional configuration is required for this activity”.
11. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MailChimp REST API activities](#).
12. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Send Campaigns activity are displayed as nodes under the request input parameter in the To Activity panel.
13. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
14. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
15. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the MailChimp Send Campaigns activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type are supported.

## Using the MailChimp Cancel Campaigns Activity

---

Use the Cancel Campaigns activity to Cancel a Regular or Plain-Text Campaign after you send, before all of your recipients receive it. This feature is included with MailChimp Pro.

### About this task

---

Use this task to cancel a Regular or Plain-Text campaign in MailChimp instance in just one call. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the MailChimp folder contents.
2. Drag the Cancel Campaigns activity icon onto the orchestration. Select the activity. The MailChimp Cancel Campaigns Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MailChimp endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. This is atomic activity so you should see the message "No additional configuration is required for this activity".
11. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MailChimp REST API activities](#).
12. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Cancel Campaigns activity are displayed as nodes under the request input parameter in the To Activity panel.
13. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
14. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
15. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the MailChimp Cancel Campaigns activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type are supported.

**Parent topic:** [MailChimp Activities](#)

## Using the MailChimp Batch Create Objects Activity

---

Use the Batch Create Objects activity to create objects in MailChimp asynchronously. Refer to the Objects supported by MailChimp Connector.

### About this task

---

Use this task to create more than one objects in MailChimp instance in just one call. The call to this activity is an asynchronous call where the input data is sent to the activity for processing and the actual response is not sent back to the orchestration. Batch Id is sent as a response. Using this Batch Id, periodically check the batch status using Get Batch Status Activity.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the MailChimp folder contents.
2. Drag the Batch Create Objects activity icon onto the orchestration. Select the activity. The MailChimp Batch Create Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MailChimp endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Object Type and List Name available. List Name Browse is enabled only for Member Object.
11. Click Browse to select the object. The Browse MailChimp window is displayed.
12. In the Object Type Browse MailChimp window, you can select the MailChimp object types from the object type list. Click OK.
13. In the List Name Browse MailChimp, you can select the MailChimp List Name. Click OK.
14. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MailChimp REST API activities](#).
15. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Batch Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
16. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
18. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the MailChimp Batch Create Objects activity.

Note:

MailChimp also supports custom field value creation. Please refer section about [Custom fields support](#) for more information.

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type are supported.

**Parent topic:** [MailChimp Activities](#)

## Using the MailChimp Batch Update Objects Activity

---

Use the Batch Update Objects activity to update objects in MailChimp asynchronously. Refer to the Objects supported by MailChimp Connector.

### About this task

---

Use this task to update more than one objects in MailChimp instance in just one call. The call to this activity is an asynchronous call where the input data is sent to the activity for processing and the actual response is not sent back to the orchestration. Batch Id is sent as a response. Using this Batch Id, periodically check the batch status using Get Batch Status Activity.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the MailChimp folder contents.
2. Drag the Batch Update Objects activity icon onto the orchestration. Select the activity. The MailChimp Batch Update Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MailChimp endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Object Type and List Name Browse available. List Name Browse is enabled only for Member Object.
11. Click Browse to select the object. The Browse MailChimp window is displayed.
12. In the Object Type Browse MailChimp window, you can select the MailChimp object types from the object type list. Click OK.
13. In the List Name Browse MailChimp, you can select the MailChimp List object. Click OK.
14. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MailChimp REST API activities](#).
15. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Batch Update Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
16. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
18. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the MailChimp Batch Update Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type are supported.

**Parent topic:** [MailChimp Activities](#)

## Using the MailChimp Batch Upsert Objects Activity

---

Use the Batch Upsert Objects activity to create or update Member objects in MailChimp.

### About this task

---

Use this task to create or update more than one objects in MailChimp instance in just one call. The call to this activity is an asynchronous call where the input data is sent to the activity for processing and the actual response is not sent back to the orchestration. Batch Id is sent as a response. Using this Batch Id, periodically check the batch status using Get Batch Status Activity.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the MailChimp folder contents.
2. Drag the Batch Upsert Objects activity icon onto the orchestration. Select the activity. The MailChimp Batch Upsert Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MailChimp endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Object Type and List Name Browse available. List Name Browse is enable only for Member object.
11. Click Browse to select List Name. The Browse MailChimp window is displayed.
12. In the Object Type Browse MailChimp window, you can select the MailChimp object types from the object type list. Click OK.
13. In the List Name Browse MailChimp window, you can select the MailChimp List object. Click OK.
14. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MailChimp REST API activities](#).
15. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Batch Upsert Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
16. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
18. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the MailChimp Batch Upsert Objects activity.

Note:

MailChimp also supports custom field value update. Please refer section about [Custom fields support](#) for more information.

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type are supported.

## Using the MailChimp Batch Retrieve Objects Activity

Use the Batch Retrieve Objects activity to retrieve objects in MailChimp asynchronously. Refer Objects Supported by the MailChimp Connector.

### About this task

Use this task to retrieve more than one objects in MailChimp instance in just one call. The call to this activity is an asynchronous call where the input data is sent to the activity for processing and the actual response is not sent back to the orchestration. Batch Id is sent as a response. Using this Batch Id, periodically check the batch status using Get Batch Status Activity.

### Procedure

1. In an active orchestration, open the Activities tab and expand the MailChimp folder contents.
2. Drag the Batch Retrieve Objects activity icon onto the orchestration. Select the activity. The MailChimp Batch Retrieve Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MailChimp endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Object Type and List Name Browse available. List Name Browse is enable only for Member object.
11. Click Browse to select List Name. The Browse MailChimp window is displayed.
12. In the Object Type Browse MailChimp window, you can select the MailChimp object types from the object type list. Click OK.
13. In the List Name Browse MailChimp window, you can select the MailChimp List Name. Click OK.
14. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MailChimp REST API activities](#).
15. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Batch Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
16. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
18. Create a map between the output parameters and orchestration variables.

Table 1. Batch Retrieve Parameter

Field Name	Description
retrieveAll	retrieveAll defaults to false. Decides whether to execute retrieve or retrieveAll operation. If retrieveAll is set to true, retrieve All Operation will be executed.

Table 2. retrieveAll Validation cases

retrieveAll flag	Scenario	Validation Message
retrieveAll is true	Object supports only retrieve operation	Retrieve All Option is not available for this Object.
retrieveAll is true	Object support both retrieve and retrieveAll. And ID's are provided, Which is part of retrieve operation	ID should not be provided for RetrieveAll functionality.
retrieveAll is true	Parent Id is not provided	ID should be provided.
retrieveAll is false or not provided	Object supports only retrieveAll operation	Retrieve Option is not available for this Object.

retrieveAll flag	Scenario	Validation Message
retrieveAll is false or not provided	Object support both retrieve and retrieveAll. Required Id's for retrieve operation is not provided.	Either RetrieveAll should be true or ID should be provided.
retrieveAll is false or not provided	Object support both retrieve and retrieveAll. Count or offset values are set	count and offset are applicable only if retrieveAll is true.

## Results

---

You have configured the MailChimp Batch Retrieve Objects activity.

Note:

MailChimp also supports custom field value update. Please refer section about [Custom fields support](#) for more information.

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type are supported.

## Using the MailChimp Get Batch Status Activity

---

Use the Get Batch Status activity to get summary of batch requests that have been made in MailChimp.

### About this task

Use this task to get batch status in MailChimp instance in just one call. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the MailChimp folder contents.
2. Drag the Get Batch Status activity icon onto the orchestration. Select the activity. The MailChimp Get Batch Status Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MailChimp endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. This is atomic activity so you should see the message "No additional configuration is required for this activity".
11. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MailChimp REST API activities](#).
12. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get Batch Status activity are displayed as nodes under the request input parameter in the To Activity panel.
13. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a

mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

14. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
15. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MailChimp Get Batch Status activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type are supported.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MailChimp\\_get\\_batch\\_status\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MailChimp_get_batch_status_activity.html)

## Using the MailChimp Get Batch Results Activity

---

Use the Get Batch Results activity to read Batch responses from MailChimp. There is no MailChimp API available. However this activity simplifies the user's complexity to parse the batch response. It reads archived gzipped response file and populates the result in Map Outputs. For supported Objects, refer Objects Supported by the MailChimp Connector.

### About this task

---

Use this task to read the Batch responses objects in MailChimp instance. The call to this activity is a synchronous call where the response\_body\_url is sent to the activity for processing and the actual response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the MailChimp folder contents.
2. Drag the Get Batch Results activity icon onto the orchestration. Select the activity. The MailChimp Get Batch Results Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant MailChimp endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Operation Type, Object Type and List Name Browse available. List Name Browse is enable only for Member Object.
11. Click Browse to select the operation type. The Browse MailChimp window is displayed.
12. In the Operation Type Browse MailChimp window, you can select the MailChimp Batch Operation type from the object type list. Click OK.
13. Click Browse to select an object. The Browse MailChimp window is displayed.
14. In the Object Type Browse MailChimp window, you can select the MailChimp Object types from the object type list. Click OK.
15. In the List Name Browse MailChimp window, you can select the MailChimp List Name. Click OK.
16. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for MailChimp REST API activities](#).
17. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Batch Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
18. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

19. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
20. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the MailChimp Get Batch Results activity.

Note:

MailChimp also supports custom field value update. Please refer section about [Custom fields support](#) for more information.

- If user makes an incorrect object selection in Configure panel and Map input, the response would be empty. There is no means to validate the input given by the user. So, if the content of response\_body\_url is not corresponding to the selected batch operation type and object type, the response would be empty.
- "response\_body\_url" is only valid for 10 minutes. If the URL expires, user must rerun the "Get Batch Status" activity to get a new URL.

## Specifying the Retry options for MailChimp REST API activities

---

Specifying the Retry parameters is one of the tasks to configure a MailChimp activity. The MailChimp REST API connector uses a single login session for all connections to the MailChimp REST API endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails. The retrial exceptions include 503 and 504 for this error codes.

### About this task

---

This section contains the procedure for configuring the Retry options for MailChimp REST API activities.

### Procedure

---

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry and timeout options for connecting to an MailChimp instance, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the MailChimp instance.

Retry Fields	Description
Retry __ times before failing.	<p>Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the MailChimp instance before issuing an error and stopping the processing of the current orchestration job.</p> <p>Note: If you deploy an orchestration that contains the MailChimp REST API activity and the Integration Appliance cannot connect to the specified MailChimp instance, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>
Stop processing rest of the records of the batch if failure detected even after the configured no. of retries.	<p>Specifies that if a batch of records is sent as input to an orchestration, and if failure is detected in between, then the remaining records should be processed or not.</p> <p>For example, if the retry count is set to 3 and a batch of 5 records is sent as input to the orchestration. If, after processing the 1st record of batch, the Integration Appliance cannot connect to the specified MailChimp instance even after configured number of retries i.e. 3 retry attempts, then the processing of the remaining 4 records will not be done and execution will be terminated if this option is selected.</p> <p>For the similar settings, if this option is not selected, then the remaining 4 records would be attempted to be processed.</p>

## Overview of Marketo Connector

---

Marketo is a marketing automation platform that enables marketers to manage personalized multi-channel programs and campaigns to prospects and customers. Marketo automates, executes, and measures key marketing and lead management processes along every step of the sales funnel — from lead generation to close.

Marketo supports only cloud environments.

Marketo connector interacts using Restful Web Service API™s, which allow users to access bi-directional data-level integration.

You can perform the following activities using Marketo connector:

- Outbound activities:
  - Create Objects
  - Update Objects
  - Upsert Objects

- o Delete Objects
- o Retrieve Objects
- o Retrieve All Objects
- o Search Objects
- o Get Paging Token
- o Request Campaigns
- o Schedule Campaigns
- o Merge Lead
- o Add Leads to List
- o Remove Leads from List
- o Member of List
- o Import Leads
- o Get Import Lead Status
- o Get Import Error File
- o Get Import Warning File
- o Send Sample Email
- o Update Email Content in editable section
- o Approve Objects
- o Unapprove Objects
- o Discard Objects
- o Clone Objects

The default Marketo API version supported by this connector is v1.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Marketo\\_Overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Marketo_Overview.html)

## Creating or editing an endpoint for Marketo

Endpoints provide the configuration information that the Studio and the Integration Appliance use to connect to Marketo platform. Marketo connector supports only OAuth authentication mechanism so as to authorize users to perform operations. Marketo connector only supports HTTPS connection.

### Selecting or editing a Marketo endpoint

1. In the Create Endpoint or Edit Endpoint pane, configure the Marketo endpoint as described in the following table.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to Marketo successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
Host Name	Host Name for Marketo instance (cloud)
API Version	API version for Marketo instance. Default value: v1
Client Id	OAuth Client Id for accessing Marketo instance
Client Secret	OAuth Client Secret for accessing Marketo instance

Following parameters are required in endpoint test connection screen to make connection via Proxy:

Field Name	Description

Field Name	Description
Host name	Host Name of Proxy Network
Port	Port Number of Proxy Network
User Name	User Name for accessing service via proxy network
Password	Password for accessing service via proxy network

Note: In the Map Input section of each activity, relevant fields of endpoint panel are available to override at runtime. User can provide data to various groups of parameters like Proxy Details, Connection Details or Authentication Details to override. Providing only partial field data in a selected group is not allowed to override.

## Objects Supported by the Marketo Connector

---

Following objects are supported by the Marketo Connector and the API available for the supported object:

Table 2. CRUD Operations

Marketo Objects	Create	Update	Upsert	Delete	Retrieve All	Retrieve	Search
Lead	Yes	Yes		Yes	Yes	Yes	Yes
List					Yes	Yes	Yes
Campaign					Yes	Yes	Yes
Opportunity	Yes	Yes	Yes	Yes			Yes
Company	Yes	Yes	Yes	Yes			Yes
Sales Person	Yes	Yes	Yes	Yes			Yes
Custom Object	Yes	Yes	Yes	Yes			Yes
Opportunity Roles	Yes	Yes	Yes	Yes			Yes
Lead Activity					Yes		
Deleted Leads					Yes		
Lead Changes							Yes
Activity Types					Yes		
Folder	Yes	Yes		Yes	Yes	Yes	Yes
Folder Content					Yes		
Email Template	Yes	Yes		Yes	Yes	Yes	Yes
Email Template Content		Yes				Yes	
Email	Yes	Yes		Yes	Yes	Yes	Yes
Email Content		Yes				Yes	
Email Dynamic Content		Yes				Yes	
Snippet	Yes	Yes		Yes	Yes	Yes	
Snippet Content		Yes				Yes	
Snippet Dynamic Content		Yes				Yes	
File	Yes				Yes	Yes	Yes
Segmentation					Yes		
Segment					Yes		

### Atomic Operations:

- For Leads

- Merge Leads
  - Get Paging Token
- For Lists
  - Remove Leads from list
  - Add Leads to list
  - Member of List
- Bulk APIs for Lead
  - Import Leads
  - Get Import Lead Status
  - Get Import Failure File
  - Get Import Warning File
- For Campaign
  - Schedule Campaign
  - Request Campaign
- For Email
  - Update Email Content in Editable Section
  - Send Sample Email
- For Email, Email Template and Snippet
  - Approve Objects
  - Unapprove Objects
  - Discard Draft Objects
  - Clone Objects

## **Custom Objects support:**

---

Marketo supports Custom Objects. User can define custom object only using Marketo UI. Once custom object is defined, user can use the connector to Create, Update, Upsert, Delete and Search records of custom object.

Since the connector uses XML based input/output only those Custom Objects would be supported whose names meets the following criteria:

- Begin with Alphabet
- Contains only alphanumeric characters
- Special characters only \_ (Underscore)

Note: Custom objects not meeting above criteria would not be listed in the list of objects for activities.

## **Custom Fields support**

---

Marketo supports custom fields only for Lead object and custom objects.

For Create and Update activities, in the Map Inputs of lead object will have additional nodes for custom fields so that user can provide values for them.

For Retrieve, RetrieveAll and Search activity, the response object will have custom fields data if exists.

For example, Lead object Map input/output:

```
company
billingStreet
billingCity
.
.
customField1
customField2
```

# Using the Marketo Create Objects Activity

---

Use the Create Objects activity to create objects in Marketo.

## About this task

---

Use this task to create objects in the Marketo. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Marketo folder contents.
2. Drag the Create Objects activity icon onto the orchestration. Select the activity. The Marketo Create Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Marketo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse Marketo window is displayed.
11. In the Browse Marketo window, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Marketo REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
  - o Different objects have different sets of mandatory fields to create a record. Mandatory fields, if not specified will result into error message listing out missing fields.
  - o For create File, files of types text/html, text/plain are supported. ContentType should be provided with one of this values with data in field called `file`.
- Note:
  - o Create File and Create Email template will need binary data as input parameter for fields `file` and `content` respectively.
  - o In Create File if we try to upload same file again and
    - If `insert only` flag is true then it will throw the error message for duplicate file creation.
    - If `insert only` flag is false then it will execute the request successfully but the file content will not be updated.
  - o Create Custom Activities is not supported. The feature is not enabled in the Marketo Instance hence not implemented. Ticket has been raised with Marketo support team.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Marketo Create Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Object Name (For example: Company) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

## Using the Marketo Update Objects Activity

---

Use the Update Objects activity to update objects in Marketo.

### About this task

---

Use this task to update objects in the Marketo. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Marketo folder contents.
2. Drag the Update Objects activity icon onto the orchestration. Select the activity. The Marketo Update Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Marketo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse Marketo window is displayed.
11. In the Browse Marketo window, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Marketo REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Update Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

Table 1. Mandatory Field Limitations

Field Name	Field	Description
<ul style="list-style-type: none"><li>○ Company</li><li>○ Custom Objects</li><li>○ Opportunity</li><li>○ OpportunityRole</li><li>○ Sales Person</li></ul>	dedupeBy	This field is used for deduplication of data for mentioned list of objects only. It has below permissible values: <ul style="list-style-type: none"><li>○ dedupeFields</li><li>○ idField</li></ul>

### Results

---

You have configured the Marketo Update Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the input (For example: Company) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

## Using the Marketo Upsert Objects Activity

---

Use the Upsert Objects activity to upsert objects in Marketo.

### About this task

---

Use this task to upsert objects in the Marketo. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Marketo folder contents.
2. Drag the Upsert Objects activity icon onto the orchestration. Select the activity. The Marketo Upsert Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Marketo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse Marketo window is displayed.
11. In the Browse Marketo window, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.  
*Note:* For more information, see [Specifying the Retry options for Marketo REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Upsert Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
*Note:* Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

**Mandatory Field:** For Upsert, mandatory field validation on input data will be taken care by API itself.

15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the Marketo Upsert Objects activity.

*Note:*

You can add more than one object as input to this activity. To add more than one object as input, right click the input (For example: Company) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

## Using the Marketo Delete Objects Activity

---

Use the Delete Objects activity to delete an object from Marketo.

### About this task

---

Use this task to delete objects in the Marketo. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Marketo folder contents.
2. Drag the Delete Objects activity icon onto the orchestration. Select the activity. The Marketo Delete Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Marketo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse Marketo window is displayed.
11. In the Browse Marketo window, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Marketo REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Delete Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

Table 1. Mandatory Field Limitations

Field Name	Field	Description
<ul style="list-style-type: none"><li>○ Company</li><li>○ Custom Objects</li><li>○ Opportunity</li><li>○ OpportunityRole</li><li>○ Sales Person</li></ul>	deleteBy	deleteBy is a deletion method which has following permissible values: <ul style="list-style-type: none"><li>○ dedupeFields</li><li>○ idField</li></ul>

For rest of the objects mandatory field validation on input data will be taken care by API itself.

### Results

---

You have configured the Marketo Delete Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the input (For example: Company) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

## Using the Marketo Retrieve Objects Activity

---

Use the Retrieve Objects activity to fetch details of object from Marketo.

### About this task

---

Use this task to retrieve objects based on ID in the Marketo instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Marketo folder contents.
2. Drag the Retrieve Objects activity icon onto the orchestration. Select the activity. The Marketo Retrieve Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Marketo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse Marketo window is displayed.
11. In the Browse Marketo window, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Marketo REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the Marketo Retrieve Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the input (For example: Campaign) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Marketo\\_retrieve\\_objects\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Marketo_retrieve_objects_activity.html)

## Using the Marketo Retrieve All Objects Activity

---

Use the Retrieve All Objects activity to fetch details of object from Marketo.

### About this task

---

Use this task to retrieve all object details in the Marketo instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Marketo folder contents.
2. Drag the Retrieve All Objects activity icon onto the orchestration. Select the activity. The Marketo Retrieve All Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Marketo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse Marketo window is displayed.
11. In the Browse Marketo window, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.

Note: For more information, see [Specifying the Retry options for Marketo REST API activities](#).

The next two points (step 13 and 14) is not applicable for **Activity Type** Object as no input is required for this activity.

13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Retrieve All Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

Table 1. Mandatory Fields

Object Name	Field	Description
Folder Content	FolderId	Is mandatory
Lead Object	<ul style="list-style-type: none"><li>○ retrieveBy</li><li>○ id</li></ul>	<ul style="list-style-type: none"><li>○ Possible values of retrieveBy are ListId and ProgramId</li><li>○ Value of ID will be ID of List or ID of Program whose leads details are required</li></ul>

Object Name	Field	Description
Lead Activity	<ul style="list-style-type: none"> <li>◦ ActivityTypeId</li> <li>◦ nextPageToken</li> </ul>	<ul style="list-style-type: none"> <li>◦ Get Paging Token atomic activity can be used to get the value of nextPageToken.</li> <li>◦ Multiple activityTypeId can be provided in one request as it is unbounded.</li> </ul>
Segments	SegmentationId	Is mandatory

Table 2. Common Parameters

Object Name	Field
offset	Where to begin when retrieving entries. Can be used in conjunction with maxReturn parameter to page through large result sets. Default: 0
maxReturn	Max number of entities to be returned. Default: 20. Maximum: 200.
batchSize	The number of records to be returned in a single call (default and max depends on Marketo API. currently its 300)
nextPageToken	Used to paginate through large result sets

## Results

---

You have configured the Marketo Retrieve All Objects activity.

## Using the Marketo Search Objects Activity

---

Use the Search Objects activity to fetch details of object from Marketo.

### About this task

---

Use this task to search objects based on specified filter value in the Marketo instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Marketo folder contents.
2. Drag the Search Objects activity icon onto the orchestration. Select the activity. The Marketo Search Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Marketo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse Marketo window is displayed.
11. In the Browse Marketo window, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.

Note: For more information, see [Specifying the Retry options for Marketo REST API activities](#).

13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Search Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Marketo Search Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Id (for example: Campaign) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

Also you can add more than one value for fields and filterValues as input to the activity (for example: Lead). To add more than one value as input, right click the **filterValues and fields** in the To Activity pane of Map Inputs, and select Expand Occurrences.

Table 1. Details of input fields

Field Name	Description
filterType	This parameter value depends on supported filter types for object.
filterValues	value which will be used for search operation, user can provide multiple values by expanding this node.
fields	list of field names to be returned in the response. If the fields parameter is not included in this request, the default fields corresponding to objects will be returned.
batchSize	The number of records to be returned in a single call (default and depends on Marketo API. currently its 300)
nextPageToken	Used to paginate through large result sets

## Using the Marketo Get Paging Token Activity

---

Use Get Paging Token activity to get the nextPageToken required for fetching details of Lead Activity Object in Retrieve All Activity in Marketo.

### About this task

---

Use this task to get the nextPageToken required in fetching details of Lead Activity Object of Retrieve All Activity. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.

2. Drag the newly created Marketo endpoint to the orchestration and select Get Paging Token.
3. The Get Paging Token activity will be added to the orchestration. Double click the activity. The Marketo Get Paging Token Checklist is displayed.
4. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Marketo REST API activities](#).
5. Select the Map Inputs in the Checklist. The XML Schemas generated for that operation are displayed as nodes under the request input parameter in the To Activity panel.
6. Create a map between the orchestration variables and the input parameter of the activity.

**Mandatory Fields:** sinceDateTime : Supported datetime format: 2014-10-06T13:22:17-08:00

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

7. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
8. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Marketo Get Paging Token activity.

## Using the Marketo Request Campaigns Activity

---

Use Request Campaigns activity to run an existing Marketo lead in a Marketo Smart Campaign. The Smart Campaign must have a “Campaign is Requested” trigger with a Web Service API source.

### About this task

---

Use this task to run an existing Marketo lead in a Marketo Smart Campaign. The Smart Campaign must have a “Campaign is Requested” trigger with a Web Service API source. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created Marketo endpoint to the orchestration and select Request Campaigns.
3. The Request Campaigns activity will be added to the orchestration. Double click the activity. The Marketo Request Campaigns Checklist is displayed.
4. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Marketo REST API activities](#).
5. Click the Map Inputs in the Checklist. The XML Schemas generated for that operation are displayed as nodes under the request input parameter in the To Activity panel.
6. Create a map between the orchestration variables and the input parameter of the activity.
  - o Mandatory Fields:
    - CampaignId
    - Leads
  - o In Leads, only ID is supported. You can provide multiple leads at one go by expanding the fields.
  - o Token field:
    - It’s an array of name/value pair.
    - The name of the token you want to send a new value for.

- Use the full token format as in the Marketo UI. For example, "{{my.message}} Only My tokens local to a program or folder can be replaced in this way.

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

7. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
8. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Marketo Request Campaigns activity.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Marketo\\_request\\_campaigns\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Marketo_request_campaigns_activity.html)

## Using the Marketo Schedule Campaigns Activity

---

Use Schedule Campaigns activity to schedules a batch Smart Campaign to run either immediately or at a future date.

### About this task

---

Use this task to get the schedules a batch Smart Campaign to run either immediately or at a future date. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created Marketo endpoint to the orchestration and select Schedule Campaigns.
3. The Schedule Campaigns activity will be added to the orchestration. Double click the activity. The Marketo Schedule Campaigns Checklist is displayed.
4. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Marketo REST API activities](#).
5. Click the Map Inputs in the Checklist. The XML Schemas generated for that operation are displayed as nodes under the request input parameter in the To Activity panel.
6. Create a map between the orchestration variables and the input parameter of the activity.
  - Mandatory Fields:
    - Id
  - runAt: The time to run the scheduled campaign. If not provided, schedule it to be 5 mins later.
  - cloneToProgramName : When this attribute is present, the campaign's parent program will be cloned and the newly created campaign will be scheduled.Only 20 calls per day are allowed when this attribute is used.
  - Token field:
    - It's an array of name/value pair.
    - The name of the token you want to send a new value for.
    - Use the full token format as in the Marketo UI. For example, "{{my.message}} Only My tokens local to a program or folder can be replaced in this way.

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

7. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
8. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Marketo Schedule Campaigns activity.

## Using the Marketo Merge Lead Activity

---

Use the Merge Lead activity to merge lead in Marketo.

### About this task

---

Use this task to merge two or more leads. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created Marketo endpoint to the orchestration and select Merge Lead.
3. The Merge Lead activity will be added to the orchestration. Double click the activity. The Marketo Merge Lead Checklist is displayed.
4. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Marketo REST API activities](#).
5. Click the Map Inputs in the Checklist. The XML Schemas generated for that operation are displayed as nodes under the request input parameter in the To Activity panel.
6. Create a map between the orchestration variables and the input parameter of the activity.
  - o Mandatory Fields:
    - Id
    - LeadIds
- Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
7. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
8. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Marketo Merge Lead activity.

Note: You can merge multiple leads at one go using this activity since the input variable is unbounded.

## Using the Marketo Import Lead Activity

---

Use the Import Lead activity to import lead in Marketo.

### About this task

---

Use this task to import leads to a given list in bulk. Leads are synched asynchronously. The response returns a batch id which can be used to get status of the sync.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
  2. Drag the newly created Marketo endpoint to the orchestration and select Import Lead.
  3. The Import Lead activity will be added to the orchestration. Double click the activity. The Marketo Import Lead Checklist is displayed.
  4. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Marketo REST API activities](#).
  5. Click the Map Inputs in the Checklist. The XML Schemas generated for that operation are displayed as nodes under the request input parameter in the To Activity panel.
  6. Create a map between the orchestration variables and the input parameter of the activity.
    - o Mandatory Fields:
      - Format
      - File (File content should be provided in csv, tsv, ssv format for importing lead)
- Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
7. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
  8. Create a map between the output parameters and orchestration variables.

## Results

## Using the Marketo Get Import Lead Status Activity

---

Use the Get Import Lead Status activity to get status of imported lead from Marketo.

### About this task

---

Use this task to get status of lead operation. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created Marketo endpoint to the orchestration and select Get Import Lead Status.
3. The Get Import Lead Status activity will be added to the orchestration. Double click the activity. The Marketo Get Import Lead Status Checklist is displayed.
4. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Marketo REST API activities](#).
5. Click the Map Inputs in the Checklist. The XML Schemas generated for that operation are displayed as nodes under the request input parameter in the To Activity panel.
6. Create a map between the orchestration variables and the input parameter of the activity.
  - o Mandatory Fields:
    - Id

Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
7. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
8. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the Marketo Get Import Lead Status activity.

Note: You can get status of multiple leads at one go using this activity since the input variable is unbounded.

## Using the Marketo Get Import Error File Activity

---

Use the Get Import Error File activity to get error file from Import Lead call in Marketo.

### About this task

---

Use this task to get import error file. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created Marketo endpoint to the orchestration and select Get Import Error File.
3. The Get Import Error File activity will be added to the orchestration. Double click the activity. The Marketo Get Import Error File Checklist is displayed.
4. In the checklist, click Configure. Use the radio button to select appropriate response format among XML and Base64 Encoded String. By Default XML format is selected. If value "XML" is selected, connector would parse the file received in API response and populate the lead structure in XML format along with error/warning messages. Connector will assume that csv returned by market endpoint is in a standard csv format. If option "Base64 Encoded String" is selected, no parsing would be done and the response would return the file as base64 encoded string. This is required for the scenarios where structure of the file is complex and is not a standard csv having a header and details.
5. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Marketo REST API activities](#).
6. Click the Map Inputs in the Checklist. The XML Schemas generated for that operation are displayed as nodes under the request input parameter in the To Activity panel.
7. Create a map between the orchestration variables and the input parameter of the activity.
  - o Mandatory Fields:
    - BatchId
- Note: Values must be provided at run time for the mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
8. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
9. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Marketo Get Import Error File activity.

# Using the Marketo Approve Objects Activity

---

Use the Approve Objects activity to approve Email, Email Template and Snippet in Marketo.

## About this task

---

Use this task to approve objects in the Marketo instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Marketo folder contents.
2. Drag the Approve Objects activity icon onto the orchestration. Select the activity. The Marketo Approve Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Marketo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse Marketo window is displayed.
11. In the Browse Marketo window, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Marketo REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Approve Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
  - o Mandatory Field: ID
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Marketo Approve Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the id field in the To Activity pane of Map Inputs, and select Expand Occurrences.

# Using the Marketo Unapprove Objects Activity

---

Use the Unapprove Objects activity to un-approve Email, Email Template and Snippet in Marketo.

## About this task

---

Use this task to un-approve objects in the Marketo instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Marketo folder contents.
2. Drag the Unapprove Objects activity icon onto the orchestration. Select the activity. The Marketo Unapprove Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Marketo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse Marketo window is displayed.
11. In the Browse Marketo window, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Marketo REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Unapprove Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
  - o Mandatory Field: ID
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Marketo Unapprove Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the id field in the To Activity pane of Map Inputs, and select Expand Occurrences.

## Using the Marketo Discard Objects Activity

---

Use the Discard Objects activity to discard Email, Email Template and Snippet in Marketo.

## About this task

---

Use this task to discard objects in the Marketo instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Marketo folder contents.
2. Drag the Discard Objects activity icon onto the orchestration. Select the activity. The Marketo Discard Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Marketo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse Marketo window is displayed.
11. In the Browse Marketo window, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Marketo REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Discard Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
  - o Mandatory Field: ID
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Marketo Discard Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the id field in the To Activity pane of Map Inputs, and select Expand Occurrences.

## Using the Marketo Clone Objects Activity

---

Use the Clone Objects activity to make clone of Email, Email Template and Snippet in Marketo.

### About this task

---

Use this task to clone objects in the Marketo instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Marketo folder contents.

2. Drag the Clone Objects activity icon onto the orchestration. Select the activity. The Marketo Clone Objects Checklist is displayed.
3. In the checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Marketo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the checklist, click Configure.
10. Click Browse to select the object type. The Browse Marketo window is displayed.
11. In the Browse Marketo window, you can select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes.  
Note: For more information, see [Specifying the Retry options for Marketo REST API activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Clone Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
  - o Mandatory Field: ID
  - o Folder input: Type field of Folder field can accept two values: Folder and Program.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Marketo Clone Objects activity.

Note:

You can add more than one object as input to this activity. To add more than one object as input, right click the Object Name (for example, Email) field in the To Activity pane of Map Inputs, and select Expand Occurrences.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Marketo\\_clone\\_objects\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Marketo_clone_objects_activity.html)

## Specifying the Retry options for Marketo REST API activities

---

Specifying the Retry parameters is one of the tasks to configure a Marketo activity. The Marketo REST API connector uses a single login session for all connections to an Marketo REST API endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails. The retriable exceptions include 503 and 504 for this error codes.

## About this task

---

This section contains the procedure for configuring the Retry options for Marketo REST API activities.

## Procedure

---

1. Select the Retry task from the Checklist. The retry pane is displayed.

2. Configure the retry and timeout options for connecting to a Marketo instance, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Marketo instance.
Retry __ times before failing.	Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the Marketo instance before issuing an error and stopping the processing of the current orchestration job. Note: If you deploy an orchestration that contains the Marketo REST API activity and the Integration Appliance cannot connect to the specified Marketo instance, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
Stop processing rest of the records of the batch if failure detected even after the configured no. of retries.	Specifies that if a batch of records is sent as input to an orchestration, and if failure is detected in between, then the remaining records should be processed or not.  For example, if the retry count is set to 3 and a batch of 5 records is sent as input to the orchestration. If, after processing the 1st record of batch, the Integration Appliance cannot connect to the specified Marketo instance even after configured number of retries i.e. 3 retry attempts, then the processing of the remaining 4 records will not be done and execution will be terminated if this option is selected.  For the similar settings, if this option is not selected, then the remaining 4 records would be attempted to be processed.

## Services Provided

---

Microsoft Dynamics AX is a multi-language, multi-currency enterprise resource planning (ERP) business solution with comprehensive global business management features for financial, human resources, and operations management as well as additional industry capabilities for retailers, professional service industries, financial service businesses, manufacturers, and public sector organizations..

Following is the overview of the services provided from MS Dynamics AX end.

- Financial Management
- Manufacturing
- Sales and Marketing
- Project Accounting
- Supply Chain Management
- Human Resource Management
- Service Management
- Business Intelligence and Reporting
- Compliance Management
- Collaborative Workspace
- Mobility

Microsoft AX customer base comprises of Large Enterprise and Mid-size business owners

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MS\\_Dyn\\_AX\\_services\\_provided.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MS_Dyn_AX_services_provided.html)

## Authentication supported

---

The IBM Cast Iron connector for AX 2012 will support NTLM version 1.0 as the authentication type.

In NTLM authentication, users are authenticated against their windows credentials.

While creating an Endpoint for the Cast Iron for MS AX connector, user should provide an already Configured windows authentication to authenticate against the server.

## Creation and Deployment of new port on IIS

---

Microsoft Dynamics AX connector will only consume the services which are created inside Dynamics AX Application and hosted on IIS manager. New Port has to be created using a HTTP adapter.

### Create Port over HTTPS service

---

Steps for port creation:

1. Open Microsoft Dynamics AX 2012 application, go to System Administration form.
2. Navigate to Service and Application Integration Framework, click on Inbound port.
3. Click on New button.
4. Fill in the below mentioned fields:
  - a. Port Name – enter a unique name for the port.
  - b. Select Adapter as HTTP.
  - c. For the URI
    - i. Click on the drop down. A small window Select Web site will pop-up.
    - ii. Click on the drop down and select the https website.
    - iii. Click OK.
  - d. Click on Configure button (present above the URI drop down).
    - i. In case a message pops-up, click Yes.
    - ii. Click on Bindings under Configuration section.
    - iii. Click on Create New Binding Configuration link under configuration section. Create a New Binding window appears.
    - iv. Click on the option basicHttpBinding from the list.
    - v. Click on OK.
    - vi. Select the new binding created.
    - vii. In the Security tab, set Mode as Transport by choosing the option from Mode's drop down list.
    - viii. In the Security section, set Transport Client credential type as Ntlm from the drop down list.
    - ix. In configuration section, expand the node Services.
    - x. Expand the service node in it to get Endpoints node.
    - xi. Select and right click on the Endpoints node.
    - xii. Click on New Service Endpoint option.
    - xiii. In the new service endpoint configuration, enter valid name.
    - xiv. Select basicHttpBinding created in step (iv).
    - xv. For binding, choose the new binding created in step (v).
    - xvi. Expand the node Advanced under Configuration section.
    - xvii. Expand the sub node Service Behaviors.
    - xviii. Expand the sub node routingServiceBehavior.
    - xix. Select the sub node serviceMetaData.
    - xx. Change the value for HttpsGetEnabled to true from the default value false.
    - xxi. Close the window. A pop-up would appear for saving the changes. Click Yes.
  - e. Under the Service contract customization, click on the Service operations button.
    - i. Select the service operations which you want to invoke.
    - ii. Click on Close.
5. Click on the Activate button in the main menu, to activate the port.
6. After port activation note down WSDL URI. For example,  
<https://<hostname>:443/MicrosoftDynamicsAXAif60/FixedAssetTest/xppservice.svc>
7. Add ?wsdl to the URI and check if you can access this URI on local browser.

### Create Port over HTTP service

---

Steps for port creation:

1. Open Microsoft Dynamics AX 2012 application, go to System Administration form.
2. Navigate to Service and Application Integration Framework, click on Inbound port.
3. Click on New button.
4. Fill in the below mentioned fields:
  - a. Port Name – enter a unique name for the port.
  - b. Select Adapter as HTTP.

- c. For the URI
    - i. Click on the drop down. A small window Select Web site will pop-up.
    - ii. Click on the drop down and select the http website.
    - iii. Click OK.
  - d. Click on Configure button (present above the URI drop down).
    - i. In case a message pops-up, click Yes.
    - ii. Expand Bindings and select basicHttpBinding.
    - iii. On the right-hand panel, go to Security tab. Set TransportClientCredentialType as *Ntlm*.
    - iv. Close the window. A pop-up would appear for saving the changes. Click Yes.
  - e. Under the Service contract customization, click on the Service operations button.
    - i. Select the service operations which you want to invoke.
    - ii. Click on Close.
5. Click on the Activate button in the main menu, to activate the port.
6. After port activation note down WSDL URI. For example,  
<http://<hostname>:8085/AXHttpAppPool/AssetConditionService/xppservice.svc>
7. Add ?wsdl to the URI and check if you can access this URI on local browser.

## Endpoint Details

---

Following will be endpoint details, if you consider WSDL URI as  
<http://<XYZ>:8085/AXHttpAppPool/AssetConditionService/xppservice.svc?wsdl>

- Host Name: XYZ
- Port Number: 8085
- Application Pool: AXHttpAppPool
- Port Name: AssetConditionService

Add authentication details.

Add proxy details, if required.

For HTTPs Service, add details in Security Panel.

Click on Download/Update WSDL button. After downloading the WSDL from Endpoint, You can move forward and invoke service.

## Creating a MS Dynamics AX Endpoint in Cast Iron

---

MS Dynamics AX 2012 Endpoint contains the information that the connector requires connect to the MS AX 2012 service.

Note: Any changes you make to the MS Dynamics AX Endpoint affects all the orchestrations that use that Endpoint, as the edits are global, not local.

1. In the Cast Iron project tab, right click the Endpoints option and select Create Endpoint
2. Select the MS Dynamics AX option from the drop down. The Endpoint connection panel will be displayed.
3. Fill in the following connection parameters in the Connection Details panel

Field Name	Description
Host Name	Specifies the machine name hosting the AX 2012 service
Port Number	Specifies the PORT no at which the WSDL is available
Application Pool	Specifies the IIS configuration name on the machine hosting MS AX 2012 server
Port Name	Specifies the name of the port created on the AX instance for configuring the WSDL.

- 
1. Click on the Download WSDL. The WSDL is downloaded.
  2. Provide the parameters in the Authentication section and save the Endpoint.

Field Name	Description
Domain	Specifies the domain in which the MS AX 2012 server is Configured
Username	Specifies the username used to connect to the MS AX 2012 service
Password	Specifies the password used to connect to the MS AX 2012 service

The saved Endpoint will be visible under the Endpoints section.

## Using the MS Dynamics AX Invoke service Activity

---

This section covers the steps to use the MS AX 2012 Endpoint created in the above step.

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS AX 2012 Endpoint to the orchestration and select Invoke Service.
3. The Invoke service Activity is added to the orchestration. Double click the Activity.
4. Click the Configure option in the checklist menu.
5. The respective operations are populated in the WSDL operations section.
6. Click any one operation from the WSDL operation section.
7. Click the Map inputs. The XML schemas generated for that operation are displayed.
8. Create a map between the orchestration variables and the input parameter of the Activity

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the Activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the Activity is displayed as nodes under the response output parameter in the From Activity panel.

The MS AX 2012 connector Invoke Service Activity is Configured.

Similar process has to be executed for Verifying the different WSDL operations for the selected service.

## Connector Operations

---

A service operation is a named set of functionality that is offered by a service. For example, the service operation that creates a new sales order is named SalesSalesOrderService.create. A service can expose multiple service operations. The service operations that a service exposes can include custom service operations. The following table describes some of the common service operations for document services.

Following operations would be performed by MS Dynamics AX 2012 R3 connector:

<b>Op era tion</b>	<b>Description</b>
Create	This operation creates a record for a new item in the database. For example, for the sales order service, this operation creates a new sales order. Usually, this operation responds with an entity key that contains the ID of the new item. The new record that is created uses the field values from the record in the message.  An integration port can be Configured to replace existing documents when this service operation is called.
Delete	This operation deletes a record in the database. Only records in child tables can be deleted
Find	This operation searches for the specified database record.
FindKeys	This operation retrieves a list of entity keys that correspond to the specified search criteria. For example, a request can contain a query for customers whose last name starts with the letter T. The response to this query contains a list of key fields and values that you can use to query again for additional data. For example, you can use the key fields to update each customer record in the list that you retrieved.
Read	This operation retrieves the specified records from the database. The records that must be read are specified by using entity keys. The response contains the data for the records that are returned.
Update	This operation updates a record in the database. Only the fields for whom the values are provided in the message are updated. Values for all other database fields remain unchanged.
get Keys	This operation retrieves the keys for documents based on a document filter
get ChangeKeys	This operation retrieves the keys for documents based on a document filter and a date that is passed in.

[Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MS\\_Dyn\\_AX\\_services.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MS_Dyn_AX_services.html)

## Advance shipping notice

---

An advance ship notice or advance shipping notice (ASN) is a notification of pending deliveries, similar to a packing list. It is usually sent in an electronic format and is a common EDI document.

ASN enables external systems to receive information about shipments. The ASN document is a delivery confirmation and is used to notify a customer about an expected delivery. The ASN is typically generated based on information that is available when a shipment has left the warehouse, and it can be triggered when you post a packing slip in Microsoft Dynamics AX.

1. Create a new port for "Advanced Shipping Notice" service on IIS.
2. Add new "MS Dynamics AX" Endpoint in Cast Iron studio.
3. Download the "Advance shipping notice" WSDL.
4. Click and drag the Endpoint created to the orchestration.
5. Select the "Invoke" service.
6. Click on the service and then click "Configure".
7. Select a service from the list of services.
8. Provide values for the parameters in the Map inputs page.
9. Right click on the service and select the "Verify Activity" option.
10. Results will be displayed in the Verify tab.

## Fixed Asset

---

**Fixed assets** are items of value, such as buildings, vehicles, land, and equipment, which are owned by an individual or corporation. You can set up and enter acquisition information for fixed asset records, and then manage fixed assets by depreciating them and setting a capitalization threshold to determine depreciation. You can calculate adjustments to the **fixed assets**, and also dispose of them.

## Vendor Group

---

The Vendor portal is a website where you, as an approved vendor for an organization, can interact with your customer. In the Vendor portal, you can maintain your vendor profile information and process transactions with the customer organization. The tasks that an employee in your organization can complete in the Vendor portal are determined by the user role that is assigned to the employee. User roles are assigned when users are granted access to the website. This service enables synchronization of vendor groups with external systems.

## Exchange Rate

Exchange Rate service enables you to send your exchange rates to another subsidiary. Different sets of Exchange rates could be segregated into different Exchange Rate types. So, different exchange rate types could be used for different purpose.

Exchange rate types are a grouping that allows different exchange rates for two currencies. These exchange rates are used to convert the transactions like purchase, Sell, etc.

1. Create a new port for "Exchange Rates" service on IIS.
2. Add new "MS Dynamics AX" Endpoint in Cast Iron studio.
3. Download the "Exchange Rate" WSDL.
4. Click and drag the Endpoint created to the orchestration.
5. Select the "Invoke" service.
6. Click on the service and then click "Configure".
7. Select a service from the list of services.
8. Provide values for the parameters in the Map inputs page.
9. Right click on the service and select the "Verify Activity" option.
10. Results will be displayed in the Verify tab.

## Sales invoice

---

A sales invoice for a sales order is an invoice that is attached to a sales order. It contains a header and one or more lines for items or services. The sales invoice finishes the sales order, packing slip, and sales invoice cycle. This service sends an invoice to a customer. The invoice is based on the sales order data of the customer.

## Vendor payment

---

Prepayments are a common business practice, with organizations issuing prepayments to vendors for goods or services before those goods or services are fulfilled. To minimize risk, you can track prepayments by defining the prepayment on a purchase order. Vendors can also create a prepayment invoice that is associated with a purchase order. This service makes it easier for organizations to complete, manage and track prepayments to vendors.

## Services Provided

Microsoft Dynamics GP is a multi-language, multi-currency enterprise resource planning (ERP) business solution with comprehensive global business management features for financial, human resources, and operations management as well as additional industry capabilities for retailers, professional Service industries, financial Service businesses, manufacturers, and public sector organizations.

Following is the overview of the Services provided from MS Dynamics GP end.

- Financial Management
- Manufacturing
- Sales and Marketing
- Project Accounting
- Supply Chain Management
- Human Resource Management
- Service Management
- Business Intelligence and Reporting

- Compliance Management
- Collaborative Workspace
- Mobility

Microsoft GP customer base comprises of Large Enterprise and Mid size business owners

## Microsoft Dynamics 2013 Object Categories

The number of objects available is quite large and hence they are divided into three categories. Following are the objects that represent the categories.

- Business Document Objects: These are the objects that represent business documents in Microsoft Dynamics GP. Those are:
  - Customer
  - Vendor
  - CreditLimit
  - Account
  - SalesInvoice
  - Applicant
- Base Objects: This object serves as the basis for each specific type of object. Those are
  - Business Objects
  - Key
  - Criteria
  - Restriction
- Helper Objects: Some objects are included simply to help you work with the Dynamics GP Service. They perform actions such as controlling how the Service is called, or dealing with errors that occur during processing. Those are
  - Context

- Policy
- ExceptionInformation
- ValidationItem

## Authentication supported

---

The IBM Cast Iron connector for GP 2013 will support NTLM version 1.0 as the authentication type.

In NTLM authentication, users are authenticated against their windows credentials.

Pre-requisites:

While creating an Endpoint for the Cast Iron for MS GP connector, user should provide an already Configured windows authentication to authenticate against the GP server.

## Creating a GP Endpoint in Cast Iron

---

MS Dynamics GP 2013 Endpoint contains the information the connector requires to connect to the MS GP 2013 Service.

Any changes you make to the MS Dynamics GP Endpoint, affects all the orchestrations that use that Endpoint, as the edits are global, not local.

1. In the Cast Iron project tab, right click the Endpoints option and select Create Endpoint
2. Select the MS Dynamics GP option from the drop down. The Endpoint connection panel will be displayed.
3. Fill in the following connection parameters in the Connection Details panel.
4. Connection Details

Field Name	Description
Host Name	Specifies the machine name hosting the GP 2013 Service
Port Number	Specifies the port at which the GP Service is available
URI	Specifies the base URI for the GP WSDL. BY default, it is for the legacy webService. For custom web Service, the user will have to modify it accordingly.

1. Click on Download WSDL button. The WSDL is downloaded.
2. Provide the parameters in the Authentication section and save the Endpoint.

Field Name	Description
Domain	Specifies the domain in which the MS GP 2013 Service is Configured
Username	Specifies the username used to connect to the MS GP 2013 Service
Password	Specifies the password used to connect to the MS GP 2013 Service

The saved Endpoint will be visible under the Endpoints section.

## Using the MS Dynamics GP Invoke Service Activity

This section covers the steps to use the MS GP 2013 Endpoint created in the above step.

1. Right click the Orchestrations section and select new orchestration.
2. Drag the newly created MS GP Endpoint to the orchestration and select Invoke Service.
3. The Invoke Service Activity is added to the orchestration. Double click the Activity.
4. Click the Configure option in the checklist menu.
5. From the WSDL Operations drop down, select any operation.
6. The operation is selected and respective operation for all objects are populated in the WSDL operations section.
7. Click any one operation from the WSDL operation section.
8. Click the Map inputs. The XML schemas generated for that operation are displayed.
9. Create a map between the orchestration variables and the input parameter of the Activity

Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the Activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

1. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the Activity is displayed as nodes under the response output parameter in the From Activity panel.

The MS GP 2013 connector Invoke Service Activity is Configured.

Similar process has to be executed for Verifying the different WSDL operations for the selected standard operations.

## Connector Operations

Following operations would be performed by Microsoft Dynamics GP 2013 connector:

Op	Description
----	-------------

era tio n	
Create	This method adds new data to Dynamics GP and use objects to specify the type of data being created and the values to be saved.
Get By Key	When objects are retrieved individually, user must specify the unique key value for the object you want to retrieve. The "GetByKey" methods in the Dynamics GP Service are used to retrieve individual objects
Get List	When objects are returned as a list, you will supply a set of criteria that indicate which objects you want to retrieve. The Dynamics GP Service has criteria objects that you will use to specify criteria. The "GetList" methods in the Dynamics GP Service are used to retrieve lists of objects.
Update	The "Update" methods are used to change the values of an existing object's properties. The object is used as a parameter for this operation.
Delete	The "Delete" methods are used to delete the object based on key values provided.
Void	The "void" methods are used to void the object but does not delete the object.
