

The IBM logo is centered on a white background. It consists of the letters 'IBM' in a bold, blue, sans-serif font. The background features decorative blue and white curved lines that create a sense of motion and depth, framing the central text.

**IBM**

---

# 目錄

<b>Getting Started with IBM Cast Iron</b>	<b>1</b>
What's New for This Release	1
Introduction	2
Development Environment	3
Development process example	4
Integration Appliance	5
Web Management Console	5
Studio	6
The Project tab	7
The Activities tab	9
The Variables tab	10
The Functions tab	10
The Verify tab	11
Understanding nodes and mappings	13
Understanding parameters	14
Installation and configuration	14
Deployment concepts	15
About configurations	16
Before developing your projects	17
Planning an Integration Project	18
Translating project requirements into Studio components	19
Integration appliance configuration tips	19
Studio best practices	20
Glossary	22
Legal information	24
Notices	25
Terms and conditions for information centers	28
<b>Cast Iron Studio</b>	<b>28</b>
IBM Cast Iron Studio	28
Working with projects	29
Studio basics	31
Creating a new project	36
Protecting a project with a password	37
Changing a password associated with a project	38
Removing a password associated with a project	38
Opening a Project	39
Saving a Project	40
Renaming a Project	41
Publishing a Project	41
Exporting a Project	42

Configuring Project Settings	43
Setting Preferences	44
Project Preferences	45
Orchestration Preferences	46
Other Preferences	47
Creating Configuration Properties	50
Editing Configuration Properties	52
Creating Global Configuration Properties	53
Searching for Template Integration Projects (TIPs)	54
Installing Module Provider Libraries	55
Uploading Files into a Project	55
Uploading Files into a Project using the Mouse	56
Uploading Files into a Project using the Add Document Button	57
Uploading Included XML Schemas	58
Specifying the Location of a File to Upload	62
Valid External File Types for a Project	63
About Valid Names	64
Undo and Redo Operations	66
Updating a Changed XML Schema	66
Using the Project Explorer	68
Using the HTTP Post Utility	68
Orchestrations	69
Configuring an orchestration to orchestration connection	71
Creating an orchestration	72
Renaming an orchestration	72
Building an orchestration	73
Verifying orchestrations	73
Using SSL in Studio	75
Importing an end-entity certificate	77
Importing a Certification Authority (CA) Certificate	78
SSL server authentication	79
Testing an SSL server connection	80
SSL client authentication	81
Using the Log Viewer	81
Viewing an orchestration	82
Validating an orchestration	83
Working with activities in an orchestration	85
Printing an orchestration	87
Processing orchestration jobs sequentially	87
Enabling persistence	88
Adding a global exception handler to an orchestration	90
Saving an image of an orchestration	91
Connection Activities	92
Creating an endpoint	92
Downloading plug-in connectors	93
Using an existing endpoint	94
Polling interval behavior	95
Using the Shift-JIS encoding	96

Template Integration Process (TIPs)	97
About the Template Integration Project (TIP) Configuration Editor	97
Creating a Template Integration Project (TIP)	98
Modifying a Template Integration Project (TIP)	100
Verifying a Template Integration Project (TIP)	100
Searching for Template Integration Projects (TIPs)	54
Rating and Reviewing Template Integration Projects (TIPs)	102
Rating and Reviewing Template Integration Projects (TIPs) using the Publish Review Dialog box	102
Uploading Template Integration Projects (TIPs) to the Cast Iron solutions repository	103
Transform Activities	105
Map Variables Activity	106
Read MIME activity	107
Adding a Read MIME activity to an orchestration	108
Mapping the input of the activity	108
Mapping the output to an activity	110
Write MIME activity	111
Adding a Write MIME activity to an orchestration	112
Mapping the input of the activity	112
Mapping the output to an activity	115
Read XML activity	115
Read XML activity configuration	116
Read XML map inputs	117
Read XML map output	118
Write XML activity	118
Write XML activity configuration	119
Write XML map inputs	120
Write XML map output	120
Validate XML activity	121
Adding a Validate XML activity to an orchestration	122
Configuring a Validate XML activity	123
Mapping the input to an activity	124
Mapping the output to an activity - Validate XML	124
Read JSON activity	126
Read JSON activity configuration	127
Read JSON map inputs	127
Read JSON map output	128
Write JSON activity	129
Write JSON activity configuration	130
Write JSON map inputs	131
Write JSON map output	132
Validate JSON activity	132
Adding a Validate JSON activity to an orchestration	133
Configuring a Validate JSON activity	134
Mapping the input to an activity - Validate JSON	135
Mapping the output to an activity - Validate JSON	135
Read Flat File activity	137
Read Flat File activity configuration	138
Read Flat File map inputs	138

Read Flat File map outputs	139
Write Flat File activity	140
Write Flat File activity configuration	141
Write Flat File map inputs and outputs	142
Apply XSLT activity	143
Logic Activities	144
Logic activities overview	145
Terminate activity	146
Pick activity	146
If..Then activity	148
Try activity	149
Group activity	151
While Loop activity	152
For Each activity	152
Break Loop activity	153
Continue activity	155
Adding branches to the If..Then activity	155
Moving branches	156
Defining conditions	157
Basic condition syntax	158
bpws:getVariableData function	159
Basic XPath expressions	159
Testing XPath expressions	162
Utilities Activities	164
Create Job Keys Activity	165
Creating Job Keys	166
Log Message activity	167
Schedule Job activity	168
Archives Activities	169
Archive activity	169
Adding an Archive activity	170
Configuring an Archive activity	170
Archive activity map input	172
Archive activity map output	174
Unarchive Activity	174
Adding an Unarchive activity	176
Unarchive activity map input	176
Unarchive activity map output	177
Cryptoservice Activities	178
Overview of the PGP activities	179
Using the PGP Encrypt activity	180
Using the PGP Decrypt activity	181
Importing PGP keys	183
Troubleshooting and support	184
Data Quality Activities	184
About Data Quality Activities	185
Filter and Profile Activity	186
Configuring the Filter and Profile activity	186

Mapping Filter and Profile activity outputs	187
Creating Profile Summaries	187
Filtering Expressions	189
Creating a filter expression	189
Adding a filter expression condition	190
Deleting a filter expression condition	190
Editing a filter expression condition	191
Changing the processing order of filter expression conditions	191
Lookup Activity	192
Using the Lookup activity	193
Mapping Lookup activity outputs	195
Sort Activity	195
Merge Activity	196
Merging two sorted inputs	198
Database Activities	199
Creating or Editing a Database Activity Endpoint	201
Browsing Database Tables	206
Character Encodings	206
Database Entities and Activities	207
Defining Columns for Old Values in Updates	209
MaxPooledStatements Parameter	211
Oracle, Sybase, DB2, and Informix Parameters	212
Retry Options For Inbound Database Activities	213
Retry Options For Outbound Database Activities	215
SequeLink Parameters	216
Single-Table Inbound Database Activities	217
Single-Table Outbound Database Activities	221
Specifying Delivery Rules for Database Activities	226
Viewing Column Details	228
Working with Database Parameters	229
Call Procedure Activity	229
Execute Query Activity	232
Poll Table Activity	235
Testing an SSL Database Connection	240
Domino Activities	240
Overview of the Domino connector	242
Creating or editing an endpoint for a Domino activity	243
Creating a Domino document	245
Updating a Domino document	248
Retrieving a Domino document	251
Querying Domino documents	254
Querying views for Domino documents	259
Deleting a Domino document	261
Specifying Retry and Delivery Options for Domino activities	264
Prerequisites to use Domino inbound activities	265
Get Created Documents activity	267
Get Updated Documents activity	268
Get Deleted Documents activity	270

Handling Date/Time and Time zone data types	271
Rich text support for Domino connector	272
Troubleshooting and support	273
Email Activities	274
Creating or editing an email endpoint	274
Get Email activity	277
Send Email activity	281
Testing an SSL email connection	285
Force.com Bulk API Activities	286
Preparing Data for the Force.com Bulk API connector	287
Creating a Force.com Bulk API endpoint	288
Specifying the Retry options for Force.com Bulk API activities	289
Using the Force.com Bulk API Batch Insert activity	290
Using the Force.com Bulk API Batch Update activity	291
Using the Force.com Bulk API Batch Upsert activity	292
Using the Force.com Bulk API Batch Delete activity	294
Using the Force.com Bulk API Get Batch Status activity	295
Using the Force.com Bulk API Get Batch Results activity	296
FTP Activities	297
Creating or Editing an FTP endpoint	298
Configuring the FTP endpoint for the Parse Directory Listing Example	300
FTP Poll Directory activity	303
FTP Put File activity	310
FTP Get File activity	315
Parse directory listing example	321
Testing an FTPS server connection	323
HTTP Activities	324
Creating or editing an HTTP endpoint	325
HTTP Receive Request activity	330
Decompression with the HTTP Receive Request activity	335
HTTP Send Response activity	337
Compression/Decompression with the HTTP Send Response activity	341
HTTP Post Request activity	343
HTTP Get Request activity	350
HTTP Head Request activity	356
HTTP Invoke Request activity	363
HTTP Put Request activity	370
HTTP Delete Request activity	376
Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity	383
Troubleshooting and support	387
JDE Activities	389
Overview of the JD Edwards (JDE) connector	390
Creating or editing an endpoint for a JDE activity	390
Importing JDE Libraries	391
Installing JAR files to connect to the JDE server	393
Using the JDE Invoke Business Function activity	394
Using the JDE Poll Real-Time Events activity	395
Specifying Retry and Delivery Options for JDE Activities	396

JMS Activities	398
Creating or editing a JMS endpoint	399
Specifying delivery rules and retry parameters for JMS activities	400
Specifying delivery rules parameters for JMS activities	401
Specifying retry parameters for JMS activities	402
Get Message activity	402
Adding a JMS activity to an orchestration	403
Changing the Activity Name	404
Picking a JMS endpoint	404
Configuring the Get Message activity	404
Mapping the Inputs	405
Mapping the Outputs	406
Poll Message activity	407
Adding a JMS activity to an orchestration	408
Changing the Activity Name	408
Picking a JMS endpoint	408
Configuring the Poll Message activity	409
Mapping the Outputs	410
Publish Message activity	410
Adding a JMS activity to an orchestration	411
Changing the Activity Name	411
Picking a JMS endpoint	412
Configuring the Publish Message activity	412
Mapping the Inputs	413
Send Message activity	414
Adding a JMS activity to an orchestration	414
Changing the Activity Name	415
Picking a JMS endpoint	415
Configuring the Send Message activity	416
Mapping the Inputs	416
Subscribe Message activity	417
Adding a JMS activity to an orchestration	418
Changing the Activity Name	418
Picking a JMS endpoint	419
Configuring the Subscribe Message activity	419
Mapping the Outputs	420
Creating a JMS endpoint to a WebLogic server	421
MQ Activities	422
Creating or editing a MQ Activity endpoint	423
Installing JAR files to connect to the MQ system	424
Defining and loading an XML schema for a MQRFH2 header	425
MQ Get Message activity	426
MQ Put Message activity	431
MQ Poll Queue activity	434
MQRFH2 XML data and schema examples	436
NetSuite Activities	440
Creating or editing a NetSuite endpoint	441
Add Records activity	442

Using the Add Records activity	443
Mapping the inputs for the Add Records activity	444
Mapping the outputs for the Add Records activity	444
Attach Records activity	445
Using the Attach Records activity	446
Mapping the inputs for the Attach Records activity	447
Mapping the outputs for the Attach Records activity	447
Delete Records activity	448
Using the Delete Records activity	448
Mapping the inputs for the Delete Records activity	449
Mapping the outputs for the Delete Records activity	450
Detach Records activity	450
Using the Detach Records activity	451
Mapping the inputs for the Detach Records activity	452
Mapping the outputs for the Detach Records activity	453
Get Records activity	453
Using the Get Records activity	454
Mapping the inputs for the Get Records activity	455
Mapping the outputs for the Get Records activity	455
Initialize Record activity	456
Using the Initialize Record activity	457
Mapping the inputs for the Initialize Records activity	458
Mapping the outputs for the Initialize Records activity	459
Search Records activity	459
Using the Search Records activity	460
Mapping the inputs for the Search Records activity	461
Mapping the outputs for the Search Records activity	462
Update Records activity	462
Using the Update Records activity	463
Mapping the inputs for the Update Records activity	464
Mapping the outputs for the Update Records activity	465
Upsert Records Activity	465
Using the Upsert Records activity	465
Mapping the inputs for the Upsert Records activity	467
Mapping the outputs for the Upsert Records activity	467
Oracle CRM On Demand Activities	468
Creating or editing an Oracle CRM On Demand endpoint	468
Specifying the Retry options for Oracle CRM On Demand activities	469
Using the Oracle CRM On Demand Insert Object activity	471
Using the Oracle CRM On Demand Update Object activity	472
Using the Oracle CRM On Demand Query Object activity	473
Using the Oracle CRM On Demand Delete Object activity	474
Oracle E-Business Suite Activities	476
Overview of the Oracle E-Business Suite connector	477
Installing JAR files to connect to Oracle E-Business Suite	477
Creating or editing an endpoint for an Oracle E-Business Suite activity	478
Using the Oracle E-Business Suite Create Objects activity	479
Using the Oracle E-Business Suite Update Objects activity	481

Using the Oracle E-Business Suite Delete Objects activity	482
Using the Oracle E-Business Suite Retrieve Objects activity	483
Specifying Retry and Delivery options for Oracle E-Business Suite activities	485
PeopleSoft activities	486
Overview of the PeopleSoft connector	487
Creating or editing an endpoint for a PeopleSoft activity	488
Installing JAR files to connect to the PeopleSoft server	490
Using the PeopleSoft Create Component Interface activity	490
Using the PeopleSoft Update Component Interface activity	492
Using the PeopleSoft Delete Component Interface activity	493
Using the PeopleSoft Get Component Interface activity	495
Using the PeopleSoft Find Component Interface activity	496
Creating events table and compiling PeopleSoft JAR files	497
Using the PeopleSoft Get Created Component Interface activity	500
Using the PeopleSoft Get Updated Component Interface activity	501
Using the PeopleSoft Get Deleted Component Interface activity	502
Specifying retry and Delivery Options for PeopleSoft Activities	504
RightNow SOAP API Activities	505
Overview of the RightNow SOAP API connector	506
Creating and editing a RightNow SOAP API endpoint	507
Using the RightNow SOAP API Create Objects activity	508
Using the RightNow SOAP API Get Objects activity	509
Using the RightNow SOAP API Update Objects activity	510
Using the RightNow SOAP API Destroy Objects activity	512
Using the RightNow SOAP API Query Objects activity	513
Specifying retry parameters for RightNow SOAP API activities	514
Salesforce.com activities	515
Creating or editing a Salesforce.com endpoint	517
Configuring Salesforce.com activities	519
Migrating Salesforce.com projects	520
Setting Salesforce.com configuration properties	521
Specifying the Retry and Time Out parameters for Salesforce.com activities	521
Understanding and setting polling preferences for the Salesforce.com connector	522
Convert Lead activity	523
Map the input of the Convert Lead activity	524
Map the output of the Convert Lead activity	525
Set password activity	525
Reset password activity	526
Send email activity	528
Create Objects activity	529
Map the input of the Create Objects activity	529
Map the output of the Create Object activity	530
Delete Objects activity	531
Map the input of the Delete Objects activity	532
Map the output of the Delete Object activity	532
Get Deleted Objects	533
Map the input of the Get Deleted Objects activity	533
Map the output of the Get Deleted Object activity	534

Get Updated Objects	535
Map the input of the Get Updated Objects activity	535
Map the output of the Get Updated Object activity	536
Get User Information activity	537
Map the output of the Get User Information activity	537
Get Server Timestamp activity	538
Map the output of the Get Server Timestamp activity	538
Merge Objects Activity	539
Map the input of the Merge Objects activity	540
Map the output of the Merge Object activity	541
Poll Deleted Objects activity	541
Map the output of the Poll Deleted Object activity	542
Poll Updated Objects activity	543
Map the output of the Poll Updated Object activity	543
Query Objects activity	544
Configuring the Query Objects activity	546
Retrieve Objects activity	548
Search Objects activity	549
Undelete Objects activity	551
Configuring the Search Objects activity	552
Update Objects activity	554
Upsert Objects activity	555
SAP activities	556
Overview of the SAP connector	557
Creating or editing a SAP endpoint	558
Downloading and installing the SAP Jar Files and DLLs	560
Configuring Single Sign-on (SSO) and Secure Network Communications (SNC) for SAP connector	562
SAP Invoke BAPI activity	563
SAP Invoke RFC activity	566
SAP Receive IDOC activity	571
SAP Send IDOC activity	572
SAP Receive RFC activity	575
SAP Send RFC Response activity	577
Troubleshooting and support	578
ServiceMax activities	588
Creating or editing a ServiceMax endpoint	589
Configuring ServiceMax activities	592
Setting ServiceMax configuration properties	592
Specifying the Retry and Time Out parameters for ServiceMax activities	593
Understanding and setting polling preferences for the ServiceMax connector	594
Poll Updated Objects activity	595
Get Updated Objects	596
Poll Deleted Objects activity	598
Get Deleted Objects	599
Create Objects activity	600
Update Objects activity	602
Upsert Objects activity	603
Delete Objects activity	605

Undelete Objects activity	606
Retrieve Objects activity	607
Query Objects activity	544
Configuring the Query Objects activity	611
Search Objects activity	613
Configuring the Search Objects activity	614
Convert Lead activity	616
Merge Objects Activity	618
Get User Information activity	619
Get Server Timestamp activity	620
Send email activity	621
Set password activity	622
Reset password activity	624
Siebel activities	625
Overview of the Siebel connector	626
Installing JAR files to connect to the Siebel server	627
Creating or editing a Siebel endpoint	628
Using the Siebel Create Objects activity	630
Using the Siebel Update Objects activity	632
Using the Siebel Delete Objects activity	634
Using the Siebel Query Objects activity	636
Using the Siebel Execute Business Service activity	638
Prerequisites for starter activities in Siebel	639
Using the Siebel Get Created Objects activity	641
Using the Siebel Get Updated Objects activity	643
Using the Siebel Get Deleted Objects activity	644
Specifying Retry and Delivery Options for Siebel Activities	646
Siebel properties file	648
Security Token Service (STS) activities	650
Creating or editing an STS endpoint	650
Using the STS Get SAML 2.0 Token activity	653
SugarCRM activities	656
Creating and editing a SugarCRM endpoint	657
Using the SugarCRM Upsert Object activity	658
Using the SugarCRM Get Reports activity	659
Using the SugarCRM Delete Object activity	660
Using the SugarCRM Get Object activity	661
Using the SugarCRM Query Object activity	663
Using the SugarCRM Get ServerInfo activity	664
Using the SugarCRM Get UserInfo activity	665
Using the SugarCRM Search activity	666
Using the SugarCRM Set Relationship activity	667
Using the SugarCRM Delete Relationship activity	668
Using the SugarCRM Get Relationship activity	669
Specifying the Retry options for SugarCRM activities	670
Taleo activities	672
Creating and editing a Taleo endpoint	673
Using the Taleo Create Attachments activity	674

Using the Taleo Create Objects activity	675
Using the Taleo Get Objects activity	676
Using the Taleo Search Objects activity	677
Using the Taleo Delete Objects activity	678
Using the Taleo Set Associated Users activity	679
Using the Taleo Set Binary Resume activity	680
Using the Taleo Submit Candidates activity	681
Using the Taleo Update Attachments activity	683
Using the Taleo Update Objects activity	684
Using the Taleo Upsert Objects activity	685
Specifying retry parameters for Taleo activities	686
Web Services Activities	687
Creating or Editing a Web Services Endpoint	688
Creating or editing an endpoint for an Invoke Service activity	688
Creating or editing an endpoint for a Provide Service activity	692
Updating a Changed WSDL	693
Updating a changed WSDL	697
Web Services Invoke Service Activity	698
Adding an activity	699
Creating an endpoint	699
Configuring the activity	700
Specifying the retry options	700
Mapping the inputs of the activity	702
Mapping the outputs of the activity	703
Invoking an Orchestration with Web Services Provide Service Starter Activity	704
Compression/Decompression with the Web Services Invoke Service Activity	705
Web Services Provide Service Activity	708
Adding an activity	710
Creating an endpoint	710
Configuring the activity	711
Mapping the outputs of the activity	712
Decompression with the Web Services Provide Service Activity	713
Web Services Send Reply Activity	716
Adding an activity	717
Configuring the activity	717
Mapping the inputs of the activity	718
Web Services Send Reply with Fault Activity	719
Creating the Required Fault Names	719
Configuring the Activity	720
Map the Inputs of the Activity	721
Compression with the Web Services Send Reply Activity	721
Troubleshooting and support	723
Workday Activities	724
Overview of the Workday connector	724
Creating and editing a Workday endpoint	725
Using the Invoke Workday activity	726
Specifying the retry options for Workday activity	728
Zuora Activities	729

Overview of the Zuora connector	730
Creating and editing a Zuora endpoint	730
Using the Zuora Create Objects activity	732
Using the Zuora Update Objects activity	733
Using the Zuora Delete Objects activity	734
Using the Zuora Query Objects activity	735
Using the Zuora Amend Subscription activity	737
Using the Zuora Create Subscription activity	738
Using the Zuora Generate Invoice activity	739
Specifying the Retry options for Zuora activities	740
Using Secure Connectors	741
Variables	743
About variables	743
Creating variables	746
Create a new variable using the Create New Variable option	746
Create a new variable using the Select Inputs or Select Outputs buttons	747
Create a new variable using the toolbar menu	748
Create a new variable using the Copy menu option	749
Create a new variable using the Copy button	749
Primitive Data Types	750
Configuring variable properties	750
Removing Variables	751
Specifying a default value	752
Browse for Schema Element	753
Selecting a Substitution Type for Variables	753
Flat File Schemas	756
Flat File Schema Editor Overview	757
About delimited data	758
About fixed length or 'positional' data	760
Mixed positional and delimited example	762
Creating a flat file schema	768
Testing flat file schemas	770
Load input test data	770
Test a Flat File Schema	771
Save test output data to a file	772
Root node properties	773
Adding Fields or Field Types	781
Field properties	783
Adding Records or a Record Type	791
Record properties	792
Adding Groups or Group Types	797
Group Properties	799
Group Example	800
Working with Nodes in the Schema Tabs	807
Copy nodes	807
Delete nodes	808
Rename nodes	809
Move nodes	810

Adding Several Children	810
Valid Node Names	811
The Type Library Tab	812
Specifying Optional Fields and Records	813
Generating a flat file schema from an IDOC	813
Using the Flat File Wizard	815
Mapping	817
About Maps	818
Creating a map	818
Mapping Inputs	820
Mapping Outputs	821
Creating a Standalone Map	822
Select source schemas for a standalone map	823
Select destination schemas for a standalone map	824
Creating a Standalone Map from a Map Variables Activity	824
Creating a Map Variables Activity from a Standalone Map	825
Adding Variables to Mapping Panes	826
Copying Parameters	827
Replacing a Variable used in a Map	827
Finding Nodes	829
Assigning a Default Value for a Destination Node	830
Mapping Techniques	832
Mapping One Source to One Destination	832
Mapping Multiple Sources to One Destination	833
Mapping One Source to Multiple Destinations	833
Conditional Mapping for a Recurring Node	833
Automapping Matching Nodes	834
Bulk Mapping Nodes	834
Mapping Recurring Nodes	835
Mapping All Occurrences	836
Mapping Specific Occurrences	836
Select Source Occurrences	837
Expand Destination Occurrences	838
Collapse Destination Occurrences	838
Add destination occurrence	839
Remove Destination Occurrence	840
Select a substitution type in a mapping pane	840
Mapping Destination Nodes	842
Selecting a substitution type	842
Select a substitution type in a mapping pane	840
Remove the Derived Type Associated with a Node	847
Mapping Rules That Are Automatically Deleted	848
Assigning a Count of Occurrences	848
Removing Mapping Rules	849
Removing mapping rules with links	849
Removing mapping rules with no visible links	850
Remove All Mapping Rules	850
Finding Sample or Result Content	851

Loading a Sample Message	852
Testing maps	852
Saving or Clearing the Transformation Result	853
The Emit CData Option	854
Unsupported XML Schema Features	854
About Unmapped Destination Nodes	856
Filter Recurring Nodes	856
Using Custom Functions and Lookup Tables	858
About Lookup Tables	859
Defining Lookup Tables	859
Editing Lookup Tables	860
About Custom Functions	861
Defining a custom function	862
Editing a custom function	863
Custom Function Parameter and Return Datatypes	864
Assigning a Function Without a Source Node Link	864
Assigning a Function While Creating Maps	865
Adding a Function to an Existing Mapping Rule	866
Example: Chaining Multiple Functions	867
Assigning Function(s) to a Mapping Rule	868
Deleting a Function from a Mapping Rule	868
Math Functions with Node Set Constraints	869
Adding a Parameter	870
Editing a Parameter	870
Deleting a Parameter	871
Reordering Parameters	871
Specifying Default Values for Functions that Accept Recurring Nodes as Input	872
Mapping Function Reference	873
Mapping functions overview	876
Mapping Function Syntax and Datatypes	878
Absolute Value function	881
Add function	881
AES Decrypt function	881
AES Encrypt function	882
Align Center function	882
Align Left function	883
Align Right function	884
Average function	884
Base64 Encode and Decode functions	885
Boolean function	886
Ceiling function	887
Concatenate function	887
Cast From Base64Binary function	888
Casts From HexBinary function	888
Cast To Base64Binary function	889
Cast To HexBinary function	889
CopyOf function	890
Count Function	891

Decode Configuration Property of Type Password	892
Digest/Hash function	892

## Cast Iron Express

Cast Iron Express 入門	923
登錄帳戶	924
協助入門	925
管理您的帳戶設定檔	925
管理使用者	926
Cast Iron Express 說明中心	926
新增函數至 Express 帳戶	927
隨時掌握 Cast Iron Express 的最新功能	928

與 Cast Iron Express 整合	928
支援的來源和目標系統	929
FTP 來源支援的檔案類型	929
管理安全連接器	930
建立安全連接器	930
安裝安全連接器	931
啟動和停止安全連接器	931
移除安全連接器	932
建立整合	932
使用「整合」編輯器	932
配置連線	934
連接至 MySQL 資料庫	934
選取作業	935
資料庫觸發程式表格	936
選取物件	936
選取欄位	936
連接至 salesforce.com 時使用外部 ID	937
搭配使用外部 ID 與更新插入作業	938
搭配使用外部 ID 與相關物件	938
過濾來源物件	938
設定整合	939
定義對映	940
定義函數	941
配置函數	942
複合函數	943
使用複合函數	943
函數清單	944
管理整合	948
修改整合	948
刪除整合	948
監視整合活動	949
使用率圖表	949
指導教學	950
指導教學：建立本端檔案與 salesforce.com 的整合	950
名詞解釋	956
組合 (Bundles)	957
連線 (Connection)	957
端點 (Endpoint)	957
欄位 (Fields)	957
函數 (Functions)	958
整合 (Integration)	958
作業 (Operations)	958
來源 (Source)	958
目標 (Target)	958
轉換 (Transformation)	958

## What's New for This Release

---

IBM® WebSphere® Cast Iron® version 7.5.1 delivers new and enhanced features.

IBM WebSphere Cast Iron Version 7.5.1 contains new features and updates for the following components:

- Studio
- Connectors
- Management Console

## Studio

---

This section describes new features and updates for Studio. For more information about connector new features and updates, see the Connectors section.

- Support for migrating WSDL of a WorkDay Connector Project
- Enhancements to supported activities of JIRA Connector, Insightly Connector, and MS SharePoint.
- SAP dependency JCo Jar files - Version Specific information
- Transformation activities for Open Data Protocol (OData)
- New connectors are available for download. For more information about the new connectors, see the Connectors section.

## Connectors

---

Along with updates to the existing connectors, Studio now supports the following:

- The new connectors added to the list are:
  - Apache Cassandra connector - Allows you to Insert Rows, Update Rows, Delete Rows, and Execute Query on Cassandra.
  - MailChimp connector - Supports Objects on CRUD operations, Batch operations, and Atomic operations.
  - Marketo connector - interacts using Restful Web Service API's, which allow users to access bi-directional data-level integration.
  - Sage CRM connector - Enables fetching data from the CRM and saving / updating data into the CRM for integration.
- Enhancements to supported activities of JIRA Connector, Insightly Connector, and MS SharePoint.

## Management Console

---

The following section describes new features and updates for the Web Management Console (WMC):

- Agent Monitoring tool for Secure Connectors
- Push WSDL from Cast Iron Project to API Management
- Push REST API (Swagger) from Cast Iron Project to API Management
- Support for Cast Iron Docker Container

---

### Feedback | Notices

 Last updated: Thursday, 2 June 2016

<file:///dcs/markdown/workspace/Transform/out.html>

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/whatsnew.html>

## Introduction

---

This section gives an introduction to the Integration Appliance, Studio, and the Web Management Console. There is also information about accessing Template Integration Projects, and information about installation and configuration.

- [Development Environment](#)  
The Integration Appliance combines data integration, transformation, routing, monitoring, and

management capabilities in a single product. During run time, the Integration Appliance shares data and processing among databases, enterprise applications, legacy systems, and business applications.

- [Integration Appliance](#)

The Integration Appliance is a rack-mountable appliance comprised of redundant and hot-swappable components

- [Web Management Console](#)

The Web Management Console (WMC) is a browser-based application hosted by the Integration Appliance

- [Studio](#)

Studio is a development tool for designing and building integration projects.

- [Installation and configuration](#)

This topic discusses the installation and configuration steps you must complete before you build and run an integration project.

---

## [Feedback](#) | [Notices](#)

 Last updated: Thursday, 2 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_introduction.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_introduction.html)

## Development Environment

---

The Integration Appliance combines data integration, transformation, routing, monitoring, and management capabilities in a single product. During run time, the Integration Appliance shares data and processing among databases, enterprise applications, legacy systems, and business applications.

## Capabilities

---

- Broad support for the following industry-standard formats:
  - XML (W3C XML Schemas, DTDs, and XML documents)
  - Flat File, raw text, and raw binary data types
  - Supports many character encodings including UTF-8, US-ASCII, ISO- 8859-1, SHIFT\_JIS, EBDIC-XML-US, and EUC-JP
  - Commercial database systems, including Informix®, Sybase, DB2®, MySQL, Oracle and others through Sequelink.
  - System-specific protocols, such as SAP IDOC and IBM® MQ Series
  - Web Services
- Ability to transform data easily from one format to another format, for example: Flat File data to XML data.
- Guaranteed message delivery by means of a built-in message repository that holds all messages processed by the Integration Appliance.
- Support for a variety of application programming styles: synchronous and asynchronous (request/reply, store-and-forward, publish/subscribe).
- Support for data transfer through configurable ports for HTTP, secure HTTP (HTTPS), FTP, secure FTP (SFTP).
- Support for client-side PKI authentication—the ability to connect to a secure server from the Integration Appliance.

- Ability to be managed remotely, from anywhere on the network, using a Web Management Console (WMC) and Command Line Interface (CLI).
- Support for email-based notifications using your network's SMTP-based email system and simple network management protocol (SNMP) traps.

## Components

---

The development environment contains the following hardware and software components:

### Studio

A graphical tool used to create integration projects on your Windows development environment. You publish integration projects from Studio to the Integration Appliance.

### Integration Appliance

An appliance that connects directly into a network and runs the integration projects that you create using Studio.

### Web Management Console (WMC)

A browser-based console that you use to manage the projects on the Integration Appliance.

### Command Line Interface (CLI)

A set of commands that you can use to manage the projects on the Integration Appliance.

- [Development process example](#)

The steps in this topic provide an example of the development process for an integration project:

**Parent topic:** [Introduction](#)

---

## Feedback | Notices

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_dvlpmntenv.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_dvlpmntenv.html)

## Development process example

---

The steps in this topic provide an example of the development process for an integration project:

### Procedure

---

1. Develop your integration project using Studio on a standard Windows 7 machine.
2. In Studio, verify that the orchestration is valid.
3. Publish the integration project to the Integration Appliance.
4. Open a browser on a Windows 7 machine. In the browser, start the Web Management Console (WMC). From the WMC, issue a request to the Integration Appliance to deploy the orchestration job (instance) of the integration project.
5. An event triggers an orchestration job to be created and to start processing the activities that make up the orchestration. For example, a file being placed in a particular directory on a FTP server can trigger an orchestration job to be created and start processing.
6. From the WMC, verify that the orchestration job has completed and that no errors have occurred.

7. Modify the integration project in Studio. For example, your original integration project checks if a file appears in a particular directory on the FTP server and now you want to modify your integration project to move the file from the FTP source directory to an FTP output directory.
8. In Studio, verify that the project updates are valid by using the Verify tab to run each affected orchestration.
9. From the WMC, undeploy the original integration project.
10. Publish the modified integration project to the Integration Appliance.
11. From the WMC, deploy the modified integration project.
12. An event triggers an orchestration job to be created and to start processing the activities in the orchestration.
13. From the WMC, verify that the integration project has run.

**Parent topic:** [Development Environment](#)

[Feedback](#) | [Notices](#)

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_developmentprocessexample.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_developmentprocessexample.html)

## Integration Appliance

---

The Integration Appliance is a rack-mountable appliance comprised of redundant and hot-swappable components

Components that can be used in the Integration Appliance include network ports, hard-disk drives, RAM, cooling fans, and other critical components, that ensures fault-tolerant operations.

Use the Web Management Console (WMC) and the Command Line Interface (CLI) to manage the Integration Appliance.

**Parent topic:** [Introduction](#)

[Feedback](#) | [Notices](#)

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_integrationappliance.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_integrationappliance.html)

## Web Management Console

---

The Web Management Console (WMC) is a browser-based application hosted by the Integration Appliance

The WMC can configure and monitor hardware, orchestration, and network status of an Integration Appliance, using a Web browser.

System Administrators can use the WMC for the following monitoring tasks:

- Obtaining Integration Appliance status information, such as memory-usage statistics, disk-space statistics, CPU status, fan status, and power-supply status.
- Obtaining overall processing information at a glance, and then drill-down on specific orchestrations and obtain comprehensive information about specific messages, activities, errors, and other details.
- Viewing logs and error notifications.

In addition to the WMC, you can also use the Command Line Interface (CLI) to perform many administrative and monitoring tasks. For more information on the CLI, see the Command Line Interface reference.

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_webmanagemntconsole.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_webmanagemntconsole.html)

## Studio

---

Studio is a development tool for designing and building integration projects.

In Studio, you build orchestrations that model business-process and data integration solutions. Studio provides a palette of activities that you drag onto the Studio Workspace and then configure. During run time, these activities perform actions, such as polling for a insert event in a database table. An orchestration is made up of one or more activities. An integration project can contain one or more orchestrations.

You can design simple point-to-point orchestrations, as well as more complex orchestrations that involve multiple endpoints, without writing any code.

After building an integration project, you publish it to an Integration Appliance.

## Studio Layout

---

The main pane of Studio contains the following two sections:

### Workspace

Visible on the left side of the main Studio pane. As you create components, such as Endpoints and flat File Schemas, property panes for the component display in the Workspace. When you create a new orchestration, a blank orchestration are displayed in the Workspace. You drag activities from the Activities tab into the orchestration displayed in the Workspace. When you configure an activity of an orchestration, the configuration panes of activity are also displayed in this Workspace.

### Tabs

On the right side of the main Studio pane, the following tabs are available:

- Project

- Activities
  - Variables
  - Functions
  - Verify
- [The Project tab](#)  
The Project tab contains folders for each component
  - [The Activities tab](#)  
An activity performs a particular operation in an orchestration, and are organized into categories on the activities tab
  - [The Variables tab](#)  
The variables used in the current orchestration are listed in the Variables tab.
  - [The Functions tab](#)  
The functions that you can add to a map between input and output parameters of an activity are listed in the Functions tab.
  - [The Verify tab](#)  
By simulating the DataPower® Cast Iron® Operating System, the Verify tab allows you to test orchestrations within a project and resolve any issues before deploying the project to the Integration Appliance.
  - [Understanding nodes and mappings](#)  
The integration projects that you build using Studio are based on industry standards, including BPEL4WS (business process execution language for Web Services), WSDL (web services description language), and other XML based standards.
  - [Understanding parameters](#)  
Parameters are values that are passed to activities from an orchestration, or to the orchestration from an activity. The values from parameters are used to initialize the variables that comprise the orchestration.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_studio.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_studio.html)

## The Project tab

---

The Project tab contains folders for each component

The following component folders can be accessed from the Project tab:

- Orchestrations
- Endpoints
- Flat File Schemas
- Stylesheets
- Transformations
- WSDLs
- XML Schemas

When you create new instances of a Project tab component, these instances display within the appropriate component folder.

To create new instances of any of the components in the Project tab, right-click on the folder (e.g., Endpoint) to display a menu and select the create option. The component is then created and displays under the appropriate folder, and given a generic name: Orchestration, Orchestration1, and so on. You should rename all components to something meaningful in the context of your integration project.

You can create these components in any order. To ensure that all components are available, create Flat File Schemas, and upload XML Schemas, WSDLs, and Stylesheets before you start defining the orchestration.

### Orchestrations

Orchestrations are the central component of any integration project. An orchestration contains a sequence of activities that perform a specific business process. For example, an orchestration could get a Flat File from a FTP Server, take the data from the Flat File, transform it, and then save the result into a database. An integration project must contain at least one orchestration.

### Endpoints

Endpoint components display in the Endpoint folder of the Project tab and specify the connection information required to connect to the various external systems or endpoints. The Integration Appliance supports connecting to Endpoints of many types including Email (SMTP, POP), FTP, SFTP, HTTP, HTTPS, JDE, JMS, MQ, NetSuite, PeopleSoft, Salesforce.com, SAP, Siebel, Web Services, and many commercial database systems.

Each type of endpoint has an associated configuration pane where you specify endpoint connection information. For example for a database endpoint, you must provide a database name, server name, user account, and password. You may, however, want to specify a different set of configuration information when you move from a testing environment to the production environment. You can simplify the process of moving from one set of connection information to another (for example: from one database to another) by defining configuration properties (or name/ value pairs) in studio, to define the configuration information.

### Flat File Schemas

A Flat File Schema defines the parsing rules, content, and structure of a Flat File. Flat Files are any non-XML text data, such as comma- and tab-delimited files and EDI or industry-specific textual formats, such as the Health Level 7 (HL7) format for the health care industry.

In addition to supporting variable-length Flat File formats that use delimiters to distinguish one record or field from another, studio also supports fixed-length records and fields such as the COBOL copy book format. In studio using the Flat File Schema Editor, you can create definitions for either type of text file and groups.

### Stylesheets

An XSLT Stylesheet defines how to transform XML data from one format to another format. You can upload a XSLT Stylesheet into studio and add an Apply XSLT activity to your orchestration that uses the XSLT Stylesheet during run time.

### Transformations

The Transformation folder contains standalone maps. A standalone map represents a set of one or more mappings between source and destination nodes.

For example, you can create a standalone map called myMap that contains a set of mappings between a source XML Schema called IncomingOrder and a destination XML Schema called ShippingOrder. A standalone map can be used to create any number of Map Variables activities in the same orchestration or in other orchestrations in the same project. You can create a Map Variables activity from a standalone map by dragging the standalone map from the Transformations folder to an empty node on the orchestration. A Map Variables activity based on the standalone map is created.

## WSDLs

A WSDL (Web Services Description Language) is an XML document that describes a Web Service. It defines how to access a Web Service and the operations available for the Web Service.

## XML Schemas

An XML Schema defines the content and structure of XML data. XML Schemas are typically stored in files that end with the .xsd extension. Once you upload an XML Schema into a project, you can use that XML Schema to create variables used in the activities of an orchestration.

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_theprojecttab.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_theprojecttab.html)

# The Activities tab

---

An activity performs a particular operation in an orchestration, and are organized into categories on the activities tab

Activities are organized into the following general categories:

### Transform activities

Transform activities transform data from one format to another. For example, the Read Flat File activity converts Flat File data to XML data. The transform activities are listed under the Transform folder of the Activities tab.

### Logic activities

Logic activities affect the processing flow of an orchestration, such as control-flow logic, branching, or looping (for example: the For Each and the While Loop activities). The logic activities are listed under the Logic folder of the Activities tab.

### Utilities activities

Utilities activities are utilities that start or act on the current orchestration job (or instance of the orchestration). The utilities activities are listed under the Utilities folder of the Activities tab.

### Connector activities

Connector activities perform operations on the various external systems associated with the orchestration. Connection-oriented activities are grouped into various folders named for the type of system, such as Database, Email, FTP, HTTP, JMS, Salesforce.com, Siebel, MQ, SAP, and Web Services.

To use any activities, drag the activity icon from the Activities tab to the orchestration in the workspace. To configure the specifics of an activity, click the icon in the orchestration. The configuration pane displays underneath the orchestration.

The configuration pane includes an activity-specific Checklist to guide you through the configuration of each activity. A key part of configuring most activities involves the mapping of input and output parameters.

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_theactivitiestab.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_theactivitiestab.html)

## The Variables tab

---

The variables used in the current orchestration are listed in the Variables tab.

Variables are used in the context of a specific orchestration to bind data sources to an orchestration, and to pass (or operate on) data values created as the result of orchestration processing. An orchestration's variables are typically initialized by the parameters from the specific activities that make up the orchestration.

Variables can store primitive data, such as a string or integer value, or can represent an entire XML Schema or a fragment of an XML Schema. In Studio, you can automatically create variables for the orchestration using the Mapping Editor's Copy button. In the Variables tab of Studio, you can create a variable based on a fragment of an XML Schema, by dragging a fragment (or sub-node) of an XML Schema from the Schema of pane, into the Variables pane.

**Parent topic:** [Studio](#)

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_thevariablestab.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_thevariablestab.html)

## The Functions tab

---

The functions that you can add to a map between input and output parameters of an activity are listed in the Functions tab.

You can add functions to the mappings between the input and output parameters of an activity to alter the data flowing through the orchestrations. Using the functions available on the Function tab, you can complete the following actions:

- calculations
- converting datatypes
- re-formatting data
- combining multiple data fields into a single field

For the list of functions available with Studio and for reference information about each function including the input and output parameters, see the Mapping Function Reference section of the Studio online help.

From the Functions tab, you drag the desired function onto the link between an input and output node of the Mapping editor. If the functionality you need is not available in one of the standard Studio functions, you can create your own custom functions. For more information, see the Mapping Custom Functions section of the Studio online help.

## [Feedback](#) | [Notices](#)

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_thefunctionstab.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_thefunctionstab.html)

## The Verify tab

---

By simulating the DataPower® Cast Iron® Operating System, the Verify tab allows you to test orchestrations within a project and resolve any issues before deploying the project to the Integration Appliance.

When initiating a test run, you can start a single orchestration or all the orchestrations in a project. Studio runs one orchestration job for each orchestration. You can start and stop orchestrations, and view orchestration monitoring logs from the Studio toolbar or from the Verify tab.

If the orchestration is invalid, a message dialog displays possible resolutions. In the workspace, Studio highlights each activity in the orchestration as the activity is processing the data. As Studio runs the orchestration, the Verify tab provides orchestration job details such as activity name, processing status, variable/parameter names, and variable/ parameter data in a tree view. If an error occurs, Studio highlights the node where the error occurred. Clicking the node takes you to the location of the error, where you can resolve any issues before running another instance of the orchestration.

When you click a node in the tree view, Studio displays in the Properties Pane the Checklist task that corresponds to the node. For example, when you click an activity node, Studio displays the Configure panel for the activity in the Properties Pane. When you click the Map Outputs node, Studio displays the Map Outputs panel in the Properties Pane. If you click a mapping variable or parameter, the data displays in the Variable/Parameter Message Data section of the Verify tab.

While Studio only runs one orchestration job for each orchestration, you can start the same orchestration multiple times. The Verify tab displays the results for each run of the same orchestration under a separate instance. For example, Instance #1 and Instance #2. You must allow an orchestration job to complete before you can run another instance of the same orchestration.

**Note:** Studio does not persist the results of the runtime test. When you close the orchestration tab, you lose runtime results for the orchestration.

## Additional Requirements

---

Depending on the activities in the orchestration, Studio might require more input to run the orchestration job.

For example, an orchestration with a database activity requires that you generate database assets before running the orchestration in Studio, just as you must do in the WMC before running the orchestration on the Integration Appliance. If the orchestration contains an HTTP Receive Request activity, you must post a message to the specified URL. Studio provides an HTTP Post Utility to help you post a message. If the orchestration contains an FTP Poll activity, you must place a file in the specified location before Studio can run the orchestration. Studio prompts you for this information before it runs an orchestration.

Since the Verify tab allows you to simulate the runtime on the Integration Appliance, you can also specify Kerberos Protocol settings in Studio to test the settings before actually deploying to the Integration Appliance. Specifying these setting in Studio does not impact the runtime on the Integration Appliance. You must specify the Kerberos Protocol settings in the WMC to allow the Integration Appliance to authenticate the server that the Integration Appliance is communicating with. For more information about specifying Kerberos Protocol settings for the Integration Appliance, see the WMC Online Help.

## Navigating the Verify Tab Toolbar

The following table describes the Verify tab toolbar:

Table 1.

Icon	Description
	Starts the open orchestration. The orchestration must be valid before Studio can run an orchestration job.
	Stops the running orchestration job immediately. Studio does not allow the orchestration job to complete before stopping.
	Starts all the valid orchestrations in the project that are not already running. If an orchestration is already running when you click this icon, Studio does not rerun the orchestration.
	Stops all running orchestration jobs immediately. Studio does not allow the orchestration jobs to complete before stopping.
	Displays orchestration monitoring data in a table or text format.
	In the Workspace, highlights the activities in the execution path of the orchestration job, which allows you can follow the logic Studio used to complete the orchestration job. Different instances can have a different path depending on the inputs and orchestration logic. Click this icon to toggle between providing and not providing a highlighted path.
	Assigns the results from the selected instance to the Map Inputs and Map Outputs, so that when you run a test from the Properties Pane, Studio populates the inputs and outputs with the results of the orchestration job.
	Deletes one or more selected instances from the orchestration details tree. To delete multiple instances hold the Shift key or Ctrl key, select the instances you want to delete, and click the icon.
	Expands all the nodes under the selected node in the orchestration details tree.
	Collapses all the nodes under the selected node in the orchestration details tree.
	Expands a single node under the selected node in the orchestration details tree.
	Collapses a single node under the selected node in the orchestration details tree.

## Understanding nodes and mappings

---

The integration projects that you build using Studio are based on industry standards, including BPEL4WS (business process execution language for Web Services), WSDL (web services description language), and other XML based standards.

You do not are not required to know the technical details of these standards to use the product. Nonetheless, as you work with Studio, you are exposed to the XML content of your inputs and outputs. Since orchestrations running on the Integration Appliance use, process, and deliver messages in an optimized XML format, all data and its definition is presented as a hierarchy of nodes, as in an XML document.

For example, columns in a database table are represented as nodes. As another example, Flat File Schemas are defined in Studio as a series of record, field, or group nodes in a tree structure that comprises a root node containing descendents (children, grandchildren, etc).

There are two basic distinctions between node types in Studio:

- Structure nodes are nodes that convey information about structure only. An example of a structure node is a record definition (defined for a Flat File Schema). Structure nodes can contain other structure nodes, and nodes that contain data.
- Data nodes are nodes that can contain data.

In a typical complete node representation, the top node is often referred to as the root node—root in the sense that it contains all other nodes. Subsequent nodes are descendent nodes comprised of both structure nodes and data nodes.

A key part of designing an orchestration is specifying the mapping between nodes, that is, defining how nodes and the data they contain should be used and transformed in the course of orchestration processing.

Several XML-specific characteristics can be associated with nodes; these characteristics are represented as an additional icon adjacent to a node in a tree. These properties include:

- Recurring - denotes that a node can repeat (either a specified number of times or an unbounded number of times). Each time a recurring node repeats is an occurrence of the node.
- Nillable - a boolean property that denotes whether the data node to which this property is associated can have an attribute set to “nil” by the application. The nillable mechanism is defined by the XML Schema recommendation as a way to identify non-required data elements that are empty vs. those that convey a null data value.
- Optional - denotes whether an optional node exists or not.

Studio activities contain embedded maps that you must configure at design time, in the context of an orchestration, to define how actual parameters should map to variables, and how the variables should be processed in the orchestration.

The characteristics and node structure of the node tree in the right pane of the mapping editor determines whether a node from the left pane can be mapped to the right pane.

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_understandingn odesandmappings.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_understandingn odesandmappings.html)

## Understanding parameters

---

Parameters are values that are passed to activities from an orchestration, or to the orchestration from an activity. The values from parameters are used to initialize the variables that comprise the orchestration.

Parameters can be either input parameters or output parameters. Activities can either contain just input parameters, just output parameters, or both.

You map variables of an orchestration to the input parameters of an activity in the Map Inputs task. During run time, the values of the variables are passed into the input parameters of the activity and are used by the activity. For example during run time, the FTP Put File activity creates a file using the name provided in the input parameter called filename and with the data provided in the input parameter called data. The values for the filename and data input parameters are populated by the data in variables in the orchestration.

Output parameters are return values from an activity. For example, the FTP Poll Directory activity passes three output parameters to an orchestration, as shown in the following table, each of which can be used to initialize a variable in the orchestration. Output parameters can be mapped from an activity to the orchestration.

Table 1.

Activity	Parameter	Description
FTP Poll Directory	filename	Name of the file obtained from the FTP server.
FTP Poll Directory	data	String containing the contents of the file.
FTP Poll Directory	timestamp	Timestamp on the file.

## Installation and configuration

---

This topic discusses the installation and configuration steps you must complete before you build and run an integration project.

## Integration Appliance

---

The Integration Appliance is shipped with DataPower® Cast Iron® Operating System preinstalled. You must however, set up and configure your Integration Appliance before publishing and deploying your integration project to the Integration Appliance. Setup might include installing additional connector licenses. For more information, see the Installation Guide. Once the Integration Appliance is set up, configured, and available to the network, you can bring up the Web Management Console by entering the following URL into the address field of a browser: `https://hostname`

Where hostname is the name of the Integration Appliance. This name was assigned to the Integration Appliance during the installation process.

The Web Management Console opens to the Login screen in the browser window. The default login account and password is `admin/!n0r1t5@C`

Note: The Web Management Console uses the default port 443.

You can also access the Integration Appliance through the Command Line Interface.

## Studio

---

To start creating integration projects to run on the Integration Appliance, you must install Studio on a Windows development workstation. Your Windows development workstation must meet some minimum hardware and software requirements. For more information, see the Installation Guide.

Once you have Studio installed, you can log into the Solutions Repository and access a repository of template integration projects (TIPs). Each TIP addresses a specific integration project scenario. For example, you can find a TIP for integrating data from a Salesforce.com endpoint to a database endpoint. When you select a TIP from the Solutions Repository and download the TIP to your workstation, a wizard opens and guides you through the configuration steps.

Note: The Solutions Repository contains TIPs that have been certified, as well as uncertified TIPs. Anyone who has access to the Solutions Repository can upload a TIP. For more information about creating, modifying, and searching for TIPs, see the Studio online help.

## Deployment concepts

---

Use Studio to create integration projects, which you deploy to the Cloud using the Management Console or deploy to the Integration Appliance using the Web Management Console. A deployment of a project contains all runtime components necessary to run the processing defined in the orchestrations of the project.

With respect to deployment, there are two important concepts to keep in mind as you develop a project:

- Publishing and Deploying are two distinct steps. Publishing is the act of promoting a project from Studio to an integration environment (cloud or Integration Appliance) or to another intermediate location. A project does not run in the integration environment until you deploy it.
- Projects can have multiple configurations that support completely different environments (development, test, production). Using Studio to create configuration properties for projects offers greater flexibility at deployment time, because you can bind the properties to different environments.

The Integration Appliance provides the following two options for getting your projects from Studio to the Integration Appliance:

- Projects can be published directly to an Integration Appliance.
- Projects can be exported from Studio to a staging location and then uploaded to an Integration Appliance.

Whether you export from Studio and later upload to the Integration Appliance or publish directly to the Integration Appliance from Studio, the project does not run on the Integration Appliance until you deploy.

- [About configurations](#)  
You publish a project to the Integration Appliance. The WMC then runs a configuration of the project. Once you publish a project to an Integration Appliance, the WMC creates a default project configuration. The default project configuration settings enable all orchestration in the project and allow you to quickly deploy a project.

---

## Feedback | Notices

 Last updated: Thursday, 2 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_deploymentconcepts.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_deploymentconcepts.html)

## About configurations

---

You publish a project to the Integration Appliance. The WMC then runs a configuration of the project. Once you publish a project to an Integration Appliance, the WMC creates a default project configuration. The default project configuration settings enable all orchestration in the project and allow you to quickly deploy a project.

You can create numerous configurations of the same project on your Integration Appliance. Each configuration can connect to a different endpoint, if you have used configuration properties to specify the connection information for the endpoint. For example, one configuration could connect to a test database while another configuration connects a production database. Project configurations are created using the WMC, and by default, are not deployed when they are created.

## Publishing

---

Publishing is the process of bundling up a specific integration project (the named project in Studio) and preparing the project for deployment on an Integration Appliance. When you publish a project, Studio creates a runnable version of the project and sends it to the Integration Appliance that you specify.

## Exporting

Exporting is a process very similar to publishing in that it compresses your project, but instead of pushing the result to the Integration Appliance, you give the file a name and save it for subsequent uploading to the Integration Appliance. For example, this allows for additional testing by a quality control team.

## Uploading

Uploading is the process of moving a project that has been exported from Studio to the Integration Appliance. A menu selection is available for this task in the WMC.

## Deploying

---

Deploying is the process of instantiating all the runtime components necessary so that the Integration Appliance can perform the actual integration. Deploying presumes that a project has been published or uploaded to the Integration Appliance. Use the Web Management Console to deploy a project configuration.

## Understanding configuration properties

---

Configuration Properties simplify the deployment process in moving from a development environment to a production environment. Rather than hard-code configuration details into the endpoint properties, you can create Configuration Properties, and then use these property names in the configuration pages of your endpoints.

This is because endpoints created in Studio are configured with specific address information (hostname, IP address) and other details (user account, password). These details may need to be changed at deployment for the specifics of the actual environment in which the project will run (assuming that the development, test, and production environments use different servers and systems).

At deployment, the values associated with the properties can be changed to the appropriate hostnames, IP addresses etc.

For more information about creating configuration properties, see the Studio online help.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_beforedevelopingyourprojects.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_beforedevelopingyourprojects.html)

## Planning an Integration Project

---

When beginning the development process for an integration project you must define the integration scenario before using Studio to translate the project requirements into an orchestration.

### Defining an integration scenario

---

When defining an integration scenario, specify a clear goal. With this goal in mind, identify the high level project requirements:

- Endpoints - From what source system and to what target system are you moving the data?
- Formats - What is the format of the data from the source system? What data format does the target system accept?
- Transformation - If the source data and target data have different formats or structure, then what type of data transformation is needed? Are there any special processing rules?

For example, if your goal is to consolidate multiple purchase orders and place the consolidated purchase order into a supplier's database. High level project requirements might include the following details:

- Endpoints - The source system is an FTP server. The target system is an Oracle database.
- Formats - The source data is pulled from CVS flat files stored on the FTP server. The target database requires data in table format.
- Transformation - A flat file to table transformation is required. Also orders from locations that have sales tax should be processed differently than orders from locations without sales tax.
- Overall goal of the integration project. For example, combining a flat file purchase order with an XML purchase order, into a single large purchase order that is stored in the supplier's database.

For example, you want to consolidate multiple purchase orders, verify that they conform to a specific format, and then:

- A few Flat File sources need to be consolidated into a target XML file.
- Files from one FTP site need to be moved to another.

## Translating project requirements into Studio components

---

After identifying high-level goals for your integration project, you can start analyzing more specific aspects of the integration project and identifying the Studio components that you can use to accomplish your goals.

You can start by analyzing the following characteristics of your integration project:

- From what source, or sources, do you want to obtain the data, and to what target do you want to transmit the data? These sources and targets (databases, FTP servers, HTTP servers, Email, etc) comprise the endpoints that are created as part of a project in Studio.
- In what format is the source data, and in what format is the required target data? Text-based files, including EDI formats, CSV, and other formats can be defined in Studio as a Flat File Schema that converts the data into the appropriate format for the Integration Appliance. In addition, a Flat File Schema can be used to produce data in a flat file format to be used outside of the Integration Appliance. XML-based data can be included in an integration project by uploading the appropriate XML Schemas (.xsd) or document type definitions (.dtd) to Studio.
- Does the data format or structure need to change from source to target, and if so, how does it need to change? Should some of the processing be based on the content itself?

Identifying these requirements provides the information needed to define (in Studio) one or more orchestrations that comprises a set of activities, including transformations on data. Transformations convert data from one format to another. For example converting Flat File data in a CSV (Comma Separated Values) format to XML data. Transformations can also suppress data, add data, alter datatypes, and perform calculations.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart\\_translatingprojectrequirements.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.gettingstarted.doc/getstart_translatingprojectrequirements.html)

## Integration appliance configuration tips

---

You might want to make the changes to your Integration Appliance configuration. This topic covers some changing passwords, creating users and groups and optimal performance configuration.

## Change the default password

---

Using the Web Management Console:

1. In the upper right corner of the WMC, click your username.
2. Select Change Password.
3. Enter the old and new passwords, and confirm the new password.
4. Click Save.

Using the Command Line Interface:

1. Use an SSH connection to log in to the CLI, by starting an application like PuTTY.
2. Enter the appliance-host-name.
3. If needed, select SSH as the connection protocol or set other connection parameters offered by the application.
4. Initiate<sup>®</sup> the connection. The login prompt displays at first access.
5. Log in to the Integration Appliance using the default username and password [Username=admin, Password = ! n0r1t5@C].
6. Run the following command: `auth set user admin <old_password> <new_password>`

## Create users and groups, and define appropriate privileges.

---

As you would with any multi-user device, be sure to create users and groups and provide access to the Integration Appliance using the rule of 'least privilege,' that is, users should have no more privileges than necessary to do their jobs. For more information about setting privileges, see the Web Management Console online help.

## Configure the Integration Appliance for optimal performance

---

For better performance, once an integration project has been deployed to production and runs as expected, tune the following parameters:

- For each orchestration, change the logging level from the All option to the Error Values option.
- For each notification, set the Level exceeds field to the Critical option.

## Studio best practices

---

Some guidance for using Studio to its full potential.

## Establish naming conventions for your organization

Provide unique, meaningful names (meaningful in the context of the business problem being solved) for all your Studio projects and related components—files, folders, projects, orchestrations, endpoints, and so on. Names should be:

- **Unique** - Studio is case sensitive: filename1, FILENAME1, and FileName1 are three different files. However, do not rely on capitalization to distinguish among Studio projects, it can lead to confusion.
- **Descriptive** - For example, a project that integrates suppliers and an inventory system might be called “SupplyChainIntegration.”

## Back up projects frequently

In multi-user environments especially, be sure to back up projects frequently. You can quickly back up all Studio project components by simply creating a compressed file of the contents in a specific project's directory. Store the compressed file elsewhere, in a secure location. Ideally, in a version control system that will let you also track project changes.

## Store projects in a central location

Place all project files in a central location, preferably using version control software, so that projects are easy to find and previous iterations are easy to recover (this is especially important if you have numerous developers working on the same project).

## Design orchestrations for optimal performance

When possible, preprocess as much input data using the native facilities of the source systems before integrating. Transforming data outside the source system adds to the processing overhead. If performance becomes an issue, investigate how you can minimize the use of the Map Activity in an integration project's orchestration.

For example, if you are integrating data from several different database systems, consider creating extract tables that preprocess the data, rather than trying to resolve all differences among disparate data types in the orchestration.

## Use Configuration Properties for endpoint definitions

Rather than hard-coding details in your project endpoints, you can use properties for some of the details. You define these configuration properties in Studio and then use the Management Console to specify various runtime values. Before deploying the project, you must configure the properties for the actual endpoints in the production environment. For more details, see the online help.

## Test activities and all definitions in Studio, as you design

As you use Studio to design all the elements of an orchestration, be sure to use test data wherever appropriate to ensure that mappings work as expected. Before publishing a project, test all mappings and flat-file schemas using Studio.

## Set up development and test environments

Ideally, you should set up development and testing environments that mirror your production environment, including replicating data sources and targets in the test environment.

- Extract (or replicate) production data to your development and test environments.

Before deploying the project, you must configure the properties for the actual endpoints in the production environment by changing the Configuration Properties. See the Management Console online help for details.

## Glossary

---

A glossary of terms

### Activity

A complete, functional unit of processing within an orchestration. Activities include flow-control (logic) activities; data activities to facilitate consumption and transmission of data; and activities that enable integration with database systems, enterprise systems, Web servers, e-mail servers, and other systems. An orchestration contains a series of activities.

### Assets

Supplemental configuration files, scripts, or other materials associated with a specific activity. For example, the buffer table scripts created for a database insert activity are assets. Assets are controlled by the Web Management Console. Access privileges to assets can be given to users beyond the users of the WMC. For example, DBAs can be given privileges to the assets associated with a database activity so that they can create the required tables or triggers.

### Buffer table

An auxiliary table used in conjunction with various Database Module Activities, such as the single-table insert, update, or delete database activities. When you configure one of the database DML (data manipulation language) activities, Studio generates a SQL script that can be used to create the appropriate trigger on the database table; the buffer table gets populated when the triggering event (INSERT, UPDATE, DELETE) occurs. The buffer table provides the means to capture database changes and initiate processing by the orchestration.

### Command-line interface

A text-based alternative to the Web Management Console for configuring, managing, and querying an Integration Appliance.

### Control table

A database table that facilitates using database endpoints in integrations. As it does with buffer tables, Studio generates scripts to create control tables that can be used to ensure that inserts, updates, and deletes to specific tables occur once and only once.

### Deploy

Create an instance of a project configuration on an Integration Appliance.

### Document

Any of the XML Schema files, DTDs, and other configuration files that comprise integration projects.

### Dynamic delimiters

A delimiter that is obtained from within the fields of the message itself, such as an HL7 PID (patient ID) message header that denotes the beginning of a new record in a file containing a batch of electronic health records.

### Empty placeholder

Appears in activities that have multiple branches as an initial placeholder for the activities in that branch. Dropping other activities on this icon removes it.

### Endpoint

Is an external system, such as a database server, FTP server, e-mail system, or enterprise application that the Integration Appliance connects to either get data or return data during run time.

### Flat file

A file containing non-XML data. Flat files are typically of two types: delimited, in which a comma, tab, white space, or other delimiter is used to separate variable-length fields and records; or positional, in which fields and records have a fixed width.

### For each

A activity that iterates over a message structure where the data repeats.

## Flat File Schema

Defines how to interpret a specific set of Flat Files. Studio creates flat-file schema (XML Schema) based on the configuration you define in the Message Definition pane. A flat-file schema is used in conjunction with Read Flat File activity to convert a source flat-file into XML.

## Function

String, mathematical, and miscellaneous functions provided by Studio that you can use in defining processing in your orchestrations. In addition to the pre-built functions, Studio lets you build your own custom functions and add lookup tables.

## Integration project

The various inputs, outputs (endpoints), mapping and schema definitions (transformations, message formats), orchestrations, and configuration information that comprise an integration solution as designed in Studio and deployed to the Integration Appliance.

## Job

A specific runtime instance of an orchestration.

## Map

A component that lets you bind input parameters to variables, and variables to the orchestration. Many Studio activities contain embedded maps that you must configure at design time, in the context of an orchestration, to define how actual parameters should map to variables, and how the variables should be processed in the orchestration. In addition to the embedded activity maps, Studio has a stand-alone Map activity that can be used to bind any type of input and output to the orchestration.

## Node

All data input to or output from the Integration Appliance is materialized in Studio as a series of nodes, as in a tree-like, hierarchical structure. In many cases, the nodes represent the structure and content of an XML document, but in many cases they don't (e.g., rows in a database table display as nodes). Nodes in Studio convey information about structure; the type of content that can be supported; or additional characteristics of the data.

## Orchestration

The specific sequence of processing activities (such as data mapping, transformation, and control logic activities), endpoints, and data types defined and configured using Studio and deployed to run on the Integration Appliance.

## Parameter

A value passed to an activity or to an orchestration. For example, filename and data are two of the parameters that can be passed from an FTP endpoint to an orchestration.

## Pick

An activity that determines what starter activity to launch based on the action that has occurred. For example, a Pick activity could contain three branches, one that contains a Get Inserted Rows activity, one that contains a Get Deleted Rows activity, and the other contains a Get Updated Rows activity. If an UPDATE event occurs on the database, an instance of the orchestration is created and branch that contains the Get Updated Rows activity is invoked.

## Project

A project defined and created using Cast Iron® Studio. Each project has a properties file (filename.sp3) and several additional metadata files and folders that comprise all integration elements - orchestrations, endpoints, XML schemas, Flat Files - and their specific configuration (variables, parameters).

## Publish

Copy all project files from Studio to an Integration Appliance or to an intermediate staging area, such as a shared directory on a file server, for subsequent runtime configuration and deployment to a specific environment. The Publish process encompasses validating the project; creating a .par file of project configuration documents; and sending the package to the Integration Appliance specified.

## Record identifier

A special field that delimits records in certain types of Flat Files, such as EDI (electronic data interchange) or HL7 (Health Level 7) files. For example, an HL7 PID (patient ID) number is a record identifier.

## Repetition delimiters

A delimiter in a Flat File that is used when the data lacks a unique value, such as record ID, to distinguish one record from another.

#### Replace

Appears in Pick and other activity branches as an initial placeholder for the endpoint activity to receive a message for that branch. Dropping a Receive endpoint Activity on this icon removes it.

#### Stored procedure

A functional code unit that resides in a database and is ran explicitly by invoking its name. Stored procedures can be used to populate buffer tables when specific insert, update, or delete activities occur on a particular database table.

#### Studio

An integrated development environment (IDE) for creating, configuring, and publishing integration projects and the orchestrations they comprise. Studio projects run on the Cast Iron Integration Appliance.

#### Terminate

Stops orchestration processing.

#### Transformation

Converting data from one format to another. For example converting Flat File data in a CSV (Comma Separated Values) format to XML data. Transformations can also suppress data, add data, alter datatypes, and perform calculations.

#### Trigger

A type of database stored procedure that is called implicitly when a triggering event occurs. In the Database Module, a “triggering event” as an INSERT, UPDATE, or DELETE on a table.

#### Variable

Used to pass data values processed by an orchestration. Variables are used by maps to identify the source and target. Some Activities create variables automatically.

#### While loop

Initiates and continually processes any children activities for as long as a specified condition is true.

## Privacy Policy Considerations

---

IBM Software products, including software as a service solutions, ("Software Offerings"[]) may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth in the following paragraphs.

Depending upon the configurations deployed, this Software Offering may use session and persistent cookies that collect each user's session ID for purposes of session management, or functional purposes. These cookies can be disabled, but disabling them will also eliminate the functionality they enable.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, See IBM's Privacy Policy at <http://www.ibm.com/privacy> and IBM's Online Privacy Statement at <http://www.ibm.com/privacy/details> the section entitled "Cookies, Web Beacons and Other Technologies"[] and the "IBM Software Products and Software-as-a-Service Privacy Statement"[] at <http://www.ibm.com/software/info/product-privacy>.

IBM® Cast Iron® Studio is a development tool that is used to design, test, and publish integration projects to an IBM Cast Iron Integration Appliance. Studio provides numerous entities that you can drag into a workspace and configure as part of one, or more, business-process orchestrations that comprise an integration project.

Before you start, read [Studio basics](#) to familiarize yourself with the Studio environment and the terminology used, then refer to the topics in the help to find out how to complete specific tasks.

For detailed information about deploying your projects and working with them on the Integration Appliance, see the [Web Management console](#) help.

For a conceptual overview of Studio, including a step-by-step sample of how to create, test, and publish a project, see the [Introduction to getting started](#) section.

## IBM Cast Iron Studio introduction pane

---

When you first launch Studio, the IBM Cast Iron Studio introduction pane is displayed. If Studio was closed while editing an existing project, Studio automatically loads the last edited project. To edit the loaded project, click an entity in the Project tab.

The following options are available from the IBM Cast Iron Studio introduction pane:

- [Create Project](#) - Launches the New Studio Project dialog box. Use the New Studio Project dialog box to create a new empty project with a default empty orchestration.
- [Open Project](#) - Launches the Open dialog box. Use the Open dialog box to browse for and open an existing project file. A Studio project file ends in the .sp3 extension.
- **Recent Project** - To view a project that was recently opened, click directly on project name under the Recent Projects folder.
- **View Help** - Launches the Studio help.
- **Find Solutions** - Launches the Template Integration Projects (TIPs) [Searching for Template Integration Projects \(TIPs\)](#) dialog box, which allows you to search for TIPs from the Cast Iron solutions repository.

---

### [Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics\\_welcome.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_welcome.html)

## Working with projects

---

This page is the starting point for finding information about working with projects using IBM® Cast Iron® Studio.

- [Studio basics](#)  
Studio provides an environment called a Workspace in which you can design and configure your integration projects. The Toolbox is the area next to the Workspace where multiple tabs contain components that you use to build an integration project; components such as endpoints, schemas, orchestrations, style sheets, transformation, WSDLs, activities, variables, and functions.
- [Creating a new project](#)  
Each time you create a project, a project properties file is also created with the project name. These

property files are used when you export or publish projects.

- [Protecting a project with a password](#)  
In Studio, you can protect a project by assigning a password to it.
- [Opening a Project](#)  
When you first launch Studio, the Project last worked on is opened by default. There are several ways to open a different project.
- [Saving a Project](#)  
You can save a project using the Studio toolbar.
- [Renaming a Project](#)  
You can rename a project using the Studio toolbar.
- [Publishing a Project](#)  
When you publish a project, Studio connects to an Integration Appliance and directly updates the Integration Appliance with the documents that make up the project. Publish a project when the project is complete, has been validated, and has been tested in Studio. You cannot publish a project that has not been successfully validated.
- [Exporting a Project](#)  
Export saves all the orchestrations, endpoints, schemas, and other items associated with the project, into a single file that ends in the .par extension.
- [Configuring Project Settings](#)  
You can assign a unique version number to a project using the Project Settings dialog box.
- [Setting Preferences](#)  
You can specify Project, Orchestration, Flat File, SSL/Kerberos, Session Login, and XML Schema preferences from the Preferences dialog box. You can change preferences at any time.
- [Creating Configuration Properties](#)  
Create configuration properties or name/value pairs in a project. Use configuration properties to supply the default values for destination nodes of a map in the Mapping Editor.
- [Editing Configuration Properties](#)  
You can edit configuration properties in Studio and in the Web Management Console (WMC).
- [Creating Global Configuration Properties](#)  
When a global configuration property is created, you can import the global configuration property into a project as a project configuration property.
- [Searching for Template Integration Projects \(TIPs\)](#)  
Template Integration Projects (TIPs) are stored in the Cast Iron solutions repository. Through the Configuration Wizard, TIPs guide you through the configuration steps for an integration scenario. TIPs can be downloaded to your local machine. The login window is pre-populated with the User Name and Password to make it easier for you to download the TIPs, without registration.
- [Installing Module Provider Libraries](#)  
Both IBM Cast Iron Studio and the Integration Appliance require library files (.jar and .dll) associated with instances of certain connector types to be imported. For example, the following connectors require additional libraries: Database Connector, JDE, JMS, MQ, PeopleSoft, and SAP. These files must be present in Studio to enable configuration of the endpoints and orchestrations that use any of those connectors.
- [Uploading Files into a Project](#)  
You can upload only specific types of files into a project. For example, if you plan on mapping a string to XML data (valid to a particular XML Schema), you must first upload the XML Schema file (ends in the .xsd extension) into the project before mapping the nodes in the XML Schema.
- [Uploading Included XML Schemas](#)  
An XML Schema or WSDL document can include other XML Schemas in the main document, using Schema Inclusion, Schema Inclusion with Redefinition, or Importing a Namespace.
- [Specifying the Location of a File to Upload](#)  
Files can be uploaded into a project from a web location (HTTP or FTP Server) or from the local file system.

- [Valid External File Types for a Project](#)  
When building orchestrations, you can upload XML Schemas or other files into your project to complete configuration tasks. External files are used in connection activities and orchestrations that use a message that Studio cannot generate an XML schema for automatically. You must supply an XML schema or DTD if the message must be transformed or if you need to define a job key for the message.
- [About Valid Names](#)  
To be valid, the names for projects, Endpoints, orchestrations, stylesheets, Flat File Schemas, XML Schemas, WSDLs, and transformations must not exceed 42 characters and must not contain any of the reserved characters or words.
- [Undo and Redo Operations](#)  
Studio stores up to the last 100 actions you make and you can undo and redo those actions. You can undo and redo an action that you take on the fields in the UI, orchestration views, Mapping Editor, project tree, configuration properties, and variable panel activities.
- [Updating a Changed XML Schema](#)  
If you created a project that uses an XML Schema and the XML Schema changes, you can attempt to update the existing XML Schema with the new XML Schema.
- [Using the Project Explorer](#)  
The Project Explorer dialog box list the set of entities of the current type, that have been already defined for the project.
- [Using the HTTP Post Utility](#)  
This utility provides a simple HTTP client interface that enables you to post messages/requests to HTTP servers, which is useful for orchestrations that have an **HTTP Receive Request** activity as the starter activity.

---

## Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_workingwithprojects.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_workingwithprojects.html)

## Studio basics

---

Studio provides an environment called a Workspace in which you can design and configure your integration projects. The Toolbox is the area next to the Workspace where multiple tabs contain components that you use to build an integration project; components such as endpoints, schemas, orchestrations, style sheets, transformation, WSDLs, activities, variables, and functions.

## Toolbar icons

---

Directly under the Studio toolbar menu options are the following Studio toolbar icons:

- New Project:  [Create Project](#)
- Open Project:  [Opening a Project](#)
- Save Project:  [Saving a Project](#)
- Close Project:  [seeSaving a Project](#)

- Undo:  Allows you to undo previous actions.
- Redo:  Allows you to redo previously undone actions.
- Cut:  Removes an entity and saves a copy of the entity in the clipboard that can be used later by a paste action. For example, from an orchestration you can remove and store an activity to the clipboard. For more information, see [Working with activities in an orchestration](#)
- Copy:  Saves a copy of the selected entity into the clipboard that can be used later by a paste action.
- Paste:  Copy the stored entity from the clipboard.
- Delete:  Removes the entity. The activity is not saved in the clipboard.
- Validate Project:  Validates all the orchestrations in the project. If an orchestration is invalid the invalid orchestration icon  is displayed next to the orchestration in the Project tab. If the orchestration is invalid, click the orchestration to view the errors in the Validation Results window.
- Publish Project:  Opens the [Publishing a Project](#) dialog box. From the Publish Project dialog box, you can publish a project to an Integration Appliance
- Export Project:  Opens the Save dialog box. From the Save dialog box, you can save all the orchestrations, endpoints, schemas, and other objects associated with the project, into a single file that ends in the .par extension.
- Project Documentation Generation: Generates and saves project documentation as an HTML file.
- Preferences:  Opens the Preferences dialog box. You can specify Project, Orchestration, Flat File Properties, SSL/Kerberos, Session Login, and XML Schema preferences from the Preferences dialog box.
- Help:  Opens the Studio help. You can also connect to the **WebSphere Cast Iron Community** by selecting the option from the main Help menu.

## Orchestrations and the Workspace

---

When you select an orchestration a tab view of the selected entities is displayed in the upper half of the Workspace. For example, if you double-click an orchestration in the Project tab, a graphic view of the orchestration is displayed as a tab. An orchestration or workflow contains the logical flow of your integration. Drag-and-drop activities from the Activity tab onto the orchestration to visually define the logical flow of your integration. For a list of other entities configurable from the top half of the Workspace, see the Project tab.

The lower half of the Workspace is where you define or configure the activities you added to the orchestration. It is referred to by different names, depending on what you are doing at the time. If you are creating a map, this area is called the Mapping Editor. If you are configuring endpoints or configuring an activity, it is referred to as the Properties pane.

## Toolbox tabs

---

The Toolbox comprises five sideways-oriented tabs: Project, Activities, Variables, Functions, and Verify.

Note: You can make the Toolbox larger or smaller by moving the invisible slider between the Workspace and the Toolbox.

## Project tab

---

The Project tab contains folders that store the basic entities that make up any integration project. These folders are initially empty. The Project tab contains the following folders:

Endpoints

Specifies the connection information required to connect to the various external systems. The Integration Appliance supports connecting to endpoints of many types including FTP, SFTP, HTTP, HTTPS, Email (SMTP, POP), SAP, MQ, Web Services, and many commercial database systems.

#### Flat File Schemas

Defines the content and structure of a Flat File. Flat Files are any non-XML text data, such as comma and tab-delimited files and EDI or industry-specific textual formats, such as the Health Level 7 (HL7) format for the healthcare industry.

#### Orchestrations

Contains a sequence of activities that performs a specific business process. Orchestrations are the central entity of any integration project.

#### Stylesheets

Defines how to transform XML data from one format to another. You can upload an XSLT Stylesheet into Studio and add an Apply XSLT activity to your orchestration that starts the XSLT Stylesheet during run time.

#### Transformations

Contains stand-alone maps that represents a set of one or more mappings between source and destination nodes.

#### WSDLs

A WSDL is an XML document that describes a Web Service. It defines how to access a Web Service and the operations available for the Web Service.

#### XML Schemas

Defines the content and structure of XML data. XML Schemas are typically stored in files that end with the .xsd extension. When you upload an XML Schema into a project, you can use that XML Schema to create variables used by the activities of an orchestration.

In addition, the following icons are provided:

- New Orchestration:  Click to create an Orchestration.
- New Endpoint:  Click to create an Endpoint.
- New Flat File Schema:  Click to create a new Flat File Schema.
- New Standalone Map:  Click to create a Standalone map.
- Add Document:  Click to upload a file into the current project.
- Revalidate Project:  Click to validate the orchestrations in the current project.

To view the entities that make up the Project tab as a list view:

1. Select Edit > Preferences from the Studio toolbar menu. The Preferences dialog box displays.
2. Select the Show the entities of the Project tab as a list check box.

To view and configure an existing entity in the Project tab, open an entity choose from one of the following options:

- Double-click the entity in the Project tab
- Select the entity in the Project tab and press Return.

The properties of the entity show in the Properties pane. Clicking an orchestration in the Project tab, validates the orchestration. If the orchestration is invalid, the orchestration warning icon is displayed , and the Validation Results window opens next to the Project tab. Click the error message in the window to open the appropriate panel to fix the error.

To rename or delete an entity in the Project tab, right-click the entity and from the list select Rename or Delete.

To copy and paste an entity in the Project tab:

1. Select an entity in one of the folders in the Project tab.
2. To copy the entity, enter the key sequence: CTRL+C.
3. To paste the entity, enter the key sequence: CTRL+V. A copy of the entity displays in the Project tab.

To view the entities of the Project tab as a list, select the Show entities of the Project tab as a list check box in the Preferences pane of Studio. For more information, see [Setting Preferences](#).

When the Project tab opens, a Dependencies pane shows by default in the Project tab. Selecting an entity in the Project tab shows the entities that are directly dependent on this entity in the project, which entities in the project would be incomplete if this entity was removed.

For example, if you had FTP endpoint that was used by the **FTP Poll Directory** and **FTP Put File** activities of the BatchOrder orchestration, clicking the FTP endpoint in the Project tab, displays the BatchOrder orchestration in the Dependencies pane because the endpoint is used by the orchestration. If you deleted the FTP endpoint, the BatchOrder orchestration would be incomplete. If you select the BatchOrder orchestration, you would not see the FTP endpoint listed in the Dependencies pane because you can delete the BatchOrder orchestration without affecting the FTP endpoint.

By default, the Dependencies pane appears underneath the Project tab. You can hide the Dependencies pane, by clearing the Show dependant project nodes check box for the Project in the Preferences pane. To view the preferences for a project, select Edit > Preferences from the toolbar menu and then select Project in the left pane. The preferences for the project display.

## Activities tab

---

An activity performs a specific operation in an orchestration. Activities are organized into the following general categories on the Activities tab:

- Transform
- Logic
- Utilities
- Archives
- Cryptoservice
- Database
- Data Quality
- Domino
- Email
- Force.com Bulk API
- FTP
- HTTP
- JDE
- JMS
- MQ
- NetSuite
- PeopleSoft
- SAP
- Salesforce.com
- ServiceMax
- Siebel
- STS
- Web Services
- Workday

## Variables tab

---

Variables are tools for orchestrations. They are used to bind data sources to orchestrations and pass or operate on data values as they pass through the orchestration. The Variables tab provides an area where you can create and edit variables.

## Functions tab

---

Functions are tools used in the Mapping Editor. Use the tools to specify how to transform data as it passes through an orchestration. If the functions provided in the Functions tab do not meet your needs, you can create your own custom functions.

## Memory usage and garbage collection

---

If the Show memory usage in status bar option is selected in the Preference dialog box, a memory bar and trash can icon is displayed as shown in the following figure. This memory bar displays how much memory is currently used by Studio, compared to the total memory that is currently allocated to Studio (520 MBytes) from the Operating System, as shown in [Figure 1](#):

To request that Studio attempt garbage collection, reclaiming any unused memory inside of Studio, click the trash can icon located to the right of the memory bar. Clicking the garbage collection trash can icon might reduce the amount of memory Studio is currently using internally, potentially increasing the performance of Studio when working with a large project. Clicking the garbage collection trash can does not reduce the memory used by Studio from the operating system, the size of this memory remains constant to the 520 MBytes size initially allocated to Studio.

## Entity tabs

---

To manage the Entities tabs: in the upper half of the Workspace, the entities selected from Project tab are displayed as tabs (for example: Orchestrations and Endpoints). You can manage these tabs by right-clicking a tab and selecting the appropriate action from the menu:

- Close: Close the tab that you right-clicked on to open the menu.
- Close Other Tabs: Close all the open entity tabs except the entity tab that you right-clicked to open the menu.
- Close All Tabs: Closes all the entity tabs currently open.
- Close All But Current Tab: Close all the open entity tabs except the entity tab that is currently selected.

To navigate to hidden entity tabs, when many entities have been opened from the Project tab, the hidden tabs icon  is displayed as shown in [Figure 2](#).

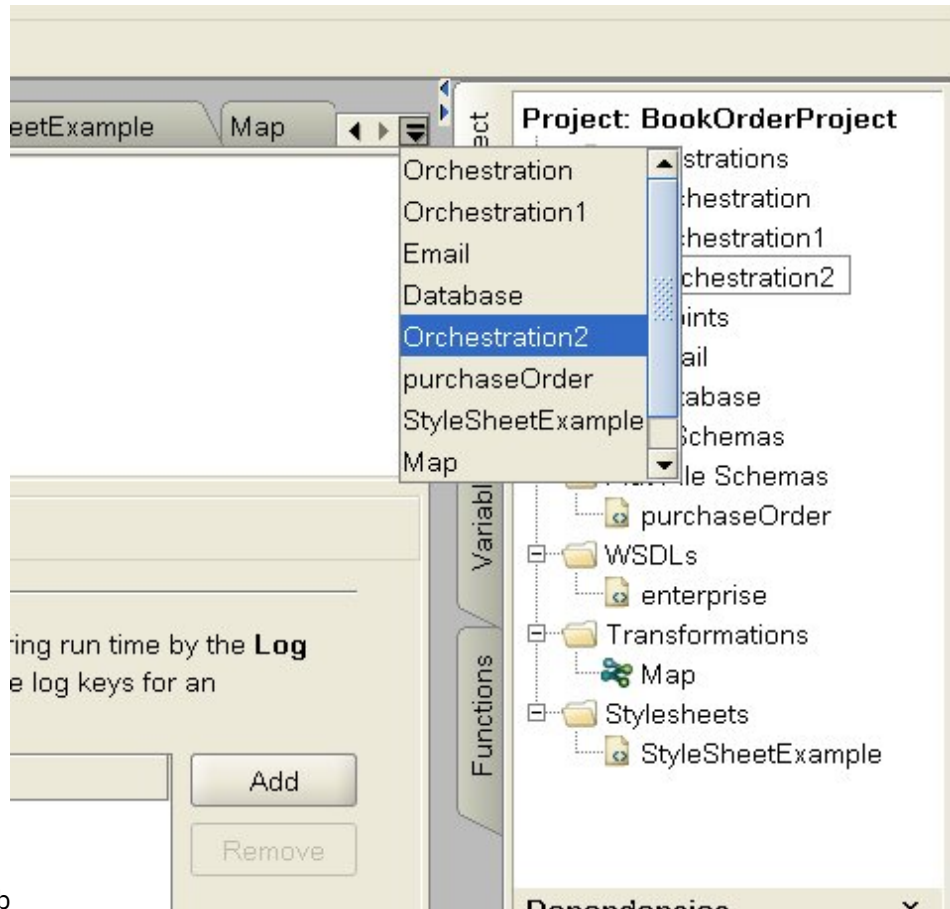

Figure 2. Hidden Tab

To access the hidden entity tabs, click the hidden tabs icon . A list of all the currently opened tabs is displayed. Select one of the tabs from the menu.

## Creating a new project

Each time you create a project, a project properties file is also created with the project name. These property files are used when you export or publish projects.

### Procedure

1. Select File > New Project
2. Enter CTRL+N, or click the New Project toolbar icon The New Studio Project dialog box is displayed.
3. Enter a name in the Project Name field. The name of the project cannot be longer than 42 characters and cannot contain any reserved characters or words. For the list of reserved characters and words see

[About Valid Names.](#)

4. In the Project Directory field, click [...], to browse for the folder in which to save the project. The Open dialog box is displayed
5. Select a folder and click Open.
6. Click OK.

## Protecting a project with a password

---

In Studio, you can protect a project by assigning a password to it.

### Before you begin

---

This password does not protect a project that has been exported from Studio or published to an Integration Appliance. This password is not used by the Integration Appliance.

### Procedure

---

1. Select Project > Permissions > Protect from the Studio toolbar menu. The Enter Project Password dialog box is displayed.
2. In the Enter Password field, enter a valid password. Passwords must be 4-15 characters in length and contain at least one letter and one number. Once a valid password is entered, the message displayed at the end of the dialog box changes from `Enter password` to `Confirm password`.
3. In the Confirm Password field, enter the same password. The message displayed at the end of the dialog box changes from `Passwords do not match` to `Passwords match` when the correct password is entered in the Confirm password field.
4. Click OK.

### Results

---

The project is now protected with a password.

### What to do next

---

Note: Studio does not store passwords. If you forget the password for the project and Studio does not currently have that project open, you must rebuild the project. If the project is still open, you can change the current password as described in the following topics.

- [Changing a password associated with a project](#)  
If a project is protected with a password, it can be changed from the Studio toolbar menu
- [Removing a password associated with a project](#)  
If a project is protected with a password, it can be removed from the Studio toolbar menu

## Changing a password associated with a project

---

If a project is protected with a password, it can be changed from the Studio toolbar menu

### About this task

---

The option to change the password is only available if the project has already been protected with a password.

### Procedure

---

1. Select Project > Permissions > Change Password from the Studio toolbar menu. The Enter Project Password dialog box displays.
2. In the Old Password field, enter the existing password assigned to the project.
3. In the New Password field, enter a new valid password. Passwords must be 4-15 characters in length and contain at least one letter and one number. Once a valid password is entered, the error changes from `Invalid password selected` to `Passwords do not match`.
4. In the Confirm Password field, enter the same new password. Once the same password has been entered in the Confirm Password field, the message displayed in the dialog box changes from `Passwords do not match` to `Passwords match`.
5. Click OK.

### Results

---

The project password has been changed.

**Parent topic:** [Protecting a project with a password](#)

## Removing a password associated with a project

---

If a project is protected with a password, it can be removed from the Studio toolbar menu

## About this task

---

The option to remove the password is only available if the project has already been protected with a password.

## Procedure

---

1. Select Project > Permissions > Unprotect from the Studio toolbar menu. The Enter Project Password dialog box displays.
2. In the Password field, enter the existing password assigned to the project.
3. Click OK.

## Results

---

The project is no longer protected by password.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics\\_removing\\_project\\_security.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_removing_project_security.html)

## Opening a Project

---

When you first launch Studio, the Project last worked on is opened by default. There are several ways to open a different project.

## About this task

---

The following steps explain how to open a project using the menu toolbar. You can have only one project open at a time.

## Procedure

---

1. Select File > Open Project , or select the Open Project  toolbar icon.
  2. Navigate to the location of the project you want to open.
  3. Select the project to open. Either:
    - o Select a project file that ends in the .sp3 extension and click Open.
    - o To view a project that was recently opened, select File > Reopen Projects > *OldProjectName*, where *OldProjectName* is the name of the recently opened project.
- If the project is secure, you must enter a valid password to open it.

## What to do next

---

You can also open a project using the Studio Introduction pane or by using the keyboard.

- Using the Studio Introduction pane, click Open Project to display the Open dialog box
- Using the keyboard, use CTRL+o to select a project file that ends in the .sp3 extension

## Feedback | Notices

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics\\_Opening\\_a\\_Project.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_Opening_a_Project.html)

## Saving a Project

---

You can save a project using the Studio toolbar.

### About this task

---

To save a project to the file system using the default project name, choose one of the following options:

- SelectFile > Save Project from the Studio toolbar
- Press CTRL+S
- Click the Save Project toolbar icon 

### Procedure

---

1. Choose one from one of the following options:
  - Select File > Save As from the Studio toolbar
  - Press CTRL+AThe Save As dialog box displays.
2. In the Project Name field, enter the new name of the project.
3. Optional: By default, the project is saved into the directory location specified by the Default Create Path field of the Preferences dialog box. To specify a different directory location, click Browse.
4. Click OK.

### Results

---

The Saving Project progress dialog box displays as the current project is saved using the new name. The new project is saved into a directory on the local file system and the new project is opened and displays in the Project tab. The original project remains unchanged since the last time it was saved to the local file system

### What to do next

---

To close the current project, choose from one of the following options:

- SelectFile > Close Project from the Studio toolbar.
- Click the Close Project toolbar icon .

Parent topic: [Working with projects](#)

---

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics\\_saving\\_closing\\_a\\_project.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_saving_closing_a_project.html)

## Renaming a Project

---

You can rename a project using the Studio toolbar.

### Procedure

---

1. Choose one from one of the following options:
  - o Select File > Rename Project from the Studio toolbar
  - o Press CTRL+RThe Rename Project dialog box displays.
2. In the Project Name field, enter the new name of the project.
3. Optional: By default, the renamed project is saved into the directory location specified by the Default Create Path field of the Preferences dialog box. To specify a different directory location, click Browse.
4. Click OK.

### Results

---

If the project was changed since the last save, the current project is saved before the project is renamed.

The Saving Project progress dialog box displays as the current project is renamed and saved into a directory on the local file system using the new name. The current project with the new name is opened and displays in the Project tab. The original project with the old name no longer exists on the local file system.

### What to do next

---

To close the current project, choose from one of the following options:

- Select File > Close Project from the Studio toolbar.
- Click the Close Project toolbar icon .

**Parent topic:** [Working with projects](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics\\_renaming\\_closing\\_a\\_project.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_renaming_closing_a_project.html)

## Publishing a Project

---

When you publish a project, Studio connects to an Integration Appliance and directly updates the Integration Appliance with the documents that make up the project. Publish a project when the project is complete, has been validated, and has been tested in Studio. You cannot publish a project that has not been successfully validated.

## About this task

---

You can publish multiple projects to the Integration Appliance.

Note: If you attempt to publish a project from Studio to the Integration Appliance and a project of the same name already exists on the Integration Appliance, whether the project gets published depends on the status of the project on the Integration Appliance:

- If any of the orchestrations in the project have been deployed on the Integration Appliance, the new project does not get updated on the Integration Appliance.
- If all the orchestrations in the project have been removed from the Integration Appliance, the new project from Studio overrides the existing project of the same name on the Integration Appliance.

As an alternative to publishing a project, you can choose to export a project. Exporting is typically used for publishing projects to production environments where administrators need to control the timing and impact of the deployment. For more information about exporting, see [Exporting a Project](#).

Note: To publish a project, Studio relies on the supported SSL and TLS protocols enabled in the SSL/Kerberos - Preferences window. You can select the TLSv2 or TLSv1.2 protocol. The default is TLSv2.

## Procedure

---

1. Select File > Publish Project or the Publish Project toolbar button.  The Publish Project dialog box displays.
2. In the Host name field, enter the host name or the IP address of the Integration Appliance you want to publish the project to. This is the host name for the management interface (mgmt).
3. Enter the *User Name* and *Password* for the Web Management Console (WMC) account for this Integration Appliance. The default account name is admin and the default password is !n0r1t5@C.
4. Optional: To specify that the project documents are to be sent over HTTPS to the Integration Appliance, select the Security check box.
5. Click OK. Studio connects to the Integration Appliance and updates the Integration Appliance with the documents that make up the project.
6. When the publish is confirmed, click OK.

**Parent topic:** [Working with projects](#)

### [Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics\\_Publishing\\_a\\_Project.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_Publishing_a_Project.html)

## Exporting a Project

---

Export saves all the orchestrations, endpoints, schemas, and other items associated with the project, into a single file that ends in the .par extension.

## About this task

---

Exporting is typically used for publishing projects to production environments where administrators need to control the timing and impact of the deployment. When a project is exported to a PAR file (in Studio), an administrator can use the Web Management Console (WMC) to upload the project to the Integration Appliance. This two-step process (exporting to a PAR file and uploading a project using the WMC) is equivalent to publishing a project directly from Studio to an Integration Appliance.

## Procedure

---

1. Select File > Export Project from the toolbar menu or select the Export Project toolbar button . The Save dialog box displays.
2. Navigate to the directory where you want to save the exported project.
3. Optional: Change the name of the exported file. Keep the .par extension.
4. Click Save.
  - If successfully exported, a project file shows in the specified directory. The file name is the same as the current name of the project with a .par extension. For example, if you export a project named *MySimpleProject*, the project is saved in the *MySimpleProject.par* file. A dialog box displays indicating that the export process was successful.
  - If there are problems with the project it is not exported; the Exporting Results dialog box displays with a list of problems that must be corrected before the project can be successfully exported.
5. Click OK.

## What to do next

---

For more information about exporting a project into the Integration Appliance using the WMC, see the WMC online help.

**Parent topic:** [Working with projects](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics\\_Exporting\\_a\\_Project.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_Exporting_a_Project.html)

## Configuring Project Settings

---

You can assign a unique version number to a project using the Project Settings dialog box.

## About this task

---

When you publish a project to the Integration Appliance, the version number associated with the project is visible in the Web Management Console (WMC). By changing the version number in the Version field, you can

publish different versions of a project, even if the project itself hasn't changed. The different versions of the project are listed separately in the WMC and can be deployed individually.

## Procedure

---

1. Select Project > Project Settings from the menu toolbar. The Project Settings dialog box displays.
2. Enter a version number in the Version field.
3. Enter a description of the project in the Description field.
4. Enter any comments for the project in the Comments field
5. Click OK.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics\\_Configuring\\_Project\\_Settings.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_Configuring_Project_Settings.html)

## Setting Preferences

---

You can specify Project, Orchestration, Flat File, SSL/Kerberos, Session Login, and XML Schema preferences from the Preferences dialog box. You can change preferences at any time.

## Procedure

---

1. Select Edit > Preferences option from the toolbar. The Preferences dialog box opens.
2. In the left pane, select the type of preferences to change:
  - o Appearance
  - o Project
  - o Orchestration
  - o Flat File
  - o SSL/Kerberos
  - o Session Login
  - o XML Schema
  - o Current Project
3. Specify, select, or clear preferences in the dialog box.
4. Click OK.

## Results

---

The tables in the following topics describe the Appearance, Project, Orchestration, Flat File, SSL/Kerberos, Session Login, and XML Schema preferences available from the Preferences dialog box.

Using the Appearance preferences you can change the application display and font.

- [Project Preferences](#)  
Project preferences can be set using the Preferences dialog box.

- [Orchestration Preferences](#)  
Orchestration preferences can be set using the Preferences dialog box.
- [Other Preferences](#)  
Appearance, Flat File, SSL/Kerberos, Session Login, XML Schema, and Current® Project preferences can all be set using the Preferences dialog box.

## Orchestration Preferences

---

Orchestration preferences can be set using the Preferences dialog box.

Table 1.

Button or Option Label	Description

Button or Option Label	Description
By Default Animate Orchestration Views	<p>This is a global option that determines the behavior for all orchestrations. By default, this option is selected and all actions that occur in the Studio Workspace are animated.</p> <p>Clear this option, to turn off workspace animation. When this option is clear and you perform action in the Workspace, such as adding an activity, the Workspace snaps into place.</p> <p>You can override this option at the individual orchestration level, using the Animate Graph orchestration view icon. However, if the global option is modified after you set the option for an individual orchestration, the global change overrides any individual orchestration setting you previously set.</p>
Use Old Orchestration View	Select this option to view an orchestration as it would display in Studio 3.X. When you select this option, Studio 4.X orchestration view improvements are no longer available. For a complete list of 4.X orchestration view improvements, see the Studio Release Notes®.
Maximum Job Instances to be displayed	Determines the maximum number of jobs that can display in the Verify tab. For example, if you specify 2, the status of two jobs display: instance #1 and instance #2. If you run the orchestration again, the Verify tab displays: instance #2 and instance #3.
Show Activity ID	When you select this option, ID numbers display in the activities of an orchestration.
Enforce Strict Validation for Reply activities	By default, this option is selected. If you clear this option, Studio allows more than two Reply activities on the execution path. Reply activities include: Web Services <b>Send Reply</b> , Web Services <b>Send Reply with Fault</b> , and <b>HTTP Send Response</b> .
WS Provide-Generate WSDL compatible with 3.6.x version	<p>Typically, when you upgrade projects that contain Web Services <b>Provide Service</b> activities, the Studio generates a WSDL with a new namespace. Select this option so that Studio keeps the 3.6X WSDLs instead.</p> <p>If you select this option, Studio does not generate WSDLs with the most current namespaces.</p>
CDK Log Enable/Disable	Select this option to view CDK Connector activity log (or flow) in the Verify pane.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basis\\_orchestrationpreferences.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basis_orchestrationpreferences.html)

## Other Preferences

Appearance, Flat File, SSL/Kerberos, Session Login, XML Schema, and Current® Project preferences can all be set using the Preferences dialog box.

Table 1. Appearance Preferences

<b>Button or Option Label</b>	<b>Description</b>
<i>Application</i>	
Use native application frame	Indicates that if you select this check box, the look and feel of the operating system will be applied to the application window.
Use Color Scheme	Indicates the color schemes available to customize your application display. This option is available only if the Use native application frame options is not selected.
<i>Font</i>	
User Interface	Lists the font types available to change the font of the user interface. The Reset button allows you to set the default font.
Data Fields	Lists the font types available to change the font of the data fields. The Reset button allows you to set the default font.

Table 2. Flat File Preferences

<b>Button or Option Label</b>	<b>Description</b>
Maximum Preview Size of Sample File (in KBytes)	<p>When testing a Flat File Schema, this field specifies how many KBytes of data is displayed in the source pane - the left side of the Test tab. This field is useful when you have a large source data file and you need to only view the top portion of the file to design the Flat File Schema.</p> <p>This field does not affect the size of the file that is transformed when you click the Test icon in the Test tab. The entire source data file is transformed if the Maximum Size of Sample File (in KBytes) field is set to a large enough size to load the entire file.</p>
Maximum Size of Sample File (in KBytes)	When testing a Flat File Schema, this field limits the size in KBytes of the test data that is loaded into Studio for testing a Flat File Schema. The maximum supported sample data size is 2000 KBytes. If you specify a value greater than 2000 KBytes in this field, Studio resets the value to 2000 KBytes.

Table 3. SSL/Kerberos Preferences

<b>Button or Option Label</b>	<b>Description</b>
Kerberos Realm	Specifies the Kerberos realm.
Kerberos Server Name	Specifies the Kerberos server name.
KeyStore Password	Provides the password to access the keystore.
KeyStore Path	Specifies the path to the local Java™ keystore.

<b>Button or Option Label</b>	<b>Description</b>
TrustStore Password	Provides the password to access the truststore.
TrustStore Path	Specifies the path to the local Java truststore.
SSL Protocol	Use the drop-down menu to specify the SSL Protocol. TLSv2 is the default and enables all SSL and TLS protocols (including TLSv1.2) for SSL negotiation. TLSv1.2 enables the SSL communication using the TLSv1.2 protocol only.

Table 4. Session Login Preferences

<b>Button or Check Box Label</b>	<b>Description</b>
Username	Studio uses this user name to log in to the Cast Iron® TIPs repository.
Password	Studio uses this password to log in to the Cast Iron TIPs repository.
URL	Specifies the URL to the Cast Iron Service Login. Note: Do not modify the default value.
Host Name	Specifies a proxy host if you choose to use one.
Port	The proxy server port. By default, 8080.

Table 5. XML Schema Preferences. The following preferences determine the number of child levels, which Studio allocates and displays, for each XML Schema (including WSDLs) in the currently opened project.

<b>Button or Check Box Label</b>	<b>Description</b>
Number of child node levels allocated in memory for the schema	Specifies the number of child node levels that are allocated in memory for the XML Schema. The number of child nodes allocated in the internal tree that stores the metadata of the XML Schema in Studio. Note: Specifying a large number of child node levels can adversely affect the performance of Studio. The recommended value for this preference is 6.
Number of recursive node levels	Specifies the number of recursive node levels allowed and graphically displayed. Note: Specifying a large number of recursive node levels can adversely affect the performance of Studio. The recommended value for this preference is 3.
Number of child node levels that are initially expanded when a schema is displayed graphically	Specifies the number of child node levels that are initially expanded when an XML Schema is displayed graphically. For example if this limit was set to 6 in the preferences and a variable was selected for the From Orchestration pane of the Map Inputs task contained 8 node levels ( <i>input/po/purchase/widgetId/price/discount/special/december</i> ), only the first 6 levels ( <i>input/po/purchase/widgetId/price/discount</i> ) would be displayed in the Map Inputs task. You can expand a child node manually, by clicking the + sign next to the unexpanded child node.  Note: Specifying a large number of child node levels can adversely affect the performance of Studio. The recommended value for this preference is 4.

<b>Button or Check Box Label</b>	<b>Description</b>
Number of child node levels allocated in memory for the substituted types of schema	Specifies the number of child node levels that are allocated in memory for the substituted types of XML Schema. The number of child nodes allocated in the internal tree that stores the metadata of the substituted types of XML Schema in Studio. The default value is 10. The minimum value is 4. Note: Lowering this value decreases the memory requirement for child node levels in Studio.

Note: A word about memory consumption: Studio allocates memory for each variable or parameter displayed in the Variables or Mapper panes and generates metadata in a tree structure with each node containing information about a specific element/complexType. Because elements or complex types have references to themselves, the tree depth of those elements can exceed ten levels, resulting in OutOfMemory errors. To avoid this, use the XML Schema preference parameters to improve memory consumption. For example, you can use the Number of recursive node levels function to limit how many times a self-referring node is added to the tree structure. Additionally, you can use the Number of child node levels allocated in memory for the schema function to control tree depth and prevent Studio from exceeding a certain limit.

Table 6. Current Project Preferences. The following preference determines whether the password is encrypted or not for the current opened project.

<b>Check Box Label</b>	<b>Description</b>
Backwards compatibility with pre-4.5 projects is not required	When checked, encrypts the password upon publishing. This is the default starting with the Cast Iron 4.5 release. Before the 4.5 release, passwords were symmetrically encoded. If you plan to have the current project send the password to pre-4.5 projects, clear the check box. This avoids errors when the password is consumed by pre-4.5 projects.

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics\\_otherpreferences.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_otherpreferences.html)

## Creating Configuration Properties

---

Create configuration properties or name/value pairs in a project. Use configuration properties to supply the default values for destination nodes of a map in the Mapping Editor.

### About this task

---

When you add configuration properties to the project, using the Project > Configuration Properties option of the Studio toolbar menu, you can choose from these properties to supply the values for some of the fields in

endpoints and default values for destination nodes in maps.

For example, if you created a configuration property named *myDatabaseName* of String type in Studio. While configuring your database endpoint, click the Database Name field and the  icon displays on the right side of field because at least one configuration property of String type was previously created. Click the  icon and select the *myDatabaseName* configuration property from the menu. The Database Name for the endpoint is supplied by the *myDatabaseName* configuration property during both design time (in Studio) and run time (on the Integration Appliance). A configuration property can be of type String or Password.

A destination node of a map is located in the right pane of the Mapping Editor. For more information, see [Assigning a Default Value for a Destination Node](#).

You can create configuration properties in the Configuration Properties dialog box or use the quick create method.

### **To create configuration properties using the Configuration Properties dialog box:**

## Procedure

---

1. Open a Project.
2. Select Project > Configuration Properties from the toolbar menu. The Configuration Properties dialog box displays.
3. In the Add Name field, enter the name of the property you want to create.
4. From the Type list, select either String or Password.
5. Click Create. The new property name and type display in the properties list.
6. Click in the Value column for the newly created property.
7. Enter a value for the property; if it is of type `password`, the value is masked.
8. Press Enter or click out of the Value table cell to stop editing.
9. Continue adding additional properties as required. When finished, click OK.

## Example

---

Instead of creating configuration properties in the Configuration Properties dialog box, you can use the quick create option to define configuration properties directly from a text field in Studio. Fields that are enabled for the quick create option display a small green globe in the lower-right corner.

You can change the values of the configuration properties using the Web Management Console (WMC), like the configuration properties created in the Configuration Properties dialog box, after publishing a project.

Updating the value of the configuration property in the WMC does not affect the original value of the configuration property, that you defined in Studio.

### **To create configuration properties using the quick create option:**

1. In an Enabled field, click the green globe. The Create Configuration Property window is displayed.
2. In the text field, enter a name for this property.
3. Click Create to save the entry as a reusable property.

The property displays in the current text field, the  icon is replaced by the green globe, and the property is saved in the Configuration Properties dialog box.

**Parent topic:** [Working with projects](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics\\_Creating\\_Configuration\\_Properties.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_Creating_Configuration_Properties.html)

## Editing Configuration Properties

---

You can edit configuration properties in Studio and in the Web Management Console (WMC).

### About this task

---

#### Editing Configuration Properties in Studio

You can edit specific information for an existing property by opening the Configuration Properties dialog box and double-clicking the entry. This does not include changing the type. If you make a change and click OK, all of the applications of that property are updated automatically. You cannot delete properties that are in use in an orchestration. You can delete only unused properties or properties that you have removed from active orchestrations.

#### Editing Configuration Properties in the WMC

When the project is published to the Integration Appliance, you can change the values of the configuration properties using the WMC. For example, you can create configuration properties in Studio that stores the following database connection information for a database endpoint: hostname, IP address, username, and password. You can then publish the project to the Integration Appliance, deploy the project, and test against a development database. When testing is complete, you might want to connect to a different database; for example, your production database. Using the WMC, you can update the values of the configuration properties in the project on the Integration Appliance to point to the production database.

### Results

---

Changes you make to configuration properties in a project configuration using the WMC are independent of values you specified for the configuration property in Studio. When you create project configuration properties in Studio and publish the project to the WMC, the WMC displays a Default project configuration. In this project configuration, and any project configuration you generate from the published project, you can use the WMC to modify the configuration property values you specified in Studio before publishing the project.

If you undeploy the project, update the configuration property values using Studio, and publish the project to the WMC again. The existing project configurations do not reflect the changes. To see the changes you just made to the configuration properties (using Studio), you must use the WMC to create a project configuration. This new project configuration displays the configuration property values you specified for the project in Studio.

### What to do next

---

For more information, see "Enhancing the Simple Project" in the Getting Started Guide.

**Parent topic:** [Working with projects](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

## Creating Global Configuration Properties

---

When a global configuration property is created, you can import the global configuration property into a project as a project configuration property.

### About this task

---

You can use global properties to supply the values for fields in endpoints or for default values for destination nodes in maps. Create global configuration properties in Studio using the Edit > Manage Global Configuration Properties option of the Studio toolbar menu. For example, create a global configuration property named dbPassWord of the type Password in Studio, then create a configuration property in your project by importing dbPassWord.

A global configuration property can be of type String or Password.

### Procedure

---

1. In Studio, click Edit > Manage Global Configuration Properties.
2. Under the Global Property Lists pane, click New. The New Global Properties dialog displays.
3. Enter a name for the new global configuration property list and click OK. You can create one or more global configuration properties for each list.
4. Enter a name for the global configuration property that you want to create.
5. Select either String or Password from the Type list. If you select Password, the value is masked.
6. Click Create.
7. In the Value field, enter the value you want for the property.
8. Click OK. If you want to add more properties to the list, repeat steps 4 through 8.

### What to do next

---

Import project properties into a global properties list by clicking Import, select the project property you want to make global, and click Add.

To delete a global property from a global property list, select the property and click Delete.

**Parent topic:** [Working with projects](#)

## Searching for Template Integration Projects (TIPs)

---

Template Integration Projects (TIPs) are stored in the Cast Iron® solutions repository. Through the Configuration Wizard, TIPs guide you through the configuration steps for an integration scenario. TIPs can be downloaded to your local machine. The login window is pre-populated with the User Name and Password to make it easier for you to download the TIPs, without registration.

### Procedure

---

1. From the Solutions menu, select Search For TIPs. The Login window is displayed with the pre-populated User Name and Password. These credentials have the access privilege only to download TIPs.  
Note: You can also log on by clicking the Login link present on the right-hand side, near the memory bar.
2. If you already have the credentials to log on, specify the user name and password. You can specify default login settings for the central repository in the Preferences dialog.
3. Click OK. The Search window is displayed and a confirmation message displays at the end of the main Studio window.
4. In the Search window, choose Keywords, Filter, or My TIPs as the method by which you want to search for TIPs.
  - o If you select the Keywords search option, the Keywords field is displayed.
    - a. Enter a search keyword.
    - b. Click Go. The results are displayed in the Results table and a "Searching ... completed" message is displayed at the end of the Search window. For example, if you enter the keyword USECASES, all TIPs under the USECASES category in the Cast Iron solutions repository are returned.
  - o If you select Filter search option, the filter options: Source Endpoint, Target Endpoint, Integration Patterns, and Searchable Keywords are displayed.
    - a. You must specify a value for at least one filter option. The options lists provide valid values.
    - b. Click Query. The results are displayed in the Results table and a "Searching ... completed" message is displayed at the end of the Search window.
  - o If you select My TIPs, all TIPs that you have created are displayed in the Results table.
5. In the Results table, select a TIP. The details for the project are displayed in the details section.
6. Optional: You can rate the TIP that you have selected.
  - a. Click the Edit Review link. The Publish Review window is displayed.
  - b. Move the slider until the appropriate number of stars are highlighted. Rate the TIP on a scale between 1-5, 5 being the highest rating.
  - c. In the My Title field, add a brief description for your review.
  - d. In the My Summary field, add more details about your review of the project.
  - e. Click OK. Studio submits the review to the Cast Iron solutions repository.
7. In the Search window, click Download. The Select directory where to save the TIP window is displayed.
8. Specify the download directory and click Open. The project is saved to the directory you specified and Studio opens the Configuration Wizard for the project.

## Installing Module Provider Libraries

---

Both IBM® Cast Iron® Studio and the Integration Appliance require library files (.jar and .dll) associated with instances of certain connector types to be imported. For example, the following connectors require additional libraries: Database Connector, JDE, JMS, MQ, PeopleSoft, and SAP. These files must be present in Studio to enable configuration of the endpoints and orchestrations that use any of those connectors.

### About this task

---

For information about installing the required library files on the Integration Appliance using Web Management Console, see the WMC Online Help.

You need access to the connector-specific library files, either on your Studio workstation or through the network.

### Procedure

---

1. With Studio open, select Tools > Install Module Providers. The Add Provider(s) dialog box displays.
2. Click the plus button under the relevant provider name. A text entry field and a browse button display to the right.
3. Click Browse, and use the browse dialog box to locate and select the files. Press the CTRL or SHIFT key to select more than one file.
4. Click Open to import the file contents. The library files display in the Add Provider(s) dialog box.
5. Click OK. When a library is installed or removed you are prompted to shut down Cast Iron Studio to apply the changes.
6. To apply the changes, click Yes then manually restart Cast Iron Studio. The library files are installed and you can proceed with your endpoint configurations. To return to the Add Provider(s) dialog box without applying the changes, click No.

## Uploading Files into a Project

---

You can upload only specific types of files into a project. For example, if you plan on mapping a string to XML data (valid to a particular XML Schema), you must first upload the XML Schema file (ends in the .xsd extension) into the project before mapping the nodes in the XML Schema.

## About this task

---

See [Valid External File Types for a Project](#) for a complete list of valid external file types.

There are three ways to upload a file from the file system into a project:

- Upload files into a project by dragging a file into the Project tab
- Upload files into a project by right-clicking the appropriate folder in the Project tab
- Upload files into a project by clicking Add Document in the Project tab

The following procedure describes how to upload files into a project by dragging a file into the Project tab.

## Procedure

---

1. Select a file from a Windows folder in the local file system and drag into the Project tab.
  - If file is a supported file type and ends in the correct extension, a node displays under the appropriate folder in the Project tab with a default name. For example, if you dragged an XML Schema file called PurchaseOrder.xsd from the file system to the Project tab, a new node called PurchaseOrder shows in the XML Schemas folder of the Project tab. For a list of supported file types see [Valid External File Types for a Project](#).
  - If the uploaded file is an XML Schema or WSDL that includes other XML Schemas, the Uploading Included XML Schemas dialog box automatically displays. For more information, see [Uploading Included XML Schemas](#).
2. Optional: Change the default name.
3. Press Return.

- [Uploading Files into a Project using the Mouse](#)

There are three ways to upload a file from the file system into a project, this procedure describes how to upload files into a project by right-clicking the appropriate folder in the Project tab.

- [Uploading Files into a Project using the Add Document Button](#)

There are three ways to upload a file from the file system into a project, this procedure describes how to upload files into a project by clicking the Add Document button in the Project tab.

## Uploading Files into a Project using the Mouse

---

There are three ways to upload a file from the file system into a project, this procedure describes how to upload files into a project by right-clicking the appropriate folder in the Project tab.

## Procedure

---

1. In the Project tab, right-click the appropriate folder for the type of file you are uploading, and select Add Document from the list. For example, if you are uploading an XML Schema file, select the XML Schemas folder in the Project tab. The Add Document dialog box displays.
2. In the Location field, [specify the location of the file from an external web location or from the file system](#).
3. Optional: In the Name field, enter the name for the entity that you want to display in Studio. The name you enter must not exceed 42 characters, and must not contain any reserved characters. For a list of reserved characters see [About Valid Names](#).
4. Click OK.

## Results

---

If the uploaded file is an XML Schema or WSDL that includes other XML Schemas, the Uploading Included XML Schemas dialog box automatically displays. For more information, see [Uploading Included XML Schemas](#).

The file is uploaded into the project.

## Uploading Included XML Schemas

---

An XML Schema or WSDL document can include other XML Schemas in the main document, using Schema Inclusion, Schema Inclusion with Redefinition, or Importing a Namespace.

### About this task

---

#### Schema Inclusion

You can include other XML Schema fragments into the main XML Schema or WSDL using the `include` element as shown by the following example: `<xsd:include schemaLocation="myTypes.xsd"/>`

#### Schema Inclusion with Redefinition

The XML Schema specification supports redefining definitions included by other XML Schema fragments in the current XML Schema or WSDL. For example, the `myTypes.xsd` XML Schema fragment defines a complex type called `PurchaseOrderType`. Another XML Schema called `PurchaseOrder.xsd` includes the `myTypes.xsd` XML Schema fragment using the `redefine` element and redefines the complex type called `PurchaseOrderType`.

You can include other XML Schema fragments into the main XML Schema or WSDL using the `redefine` element as shown in the following example: `<xsd:redefine schemaLocation="myTypes.xsd"/>`

#### Importing a Namespace

You can include a namespace into the current document using the `import` element as shown in the following example: `<xs:import namespace="http://acme.com/ns/example schemaLocation="mySchema.xsd" /> .`

When you add or upload the main XML Schema or WSDL to the project using the Add Document dialog box, you are prompted to locate any included XML Schema or XML Schemas into the project, as shown in the following procedure. All the included XML Schemas must be located before the main XML Schema or WSDL document shows in the Project tab and can be used in the project.

## Procedure

---

1. Upload an XML Schema or WSDL document into the current project. If the XML Schema or WSDL document includes other XML Schemas, the Uploading Included XML Schemas dialog box displays listing all the included XML Schemas as shown in [Figure 1](#).

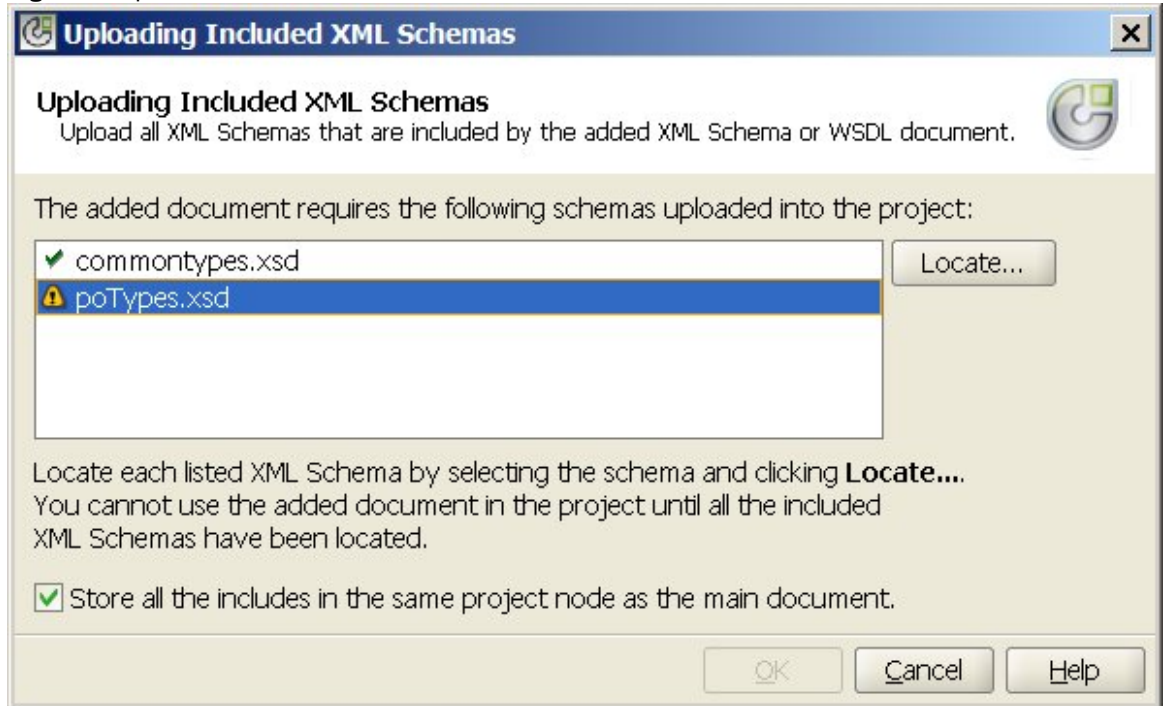

Figure 1. Uploading Included XML Schemas

If the included XML Schema is automatically located, the checkmark icon  displays next to the XML Schema in the Uploading Included XML Schemas dialog box as shown for the `commonTypes.xsd` XML Schema in the preceding figure. If the main XML Schema or WSDL was located on the local file system, Studio looks for the included XML Schemas in the same directory and automatically locates them; for example, if you uploaded `mySchema.xsd` from the `C:\temp` directory and `mySchema.xsd` includes the `commonTypes.xsd` XML Schema, Studio automatically locates the `commonTypes.xsd` XML Schema in the `C:\temp` directory. If the included XML Schema is not automatically located, the warning icon  displays next to the XML Schema in the Uploading Included XML Schemas dialog box as shown for the `poTypes.xsd` XML Schema in [Figure 1](#).

2. Repeat the following steps to locate all the unlocated XML Schemas:
  - a. Select the XML Schema in the Uploading Included XML Schemas dialog box. The XML Schema is highlighted in the table as shown in [Figure 2](#).

Figure 2. Upload an XML Schema

- b. Click Locate. The Locate the Selected XML Schema dialog box is displayed.
  - c. In the Location field, specify the location of the included XML Schema from an external web location or from the file system.
  - d. Click OK. If the XML Schema is located, the checkmark icon  displays next to the XML Schema in the Uploading Included XML Schemas dialog box.
3. By default, the Store all the includes in the same project node as the main document check box is selected. When this check box is selected, the included XML Schemas and the main XML Schema or WSDL are uploaded as a single project node. When this check box is cleared, all the included XML Schemas and the main XML Schema or WSDL are all displayed separately in the Project tab. A checkmark icon shows next to every listed XML Schema indicating that all the included XML Schemas have been located.
4. Click OK.

## Example

If the Store all the includes in the same project node as the main document check box is selected, only the main XML Schema or WSDL displays in the Project tab as shown in [Figure 3](#).

Figure 3. Example

With the check box selected, the included XML Schemas are still uploaded into the project but are not displayed in the Project tab, so you cannot individually update these XML Schemas in the project as described in [Uploading Included XML Schemas](#).

If the Store all the includes in the same project node as the main document check box is cleared, the main XML Schema or WSDL displays and all the included XML Schemas are uploaded in the project and show in the Project tab as shown in [Figure 4](#).

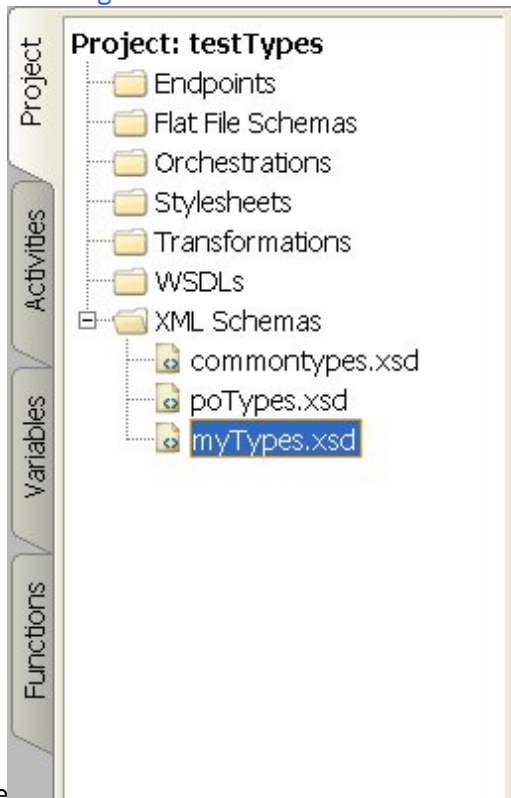

Figure 4. Example

With the check box cleared, all the included XML Schemas can be individually updated as described in [Uploading Included XML Schemas](#).

Note: If possible, always load the main XML Schema or WSDL with this check box selected (as one project node) to reduce potential dependency conflicts between XML Schemas. For example, if you upload the main *myTypes.xsd* file into the project with the Store all the includes in the same project node as the main document check box cleared, the following XSD files are also uploaded and show in the Project tab:

- `commonTypes.xsd`
- `poTypes.xsd`

If you created and uploaded a third XSD file called *myTypesTwo.xsd* that also included and used the types defined in the *commonTypes.xsd* file, and you then changed the names of the types defined in the *commonTypes.xsd* and used in *myTypes.xsd* outside of Studio and uploaded new versions these files, the *myTypesTwo.xsd* file in the project still refers to the original names of the types and is now invalid.

## Feedback | Notices

 Last updated: Wednesday, 15 June 2016

<file:///dcs/markdown/workspace/Transform/out.html>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Uploading\\_Included\\_XML\\_Schemas.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Uploading_Included_XML_Schemas.html)

## Specifying the Location of a File to Upload

---

Files can be uploaded into a project from a web location (HTTP or FTP Server) or from the local file system.

### Procedure

---

1. To specify a location for the file from the local file system, choose from one of the following options:
  - Click Browse to browse for the file, and click Open.
  - In the Location field, enter the URI of the file on the local file system, for example:  
`file:/C:/temp/mySchema.xsd`
2. To specify a location for the file from an external web location (FTP or HTTP Server), in the Location field enter the URI of the file using any of the following format descriptions:
  - `http://[username:password@]hostname[:portNumber]/location`
  - `https://[username:password@]hostname[:portNumber]/location`
  - `ftp://[username:password@]hostname[:portNumber]/location`

The preceding format descriptions contain the following representations:

- brackets [] - represent optional parameters and should not be included in the URI
- username - specifies the user name to connect to the HTTP or FTP server
- password - specifies the password of the specified user name to connect to the HTTP or FTP server
- portNumber - specifies the port number to use to connect to the HTTP or FTP server
- location - specifies the URL path to find the file. The URL must include the name of the file as shown in the following example.

## Example

To upload the *mySchema.xsd* file from the *acme.com* FTP server in the */input* directory using the username *bob* with a password of *snippy1*, specify the following string in the Location field:

- `ftp://bob:snippy1@acme.com/input/mySchema.xsd`

## Valid External File Types for a Project

When building orchestrations, you can upload XML Schemas or other files into your project to complete configuration tasks. External files are used in connection activities and orchestrations that use a message that Studio cannot generate an XML schema for automatically. You must supply an XML schema or DTD if the message must be transformed or if you need to define a job key for the message.

The types of files that you can upload into a project and the file extensions they are required to include:

Table 1.

Type	File Extension	Description
XML DTD	*.dtd	XML Document Type Definitions (DTDs) define XML message formats using a non-XML syntax. Studio automatically converts DTDs to XML Schemas when you load them into a project.
Web Services Definition Language	*.wsdl	An XML document that defines the W3C Web Services Definition Language. Studio uses WSDLs to describe all messages in integration transactions.
XML Schema	*.xsd	A definition of an XML message format using the W3C XML Schema language. Studio uses XML Schemas to describe all messages in integration transactions.  Note: Only global elements are shown as schema types in Studio. A global element is an immediate child of the schema element. If the schema file contains no global elements, then the schema will appear to be empty in Studio.

## About Valid Names

---

To be valid, the names for projects, Endpoints, orchestrations, stylesheets, Flat File Schemas, XML Schemas, WSDLs, and transformations must not exceed 42 characters and must not contain any of the reserved characters or words.

Reserved characters or words are listed in the following tables.

The names of activities must not exceed 30 characters and must not contain any of the reserved characters listed in the table provided in [Table 3](#).

Table 1. Reserved Characters

Reserved Characters	Description
&	ampersand
{ } [ ] < >	any brackets
*	asterisk
\	backslash
^	caret
:	colon
\$	dollar sign
/	forward slash
#	number sign
()	parenthesis
	pipe
.	period
?	question mark
;	semicolon
	space
~	tilde

Table 2. Reserved Words for Windows

Reserved Words for Windows
AUX
COM1

<b>Reserved Words for Windows</b>
COM2
COM3
COM4
CON
LPT1
LPT2
LPT3
PRN
NUL

Table 3. Reserved Characters For Activity Names.

The names of activities must not exceed 30 characters and must not contain any of the reserved characters listed in the following table:

<b>Reserved Characters</b>	<b>Description</b>
&	ampersand
{ } [ ] < >	any brackets
*	asterisk
\	backslash
:	colon

## Undo and Redo Operations

---

Studio stores up to the last 100 actions you make and you can undo and redo those actions. You can undo and redo an action that you take on the fields in the UI, orchestration views, Mapping Editor, project tree, configuration properties, and variable panel activities.

### Before you begin

---

Note: When you close Studio, the history of actions you have taken is cleared and you cannot undo or redo actions that occurred prior to you closing Studio.

### Procedure

---

1. Select the Edit menu.
2. Select Undo, to undo the last action.
3. Select Redo, to redo the last action.

### Results

---

You can also undo and redo actions using the following keyboard shortcuts:

- Ctrl + Z: Undo last action
- Ctrl + Y: Redo last action

**Parent topic:** [Working with projects](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics\\_Undo\\_and\\_Redo\\_Operations.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/basics_Undo_and_Redo_Operations.html)

## Updating a Changed XML Schema

---

If you created a project that uses an XML Schema and the XML Schema changes, you can attempt to update the existing XML Schema with the new XML Schema.

### About this task

---

Updating to a new XML Schema means that any of the project entities that interface with the XML Schema might be affected by the change. The following project entities can be affected by XML Schema change:

- Maps that refer to the XML Schema, both stand-alone maps and the inline maps in activities.
- Variables that refer to the XML Schema.

- XPath expressions in orchestrations.
- XPath expressions used in job keys.
- Some Endpoint configurations.
- Conditions defined in orchestrations.

During the update process, Studio reports which project entities are affected by the change before the change is committed.

For example, an XML Schema defines an input parameter to the Map Variables activity. In the From Orchestration pane of the Map Variables activity there are links between the nodes of the input parameter to the nodes of the output parameters. When the XML Schema that defines the input parameter is updated to the new XML Schema, those links might no longer be valid if the input nodes have been renamed or removed in the new XML Schema. You must recreate the links in order for the orchestration to be valid again.

In some cases, Studio completely prevents the uploading a new XML Schema for the following reasons:

- The new XML Schema is invalid.
- Uploading the new XML Schema to replace the existing one, would result in an invalid project.

Note: Updating an existing XML Schema (as described in the following procedure) is different from loading multiple XML Schemas into a project by either dragging a file into the Project tab or right-clicking on the XML Schemas folder in the Project tab and selecting Add Document. Updating an existing XML Schema replaces the existing XML Schema in the project while uploading the same file into the Project tab creates two instances of the XML Schema in the project.

## Procedure

---

1. Open the XML Schema that is already used in the project that is to be replaced by the new XML Schema. Open the graphical representation:
  - a. Open the Project tab and double-click the XML Schema in the XML Schemas directory. The nodes of the XML Schema display in the XML Schema tab.
  - b. In the XML Schema tab, click any node of the XML Schema.
2. Select a new XML Schema to replace the existing XML Schema, using one of the following options:
  - In the graphic representation, you can drag an XML Schema file from the local file system onto the XML Schema open in the XML Schema tab.
  - Select the File > Update option on the Studio toolbar menu. The Update the Current Schema Document dialog box displays. In the Location field, specify the location of the new XML Schema from an external web location or from the file system.
3. Click OK. The Updating the XML Schema Affects the Listed Dependant Project Entities dialog box displays and any project entities that are possibly affected by the replacement of the original XML Schema with the new XML Schema are listed.
4. Optional: In the dialog box, click any of the listed dependent entities to view the affected entity in Studio.
5. Click Update. Studio attempts to update the project with the new XML Schema and the result of the attempted update depends on the following conditions:
  - If any of the changes in the XML Schema would result in a corrupted project after the update or the new XML Schema is invalid, an Error dialog box displays describing the problem with the XML Schema. Click OK. The update is canceled, the XML Schema reverts to the original XML Schema, and the project is not changed.
  - If the changes to the XML Schema would not result in a corrupted project and the XML Schema is valid, the update occurs and the original XML Schema is replaced by the new XML Schema. Some of the project entities might be invalid after the update and might require clean up. For example, links in the Map Inputs and Map Outputs panes might need to be recreated after the update. To find the validation errors, open an orchestration and select Orchestration > Validate from the Studio toolbar menu.

6. Click Close.

## Using the HTTP Post Utility

---

This utility provides a simple HTTP client interface that enables you to post messages/requests to HTTP servers, which is useful for orchestrations that have an **HTTP Receive Request** activity as the starter activity.

### About this task

---

To use this utility, either Studio or the Integration Appliance must be a web server capable of receiving messages from any http client interface.

### Procedure

---

1. From the Windows Start menu, choose Programs > IBM > Cast Iron Studio > HTTP Post Utility. A web browser opens and displays the Post a Document page.

Note: If you are using the HTTP Post Utility with Internet Explorer 8, you must click the Information Bar and select Allow Blocked Content to avoid duplicate forms being displayed.

2. In the URL of Inbound Connector field, specify the hostname of the HTTP server, followed by the HTTP path.
3. In the Document to Post field, you have two options:
  - o Click Browse and open an existing file.
  - o Enter the message into the text field.
4. Click Submit to post the message.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Using\\_the\\_HTTP\\_Post\\_Utility.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Using_the_HTTP_Post_Utility.html)

## Orchestrations

---

- [Configuring an orchestration to orchestration connection](#)  
You can configure a Web Service endpoint to call another Web Service orchestration stored in the Integration Appliance, in the same project.
- [Creating an orchestration](#)  
There are three steps to creating a completed orchestration: Create the new orchestration, rename the orchestration, and build the orchestration.
- [Renaming an orchestration](#)  
Orchestrations are given default names when they are created. You can rename it from the Project tab.
- [Building an orchestration](#)  
Studio provides visual cues in the workspace so that it is easier to see and control the placement of activities in an orchestration. When you drag-and-drop activities from the Studio Toolbox to the workspace, a green circle icon displays the target location in the orchestration where the activity is to be placed. When adding activities to the branches of logic activities, Studio highlights the target branch.
- [Verifying orchestrations](#)  
Studio can simulate the Cast Iron® operating system (CIOS) runtime so that you can test orchestrations within a project and resolve any issues before deploying the project to the Integration Appliance.
- [Using SSL in Studio](#)  
The Secure Sockets Layer (SSL) is the standard security technology for establishing an encrypted link between a server and a client. The encrypted link ensures that all data passed between the server and clients remain private and unchanged. To create an SSL connection a server requires an SSL certificate. This section provides an overview of using SSL in Studio, discusses Transport Layer Security (TLS) and SSL security, discusses certificates and supplies the procedures you need to properly import Certificate Authority (CA) and end-entity certificates and private keys for use when verifying SSL client authentication.
- [Importing an end-entity certificate](#)  
An end-entity certificate is a digitally-signed statement issued by a Certificate Authority to a person or system. It binds a public key to some identifying information and is used for encryption, authentication, digital signatures and other purposes. The term “end-entity” is used to distinguish it from a Certificate

Authority certificate. The signer of the statement is the issuer and the entity discussed in the certificate is the subject.

- [Importing a Certification Authority \(CA\) Certificate](#)  
Abbreviated as CA, a Certification Authority is a trusted third-party organization or company that issues certificates used to create digital signatures and public-private key pairs. Because they guarantee that the two parties exchanging information are really who they claim to be, CA's are a critical component in data security and electronic commerce. Although the relationship between CA's is most commonly hierarchical, CA certificates can also be used to establish trust relationships between CA's in two different public key infrastructure (PKI) hierarchies. A PKI is the set of people, policies, procedures, hardware, and software used in creating, distributing, managing and using digital IDs. In all of these cases, the CA certificate is critical to defining the certificate path and usage restrictions for all end-entity certificates issued for use in the PKI.
- [SSL server authentication](#)  
SSL server authentication verifies that sites you communicate with are who they claim to be. Authentication confirms a server's identity through standard techniques of public-key cryptography to ensure that a server's certificate and public ID are valid and have been issued by a certificate authority listed in the client's list of trusted CA's.
- [Testing an SSL server connection](#)  
After creating an endpoint for the server using SSL, you are ready to test the SSL server connection.
- [SSL client authentication](#)  
Client authentication is similar to server authentication except that the server requests a certificate from the client to verify that the client is who it claims to be. The certificate must be an **X.509** certificate and signed by a certificate authority trusted by the server. You can only use client authentication when a server requests a certificate from a client. Not all servers support client authentication.
- [Using the Log Viewer](#)  
Orchestration monitoring data is displayed in the Log Viewer in a table or text format.
- [Viewing an orchestration](#)  
You can use orchestration view icons on the workspace, and View options from the Studio toolbar menu to manipulate your orchestration view in the workspace.
- [Validating an orchestration](#)  
An orchestration must be valid (complete and correct) before you can publish it to the Integration Appliance. Use the validation feature in Studio to validate your orchestration.
- [Working with activities in an orchestration](#)  
You can cut, copy, and paste activities, drag activities in an orchestration and add and delete new activities.
- [Printing an orchestration](#)  
You can print an orchestration directly or view a print preview of an orchestration.
- [Processing orchestration jobs sequentially](#)  
You can use the Process Orchestration Jobs Sequentially option when an orchestration contains activities that can conflict with each other when multiple instances of the orchestration are running. An instance of an orchestration is also known as an orchestration job.
- [Enabling persistence](#)  
The Orchestration pane contains an Enable Persistence check box that by default is selected. The setting of the Enable Persistence check box affects the way orchestration jobs are restarted after a failure.
- [Adding a global exception handler to an orchestration](#)  
During run time if any of the activities of the orchestration throws an exception, and a global exception handler has been enabled, the global CatchAll branch is run.
- [Saving an image of an orchestration](#)  
You can save a graphical image of the current orchestration as a ,jpg file.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_orchestrations.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_orchestrations.html)

## Configuring an orchestration to orchestration connection

---

You can configure a Web Service endpoint to call another Web Service orchestration stored in the Integration Appliance, in the same project.

### About this task

---

You can configure an Orchestration to Orchestration connection by specifying the transport protocol to the endpoint location as local:// instead of the conventional http://.

You apply this option to either call (invoke) or provide endpoint type.

Note:

When an orchestration that has Web Services Provide service starter activity with Transport type set to Local, referred to as sub-orchestration, then persistence setting for the main orchestration and the sub-orchestration should be same within the same project.

For example, if the persistence is enabled for the main orchestration, then it should be enabled for the sub-orchestration also. If the persistence is disabled in the main orchestration, then it should be disabled for the sub-orchestration and vice-versa.

### Procedure

---

1. Open a new or existing Web Service endpoint.
2. In the Type section, select either the Invoke option or Provide option. Invoke is selected by default.
  - o If you select the Invoke option, complete the following steps:
    - a. From the Location drop-down list, select Local
    - b. From the Orchestration drop-down list, select the orchestration you want to call.
    - c. From the WS Provide Activity drop-down list, select an activity.  
Note: This activity is displayed only if the selected orchestration has a Web Services Provide Service starter activity and Local as the relevant endpoint. If you select an orchestration that does not have a Web Services Provide Service starter activity, then the WS Provide Activity menu is empty.
  - o If you select the Provide option, complete the following steps:
    - a. From the Transport drop-down list, select Local.
    - b. In the Path field, enter the path which is used to call the Provide activity.

**Parent topic:** [Orchestrations](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring\\_an\\_Orchestration\\_to\\_Orchestration\\_Connection.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring_an_Orchestration_to_Orchestration_Connection.html)

## Creating an orchestration

---

There are three steps to creating a completed orchestration: Create the new orchestration, rename the orchestration, and build the orchestration.

### Procedure

---

1. Complete one of these three steps to create a new Orchestration:
  - o To create an orchestration from the toolbar menu, select Project > New Orchestration. A new orchestration is opened in the workspace. The new orchestration name is added to the Orchestrations folder in the Project tab.
  - o Click the New Orchestration button  in the Project tab.
  - o Right-click the Orchestration folder and select New Orchestration. A new orchestration opens in the main Studio pane. The new orchestration with a default name is added to the Orchestrations folder in the Project tab.
2. Optional: Change the default name.
3. Press Return.

## Renaming an orchestration

---

Orchestrations are given default names when they are created. You can rename it from the Project tab.

### Procedure

---

1. Click the Project tab.
2. Open the Orchestrations folder.
3. Either
  - o Right-click the orchestration you want to rename and select Rename.
  - o Click three times on the orchestration name in the Project tab.
4. Enter a new name for the orchestration. The orchestration name must not exceed 42 characters and must not contain any reserved characters. For a list of reserved characters see [About Valid Names](#).
5. The orchestration name is changed.

**Parent topic:** [Orchestrations](#)

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_renaming\\_an\\_orchestration.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_renaming_an_orchestration.html)

## Building an orchestration

---

Studio provides visual cues in the workspace so that it is easier to see and control the placement of activities in an orchestration. When you drag-and-drop activities from the Studio Toolbox to the workspace, a green circle icon displays the target location in the orchestration where the activity is to be placed. When adding activities to the branches of logic activities, Studio highlights the target branch.

### Procedure

---

1. Drag the appropriate activities from the Activities tab onto the orchestration
2. Configure the activities. You must add at least one inbound activity (or one schedule), and one outbound activity in order to complete an orchestration. See the Basic Validation Requirements section of Validating the Orchestration for more information.
3. After the orchestration is built, set the orchestration options in the Properties pane. For more information see [Processing Orchestration Jobs Sequentially](#) and Enabling Persistence.
4. Save the orchestration, then validate it.
5. Fix any validation issues displayed in the Validation Results dialog box.

Studio can simulate the Cast Iron® operating system (CIOS) runtime so that you can test orchestrations within a project and resolve any issues before deploying the project to the Integration Appliance.

### Before you begin

---

When initiating a test run, you can start a single orchestration, or all the orchestrations in a project. Studio runs one orchestration job for each orchestration. You can start and stop orchestrations, and view orchestration monitoring logs from the Studio toolbar or from the Verify tab.

If the orchestration is invalid, a message dialog is displayed showing possible resolutions. In the workspace, Studio highlights each activity in the orchestration as the activity is processing the data. As Studio runs the orchestration, the Verify tab shows a tree-view of the orchestration job details including; activity name, processing status, variable/parameter names, and variable/parameter data. If an error occurs, Studio highlights the node where the error occurred. Clicking the node links you to the location of the error, where you can resolve any issues before running another instance of the orchestration.

When you click a node in the tree-view, Studio displays in the Properties Pane the Checklist task that corresponds to the node. For example, when you click an activity node, the Configure panel for the activity is displayed in the Properties Pane. When you click the Map Outputs node, the Map Outputs panel is displayed in the Properties Pane. If you click a mapping variable or parameter, the data is displayed in the Variable/Parameter Message Data section of the Verify tab.

Although Studio only runs one orchestration job for each orchestration, you can start the same orchestration multiple times. The Verify tab shows the results for each run of the same orchestration under a separate instance. For example, *Instance #1* and *Instance #2*. An orchestration job must be complete before you can run another instance of the same orchestration.

Note: Studio does not persist the results of the runtime test. When you close the orchestration tab, you lose the runtime results for the orchestration.

## About this task

---

Depending on the activities in the orchestration, Studio may require more input to run the orchestration job. For example, an orchestration with a database activity requires that you generate database assets before running the orchestration in Studio, just as you must do in the WMC before running the orchestration on the Integration Appliance. If the activities in the orchestration use the Secure Sockets Layer (SSL), you may need to understand SSL concepts and you may need to import certificates before verifying the orchestration. See [Using SSL in Studio](#) for more information.

If the orchestration contains an HTTP Receive Request activity, you must post a message to the specified URL. Use the HTTP Post Utility to post a message. If the orchestration contains an FTP Poll activity, you must place a file in the specified location, as prompted by Studio, before the orchestration can run.

Since you can use the Verify tab to simulate the runtime on the Integration Appliance, you can also specify Kerberos Protocol settings in Studio to test the settings before deploying to the Integration Appliance. Specifying these setting in Studio does not impact the runtime on the Integration Appliance. You must specify the Kerberos Protocol settings in the WMC to allow the Integration Appliance to authenticate the server that the Integration Appliance is communicating with. For more information about specifying Kerberos Protocol settings for the Integration Appliance, see the WMC Online Help.

## Procedure

---

To specify Kerberos Protocol settings in Studio:

1. In Studio, select Edit > Preferences... . The Preferences dialog is displayed.
2. In the navigation pane, select SSL > Kerberos.
3. Specify the Kerberos Server Name.
4. Specify the Kerberos Realm.
5. Click OK.

## Example

---

You can now test the orchestration, using the Kerberos Protocol, within Studio.

Table 1. Navigating the Verify Tab toolbar

Icon	Description
	Starts the open orchestration. The orchestration must be valid before Studio can run an orchestration job.
	Starts all the valid orchestrations in the project that are not already running. If an orchestration is already running when you click this icon, Studio does not rerun the orchestration.
	Stops the running orchestration job immediately. Studio does not allow the orchestration job to complete before stopping.
	Stops all running orchestration jobs immediately. Studio does not allow the orchestration jobs to complete before stopping.
	Shows orchestration monitoring data in a table or text format. For more information about the Log Viewer, see <a href="#">Using the Log Viewer</a> .
	In the Workspace, highlights the activities in the execution path of the orchestration job, so you can follow the logic Studio used to complete the orchestration job. Different instances can have a different path depending on the inputs and orchestration logic. Click this icon to toggle between providing and not providing a highlighted path.
	Assigns the results from the selected instance to the Map Inputs and Map Outputs, so that when you run a test from the Properties Pane, Studio populates the inputs and outputs with the results of the completed orchestration job.
	Deletes one or more selected instances from the orchestration details tree. To delete multiple instances hold the Shift key or Ctrl key, select the instances you want to delete, and click the icon.
	Expands all the nodes under the selected node in the orchestration details tree.
	Collapses all the nodes under the selected node in the orchestration details tree.
	Expands a single node under the selected node in the orchestration details tree.
	Collapses a single node under the selected node in the orchestration details tree.

## Using SSL in Studio

The Secure Sockets Layer (SSL) is the standard security technology for establishing an encrypted link between a server and a client. The encrypted link ensures that all data passed between the server and clients remain private and unchanged. To create an SSL connection a server requires an SSL certificate. This section provides an overview of using SSL in Studio, discusses Transport Layer Security (TLS) and SSL security, discusses

certificates and supplies the procedures you need to properly import Certificate Authority (CA) and end-entity certificates and private keys for use when verifying SSL client authentication.

## SSL and Transport Layer Security

---

TLS 1.0 represents an upgrade of SSL 3.0. As an example, the TLS handshake protocol for establishing client/server authentication and encryption differs from the SSL handshake protocol. Additionally, TLS is now more extensible. Although they cannot interoperate, TLS provides a mechanism by which a TLS 1.0 implementation can revert to an SSL 3.0 implementation.

The TLS protocol uses public-key and symmetric-key cryptographic technology. Public-key cryptography uses a public key and a private key. Information encrypted with one key can be decrypted only with the other key. For example, information encrypted with the public key can be decrypted only with the private key.

Each server's public key is published, while the private key is kept secret. To send a secure message to the server, the client encrypts the message by using the server's public key. When the server receives the message, it decrypts the message with its private key.

Symmetric-key cryptography uses the same key to encrypt and decrypt messages. The client randomly generates a symmetric key to be used for encrypting all session data. The key is then encrypted with the server's public key and sent to the server.

TLS provides three basic security services:

- Message privacy – Achieved through a combination of public-key and symmetric-key encryption. All traffic between a client and a server is encrypted using a key and an encryption algorithm negotiated during session setup.
- Message integrity – Ensures that session traffic does not change en route to its final destination. TLS and SSL use a combination of public/private keys and hash functions to ensure message integrity.
- Mutual authentication – Exchange of identification through public-key certificates. Client and server identities are encoded in public-key certificates, which contain the following components:
  - Subject's distinguished name
  - Issuer's distinguished name
  - Subject's public key
  - Issuer's signature
  - Validity period
  - Serial number

You can also use secure HTTP (HTTPS) to ensure that a client's security information is not compromised when downloaded from a server.

## Certificates

---

SSL uses digital certificates to authenticate the identity of the server and optionally the client. Digital certificates are issued by a Certificate Authority (CA), a trusted agency that is authorized to issue, renew and revoke digital certificates after verifying the identity and legitimacy of the requesting party. A CA certificate, which may be a root CA certificate or a subordinate CA certificate, includes the CA's signature and the period of validity. A CA guarantees the connection between a key and another CA or end-entity. A end-entity is a person, a role, an organization, a pseudonym or a piece of hardware or software.

Encryption and authentication are performed by means of a public and a private key. The public key is embedded into a certificate, known as a site or server certificate. The certificate contains several items of information, including the name of the CA that issued the certificate, the name and public key of the server or client, the CA's signature and the certificate's date and serial number. The private key is created when you create a self-signed certificate or a CA certificate request and is used to decrypt messages from clients.

A SSL or TLS session is established in the following sequence:

1. The client and the server exchange hello messages to negotiate the encryption algorithm and hashing function (for message integrity) to be used for the session.
2. The client requests an *ITU-T standard X.509* certificate from the server to prove its identity. Optionally, the server can request a certificate from the client. Certificates are verified by checking the certificate format, the validity dates and by verifying that the certificate includes the signature of a trusted certificate authority (or is self-signed).
3. The client randomly generates a set of keys that is used for encryption. The keys are encrypted with the server's public key and securely communicated to the server.

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SSL\\_overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SSL_overview.html)

## Importing an end-entity certificate

---

An end-entity certificate is a digitally-signed statement issued by a Certificate Authority to a person or system. It binds a public key to some identifying information and is used for encryption, authentication, digital signatures and other purposes. The term “end-entity” is used to distinguish it from a Certificate Authority certificate. The signer of the statement is the issuer and the entity discussed in the certificate is the subject.

### About this task

---

To import an end-entity certificate and private key, you must import a file in PKCS#12 format using the Java `keytool -importkeystore` command. PKCS #12, the successor to PFX from Microsoft, defines a file format commonly used to store **X.509** private keys with accompanying public key certificates, protected with a password-based symmetric key. PKCS #12 format files typically have a file extension of .pfx or .p12.

The following steps provide an example of how to import an end-entity certificate:

### Procedure

---

1. Navigate to the Studio security directory. For example. C:\Program Files\IBM\WebSphere Cast Iron Studio 6.0\security.
2. Copy the PKCS #12 format file into Studio security directory, for example C:\Program Files\IBM\WebSphere Cast Iron Studio 6.0\security\certificate.p12.
3. Import the certificate and private key into the Studio keystore using the `keytool -importkeystore` command. For example: `keytool -importkeystore -deststorepass "keystore admin" -destkeystore certs -srckeystore certificate.p12 -srcstoretype PKCS12 -srcstorepass <certificatePswd> -srcalias <certificateAlias>`.

### Results

---

At the conclusion of these steps, the certificate is imported into your Studio security directory. For more information about the `keytool -importkeystore` command, see:  
<http://www.ibm.com/developerworks/java/jdk/security/60/secguides/keytoolDocs/keytool.html#importKeyStore>.

## Importing a Certification Authority (CA) Certificate

---

Abbreviated as CA, a Certification Authority is a trusted third-party organization or company that issues certificates used to create digital signatures and public-private key pairs. Because they guarantee that the two parties exchanging information are really who they claim to be, CA's are a critical component in data security and electronic commerce. Although the relationship between CA's is most commonly hierarchical, CA certificates can also be used to establish trust relationships between CA's in two different public key infrastructure (PKI) hierarchies. A PKI is the set of people, policies, procedures, hardware, and software used in creating, distributing, managing and using digital IDs. In all of these cases, the CA certificate is critical to defining the certificate path and usage restrictions for all end-entity certificates issued for use in the PKI.

### About this task

---

Perform the following steps to import a CA certificate.

### Procedure

---

1. Open a command window.
2. Navigate to the server, and locate the certificate file `ca-cert` stored in the server.
3. Copy the `ca-cert` file and then navigate to the workstation where Studio is installed.
4. Using the command window, paste the CA certificate copy in the home directory of Studio: `C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x`.
5. Navigate to the security directory of Studio: `C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x\security`.
6. Run the following command to import the CA certificate file into Studio: `..\jre\bin\keytool.exe -import -v -keystore cacerts -storepass changeit -file ..\castiron_ca_cert.pem -alias alias_name` Where *alias\_name* is the alias of the server CA certificate.
7. When you are prompted for a yes or no, type yes (**Y**) and press **Enter**.
8. Exit the command window.

### Results

---

At the conclusion of these steps, the certificate is imported into your Studio security directory. For more information about the `keytool -import` command, see [keytool - Key and Certificate Management Tool](#).

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SSL\\_import\\_a\\_certif\\_authority\\_certif.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SSL_import_a_certif_authority_certif.html)

## SSL server authentication

---

SSL server authentication verifies that sites you communicate with are who they claim to be. Authentication confirms a server's identity through standard techniques of public-key cryptography to ensure that a server's certificate and public ID are valid and have been issued by a certificate authority listed in the client's list of trusted CA's.

Communication with "trusted" servers that possess authentication certificates issued by a certificate authority is critical to establishing a secure environment. Authentication certificates are digitally signed documents which bind the public key to the identity of the private key owner. Authentication happens at connection time and is independent of the application or application protocol. With SSL, authentication is performed by an exchange of certificates, which are blocks of data in a format described in the **X.509 ITU-T standard**. **X.509** certificates are issued and digitally signed by a certificate authority.

However using SSL does not guarantee that the client is communicating with the correct server. Consider the following scenario, in which "Server1" and "Server2" both have valid certificates from a CA that the client ("Client") trusts. Client wants a secure session with Server1, but Server2 wants to eavesdrop on their communication and is physically located in a place that makes it possible to do so:

1. Client sends a request for an SSL session to Server1. Instead, the request (and all subsequent traffic) goes through Server2. Instead of forwarding Client's request to Server1, Server2 responds directly to the request by sending its own certificate to Client.
2. Client receives Server2's certificate and checks its list of trusted CAs. Since Server2's certificate is signed by the same CA as Server1's certificate, Client accepts the certificate and creates a secure session with Server2.
3. Having completed the secure session with Client, Server2 requests and creates its own SSL session with Server1. From this point, Client sends encrypted information to Server2. Server2 decrypts the information, re-encrypts it, then sends it to Server1. It does the same for information flowing in the opposite direction. The result is that Server2 is able to read it and even change it, even though all data is encrypted as it flows over the Internet.

SSL server authentication is designed to prevent this outcome. When server authentication is enabled, the client, after ensuring that the server's certificate can be trusted, checks that the Internet name in the certificate matches the Internet name of the server. If they match, the SSL negotiation continues. If not, the connection ends.

With server authentication enabled, the security scenario outlined above would proceed as follows:

1. Client sends a request for an SSL session to Server1. The request (and all subsequent traffic) actually goes through Server2. Instead of forwarding Client's request to Server1, Server2 responds directly to Client's request by sending its own certificate to Client.

2. Client receives Server2's certificate and checks its list of trusted CAs. Since Server2's certificate is signed by the same CA as Server1's certificate, Client accepts the certificate and creates a secure session with Server2.
3. After the secure session has been completed, but before any real data has been sent or received, Client compares the Internet name in the certificate it received with the name of the server it wants to talk to. Since they do not match, Client knows that the connection should not continue and disconnects it.

## Testing an SSL server connection

---

After creating an endpoint for the server using SSL, you are ready to test the SSL server connection.

### About this task

---

Perform the following procedure to test the SSL connection to the server:

### Procedure

---

1. Import the server CA certificate using the instructions in [Importing a Certification Authority \(CA\) Certificate](#).
2. Open the endpoint for the server.
3. For FTPS, SSL email and SSL database connections, verify the following login credentials for the server connection: server, Port, User, and Password.
4. For HTTP and Web Services connections using SSL, if the HTTP or Web Services server requires client authentication, configure a Client Certificate Alias Name as described in [Creating or editing an HTTP endpoint](#).
5. Click **Test Connection**.
6. If the connection is successful, use this endpoint in Studio orchestrations, then use the **Verify** tab features to evaluate the orchestration.

**Parent topic:** [Orchestrations](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SSL\\_testing\\_a\\_SSL\\_server\\_connection.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SSL_testing_a_SSL_server_connection.html)

## SSL client authentication

---

Client authentication is similar to server authentication except that the server requests a certificate from the client to verify that the client is who it claims to be. The certificate must be an **X.509** certificate and signed by a certificate authority trusted by the server. You can only use client authentication when a server requests a certificate from a client. Not all servers support client authentication.

When a server requests a certificate, the client has the option to send a certificate or attempt to connect without it. The server allows the connection if the client's certificate can be trusted. When a client attempts to connect without a certificate, the server might grant the client access but at a lower security level, as illustrated by the following sequence of events:

1. The client sends a request for an SSL session to the server.
2. The client receives the server's certificate and checks its list of trusted CA's. Since the server's certificate is signed by a trusted certificate authority, the client accepts the certificate. The server then asks the client for a certificate that identifies the client.
3. The client responds by sending a certificate or by trying to establish a session without one.
4. If the client sends a certificate, the server checks its list of trusted certificates. If the client can be trusted, the secure session is established. If the client does not send a certificate, normally the server terminates the session.

## Using the Log Viewer

---

Orchestration monitoring data is displayed in the Log Viewer in a table or text format.

By default, the following orchestration monitoring data is displayed by the Log Viewer, in a table:

Time

Provides a timestamp of when the specified event occurred.

Level

Specifies the logging level for a specific event. Logging levels include: Off, Severe, Warning, Info, and All.

Type

Identifies the type of the activity that generated the event. For example, Scheduler, Mime, JMS, or HTTP.

Message

Provides details about a specific event.

You can filter the log events displayed in the table by specifying the logging level or an activity type from the Level and Type list. When filtering the log events by type, you can press the Shift key to select or clear multiple types.

To toggle between the text or table format, select or clear the View as Text option.

Click Clear to delete all orchestration monitoring data.

You cannot restore orchestration monitoring data to the log once the log has been cleared

**Parent topic:** [Orchestrations](#)

## Viewing an orchestration

---

You can use orchestration view icons on the workspace, and View options from the Studio toolbar menu to manipulate your orchestration view in the workspace.

### About this task

---

The workspace denotes source and target endpoints by using blue and green separating lines, respectively. With the endpoints displayed, the workspace uses data flow lines to associate an endpoint with a specific activity so that you can associate an activity with its endpoint.

You can manipulate the orchestration view in the workspace using the following icons:

#### Orientation of Orchestration

You can choose to view the orchestration in a horizontal  or vertical  view.

#### Expand or Collapse Orchestration Activities

Expands  or collapses the activities in an orchestration.

#### Orientation of Endpoints

You can choose to view the endpoints in a horizontal  or vertical  view, relative to the orchestration.

#### Show/Hide Endpoints

You can choose whether to display endpoints for the orchestration in the workspace. Show/Hide endpoints that are oriented horizontally . Show/Hide endpoints that are oriented vertically .

#### Expand or collapse Orchestration

Expands , or collapses  the entire orchestration, not just the activities.

#### Animate Graph

 Animates the actions that occur in the workspace. By default, orchestration graphics in the workspace are animated and Studio smoothly transitions any modifications you make to an orchestration. Click the icon to disable the animations and have the actions occur more crisply. For example, when you add an activity to the orchestration, the new activity snaps into place.

#### Navigate Satellite View

 You can view your entire orchestration and select a specific area to view.

#### Zoom Out

 Minimizes the view of an orchestration.

#### Zoom In

 Enlarges the view of an orchestration.

Restore view to 100%

 Resets the zoom out and zoom in changes you made to the orchestration view.

Fit to view

Resizes the orchestration to fit in the workspace.

Table 1. Studio toolbar menu options. You can control the magnification level to view an orchestration by selecting one of the following options from the View option of the toolbar menu.

Option	Description
Zoom In	Increase the magnification level to view the orchestration.
Zoom Out	Decrease the magnification level to view the orchestration.
Zoom 100%	Returns the view of the orchestration to the normal magnification level.
View as Tree Flow or View as Flow	The View as Tree Flow option lists the activities of the orchestration in a top-to-bottom view. During run time, the flow starts at the top activity and continues downward. This view is useful for displaying large orchestrations.  The View as Flow option lists the activities of the orchestration in a left-to-right view. During run time, the flow starts at the activity on the left side of the view and continues to the right. This is the default view.
Status View	Check box that defines if a status bar is displayed at the end of the main Studio pane. The status bar shows descriptions of the menu options.

You can also right-click anywhere in the orchestration (when the orchestration is displayed as a flow) and select one of the following options from the shortcut menu:

- Zoom In
- Zoom Out
- Zoom 100%

## Procedure

1. To view a top-level scaled-down overview of the orchestration for navigating large orchestrations, Double-click the overview  icon. The top-level scaled-down overview of the orchestration is displayed in a small pane in the Orchestration tab.
2. Move the cursor into the small pane to change the section of the orchestration displayed in the larger detailed pane of the Orchestration tab.
3. Double-click in the small pane to remove the small top-level overview of the orchestration.

**Parent topic:** [Orchestrations](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_Viewing\\_an\\_Orchestration.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Viewing_an_Orchestration.html)

## Validating an orchestration

An orchestration must be valid (complete and correct) before you can publish it to the Integration Appliance. Use the validation feature in Studio to validate your orchestration.

## Before you begin

---

To be valid an orchestration must meet the following requirements:

- Have a starter activity or a Pick activity as the first activity. Starter activities are denoted in the Activities tab with the blue orchestration icon and a downward arrow . The first activity in each branch of the Pick activity must be a starter activity.

Note: All starter activities are represented in Studio by the inbound icon , except for the Schedule Job activity.

- Variables must be initialized before they are used. This includes variables that are initialized in the branches of an If.. Then activity. The variable must be initialized in all branches.

## Procedure

---

1. Select the Project tab, and expand the Orchestration folder.
2. Select and open an orchestration from the Orchestration folder. A graphical representation of the orchestration is displayed in the Orchestration tab.
3. Validate your orchestration using one of the following options:
  - Select Orchestration > Validate from the menu toolbar. The Validation Results dialog box is displayed.
  - Press **ALT-F8**. The Validation Results dialog box is displayed.
  - Click an orchestration in the Project tab. If the orchestration is invalid, the Validation Results popup is displayed next to the Project tab and the invalid orchestration icon  is displayed next to the orchestration in the Project tab

The Validation Results dialog box lists the problem areas in the orchestration. Problems prefaced by a blue icon are informational; you will have to navigate to that area to fix the problem. Problems prefaced by a red icon are errors. Click the error message in the dialog box to open the appropriate panel to fix the error.

Validation ensures that all the basic requirements for an orchestration have been met. You must resolve all validation issues before publishing the orchestration to the Integration Appliance.

## Example

---

To validate all the orchestrations in the project complete the following steps:

1. In the Project tab, click Revalidate Project . All the orchestrations in the project are validated. If an orchestration is invalid the invalid orchestration icon  is displayed next to the orchestration in the Project tab. If the orchestration is invalid, click on the orchestration to view the errors in the Validation Results list.
2. Select the Validate Project  toolbar button. All the orchestrations in the project are validated. If an orchestration is invalid the invalid orchestration icon  is displayed next to the orchestration in the Project tab. If the orchestration is invalid, click on the orchestration to view the errors in the Validation Results list.

## What to do next

---

Validation icons are displayed throughout the orchestration providing visual clues to potential problem areas or to provide further information.

In Studio, the following validation icons are displayed:

 Warning icon

Click warning icons to learn what information is required to complete the configuration of the entity in the pane. For example, in an activity's checklist, the warning icon appears next the endpoint if an endpoint has not yet been specified.

 Information icon

Click information icons to learn details about a entity in the pane, for example why a button has been disabled.

 Checkmark icon

Checkmark icon is displayed when all the information for a entity in the pane has been specified. For example, in an activity's checklist, the checkmark icon appears next to the endpoint if a valid endpoint has been specified.

A warning icon  displays in the upper-right corner of many panes (for example, the Endpoint configuration pane). You can click this icon to toggle the warning icons ON or OFF displayed in the pane. If turned OFF, the warning icons are not displayed in the pane.

**Parent topic:** [Orchestrations](#)

---

## Working with activities in an orchestration

---

You can cut, copy, and paste activities, drag activities in an orchestration and add and delete new activities.

### About this task

---

You can cut, copy, paste, delete, and rename activities using any of the following methods:

- Keyboard shortcuts
- Right-click an activity and select an option from the drop-down list
- Select an activity and then select an option from the Edit toolbar menu
- Select an activity and then select a toolbar button.

Keyboard shortcuts and their menu option equivalents are listed in the following table.

Table 1. Keyboard shortcuts and their menu option equivalents

Keyboard Shortcuts	Right-Click Menu Options	Toolbar Menu Options	Toolbar Buttons	Action
--------------------	--------------------------	----------------------	-----------------	--------

Keyboard Shortcuts	Right-Click Menu Options	Toolbar Menu Options	Toolbar Buttons	Action
CTRL + X	Cut	Edit > Cut		Removes the activity and saves a copy of the activity in the clipboard that can be used later by a paste action.
CTRL + C	Copy	Edit > Copy		Saves a copy of an activity into the clipboard that can be used later by a paste action.
CTRL + V	Paste	Edit > Paste		Copies the stored activity from the clipboard into the orchestration.
Delete	Delete	Edit > Delete		Removes the activity. The activity is not saved in the clipboard.
F2	Rename	Edit > Rename		Opens a field so you can rename an activity in an orchestration.

Note: The keyboard shortcuts and menu options listed in the preceding table are only available when the orchestration is viewed as a flow and not when the orchestration is viewed as a tree. For more information, see [Viewing an Orchestration](#).

You can cut, copy, or paste activities within the same orchestration and between orchestrations in the same project.

You can drag an activity from one location in an orchestration to another location in orchestration by selecting the activity and dragging it to the new location.

You can make a copy of an activity, by selecting the activity you want to copy, hold down the CTRL key, and then drag the activity to new location. A copy of the activity is created in the new location.

Note: Drag functionality is only available when the orchestration is viewed as a flow and not when the orchestration is viewed as a tree. For more information, see [Viewing an Orchestration](#).

## Procedure

1. Drag an activity from the Activities tab onto any green target in the orchestration.
2. Complete the properties of the activity in the Properties pane.
3. Optional: To rename the activity, select the Edit > Rename option in the toolbar menu. The activity name field becomes active. You can also use one of the alternate methods mentioned in Table 1.

## What to do next

To delete an activity, select the Edit > Delete option in the toolbar menu. You can also use one of the alternate methods mentioned in Table 1.

## Printing an orchestration

---

You can print an orchestration directly or view a print preview of an orchestration.

### Procedure

---

1. Select the Project tab and expand the Orchestrations folder.
2. To open an orchestration, double-click an orchestration in the Orchestrations folder. The Orchestration is displayed.
3. Optional: To view a print preview press CTRL+SHIFT+P.
4. To print the orchestration, press CTRL+P.

## Processing orchestration jobs sequentially

---

You can use the Process Orchestration Jobs Sequentially option when an orchestration contains activities that can conflict with each other when multiple instances of the orchestration are running. An instance of an orchestration is also known as an orchestration job.

### About this task

---

For example, an orchestration could contain a Pick activity that contains branches for the Get Inserted Rows, Get Updated Rows, and Get Deleted Rows activities. The following steps show an example run time scenario for this orchestration with the Process Orchestration Jobs Sequentially check box not selected:

1. An insertion into the database occurs, triggering the first instance of the orchestration to be created.
2. The first instance of the orchestration starts processing the insert branch of the Pick activity.

3. Before Get Inserted Rows activity completes in the first orchestration instance, a deletion in the database occurs triggering a second instance of the orchestration to be created.
4. The second instance of the orchestration starts processing the delete branch of the Pick activity.

This is undesirable behavior because first instance of the orchestration (that is processing the Get Inserted Rows activity) should complete before the second instance of the orchestration starts to process the Get Inserted Rows activity to avoid a potential primary key exception in the database. These database actions should occur sequentially. To force the instances of the orchestration to run sequentially, select the Process Orchestration Jobs Sequentially check box for the orchestration. With this option set, the instances of the orchestration are run one at a time and conflicts, like primary key exceptions, are avoided.

Complete the following steps to set all jobs to run in a single instance check box.

Note: Selecting this option decreases the performance of the project.

## Procedure

---

1. Select the Project tab and expand the Orchestrations folder.
2. To open an orchestration, double-click an orchestration in the Orchestrations folder. The orchestration is displayed.
3. If the orchestration options are not displayed the bottom part of the orchestration tab, select Orchestration > Properties from the toolbar menu.
4. Select the Process Orchestration Jobs Sequentially check box. This option is automatically selected if the orchestration contains shared variables.

**Parent topic:** [Orchestrations](#)

### Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_Processing\\_Orchestration\\_Jobs\\_Sequentially.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Processing_Orchestration_Jobs_Sequentially.html)

## Enabling persistence

---

The Orchestration pane contains an Enable Persistence check box that by default is selected. The setting of the Enable Persistence check box affects the way orchestration jobs are restarted after a failure.

### About this task

---

The effect of setting of the Enable Persistence check box is described by the following two options:

Enable Persistence check box is selected

During run time if an orchestration job is running and a failure occurs that causes the job to stop, when the orchestration is restarted, the original job continues processing where it stopped and no in-flight messages are lost.

Enable Persistence check box is cleared

During run time if an orchestration job is running and a failure occurs that causes the job to stop, when the orchestration is restarted, the current job does not complete and the in-flight messages are lost.

When the Enable Persistence check box is cleared the run time performance is improved.

Note:

When an orchestration that has Web Services Provide service starter activity with Transport type set to Local, referred to as sub-orchestration, then persistence setting for the main orchestration and the sub-orchestration should be same within the same project.

For example, if the persistence is enabled for the main orchestration, then it should be enabled for the sub-orchestration also. If the persistence is disabled in the main orchestration, then it should be disabled for the sub-orchestration and vice-versa.

Note:

You should enable persistence for the FTP Poll Directory activity:

- If you have an orchestration job with a FTP Poll Directory activity that is processing large input files. Otherwise, you can experience problems like "Variable 'Lotdata' is too large, please turn on persistence for this orchestration".
- If you disable persistence and have an orchestration job with a FTP Poll Directory activity with the Keep in place option selected, and during run time if a failure occurs that causes the job to stop, when the orchestration is restarted it processes the file again. The state of the job is lost and Integration Appliance does not know that it has already processed the file.

The following activities require that persistence be enabled when the Exactly Once option is selected in the Delivery Rules for the activity:

#### Database

- Poll Table
- Get Inserted Row
- Get Updated Rows
- Get Deleted Rows
- Insert Rows
- Update Rows
- Delete Rows
- Call Procedure

#### Email

- Get Email

#### FTP

- Poll Directory

#### JMS

- Subscribe Message
- Poll Message

#### MQ

- Poll Message

#### SAP

- Receive IDOC
- Send IDOC

#### SFDC

- Poll Deleted Objects
- Poll Updated Objects

#### Domino®

- Get Created Documents
- Get Deleted Documents
- Get Updated Documents

## Procedure

1. To change the setting of the Enable Persistence check box, select Orchestration > Properties from the toolbar menu. The Orchestration pane is displayed.
2. Select Enable Persistence check box.

## Adding a global exception handler to an orchestration

During run time if any of the activities of the orchestration throws an exception, and a global exception handler has been enabled, the global CatchAll branch is run.

---

### About this task

The following figure shows an example orchestration:

In this example, if either the Database Get Inserted or the Database Insert Rows activities fail and throw an exception, the If..Then activity in the CatchAll branch is run.

---

## Procedure

1. Right-click the start icon  of the orchestration and from the menu, and select the Add CatchAll Branch option. The CatchAll branch is added to the orchestration and the following variables are automatically created:
  - o `faultName` - During run time, the `faultName` variable contains the name of the exception thrown by an activity in the orchestration.
  - o `faultData` - During run time, the `faultData` variable contains the error message associated with the exception. This additional information is only currently returned for the Web Services activities. For Web Services activities, the `faultData` variable contains the fault.
  - o `faultInfo` - During run time, the `faultInfo` variable returns the following nodes:

- name - During run time, the faultInfo/name node contains the name of the exception thrown by an activity in the orchestration. The faultInfo/name node is an xsd:QName type.
- message - During run time, the faultInfo/message node contains the error message associated with the exception. The faultInfo/message node is an xsd:string type.
- activityId - During run time, the faultInfo/activityId node contains the activity ID that uniquely identifies the activity where the exception occurred. The faultInfo/activityId node is an xsd:int type.
- activityName - During run time, the faultInfo/activityName node contains the activity name where the exception occurred. The faultInfo/activityName node is an xsd:string type.
- faultTime - During run time, the faultInfo/faultTime node contains the time the error occurred. The faultInfo/faultTime node is an xsd:dateTime type.

Note: The exception name returned by an activity in the faultName variable and the faultInfo/name node may change in a future release.

2. Configure the CatchAll branch by dragging activities from the Activities tab to the CatchAll branch, as shown in the preceding figure.

## Results

---

Note: The scope of the faultName, faultData, and faultInfo variables is limited to the CatchAll branch. This scope limitation means that the value of these variables is only guaranteed to be valid within the CatchAll branch. For example, if you add a If...Then activity that tests the value of the faultName variable, the If...Then activity must be placed inside the CatchAll branch as shown in the preceding figure.

## Saving an image of an orchestration

---

You can save a graphical image of the current orchestration as a ,jpg file.

### Procedure

---

1. To create, or open, an existing orchestration double-click an orchestration in the Orchestrations folder of the Project tab. A graphical representation of the orchestration is displayed.
2. Click an activity in the orchestration and select the Orchestration > Save as an Image option from the Studio toolbar menu. The Save Orchestration Flow to an Image dialog box is displayed.
3. Browse for a directory location.
4. In the File Name field, enter the complete name of the file including the jpg extension. For example: *ProcessPO.jpg*.
5. Click Save. The image file is saved to the file system.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_connectionactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_connectionactivities.html)

## Creating an endpoint

---

You can create an endpoint from either the Activities tab or the Project tab. Use the Activities tab when you are in the process of building an orchestration and want to use the endpoint straight away. Use the Project tab to configure a set of endpoints for later use.

### Creating an endpoint from the Activities tab

---

1. Drag a connection activity from the Activities tab to the orchestration. The **Checklist** is displayed in the lower left side of the pane. The summary information is displayed, on the right.
2. By default, the Activity Name displayed is the name of the connection activity; for example, `FTP Poll Directory`. To change the name, enter the new name in the field.
3. Select Pick Endpoint from the **Checklist**. The endpoint pane is displayed to the right.
4. Click New. The Create Endpoint dialog is displayed.

Note: The dialog contents vary depending on what type of connection activity you create.

## Creating an endpoint by right-clicking in the Project tab

---

1. Right-click on the endpoints folder in the Project tab.
2. Select Create Endpoint > *EndpointType*, where *EndpointType* is type of endpoint. A new endpoint is created and displayed under the endpoints folder in the Project tab with a default name. An Endpoint tab is displayed in the main Studio pane.
3. Change the default name.
4. Press Return.
5. Configure the endpoint by specifying values in the Endpoint tab.

Note: The fields in the tab are identical to the fields displayed for the same type of endpoint created from the Activities tab.

## Creating an endpoint by clicking the New Endpoint icon in the Project tab

---

1. Click the Project tab.
2. In the Project tab, click the New Endpoint icon. A list with all types of endpoints is displayed.
3. Select an Endpoint type.
4. Change the default name.
5. Press Return.

## Creating an endpoint by right-clicking in the Project tab

---

1. Right-click on the endpoints folder in the Project tab.
2. Select Create Endpoint *EndpointType*, where *EndpointType* is type of endpoint. A new endpoint is created and displayed under the endpoints folder in the Project tab with a default name. An Endpoint tab is displayed in the main Studio pane.
3. Change the default name.
4. Press Return.
5. Configure the endpoint by specifying values in the Endpoint tab.

Note: The fields in the tab are identical to the fields displayed for the same type of endpoint created from the Activities tab.

**Parent topic:** [Connection Activities](#)

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/creating\\_endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/creating_endpoint.html)

## Downloading plug-in connectors

---

Plug-in connectors are additional connectors that you can download into Studio and access like a built-in connector. When you download a plug-in connector, the connector is displayed in the Activities tab with all the other built-in connectors. You can now drag the plug-in connector activities into the Studio workspace to create an orchestration.

## About this task

---

When you download plug-in connectors you can view available and installed plug-in connectors. Click the Available tab to view the names and versions of all the plug-in connectors that are available for download. Click the Installed tab to view the names and versions of all the plug-in connectors that you have already downloaded and installed on Studio. You can check for updates to these lists on startup or at one of the following intervals: daily, weekly, on alternative weeks, monthly, or never. Select the update interval and click Check Now to refresh the lists.

To download a plug-in connector complete the following steps:

## Procedure

---

1. Select Solutions > Plugin Connectors. The Login window is displayed.  
Note: If you are already logged into the IBM® Cast Iron® services, the Plugin Connector window is displayed and you can omit steps 2 and 3.
2. Specify the user name and password that IBM Support has provided you with. If you do not have login information, request a login from IBM Support.
3. Click OK. The Plugin Connectors window is displayed.
4. In the Available tab, select a connector.
5. Click Install. The plug-in connector is displayed in the Installed tab.

**Parent topic:** [Connection Activities](#)

---

### Feedback | Notices

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/downloading\\_plugin\\_connectors.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/downloading_plugin_connectors.html)

## Using an existing endpoint

---

You can define an endpoint and reuse it for connection activities within the same project.

## Procedure

---

1. Select the connection activity from within the orchestration.
2. Click Pick Endpoint from the Checklist.
3. Click Browse. The Project Explorer dialog box displays.
4. Select an endpoint from the list and click OK. The endpoint information is displayed.

**Parent topic:** [Connection Activities](#)

Last updated: Wednesday, 15 June 2016  
 file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn\\_Using\\_an\\_Existing\\_Endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn_Using_an_Existing_Endpoint.html)

## Polling interval behavior

Some starter activities poll for a change in state at the specified polling interval. Once the poll occurs and the change of state is detected, an orchestration job is started to start processing.

For example, during run time, the **FTP Poll Directory** activity polls for the existence of the specified file or files on the FTP server at the specified location and polling interval.

You specify the polling interval for the starter activity in the **Delivery Rules** task of the **Checklist** for the activity. The polling interval determines how often a poll occurs to check for a change in state. Once an orchestration that starts with a polling starter activity is published and deployed, the first poll occurs when the orchestration is deployed and the second poll occurs at the next time interval in the polling schedule. For example, if the polling interval is 10 minutes and the orchestration is deployed at 10:14 PM, the first poll occurs at 10:14 PM and the second poll occurs at 10:20 PM, which is the next interval of 10 minutes, as shown in the following figure:

The intervals start at the beginning of the hour, 10:00 PM in this example.

Note: When specifying the polling interval in days, the Integration Appliance uses UTC time zone and not the local time zone to determine when to poll. When the Polling Interval is set to `days` in the **Delivery Rules** task, the Integration Appliance polls at the start of the day (00:00) using the UTC time zone and not the local time zone specified for the Integration Appliance. For example, if your Integration Appliance is set to Pacific Standard Time (PST) which is 8 hours behind Coordinated Universal Time (UTC) and the Polling Interval was set to 1 day, the poll occurs at 00:00 in the UTC time zone which is equivalent to 4:00 PM (16:00 in 24 hour time) in the PST time zone.

The following starter activities poll for a change in state:

- Database Get Inserted Rows
- Database Get Updated Rows
- Database Get Deleted Rows
- Database Poll Table
- Get Email
- FTP Poll Directory
- MQ Poll Queue

**Parent topic:** [Connection Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
 file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Polling\\_Interval\\_Behavior.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Polling_Interval_Behavior.html)

## Using the Shift-JIS encoding

During run time, if the Shift-JIS encoding is specified, the Integration Appliance will not convert some of the double-byte characters.

### About this task

The Integration Appliance does not convert the double-byte characters listed in the following table:

Hexadecimal Shift-JIS Character Code	Hexadecimal Unicode Character Code	Description
0x815C	U+2014	Em Dash
0x8160	U+301C	Wave Dash
0x8161	U+2016	Double Vertical Line
0x817C	U+2212	Minus Sign
0x8191	U+00A2	Cent Sign
0x8192	U+00A3	Pound Sign
0x81CA	U+00AC	Not Sign

Use the CP943 encoding instead of the Shift-JIS encoding.

<file:///dcs/markdown/workspace/Transform/out.html>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_TIPsandPIPs.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_TIPsandPIPs.html)

## About the Template Integration Project (TIP) Configuration Editor

---

Use the TIP Configuration Editor to drag objects from Studio into the TIP Configuration Editor workspace to create and modify Template Integration Projects (TIPs), which you can upload to the Cast Iron® solutions repository for other users to access.

When you have created a TIP, you can use the Configuration Wizard to configure the project for your integration scenario.

When you close the TIP Configuration Editor all changes are saved. However, if you close the project in Studio before you save your changes in the TIP Configuration Editor, the changes you made in the TIP Configuration Editor are not saved.

You can launch the TIP Configuration Editor from the Studio menu. Select Tools > TIP Configuration Editor.

## TIP Configuration Editor Workspace

---

The TIP Configuration Editor workspace contains the Edit and Preview tabs.

In the Edit tab, you can use the interface to build the pages for each step in the TIP. You can use this interface to drag images directly into the Description and Summary Content fields. By selecting the Show Markup option at the bottom of the tab, you can edit the underlying HTML source for the page.

You can view the page for the TIP step in the Configuration Wizard use the Preview option.

## TIP Configuration Editor Modes

---

The TIP Configuration Editor has a compact mode, which shows only a panel with the Steps list. Click the compact mode icon, in the upper right corner of the Steps list, to collapse or expand the TIP Configuration Editor. When you select the Sync Selection option at the end of the Steps list, the Studio application is opened and automatically navigates to the entity corresponding to the step in the TIP Configuration Editor that you are editing.

**Parent topic:** [Template Integration Process \(TIPs\)](#)

---

### Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/TIPPIP\\_About\\_the\\_TIP\\_Configuration\\_Editor.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/TIPPIP_About_the_TIP_Configuration_Editor.html)

## Creating a Template Integration Project (TIP)

---

You can create, and modify, Template Integration Projects (TIPs) using the TIP Configuration Editor to drag objects from Studio into the TIP Configuration Editor.

### About this task

---

You can upload to the Cast Iron® solutions repository for other users to access. After using the TIP Configuration Editor to create a TIP, you can use the Configuration Wizard to configure the project for your integration scenario.

**Important:** Only the creator of a TIP can modify the TIP. However, after you upload your TIP to the Cast Iron solutions repository and it is certified by IBM®, you no longer have the ability to delete your TIP from the Cast Iron solutions repository.

### Procedure

---

1. From the Studio menu, select Tools > TIP Configuration Editor. The TIP Configuration Editor window shows.
2. Define the steps for the TIP using one of the following methods:

Adding one of the TIP Configuration Editor's predefined step types:

- a. Click Add. The Select Type window opens.
- b. Select the appropriate option and click OK. The new step is displayed beneath the highlighted step in the Steps list. You can shuffle the order of the steps by selecting the step and moving it to the appropriate locations on the list.

Dragging a Studio object into the TIP Configuration Editor:

- a. Select a Studio object.
- b. Drag the object to the appropriate position on the Steps list. You can shuffle the order of the list by selecting a step and moving it to the required position on the list.
- c. Optional: You can drag images directly into the Description and Summary Content fields of the various steps.

Deleting a step:

- a. Select a step in the Steps list. Your selection is indicated by bold type
- b. Click Delete.

Renaming a step:

- a. Double-click a step in the Steps list. The step name becomes an editable field.
- b. Enter the required name of the step.

Or

- a. Select a step in the Steps list. Your selection is indicated by bold type.
- b. In the Edit tab, edit the value in the Name field.

3. In the Edit tab, define properties for each step:

- a. Select a step in the Steps list. Your selection is indicated by bold type. The Edit tab opens a form showing the properties for the selected step.
- b. Optional: Optional: Select the Show Markup option to view the HTML markup for the Description and Summary Content sections of the form. Right-click these sections to see a list of available HTML styles.

In the HTML source view, you can add images to the Description and Summary Content fields by dropping an image into either field. The image is converted to a file with a “.b64” extension, which can be referenced as a relative path. For example: ``.

Referencing images outside of the project structure is supported by using fully-qualified HTTP paths. For example: ``

Note: Selecting the Show Markup option only shows the HTML markup for the selected step.

- c. Complete the form.
- d. Preview the results in the Preview tab.

4. Click Close. The TIP Configuration Editor saves all changes and closes.

# Verifying a Template Integration Project (TIP)

---

You can verify a Template Integration Project (TIP) from the Studio menu using the same process as for verifying an orchestration.

## About this task

---

### Procedure

---

1. From the Studio menu, select Solutions > TIP Configuration Editor. The Configuration Wizard is displayed.
2. If the TIP does not have a Verify Orchestration step, add one before the Finish step. To add a Verify Orchestration step, select Tools > Edit Configuration Wizard and add a Verify Orchestration step.
3. Click Next to step through the orchestration.
4. When you reach the Verify Orchestration step, click Start Orchestration.

# Searching for Template Integration Projects (TIPs)

---

Template Integration Projects (TIPs) are stored in the Cast Iron® solutions repository. Through the Configuration Wizard, TIPs guide you through the configuration steps for an integration scenario. TIPs can be downloaded to your local machine. The login window is pre-populated with the User Name and Password to make it easier for you to download the TIPs, without registration.

## Procedure

---

1. From the Solutions menu, select Search For TIPs. The Login window is displayed with the pre-populated User Name and Password. These credentials have the access privilege only to download TIPs.  
Note: You can also log on by clicking the Login link present on the right-hand side, near the memory bar.
2. If you already have the credentials to log on, specify the user name and password. You can specify default login settings for the central repository in the Preferences dialog.
3. Click OK. The Search window is displayed and a confirmation message displays at the end of the main Studio window.
4. In the Search window, choose Keywords, Filter, or My TIPs as the method by which you want to search for TIPs.
  - o If you select the Keywords search option, the Keywords field is displayed.
    - a. Enter a search keyword.
    - b. Click Go. The results are displayed in the Results table and a "Searching ... completed" message is displayed at the end of the Search window. For example, if you enter the keyword USECASES, all TIPs under the USECASES category in the Cast Iron solutions repository are returned.
  - o If you select Filter search option, the filter options: Source Endpoint, Target Endpoint, Integration Patterns, and Searchable Keywords are displayed.
    - a. You must specify a value for at least one filter option. The options lists provide valid values.
    - b. Click Query. The results are displayed in the Results table and a "Searching ... completed" message is displayed at the end of the Search window.
  - o If you select My TIPs, all TIPs that you have created are displayed in the Results table.
5. In the Results table, select a TIP. The details for the project are displayed in the details section.
6. Optional: You can rate the TIP that you have selected.
  - a. Click the Edit Review link. The Publish Review window is displayed.
  - b. Move the slider until the appropriate number of stars are highlighted. Rate the TIP on a scale between 1-5, 5 being the highest rating.
  - c. In the My Title field, add a brief description for your review.
  - d. In the My Summary field, add more details about your review of the project.
  - e. Click OK. Studio submits the review to the Cast Iron solutions repository.
7. In the Search window, click Download. The Select directory where to save the TIP window is displayed.
8. Specify the download directory and click Open. The project is saved to the directory you specified and Studio opens the Configuration Wizard for the project.

## Rating and Reviewing Template Integration Projects (TIPs)

---

You can rate and provide a review for all Template Integration Projects (TIP) that you download.

### About this task

---

Ratings are given on a scale of 1-5, where 5 is the highest rating. When you submit your rating and review for a TIP, Studio uploads the information to the Cast Iron® solutions repository. Your rating is combined with any other ratings that have been submitted by other reviewers and the average is displayed in the Details pane of the specific TIP.

You can rate and review TIPs using the Configuration Wizard to complete TIP configurations or by accessing the Publish Review dialog box.

### Procedure

---

When you open a TIP in the Configuration Wizard, the last step provides an opportunity to rate and review the TIP.

1. Select Solutions > Start Configuration Wizard. The Configuration Wizard opens.
2. Complete each step of the wizard or just click Finish to go directly to the rating and review page.
3. In the rating and review page, move the My Rating slider until the appropriate number of stars are highlighted. Ratings are on a scale between 1 and 5; 1 is the lowest, and 5 is the highest rating.
4. In the My Title field, add a brief description for your review.
5. In the My Summary field, add more details about your review of the project.
6. Click Submit Review. Studio submits the review to the Cast Iron solutions repository.
7. Click Close.

- [Rating and Reviewing Template Integration Projects \(TIPs\) using the Publish Review Dialog box](#)  
You can rate and provide a review for all Template Integration Projects (TIPs) that you download.

## Rating and Reviewing Template Integration Projects (TIPs) using the Publish Review Dialog box

---

You can rate and provide a review for all Template Integration Projects (TIPs) that you download.

## About this task

---

You can rate and review a TIP without having to complete the configuration steps listed in the Configuration Wizard, by using the Publish Review dialog box.

## Procedure

---

1. In Studio, select Solutions > Create Review. The Publish Review window opens.
2. Move the My Rating slider until the appropriate number of stars is highlighted. Ratings are on a scale between 1 and 5; 1 is the lowest, and 5 is the highest rating.
3. In the My Title field, add a brief description for your review.
4. In the My Summary field, add more details about your review of the project.
5. Click OK. Studio submits the review to the Cast Iron® solutions repository.

## What to do next

---

You can edit a review by click the Edit Review link. The Publish Review window opens. Complete steps 3-5 as described in the preceding procedure.

**Parent topic:** [Rating and Reviewing Template Integration Projects \(TIPs\)](#)

## Uploading Template Integration Projects (TIPs) to the Cast Iron solutions repository

---

You can upload Template Integration Projects (TIPs) that you have created to the Cast Iron® solutions repository.

## Procedure

---

1. From the Studio menu, select Solutions > Upload Project to Repository. The Upload Project Wizard opens.
2. Enter the following summary information:

Option	Description
Parameter	Description
Name	Name of TIP.
Path	Specify the location in the Cast Iron solutions repository to which Studio uploads the TIP.

Option	Description
<b>Category</b>	Specify the type of TIP created: <ul style="list-style-type: none"> <li>○ Usecases</li> <li>○ Best Practices</li> <li>○ Utilities</li> <li>○ General</li> </ul>
<b>Description</b>	Enter a brief description of the TIP.

3. Click Next.

4. Enter source and target endpoint information for the project:

Option	Description
<b>Source Endpoint Parameter</b>	Description
<b>Name</b>	Name of source endpoint.
<b>Description</b>	Enter a brief description of the source endpoint.
<b>Version</b>	Specify a version number for the source endpoint configuration.
Option	Description
<b>Target Endpoint Parameter</b>	Description
<b>Name</b>	Name of target endpoint.
<b>Description</b>	Enter a brief description of the target endpoint.
<b>Version</b>	Specify the version number of the target endpoint configuration.

5. Click Next.

6. Enter details about project patterns:

Option	Description
<b>Parameters</b>	Description
<b>Name/Description</b>	Name/Value pair for project patterns  Click the appropriate field to specify the name and description for the project pattern.  Click Add to specify additional patterns.  Click Delete to remove specified patterns.
<b>Searchable Tags</b>	You can use this string value later to search for the project.
<b>Creator</b>	Identify the person or entity that created the project. For example: John Smith or IBM®.
<b>Version</b>	Specify the version of the TIP you are uploading to the Cast Iron solutions repository.

7. Click Finished. Studio uploads the TIP to the Cast Iron solutions repository.

**Parent topic:** [Template Integration Process \(TIPs\)](#)

## Transform Activities

---

- [Map Variables Activity](#)  
You can create a new Map Variables activity in an orchestration.
- [Read MIME activity](#)  
During run time, the **Read MIME** activity reads the MIME header and the body of the message. The **Read MIME** activity breaks up the attachments contained in the body of the message and places the result into the parts XML output parameter, as shown in the figure below.
- [Write MIME activity](#)  
During run time the **Write MIME** activity constructs a MIME header and the body of the message from multiple attachments contained in the parts XML input parameter and optionally the **mimeheader** input parameter, as shown in the figure below.
- [Read XML activity](#)  
The **Read XML** activity takes an XML document and parses it to a defined schema. XML data is returned from this activity as the output parameter and the data can be used in subsequent activities.
- [Write XML activity](#)  
The **Write XML** activity takes a complex (XML) variable and outputs a string in the XML format containing the data held in the complex variable. This string can then be written to a file or a database.
- [Validate XML activity](#)  
During run time, the **Validate XML** activity determines if the input XML data is valid to the specified XML Schema or WSDL.
- [Read JSON activity](#)  
The **Read JSON** activity takes a JSON or XML message and parses it to a defined schema to generate an output structure that can be used by the orchestration. At runtime this activity parses the JSON message and generates equivalent XML that can be mapped to other Studio activities.
- [Write JSON activity](#)  
The **Write JSON** activity takes a structure equivalent to JSON as input and outputs a string in the JSON format containing the data held in the complex variable. This string can then be written to a file or posted using HTTP.
- [Validate JSON activity](#)  
During run time, the **Validate JSON** activity determines if the input JSON or XML data is valid to the specified XML schema.
- [Read Flat File activity](#)  
The Read Flat File activity converts flat file data (non-XML data) to XML data by applying the specified Flat File Schema. XML data is returned from this activity as the output parameter.
- [Write Flat File activity](#)  
The Write Flat File activity converts data from an orchestration into flat file data (non-XML data) that is valid to the specified Flat File Schema.
- [Overview of OData Activities](#)
- [Apply XSLT activity](#)  
You can use the Apply XSLT activity to transform XML data, stored in one XML variable, to XML data, stored in another XML variable, using the specified XSLT stylesheet.

## Map Variables Activity

---

You can create a new Map Variables activity in an orchestration.

### About this task

---

Using the Map Variables activity you can transform and initialize variables. You can transform the data from one or more source variables to the data stored in one or more destination variables. For more information see [About Maps](#).

You can create a new Map Variables activity by completing one of the following procedures:

### Procedure

---

1. Open or [create an orchestration](#)
2. If the activity is mapping variables that conform to a particular XML Schema or DTD, upload the XML Schema or DTD file into your project using [Uploading Files into a Project](#).
3. Open the Activities tab.
4. Drag the Map Variables activity from the Activities tab onto the orchestration.
5. If not already selected, click Design The Mapping Editor is displayed in the lower part of the pane.
6. [Add variables](#) to the From Orchestration pane.
7. [Add variables](#) to the To Orchestration pane.
8. Drag a source node from the From Orchestration pane to a destination node in the To Orchestration pane. If the mapping is valid, a link (line) displays from the source node to the destination node, indicating that a mapping rule has been established. Repeat this step until all the required nodes have been mapped.
9. If possible, test your mappings to ensure that the output is what you expect. For more information, see [Testing maps](#).

Note: The Extensible Markup Language (XML) specification prohibits the use of non-printing unicode control characters. The accepted character range is:

```
Char      :=      #x9 | #xA | #xD | [#x20-#xD7FF] | [#xE000-#xFFFF] |  
[#x10000-#x10FFFF]
```

Note: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#)

**Parent topic:** [Transform Activities](#)

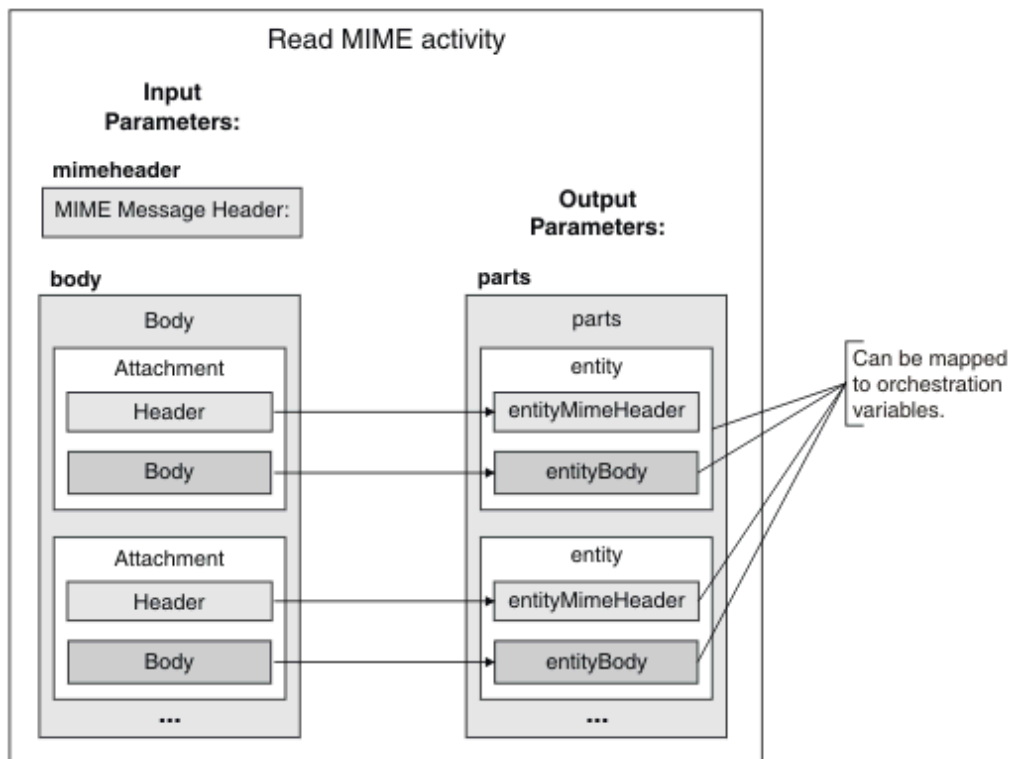

---

### Feedback | Notices

## Read MIME activity

During run time, the **Read MIME** activity reads the MIME header and the body of the message. The **Read MIME** activity breaks up the attachments contained in the body of the message and places the result into the parts XML output parameter, as shown in the figure below.

For example, an orchestration could contain a **Get Email** activity, that during run time gets an email message from a POP3 endpoint and places the resulting email message in two variables, one XML variable that contains the mail header and another string variable that contains the body of the email message. The next activity in the orchestration could be a **Read MIME** activity that maps the contents of the mail header and the body variables to its input parameters. If the mail message contains attachments, the **Read MIME** activity then breaks up the attachments contained in the body of the message and places the result into the parts XML output parameter.

- [Adding a Read MIME activity to an orchestration](#)  
Perform the steps in this section to add a **Read MIME** activity to an orchestration.
- [Mapping the input of the activity](#)  
In this task, you map the XML variable containing the MIME header part of the mail header and the string variable containing the body of the message to the **mimeheader** and **body** input parameters of the **Read MIME** activity, respectively. Variables must be mapped to the mime header and body input parameters—both input parameters are required. The mime header input parameter is of type XML and the body input parameter is of type string.
- [Mapping the output to an activity](#)  
In this task, you map the elements of the parts XML output parameter to variable(s).

**Parent topic:** [Transform Activities](#)

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read\\_Mime\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read_Mime_activity.html)

## Adding a Read MIME activity to an orchestration

---

Perform the steps in this section to add a **Read MIME** activity to an orchestration.

### Procedure

---

1. Create or open an orchestration. A graphical representation of the orchestration displays.
2. Select the **Activities** tab and expand the **Transform** folder.
3. Drag the **Read MIME** activity onto the orchestration. Place the **Read MIME** activity after the activity that gets the message, for example a Get Email activity.
4. Select the **Read MIME** activity and configure it as described in the next section.

**Parent topic:** [Read MIME activity](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add\\_Read\\_MIME\\_to\\_Orchestration.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add_Read_MIME_to_Orchestration.html)

## Mapping the input of the activity

---

In this task, you map the XML variable containing the MIME header part of the mail header and the string variable containing the body of the message to the mimeheader and body input parameters of the **Read MIME** activity, respectively. Variables must be mapped to the mime header and body input parameters—both input parameters are required. The mime header input parameter is of type XML and the body input parameter is of type string.

### About this task

---

The following table defines the elements in the mimeheader input parameter:

Table 1.

Element Name	Default
mimeVersion	Currently not used.
contentType/mainType	Currently not used. The <b>Read MIME</b> activity determines if the message is multipart or not by parsing the message using the specified boundary delimiter

Element Name	Default
contentType/subType	Currently not used.
contentType/charset	Currently not used.
contentType/attribute/name – contentType/attribute/value	The attribute element contains a set of attributes as name/value pairs. You can specify the <b>boundary</b> attribute that specifies the <b>boundary</b> delimiter between the multipart entities of the message. If you specify the <b>boundary</b> attribute, it overrides the default <b>boundary</b> set in the message itself. If no <b>boundary</b> attribute is specified in the message itself or using the attribute element, an exception is thrown during run time.
contentTransferEncoding	Currently not used.
otherMimeHeaders	Currently not used.

The message body can contain one or more MIME parts separated by the boundary value specified in the **contentType/attribute** element of the mimeheader input parameter. Each part contains a MIME header that describes various attributes of the associated part body. How the individual part is parsed depends on the values assigned to the following parameters in the entityMimeHeader of the entity body:

- Content-Type header
- Charset attribute within the Content-Type header
- Content-Transfer-Encoding

How the part body is parsed depends on the settings of Content-Transfer-Encoding and Content-Type:

Content-Type is equal to “text:”

- If the Content-Type is “text” and the Content-Transfer-Encoding is “7-bit”/”8-bit” or “binary,” the part body is converted to an UTF8 encoded string and copied into the **entityBody** element of the **parts** output parameter.
- If the Content-Type is “text” and the Content-Transfer-Encoding is “quoted-printable,” the part body is quoted-printable decoded, converted to an UTF8 encoded string based on the charset attribute and copied into the **entityBody** element of the parts output parameter.
- If the Content-Type is “text” and the Content-Transfer-Encoding is “base64,” the part body is base64 decoded, converted to an UTF8 encoded string based on the charset attribute and copied into the **entityBody** element of the parts output parameter.

If not explicitly specified in the part MIME header, charset defaults to UTF8. The only exception to this default behavior is when the Content-Disposition is equal to “attachment” and the Content-Type is equal to “text.” In this case, the part is not be treated as text since the charset of the data cannot be known. In addition, the Content-Transfer-Encoding is set to “binary.”

Content-Type is not equal to “text:”

- If the Content-Type is not equal to “text” and the Content-Transfer-Encoding is “7bit”/”8bit” or “binary,” the part body is converted to an UTF8 encoded string and copied into the **entityBody** element of the **parts** output parameter.
- If the Content-Type is not equal to “text” and the Content-Transfer-Encoding is “quoted-printable,” the part body is quoted-printable decoded, base64 encoded, and copied into the **entityBody** element of the

**parts** output parameter.

- If the Content-Type is not equal to “text” and the Content-Transfer-Encoding is “base64,” the part body is copied as is (base64 data) into the **entityBody** element of the **parts** output parameter.

**Parent topic:** [Read MIME activity](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Map\\_Activity\\_Input\\_Read\\_MIME.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Map_Activity_Input_Read_MIME.html)

## Mapping the output to an activity

---

In this task, you map the elements of the parts XML output parameter to variable(s).

The entity/entityBody element of the parts output parameter contains the body and the attachments of the mail message. To access the body and the attachments of the mail message, you must iterate through the instances of the entity element using the For Each or While Loop activities

The order of the attachments and the body in the entity element depend on the email client that sent the message and the type of message (either plain text or HTML). For example, for a plain text email message sent from a Microsoft Outlook client, the parts output parameter consists of the following entity elements:

- The first **entityBody** element contains the body of the message.
- If an attachment was included in the message, the second **entityBody** element contains the first attachment.
- If a second attachment was included in the message, the third entityBody element contains the second attachment.

...and so on with the rest of the attachments.

You may need to decode the attachments before parsing the contents of the attachment. For example, an attachment that is encoded with the base64 encoding must be decoded before the contents of the attachment can be parsed by the Read Flat File activity. Another attachment might be text and therefore can be parsed without decoding.

Note: The Email and MIME activities can only process 8-bit or binary data using the UTF8 charset. Only MIME 1.0 compliant email messages are supported. The **Read MIME** activity can only parse email messages that have come from a MIME 1.0 compliant Email Server. If the message you are parsing in the **Read MIME** activity does not come from the Get Email activity but from another activity such as the HTTP Receive Request activity, you must create a Flat File Schema to parse the MIME header from the payload.

**Parent topic:** [Read MIME activity](#)

**Related concepts:**

[Read MIME activity](#)

---

[Feedback](#) | [Notices](#)

## Write MIME activity

During run time the **Write MIME** activity constructs a MIME header and the body of the message from multiple attachments contained in the parts XML input parameter and optionally the **mimeheader** input parameter, as shown in the figure below.

For example, an orchestration could contain a **Write MIME** activity, that during run time constructs a MIME header and a body of a message and places the result in two orchestration variables. The orchestration then invokes a **Send Email** activity that takes these two orchestration variables as input and builds a mail message and then sends that mail message to the specified SMTP endpoint.

The steps for adding and configuring a **Write MIME** activity in an orchestration are described in: [Adding a Write MIME activity to an orchestration](#).

- [Adding a Write MIME activity to an orchestration](#)  
Perform the steps in this section to add a Write MIME activity to an orchestration.
- [Mapping the input of the activity](#)  
In this task, you map the XML variables containing the MIME header and the parts (contains the attachments) to the mimeheader and parts input parameters of the **Write MIME** activity, respectively. Variable(s) must be mapped to the parts input parameter—this input parameter is required. The mimeheader input parameter is optional. If you do not map to or define default values for the elements of the **mimeheader** input parameter, default values are provided in the following table.
- [Mapping the output to an activity](#)  
In this task, you map the **mimeheader** (of type XML) and **body** (of type string) output parameters to variable(s).

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write\\_Mime\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write_Mime_activity.html)

## Adding a Write MIME activity to an orchestration

---

Perform the steps in this section to add a Write MIME activity to an orchestration.

### Procedure

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the **Activities** tab and expand the **Transform** folder.
3. Drag the Write MIME activity onto the orchestration. Place the Write MIME activity before the activity that pushes the message to an endpoint during run time. For example, place the Write MIME activity before the Send Email activity in the orchestration. During run time, Send Email activity sends the email message to the POP3 server.
4. Select the **Write MIME** activity and configure it as described in the next section.

**Parent topic:** [Write MIME activity](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add\\_Write\\_MIME\\_to\\_Orchestration.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add_Write_MIME_to_Orchestration.html)

## Mapping the input of the activity

---

In this task, you map the XML variables containing the MIME header and the parts (contains the attachments) to the mimeheader and parts input parameters of the **Write MIME** activity, respectively. Variable(s) must be mapped to the parts input parameter—this input parameter is required. The mimeheader input parameter is optional. If you do not map to or define default values for the elements of the **mimeheader** input parameter, default values are provided in the following table.

### About this task

---

If the mimeheader input parameter is not listed in the **To Activity** pane of the **Map Inputs** pane, select **Map > Show Optional Parameters** from the toolbar menu or right-click in the **To Activity** pane and select the **Show Optional Parameters** option. If the **Map > Show Optional Parameters** option is not selectable in the toolbar menu, click on a element in the **Map Inputs** pane to make this option active.

The following table defines the elements in the mimeheader input parameter:

Table 1.

<b>Child Element of the mimeheader Input Parameter</b>	<b>Default Value</b>
mimeVersion	The standard MIME Version of 1.0 is assigned. The resulting MIME header is equal to the following setting: <code>MIME-Version: 1.0</code> .
contentType	The value of the Content-Type setting in the resulting MIME header is equal to the following setting: <code>Content-Type: multipart/mixed</code> .
contentType/attribute/name contentType/attribute/value	The attribute element contains a set of attributes as name/value pairs. The boundary between attachments can be specified using a boundary attribute element. If a boundary attribute is not specified a default value is generated.
contentTransferEncoding	The value of the Content-Transfer-Encoding in the resulting MIME header is equal to the following setting: <code>Content-Transfer-Encoding: 7-bit</code> . NOTE: The Content-Transfer-Encoding you specify in this element for the main MIME header cannot be more restrictive than Content-Transfer-Encoding of the entity MIME headers. For example if you specify that the Content-Transfer-Encoding for the main MIME header is 7-bit but the Content-Transfer-Encoding specified in the entity MIME headers is 8-bit, the Content-Transfer-Encoding of the main MIME header is changed to 8-bit.

If you do not specify values for some of the child elements of the parts input parameter, defaults are described in the following table.

Table 2.

<b>Child Element of the parts Input Parameter</b>	<b>Default Value</b>
mimeVersion	The standard MIME Version of 1.0 is assigned. The resulting MIME header contains the following setting: <code>MIME-Version: 1.0</code> .

content-type	The value of the Content-Type in the resulting MIME header contains the following setting: Content-Type: text/plain; charset=US-ASCII.
content-transfer-encoding	The value of the Content-Transfer-Encoding in the resulting MIME header depends on the Content-Type setting. If the Content-Type is equal to multipart, the resulting MIME header contains the following setting: Content-Transfer-Encoding: 7-bit. If the Content-Type is equal to text and charset is equal to not-us-ascii (where not-us-ascii is any type except US-ASCII) the resulting MIME header contains the following setting: Content-Transfer-Encoding: quoted-printable. If the Content-Type is equal to non-text, the resulting MIME header contains the following setting: Content-Transfer-Encoding: base64. NOTE: If the Content-Disposition is equal to attachment, the entity part is not treated as text.

The parts input parameter can contain one or more parts. Each part contains a MIME header that describes various attributes of the associated part body. How the individual MIME part is serialized depends on the values assigned to the following parameters in the mine header:

- Content-Type header
- Charset attribute within the Content-Type header
- Content-Transfer-Encoding

How the part body is serialized depends on the settings of Content-Transfer-Encoding and Content-Type:

Content-Type is equal to "text:"

- If the Content-Type is "text" and the Content-Transfer-Encoding is "7-bit"/"8-bit" or "binary," the part body is converted from UTF8 charset to the charset specified and copied into the body output parameter.
- If the Content-Type is "text" and the Content-Transfer-Encoding is "quoted-printable," the part body is converted from UTF8 charset to the charset specified, quoted-printable encoded and copied into the body output parameter.
- If the Content-Type is "text" and the Content-Transfer-Encoding is "base64," the part body is converted from UTF8 charset to the charset specified, base64 encoded, and copied into the body output parameter.

If not explicitly specified in the part MIME header, charset defaults to "UTF8." The only exception to this default behavior is when the Content-Disposition is equal to "attachment" and the Content-Type is equal to "text." In this case, the part is not treated as text since the charset of the data cannot be known. In addition for this case, the Content-Transfer-Encoding is set to "binary."

Content-Type is not equal to "text:"

- If the Content-Type is not equal to "text" and the Content-Transfer-Encoding is "7bit"/"8bit" or "binary," the part body is copied to the body output parameter as is.
- If the Content-Type is not equal to "text" and the Content-Transfer-Encoding is "quoted-printable," the part body is base64 decoded, quoted-printable encoded and copied into the body output parameter.
- If the Content-Type is not equal to "text" and the Content-Transfer-Encoding is "base64," the part body is copied as is (base64 data) into the body output parameter.

See [Creating a Standalone Map](#) for general instructions on mapping.

## Mapping the output to an activity

---

In this task, you map the **mimeheader** (of type XML) and **body** (of type string) output parameters to variable(s).

For an email message with no message body and a single attachment of a text file, the text attachment becomes the body of the message.

The Email and MIME activities can only process 8-bit or binary data using the UTF8 charset.

**Parent topic:** [Write MIME activity](#)

## Read XML activity

---

The **Read XML** activity takes an XML document and parses it to a defined schema. XML data is returned from this activity as the output parameter and the data can be used in subsequent activities.

### About this task

---

The input parameter of the **Read XML** activity expects XML text. This data can be obtained from various endpoint activities such as the FTP Poll Directory activity reading a file containing XML data or HTTP Receive Request activity. The input data must be a well formed XML document or the activity will error. You must create an XML variable (see the **Variables** tab) before you can use an XML Schema in the Configure task. The XML variable can be defined by adding an XML schema to the project or by using an existing variable.

Note: If no function is defined in the Map Outputs for the Read XML activity and there is a straight mapping, in the From Activity to the To Orchestration, the XML data is passed to the output activity without validating against the schema that is specified in the XML variable.

Note: If there are any functions or other changes to the mappings in the Map Outputs for the Read XML activity, and the content does not match the schema, then an empty XML document is provided as the output of the Read XML activity.

To add a **Read XML** activity to an orchestration:

### Procedure

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the **Activities** tab and expand the **Transform** folder.
3. Drag the **Read XML** activity onto the orchestration. Place it to the right of an activity from which the orchestration will obtain the XML data (for example, an FTP Poll Directory).
4. Select the **Read XML** activity and configure it as described in [Read XML activity configuration](#).

- [Read XML activity configuration](#)

You can specify the XML Schema to apply to the **Read XML** input parameter.

- [Read XML map inputs](#)

You can map a string variable that contains the XML data to the input parameter of the **Read XML** activity called XMLText.

- [Read XML map output](#)

You can map the OutputXml output parameter that contains the XML data (stored as a string) to a variable valid to the specified XML Schema.

## Read XML activity configuration

---

You can specify the XML Schema to apply to the **Read XML** input parameter.

### About this task

---

You must create an XML variable that defines the schema before starting this task.

### Procedure

---

1. In the XML Variable that defines the XML schema to parse, click **Browse**. The **Select a Variable to Parse** dialog box is displayed.
2. Select the appropriate XML Variable and click **OK**.
3. Specify how to read the data passed into the XMLText input parameter during run time by selecting one of the appropriate options:
  - a. Select the **Data is text-Needs no decoding** option if the incoming data is text and does not need decoding.
  - b. Select the **Decode data using encoding type** option if incoming data is binary data that needs to be decoded using the specified encoding type. Set the encoding type by selecting a default encoding type from the **Decode data using encoding type** list or enter your encoding type by clicking in the **Decode data using encoding type** field and typing in your encoding type.
4. Click **OK**.

Parent topic: [Read XML activity](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read\\_xml\\_Activity\\_conf.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read_xml_Activity_conf.html)

## Read XML map inputs

---

You can map a string variable that contains the XML data to the input parameter of the **Read XML** activity called XMLText.

### About this task

---

XMLText is an input parameter of type string or base64Binary. During run time the string variable must contain well formed XML data before the **Read XML** activity is run. The Encoding input parameter is optional. (You are not required to map this input parameter). If the Encoding input parameter is not listed in the **To Activity** pane of the **Map Inputs** pane, select **Map > Show Optional Parameters** from the toolbar menu or right-click the **To Activity** pane and select the **Show Optional Parameters** option. If the **Map > Show Optional Parameters** option is not selectable in the toolbar menu, click a node in the **Map Inputs** pane to make the option active. The Encoding input parameter specifies how the incoming data is decoded when read.

### Procedure

---

1. If no decoding is required, specify the string: text.
2. If decoding is required, specify the encoding type to be used to decode the incoming data. For example: UTF-8, US-ASCII, ISO-8859-1, EBCDIC-XML-US, or SHIFT\_JIS.

### Example

---

Optionally, you can override the Encoding setting you specified in the Configure task of the Checklist dynamically during run time, using the Encoding input parameter. For example, if you set the Encoding to UTF-8 in the Configure task but during run time you passed in the Encoding setting of Shift\_JIS, the Encoding setting specified dynamically during run time overrides the original setting specified in the **Configure** pane. In this example, the Encoding is set to Shift\_JIS. There is one exception to the dynamic overriding behavior: if the **XMLText is text-Needs no decoding** or **encoding** option is selected in the **Configure** task, the Encoding dynamically set during run time is ignored and no decoding occurs.

## Read XML map output

---

You can map the OutputXml output parameter that contains the XML data (stored as a string) to a variable valid to the specified XML Schema.

See [Creating a Standalone Map](#) for general instructions on mapping.

During run time, an orchestration could invoke the following sequence of activities:

1. A FTP Poll Directory activity assigns the contents of a flat file to a String variable called **XMLRawContent**.
2. A **Read XML** activity assigns the contents of the **XMLRawContent** variable to the string input parameter called XMLText.
3. The **Read XML** activity converts XMLText to XML data and passes the XML data back to the orchestration via the output parameter. The contents of the output parameter are assigned to the variable valid to the XML Schema. The data XML input document can now be used and mapped within the orchestration.

**Parent topic:** [Read XML activity](#)

## Write XML activity

---

The **Write XML** activity takes a complex (XML) variable and outputs a string in the XML format containing the data held in the complex variable. This string can then be written to a file or a database.

### About this task

---

The string is returned as an output parameter. The data from the orchestration must come from a complex variable which, on the variables tab, is indicated by the XML icon. You must create the input XML variable that defines the schema.

To add a **Write XML** activity to an orchestration:

### Procedure

---

1. Create or open an orchestration. For more information, see [Building an orchestration](#). A graphical representation of the orchestration is displayed.
  2. Select the **Activities** tab and expand the **Transform** folder.
  3. Drag the **Write XML** activity onto the orchestration.
  4. Select the **Write XML** activity and configure it as described in [Write XML activity configuration](#).
- [Write XML activity configuration](#)  
For this task, you specify the XML Schema for the inbound data. The inbound data must be defined by an

XML variable that defines the schema. You specify the XML Schema that applies to the input parameter.

- [Write XML map inputs](#)

You can map the data from variables of the orchestration to the InputXML parameter defined by the XML Schema specified in the Configure task.

- [Write XML map output](#)

You can map the XMLText output parameter that contains the XML data to a string variable.

## Write XML activity configuration

---

For this task, you specify the XML Schema for the inbound data. The inbound data must be defined by an XML variable that defines the schema. You specify the XML Schema that applies to the input parameter.

### Procedure

---

1. In the XML variable that defines the XML schema to serialize, click **Browse**. The **Select a Variable to Serialize** dialog box is displayed.
2. Select the appropriate XML variable and click **OK**.
3. Specify how the data defined by the OutputXML output parameter is to be encoded:
  - a. Select the **Data is text-Needs no decoding or encoding** option if the data is text and does not require encoding.
  - b. Select the **Decode or encode data using encoding type** option if outgoing data is binary data that requires encoding using the specified encoding type.
4. Set the encoding type using one of the following options:
  - a. From the **Decode or encode data using encoding type** list, select one of the default encoding types.
  - b. Click directly in the **Decode or encode data using encoding type** field and enter your encoding type.
5. Click **OK**.

**Parent topic:** [Write XML activity](#)

[Feedback](#) | [Notices](#)

## Write XML map inputs

---

You can map the data from variables of the orchestration to the InputXML parameter defined by the XML Schema specified in the Configure task.

### About this task

---

The Encoding input parameter is optional. You are not required to map this input parameter. If the Encoding input parameter is not listed in the **To Activity** pane of the **Map Inputs** pane, select **Map > Show Optional Parameters** from the toolbar menu or right-click in the **To Activity** pane and select the **Show Optional Parameters** option. If the **Map > Show Optional Parameters** option is not selectable in the toolbar menu, click on a node in the **Map Inputs** pane to make this option active. The Encoding input parameter specifies how outgoing data should be encoded for this procedure.

### Procedure

---

1. If no decoding is required, specify the string: **text**.
2. If encoding is required, specify the encoding type that should be used to encode the outgoing data, for example: UTF-8, US-ASCII, ISO-8859-1, EBCDIC-XML-US, or SHIFT\_JIS.

### Example

---

Optionally, you can override the Encoding setting you specified in the Configure task of the **Checklist** dynamically during run time, using the Encoding input parameter. For example, if you set the Encoding to UTF-8 in the Configure task but during run time you passed in the Encoding setting of **Shift\_JIS**. The Encoding setting specified dynamically during run time overrides the original setting specified in the **Configure** pane. In this example, the Encoding is set to **Shift\_JIS**. There is one exception to the dynamic overriding behavior: if the **Data is text-Needs no decoding or encoding** option is selected in the Configure task, the Encoding that is dynamically set during run time is ignored. See [Creating an orchestration](#) for more information.

#### Feedback | Notices

## Write XML map output

---

You can map the XMLText output parameter that contains the XML data to a string variable.

See [Creating a map](#) for general instructions on mapping.

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write\\_xml\\_map\\_output.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write_xml_map_output.html)

## Validate XML activity

During run time, the **Validate XML** activity determines if the input XML data is valid to the specified XML Schema or WSDL.

The **Validate XML** activity has the following limitations:

- The **Validate XML** activity only supports the validation of the selected root element of an XML Schema. The validation of XML Schema fragments is not supported. If the XML Schema contains more than one root (or global element), you must select one of the root elements.
- The **Validate XML** activity does not support the validation of XML data against a DTD.

Note: You must upload an XSD file (ends in the .xsd extension) that contains the XML Schema into the project before configuring the **Validate XML** activity. Upload the XML Schema into the project that is used to validate the XML data during run time.

The following table describes the result when an error or warning occurs when the **Validate XML** activity is parsing XML data against an XML Schema.

Table 1.

Error/Warning Type	Description	Example	Result
Fatal Error	Parsing of the XML data fails because of a severe problem and the parsing cannot continue. For example, the XML data is not valid to the XML Schema.	The XML data is not valid to the XML Schema. For example, the XML Schema defines that there should be a root element called <d> but the XML data contains the root element called <a>.	When a fatal error occurs, the current orchestration job stops processing— even the processing of the Validate XML activity does not complete. In addition, the activities in the orchestration after the Validate XML activity are not processed. The value returned from the Validate XML activity for the success output parameter is false but since the activity never completes, nothing is returned.

Error/Warning Type	Description	Example	Result
Error (recoverable)	An error occurs during the parsing of XML data but it does not prevent the parsing of rest of the XML data.	An XML element in an integer but a string is provided as a value: <code>&lt;a&gt;&lt;count&gt;two&lt;/count&gt;&lt;/a&gt;</code>	If only recoverable errors or warnings occur during parsing, the processing of the Validate XML activity completes and the activities in the orchestration after the Validate XML activity are processed. The value of false is returned from the success output parameter.
Warning	A warning occurs during the parsing of XML data but it does not prevent the parsing of rest of the XML data		If only warnings occur during parsing, the processing of the Validate XML activity completes and the activities in the orchestration after the Validate XML activity are processed. The value of true is returned from the success output parameter.

# Adding a Validate XML activity to an orchestration

---

Perform the steps in this section to add a **Validate XML** activity to an orchestration.

## Procedure

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the **Activities** tab and expand the **Transform** folder.

3. Drag the Validate XML activity onto the orchestration.
4. Select the Validate XML activity.

Parent topic: [Validate XML activity](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add\\_Validate\\_XML\\_Activity\\_to\\_Orchestration.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add_Validate_XML_Activity_to_Orchestration.html)

## Configuring a Validate XML activity

---

Perform the steps in this section to configure a **Validate XML** activity.

### Procedure

---

1. Click **Configure** from the **Checklist**.
2. In the **XML Schema** field, click **Browse**. The **Browse For Schema Type Element** dialog box displays. Select the XML schema to parse against during run time. You must select a root or global element and not a schema fragment. The selected XML schema defines the nodes that make up the **InputXml** input parameter in the Map Inputs task.
3. Select or clear the **Continue Parsing XML Data after First Recoverable Error** check box. (This check box defines the run-time behavior when a recoverable error occurs).

### Results

---

If the **Continue Parsing XML Data after First Recoverable Error** check box is selected and only recoverable errors and warnings occur but no fatal errors, the processing of the **Validate XML** activity completes after the first recoverable error and the value **false** is returned from the success output parameter. Only the first error is returned in the **errors** output parameter. The activities in the orchestration after the **Validate XML** activity are processed.

If the **Continue Parsing XML Data after First Recoverable Error** check box is cleared and only recoverable errors and warnings occur but no fatal errors, the processing of the **Validate XML** activity processes all the recoverable errors and the value **false** is returned from the **success** output parameter. Messages about all the recoverable errors are returned in the repeating **Message** node of the **errors** output parameter. The activities in the orchestration after the **Validate XML** activity are processed.

## Mapping the output to an activity - Validate XML

---

Do the steps in this section to map the output to an activity for **Validate XML**.

To map the output of the activity:

1. Select the **Map Outputs** task in the **Checklist**. The output parameters for the activity are displayed in the **From Activity** pane as described in the following table:

Table 1.

Output Node	Description
s	During run time, if the parsing was successful, the value of <b>true</b> is returned. If parsing was unsuccessful, the value of <b>false</b> is returned. If fatal errors occur during parsing, the value of <b>false</b> is returned. If recoverable errors occur during parsing, the value of <b>false</b> is returned. If only warnings occur during parsing, the value of <b>true</b> is returned. In addition, if no warnings or errors occur during parsing, the value of <b>true</b> is returned. Map from the <b>success</b> output parameter to a variable of type string. In XPATH expressions, compare the value of the string variable against the string values of <b>true</b> and <b>false</b> .

<b>O u t p u t N o d e</b>	<b>Description</b>
<b>e r r o r s / e r r o r T y p e</b>	<p>The type of error/warning for the last error or warning that occurred during run time.</p>
<b>e r r o r s / M e s s a g e</b>	<p>A repeating structure that contains a string that describes each error and warning that occurred during run time. All parsing warnings, fatal errors, and recoverable errors are returned.</p>

2. Map the desired output parameters to variable(s). See [Creating a Standalone Map](#) for general instructions on mapping. You are not required to map output parameters for this activity.

**Parent topic:** [Validate XML activity](#)

**Related tasks:**

[Read XML activity](#)

## Read JSON activity

---

The **Read JSON** activity takes a JSON or XML message and parses it to a defined schema to generate an output structure that can be used by the orchestration. At runtime this activity parses the JSON message and generates equivalent XML that can be mapped to other Studio activities.

### About this task

---

The input parameter of the **Read JSON** activity expects sample JSON or equivalent sample XML text. (Equivalent JSON or XML text is available from the JSON/REST API documentation). The input data must be a well formed JSON or XML message or the activity fails. If you do not use a schema, you must create a JSON variable (see the **Variables** tab) before you can use an XML schema in the Configure task. The variable can be defined by adding an XML schema to the project or by utilizing an existing variable. Once the JSON/REST sample is provided, the activity generates an equivalent structure for JSON/XML. The XML is mapped to the activity output which can be used by the orchestration. At runtime this activity consumes the JSON message and generates equivalent XML that can be mapped to other studio activities.

To add a **Read JSON** activity to an orchestration:

### Procedure

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
  2. Select the **Activities** tab and expand the **Transform** folder.
  3. Drag the **Read JSON** activity onto the orchestration. Place it to the right of an activity from which the orchestration will obtain the JSON data (for example, an FTP Poll Directory).
  4. Select the **Read JSON** activity and configure it as described in [Read JSON activity](#).
- [Read JSON activity configuration](#)  
You can apply a sample JSON or XML message to the **Read JSON** input parameter. Use of a schema is optional for this step.
  - [Read JSON map inputs](#)  
You can map a string variable that contains JSON data to the input parameter of the **Read JSON** activity called JSONText.
  - [Read JSON map output](#)  
You can map the OutputJSON output parameter that contains the JSON data (stored as a string) to a variable valid to the specified XML schema.

**Parent topic:** [Transform Activities](#)

**Related tasks:**

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read\\_json\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read_json_Activity.html)

## Read JSON activity configuration

---

You can apply a sample JSON or XML message to the **Read JSON** input parameter. Use of a schema is optional for this step.

### About this task

---

If you're applying a JSON or XML message to the **Read JSON** input parameter, do the following steps:

**Note:** Because not all JSON messages contain a root node, Studio, by default, adds a virtual root element to all JSON messages during a write JSON activity. (Virtual nodes facilitate handling of rootless messages in Studio). To determine if a root node is present, view the message in the Configure panel. If the message does not contain a root element, Studio will automatically generate one during the write JSON activity and display it in the root element file. To remove the root element, delete it from the Configure panel so the output message matches the required structure.

### Procedure

---

1. Click **Configure** from the Checklist. The Configure window is displayed.
2. In the Configure window, copy the JSON or XML message into the text area and click **Generate Output Map**. If you're specifying an XML schema to apply to the Read JSON input parameter, do the following additional steps: (a) In the **Select XML Schema** pane click the **Select XML Schema** button to browse for the XML schema, then (b) select the XML schema to parse against during run time and click **OK**. (You must select a root or global element and not a schema fragment).
3. Specify how to read the data passed into the **JSONText** input parameter during run time by selecting one of the appropriate options:
  - a. Select the **Data is text-Needs no decoding** option if the incoming data is text and does not need decoding.
  - b. Select the **Decode data using encoding type** option if incoming data is binary data that needs to be decoded using the specified encoding type. Set the encoding type by selecting a default encoding type from the **Decode data using encoding type** list or enter your encoding type by clicking in the **Decode data using encoding type** field and typing in your encoding type.
4. Click **OK**.

#### Feedback | Notices

 Last updated: Wednesday, 15 June 2016

<file:///dcs/markdown/workspace/Transform/out.html>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read\\_json\\_Activity\\_conf.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read_json_Activity_conf.html)

## Read JSON map inputs

---

You can map a string variable that contains JSON data to the input parameter of the **Read JSON** activity called JSONText.

## About this task

---

JSONText is an input parameter of type string or base64Binary. During run time the string variable must contain well formed JSON data before the **Read JSON** activity is run. The Encoding input parameter is optional. (You are not required to map this parameter). If the Encoding input parameter is not listed in the **To Activity** pane of the **Map Inputs** pane, select **Map > Show Optional Parameters** from the toolbar menu or right-click the **To Activity** pane and select the **Show Optional Parameters** option. If the **Map > Show Optional Parameters** option is not selectable in the toolbar menu, click a node in the **Map Inputs** pane to make the option active. The Encoding input parameter specifies how the incoming data is decoded when read.

## Procedure

---

1. If no decoding is required, specify the string: text.
2. If decoding is required, specify the encoding type to be used to decode the incoming data. For example: UTF-8, US-ASCII, ISO-8859-1, EBCDIC-XML-US, or SHIFT\_JIS.

## Example

---

Optionally, you can override the Encoding setting you specified in the **Configure** task of the Checklist dynamically during run time, using the Encoding input parameter. For example, if you set the Encoding to UTF-8 in the Configure task but during run time you passed in the Encoding setting of Shift\_JIS, the Encoding setting specified dynamically during run time overrides the original setting specified in the **Configure** pane. In this example, the Encoding is set to Shift\_JIS. There is one exception to the dynamic overriding behavior: if the **JSONText is text-Needs no decoding** or **encoding** option is selected in the **Configure** task, the Encoding dynamically set during run time is ignored and no decoding occurs.

## Read JSON map output

---

You can map the OutputJSON output parameter that contains the JSON data (stored as a string) to a variable valid to the specified XML schema.

See [Creating a Standalone Map](#) for general instructions on mapping.

During run time, an orchestration could invoke the following sequence of activities:

1. An HTTP Receive activity assigns the received body to a String variable called **JSONRawContent**.
2. A **Read JSON** activity assigns the contents of the **JSONRawContent** variable to the string input parameter called JSONText.

3. The **Read JSON** activity converts JSON data to XML data and passes the XML back to the orchestration via the output parameter. The contents of the output parameter are assigned to the variable valid to the XML schema. The data JSON input document can now be used and mapped within the orchestration.

**Parent topic:** [Read JSON activity](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/read\\_json\\_map\\_output.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/read_json_map_output.html)

## Write JSON activity

---

The **Write JSON** activity takes a structure equivalent to JSON as input and outputs a string in the JSON format containing the data held in the complex variable. This string can then be written to a file or posted using HTTP.

### About this task

---

The JSON string is returned as an output parameter. (This is only applicable if you use a schema). The orchestration data must come from a complex variable which is indicated by the XML icon on the Variables tab. You configure the activity by pasting a JSON or XML sample message (available in the JSON/REST API documentation) in the Configure panel. This generates a compatible input structure for mapping the input data, which is then converted to a JSON message.

To add a **Write JSON** activity to an orchestration:

### Procedure

---

1. Create or open an orchestration. For more information, see [Building an orchestration](#). A graphical representation of the orchestration is displayed.
  2. Select the **Activities** tab and expand the **Transform** folder.
  3. Drag the **Write JSON** activity onto the orchestration.
  4. Select the **Write JSON** activity and configure it as described in [Write JSON activity configuration](#).
- [Write JSON activity configuration](#)  
During this procedure, you apply a sample JSON or XML message to the Write JSON input parameter. If you prefer, you can also use a schema for this task.
  - [Write JSON map inputs](#)  
You can map data from variables in the orchestration to the InputJSON parameter defined by the XML schema specified in the Configure task or use sample JSON/REST XML and the Configure panel to generate the input structure.
  - [Write JSON map output](#)  
You can map the JSONText output parameter that contains the JSON data to a string variable.

[Write JSON map output](#)

**Related tasks:**

[Write JSON activity configuration](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write\\_json\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write_json_Activity.html)

## Write JSON activity configuration

---

During this procedure, you apply a sample JSON or XML message to the Write JSON input parameter. If you prefer, you can also use a schema for this task.

### About this task

---

Note: Because not all JSON messages contain a root node, Studio, by default, adds a virtual root element to all JSON messages during a write JSON activity. (Virtual nodes facilitate handling of rootless messages in Studio). To determine if a root node is present, view the message in the Configure panel. If the message does not contain a root element, Studio will automatically generate one during the write JSON activity and display it in the root element file. To remove the root element, delete it from the Configure panel so the output message matches the required structure.

### Procedure

---

1. Click Configure from the Checklist. The Configure window is displayed.
2. In the Configure window, you can either use an XML Schema or JSON or XML message to generate map.
  - a. If you are specifying an XML schema to apply to the Write JSON input parameter, do the following:  
In the Select XML Schema field, click the Select XML Schema button to browse and select XML schema. Select the XML schema to parse during run time and click OK.
  - b. If you want to use the JSON or XML message, copy the JSON or XML message into the Use JSON or XML message to generate the output schema text area.
3. Choose a Virtual Root Configuration.
  - a. When you use JSON or XML message to generate map, if more than one element present in JSON, then by default, Remove root Element is checked automatically.
  - b. When you use XML Schema to generate map, Remove root Element is not checked by default.

Note: If the Remove Root Element is checked, the first root element is skipped and the JSON text is created properly with the remaining elements. You can specify a Root Element Name. However if the Remove Root Element is not checked, then for all the complex types will not get the root element names and hence will be displayed as null.
4. Specify how the data defined by the OutputJSON output parameter is to be encoded:
  - a. Select the **Data is text-Needs no decoding or encoding** option if the data is text and does not require encoding.
  - b. Select the **Encode data using encoding type** option if outgoing data is binary data that requires encoding using the specified encoding type.
5. Set the encoding type using one of the following options:
  - a. From the Encode data using encoding type list, select one of the default encoding types.
  - b. Click directly in the Encode data using encoding type field and enter your encoding type.
  - c. Click OK.
6. Click Generate Map.

## Write JSON map inputs

---

You can map data from variables in the orchestration to the InputJSON parameter defined by the XML schema specified in the Configure task or use sample JSON/REST XML and the Configure panel to generate the input structure.

### About this task

---

The Encoding input parameter is optional and you are not required to map it. If the Encoding input parameter is not listed in the **To Activity** pane of the Map Inputs pane, select **Map > Show Optional Parameters** from the toolbar menu or right-click in the **To Activity** pane and select the **Show Optional Parameters** option. If the **Map > Show Optional Parameters** option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The Encoding input parameter specifies how outgoing data should be encoded for this procedure.

### Procedure

---

1. If no decoding is required, specify the string: **text**.
2. If encoding is required, specify the encoding type to be used to encode the outgoing data, for example: UTF-8, US-ASCII, ISO-8859-1, EBCDIC-XML-US, or SHIFT\_JIS.

### Example

---

Optionally, you can override the Encoding setting you specified in the **Configure** task of the **Checklist** dynamically during run time using the Encoding input parameter. For example, if you set the Encoding to UTF-8 in the **Configure** task but during run time you passed in the Encoding setting of **Shift\_JIS**. The Encoding setting specified dynamically during run time overrides the original setting specified in the **Configure** pane. In this example, the Encoding is set to **Shift\_JIS**. There is one exception to the dynamic overriding behavior: if the **Data is text-Needs no decoding or encoding** option is selected in the **Configure** task, the Encoding that is dynamically set during run time is ignored. See [Creating an orchestration](#) for more information.

### Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write\\_json\\_map\\_output.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write_json_map_output.html)

## Validate JSON activity

During run time, the **Validate JSON** activity determines if the input JSON or XML data is valid to the specified XML schema.

The **Validate JSON** activity has the following limitations:

- The **Validate JSON** activity only supports the validation of the selected root element of an XML schema. The validation of XML schema fragments is not supported. If the XML schema contains more than one root (or global element), you must select one of the root elements.
- The **Validate JSON** activity does not support the validation of JSON or XML data against a DTD.

Note: You must upload an XSD file (ends in the .xsd extension) that contains the XML schema into the project before configuring the **Validate JSON** activity. Upload the XML schema into the project that is used to validate the JSON data during run time.

The following table describes the result when an error or warning occurs when the **Validate JSON** activity is parsing JSON or XML data against an XML schema.

Table 1.

Error/Warning Type	Description	Example	Result
Fatal Error	Parsing of the JSON data fails because of a severe problem and the parsing cannot continue. For example, the JSON or XML data is not valid to the XML schema.	The JSON or XML data is not valid to the XML schema. For example, the XML schema defines that there should be a root element called <d> but the JSON or XML data contains the root element called <a>.	When a fatal error occurs, the current orchestration job stops processing— even the processing of the Validate JSON activity does not complete. In addition, the activities in the orchestration after the Validate JSON activity are not processed. The value returned from the Validate JSON activity for the success output parameter is false but since the activity never completes, nothing is returned.

Error/Warning Type	Description	Example	Result
Error (recoverable)	An error occurs during the parsing of JSON data but does not prevent parsing of the remaining data.	A JSON element in an integer but a string is provided as a value: <code>&lt;a&gt;&lt;count&gt;two&lt;/count&gt;&lt;/a&gt;</code>	If only recoverable errors or warnings occur during parsing, the processing of the Validate JSON activity completes and the activities in the orchestration after the Validate JSON activity are processed. The value of false is returned from the success output parameter.
Warning	A warning occurs during the parsing of JSON data but does not prevent parsing of the remaining data		If only warnings occur during parsing, the processing of the Validate JSON activity completes and the activities in the orchestration after the Validate JSON activity are processed. The value of true is returned from the success output parameter.

# Adding a Validate JSON activity to an orchestration

---

Perform the steps in this section to add a **Validate JSON** activity to an orchestration.

## Procedure

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the **Activities** tab and expand the **Transform** folder.

3. Drag the Validate JSON activity onto the orchestration.
4. Select the Validate JSON activity.

Parent topic: [Validate JSON activity](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add\\_Validate\\_JSON\\_Activity\\_to\\_Orchestration.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Add_Validate_JSON_Activity_to_Orchestration.html)

## Configuring a Validate JSON activity

---

Perform the steps in this section to configure a **Validate JSON** activity.

### Procedure

---

1. Click **Configure** from the **Checklist**. The Configure window is displayed.
2. In the **XML Schema** field, click **Browse**. The **Browse For Schema Type Element** dialog box displays. Select the XML schema to parse against during run time. You must select a root or global element and not a schema fragment. The selected XML schema defines the nodes that make up the **InputJSON** input parameter in the Map Inputs task.
3. Select or clear the **Continue Parsing JSON Data after First Recoverable Error** check box. (This check box defines the run-time behavior when a recoverable error occurs).

### Results

---

If the **Continue Parsing JSON Data after First Recoverable Error** check box is selected and only recoverable errors and warnings occur but no fatal errors, processing of the **Validate JSON** activity completes after the first recoverable error and the value **false** is returned from the success output parameter. Only the first error is returned in the **errors** output parameter. The activities in the orchestration after the **Validate JSON** activity are processed.

If the **Continue Parsing JSON Data after First Recoverable Error** check box is cleared and only recoverable errors and warnings occur but no fatal errors, the processing of the **Validate JSON** activity processes all the recoverable errors and the value **false** is returned from the **success** output parameter. Messages about all the recoverable errors are returned in the repeating **Message** node of the **errors** output parameter. The activities in the orchestration after the **Validate JSON** activity are processed.

## Mapping the output to an activity - Validate JSON

---

Do the steps in this section to map the output to an activity for **Validate JSON**.

To map the output of the activity:

1. Select the **Map Outputs** task in the **Checklist**. The output parameters for the activity are displayed in the **From Activity** pane as described in the following table:

Table 1.

Output Node	Description
-------------	-------------

<b>O u t p u t N o d e</b>	<b>Description</b>
<b>s</b>	During run time, if the parsing was successful, the value of <b>true</b> is returned. If parsing was unsuccessful, the value of <b>false</b> is returned. If fatal errors occur during parsing, the value of <b>false</b> is returned. If recoverable errors occur during parsing, the value of <b>false</b> is returned. If only warnings occur during parsing, the value of <b>true</b> is returned. In addition, if no warnings or errors occur during parsing, the value of <b>true</b> is returned. Map from the <b>success</b> output parameter to a variable of type string. In XPATH expressions, compare the value of the string variable against the string values of <b>true</b> and <b>false</b> .
<b>e r r o r s / e r r o r T y p e</b>	The type of error/warning for the last error or warning that occurred during run time.
<b>e r r o r s / M e s s a g e</b>	A repeating structure that contains a string that describes each error and warning that occurred during run time. All parsing warnings, fatal errors, and recoverable errors are returned.

2. Map the desired output parameters to variable(s). See [Creating a Standalone Map](#) for general instructions on mapping. You are not required to map output parameters for this activity.

**Parent topic:** [Validate JSON activity](#)

## Read Flat File activity

---

The Read Flat File activity converts flat file data (non-XML data) to XML data by applying the specified Flat File Schema. XML data is returned from this activity as the output parameter.

### About this task

---

The input parameter of the Read Flat File activity expects flat file data. Flat file (non-XML) data includes comma-separated values (.csv) and other types of delimited files, as well as fixed-length text files that comprise many EDI systems. Flat File data can be obtained from various endpoint activities, such as the FTP Poll Directory activity, HTTP Receive Request activity, or Get Email activity.

For an example of using a Read Flat File activity in an orchestration, see *"Developing a Simple Project"* in the *Getting Started Guide*.

You must [create the Flat File Schema](#) before you can select a Flat File Schema in the Select a Flat File Schema field of the Configure task.

To add a Read Flat File activity to an orchestration:

### Procedure

---

1. Create or open an orchestration. For more information, see [Creating an orchestration](#). A graphical representation of the orchestration is displayed.
  2. Select the Activities tab and expand the Transform folder.
  3. Drag the Read Flat File activity onto the orchestration. Place it to the right of an endpoint activity from which the orchestration will obtain the flat file data (for example, an **FTP Poll Directory** activity).
  4. Select the Read Flat File activity and configure it as described in [Configuring a Flat File activity](#).
- [Read Flat File activity configuration](#)  
You can specify the Flat File Schema to apply to the Read Flat File input parameter.
  - [Read Flat File map inputs](#)  
You can map a string variable that contains the flat file data to the input parameter of the Read Flat File activity called Data.
  - [Read Flat File map outputs](#)  
You can map the Xml output parameter that contains the XML data (stored as a string) to a variable valid to the specified Flat File Schema.

**Parent topic:** [Transform Activities](#)

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Flat\\_File\\_to\\_XML\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Flat_File_to_XML_Activity.html)

## Read Flat File activity configuration

---

You can specify the Flat File Schema to apply to the Read Flat File input parameter.

### Before you begin

---

You must [create the Flat File Schema](#) before starting this task.

### About this task

---

To complete the Configure task:

### Procedure

---

1. In the Select a Flat File Schema field, click Browse... . The Project Explorer dialog box is displayed.
2. Select the appropriate Flat File Schema from the Flat File Schema folder and click OK.
3. Specify how to read the data passed into the Data input parameter during run time, by selecting one of the appropriate options:
  - a. Select the Data is text-Needs no decoding option, if the incoming data is text and does not need decoding.
  - b. Select the Decode data using encoding type option, if incoming data is binary data that needs to be decoded using the specified encoding type. Set the encoding type using one of the following options:
    - From the Decode data using encoding type list, select one of the default encoding types.
    - Enter your encoding type by clicking in the Decode data using encoding type field and typing in your encoding type.
4. Click OK.

**Parent topic:** [Read Flat File activity](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read\\_Flat\\_File\\_Activity\\_Configuration.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Read_Flat_File_Activity_Configuration.html)

## Read Flat File map inputs

---

You can map a string variable that contains the flat file data to the input parameter of the Read Flat File activity called Data.

## About this task

---

Data is an input parameter of type string or base64Binary. During run time the string variable must contain flat file data before the Read Flat File activity is run. For more information see the following Runtime Example.

The Encoding input parameter is optional. You are *not* required to map this input parameter. If the Encoding input parameter is not listed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click a node in the Map Inputs pane to make this option active.

The Encoding input parameter specifies how the incoming data is decoded when read:

## Procedure

---

- If no decoding is required, specify the string: `text`.
- If decoding is required, specify the encoding type that should be used to decode the incoming data. For example: `UTF-8`, `US-ASCII`, `ISO-8859-1`, `EBCDIC-XML-US`, or `SHIFT_JIS`.

## Example

---

Optionally, you can override the Encoding setting you specified in the Configure task of the Checklist dynamically during run time, using the Encoding input parameter. For example, if you set the Encoding to `UTF-8` in the Configure task but during run time you passed in the Encoding setting of `SHIFT_JIS`. The Encoding setting specified dynamically during run time overrides the original setting specified in the Configure pane. In this example, the Encoding would be set to `SHIFT_JIS`. There is one exception to the dynamic overriding behavior if the Data is text-Needs no decoding or encoding option is selected in the Configure task, the Encoding dynamically set during run time is ignored and no decoding occurs.

See [Creating a map](#) for general instructions on mapping.

**Parent topic:** [Read Flat File activity](#)

---

## Read Flat File map outputs

---

You can map the Xml output parameter that contains the XML data (stored as a string) to a variable valid to the specified Flat File Schema.

## About this task

---

See [Creating a Map](#) for general instructions on mapping.

## Runtime Example

During run time, an orchestration could invoke the following sequence of activities:

## Procedure

---

1. A FTP Poll Directory activity assigns the contents of a flat file to a String variable called *flatFileRawContent*.
2. A Read Flat File activity assigns the contents of the *flatFileRawContent* variable to the string input parameter called Data.
3. The Read Flat File activity converts flat file data to XML data and passes the XML data back to the orchestration via the output parameter. The contents of the output parameter are assigned to the variable valid to the Flat File Schema.

## What to do next

---

For an example of using a Read Flat File activity in an orchestration, see "Developing a Simple Project" in the *Getting Started Guide*.

**Parent topic:** [Read Flat File activity](#)

---

## Write Flat File activity

---

The Write Flat File activity converts data from an orchestration into flat file data (non-XML data) that is valid to the specified Flat File Schema.

## About this task

---

The flat file data is returned as a string output parameter. The data from the orchestration can come from multiple variables of different types. For example, the data from the orchestration could contain two sets of XML data valid to two different XML Schemas and a string.

Flat file (non-XML) data includes comma-separated values (.csv) and other types of delimited files, as well as fixed-length text files that comprise many EDI systems.

You must create the Flat File Schema before you can select a Flat File Schema in the Select a Flat File Schema field of the Configure task. See [Creating a flat file schema](#) for more information.

To add a Write Flat File activity to an orchestration:

## Procedure

---

1. Create or open an orchestration. For more information, see [Creating an orchestration](#). A graphical representation of the orchestration is displayed.
  2. Select the Activities tab and expand the Transform folder.
  3. Drag the Write Flat File activity onto the orchestration
  4. Select the Write Flat File activity and configure it as described in [Write Flat File activity configuration](#).
- [Write Flat File activity configuration](#)  
You can specify the Flat File Schema that must be applied to the outbound data.
  - [Write Flat File map inputs and outputs](#)  
You can map the data from variables of the orchestration to the Xml input parameter defined by the Flat File Schema specified in Configure task.

**Parent topic:** [Transform Activities](#)

---

## Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/XML\\_to\\_Flat\\_File\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/XML_to_Flat_File_Activity.html)

# Write Flat File activity configuration

---

You can specify the Flat File Schema that must be applied to the outbound data.

## Before you begin

---

You must first [create the Flat File Schema](#) before starting this task.

## About this task

---

You can specify the Flat File Schema to apply to the input parameter. To complete the Configure task:

## Procedure

---

1. In the Select a Flat File Schema field, click Browse.... The Project Explorer dialog box is displayed.
2. Select the appropriate Flat File Schema from the Flat File Schema folder and click OK.
3. Specify how to write the data returned by the Data output parameter during run time, by selecting one of the appropriate options:
  - a. Select the Data is text-Needs no decoding or encoding option, if the outgoing data is text and therefore does not require encoding.
  - b. Select the Decode or encode data using encoding type option, if outgoing data is binary data that requires encoding using the specified encoding type. Set the encoding type using one of the following options:
    - From the Decode or encode data using encoding type list, select one of the default encoding types.
    - Click directly in the Decode or encode data using encoding type field and enter your encoding type.
4. Click OK.

**Parent topic:** [Write Flat File activity](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write\\_Flat\\_File\\_Activity\\_Configuration.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Write_Flat_File_Activity_Configuration.html)

## Write Flat File map inputs and outputs

---

You can map the data from variables of the orchestration to the Xml input parameter defined by the Flat File Schema specified in Configure task.

### About this task

---

The Encoding input parameter is optional. You are not required to map this input parameter. If the Encoding input parameter is not listed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active.

The Encoding input parameter specifies how outgoing data should be encoded:

### Procedure

---

- If no encoding is required, specify the string: `text`.
- If encoding is required, specify the encoding type that should be used to encode the outgoing data, for example: `UTF-8`, `US-ASCII`, `ISO-8859-1`, `EBCDIC-XML-US`, or `SHIFT_JIS`.

### Example

---

Optionally, you can override the Encoding setting you specified in the Configure task of the Checklist dynamically during run time, using the Encoding input parameter. For example, if you set the Encoding to `UTF-8` in the Configure task but during run time you passed in the Encoding setting of `SHIFT_JIS`. The Encoding setting specified dynamically during run time overrides the original setting specified in the Configure pane. In this example, the Encoding would be set to `SHIFT_JIS`. There is one exception to the dynamic overriding behavior, if the Data is text-Needs no decoding or encoding option is selected in the Configure task, the Encoding dynamically set during run time is ignored.

See [Creating a map](#) for general instructions on mapping.

**Parent topic:** [Write Flat File activity](#)

## Write Flat File map outputs

---

You can map the Data output parameter that contains the flat file data to a string variable.

### About this task

See [Creating a Map](#) for general instructions on mapping.

---

## Apply XSLT activity

---

You can use the Apply XSLT activity to transform XML data, stored in one XML variable, to XML data, stored in another XML variable, using the specified XSLT stylesheet.

### About this task

---

The Apply XSLT activity transforms XML data, stored in one XML variable, to XML data, stored in another XML variable, using the specified XSLT stylesheet. The XSLT stylesheet is created outside of Studio.

For example, if you have a XSLT stylesheet that converts XML data, valid to one XML Schema, to XML data, valid to a second XML Schema, you can create an Apply XSLT activity that calls this XSLT stylesheet to do this conversion in your orchestration during run time.

To create an Apply XSLT activity:

### Procedure

---

1. **Upload** the XSLT stylesheet into the project.
2. **Upload** the XML Schemas or DTD files that define the input and output XML variables.
3. **Create** the following two XML variables:
  - o a variable to hold the input XML data based on a XML Schema or DTD.
  - o a variable to hold the output XML data based on a different XML Schema or DTD.
4. Add the Apply XSLT activity to your orchestration:
  - a. **Create** or open an orchestration. A graphical representation of the orchestration is displayed.
  - b. Select the Activities tab and expand the Transform folder.
  - c. Drag the Apply XSLT activity onto the orchestration
5. Configure the Apply XSLT activity:
  - a. In the Pick Stylesheet task, for the Stylesheet field click Browse. The Project Explorer is displayed.
  - b. Select the appropriate stylesheet and click OK. The stylesheet is displayed.
  - c. In the Checklist, select Set Input & Output.
  - d. In the Input pane, select Browse. The Select Variable pane is displayed.
  - e. Select a variable and click OK.
  - f. In the Output pane, select Browse. The Select Variable pane is displayed.
  - g. Select a variable and click OK.

**Parent topic:** [Transform Activities](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Custom\\_XSLT\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Custom_XSLT_Activity.html)

## Logic Activities

---

- [Logic activities overview](#)  
Logic activities control the flow of an orchestration.
- [Terminate activity](#)  
The Terminate activity stops all further orchestration job processing in the current branch.
- [Pick activity](#)  
The Pick activity determines what starter activity to launch based on the action that has occurred during run time.
- [If..Then activity](#)  
The If..Then activity tests the Where expression in the If branches to determine what branch of the If..Then activity to run.
- [Try activity](#)  
The Try... activity attempts to run the activity or activities in the main Try branch.
- [Group activity](#)  
Use this activity to group a set of activities in an orchestration. As a group, you can name, add comments, and collapse the block of activities as one entity.
- [While Loop activity](#)  
The While Loop activity initiates and continually processes any associated activities for as long as the specified condition evaluates to true.
- [For Each activity](#)  
The For Each activity iterates through recurring elements of a variable, performing other activities during each iteration cycle.
- [Split activity](#)  
The Split activity is a variation of the For Each activity that can be used to break up very large messages to improve performance.
- [Break Loop activity](#)  
During run time, when a Break Loop activity is processed, the processing flow breaks out of the current looping activity and continues to the next activity in the orchestration.
- [Continue activity](#)  
The Continue activity jumps to the next item to process in the loop and is typically placed after an If or an If..Then activity.
- [Adding branches to the If..Then activity](#)  
The If..Then activity supports multiple branches to handle different conditions.
- [Moving branches](#)  
You can change the position of a branch within an If..Then activity or a Pick activity.
- [Defining conditions](#)  
You can specify conditions in If..Then and While Loop activities to define a criteria that must be met before the orchestration continues with that branch.
- [Basic condition syntax](#)  
There are various types of conditions that you can use to evaluate an XPath expression.
- [bpws:getVariableData function](#)  
Use the bpws:getVariableData function to create conditions to access variable data.
- [Basic XPath expressions](#)  
XPath expressions are used in orchestrations and flat file schema definitions when you need to identify

one or more nodes in a message or variable in order to access data or determine whether a condition has been met.

- [Testing XPath expressions](#)

Use the XPath Evaluator to test XPath expressions against test XML documents.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_logicactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_logicactivities.html)

## Logic activities overview

---

Logic activities control the flow of a orchestration.

Logic activities provide the functionality described in the following table:

<b>Acti vity</b>	<b>Description</b>
<a href="#">Break Loop</a>	Breaks out of a For Each, Split, or While Loop activity.
<a href="#">Cont inue</a>	Jumps to the next item to process in a For Each, Split, or While Loop activity.
<a href="#">For Eac h</a>	Iterates through repeating nodes of a variable, performing one or more activities during each iteration cycle.
<a href="#">If..T hen</a>	Routes messages based on conditions to different branches.
<a href="#">Pick</a>	Receives messages from one or more activities and selects one of them to start an orchestration.
<a href="#">Split acti vity</a>	Iterates through repeating sections of a variable, performing one or more activities during each iteration cycle. The Split activity is a variation of the For Each activity that can be used to break up very large messages to improve performance.
<a href="#">Ter min ate</a>	Stops all further processing of the current orchestration job.
<a href="#">Try acti vity. ..</a>	Attempts to run the activity or activities in the main Try branch. If any exception occurs when running the activity or activities in the main Try branch, the CatchAll branch is run.

Activity	Description
While Loop	Initiates and continually processes any children activities for as long as a specified condition is true.

**Parent topic:** [Logic Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

## Terminate activity

---

The Terminate activity stops all further orchestration job processing in the current branch.

### About this task

---

This activity is commonly used in the If and Else branches of an If..Then activity to stop orchestration processing after an error occurs.

**Parent topic:** [Logic Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_Terminate\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Terminate_Activity.html)

## Pick activity

---

The Pick activity determines what starter activity to launch based on the action that has occurred during run time.

### About this task

---

For example, a Pick activity could contain three branches, one that contains a Get Inserted Rows activity, one that contains a Get Deleted Rows activity, and the other that contains a Get Updated Rows activity. If an update event occurs on the database, an instance of the orchestration is created and branch that contains the Get Updated Rows activity is called.

When you add a Pick activity to an orchestration, two Receive branches are automatically added. You can add additional receiveEvent nodes to the Pick activity. A Pick activity is always a starter activity and in each branch of a Pick activity the first activity must be a starter activity.

The Receive branch contains a receiveEvent node and an empty placeholder. Each message is defined in a Receive branch that can contain other activities to handle that specific message.

Delete Receive branches if you do not want a receive operation to be a part of the Pick activity. Deleting the Receive node removes the entire Receive branch.

Attention: If a variable is not initialized in every branch of a Pick activity, the variable cannot be used outside the scope of a Pick activity. Attempting to use a variable outside the Pick activity that is not initialized in every branch results in an invalid orchestration. For example, a Pick activity has two branches, one that contains a Get Updated Rows activity and one that contains a Get Inserted Rows activity. The Get Updated Rows activity returns the data to a variable named updateResult while the Get Updated Rows activity returns the data to a variable named insertResult. These variables can only be used within the Pick activity and cannot be used in the activities that follow after the Pick activity in the orchestration. If the output of each activity is based on the same schema, you can however define one variable that both activities initialize. If all branches in a Pick activity initialize the variable, the scope of the variable includes all activities after the Pick activity and is not limited to the scope of the Pick activity.

To use a Pick activity complete the following steps:

## Procedure

---

1. Drag the Pick activity from the Logic folder in the Activities tab onto the orchestration.
2. Select an inbound activity or the Schedule Job activity and drag it onto the receiveEvent placeholder.
3. To add an activity to the branch, drag the activity onto the empty placeholder.

## Adding, editing, or deleting condition branches

---

The Pick activity can have several branches to process complex conditions

### To add a branch to the Pick activity:

1. Click the Pick node.
2. Select Add Receive Branch from the list.

### To edit a branch or activity name complete the following steps:

1. Select an activity or branch.
2. Select Edit from the list. The name is displayed in a box.
3. Select the current name, then enter the new one.
4. Press Enter.

### To delete an activity or branch complete the following steps:

1. Select an activity or branch.
2. Select Delete from the list.

Note: If you delete a condition branch, all activities within the condition branch are also deleted.

Parent topic: [Logic Activities](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_Pick\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Pick_Activity.html)

## If..Then activity

---

The If..Then activity tests the Where expression in the If branches to determine what branch of the If..Then activity to run.

### About this task

By default, each If..Then activity includes an If branch and an Else branch. You can [add if additional branches](#) to an If..Then activity.

When the Where expression in the If branch is equal to true, processing proceeds down that If branch of the orchestration. If an If..Then activity contains multiple If branches, the Where expressions in the If branches are tested in sequential order. When none of the Where expressions in the If branches are satisfied, processing proceeds down the Else branch.

You also have the option of [copying a branch](#) or [Else](#) branch from another If..Then activity.

To use an If..Then activity complete the following steps:

### Procedure

1. Open the Activities tab and the Logic folder.
2. Drag the If..Then activity onto the orchestration.
3. Add more If branches as required.
4. Configure the If and Else branches.

## Configure an IF branch

---

1. Select the If branch. The Expression Builder opens.
2. [Define conditions](#) for the branch.
3. Drag an activity from the Activities tab onto the empty placeholder.

## Configuring an Else branch

---

1. Drag an activity from the Activities tab onto the empty placeholder.

## Copying and pasting If nodes

---

1. Click the If branch and select Copy from the list.
2. Click on the If..Then activity in the orchestration and select Paste from the list.  
Note: If and Else branches cannot be pasted outside of an If..Then activity. You cannot replace an If branch with an Else branch.

## Copying and pasting Else nodes

---

Else branches can be pasted into a If..Then activity only if the If..Then activity does not already contain an Else branch.

1. Click the Else branch and select Copy from the list.
2. Click the If..Then activity and select Paste from the list.

## Adding branches

---

1. Click the If..Then activity and select Add If.
2. [Define the conditions](#) and the activities for the branch.

## Editing an activity or branch

---

1. Select the activity or branch to edit existing properties.
2. Select Edit from the list.

## Deleting an activity or branch

---

1. Select the activity or branch to edit existing properties.
2. Select Delete from the list.

Note: If you delete a condition branch, all activities within the condition branch are also deleted.

**Parent topic:** [Logic Activities](#)

---

### Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_Switch\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Switch_Activity.html)

## Try activity

---

The Try... activity attempts to run the activity or activities in the main Try branch.

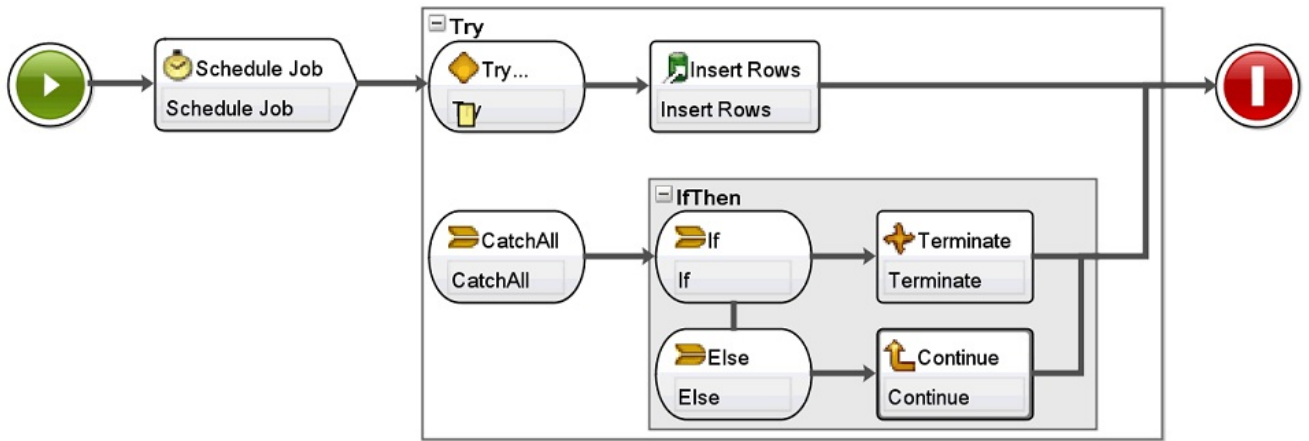

### About this task

---

If any exception occurs while running the activity or activities in the main Try branch, the CatchAll branch is run.

Right-clicking the mouse on the background creates a new CatchAll branch.

For example, the main Try branch can call the Database Insert Rows activity as shown in the following figure:

If the Database Insert Rows activity fails and throws an exception, the activity or activities in the CatchAll branch are run. In this example orchestration, when an exception is thrown by the Database Insert Rows activity, the Terminate activity runs thus terminating the current orchestration job.

**To add and configure a Try... activity, complete the following steps:**

## Procedure

1. Open the Activities tab and the Logic folder.
2. Drag the Try... activity onto the orchestration. The Try... activity is displayed with the following branches:
  - o Try... branch
  - o CatchAll branch

When the first CatchAll branch is created, the following variables are automatically created:

- o **faultName** - During run time, the faultName variable contains the name of the exception thrown by an activity in the Try branch.
- o **faultData** - During run time, the faultData variable contains the error message associated with the exception. This additional information is only currently returned for the Web Services activities. For Web Services activities, the faultData variable contains the fault.
- o **faultInfo** - During run time, the faultInfo variable returns the following nodes:
  - **name** - During run time, the faultInfo/name node contains the name of the exception thrown by the activity in the Try branch. The faultInfo/name node is a xsd:QName type.
  - **message** - During run time, the faultInfo/message node contains the error message associated with the exception. The faultInfo/message node is a xsd:string type.
  - **activityId** - During run time, the faultInfo/activityId node contains the activity ID that uniquely identifies the activity where the exception occurred. The faultInfo/activityId node is a xsd:int type.
  - **activityName** - During run time, the faultInfo/activityName node contains the activity name where the exception occurred. The faultInfo/activityName node is a xsd:string type.
  - **faultTime** - During run time, the faultInfo/faultTime node contains the time the error occurred. The faultInfo/faultTime node is a xsd:dateTime type.

Note: The exception name returned by an activity in the faultName variable and the faultInfo/name node might change in a future release.

3. Configure the Try... and CatchAll branches by dropping activities from the Activities tab to the branches of the Try... activity as shown in the preceding and following figures.

Attention: The scope of the faultName, faultData, and faultInfo variables is limited to the CatchAll branch of the Try... activity. This scope limitation means that the value of these variables is only guaranteed to be valid within the CatchAll branch. For example, if you add an If...Then activity that tests the value of the faultName variable, the If...Then activity must be placed inside the CatchAll branch of the Try... activity as shown in the following figure:

## Group activity

---

Use this activity to group a set of activities in an orchestration. As a group, you can name, add comments, and collapse the block of activities as one entity.

### About this task

---

When you add a CatchAll branch to the group, the CatchAll branch runs as an exception occurs in the group of activities.

To use the Group activity complete the following steps:

### Procedure

---

1. In the Studio toolbox, click the Activities tab.
2. Expand the Logic directory.
3. Drag the Group activity onto the orchestration.
4. Optional: Add a CatchAll branch.
  - a. Right-click the Group activity. An option menu opens.
  - b. Select Add CatchAll Branch. The CatchAll branch is displayed in the Group activity.

## While Loop activity

---

The While Loop activity initiates and continually processes any associated activities for as long as the specified condition evaluates to true.

### About this task

---

To define a While Loop activity complete the following steps:

### Procedure

---

1. Drag a While Loop activity from the Logic folder of the Activities tab onto the orchestration. The [Expression Builder](#) is displayed.
2. Use the Expression Builder to [define conditions](#) in the While Loop activity. You must define a condition that evaluates to false to ensure that the loop ends. The variables needed to iterate through the conditions you specify are automatically created.
3. Drag an activity from the Activities tab onto the empty placeholder inside of the While Loop activity, typically, For Each, While Loop, or Split. Use the Break Loop or Continue activities to control iterations in these activities

**Parent topic:** [Logic Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_While\\_Loop\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_While_Loop_Activity.html)

## For Each activity

---

The For Each activity iterates through recurring elements of a variable, performing other activities during each iteration cycle.

### About this task

---

When you drop a For Each activity onto an orchestration, Studio creates the following two variables:

- loopvalue\_X - During run time, as the For Each activity loops through a set of recurring elements, the loopvalue\_X variable contains the value of the current element.
- loopcounter\_X - During run time, as the For Each activity loops through a set of recurring elements, the loopcounter\_X variable contains the current count of the number of iteration cycles that have been processed by the For Each activity.

Where X is equal to the number of For Each activities that have been dropped on the orchestration. For example, when the first For Each activity is dropped on an orchestration, the variables called loopvalue\_1 and loopcounter\_1 are created.

Attention: Do not use the loopvalue\_X and loopcounter\_X variables outside of the For Each activity. The scope of these variables are limited to the For Each activity.

To use a For Each activity complete the following steps:

## Procedure

---

1. Open the Activities tab and the Logic folder.
2. Drag the For Each activity onto the orchestration.
3. In the Variable Name field, select a variable containing the recurring element that you want to loop through in the For Each activity.
4. In the Element Name field click [...] to browse for the recurring element that you want to loop through in the For Each activity. The Select Recurring Element window is displayed.
5. Select a recurring element and click OK.

## Results

---

An [XPath expression](#) that refers to the recurring element is displayed in the Element Name field. The Variable Name field is automatically populated with the loopvalue\_X variable created for this For Each activity. You can edit the generated XPath expression in the Element Name field.

You can add other activities within the For Each loop. Use the Break Loop and Continue activities to control iterations of the For Each loop.

**Parent topic:** [Logic Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_For\\_Each\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_For_Each_Activity.html)

## Break Loop activity

---

During run time, when a Break Loop activity is processed, the processing flow breaks out of the current looping activity and continues to the next activity in the orchestration

### About this task

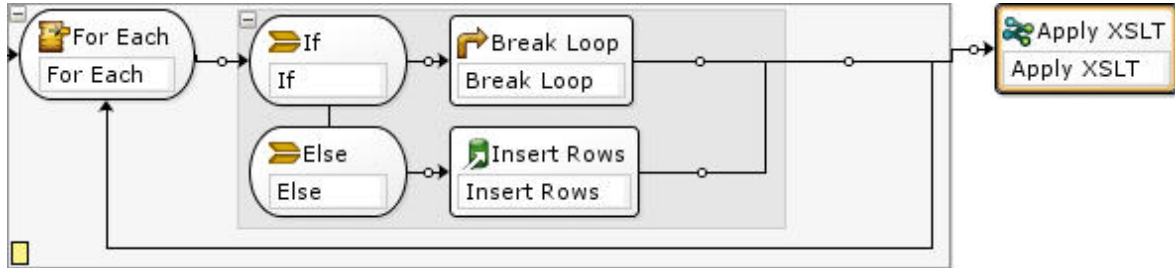

The Break Loop activity can only be used in any of the following looping activities: For Each, Split, and While Loop, as shown in the following examples.

To use a Break activity:

### Procedure

1. Open the Activities tab and the Logic folder.
2. Drag a For Each, Split, or While Loop activity onto the orchestration.
3. Drop the Break Loop activity into the looping activity, as shown in the following example:
  - o To break out of a loop when a condition is true, see Example 1.
  - o To break out of a loop after a single iteration, see Example 2.

## Example 1 - Break out of a loop when a condition is true

1. Drag an If..Then activity into the looping activity you set up, as shown in the preceding figure.
2. Drag an action activity (for example: the Insert Rows activity) onto the empty placeholder to the right of the Else node.
3. Configure the action activity.
4. Click the If node and enter a condition in the Expression Builder.
5. Drag a Break Loop activity onto the empty placeholder to the right of the If node.

### At run time:

- If the condition in the If activity evaluates to true, the Break Loop exits out of the looping activity.
- If the condition in the If activity evaluates to false, the Else branch is started and the action activity (for example: the Insert Rows activity) is run.

## Example 2 - Break out of a loop after a single iteration runs

1. Drag an action activity (for example, the Insert Rows activity) onto the empty placeholder inside of the looping activity you selected.
2. Configure the action activity.
3. Drag a Break Loop activity onto the empty placeholder inside of the looping activity.

### At run time:

- The action activity (for example: the Insert Rows activity) runs only once before the Break Loop exits out of the looping activity.

[Feedback](#) | [Notices](#)

Last updated: Wednesday, 15 June 2016

## Continue activity

---

The Continue activity jumps to the next item to process in the loop and is typically placed after an If or an If..Then activity.

### About this task

---

The Continue activity can only be used inside one of the following looping activities: For Each, Split, and While Loop activities.

To use a Continue activity complete the following steps:

### Procedure

---

1. Open the Activities tab and the Logic folder.
2. Drag a For Each, Split, or While Loop activity onto the orchestration.
3. Set up the looping activity to continue processing as shown in the following example.

Example - Continue processing when a condition is true

- a. Drag an If..Then activity into the looping activity you set up in step 1.
- b. Drag an action activity (for example: an Insert Rows activity) onto the empty placeholder to the right of the If node.
- c. Configure the action activity.
- d. Click the If node and enter a condition in the [Expression Builder](#).
- e. Drag a Continue activity onto the empty placeholder to the right of the Else node.

#### At Run Time:

- o If the condition in the If evaluates to true, the action activity runs.
- o If the condition in the If evaluates to false, the Continue activity in the Else branch runs and jumps to the next item in the looping activity.

**Parent topic:** [Logic Activities](#)

---

## Adding branches to the If..Then activity

---

The If..Then activity supports multiple branches to handle different conditions.

### About this task

---

To add additional If and Else branches complete the following steps:

## Procedure

---

1. Select the If..Then activity in the orchestration
2. Right-click and select one of these options:
  - o Add If – to add another branch with a condition.
  - o Add Else – to add a final, catch-all branch to use when a message does not match any of the conditions in the If statements. (This option is only available if there is no Else branch displayed.)
  - o Double-click the If icon and enter a name for the branch.
  - o Use the Expression Builder to [define the conditions](#) for the branch.

**Parent topic:** [Logic Activities](#)

## Moving branches

---

You can change the position of a branch within an If..Then activity or a Pick activity.

### About this task

---

To move a branch within an If..Then activity or a Pick activity complete the following steps:

## Procedure

---

1. Select the branch you want to move. For an If..Then activity, select one of the If nodes; for a Pick activity, select one of the receiveEvent nodes.
2. To move the branch use one of the following actions:
  - o Select Orchestration > Go Up or Orchestration > Go Down from the toolbar menu.
  - o Right-click the branch and select Go Up or Go Down from the list.

**Parent topic:** [Logic Activities](#)

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_Moving\\_Branches.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Moving_Branches.html)

# Defining conditions

---

You can specify conditions in If..Then and While Loop activities to define a criteria that must be met before the orchestration continues with that branch.

In most cases, conditions test the value of data in a message or in other variables defined within the orchestration. Use the Expression Builder to define conditions.

## Expression Builder

---

The Expression Builder is used to define conditions for If..Then and While Loop activities. It is displayed beneath the orchestration, in the Property pane, when you select an If..Then or While Loop activity in the orchestration.

These conditions are boolean expressions that describe the criteria against which the Integration Appliance compares a message. During runtime, the result of this comparison determines the execution path through the orchestration. For a complete list of operators that you can use in the Expression Builder, see [Valid Operators for Conditions](#). For more information about the order precedence of the conditions in the Expression Builder, see <http://www.w3.org/TR/xpath#booleans>.

The Expression Builder allows you to add, delete, and edit conditions as well as change their processing order.

To add a condition:

1. Click Add. A new condition displays beneath the existing list of conditions.
2. To or the new condition with the previous condition in the link, right-click and select or from the list.

To delete a condition:

- Select the condition, then click Delete.

To edit a condition:

- Select any field in the Expression Builder and make your edits. If the Expression Builder is not displayed, click Use Builder. You can edit left-hand expressions, select operators, and right-hand expressions.

-OR-

- Click Advanced to directly edit XPath expression that defines the condition. For more information, see [Basic Condition Syntax](#), [Basic XPath Expressions](#), and [bpws:getVariableData Function](#)

Note: Use the XPath Evaluator to [test XPath expressions](#).

To change the processing order of the conditions:

- Select a condition in the Expression Builder and click the up or down arrows.

**Parent topic:** [Logic Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

## Basic condition syntax

---

There are various types of conditions that you can use to evaluate an XPath expression.

The most common operator used to evaluate an expression is = (equals), but you can use any valid XPath operator. See [Basic XPath Expressions](#) for a list of valid XPath operators.

The following examples demonstrate how to use various conditions to evaluate an XPath expression.

### Example 1: Using string literals

---

String literals must be enclosed in quotation marks as shown in this example:

```
bpws:getVariableData('PatientInfo')/PV1/Department = 'ICU'
```

### Example 2: Accessing variable data

---

Use the [bpws:getVariableData function](#) to access variable data

#### Using string literals in the `getVariableData` function:

The following example evaluates string nodes from two variables. The variable names in the `bpws:getVariableData` function are string literals.

```
bpws:getVariableData('PatientInfo')/PV1/Department =  
bpws:getVariableData('Orders')/PID/PtDept
```

#### Using numeric literals in the `getVariableData` function:

To evaluate numeric literals you must cast either one or both sides of the expression. For example:

```
number(bpws:getVariableData('PatientInfo')/PV1/Department) =  
bpws:getVariableData('Orders')/PID/PtDept
```

- OR -

```
number(bpws:getVariableData('PatientInfo')/PV1/Department) =  
number(bpws:getVariableData('Orders')/PID/PtDept)
```

### Example 3: Numeric literals

---

Numeric literals do not require quotation marks. Placing quotes around a numeric literal transforms it into a string literal.

#### Valid numeric expression example:

```
number(bpws:getVariableData('PurchaseOrder')/PurchaseOrder/POTotal) >= 5000.00
```

#### Invalid numeric expression example:

```
number(bpws:getVariableData('PurchaseOrder')/PurchaseOrder/POTotal) >= '5000.00'
```

**Parent topic:** [Logic Activities](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Basic\\_Condition\\_Syntax.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Basic_Condition_Syntax.html)

## bpws:getVariableData function

---

Use the bpws:getVariableData function to create conditions to access variable data.

It can be combined with an XPath expression identifying specific nodes within the variable.

For example:

- To access the data in the POTotal node in a variable named PurchaseOrder, you would enter:  
`bpws:getVariableData('PurchaseOrder')/PurchaseOrder/POTotal`
- To access the data in a primitive variable named ItemCount, enter:  
`bpws:getVariableData('ItemCount')`

**Parent topic:** [Logic Activities](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_bpws\\_getVariableData\\_Function.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_bpws_getVariableData_Function.html)

## Basic XPath expressions

---

XPath expressions are used in orchestrations and flat file schema definitions when you need to identify one or more nodes in a message or variable in order to access data or determine whether a condition has been met.

XPath is an XML standard that defines a grammar to identify nodes or sets of nodes (called node sets) in XML documents.

You can edit the default XPath expressions, generated in the following panes:

- In the Configure panes of the [For Each](#) and [Split activity](#) activities, an XPath expression is generated to define the recurring element. You can edit the default XPath expression displayed in the Element Name field.
- In the Configure panes of the [While Loop](#) and [If..Then](#) activities, an XPath expression is generated in the Expression Builder to define the conditions. You can edit the default XPath expression displayed by clicking Advanced.

XPath 2.0 is supported.

## Selecting nodes by path

---

XPath describes the location of XML elements and attributes as a path similar to URLs or directories on your local file system. Each element or attribute is a node in a tree that begins with the root node. The root node contains the entire tree, so any node within the tree can be found by following a path down the branches.

The basic syntax is:

```
/root-node/child-node/.../final-element-node
```

```
/root-node/child-node/.../final-element-node/@attribute-node
```

You determine this path from the XML Schema that describes the messages.

XPath uses the @ symbol as a shorthand to identify attributes. Paths without @, or the attribute:: prefix, identify elements by default. For example:

```
/PackingSlip/PONumber/Item
```

identifies the Item element found inside PONumber in the PackingSlip root node.

## Node names and XML namespaces

---

Node names can also appear with namespaces, such as tns:OrderNumber or \*:Item. The portion of the name up to the colon is a prefix identifying a namespace and the colon is the delimiter between the namespace and the node's local name.

Namespaces are an XML standard used to uniquely identify elements or attributes when documents share content from several schemas. Cast Iron® Studio automatically assigns and manages namespaces for the XML Schemas used in configuration documents.

Note: Each schema within a WSDL definition can be defined by a namespace.

## Select nodes conditionally with predicates

---

You might occasionally want to select a node only if some condition is met. These selection conditions are known as predicates.

You define predicates inside brackets, such as:

```
/PV1/PatientDepartment[text()='Nursery']
```

This expression selects the PatientDepartment node only if the data in the node is Nursery.

```
/Order/OrderDetail/Item[5]
```

This expression selects the fifth Item node within OrderDetail.

## Valid operators for conditions

---

XPath expressions can also be boolean conditions that evaluate to true or false. These expressions can be used to select specific nodes or simply to identify a condition that must be met. You can use the [Expression Builder](#) to help you define conditions. XPath operators that can appear in expressions include:

- = equals
- != not equals
- < less than

- > greater than
- <= less than or equals
- >= greater than or equals

## Functions in XPath expressions

---

XPath also contains functions that allow you to manipulate data from nodes. This can be useful in building subject lines that contain some constant text plus dynamic data from messages. XPath functions can also be used to handle requirements such as trimming space or ensuring that a job key is a string datatype. Some of the common XPath functions include:

### concat()

you can combine any number of strings and the data from nodes in the order you specify the parameters. You can specify XPath paths as parameters. Specify constant text strings within quote marks. For example:

```
concat('New Order # ',/Orders/Order/OrdNumber)
```

### count()

you can count the number of nodes in the parameter you specify. Typically the parameter is an XPath path expression that identifies several nodes, such as all the Item nodes that are children of PODetail. For example:

```
count(/Orders/Order)
```

### normalize-space()

trims all leading and trailing space characters from the input parameter and also normalizes all space within the input to single space characters and single line feeds. For example:

```
normalize-space(/Job/Address/Line1)
```

### number()

converts the parameter to a number datatype. This function can be used to ensure that strings are treated as numbers. For example:

```
number(/PurchaseOrder/POTotal)
```

### string()

converts the parameter to a string datatype. This function can be used to ensure that numeric or date nodes are treated as strings. For example:

```
string(/PurchaseOrder/VendorID)
```

### translate()

replaces individual characters with other characters in the first parameter you specify. The second parameter is the character or characters to replace and the third parameter is the replacement characters. This function can be useful for ensuring that job keys are all uppercase, for example.

```
translate(/Issue/ShortDescr,  
'abcdefghijklmnopqrstuvwxyz',  
'ABCDEFGHIJKLMNOPQRSTUVWXYZ')
```

For a complete list of XPath functions, see the XPath Specification ( <http://www.w3.org/TR/xpath>).

## Testing XPath expressions

---

You can [test your XPath Expressions](#) against XML test data using the XPath Evaluator.

**Parent topic:** [Logic Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Basic\\_XPath\\_Expressions.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Basic_XPath_Expressions.html)

## Testing XPath expressions

---

Use the XPath Evaluator to test XPath expressions against test XML documents.

To bring up the XPath Evaluator window, select Tools > XPath Evaluator option from the Studio toolbar menu. You can use the XPath Evaluator to test XPath expressions against XML files. You can edit the default XPath expressions, generated in the following panes:

- In the Configure panes of the [For Each](#) and [Split](#) activities, an XPath expression is generated to define the recurring element. You can edit the default XPath expression displayed in the Element Name field.
- In the Configure panes of the [While Loop](#) and [If..Then](#) activities, an XPath expression is generated in the Expression Builder to define the conditions. You can edit the default XPath expression displayed clicking Advanced.

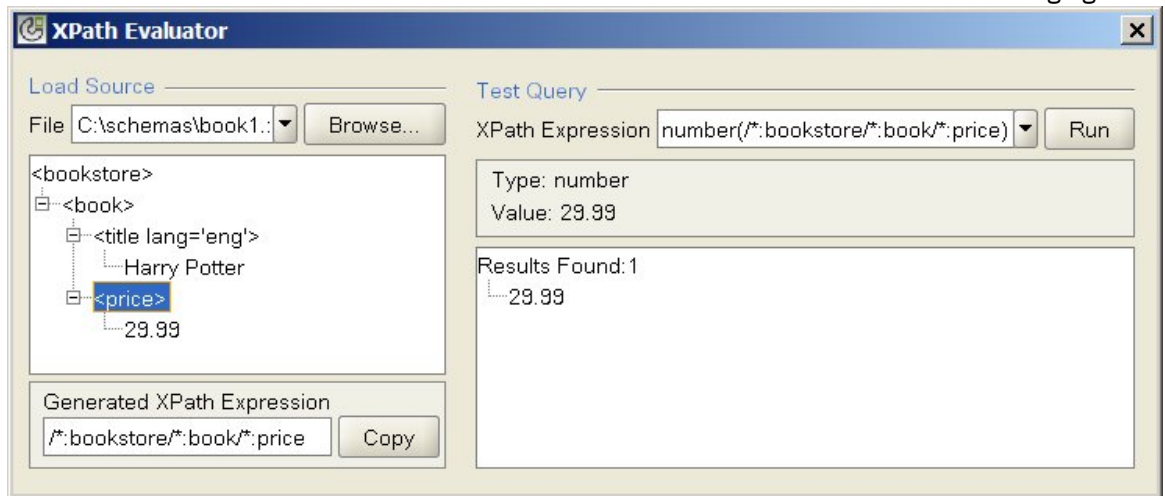

Note: XPath 2.0 is supported.

The following table describes the functionality of the XPath Evaluator dialog box.

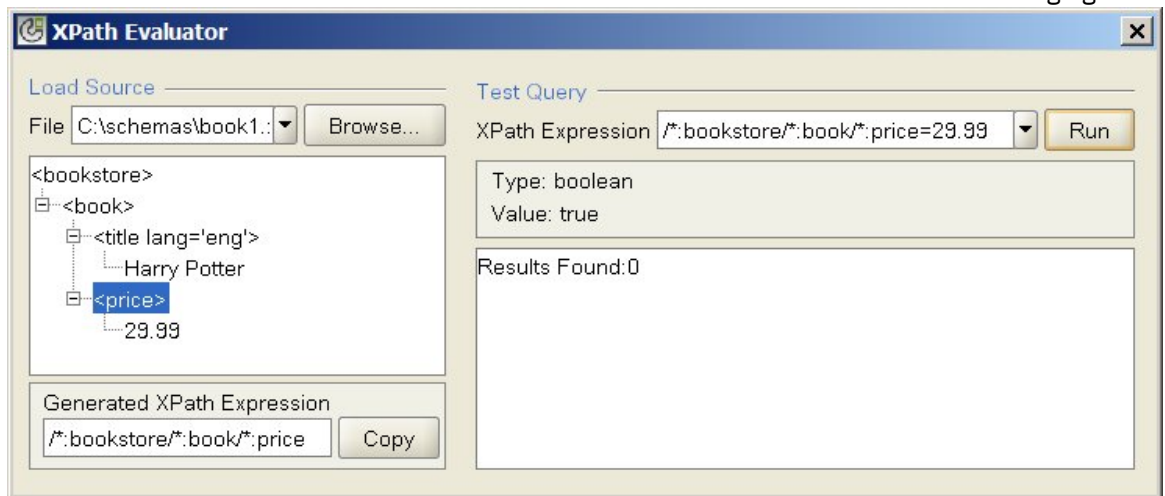

Field	Name Description
File	Specifies the directory location of the selected test XML file. Select the down arrow to select from the set of previously loaded XML files.
Browse..	Click Browse... to load the contents of the XML file from the file system.
Load Source	A graphical representation of the source XML elements to test against. Selecting a node in this text box generates an XPath expression that finds all occurrences of this element when this XPath expression is evaluated against the specified XML data.
Generated XPath Expression	XPath expression that is generated when an XML element is selected in the Load Source text box.
Copy	Copy the XPath Expression from the Generated XPath Expression field to the XPath Expression field.
XPath Expression	Specifies the XPath Expression used to evaluate or test against the XML data.
Run	Select Run to evaluate the XPath expression against the source XML test data. The results of the evaluation are displayed in the text box on the right side of the pane.

To evaluate an XPath expression complete the following steps:

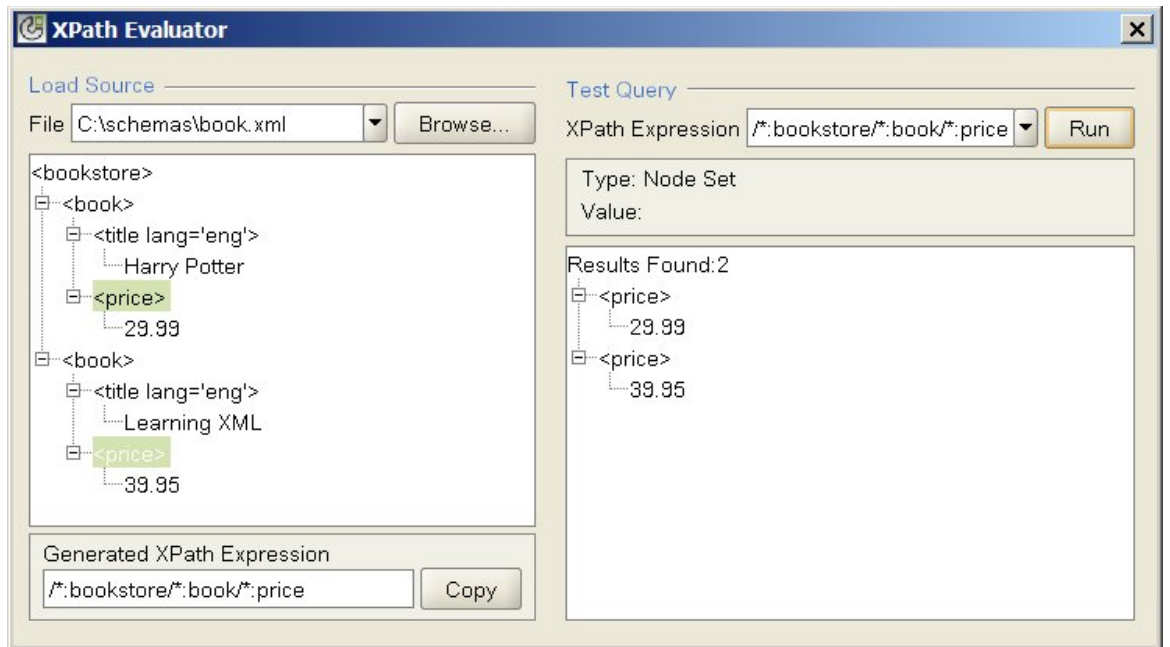

1. Select the Tools > XPath Evaluator option from the Studio toolbar menu. The XPath Evaluator window opens.
2. Click Browse... to load a test XML file from the file system. A graphical representation of the text XML elements shows in the Load Source text box.
3. To specify an XPath expression, choose from one of the following options:
  - o Enter an XPath expression directly into the XPath Expression field.
  - o Select an XML element in the Load Source text box and click Copy to copy the XPath expression from the Generated XPath Expression field to the XPath Expression field.
4. Click Run. The result of running the XML data against the XPath expression is displayed in the right bottom pane. The following types can be returned:
  - o **number** —the value of the number is returned in the Value field as shown in the following figure:

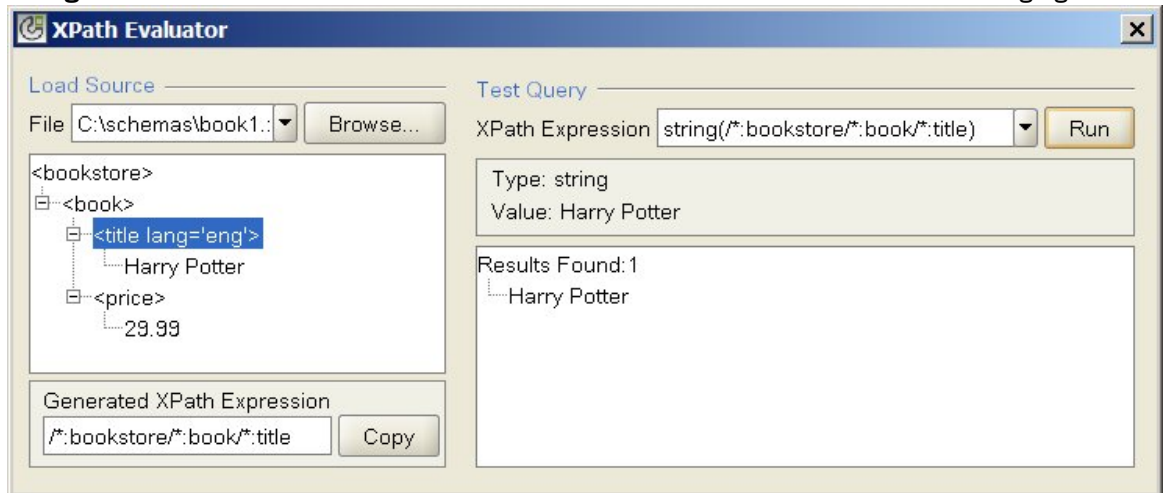

- o **boolean** —the value of the boolean is returned in the Value field as shown in the following figure:

- o **Node Set** —the XML elements that match those displayed in the XPath expression, the Value field is blank, and the number of matching XML elements is reported as shown in the following figure:

- o **string**—the value of the boolean is returned in the Value field as shown in the following figure:

---

## Create Job Keys Activity

The Create Job Keys activity sets the values of job keys dynamically during run time.

---

### About this task

After the orchestration job has run on the Integration Appliance, you can view the values of the job keys in the Jobs detail pane of the Web Management Console (WMC). In addition, you can search for orchestration jobs using the primary key in the WMC. For more information see the WMC online help.

To create and configure a Create Job Keys activity complete the following steps:

---

### Procedure

1. Create a Job Key by using the [Creating Job Keys](#) topic before configuring the Create Job Keys activity.
2. Add the Create Job Keys activity to your orchestration:
  - a. Create an orchestration using the [Creating an orchestration](#) topic, or open an existing orchestration. A graphical representation of the orchestration is displayed.
  - b. Select the Activities tab and expand the Utilities folder.
  - c. Drag the Create Job Keys activity onto the orchestration.
3. Configure the Create Job Keys activity:
  - a. In the Checklist, select Map Inputs.
  - b. You can either set the default value of your job keys or map variables to the job keys, as described in steps 4 and 5.
4. Set a default value for the job keys:
  - a. In the To Activity pane of the Map Outputs task, right-click the job key and select Define Default Value from the list. The Define Default Value dialog box is displayed.
  - b. Enter the required value in the Default Value field.
  - c. Click OK.

During run time, the values of the job keys are set to the values specified in the Default Value field.
5. Map variables to the job keys:
  - a. In the From Orchestration pane, click Add. The Add Variable dialog box is displayed. If any job keys have been created, they are displayed in the To Activity pane.
  - b. Select variables. These variables supply the values of the job keys during run time.
  - c. Click OK.

- d. Create mappings for each job key. From the From Orchestration pane, drag each variable to the corresponding job key in the To Activity pane.  
During run time, the value of the job keys are set to the values of the corresponding variables.

**Parent topic:** [Utilities Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch\\_Log\\_Keys\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/orch_Log_Keys_Activity.html)

## Creating Job Keys

---

You can associate job keys (or identify keys) with a specific orchestration job.

### About this task

---

You create job keys from the Job Identification pane in Studio. To launch the Job Identification pane, select Orchestration > Properties option from the Studio toolbar menu. In the Job Identification pane, define the name and type of the job key. You can also specify one job key as the Primary key.

During run time, a Create Job Keys activity dynamically sets the values of the job keys when an orchestration job runs on the Integration Appliance. After the orchestration job has completed, you can view the values of the job keys from the Web Management Console (WMC). In the WMC, you can also search for the value of a key. All orchestration jobs that contain keys with that value are displayed.

Note: When designing your orchestration, typically it is best to add only one Create Job Keys activity to an orchestration. If the first Create Job Keys activity in an orchestration has a map to the job key, during run time, the second Create Job Keys activity in an orchestration does not reset the value of the job key that was set by first Create Job Keys activity. The action of the second Create Job Keys activity is ignored.

### Procedure

---

1. Create or open an orchestration. See [Creating an orchestration](#) for more information. A graphical representation of the orchestration is displayed.
2. Select Orchestration > Properties to open the Orchestration pane.
3. Click Add. A new key with default values is added to the Keys list.
4. Enter the configuration information for new job keys as described in the following table.

Field / Column	Description
<b>Name (Required)</b>	Specifies the name of the job key
<b>Type (Required)</b>	Specifies the type of the job key
<b>Primary</b>	Specifies that the key is the Primary key. You can only select one key as the Primary key

### What to do next

---

To remove a key, select the key you want to remove and click Remove.

**Parent topic:** [Utilities Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

## Log Message activity

---

You can use the Log Message activity to specify the alert levels and message text, which is displayed in the Integration Appliance orchestration monitoring logs and system logs.

### About this task

---

Use this task to configure the Log Message activity. You can view the Integration Appliance orchestration monitoring logs and system logs from the Web Management Console.

### Procedure

---

1. In the Studio toolbox, click the Activities tab.
2. Expand the Utilities folder contents, and drag the Log Message activity onto the orchestration. The Utilities Log Message Checklist is displayed.
3. In the Checklist, click Summary.
4. Optional Change the description in the Activity Name field.
5. Click Map Inputs. The Map Inputs workspace is displayed. The default parameters: level and message are displayed in the To Activity column.
6. Click Select Inputs. The variables associated with the orchestration are displayed  
Tip: If required, you can create a custom mapping variable in Source or Destination column by completing the steps in [Creating Variables](#).
7. Choose a variable, and click OK. The variable and parameters are displayed in the From Orchestration column.
8. To link the activities, drag a variable from the From Orchestration list onto a parameter listed in the To Activity list. If a link can be established, a line connects the two.
9. Repeat this procedure to link other orchestration variables to this activity.

# Schedule Job activity

The Schedule Job activity is a starter activity that creates an instance of an orchestration at the specified date and time.

## About this task

Use this task to add a Schedule Job activity to an orchestration.

## Procedure

1. [Create](#) or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activity tab and expand the Utilities folder.
3. Drag a Schedule Job activity onto the orchestration.
4. Specify the Schedule setting in the Configure pane as described in the following table:

<b>Option</b>	<b>Description</b>
<b>5 seconds</b>	Specifies the orchestration to run once every five seconds.
<b>10 seconds</b>	Specifies the orchestration to run once every ten seconds.
<b>20 seconds</b>	Specifies the orchestration to run once every twenty seconds.
<b>30 seconds</b>	Specifies the orchestration to run once every thirty seconds.
<b>60 seconds</b>	Specifies the orchestration to run once every sixty seconds.
<b>5 Minutes</b>	Specifies the orchestration to run once every five minutes.
<b>Hour</b>	Specifies the orchestration to run once an hour at the specified time.
<b>Day</b>	Specifies the orchestration to run once a day at the specified time. The time is based on a 24-hour clock in the GMT timezone.
<b>Week</b>	Specifies the orchestration to run once a week on the specified day (Sunday - Saturday) and at the specified time (24-hour clock) based on the GMT timezone.
<b>Month</b>	Specifies the orchestration to run once a month on the specified date (1 - 31) and time (24-hour clock) based on the GMT timezone.
<b>Year</b>	Specifies the orchestration to run once a year on the specified date (month and day) and time (24-hour clock) based on the GMT timezone.

Note: The Schedule Job activity starts the orchestration on the specified time and date based on the GMT timezone. You must adjust the specified time and date for your timezone.

5. To map the output of the activity:
  - a. Select the Map Outputs task in the Checklist. The time output parameter is displayed in the From Activity pane. This is an optional parameter that during run time returns the date and time (in the XML Schema `xsd:dateTime` data type) that the orchestration started processing.
  - b. If desired, map the time output parameter parameters to variable(s). See [Creating a Map](#) for general instructions on mapping.

Note: To create an orchestration that starts on two different dates, for example: February 13, 2011 and April 21, 2011. Drop a Pick activity on the orchestration as the starter activity and drop into the Pick branches, two Schedule Job activities, one that starts on February 13, 2011 and the other on April 21, 2011.

## Adding an Archive activity

---

### About this task

---

To add an Archive activity in the orchestration complete the following steps:

### Procedure

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the Archives folder.
3. Drag the Archive activity onto the orchestration. The Summary task is displayed.

### What to do next

---

[Configure](#) the Archive activity.

**Parent topic:** [Archive activity](#)

---

## Configuring an Archive activity

---

### About this task

---

To configure an Archive activity, complete the following steps:

### Procedure

---

1. Select the Configure task from the Checklist. The Configure task is displayed.
2. Select a format type as described in the following table:

<b>Format</b>	<b>Archived?</b>	<b>Compressed?</b>	<b>Description</b>
TAR	Yes	No	Specifies that input files and directories are archived using the tar format before being returned in the archive output parameter as a single value. The returned value is compatible with the archive format produced by the UNIX tar -cf command. This option returns a value that is compatible with a file that ends in the .tar extension.
TAR+GZIP	Yes	Yes	Specifies that input files and directories are archived using the tar format and then compressed using the gzip format, before being returned in the archive output parameter as a single value. The returned value is compatible with the archive format produced by the UNIX tar -cf command and the compression format produced by the GNU gzip command. This option returns a value that is compatible with a file that ends in the .tar.gz extension.

Format	Archived?	Compressed?	Description
ZIP	Yes	Yes	Specifies that input files and directories are compressed and archived using the .zip format before being returned in the archive output parameter as a single value. The returned value is compatible with the compression and archive format produced by proprietary compression products. This option returns a value that is compatible with a file that ends in the .zip extension.
GZIP	No	Yes	Specifies that a single input file is compressed using the gzip format, before being returned in the archive output parameter. The returned value is compatible with the compression format produced by the GNU gzip command. This option returns a value that is compatible with a file that ends in the .gz extension.

## What to do next

---

Map the input of the activity.

**Parent topic:** [Archive activity](#)

---

## Archive activity map input

---

## About this task

---

To map the input of the Archive activity complete the following steps:

### Procedure

---

1. Select the Map Inputs task in the Checklist. The Map Inputs task is displayed. The archiveEntries input parameter is displayed in the To Activity pane.
2. Map variables to the nodes of the archiveEntries input parameter. See [Creating a Map](#) for general instructions on mapping. The archiveEntries/entry node is a recurring node and each entry represents a either a single file or directory in the archive. The nodes of the archiveEntries/entry node are described in the following table:

Node Name	Required	xsd Type	Description
name	Yes	string	Specifies the name of the directory or file to be added to the archive. If the file or directory is located in a sub-directory, the value of the name node must contain the directory path of the file in addition to the file name. For example, to specify the file called file1.txt located in the directory called cat, specify the value: cat/file1.txt.
datetime	No	dateTime	Specifies the creation date and time of the file or directory to be added to the archive.
isdirectory	No	boolean	Specifies if the current entity is a directory or a file: <ul style="list-style-type: none"><li>o true specifies the entity is a directory</li><li>o false specifies the entity is a file</li></ul>
content	No	base64Binary	Specifies the contents of the file or directory.
size	No	decimal	Specifies the size of the file or directory.
userid	No	string	Specifies the user ID of the file or directory.
groupid	No	string	Specifies the group ID of the file or directory.

Node Name	Required	xsd Type	Description
permissions	No	string	Specifies the permissions of the file or directory.

## What to do next

---

Map the output of the activity.

## Archive activity map output

---

### About this task

---

To map the output of the activity complete the following steps:

### Procedure

---

1. Select the Map Outputs task in the Checklist. The Map Outputs task is displayed. The archive output parameter is displayed in the From Activity pane. The archive output parameter contains the archived files and directories.
2. Map a variable to the archive output parameter. See [Creating a Map](#) for general instructions on mapping. For example, you could map the archive output parameter to a variable you created called *outdata*. You could then map the *outdata* variable to the data input parameter of the FTP Put File activity. During run time, the FTP Put File activity creates an archive file on an FTP server.

**Parent topic:** [Archive activity](#)

## Unarchive Activity

---

The Unarchive activity extracts the input files and directories from the passed in archive during run time. At run time, the Unarchive activity determines the archive/compression types and unarchives/decompresses the archive appropriately

## About this task

The supported unarchive and decompression formats are listed in the following table:

Decompression/Unarchive Formats	Description
tar	During run time, if the Unarchive activity determines that the archive type is tar, the passed in archive is extracted into its component parts (files and directories) and passed back from the activity using the archiveEntries output parameter. The extraction done during run time by the Unarchive activity is equivalent to extraction done on the command line using the UNIX tar -xf command.
untar and gunzip	During run time, if the Unarchive activity determines that the archive type is tar and the compression type is gzip, the passed in archive is first decompressed from the gzip format and then extracted into its component parts (files and directories) and passed back from the activity using the archiveEntries output parameter. The extraction done during run time by the Unarchive activity is equivalent to extraction done on the command line using the UNIX tar -xf command to files that end in the .tar extension. The decompression done during run time by the Unarchive activity is equivalent to the decompression done on the command line using the GNU gunzip command to files that end in the .gz extension.
zip	During run time, if the Unarchive activity determines that the archive/compression type is zip, the passed in archive is decompressed and extracted into its component files and directories, and passed back from the activity using the archiveEntries output parameter. The decompression and extraction done during run time by the Unarchive activity is equivalent to the decompression and extraction done using proprietary compression products to files that end in the .zip extension.
gunzip	During run time, if the Unarchive activity determines that the compression type is gzip, the passed in archive is decompressed from the gzip format and passed back from the activity using the archiveEntries output parameter. The decompression done during run time by the Unarchive activity is equivalent to the decompression done on the command line using the GNU gunzip command to files that end in the .gz extension.

During run time, if the passed in archive format is unsupported, the Unarchive activity produces an ActivityFailedException error and issues the following message:

```
Invalid or unsupported archive format
```

During run time, if the passed in archive is incorrectly formed, the Unarchive activity produces an ActivityFailedException error and issues the following message:

```
Error while reading archive
```

To add and configure an Unarchive activity in an orchestration complete the steps in the following procedures:

- [Adding an Unarchive activity](#)
- [Unarchive activity map input](#)
- [Unarchive activity map output](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/unarchive\\_activity\\_mapping\\_input.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/unarchive_activity_mapping_input.html)

## Unarchive activity map output

---

### About this task

---

To map the output of the Unarchive activity complete the following steps:

### Procedure

---

1. Select the Map Outputs task in the Checklist. The Map Inputs task is displayed. The archiveEntries output parameter is displayed in the From Activity pane. The archiveEntries/entry node is a recurring node and each entry represents a either a single file or directory in the archive. The nodes of the archiveEntries/entry node are described in the following table:

Node Name	Required	xsd Type	Description
name	Yes	string	Specifies the name of the directory or file that was extracted from the archive. If the file or directory is located in a sub-directory the value returned by the name node during run time includes the relative directory path of the file or directory. For example, if the archive contains the file called file1.txt located in the directory called cat, the value: cat\file1.txt is returned.
datetime	No	dateString	Specifies the creation date and time of the file or the directory in the archive.

Node Name	Required	xsd Type	Description
isdirectory	No	boolean	Specifies if the current entity is a directory or a file: <ul style="list-style-type: none"> <li>o true specifies the entity is a directory</li> <li>o false specifies the entity is a file</li> </ul>
content	No	base64Binary	Specifies the contents of the file or directory.
size	No	long	Specifies the size of the file or directory.
userid	No	string	Specifies the user ID of the file or directory.
groupid	No	string	Specifies the group ID of the file or directory.
permissions	No	string	Specifies the permissions of the file or directory.

- Map variables to the archiveEntries output parameter. See [Creating a Map](#) for general instructions on mapping. For example, you could map the archiveEntries output parameter to an *archiveEntries* variable and then add an For Each activity after the Unarchive activity to iterate through the instances of the *archiveEntries* variable. Each instance of the *archiveEntries* variable represents a file or a directory. You could add a If..Then activity to the For Each loop that tests the value of the isdirectory node and if the entity is not a directory, place the extracted file on an FTP Server using the FTP Put File activity. This example orchestration is shown in the following figure:

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_cryptoserviceactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_cryptoserviceactivities.html)

## Overview of the PGP activities

---

WebSphere® Cast Iron® Studio supports PGP encryption and decryption. You can import, store, and retrieve keys and certificates that are used for PGP activities.

PGP has its own keystore for managing keys. The keystore location depends on the tool used. The public and the secret key ring of PGP is for cryptography. Cryptoservice uses the PGP keys to encrypt and decrypt content.

Cryptoservice comes with a utility to extract the PGP keys and store the same in the `PKCS12` keystore.

For Cast Iron Studio, you must use the command line utility to import the extracted `PKCS12` to the Studio keystore.

For the On-Premise Appliance, you must import the extracted `PKCS12` to the Appliance keystore from the Web Management Console.

After completing the procedures mentioned above, you can encrypt and decrypt content.

- To encrypt content, you must encode the human readable content to `base64`, and then pass the `base64` content to PGP Encrypt activity. Then, configure the inputs and provide the public key to the activity, which in turn would return the encrypted data.
- To decrypt the content you must pass the encrypted data to the PGP Decrypt activity, and configure the input with the private keys and password. The output is `base64`. You must decode the `base64` data to get the original content.

**Parent topic:** [Cryptoservice Activities](#)

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PGP\\_overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PGP_overview.html)

## Using the PGP Encrypt activity

---

During run time, the PGP Encrypt activity encrypts content. Complete the following steps to add and map inputs and output of the PGP Encrypt activity in an orchestration:

**Parent topic:** [Cryptoservice Activities](#)

### Adding the PGP Encrypt activity

---

#### About this task

To add the PGP Encrypt activity in the orchestration, complete the following steps:

#### Procedure

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the Cryptoservice folder.
3. Drag the PGP Encrypt activity onto the orchestration. The Summary of the activity configuration checklist is displayed.

#### What to do next

Map the inputs of the PGP Encrypt activity.

### Mapping the inputs of the activity

#### About this task

To map the inputs of the PGP Encrypt activity, complete the following steps:

#### Procedure

1. Select the Map Inputs task in the Checklist. The Map Inputs task is displayed. The `cryptoserviceEntry` input parameter is displayed in the To Activity pane.
2. Map the variables to the nodes of the `cryptoserviceEntry` input parameter. The nodes of the `cryptoserviceEntry/entry` node are described in the following table:

Table 1. Nodes of `cryptoserviceEntry`

Node name	Required	xsd Type	Description
-----------	----------	----------	-------------

Node name	Required	xsd Type	Description
content	Yes	base64Binary	Indicates the actual base64Binary content that must be encrypted.
keyhandle	Yes	String	Indicates the name of the GPG key that is used to encrypt the content.
password	Optional	String	Indicates the password that must be used to decrypt keyhandle.
armored	Optional	Boolean	Indicates the value that must be set for ASCII Armored output. The default value is False.

Note: 128-bit encryption level requires an 8-byte key, which must be a 32-character hexadecimal string.

## Mapping the output of the activity

---

### About this task

To map the output of the activity, complete the following steps:

### Procedure

1. Select the Map Outputs task in the Checklist. The Map Outputs task is displayed. The PGP Encrypt output parameter is displayed in the From Activity pane. The PGP output parameter contains a variable that stores the encrypted content, which can be used in the orchestration.
2. Map a variable from the PGP Encrypt output parameter to another variable or activity in the orchestration.

---

To add the PGP Decrypt activity in the orchestration, complete the following steps:

## Procedure

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the Cryptoservice folder.
3. Drag the PGP Decrypt activity onto the orchestration. The Summary of the activity configuration checklist is displayed.

## What to do next

Map the inputs of the PGP Decrypt activity.

## Mapping the inputs of the activity

### About this task

To map the inputs of the PGP Decrypt activity, complete the following steps:

## Procedure

1. Select the Map Inputs task in the Checklist. The Map Inputs task is displayed. The `cryptoserviceEntry` input parameter is displayed in the To Activity pane.
2. Map the variables to the nodes of the `cryptoserviceEntry` input parameter. The nodes of the `cryptoserviceEntry/entry` node are described in the following table:

Table 1. Nodes of `cryptoserviceEntry`

Node name	Required	xsd Type	Description
content	Yes	base64Binary	Indicates the actual <code>base64Binary</code> content that must be encrypted.
keyhandle	Yes	String	Indicates the name of the GPG key that is used to encrypt the content.
password	Yes	String	Indicates the password that must be used to decrypt <code>keyhandle</code> .
armored	Optional	Boolean	Indicates the value that must be set for ASCII Armored output. The default value is <code>False</code> .

Note: 128-bit encryption level requires an 8-byte key, which must be a 32-character hexadecimal string.

## What to do next

Map the output of the PGP Decrypt activity.

## Mapping the output of the activity

### About this task

To map the output of the activity, complete the following steps:

## Procedure

1. Select the Map Outputs task in the Checklist. The Map Outputs task is displayed. The PGP Decrypt output parameter is displayed in the From Activity pane. The PGP Decrypt output parameter contains a

- variable that stores the decrypted content, which can be used in the orchestration.
2. Map a variable from the PGP Decrypt output parameter to another variable or activity in the orchestration.

---

## Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PGP\\_Decrypt.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PGP_Decrypt.html)

## Importing PGP keys

---

The `commandLine` utility that is discussed in this topic, extracts the private and public keys from the secure and public ring files, from the PGP/GPG keystore.

### Procedure

---

To extract the keys from the PGP/GPG keystore, the `commandLine` utility uses the following parameters:

1. `commandLine` utility accepts the following parameters to extract the private and public keys:

```
extractPKCS12AndPublicKey.bat -privateKeyRingFile <file name of the secret key ring file> -publicKeyRingFileName <file name of the pub key ring file> -passphrase <password for the gpg keys> -keyStoreLocation <keyStore Location> -keyStorePassword <keystore password> -privateCertificateName <private certificate name> -issuerName <name of the certificate issuer> -certificateStartDate <start date> -certificateExpiryDate <end date> -algorithmName SHA256withRSA
```

For example:

```
extractPKCS12AndPublicKey.bat -privateKeyRingFile C:\Users\IBM_ADMIN\Documents\gpg\secreing.gpg -publicKeyRingFile C:\Users\IBM_ADMIN\Documents\gpg\pubring.gpg -passphrase castiron -keyStoreLocation C:\mykeystore.p12 -keyStorePassword changeit -privateCertificateName myKey -issuerName "C=US, ST=CA, L=Mountain View, O=Cast Iron Systems, CN=Cast Iron Appliance VMWSULXJE23SK6HO" -certificateStartDate 01-01-2013 -certificateExpiryDate 01-01-2015 -algorithm SHA256withRSA
```

2. `commandLine` utility accepts the following parameters to import the private and public keys to a Studio keystore file:

```
importPKCS12IntoJKS.bat -privateCertificateName <private certificate name> -pkcsKeyStoreLocation < PKCS12 keystore store that we created in step1 > -pkcsKeyStorePassword < password for the keystore>
```

For example:

```
importPKCS12IntoJKS.bat -privateCertificateName myKey -pkcsKeyStoreLocation C:\mykeystore.p12 -pkcsKeyStorePassword changeit
```

Note: Step 2 is not required for the appliance. You can import the generated PKCS12 keystore to the appliance through the Security menu on the Web Management Console dashboard. For more

information about importing certificates, see Cast Iron® Web Management Console documentation.

## Troubleshooting and support

---

Troubleshooting techniques and self-help information help you identify and solve problems quickly. This topic provides potential solutions for issues you would have with the Cryptographic activities.

### OutOfMemoryError exception thrown

---

**Problem:** The following exception is thrown when you use the PGP Encrypt activity, for FTP transfer of .zip file or a .tar.gz file:

```
Internal error: java.lang.OutOfMemoryError: Java heap space (data size is over 10MB)
```

**Cause:** Insufficient default heap allocation when starting Cast Iron Studio.

**Solution:** Increase the heap allocation when starting Cast Iron Studio, by giving the following command:  
`CastIronStudio.exe -J-Xmx1024m.`

## Data Quality Activities

---

- [About Data Quality Activities](#)  
Use the Data Quality activities in Studio to migrate or load data into a new system and/or synchronize data between existing systems.
- [Filter and Profile Activity](#)  
This activity filters data based on the Boolean expression you create and generates a profile summary of the cleansed data.
- [Creating Profile Summaries](#)  
Use the Profile Summaries pane to specify parameters that determine the data that the Integration Appliance profiles.

- [Filtering Expressions](#)  
A filter expression is an XPath query that specifies conditions (boolean expressions) that the Integration Appliance uses to route data to different outputs. You can create a filter expression using the Filter and Profile activity.
- [Lookup Activity](#)  
Use the Lookup Activity to retrieve rows of data from a selected database endpoint and use values from those rows to replace or add values to the current recurring element, based on an exact or approximate match of values from the current recurring element that is used as a key to perform the lookup.
- [Sort Activity](#)  
This activity allows you to sort inputs.
- [Merge Activity](#)  
Use the Merge activity allows to join two sorted inputs. Both the left and right inputs must be sorted on a specified sort key before you can merge or join inputs. You must specify at least one sort key for both the left and right inputs. The Merge activity resolves any duplicates.

---

## Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_dataqualityactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_dataqualityactivities.html)

## About Data Quality Activities

---

Use the Data Quality activities in Studio to migrate or load data into a new system and/or synchronize data between existing systems.

From the Activities tab in the Studio toolbox, select the Data Quality directory. The Data Quality activities include:

- Filter and Profile – Filters data based on the Boolean expression you create and generates a profile summary of the cleansed data.
- Lookup – Retrieves rows of data from the database endpoint, which you select.
- Sort – Sorts the inputs based on sort keys you specify.
- Merge – Joins two sorted inputs.

The Integration Appliance has a Local Staging Database where you can stage the data. The Local Staging Database can be used to share data between jobs to facilitate an iterative data cleansing process. You can view and edit data in the Local Staging Database through the Web Management Console (WMC).

From the WMC, you can complete the following operations against the Local Staging Database:

- Start and Stop the database server
- Connect to the Local Staging Database
- Create tables
- Drop tables
- View tables and sort by columns
- Add rows
- Delete rows

For more information about performing these operations, see the WMC Online Help.

## Filter and Profile Activity

---

This activity filters data based on the Boolean expression you create and generates a profile summary of the cleansed data.

- [Configuring the Filter and Profile activity](#)
- [Mapping Filter and Profile activity outputs](#)

**Parent topic:** [Data Quality Activities](#)

## Configuring the Filter and Profile activity

---

### About this task

---

To configure the Filter and Profile activity complete the following steps:

### Procedure

---

1. In the Activities tab, open the Data Quality directory to find the Filter and Profile activity.
2. Add the activity to an orchestration. The Checklist and Summary for the activity are displayed beneath the orchestration.
3. From the Checklist, select Configure and specify the following information:
  - a. The variable name of the variable that contains the recurring element, which the activity loops through.
  - b. The element name of the recurring element in the variable, which the activity loops through.

Click the browse button to open the Select Recurring Element window, where you can view all the elements in the variable you selected.

4. From the Checklist, select Filter Expression and [create](#) an expression that the Integration Appliance uses to filter data.

Note: The Integration Appliance can only create a profile for data that passes the filter expression. To profile all data, complete one of the following tasks:

- Click Advanced and enter the following expression: `true()`

OR

- Enter the expression: `1 = 1`
5. From the Checklist, select Profile Summary to **define** parameters for the data you want to summarize.
  6. Map the **output** of the activity.

**Parent topic:** [Filter and Profile Activity](#)

---

## Mapping Filter and Profile activity outputs

---

### About this task

---

To map the outputs of the Filter and Profile activity complete the following steps:

### Procedure

---

1. In the Checklist, select Map Outputs. The following elements are displayed in the From Activity pane: goodXML, badXML, summary, and summaryCharts.pdf.
2. Click Select Outputs... and select the output variables for the map. For instructions about creating variables, see [Creating variables](#).
3. As appropriate, map the output parameters to the variables. For general mapping instructions, see [Creating a map](#).

**Parent topic:** [Filter and Profile Activity](#)

## Creating Profile Summaries

---

Use the Profile Summaries pane to specify parameters that determine the data that the Integration Appliance profiles.

## About this task

To create a profile summary complete the following steps:

## Procedure

1. In the Activities tab, open the Data Quality directory to find the Filter and Profile activity.
2. Add the activity to an orchestration. The Checklist and Summary for the activity are displayed beneath the orchestration.
3. From the Checklist, select Profile Summary. The Profiles Summaries pane is displayed.
4. Click Add.
5. Specify values for the following parameters:

<b>Profile Summary Parameter</b>	<b>Description</b>
XPath	The XPath expression, relative to the recurring element you selected, that specifies the data to profile
Name	The name of the profile. The default is the XPath expression you selected.
Datatype	Specifies the data type as either text or number.  By default, the data type is text.  For a numeric data type, the following general statistics are generated: min, max, mean, count, sum, standardDeviation, variance.  For a text data type, the following general statistics are generated: min, max.  For both data types, histograms can be generated to show frequency counts for specific values or value ranges.
Histogram ?	Specifies whether or not to generate a histogram. The default is <code>false</code> and a histogram is not generated. To generate a histogram, select the Histogram? field and select Generate Histogram. The value <code>true</code> is displayed in the field.
Max. Bins	Specifies the maximum number of bins for the histogram. Important: Only specify a value for this parameter if the datatype is specified as number. The default value is 0, indicating that no maximum exists.
Max. Values	Specifies the maximum number of values to use for the histogram. The default value is 0, indicating that no maximum exists.
Min. Freq.	Specifies the minimum frequency for values to be included in the histogram. This is a number between 0-1, indicating the ratio of the number of occurrences of a given value to all values. The default is 0.0
Chart	Generates a PDF of the chart type you specify: <ul style="list-style-type: none"> <li>○ bar</li> <li>○ pie</li> <li>○ none</li> </ul> By default, the Integration Appliance does not generate a chart.

## Filtering Expressions

---

A filter expression is an XPath query that specifies conditions (boolean expressions) that the Integration Appliance uses to route data to different outputs. You can create a filter expression using the Filter and Profile activity.

### About this task

---

Use the Studio Builder tool to:

- Create a filter expression
- Add conditions
- Delete conditions
- Edit conditions
- Specify the processing order of conditions
  
- [Creating a filter expression](#)
- [Adding a filter expression condition](#)
- [Deleting a filter expression condition](#)
- [Editing a filter expression condition](#)
- [Changing the processing order of filter expression conditions](#)

Parent topic: [Data Quality Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/filtering\\_expressions.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/filtering_expressions.html)

## Creating a filter expression

---

### About this task

---

To use the Builder to create a filter expression complete the following steps:

## Procedure

---

1. In the orchestration, select the Filter and Profile activity to open the Checklist.
2. In the Checklist, select Filter Expression. The Builder is displayed in the Filter Expression pane.
3. Click the Left Hand Expression field to enter a parameter or click (...) for the elements of a selected variable to be displayed. Click ( B ) to select a new variable.
4. Click the Op list to select an operator for the condition.

For a complete list of operators that you can use in the Builder, see Valid Operators for Conditions

5. Click the Right Hand Expression field to enter a parameter or click (...) for the elements of a selected variable to be displayed. Click ( B ) to select a new variable.

**Parent topic:** [Filtering Expressions](#)

## Adding a filter expression condition

---

### About this task

---

To add a condition complete the following steps:

## Procedure

---

1. Click Add. Fields for a new condition are displayed. By default, the new condition is inclusive, using AND logic.
2. Optional: In the first column, select OR from the list to use OR logic.
3. Specify the Left Hand Expression.
4. Specify the operator for the condition
5. Specify the Right Hand Expression.

**Parent topic:** [Filtering Expressions](#)

---

## Editing a filter expression condition

---

### About this task

---

To edit a filter expression condition complete the following steps.

### Procedure

---

- Select any field in the Filter Builder and make your edits. If the Filter Builder is not displayed, click Use Builder. You can edit left-hand expressions, select operators, and right-hand expressions.
- OR-
- Click Advanced to directly edit XPath expressions that define the condition.  
Note: Use the XPath Evaluator to test XPath expressions.

## Lookup Activity

---

Use the Lookup Activity to retrieve rows of data from a selected database endpoint and use values from those rows to replace or add values to the current recurring element, based on an exact or approximate match of values from the current recurring element that is used as a key to perform the lookup.

To use the fuzzy lookup capability, you must use the Local Staging Database on the Integration Appliance. For non-fuzzy lookups, you can use any database endpoint that Studio supports.

Note: When the Lookup activity is run from Studio, lookup results are not cached.

Lookup activity requires a parameterized SQL query, an XPath query that indicates the recurring element, and an XPath query that indicates which value to use as the key for the lookup. A set of lookup values specifies how column values from the database result set should be mapped to elements or attributes of the current context node.

To complete a fuzzy lookup and approximately match the key, the Lookup activity uses the edit distance algorithm.

For example:

In the following table Names you want to perform a query on the last name Stark. The database contains the following records:

FirstName	LastName
Tony	Stark
Bruno	Star
Georgia	States
Howard	Stark

Issue the following query: `select * from Names where Col_LastName='Stark'`

In this example, the `key_length = length("Stark") = 5`

For comparing against the threshold, use the value `(1 - (edit_distance / key_length) )`

The edit distance is  $\text{edit\_distance}(\text{"Stark"}, \text{"Stark"}) = 0$  and  $\text{edit\_distance}(\text{"Stark"}, \text{"Star"}) = 1$

- To pick up only Stark use threshold  $(1 - (0/5)) = 1$
- To pick up both Stark and Star, but not States use threshold  $(1 - (1/5)) = 0.8$
- [Using the Lookup activity](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/lookup\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/lookup_activity.html)

# Using the Lookup activity

---

## About this task

---

To use the Lookup activity complete the following steps:

## Procedure

---

1. In the Activities tab, open the Data Quality directory to find the Lookup activity.
2. Add the activity to an orchestration. The Checklist and Summary for the activity are displayed beneath the orchestration.
3. In the Checklist, select Pick Endpoint and select a database endpoint. For instructions on creating or editing a database endpoint, see [Creating or Editing a Database Activity Endpoint](#)  
Note: To complete a fuzzy lookup you must select the Local Staging Database. To access the Local Staging Database:
  - a. From the Database Type list, select Local. Staging opens in the Database Name field.
  - b. In the Network Location Server field, specify the data IP address of the Integration Appliance, where the Local Staging Database is started. The Port is fixed at 1526.
  - c. Enter a User Name and Password.  
Important: This login information must be for a user with Administrator or Publisher privileges on the Integration Appliance.
  - d. Specify any additional parameters. For more details about the database parameters. see [Creating or Editing a Database Activity Endpoint](#).
  - e. Click OK. The Database endpoint is displayed in the Endpoints directory of the Studio toolbox.
4. From the Checklist, select Configure and specify the following information:
  - a. The variable name of the variable that contains the recurring element, which the activity loops through.
  - b. The element name of the recurring element in the variable, which the activity loops through.

Click the browse button ( ... ) to open the Select Recurring Element window, where you can view all the elements in the variable you selected.

5. In the Checklist, select Enter Query
  - a. Specify the query for the lookup table.

- For fuzzy lookups, you must specify exactly one parameter.
  - For non-fuzzy lookups, you can specify one or more parameters.
- b. From the Encoding list, select the encoding type.
  - c. Click Validate Query
 

Note: If using a Local database endpoint, you must start the Local Staging Database on the Integration Appliance before you can view columns or validate queries. To start the Local Staging Database, in the Web Management Console (WMC), select Staging > Staging Database Start/Stop.
  - d. Click View Columns and select a table to view detailed column information for the table you select. The Hide Buffer and Control Table option is the default selection.
6. In the Checklist, select Setup Input Parameters. The query you entered in the previous step is displayed.

Specify the input XPath for each input parameter in the XPath column. The input XPath is an XPath expression that is relative to the recurring element which specifies the lookup key value that the query uses.

7. In the Checklist, select Setup Result Set.
  - a. Specify the output XPath for each row in the result set. The output XPath specifies the element or attribute relative to the recurring element that will hold the output value.
  - b. Use the at-sign ( @ ) at the beginning of the XPath expression to specify an attribute.
    - If the name of the element or attribute already exists, Studio replaces the existing value. Otherwise, Studio creates a new named element or attribute.
    - If the lookup fails to find a match, the row is sent to the badXML element.
8. In the Checklist, select Delivery Rules and specify the following delivery rules:

Delivery Rule	Description
Activity Timeout	Specifies in seconds the length of time that the Integration Appliance waits for the endpoint to respond. The default setting is 300 seconds.
Fuzzy lookup	Determines if the lookup is fuzzy. Select this option to perform a fuzzy lookup. Important: You can only perform a fuzzy lookup against a Local Database Endpoint. Note: Before you run the orchestration, use the Database Asset generation tool, in the WMC, to create an index table.
Output at most __ match(es) per fuzzy lookup	Specifies the maximum number of matches to output per fuzzy lookup.
The similarity threshold __ for a fuzzy lookup	Specifies the similarity threshold for determining a match during a fuzzy lookup (between 0 - 1). 1 = an exact match.
Ignore case (for fuzzy lookup only)	Select for your lookup to be case-insensitive.
Ignore leading and trailing white spaces	When selected, the Lookup activity ignores any white space that occurs before and after the data. For non-fuzzy lookups, you can only apply this option to the input value. For fuzzy lookups, you can apply this option to both the input value and the lookup table key.
Preload cache	Select this option to preload the lookup cache.
Cache at most __ lookup results	Specifies the maximum number of lookup results to cache.

## What to do next

---

Map the [output](#) of the activity.

**Parent topic:** [Lookup Activity](#)

## Sort Activity

---

This activity allows you to sort inputs.

### About this task

---

**Important:** Use the Sort activity to sort data before attempting to merge data with the Merge activity.

To sort inputs complete the following steps:

## Procedure

---

1. In the Activities tab, open the Data Quality directory to find the Sort activity.
2. Add the activity to an orchestration. The Checklist and Summary for the activity show beneath the orchestration.
3. From the Checklist, select Configure and specify the following information:
  - a. The variable name of the variable that contains the recurring element, which the activity loops through.
  - b. The element name of the recurring element in the variable, which the activity loops through. Click the browse button ( ... ) to open the Select Recurring Element window, where you can view all the elements in the variable you selected.
4. From the Checklist, select Sort Properties and specify the following information:
  - a. Optional: Select Remove Duplicates, so that the activity sends duplicates to the remainderXml element.
  - b. Click Add. A new row is displayed in the Sort Keys table.
  - c. In the XPath column, specify the recurring element.
  - d. Select the Sort Type field and from the list. Choose either ascending or descending sort order for the list. The default sort type is ascending.
  - e. Select the Datatype field and from the list, choose either the text or number data type. The default data type is text.
  - f. Optional: Select the Ignore Case option. If you select this option, the case of the data is ignored during the sort process.
  - g. Optional: Select the Ignore Leading and Trailing Whitespace option. By default, the sort process reads any white space around data. If you select this option, the activity ignores white spaces that can affect the sort results.
5. In the Checklist, select Map Outputs. The following elements are displayed in the From Activity pane: sortedXml and remainderXml.
  - a. Click Select Outputs... and select the output variables for the map. For instructions about creating variables, see [Creating variables](#).
  - b. As appropriate, map the output parameters to the variables. For mapping instructions, see [Creating a map](#).

**Parent topic:** [Data Quality Activities](#)

## Merge Activity

---

Use the Merge activity allows to join two sorted inputs. Both the left and right inputs must be sorted on a specified sort key before you can merge or join inputs. You must specify at least one sort key for both the left and right inputs. The Merge activity resolves any duplicates.

Use an XPath query to specify the recurring element for each input. There are six types of merges:

Merge Type	Description
------------	-------------

<b>Merge Type</b>	<b>Description</b>
Merge and remove duplicates	Removes the duplicates that occur in both the left and right inputs. Studio sends any duplicates to the RemainderXML element.
Merge and keep left duplicates	Sends duplicates from the left input to the RemainderXML element.
Merge and keep all duplicates	Keeps duplicates from both inputs.
Inner join	Joins inputs on the specified keys. Any row that does not participate in the join is sent to the RemainderXML element.
Left outer join	Joins the inputs on the specified keys. Rows from the left input are kept in the merged output even if they do not participate in the join. Studio sends any rows from the right input that do not participate in the join to the RemainderXML element.
Full outer join	Joins the inputs on the specified keys. Rows that are not involved with the join are kept in the merged output.

Merge Examples:

Table 1 are the Left and Right inputs for this example. Table 2 are the expected results for each type of merge operation that the Merge activity supports.

In the following example, x is the key variable. Studio sends entries that are merged or joined to the mergeXML element and sends any entries that do not participate in a merge or join to the RemainderXML element.

Table 1. Left and Right Inputs

<b>Left Inputs</b>	<b>Right Inputs</b>
<pre>&lt;entries&gt; &lt;entry x="1" y="10"/&gt; &lt;entry x="2" y="20"/&gt; &lt;entry x="2" y="21"/&gt; &lt;entry x="3" y="30"/&gt; &lt;/entries&gt;</pre>	<pre>&lt;entries&gt; &lt;entry x="0" z="00"/&gt; &lt;entry x="2" z="22"/&gt; &lt;entry x="2" z="23"/&gt; &lt;entry x="4" z="40"/&gt; &lt;/entries&gt;</pre>

Table 2. Merge Results for Each Merge Type

<b>Merge Type</b>	<b>Merge Results</b>
Merge and remove duplicates	<pre>&lt;entries&gt; &lt;entry x="0" z="00"/&gt; &lt;entry x="1" y="10"/&gt; &lt;entry x="3" y="30"/&gt; &lt;entry x="4" z="40"/&gt; &lt;/entries&gt;</pre>
Merge and keep left duplicates	<pre>&lt;entries&gt; &lt;entry x="0" z="00"/&gt; &lt;entry x="1" y="10"/&gt; &lt;entry x="2" y="20"/&gt; &lt;entry x="2" y="21"/&gt; &lt;entry x="3" y="30"/&gt; &lt;entry x="4" z="40"/&gt; &lt;/entries&gt;</pre>

Merge Type	Merge Results
Merge and keep all duplicates	<pre>&lt;entries&gt; &lt;entry x="0" z="00"/&gt; &lt;entry x="1" y="10"/&gt; &lt;entry x="2" y="20"/&gt; &lt;entry x="2" y="21"/&gt; &lt;entry x="2" z="22"/&gt; &lt;entry x="2" z="23"/&gt; &lt;entry x="3" y="30"/&gt; &lt;entry x="4" z="40"/&gt; &lt;/entries&gt;</pre>
Inner join	<pre>&lt;entries&gt; &lt;entry x="2" y="20" z="22"/&gt; &lt;entry x="2" y="20" z="23"/&gt; &lt;entry x="2" y="21" z="22"/&gt; &lt;entry x="2" y="21" z="23"/&gt; &lt;/entries&gt;</pre>
Left outer join	<pre>&lt;entries&gt; &lt;entry x="1" y="10"/&gt; &lt;entry x="2" y="20" z="22"/&gt; &lt;entry x="2" y="20" z="23"/&gt; &lt;entry x="2" y="21" z="22"/&gt; &lt;entry x="2" y="21" z="23"/&gt; &lt;entry x="3" y="30"/&gt; &lt;/entries&gt;</pre>
Full outer join	<pre>&lt;entries&gt; &lt;entry x="0" z="00"/&gt; &lt;entry x="1" y="10"/&gt; &lt;entry x="2" y="20" z="22"/&gt; &lt;entry x="2" y="20" z="23"/&gt; &lt;entry x="2" y="21" z="22"/&gt; &lt;entry x="2" y="21" z="23"/&gt; &lt;entry x="3" y="30"/&gt; &lt;entry x="4" z="40"/&gt; &lt;/entries&gt;</pre>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/merge\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/merge_activity.html)

## Merging two sorted inputs

---

### About this task

---

To merge two sorted inputs complete the following steps:

## Procedure

---

1. In the Activities tab, open the Data Quality directory to find the Merge activity.
2. Add the activity to an orchestration. The Checklist and Summary for the activity are displayed beneath the orchestration.
3. From the Checklist, select Configure and specify the following information:
  - a. The variable name of the left variable that contains the recurring element, which the activity loops through.
  - b. The element name of the recurring element in the left variable, which the activity loops through. Click the browse button ( ... ) to open the Select Recurring Element window, where you can view all the elements in the variable you selected.
  - c. The variable name of the right variable that contains the recurring element, which the activity loops through.
  - d. The element name of the recurring element in the right variable, which the activity loops through. Click the browse button ( ... ) to open the Select Recurring Element window, where you can view all the elements in the variable you selected.
4. From the Checklist, select Merge Properties and specify the following information:
  - a. Select a [merge type](#) for the list.
  - b. In the Left Sort Key section, click Add. A new row is displayed in the Sort Keys table.
  - c. In the XPath column, specify the recurring element.
  - d. Select the Sort Type field and from the list. Choose either the ascending or descending to sort the list. The default sort type is ascending.
  - e. Select the Datatype field and from the list, choose either the text or number data type. The default data type is text.
  - f. Repeat steps (b - e) for the Right Sort Keys.
  - g. Optional: Select the Ignore Case option. If you select this option, the case of the data is ignored during the merge process.
  - h. Optional: Select the Ignore Leading and Trailing Whitespace option. By default, the merge process reads any white space around data. If you select this option, the activity ignores white spaces that can affect the merge results.
5. In the Checklist, select Map Outputs. The following elements are displayed in the From Activity pane: mergedXml and remainderXml.
  - a. Click Select Outputs... and select the output variables for the map. For instructions about creating variables, see [Creating variables](#).
  - b. As appropriate, map the output parameters to the variables. For mapping instructions, see [Creating a map](#).

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_databasesactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_databasesactivities.html)

## Creating or Editing a Database Activity Endpoint

Endpoints provide the database connection information that Studio and the Integration Appliance use to connect to a database.

### Select or edit a database endpoint

1. In the Create Endpoint or Edit Endpoint pane, configure the fields as described in the following tables.  
 Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that you can connect to the database. Click OK.

### Database options

Table 1. Database options

Field	Description
Database Type	<p>Specifies the database type. If you select the Generic JDBC driver or MySQL, you must install the module providers into Studio. To add JDBC drivers into Studio, you add them to the Web Management console and then complete the following steps in the WMC.</p> <ol style="list-style-type: none"> <li>1. Go to Settings.</li> <li>2. Select Design.</li> <li>3. Select Libraries Environment and set it to the environment that you loaded the compressed files into.</li> <li>4. Restart Studio.</li> </ol> <p>Note: For JDBC drivers to access database endpoints for Cast Iron® Generic JDBC support, the JDBC driver must be:</p> <ul style="list-style-type: none"> <li>• Type 4.</li> <li>• Must implement the JDBC 2.0 or greater specification.</li> <li>• Must provide support for the DataSource feature API.</li> </ul> <p>Additional Parameters may be required for a Generic JDBC Driver. You should check the documentation for the driver you intend to use to see if any additional parameters are required. For more information about installing the JDBC libraries into the WMC, see the WMC Online help.</p>
Database Name	<p>Specifies the name of the Database to which you want to connect. If connecting to Oracle RAC, see <a href="#">For Oracle RAC:</a>.</p> <p>Note: For AS/400 DB2® databases, this is the collection name defined during installation.</p>

Field	Description
Network Location: Server	Specifies the name or IP address of the machine where the database server resides. For Informix®, log into the Informix Server Administrator and select the Configuration > SQLHOST menu option to find the hostname. For Sequelink, enter the name or the IP address of the Sequelink server.
Network Location: Port	Specifies the port number of the database server listener. For Sequelink, enter the port number of the Sequelink server listener.
User Name	Specifies the username that the Integration Appliance uses to connect to the database. Note: For DB2, the user must have the permissions to create a package.
Password	Specifies the password associated with the specified username.
Additional Parameters	Specifies the database-specific information for an endpoint. See <a href="#">Working with Database Parameters</a> for details. By default, the MaxPooledStatements parameter is automatically defined and set with a default value for all types of Database Endpoints.

Note: For some of the fields in the endpoint, you can define configuration properties to supply the values for these fields. The

icon displays when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.

## For Informix Databases

### To find the port number for an Informix database:

1. In an editor, open the following file: `$INFORMIXSERVER/etc/sqlhosts`
2. Note the `servicename` found in the SERVER column.
3. In an editor, open the appropriate file for your system:
  - o UNIX - `/etc/services`
  - o Windows - `\Winnt\system32\drivers\etc\services`
4. In the file, search for the `servicename` to find the associated port number.

## For DB2 AS/400 Databases

For some EBCDIC-US columns on DB2 AS/400, Studio cannot determine the correct size and type.

### To pass an EBCDIC-US encoded parameter:

1. In Studio, open the orchestration containing a Database Connector activity.
2. Change CHAR type columns to VARBINARY type. The EBCDIC-encoded columns display as CHAR type columns in the data type of the outbound connector.
3. Use a map before the Database Connector to pad an EBCDIC-encoded parameter with spaces, so that the value of the parameter equals the length of the column.

For example, if the column length is 10 and the value is "abc", pad the column with 7 spaces.

If the EBCDIC-encoded value is not padded with spaces, the Database Connector pads the value with NULL. This can create inconsistent data and errors can occur.

### To read an EBCDIC-US encoded column from a result set:

1. In Studio, open the orchestration containing the Database Connector Parameterized Query operation.

When you use a parameterized query to select an EBCDIC-encoded column from a database, the Database Connector returns values padded with spaces if the value is shorter than the column length.

For example, if the column length is 10 and the value is "abc", the Database Connector pads the column with 7 spaces.

2. Create a map after the Parameterized Query operation to trim the padded spaces from the XML result set.

## For Oracle RAC:

---

IBM Cast Iron supports additional properties in the connection string that enable Oracle RAC connectivity. Use the following additional properties to connect with Oracle RAC:

1. `AlternateServers=(servername1[:port1]  
[;property=value[;...]],  
servername2[:port2]  
[;property=value[;...]],...)`

Where:

*servername* is the IP address of the server

*port* is the port number of the server

*property=value* enter the ServiceName which is used as the Database Name. Entering a SID is optional.

2. `LoadBalancing=true|false`

Determines whether the driver will use client load balancing in its attempts to connect to a list of database servers, primary and alternate. The list of alternate servers is specified by the `AlternateServers` property. If set to true, client load balancing is used and the driver attempts to connect to the list of database servers, primary and alternate servers, in a random order. If set to false (the default), client load balancing is not used and the driver connects to each server based on their sequential order (primary server first, then, alternate servers in the order they are specified).

3. Use the service name in the Database Name of the end-point.

## Connection Pool, Encoding, TimeOut, and Security Options

---

Default values are provided for the connection pool options. Change them as needed.

Table 2.

Field	Description
Connection Pool Options	
Initial Pool Size	Specifies the initial number of database connections that the Integration Appliance opens and places in the connection pool.

Field	Description
Minimum Connections	Specifies the number of database connections that the Integration Appliance always keeps open in the connection pool. Specifying 0 is supported.
Maximum Connections	Specifies the maximum number of database connections that the Integration Appliance can have open in the connection pool. Specifying 0 means the number of connections is unbounded.
Maximum Idle Time	Specifies the amount of time (in minutes) that a database connection can be open and idle before being closed by the Integration Appliance. Specifying 0 means that the connections are closed when they are returned to the pool - no idle time.
Reclaim Connections	<p>Specifies how often the Integration Appliance checks the connection pool to determine if any connections should be closed. For example, if the Reclaim Connections is set to 6 minutes, the Integration Appliance checks the connection pool every six minutes to determine if the total number of open connections in the pool are greater than the minimum number of connections. If the number of open connections are greater than the specified minimum number, the Integration Appliance closes any excess connections (over the number of Minimum Connections) for any connections that have exceeded the Maximum Idle Time.</p> <p>For example, the Minimum Connections is set to 2, Maximum Connections is set to 6, the Reclaim Connections is 6 minutes, and the Maximum Idle Time set to 2 minutes. A total of five connections are currently open in the connection pool. When the Reclaim Connections of 6 minutes is reached, the Integration Appliance checks the connection pool and determines that one connection has been idle for 3 minutes, one connection has been idle for 4 minutes, and three connections are still active. The Integration Appliance closes the two idle connections. After another 6 minutes, the Integration Appliance checks the connection pool again.</p>
Default Encoding	
Encoding	<p>Specifies the default character Encoding to use when connection to this database. To set the encoding type, choose from one of the following options:</p> <ul style="list-style-type: none"> <li>• From the Encoding drop-down list, select a default encoding type.</li> <li>• Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.</li> </ul> <p>Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see <a href="#">Using the Shift-JIS encoding</a>.</p>
Quoted Identifiers	

Field	Description
Delimit the identifiers for tables, columns, and objects with quotes	Specifies if quotes are used around the identifiers for database tables, columns, and objects in the generated SQL statements that the Integration Appliance and Studio uses to communicate with the database. Quoting an identifier makes the identifier case-sensitive. For example, the identifier string: <code>myTable</code> could refer to table named <code>mytable</code> or <code>MYTABLE</code> but the identifier string with quotes: <code>"myTable"</code> only refers to a table named <code>myTable</code> . Quoting an identifier also allows characters not normally found in database names such as spaces.
Security	
Enable Encryption	Specifies that the connection should use SSL.
Validate Server Certificate	Specifies that the client should validate the database server certificate. See <a href="#">Testing an SSL Database Connection</a> .
Require Client Authentication	Specifies that the client present a certificate to the database server.
Connection Timeout	
Timeout after _____ second(s) when establishing a connection to the Endpoint.	<p>Specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. For a database activity, the amount of time the Integration Appliance attempts to establish a connection to the database before timing out. A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the Endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an Endpoint and the time it takes the Endpoint to respond. You set the activity timeout in <b>Retry</b> task of any of the following database activities:</p> <ul style="list-style-type: none"> <li>• Execute Query Activity, see <a href="#">Execute Query Activity</a>.</li> <li>• Single-Table Inbound Database Activities, see <a href="#">Single-Table Inbound Database Activities</a>.</li> <li>• Single-Table Outbound Database Activities, see <a href="#">Single-Table Outbound Database Activities</a>.</li> <li>• Poll Table Activity Call, see <a href="#">Poll Table Activity</a>.</li> <li>• Procedure Activity, see <a href="#">Call Procedure Activity</a>.</li> </ul>

## Browsing Database Tables

---

Use the Browse Database Tables dialog box to dynamically select a table from the current list of tables in the database specified by the Endpoint.

Studio connects to the database to get the current list of tables from the database.

To select a table choose one of the following options:

- Click on a table in the list and click OK.
- Double-click on a table in the list.

**To change the list of selectable tables, use the following options:**

- To see tables associated with a different schema, select a schema from the Filter by User Schema list.
- To see tables for all schemas, click Clear.
- To filter out any buffer or control tables created using the Web Management Console (WMC) that are used internally by the Integration Appliance during run time check Hide Buffer and Control Tables. The column names in these tables are prefaced by convention with the string: `IH:`

**Parent topic:** [Database Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Browsing\\_Database\\_Tables.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Browsing_Database_Tables.html)

## Character Encodings

---

Set the character encoding at the database level, the table level, or the column or parameter level.

For example, the default encoding for your database might be set to UTF-8 but one table in that database might explicit set the encoding to SHIFT-JIS. One column in this table might have the encoding explicitly set to ISO-8859-1 while all the other columns do not specify the encoding, so they inherit the default encoding of SHIFT-JIS from the table.

The Integration Appliance can convert from type of encoding to another during run time. For example, the orchestration might read in input data from a table with the encoding set to ISO-8859-1 and then write out that data to a column set to UTF-8.

### To set character encodings:

---

- At the **Database** level - Select the encoding type from the Encoding list of the Edit Endpoint or Create Endpoint dialog box.

- At the **Table** level - Select the encoding type from the Encoding list in the Pick Table pane.
- At the **Column** level - Click on the Encoding field for the desired column in the Pick Table pane and select from the list.

See the following below for descriptions of the default character encoding types.

Note: You must leave the encoding field blank for the following binary Datatypes:

- Blob
- Binary
- Varbinary

## To set the encoding type, choose from one of the following options:

- From the Encoding list, select a default encoding type.
- Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.

Some of the default encoding types are listed in the following table:

Table 1.

Encoding	Description
UTF-8	UTF-8 is a standard character encoding for Unicode or ISO-10646. Both of these standards assign a single unique number to each character used in modern languages. This is the default encoding.
US-ASCII	Also known as ASCII, this is the basic character encoding used on Windows and UNIX computers.
ISO-8859-1	Also known as Latin1, this encoding includes ASCII plus characters for many Western European languages.
EBCDIC-C-XML-US	This is the basic character encoding used on IBM® computers. EBCDIC-US, like ASCII, is a US-based character encoding.
SHIFT-JIS	Also known as Katakana, specifies the Japanese language. Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see <a href="#">Using the Shift-JIS encoding</a> .

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db\\_character\\_encodings.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db_character_encodings.html)

## Database Entities and Activities

The following table shows the relationship between the database entities and the different types of database activities. In addition, this table describes how the database entity is created in the database.

Note: For DB2® UDB, the asset generation script limits the names of buffer and control tables to nine characters.

Note: For Generic JDBC Driver connections: The scripts used to generate assets are only a template based on the information available from the database. The scripts should be analyzed to confirm that the SQL syntax and datatypes are supported for the target database. If they are not, the scripts must be modified and run via another mechanism to create the required assets for the database.

Database Entity	Associated Activity Description	How created?
Buffer Tables	<p>Used with the inbound single-table activities: <b>Get Inserted Rows</b>, <b>Get Updated Rows</b>, and <b>Get Deleted Rows</b>. The buffer tables contain the result of a database operation.</p> <p>For example, a <b>Get Inserted Rows</b> activity is polling for an insert on the database. When the insert occurs in the database, the buffer tables are populated with data that was inserted.</p>	<p>The buffer tables used with inbound single-table activities are created using the following procedure:</p> <ol style="list-style-type: none"> <li>1. In the Web Management Console (WMC), go to the Assets screen and execute the scripts.</li> <li>2. From the WMC, deploy the project.</li> </ol>
Control Tables	<p>Used with the following activities when messages are specified to be delivered exactly once:</p> <ul style="list-style-type: none"> <li>• <b>Insert Rows</b></li> <li>• <b>Update Rows</b></li> <li>• <b>Delete Rows</b></li> <li>• <b>Call Procedure</b></li> </ul> <p>Control tables are not needed if another delivery option is specified. Specify a delivery option in the <b>Deliver Rules</b> task of the <b>Checklist</b> for an activity.</p>	<p>The control tables used with activities are created using the following procedure:</p> <ol style="list-style-type: none"> <li>1. In the Web Management Console (WMC), go to the Assets screen and execute the scripts.</li> <li>2. From the WMC, deploy the project.</li> </ol>
Triggers	<p>Used with inbound single-table activities, <b>Get Inserted Rows</b>, <b>Get Updated Rows</b>, and <b>Get Deleted Rows</b>, to populate the buffer table.</p>	<p>The triggers used with inbound single-table activities are created using the following procedure:</p> <ol style="list-style-type: none"> <li>1. In the Web Management Console (WMC), go to the Assets screen and execute the scripts.</li> <li>2. From the WMC, deploy the project.</li> </ol>

Database Entity	Associated Activity Description	How created?
Stored Procedures	Stored procedures are required with the <b>Call Procedure</b> activity.	The stored procedure must be written and installed in the database before you can complete the configuration of the <b>Call Procedure</b> activity in Studio. The stored procedure is not created using the WMC. The database administrator must create the stored procedure directly in the database.
Sequence	Used with inbound single-table activities, <b>Get Inserted Rows</b> , <b>Get Updated Rows</b> , and <b>Get Deleted Rows</b> , for the Oracle database only.	Oracle only - The sequences used with inbound single-table activities are created using the following procedure: <ol style="list-style-type: none"> <li>1. Publish a project with an orchestration that contains the inbound single-table activity to the Integration Appliance from Studio.</li> <li>2. Use the Web Management Console (WMC) to create the sequences in the Oracle database used by the orchestration.</li> <li>3. From the WMC, deploy the project.</li> </ol>

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn\\_ref\\_Connector\\_Prerequisites\\_for\\_Database\\_Operations.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn_ref_Connector_Prerequisites_for_Database_Operations.html)

## Defining Columns for Old Values in Updates

### About this task

The **Get Updated Rows** (inbound) and **Update Rows** (outbound) activities can store both the new value and the original values of the specified columns during run time. For example an **Get Updated Rows** activity could be configured to stored both the original value of `Name` column and the new value of the `Name` column. [Figure 1](#) shows the transfer of example data when the **Get Updated Rows** activity is processed by the Integration Appliance after an update trigger event occurs:

Figure 1. Update old columns

In the Old Value Columns for Updates dialog box, select the columns that you want to store the original values. The Old Value Columns for Updates dialog box is available by clicking Old Values in the **Pick Table** task of the **Checklist** for the **Get Updated Rows** and **Update Rows** activities. By default the name of the column used to store the original values is the original column name prefixed with the string: `old_`. For example if the original column name is called `FirstName`, by default the column used to store the original value of the update operation is called `old_FirstName`. This default name can be changed.

For some projects, you might want to also store the original values of the Primary Keys. For example, if your application actually changes primary key values during update operations as shown in [Figure 2](#).

Figure 2. Example 1

The purpose of the example orchestration is to keep the myInput database table in sync with the myOutput database table. The example orchestration contains a **Get Updated Rows** activity that polls for update events in the myInput table and an **Update Rows** activity that updates the myOutput table.

During run time, an update operation on the myInput database table occurs, changing both the value of the Name column and the primary key value for that row. This update operation is done outside of the integration project. In order for the orchestration to keep the myInput database table in sync with the myOutput database table, it needs access to the original primary key so it knows which row in the myOutput database table to update with the new primary key and the new value for the Name.

The old primary key can be saved to a variable by the **Get Updated Rows** activity to be used later by the **Update Rows** activity when updating the myOutput database table as shown in [Figure 3](#).

Figure 3. Example 2

myInput Database Table

Name	PK	...
HARRY	1	
FRED	2	
<del>NICK MARY</del>	<del>3</del> 4	

The **Update Rows** activity does a update operation to keep the tables in sync. →

myOutput Database Table

Name	PK	...
HARRY	1	
FRED	2	
<del>NICK MARY</del>	<del>3</del> 4

## MaxPooledStatements Parameter

---

The MaxPooledStatements parameter is automatically defined and set with a default value for all types of Database Endpoints.

Attention: Changing the default setting of the MaxPooledStatements parameter can cause reduced performance.

The MaxPooledStatements parameter specifies the maximum number of prepared statements that are cached by the Database Endpoint. When the value of MaxPooledStatements parameter is greater than zero, the Database Endpoint creates a prepared statement pool to store PreparedStatement objects for later reuse. The performance cost of creating new PreparedStatement objects can be expensive, so storing and reusing existing PreparedStatement objects from a pool can result in a performance gain.

## Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MaxPooledStatements\\_Parameter.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MaxPooledStatements_Parameter.html)

# Oracle, Sybase, DB2, and Informix Parameters

---

In the Additional Parameters table of the Database Endpoint, define the connection parameters for Oracle, Sybase, DB2®, or Informix® databases.

:

## Oracle

---

If the **Call Procedure** activity calls an Oracle stored procedure that returns a result set, you must define an Endpoint solely for that connector and add the parameter `procedureresult`. The value for this parameter must be 1.

If an Oracle database table name starts with a number, Studio throws an Invalid Trigger Specification error.

If the project uses database links with the Oracle 8.1.6 database, you must define the `supportLinks` parameter and assign it a value of `true` in the Database Endpoint. By default, the [MaxPooledStatements parameter](#) is automatically defined and set with a default value for an Oracle Database Endpoint.

## DB2

---

For the DB2 database, you must define the following two parameters:

- `LocationName` - Enter the location name defined during installation for the AS/400 DB2 database. Not required for UDB.
- `PackageCollection` - The value of this field depends on the system type of the DB2 database:
  - AS/400 - Enter the collection name.
  - UDB - Enter the name of the DB2 Database.

Note: The DB2 user must have the permissions to create a package.

By default, the [MaxPooledStatements parameter](#) is automatically defined and set with a default value for a DB2 Database Endpoint.

## Informix

---

You must define the `InformixServer` parameter.

To find the Informix Server name search the `onconfig` file for `DBSERVERNAME` and specify its value for the `InformixServer` parameter.

By default, the [MaxPooledStatements parameter](#) is automatically defined and set with a default value for an Informix Database Endpoint.

## Sybase

---

For a Sybase Endpoint, the `OverwriteCharLimits` parameter is automatically defined and set to the value of 32768. This parameter defines the size of character columns, for example: `vchars` and `chars`.

By default, the [MaxPooledStatements parameter](#) is automatically defined and set with a default value for a Sybase Database Endpoint.

## Retry Options For Inbound Database Activities

---

This section contains the procedure for configuring the retry options for the following inbound database activities: **Get Inserted Rows** activity, **Get Updated Rows** activity, **Get Deleted Rows** activity, and **Poll Table** activity.

### Specify the retry options for inbound database activities

---

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to a database. The following table describes the retry options for connecting to a database:

Table 1.

Field	Description
Retry	
1) Wait --- secon d(s) betwe en each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the database.

Field	Description
2) Try to connect ___ times before failing .	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the database before issuing an error.</p> <ul style="list-style-type: none"> <li>○ If this parameter is set to "0", Studio does not try to reconnect.</li> <li>○ If this parameter is set to a value less than "0", Studio retries the connection indefinitely.</li> </ul> <p>If an orchestration that starts with an inbound database activity is deployed and the Integration Appliance cannot connect to the specified database, the Integration Appliance logs the connections errors as Warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system log, resets the connection error count to zero, and continues to attempt to establish a connection to the database.</p> <p>For example: the retry count is set to 3. The first, second, and third connection errors are shown in the system log as Warnings. The Integration Appliance logs the fourth connection error as an Error and resets the connection error count to zero. Therefore, the fifth connection error generates a Warning in the system log. The Integration Appliance continues to attempt to establish a connection to the database.</p>
Activity Timeout	
3) Time out after ___ seconds when the Endpoint does not respond to a request.	<p>Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For example, the amount of time the Integration Appliance waits for a response from the database after requesting that database polls for an INSERT trigger event, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the Endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. Set the connection timeout in Database Endpoint tab. For more information about connection timeouts, see <a href="#">Creating or Editing a Database Activity Endpoint</a>.</p>

## Retry Options For Outbound Database Activities

This section contains the procedure for configuring the retry options for the following outbound database activities: **Execute Query** activity, **Insert Rows** activity, **Update Rows** activity, **Delete Rows** activity, and **Call Procedure** activity

### Specify the retry options for outbound database activities

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to a database. The following table describes the retry options for connecting to a database:

Table 1.

Field	Description
Retry	
1) Wait --- second(s) between each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the database.
2) Try to connect ___ times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the database before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains the outbound database activity and the Integration Appliance cannot connect to the specified database, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, the retry count is set to 3. The first, second, and third connection errors are shown in the system log as Warnings. The Integration Appliance logs the fourth connection error as an Error and stops processing the current orchestration job.</p> <p>Note: For the Database Execute Query activity, if you set this parameter to zero, the Integration Appliance retries the connection indefinitely.</p>
Activity Timeout	

Field	Description
3) Time out after ____ secon ds when the Endpoi nt does not respon d to a reques t.	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For example, the amount of time that the Integration Appliance waits for a response from the database after requesting an Insert, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the Endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. Set the connection timeout in the Database Endpoint tab. For more information about connection timeouts, see <a href="#">Creating or Editing a Database Activity Endpoint</a> .

## SequeLink Parameters

---

The various parameters for a Sequelink Endpoint are listed in this section. Some parameters require that a **Parameter Value** is specified. You can also add additional parameters.

Note: When you specify SequeLink Server as the **Database Type** for an endpoint, the parameters listed in this section in bold display in the Additional Parameters table of the Endpoint pane.

### MaxPooledStatements

---

By default, the [MaxPooledStatements parameter](#) is automatically defined and set with a default value for a SequeLink Database Endpoint.

### ServerDataSource

---

This parameter is required. You must enter the Data Source Name in the **Parameter Value** field. The Data Source Name is specified in the Data Source Settings in the Sequelink Manager.

### BaseDatabaseType

---

Enter the string: OTHERS.

## DBLogonId

---

Enter the name of the user account to use to access this database. This is an optional parameter that duplicates the User Name property of the endpoint. Use this parameter if your SequeLink Server requires it. You must also complete the DBPassword parameter.

## DBPassword

---

Enter the password for the account specified in DBLogonId. This is an optional parameter that duplicates the Password property of the endpoint. Use this parameter if your SequeLink Server requires it.

## HLogonID

---

Enter the login or user name to use to access the host where the SequeLink Server is installed. This is an optional parameter that is only required if the SequeLink Server requires host authentication. You must also specify the HPassword parameter.

## HPassword

---

Enter the password to use to access the host where the SequeLink Server is installed. This is an optional parameter that is only required if the SequeLink Server requires host authentication.

## Single-Table Inbound Database Activities

---

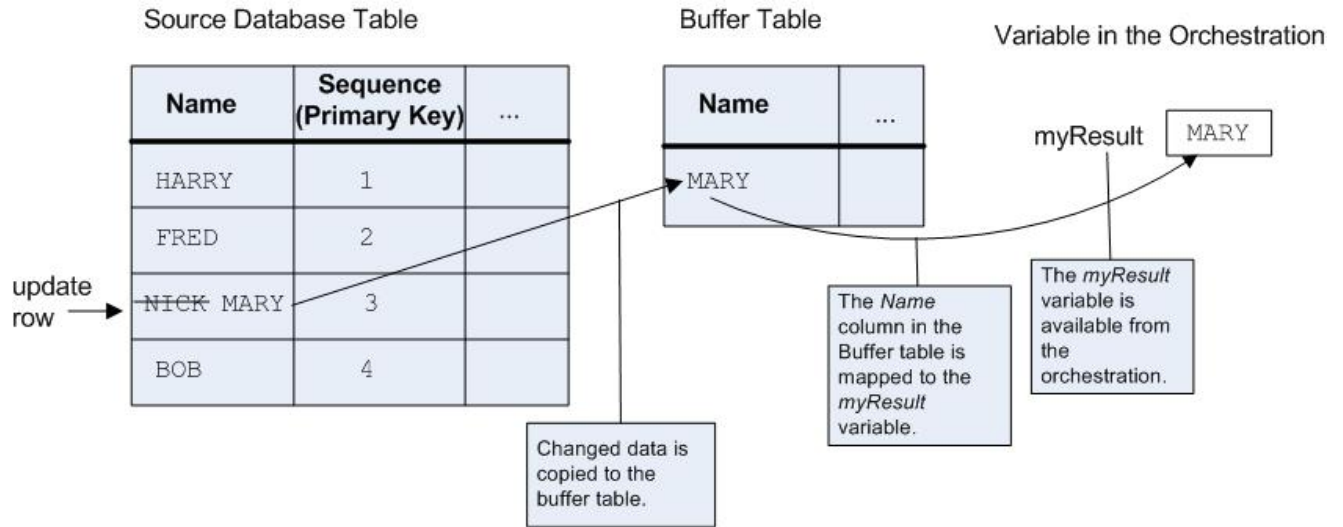

During run time, single-table inbound database activities poll if a database operation has occurred on any rows in the specified columns of a database table at the specified time interval.

This section contains the procedures for configuring the following single-table inbound database activities:

- **Get Inserted Rows** - During run time, the **Get Inserted Rows** activity polls for rows being added to the buffer table from an INSERT trigger event. The Get Inserted Rows activity then maps the buffer data to variable or variables.
- **Get Updated Rows** - During run time, the **Get Updated Rows** activity polls for rows being added to the buffer table from a UPDATE trigger event. The Get Updated Rows activity then maps the buffer data to variable or variables.

- **Get Deleted Rows** - During run time, the **Get Deleted Rows** activity polls for rows being added to the buffer table from a DELETE trigger event. The Get Deleted Rows activity then maps the buffer data to variable or variables.

Figure 1 shows the transfer of example data in the UPDATE trigger event and the **Get Updated Rows** activity:  
Figure 1. UPDATE trigger example

After publishing your orchestration with an inbound database activity to the Integration Appliance, you must create the buffer table and triggers using the Web Management Console (WMC) before the orchestration is deployed. For the Oracle database, you must also create a sequence using the WMC.

## No Activity for that Operation Run-time Error

If an orchestration accesses a buffer table containing a row for an activity that is currently not present in the orchestration, the orchestration fails and following error is reported during run time:

The buffer table contains the *OperType* operation but there is no activity in the orchestration for that operation.

Where *OperType* is type of operation; for example, INSERT. The values of the IH\_OPERATION\_NAME column in the buffer table for the orchestration must be consistent with the database activities in the orchestration. For example, if a row in the buffer table contains the value: INSERT in the IH\_OPERATION\_NAME column but the orchestration does not contain a **Get Inserted Rows** activity, this error is reported. Each orchestration must have a separate buffer table. In addition, the triggers in the source table must be consistent with database operations specified in the buffer table. For example if the orchestration only contains a single inbound **Get Updated Rows** activity, the source database table must only contain a UPDATE trigger.

## Add a single-table inbound database activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the Database folder.
3. Drag the desired single-table inbound database activity (**Get Inserted Rows**, **Get Deleted Rows**, or **Get Updated Rows**) onto the orchestration.
4. Select the activity.

## Create, select, or edit a database endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.

- b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint, see [Creating or editing an HTTP endpoint](#).

## Select the columns in the source database table that during run time the Integration Appliance polls for changes

---

1. Click Pick Table from the **Checklist**. The Pick Table pane is displayed.
2. Click Browse... to select the database table that is to be the source for inbound messages. The Browse Database Tables dialog box is displayed.
3. Select a table from the list and click OK. Column information for the selected table is displayed in the Pick Table pane.
4. If the character encoding for this table is different from the encoding for the database, enter another encoding using one of the following options:
  - o From the Encoding list, select one of the default encoding types.
  - o Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.

This sets the encoding for all the columns of the resulting buffer table.

Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see [Using the Shift-JIS encoding](#).
5. By default all columns in the source table are selected. Clear the Use check box to remove a column from resulting buffer table. Click Use All to reselect all the columns.
6. Click in the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click the Column Name heading of the column. An arrow is displayed to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with **a** and continuing to **z**. A down arrow indicates the column is sorted by reverse alphabetic order starting with **z** and continuing to **a**. Click the arrow to reverse the alphabetic order.
7. For the **Get Updated Rows** activity only - if you want the resulting buffer table to contain both the new values and the original values of the updated columns follow these steps:
  - a. Click Old Values. The Old Value Columns for Updates dialog box displays.
  - b. Select the Store check box for the database columns that you want to save the original values.
  - c. You can change the default names assigned to columns to store the original values. Double-click the appropriate Column Name to Store Old Value cell.
  - d. Click OK. The selected columns are displayed in the From Activity of the Map Outputs pane prefixed with the string: `old_`. You can map both the new and original values from the Map Outputs pane.

Note: For more information see [Defining Columns for Old Values in Updates](#).

8. If necessary, change the settings of the Data Type, Encoding, or Nullable values. Click the field to make a new selection.
  - o Data Type - Defaults to the data type for the column in the source database table. If the required data type for the column in the buffer table is different from the data type of the source table, select a different data type by clicking in the Data Type cell and selecting another Data Type from the list. You must select an appropriate data type for those data types that are marked UNSUPPORTED.

Note: For the XMLTYPE data type in an Oracle database and the MONEY data types in a SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.

Attention: You must select a compatible data type with the source data type to avoid invalid data during run time. For example, do not select the SMALLINT data type for the buffer table if the

- source data type is INTEGER because during run time a large number stored in an INTEGER column will not convert correctly to the SMALLINT data type.
- o Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable.
  - o Encoding - Defaults to current default encoding that was set either at the database level or the table level. If the required encoding for the column is different from the current default encoding, select another encoding by clicking in the Encoding cell and selecting another Encoding from the list.
  - o Nullable - Defaults to the nullable setting for the column in the source database table. The Use check box must be selected for those columns where `nullable=false`. A column marked `nullable=false` cannot not contain a null during run time.
9. Click Reset to reset all column properties to their defaults. This also resets the Use check box for all columns.
  10. Click Refresh to update the list of columns in reference to the latest state of the source database. Recent changes to the source is updated in this pane.
  11. Configure the [Specifying Delivery Rules for Database Activities](#).  
Note: If you select the Exactly once option in the **Delivery Rules** task, you must create control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.  
Note: If you select the Exactly Once option, you must enable persistence. For more information, see [Enabling persistence](#).
  12. Configure the retry options. For more information, see [Retry Options For Inbound Database Activities](#).

## Map the output of the activity

---

1. Select the **Map Outputs** task in the **Checklist**.

The output parameters for the activity are displayed under the rows element in the From Activity pane. The output parameters displayed in the From Activity pane correspond to the columns you selected in the **Pick Table** task. If the Batch option was selected in **Delivery Rules**, the multiple occurrences symbol displays next to the row element.

Note: For the **Get Updated Rows** activity only, if some columns were selected in the Old Values Columns for Updates dialog box (in the **Pick Table** task), these additional output parameters (by default prefixed with the string: `old_`) also display under the rows element. You must map all the old value columns visible in the Map Outputs pane.

2. Map the required output parameters to variable or variables. See [Creating a map](#) for general instructions on mapping. You are not required to map the output parameters for these activities.  
Note: After publishing your orchestration with an inbound database activity to the Integration Appliance, you must create the buffer table using the Web Management Console (WMC) before the orchestration is deployed.

## Single-Table Outbound Database Activities

This section contains the procedures for configuring the following single-table outbound database activities.

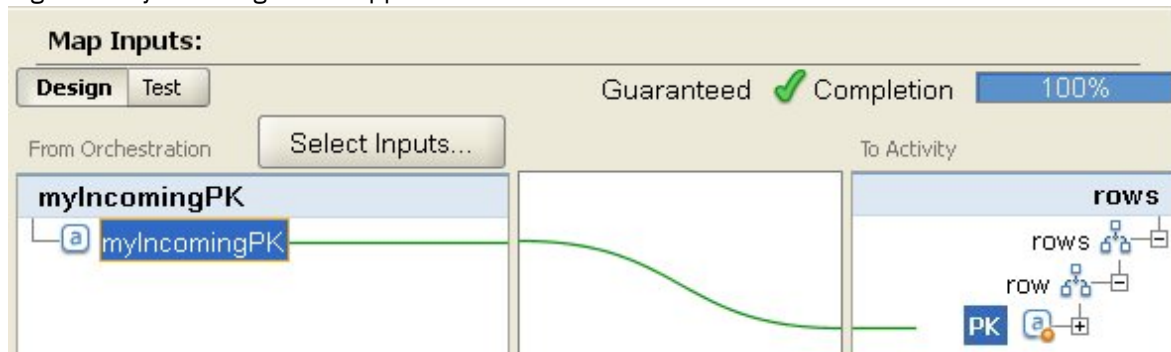

These activities include:

- **Insert Rows** - This activity takes data from variable or variables that are mapped to the input parameters of the activity and inserts this data as rows into the specified database table.
- **Update Rows** - This activity takes data from variable or variables that are mapped to the input parameters of the activity and updates the rows of the specified database table with this new data.
- **Delete Rows** - This activity takes data from variable or variables that are mapped to the input parameters of the activity and deletes rows of the specified database table based on this data.

For the **Update Rows** and the **Delete Rows** activities, the Integration Appliance integrates the database table to determine which columns in the table are primary key columns. When the **Update Rows** or the **Delete Rows** activities are started during run time, the Integration Appliance uses the value of the incoming variable that contains the primary key number to determine which rows to update or delete.

For example, the `PK` column is defined in the database as being a primary key column for the database table. The Use check box is selected for the `PK` column in the **Pick Table** task of the **Checklist** for the **Delete Rows** activity. In the Map Inputs pane of the **Delete Rows** activity, the variable called `myIncomingPK` is mapped to the `PK` element of the row as shown in [Figure 1](#):

Figure 1. `myIncomingPK` is mapped to the `PK` element of the row

During run time, if the value of the `myIncomingPK` variable is equal to 3 the row with the `PK` equal to 3 is deleted from the table as shown in [Figure 2](#):

Figure 2. The row with the primary key equal to 3 is deleted

## Variables in the Orchestration

myIncomingPK

3

The row with the primary key equal to 3 is deleted from the table.

Name	PK	...
HARRY	1	
FRED	2	
<del>MARY</del>	<del>3</del>	

The PK column is defined as a primary key column in the database.

If no primary key columns are specified in the **Pick Table** task of the **Checklist**, specify at least one column to act like the primary key. Specify acting primary key column or columns using the Configure Primary Keys dialog box, available by clicking Keys in the **Pick Table** task of the **Checklist** for the **Delete Rows** and **Update Rows** activities. If no primary keys are specified in the database table or selected as acting primary keys in the Configure Primary Keys dialog box, all the rows of the database table are affected by the delete or the update operation.

You can also use the Configure Primary Keys dialog box to specify additional columns to act as primary key columns. For example for the table in the preceding figure, you could define that the `Name` column should act like primary key column in addition to the `PK` primary column that was defined in the database as being a primary key column.

## Add a single-table outbound database activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the Database folder.
3. Drag the wanted single-table outbound database activity (**Insert Rows**, **Delete Rows**, or **Update Rows**) onto the orchestration.
4. Select the activity.

## Create, select, or edit a database endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - o Create an endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an HTTP endpoint, see [Creating or editing an HTTP endpoint](#).

## Select the columns in the source database table that during run time the Integration Appliance polls for changes

1. Click Pick Table from the **Checklist**. The Pick Table pane is displayed.
2. Click Browse... to select the database table that is to be the source for inbound messages. The Browse Database Tables dialog box is displayed.
3. Select a table from the list and click OK. Column information for the selected table is displayed in the Pick Table pane.
4. If the character encoding for this table is different from the encoding for the database, enter another encoding using one of the following options:
  - o From the Encoding list, select one of the default encoding types.
  - o Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.

This sets the encoding for all the columns of the resulting buffer table.

Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see [Using the Shift-JIS encoding](#).

5. By default all columns in the source table are selected. Clear the Use check box to remove a column from resulting buffer table. Click Use All to reselect all the columns.
6. Click in the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click the Column Name heading of the column. An arrow is displayed to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with **a** and continuing to **z**. A down arrow indicates the column is sorted by reverse alphabetic order starting with **z** and continuing to **a**. Click the arrow to reverse the alphabetic order.
7. For the **Get Updated Rows** activity only - if you want the resulting buffer table to contain both the new values and the original values of the updated columns follow these steps:
  - a. Click Old Values. The Old Value Columns for Updates dialog box displays.
  - b. Select the Store check box for the database columns that you want to save the original values.
  - c. You can change the default names assigned to columns to store the original values. Double-click the appropriate Column Name to Store Old Value cell.
  - d. Click OK. The selected columns are displayed in the From Activity of the Map Outputs pane prefixed with the string: `old_`. You can map both the new and original values from the Map Outputs pane.

Note: For more information see [Defining Columns for Old Values in Updates](#).

8. If necessary, change the settings of the Data Type, Encoding, or Nullable values. Click the field to make a new selection.
  - o Data Type - Defaults to the data type for the column in the source database table. If the required data type for the column in the buffer table is different from the data type of the source table, select a different data type by clicking in the Data Type cell and selecting another Data Type from the list. You must select an appropriate data type for those data types that are marked UNSUPPORTED.
 

Note: For the XMLTYPE data type in an Oracle database and the MONEY data types in a SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.

Attention: You must select a compatible data type with the source data type to avoid invalid data during run time. For example, do not select the SMALLINT data type for the buffer table if the source data type is INTEGER because during run time a large number stored in an INTEGER column will not convert correctly to the SMALLINT data type.
  - o Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable.
  - o Encoding - Defaults to current default encoding that was set either at the database level or the table level. If the required encoding for the column is different from the current default encoding, select another encoding by clicking in the Encoding cell and selecting another Encoding from the list.
  - o Nullable - Defaults to the nullable setting for the column in the source database table. The Use check box must be selected for those columns where `nullable=false`. A column marked `nullable=false` cannot not contain a null during run time.

9. Click Reset to reset all column properties to their defaults. This also resets the Use check box for all columns.
10. Click Refresh to update the list of columns in reference to the latest state of the source database. Recent changes to the source are updated in this pane.
11. Configure the [Specifying Delivery Rules for Database Activities](#).  
 Note: If you select the Exactly once option in the **Delivery Rules** task, you must create control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.  
 Note: If you select the Exactly Once option, you must enable persistence. For more information, see [Enabling persistence](#).
12. Configure the retry options. For more information, see [Retry Options For Inbound Database Activities](#).

## Specify the target database table for the activity

---

1. Click Pick Table from the **Checklist**. The Pick Table pane is displayed.
2. Click Browse... to select the target database table. The Browse Database Tables dialog box is displayed.
3. Select a table from the list and click OK. Column information for the selected table is displayed in the Pick Table pane.
4. If the character encoding for this table is different from the encoding for the database, enter another encoding using one of the following options:
  - o From the Encoding list, select one of the default encoding types.
  - o Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.

This sets the encoding for all the columns of the resulting buffer table.

Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see [Using the Shift-JIS encoding](#).

5. By default all columns in the source table are selected. Clear the Use check box to remove a column from resulting buffer table. If a column is not selected, it is not displayed in the Map Inputs pane and is not updated at run time. Click Use All to reselect all the columns.
6. Click in the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click the Column Name heading of the column. An arrow is displayed to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with **a** and continuing to **z**. A down arrow indicates the column is sorted by reverse alphabetic order starting with **z** and continuing to **a**. Click the arrow to reverse the alphabetic order.
7. If necessary, change the settings of the Data Type, Encoding, or Nullable values. Click the field to make a new selection.
  - o Data Type - Defaults to the data type for the column in the source database table. If the wanted data type for the column in the buffer table is different from the data type of the source table, select a different data type by clicking in the Data Type cell and selecting another Data Type from the list. You must select an appropriate data type for those data types that are marked UNSUPPORTED.  
 Note: For the XMLTYPE data type in an Oracle database and the MONEY data types in a SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.  
 Attention: You must select a compatible data type with the source data type to avoid invalid data during run time. For example, do not select the SMALLINT data type for the buffer table if the source data type is INTEGER because during run time a large number stored in an INTEGER column is not converted correctly to the SMALLINT data type.
  - o Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable.
  - o Encoding - Defaults to current default encoding that was set either at the database level or the table level. If the wanted encoding for the column is different from the current default encoding,

- select another encoding by clicking in the Encoding cell and selecting another Encoding from the list.
  - o Nullable - Defaults to the nullable setting for the column in the source database table. The Use check box must be selected for those columns where `nullable=false`. A column marked `nullable=false` cannot not contain a null during run time.
8. Click Reset to reset all column properties to their defaults. This also resets the Use check box for all columns.
  9. Click Refresh to update the list of columns in reference to the latest state of the source database. Recent changes to the source are updated in this pane.
  10. For the **Update Rows** activity only - Select the Insert row if row does not already exist check box, if during run time you want the **Update Rows** activity to first try and update the specified row but if the row does not exist, insert the row into the database table.
  11. For the **Update Rows** activity only - if you want to save both the new values and the original values in the database, follow these steps:
    - a. Click Old Values. The Old Value Columns for Updates dialog box is displayed.
    - b. Select the Store check box for the database columns that you want to save the original values.
    - c. You can change the default names assigned to columns that store the original values during run time. Double-click in the appropriate Column Name to Store Old Value cell.
    - d. Click OK. The selected columns are displayed in the To Activity of the Map Outputs pane prefixed with the string: `old_`. You can map to both the new and original values from the Map Outputs pane.

Note: For more information see [Defining Columns for Old Values in Updates](#).
  12. For the **Update Rows** or **Delete Rows** activities only - To specify acting primary key columns in addition to any primary key columns already defined by the database, follow these steps:
    - a. Click Keys. The Configure Primary Keys dialog box is displayed.
    - b. To specify a column as an acting primary key column, click the column then click `>>`.
    - c. Click OK.

Note: If no primary keys columns (as defined by the database) were specified in the **Pick Table** task of the **Checklist**, you must specify at least one column as an acting primary key column.  
Repeat this step to specify more acting primary key columns.
  13. Configure the [Specifying Delivery Rules for Database Activities](#).  
Note: If you select the Exactly once option in the **Delivery Rules** task, you must create control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.  
Note: If you select the Exactly Once option, you must enable persistence. For more information, see [Enabling persistence](#).
  14. Configure the retry options. For more information, see [Retry Options For Outbound Database Activities](#).

## Map the input of the activity

---

1. Select the **Map Inputs** task in the **Checklist**.  
The input parameters for the activity are displayed under the row element in the To Activity pane. The input parameters displayed in the From Activity pane correspond to the columns you selected in the **Pick Table** task. If the Batch Multiple Rows Per Message check box was selected in **Delivery Rules**, the multiple occurrences symbol displays next to the row element.  
Note: For the **Get Updated Rows** activity only, if columns were selected in the Old Values Columns for Updates dialog box (in the **Pick Table** task), these additional output parameters (by default prefixed with the string: `old_`) also display under the rows element.
2. Map all the input parameters. See [Creating a map](#) for general instructions on mapping. You must map all the input parameters of the activity.

## Map the output of the activity

---

1. Select the **Map Outputs** task in the **Checklist**.

The GetRowCount check box determines what is displayed in the Map Outputs pane:

- o If the Get Row Counts check box is cleared in the **Delivery Rules**, the Map Outputs pane is blank.
  - o If the Get Row Counts check box is selected in the **Delivery Rules**, the Map Outputs pane displays the rowCount element. If the Batch Multiple Rows Per Message check box is selected in the **Delivery Rules**, the multiple occurrences symbol is displayed next to the rowCount element.
2. If the RowCount output parameter is displayed, map the RowCount output parameter if wanted. See [Creating a map](#) for general instructions on mapping. You are not required to map the output parameters of the activity.

**Parent topic:** [Database Activities](#)

---

## Feedback | Notices

 Last updated: Wednesday, 15 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db\\_singletable\\_outbound\\_database\\_activities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db_singletable_outbound_database_activities.html)

# Specifying Delivery Rules for Database Activities

---

Specify how messages will be delivered at the Delivery Rules pane.

The delivery rules for inbound and outbound activities differ, as described in the following sections.

## Specify the delivery rules for inbound database activities

---

1. Select the **Delivery Rules** task from the **Checklist**.
2. Configure the Delivery rules as described in the following table which describes the delivery rules for the inbound database activities (**Get Inserted Rows**, **Get Updated Rows**, **Get Deleted Rows**, and **Poll Table**):

Table 1.

Name	Description
Polling Interval	Specifies the time interval to poll for changes in database. For example, the <b>Get Inserted Rows</b> activity polls for INSERT trigger events at the specified time interval. For more information, see <a href="#">Polling interval behavior</a> .
Fetch size	Specifies how many rows the activity should retrieve from the buffer table at one time. The default is 500 rows per poll. The range is 1 - 10,000. Note: To improve performance, set the Fetch Size to the maximum number of rows you expect to retrieve from the buffer table.
Batch	Specifies the number of rows to batch into a single message. By default, batching is turned off (the Batch check box is not selected). To turn on batching, select the Batch check box then specify the number of rows to batch. The range is 1 - 10,000. If the Batch check box is selected in <b>Delivery Rules</b> , then the multiple occurrences symbol displays next to the row element in the From Activity pane of the <b>Map Outputs</b> task of the inbound activity.

Name	Description
Deliver Messages	<p>Select from one of the following options in the Deliver messages pull-down menu:</p> <ul style="list-style-type: none"> <li>◦ <b>At least once</b> - Specifies the message will be delivered at least once, but can be delivered more than once. This delivery option is typically used when the receiving system can detect or tolerate duplicate messages.</li> <li>◦ <b>Exactly once</b> - Specifies the message will be delivered once and only once. If the Exactly once option is selected and the database is Sybase, the OverwriteCharLimits parameter must be set in the endpoint. For more information, see <a href="#">Oracle, Sybase, DB2, and Informix Parameters</a>.</li> </ul> <p>Note: If you select the Exactly once option, you must create some control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.</p> <p>Note: If you select the Exactly Once option, you must enable persistence. For more information, see <a href="#">Enabling persistence</a>.</p>
Delete rows after they have been processed	<p>This check box is displayed only for the <b>Custom Poll</b> activity. The Delete rows after they have been processed check box is used by the Integration Appliance to determine the action for a delete request while running a <b>Poll Table</b> activity:</p> <ul style="list-style-type: none"> <li>◦ If the check box is enabled, during run time the Integration Appliance sets the flag column to <b>M</b> and then deletes the row.</li> <li>◦ If the check box is cleared, during run time the Integration Appliance sets the flag column to <b>M</b> and then <b>P</b> but the row is not deleted.</li> </ul>

## Specify the delivery rules for outbound database activities

1. Select the **Delivery Rules** task from the **Checklist**.
2. Configure the Delivery rules as described in the following table, which describes the deliver rules for the outbound database activities (**Insert Rows, Update Rows, Delete Rows, Call Procedure**):

Table 2.

Name	Description
Deliver Messages	<p>Select from one of the following options in the Deliver messages menu:</p> <ul style="list-style-type: none"> <li>◦ <b>At least once</b> - Specifies the message will be delivered at least once, but can be delivered more than once. This delivery option is typically used when the receiving system can detect or tolerate duplicate messages.</li> <li>◦ <b>Exactly once</b> - Specifies the message will be delivered only once.</li> </ul> <p>Note: If you select the <b>Exactly once</b> option, you must create some control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.</p>
Batch __ rows at a time	<p>Specifies if the database operations on rows should be batched and how many rows to process by the database operation at one time. For example, if the size of the batch is set to 20 but 100 rows are processed by a database insert, 5 messages of size 20 are sent from the Integration Appliance to the database and then the final database commit message is sent.</p> <p>If the Batch __ rows at a time check box is selected in <b>Delivery Rules</b>, the multiple occurrences symbol displays next to the row element in the To Activity pane of the <b>Map Inputs</b> task of the outbound activity.</p>

Name	Description
Get Row Counts	Not available for the <b>Call Procedure</b> activity - This check box specifies that during run time the activity returns how many rows were processed per transaction. If the Get Rows Counts check box is selected, the rowCount is available in the From Activity pane of the Map Outputs pane of the outbound activity.

## Viewing Column Details

---

The View Column dialog box allows you to see detailed column information for tables as you enter a SQL statement in the **Enter Query** task of the **Checklist** for the **Execute Query** activity. This task describes how to access the View Column Details dialog box.

### Procedure

---

1. Create or open an **Execute Query** activity.
2. Select the **Enter Query** task from the **Checklist**. The Enter Query pane is displayed.
3. Click View Columns. The View Columns dialog box is displayed.
4. To change the data viewed in the View Columns dialog box, select from the following options:
  - o To see detailed column information, select a table in the list. Column names, datatypes, sizes, and nullable properties display in the right pane.
  - o To see tables in a different schema, select a schema from the Filter by User Schema list.
  - o To see tables for all schemas, click Clear.
  - o To filter out any buffer or control tables created by the Web Management Console (WMC) that are used internally by the Integration Appliance, select the Hide Buffer and Control Tables option. Note: This filter only hides buffer and control tables that use the standard names generated in scripts from Studio.

# Working with Database Parameters

---

Parameters supply database-specific connection information for an endpoint.

## About this task

---

You can add and delete database parameters and edit parameter values as described in the following procedures.

To add a parameter to the endpoint:

## Procedure

---

1. In the Project tab, click an Endpoint.
2. Click Add. The Database Endpoint Parameters dialog box is displayed.
3. Type the name of a new parameter in the Parameter Name field.
4. Type a value for the parameter in the Parameter Value field.
5. Click OK.

## Results

---

To delete a parameter from the endpoint:

1. In the Project tab, click an Endpoint.
2. Click the Parameter Name of the parameter to be deleted.
3. Click Delete.

To edit a parameter value:

1. In the Project tab, click an Endpoint.
2. Click the Parameter Value to be changed, and enter a new value in the field.
3. Press Enter.

**Parent topic:** [Database Activities](#)

---

### Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn\\_db\\_Working\\_with\\_DB\\_Parms.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn_db_Working_with_DB_Parms.html)

## Call Procedure Activity

---

During run time, the Call Procedure activity runs a stored procedure in a database. The stored procedure must be written and installed in the database before you can complete the configuration of the Call Procedure activity in Studio.

Note: Function name overloading for stored procedures in the Informix® database is not supported. Stored procedures cannot have the same name in Informix even if their signatures are unique. The steps for adding and configuring a Call Procedure activity to an orchestration are described in the following procedures:

- [Add a Call Procedure activity to the orchestration](#)
- [Create, select, or edit a database endpoint](#)
- [Configure a Call Procedure activity](#)
- [Map the input of the activity](#)
- [Map the output of the activity](#)

## Add a Call Procedure activity to the orchestration

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration opens.
2. Select the Activities tab and expand the Database folder.
3. Drag the Call Procedure activity onto the orchestration.
4. Select the Call Procedure activity.

## Create, select, or edit a database endpoint

---

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer opens.
    - b. Select an existing endpoint and click OK. Skip to the [Configure a Call Procedure activity](#) activity procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer opens.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane shows.
  - o Create a new endpoint:
    - a. Select New. The Create Endpoint pane opens.
2. [Create or edit a database endpoint](#)

## Configure a Call Procedure activity

---

1. Click Stored Procedure from the Checklist. The Stored Procedure pane opens.
2. Click Browse... The Browse Stored Procedures dialog box shows.
3. To see all the stored procedures in the database and not just those visible with the selected user schema, click Clear.
4. Select a Stored Procedure from the list.
5. Click OK. Parameter information for the selected stored procedure displays in the Stored Procedure pane.

Note: Deleting stored procedure call parameters from the middle of the parameter list is not supported. If you want to specify parameters in a different order than they are displayed in the list, you can create a wrapper stored procedure (for example, *WrapperStoredProcedure1*) that doesn't have gaps in parameters (that is, contains the exact subset of the parameters needed), then have the new stored procedure call the underlying stored procedure (for example: *BackendStoredProcedure1*) using the `@parameter = value` form supported by the Microsoft SQL Server. You can then have your orchestration use the wrapper stored procedure with only the parameters needed. Alternatively, you can provide the full set of parameters without omissions and default values in Studio for the original underlying stored procedure (for example, *BackendStoredProcedure1*). Note that while deleting stored procedure call parameters from the middle of a parameter list is not supported, parameters displayed at the end of a parameter list can be deleted.

6. To change the current character encoding (originally obtained from the database endpoint), select a different [encoding](#) option from the Encoding list. This changes the default character encoding for all the input parameters of the stored procedure.
7. By default, all the input and output (`IN`, `INOUT`, `RETURN`, `OUT`) parameters of the stored procedure are selected. You do not need to include all the input and output parameters defined for a stored procedure. Clearing the Use check box for an output parameter (`INOUT`, `RETURN`, `OUT`) means that the output parameter is not available in the Map Inputs task. Clearing the Use check box for an input parameter (`IN`, `INOUT`) means that the input parameter is not available in the Map Inputs task. Clear the Use check box only for input parameters that you do not need to specify input values at run time. Some input parameters of the stored procedure may have default values.

Most databases only return a single return parameter. For these databases, if the Use check box is selected for the return parameter, the return value is returned in the single results/result/RETURN\_VALUE node in the From Activity pane of the Map Outputs task. The Informix database, however, supports multiple return parameters and for the Informix database, the return parameters are returned in the repeating results/result/result/resultsSets/any node. Even if one parameter is returned from the stored procedure, the return parameter is returned in the results/result/result/resultsSets/any node. Use the [CopyOf function](#) in the map to copy the contents of the result node (including the child node called resultSet) to a variable. In order for the CopyOf function to correctly copy the values of the source nodes to the destination nodes, the XML Schema of the destination variable must match the XML Schema of the source node. For more information, see [CopyOf function](#).

8. Click the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click in the Column Name heading of the column. An arrow shows to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with a and continuing to z. A down arrow indicates the column is sorted by reverse alphabetic order starting with z and continuing to a. Click the arrow to reverse the alphabetic order.
9. If necessary, change the settings of the Data type, Encoding, or Nullable values for each query input parameter. Click the field to make a new selection:
  - Data Type - Defaults to the Data Type of the parameter. Select an alternate data type for the parameter by clicking in the Data Type cell and selecting another Data Type from the list. from the corresponding cell. You must change any data types that are `UNSUPPORTED`.  
Note: (for MONEY and XMLTYPE data types) For the XMLTYPE data type in an Oracle database and the MONEY data types in an SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.
  - Encoding - Defaults to current default encoding that was set either at the database level or the table level. If the required encoding for the parameter is different from the current default encoding, select another encoding by clicking in the Encoding cell and selecting another [Encoding](#) from the list.
  - Size — Size of the column defined in the table. This size is retrieved from the database table and is not configurable.
10. Click Reset to reset all parameter properties to their defaults. This also selects the Use option for all parameters.
11. Configure [Delivery Rules](#).  
Note: If you select the Exactly once option in the Delivery Rules task, you must create control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.  
Note: If you select the Exactly once option, you must enable persistence. For more information, see [Enabling Persistence](#).
12. Configure the [Retry Options](#).

## Map the input of the activity

---

1. Select the Map Inputs task in the Checklist. The input parameters for the activity are displayed under the calls element in the To Activity pane. The input parameters displayed in the To Activity pane correspond to the IN and INOUT parameters you selected in the Stored Procedure task. If the Batch Multiple Rows Per Message check box is selected in the Delivery Rules, the multiple occurrences icon displays next to the call element.
2. Map all the displayed input parameters. See [Creating a map](#) for general instructions on mapping.

## Map the output of the activity

---

1. Select the Map Outputs task in the Checklist. The output parameters for the activity are displayed under the results element in the From Activity pane. The output parameters displayed in the From Activity pane correspond to the OUT, RETURN, and INOUT parameters you selected in the Stored Procedure task.

If the Batch Multiple Rows Per Message check box is selected in the Delivery Rules, the multiple occurrences icon displays next to the result element.

A repeating node called resultSet displays in the From Activity pane of the Call Procedure activity even if the stored procedure has no return parameters. During run time, if the stored procedure started from the activity returns a result set, this result set is returned from the activity in the resultSet node. For example, if the stored procedure starts a select statement, the result set from the select statement is returned in the resultSet node. Use the [CopyOf function](#) in the map to copy the contents of the result node (including the child node called resultSet) to a variable.

Attention: In order for the CopyOf function to correctly copy the values of the source nodes to the destination nodes, the XML Schema of the destination variable must match the XML Schema of the source node. For more information, see [CopyOf function](#).

2. Map the required output parameters to variables. See [Creating a map](#) for general instructions on mapping. You are **not required** to map output parameters for this activity.

**Parent topic:** [Database Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db\\_call\\_procedure\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db_call_procedure_activity.html)

## Execute Query Activity

---

During run time, the Execute Query activity runs a select SQL statement.

The Execute Query activity supports parameterized queries - a query that contains input, or input and output parameters. When input parameters are specified in a query, the value of the parameter is supplied at run time. The ? character in the following example select statement specifies that there is one input parameter:

```
select * from myUserSchema.mySourceTable where  
myUserSchema.mySourceTable.myColumn=?
```

In the preceding select statement, the \* character, specifies that the query returns the column or columns found in the *mySourceTable* table as the output parameter or parameters. For example, if the *mySource table* contains two columns, one of type CHAR and one of type VARCHAR, the Execute Query activity returns two output parameters, one of type CHAR and the other of type VARCHAR.

Note: Only the select SQL statement is supported in the Execute Query activity. The insert SQL statement is not supported in the Execute Query activity.

The steps for adding and configuring an Execute Query activity to an orchestration are described in the following procedures:

- [Add an Execute Query in the orchestration](#)
- [Create, select, or edit a database endpoint](#)
- [Specify the query SQL statement](#)
- [Configure the input parameters for the query](#)
- [Configure output parameters](#)
- [Specify retry options for the query](#)
- [Map the input of the activity](#)
- [Map the output of the activity](#)

## Add an Execute Query in the orchestration

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration displays.
2. Select the Activities tab and expand the Database folder.
3. Drag the Execute Query activity onto the orchestration.
4. Select the Execute Query activity

## Create, select, or edit a database endpoint

---

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:
  - Select an existing endpoint:
    - a. Select Browse. The Project Explorer opens.
    - b. Select an existing endpoint and click OK. Skip to the [Specify the query SQL statement](#) procedure.
  - Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer opens.
    - b. Select an existing endpoint and click OK
    - c. Click Edit. The Edit Endpoint pane opens.
  - Create an endpoint: Select New. The Create Endpoint pane opens.
2. [Create or edit a database endpoint](#)

## Specify the query SQL statement

---

1. Select the Enter Query task from the Checklist. The Enter Query pane opens.
2. Enter the query in the white space displayed in the pane. Do not place semicolons at the end of your query.
3. Click [View Columns](#) to review column details for a selected table to assist you in building your SQL statement by entering valid table names and columns.
4. Select an alternate character [encoding](#) setting for the input and output parameters if the wanted encoding differs from the default encoding for the database using one of the following options:
  - From the Encoding list, select one of the default encoding types.
  - Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.

Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see [Using the Shift-JIS encoding](#).

5. Click Validate Query. This action checks if your query is valid and populates input and output parameters in the Map Inputs and Map Outputs tasks.
6. Enter a value into the MaxRows field. The MaxRows field specifies the maximum number of rows to return from the query during run time.

Note: If the same query is started multiple times on the same data, the same set of rows are returned. For example if MaxRows is equal to 1, the same row (the first row) is always returned each time the query is started - there is no iteration through the set of rows.

## Configure the input parameters for the query

---

1. Select the Setup Input Parameters task from the Checklist. The Setup Input Parameters pane shows the input parameter or parameters of the query.
2. Click [View Columns](#) to review column details for a selected table to assist you in building your SQL statement by entering valid table names and columns.
3. Click in the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click the Column Name heading of the column. An arrow is displayed to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with a and continuing to z. A down arrow indicates the column is sorted by reverse alphabetic order starting with z and continuing to a. Click the arrow to reverse the alphabetic order.
4. If necessary, change the settings of the Data type, Encoding, or Nullable values for each query input parameter. Click the field to make a new selection:
  - o Parameter Name - You can change the default name to a more meaningful name. Parameters are listed in the order they are specified in the query.
  - o Data Type - Select a data type for this parameter.  
Note: **(for MONEY and XMLTYPE data types)** For the XMLTYPE data type in an Oracle database and the MONEY data types in a SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.
  - o Encoding - Select an alternate character [encoding](#) setting for the parameter if the required encoding differs from the default encoding for the database.
  - o Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable.
5. Click Reset Values to interrogate the database and get the data types and size from the database. This overrides the data type and size set manually in the pane.

## Configure output parameters

---

1. Select the Setup Result Set task from the Checklist. The Setup Result Set pane opens and the defaults for the output parameter or parameters of the query are listed.
2. Click [View Columns](#) to review column details for a selected table to assist you in building your SQL statement by entering valid table names and columns.
3. If necessary, change the settings of the Data type, Encoding, or Nullable values for each query output parameter:
  - o Parameter Name - You can change the default name to a more meaningful name. Parameters are listed in the order they are specified in the query.
  - o Data Type - Select a data type for this parameter.
  - o Encoding - Select an alternate character encoding setting for the parameter if the required encoding differs from the default encoding for the database.
  - o Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable.
4. Click Reset Values to interrogate the database and get the data types and size from the database. This overrides the data type and size set manually in the pane.

## Specify retry options for the query

---

To specify the retry options for the query:

1. Configure the [Retry Options](#).

Note: For the **Database Execute Query** activity, if you set the retry option to zero, the Integration Appliance retries the connection indefinitely.

## Map the input of the activity

---

1. Select the Map Inputs task in the Checklist. The input parameters specified for the query are the input parameters for the activity. The input parameters of the activity are displayed under the parameters element in the To Activity pane.
2. You must map all the input parameters of the activity. See [Creating a map](#) for general instructions on mapping.

## Map the output of the activity

---

1. Select the Map Outputs task in the Checklist. The columns returned by select statement are the elements displayed under the rows/row element in the From Activity pane.
2. You are not required to map the output parameters of the activity. See [Creating a map](#) for general instructions on mapping.

**Parent topic:** [Database Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db\\_execute\\_query\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db_execute_query_activity.html)

## Poll Table Activity

---

The Poll Table activity checks if a database operation (insert or update) has occurred on any rows of a database table by checking the status of a special flag column at the specified time interval.

During run time, for the insert and update operations, the Poll Table activity returns the data that has changed in your database table and directly maps that data to variables in the orchestration while the Get Inserted Rows and Get Updated Rows activities returns the changed data into a buffer table and that buffer table is mapped to a variable in the orchestration.

Note: Use the Poll Table activity instead of the Get Inserted Rows, Get Deleted Rows, and Get Updated Rows activities only when you must avoid adding triggers to your database.

Before configuring the Poll Table activity in Studio, you must first either create two additional database columns in your source database table or use two appropriate existing database columns from your database table. The following database columns are required in your source database table:

- A sequence column of INTEGER type - This column contains the primary keys (a sequence of unique numbers: 1, 2, 3 ...)

- A flag column of CHAR(1) type - This column contains a flag that the Integration Appliance uses during run time to determine if the Integration Appliance should process the row.

Before an orchestration with a Poll Table activity is run on the Integration Appliance, you must also populate these columns in your database table. Set the flag column to *P* if you do not want the Integration Appliance to process the row during run time. Set the flag column to *null* if you want the Integration Appliance to process the row during run time.

In the following example database table, all the values in the Flag column are set initially to *P*, as shown in the following figure:

Initial state of your source database table with additional columns required by the **Poll Table** activity.

Name	Sequence (Primary Key)	Flag
HARRY	1	P
FRED	2	P
NICK	3	P
BOB	4	P

Time  
(in minutes)

1) Orchestration with **Poll Table** activity is deployed. This **Poll Table** activity is set to poll for a change in the database table every 1 minute.

2) The **Poll Table** activity polls for a change in the database table by looking for a null in the Flag column. No change, the activity does not process any data, the polling continues.

3) An update is done to the 3<sup>rd</sup> row in the database table from outside source as shown in the following figure.

**NOTE:** The outside source must also change the Flag value for the 3<sup>rd</sup> row from *P* to null.

Name	Sequence (Primary Key)	Flag
HARRY	1	P
FRED	2	P
<b>MARY</b>	3	<i>null</i>
BOB	4	P

-2-

4) The **Poll Table** activity polls for a change in the database table by checking if the value of the Flag column is set to null for any of the rows. In this example, the Integration Appliance processes the 3<sup>rd</sup> row and returns the 3<sup>rd</sup> row as data that is mapped to the

returns the 3<sup>rd</sup> row as data that is mapped to the specified variable(s).  
In addition, the Integration Appliance changes the Flag column for the 3<sup>rd</sup> row to P for processed.

Name	Sequence (Primary Key)	Flag
HARRY	1	P
FRED	2	P
MARY	3	P
BOB	4	P

5) The next activity after the **Poll Table** activity in the orchestration is executed in the Integration Appliance.

Attention: You must manage the state of the flag column. After processing a row, the Integration Appliance changes the flag column to *P* for processed as described in the following example scenario:

1. A row is inserted into the database. The flag column is set to *null* for the row.
2. The Poll Table activity runs for the first time and sets the flag value to *P* for this row.
3. The same row is updated, and the Poll Table activity runs again. The row is not returned in the return data of the activity because the Integration Appliance checked the flag column and the flag indicated that this row had already been processed.

In order for a row to be processed again by the Integration Appliance, you must reset the flag column back to *null* before an orchestration job with a Poll Table activity accessing the same source database table is run.

The steps for adding and configuring a Poll Table activity to an orchestration are described in the following procedures:

- [Add a Poll Table activity in the orchestration](#)
- [Create, select, or edit a database endpoint](#)
- [Specify the columns of the source table to poll for database operations](#)
- [Select the Sequence and Flag columns](#)
- [Map the output of the activity](#)

## Add a Poll Table activity in the orchestration

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration opens.
2. Select the Activities tab and expand the Database folder.
3. Drag the Poll Table activity onto the orchestration.
4. Select the Poll Table activity.

## Create, select, or edit a database endpoint

---

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:

- o Select an existing endpoint:
    - a. Select Browse. The Project Explorer opens.
    - b. Select an existing endpoint and click OK. Skip to the [Specify the columns of the source table to poll for database operations](#) procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer opens.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane shows.
  - o Create a new endpoint:
    - a. Select New. The Create Endpoint pane opens.
2. [Create or edit a database endpoint.](#)

## Specify the columns of the source table to poll for database operations

---

1. Click Pick Endpoint from the Checklist. The Pick Endpoint pane opens.
2. Click Browse. The Select a Single Source Table dialog box opens.
3. Select a table that during run time, the Poll Table activity polls for database operations.
4. Select a user schema from the Filter by User Schema list.
5. Select Hide Buffer and Control Tables to filter out any buffer or control tables used by the Integration Appliance.
 

Note: This filter only hides buffer and control tables that use the standard names generated in scripts from Studio.
6. Select a single table from the list:
  - o Click >> to add a table.
  - o Click << to remove a table.
7. If you only want to poll for database operations on primary key columns of the source table, select the Select Only the Primary Keys from Table check box.
8. Click OK. The columns of the table show in the Pick Table pane. (If you selected the Select Only the Primary Keys from Tables check box only the primary key columns display.)
9. If the character encoding for this table is different from the encoding for the database, enter another [encoding](#) using one of the following options:
  - o From the Encoding list, select one of the default encoding types.
  - o Enter your encoding type directly by clicking in the Encoding field and typing in your encoding type.
10. Select the columns in the table that during run time you want the PPoll Table activity to poll for database operations (insert, delete, or update). By default all columns are selected. Clear the Use check box for unwanted columns. Click Use All to reselect all the columns.
11. Click the heading of the column to sort the rows by the column value. For example, to sort the rows by their column name, click in the Column Name heading of the column. An arrow shows to the right of the column header name. An up arrow indicates the column is sorted by alphabetic order starting with a and continuing to z. A down arrow indicates the column is sorted by reverse alphabetic order starting with z and continuing to a. Click the arrow to reverse the alphabetic order.
12. If necessary, change the settings of the Data type, Encoding, or Nullable values for each query input parameter. Click the field to make a new selection:
  - o Data Type - Defaults to the data type for the column in the source database table. If the required data type for the column in the buffer table is different from the data type of the source table, select a different data type by clicking in the Data Type cell and selecting another Data Type from the list. You must select an appropriate data type for those data types that are marked UNSUPPORTED.

Note: (for MONEY and XMLTYPE data types) For the XMLTYPE data type in an Oracle database and the MONEY data types in a SQL Server database, Studio does not automatically associate the correct data type so you must manually select the appropriate data type.

- Size - Size of the column defined in the table. This size is retrieved from the database table and is not configurable
- Encoding - Defaults to current default encoding that was set either at the database level or the table level. If the required encoding for the column is different from the current default encoding, select another encoding by clicking in the Encoding cell and selecting another [Encoding](#) from the list.
- Nullable - Defaults to the nullable setting for the column in the source database table. If nullable = false, then the column must be included in the message. The Use check box must be selected for those columns where nullable=false. A column marked nullable=false cannot not contain a null during run time.

## Select the Sequence and Flag columns

---

1. Select Choose Columns from the Checklist.
2. Select a Sequence Column from the list. This is the sequence column of INTEGER type containing the primary keys (a sequence of unique numbers: 1, 2, 3 ...) that you either added to your source database table or determined that you could use an existing column in your source database table.
3. Select a Flag Column from the list. A flag column of CHAR type containing a flag that the Integration Appliance sets to *P* when the Integration Appliance has processed the row. The Integration Appliance uses sequence and flag columns to check for duplicate messages. In addition, both columns and the setting of the Delete rows after they have been processed check box in the Delivery Rules pane are used by the Integration Appliance to determine the action for a delete request:
  - If the Delete rows after they have been processed check box is selected, the Integration Appliance sets the flag to *M* and then deletes the row.
  - If the Delete rows after they have been processed check box is cleared, the Integration Appliance sets the flag to *M* and then *P* but the row is not deleted. In order for a row to be processed again by the Integration Appliance, you must reset the flag column back to *null* before an orchestration job with a Poll Table activity accessing the same source database table is run.
4. Configure the [Delivery Rules](#).
 

Note: If you select the Exactly once option in the Delivery Rules task, you must create control tables that are used by the Integration Appliance during run time. You create the control tables after publishing the orchestration from Studio to the Integration Appliance. You create the control tables using the Web Management Console (WMC) before you deploy the project.

Note: If you select the Exactly Once option, you must enable persistence. For more information, see [Enabling Persistence](#).
5. Configure the [Retry Options](#).

## Map the output of the activity

---

1. Select the Map Outputs task in the Checklist. The output parameters for the activity are displayed under the row element in the From Activity pane. The output parameters displayed in the From Activity pane correspond to the columns you selected in the Pick Table task. If the Batch option was selected in Delivery Rules, the multiple occurrences symbol displays next to the row element.
 

Note: During run time, the rows output parameter of the Poll Table activity is not populated with the sequence and flag column values. Only the columns selected in the Pick Table task are returned.
2. Map the required output parameters to variables. See [Creating a map](#) for general instructions on mapping. You are not required to map the output parameters for these activities.

**Parent topic:** [Database Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db\\_poll\\_table\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/db_poll_table_activity.html)

## Testing an SSL Database Connection

---

### About this task

---

After creating an endpoint for a database, you must import the CA certificate for the database into Studio and then test the SSL connection to the database. Perform the following procedure to import the database's CA certificate and then test the SSL connection to the database:

### Procedure

---

1. Open a command window.
2. Navigate to the database server, and locate the certificate file ca-cert stored in the server.
3. Copy this file and then navigate to the workstation where Studio is installed.
4. Using the command window, paste the ca-cert copy in the home directory of Studio: C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x
5. Navigate to the security directory of Studio: C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x\security
6. Run the following command to import the ca-cert file into Studio: `..\jre\bin\keytool.exe -import -v -keystore cacerts -storepass changeit -file ..\castiron_ca_cert.pem -alias alias_name` Where alias is the alias of the database CA certificate.
7. When you are prompted for a yes or no, type yes (Y) and press Enter.
8. Exit the command window.
9. Open the endpoint for the database server.
10. Verify the following login credentials for the database connection: database server, Port, User, and Password.
11. Click Test Connection
12. If the connection is successful, use this endpoint in Studio orchestrations, then use the Verify tab features to evaluate the orchestration.

#### [Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn\\_db\\_Testing\\_a\\_Database\\_Connection.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/conn_db_Testing_a_Database_Connection.html)

## Domino Activities

---

- [Overview of the Domino connector](#)

- [Creating or editing an endpoint for a Domino activity](#)  
Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a IBM® Lotus® Domino® server. Lotus Domino server provides services like email server, application server, web server, database server, and directory server. Business data on the server is stored as documents in the Domino databases (.nsf files). Domino connector provides bidirectional connectivity to work with these documents.
- [Creating a Domino document](#)  
Use the Create Document activity to create a document in the Domino server.
- [Updating a Domino document](#)  
Use the Update Document activity to update a document in the Domino database. Each updated document must be uniquely identifiable by its UniversalID or NotesID.
- [Retrieving a Domino document](#)  
Using the Retrieve Activity, you can retrieve a document from a Domino database. Each retrieved document is uniquely identified by its UniversalID or NotesID. The retrieval is done based on the input, that is, either the UniversalID or the NotesID.
- [Querying Domino documents](#)  
The Query Document activity is used to query documents from the database in the Lotus® Domino® server that matches the values that are specified in the document fields.
- [Querying views for Domino documents](#)  
The Query Views activity is used to query views from the database in the Lotus® Domino® server that matches the values that are specified in the document fields that are present in the view.
- [Deleting a Domino document](#)  
Use the Delete Activity to delete a document from the Domino database. Each deleted document must be uniquely identifiable by its UniversalID or NotesID.
- [Getting events from Domino server](#)  
The Get Events activity is used to get events from the database in the IBM Domino® server that matches the values that are specified in the input fields of Map Inputs.
- [Getting invitations from Domino server](#)  
The Get Invitations activity is used to get invitations from the database in the IBM Domino® server that matches the values that are specified in the input fields of Map Inputs.
- [Getting notices from Domino server](#)  
The Get Notices activity is used to get notices from the database in the IBM Domino® server that matches the values that are specified in the input fields of Map Inputs.
- [Processing calendar events in Domino server](#)  
The Process Calendar Events activity is used to process an action on an existing calendar event in a database in the IBM Domino® server that matches the values that are specified in the input fields that are present in the Map Inputs.
- [Processing calendar notices in Domino server](#)  
The Process Calendar Notices activity is used to process an action on an existing calendar Notice in a database of the IBM Domino® server that matches the values that are specified in the input fields present in Map Inputs.
- [Creating calendar events in Domino server](#)  
The Create Calendar Events activity is used to create the calendar events from the database in the IBM Domino® server that matches the values that are specified in the input fields of Map Inputs.
- [Updating calendar events in Domino server](#)  
The Update Calendar Events activity is used to update the calendar events from the database in the IBM Domino® server that matches the values that are specified in the input fields of Map Inputs.
- [Deleting calendar events from Domino server](#)  
The Delete Calendar Events activity is used to delete calendar events from the database in the IBM Domino® server that matches the values that are specified in the input fields of Map Inputs.
- [Specifying Retry and Delivery Options for Domino activities](#)  
Specifying the Retry and Delivery parameters is one of the tasks to configure a Domino activity configuration.

- [Prerequisites to use Domino inbound activities](#)
- [Get Created Documents activity](#)

Use the Get Created Documents activity to get the documents (which are of interest) that were created on the Domino server. The activity polls the event table in the Domino server for new events periodically and process them.
- [Get Updated Documents activity](#)

Use the Get Updated Documents activity to get the documents (which are of interest) that got updated on the Domino server. The activity polls the event table in the Domino server for new events periodically and process them.
- [Get Deleted Documents activity](#)

Use the Get Deleted Documents activity to get the documents (which are of interest) that were deleted on the Domino server. The activity polls the event table in the Domino server for new events periodically and process them.
- [Handling Date/Time and Time zone data types](#)

In the Lotus Domino form, a field of Date/Time type can be configured to represent only a date value, time value, or both date and time values. This configuration is done while creating/editing the form in Domino Designer. So, when a document is created for such a form, the value can be a date, time, or a datetime.
- [Rich text support for Domino connector](#)

The Domino connector supports RichText type in forms. Fields of RichText type can store both text and attachments as part of the document. The connector supports attachments only for the Retrieve and Query Document activities. Text content can be used for the Create, Update, Retrieve, and Query Document activities.
- [Troubleshooting and support](#)

Troubleshooting techniques and self-help information help you identify and solve problems quickly. This topic provides potential solutions for issues you would have with the Domino connector.

---

## Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
<file:///dcs/markdown/workspace/Transform/out.html>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_dominoactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_dominoactivities.html)

## Overview of the Domino connector

---

The Domino® connector enables a two-way communication between Cast Iron® and IBM Domino server. The business data can be Domino documents such as a calendar entry, a to-do item, or a note.

You can perform the following activities using the Domino connector:

- Outbound Activities
  - [Create Documents](#)
  - [Update Documents](#)
  - [Delete Documents](#)
  - [Query Documents](#)
  - [Query Views](#)
  - [Retrieve Documents](#)
  - [Get Events](#)
  - [Get Invitations](#)

- [Get Notices](#)
- [Process Calendar Events](#)
- [Process Calendar Notices](#)
- [Create Calendar Events](#)
- [Update Calendar Events](#)
- [Delete Calendar Events](#)
- Inbound/Starter Activities
  - [Get Created Documents](#)
  - [Get Updated Documents](#)
  - [Get Deleted Documents](#)

The Calendar Service is an addition to the family of REST services in the IBM Domino Server, from V9.0.1. Using Calendar Service you can perform create/retrieve/update/delete operations on the Calendar Events, Invitations, and Notices. An event in Domino stands for a Meeting, Recursive Meeting, All Day Event, Appointment, Recursive Appointment, and a Reminder. A Notice can be an Invitation for a Calendar Event or an update information of a Calendar Event.

The Domino connector supports the REST Based APIs of Calendar Service of IBM Domino Server from V7.0.0.1. The activities listed below are added to support this service :

- Create Calendar Events
- Update Calendar Events
- Delete Calendar Events
- Get Events
- Get Invitations
- Get Notices
- Process Calendar Events
- Process Calendar Notices

The versions of IBM Domino supported by the connector depend on the support lifecycle of IBM Domino. You can configure the connector with all the versions of IBM Domino that are currently supported. The IBM Domino versions that are currently supported are 8.0.x, 8.5.x, 9.0, and 9.0.1. The Domino connector cannot be used to connect to a Lotus Notes® client directly. It always connects to the IBM Domino server.

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_Overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_Overview.html)

## Creating or editing an endpoint for a Domino activity

---

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a IBM® Lotus® Domino® server. Lotus Domino server provides services like email server, application server, web server, database server, and directory server. Business data on the server is stored as documents in the Domino databases (.nsf files). Domino connector provides bidirectional connectivity to work with these documents.

## Selecting or editing a Domino endpoint

1. In the Create Endpoint or Edit Endpoint pane, configure the Domino server as described in the following table. In addition to these fields, the endpoint pane contains Connection pool options and Remote Endpoint Configuration.

Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.

2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the Domino server successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
<b>Domino Server Configuration</b>	
Host Name	Specifies the host name or IP address of the machine on which Domino server is running.
DIIO Port	Specifies the Domino Internet Inter ORB Protocol (DIIO) port that allows Java™ applets or applications to access Domino data remotely using CORBA. The default value is 63148.
User Name	Specifies the user name to connect to the Domino server.
Password	Specifies the password associated with the user name to connect to the Domino server.
Note: For outbound activities such as Create, Update, Retrieve, Query, and Delete, you can dynamically specify a different Domino server during Map Inputs. The server details in the Map Inputs section holds preference to the regular endpoint declaration.	
<b>Connection Pool options</b>	
Minimum Connections	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
Maximum Connections	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
Maximum Idle Time	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool —no idle time. The default value is 120 minutes.
Maximum Wait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
Reclaim Connections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.
Note: The Connection pool properties need to be configured as per the load (number of concurrent requests) on the endpoint.	

Field Name	Description
<b>Remote Endpoint Configuration</b>	
Endpoint Runs Behind Firewall	Enables the secure connector name property so that secure connector can be used if the Lotus Domino server is running behind a firewall.
Secure Connector Name	Specifies the name of the secure connector that is used to connect to the Lotus Domino server running behind a firewall. For example, if an orchestration containing Domino activity is deployed on to Cast Iron Live (cloud), then the secure connector needs to be configured.

## Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_creating\\_an\\_endpoint\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_creating_an_endpoint_activity.html)

## Creating a Domino document

---

Use the Create Document activity to create a document in the Domino® server.

### Using the create activity

---

1. Right-click **Orchestration** in the **Project** pane and click **New Orchestration** to create or open an orchestration. The orchestration pane is displayed.
2. Select the **Activities** tab and expand the **Domino** folder.
3. Drag **Create Document** activity from the **Domino** folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
4. The **Checklist** pane lists the tasks (**Summary, Pick Endpoint, Configure, Map inputs, Map outputs**) that you must complete to configure the outbound activity.
5. Click **Pick Endpoint**, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#)

6. Click **Configure** from the Checklist. The Configure pane is displayed.
  - o Click **Browse** to select an existing database from the Browse Domino databases pane. The Browse Domino databases display all the databases for the selected endpoint.
  - o Click **Next** to select an existing form from the Browse Domino Forms pane. The Browse Domino Forms displays all the forms present in the selected database of the Domino server.

Note: The Next button is enabled only after selecting the database name.

### Specifying the map inputs for create activity

---

1. Click **Map Input** from the **Checklist** pane.

The input parameters for the specific Domino activity are displayed under the **To Activity** pane.  
 Note: You *must* map all the required input parameters of the activity, whose data comes from previous activity.

Note: To populate dynamically added fields of the Domino document, which are not part of the map inputs structure, use the `AdditionalFields` property and provide the field names and field values in `FieldDetails` section.

For Form Types that are same across multiple databases, you can now specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this you must specify the database name in the `databaseName` optional parameter (described in the table given below). If the `databaseName` parameter is populated with a value, the outbound operation will be performed on the database specified in the `databaseName` parameter. If there is no value specified, the database name specified during configuration will be used to perform the outbound operation.

The optional input parameter is described in the following table:

Table 1. Database name optional parameter

Parameter Name	Description
<code>databaseName</code>	Specifies the database name that can be dynamically added in map inputs to enable a single orchestration to perform outbound operations across multiple databases having the same Form Type.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in the endpoint page, add the new optional parameters in `dominoConnectionProperties` of map inputs. The parameters of `dominoConnectionProperties` are described in the following table:

Table 2. Optional connection parameters

Parameters	Description
<code>dominoConnectionProperties</code> parameters	
<code>hostName</code>	Specifies the host name or IP address of the machine on which Domino server is running.
<code>diiopPort</code>	Specifies the Domino Internet Inter ORB Protocol (DIIOP) port that allows Java™ applets or applications to access Domino data remotely using CORBA. The default value is 63148.
<code>username</code>	Specifies the user name to connect to the Domino server.
<code>password</code>	Specifies the password associated with the user name to connect to the Domino server.
<code>connectionPool</code> parameters	
<code>minimumConnections</code>	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
<code>maximumConnections</code>	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.

Parameters	Description
maxIdleTime	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool —no idle time. The default value is 120 minutes.
maxWait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
reclaimConnections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.

## Specifying the map outputs create activity

1. Click **Map output** from the **Checklist** pane.

The output parameters for the Domino activity are displayed under the **From Activity** pane.

The response of the `AdditionalFields` property is also displayed in the From Activity pane.

Some of the common output parameters are defined in the following table.

Parameter Name	Description
UniversalID	A UniversalID of a document is a read/write property that uniquely identifies a document across all replicas of a database. In character format, the UniversalID is a 32-character combination of hexadecimal digits (0-9, A-F). The UniversalID is also known as the uniqueID or UNID. The datatype is string.
NotesID	A NotesID of a document is a read only property and has a hexadecimal value of up to 8 characters, which uniquely identifies a document within a particular database. A note ID represents the location of a document within a specific database file. So the documents that are replicas of one another generally have different note IDs. A note ID does not change, unless the document is deleted.
Form	A form provides the structure for creating and displaying documents, which are the design elements that store data in the database. When you enter the information in a form and save it, the information is saved as a document. When you open the document, the document uses the form as a template to provide the structure for displaying the data. Note: Changing a form (for example, by adding a field) does not change documents previously created with that form until they are modified and saved, either manually or automatically by an agent. Removing a field from a form does not remove the value of that field from previously created documents.
Parent Document	A parentdocumentUNID of a document is a read-only property. It is defined as the universal ID of a document's parent, if the document is a response document. If a document does not have a parent, it returns an empty string (""). The datatype is string.

Note: You can map the output parameters of the activity based on requirement.

## Summary flag (field flag) behavior

---

When a document is created for a form containing fields of type Authors, Readers, or Names; and data is set for these fields in the Map Input, the summary flag is set with proper permissions based on the Domino field type. This feature is supported from Domino server version 8.5.3 onwards.

For example:

1. If a Domino field of type `Authors` is set with a value `CN=SYSTEM/O=IBM`, the summary flag will be **SUMMARY READ/WRITE-ACCESS NAMES "CN=SYSTEM/O=IBM"**.
2. If a Domino field of type `Readers` is set with a value `CN=SYSTEM/O=IBM`, the summary flag will be **SUMMARY READ-ACCESS NAMES "CN=SYSTEM/O=IBM"**.
3. If a Domino field of type `Names` is set with a value `CN=SYSTEM/O=IBM`, the summary flag will be **SUMMARY NAMES "CN=SYSTEM/O=IBM"**.

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_create\\_outactivity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_create_outactivity.html)

## Updating a Domino document

---

Use the Update Document activity to update a document in the Domino® database. Each updated document must be uniquely identifiable by its UniversalID or NotesID.

### Using the update activity

---

1. Right-click **Orchestration** in the **Project** pane and click **New Orchestration** to create or open an orchestration. The orchestration pane is displayed.
2. Select the **Activities** tab and expand the **Domino** folder.
3. Drag **Update Activity** from the **Domino** folder onto the orchestration. The graphical representation of the orchestration, along with the Checklist pane is displayed.
4. The **Checklist** pane lists the tasks (**Summary, Pick Endpoint, Configure, Map Inputs, Map Outputs**) that you must complete to configure an outbound activity.
5. Click **Pick Endpoint**, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#)

6. Click **Configure** from the Checklist. The Configure pane is displayed.
  - o Click **Browse** to select an existing database from the Browse Domino databases pane. The Browse Domino databases display all the databases for the selected endpoint.

- o Click Next to select an existing form from the Browse Domino Forms pane. The Browse Domino Forms displays all the forms present in the selected database of the Domino server.

Note: The Next button is enabled only after you select the database name.

## Specifying the map inputs for update activity

The input parameters for update activity are either UniversalID or NotesID and all the business data fields (specific to the selected form) must be updated.

1. Click **Map Input** from the **Checklist** pane.

The input parameters for the specific Domino activity are displayed under the **To Activity** pane. The input parameters are defined in the following table.

Parameter Name	Description
UniversalID	A UniversalID of a document is a read/write property that uniquely identifies a document across all replicas of a database. In character format, a UniversalID is a 32-character combination of hexadecimal digits (0-9, A-F). A UniversalID is also known as the unique ID or UNID. The data type is string.
NotesID	A NotesID of a document is a read only property and has a hexadecimal value of up to 8 characters, which uniquely identifies a document within a particular database. A NotesID represents the location of a document within a specific database file. So the documents that are replicas of one another generally have different note IDs. A NotesID does not change, unless the document is deleted.

Note: You *must* map the input parameters of the activity.

Note: To populate dynamically added fields of the Domino document, which are not part of the map inputs structure, use the `AdditionalFields` property and provide the field names and field values in `FieldDetails` section.

For Form Types that are same across multiple databases, you can now specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this, you must specify the database name in the `databaseName` optional parameter (described in Table 1). If the `databaseName` parameter is populated with a value, the outbound operation is performed on the database specified in the `databaseName` parameter. If there is no value specified, the database name that is specified during configuration is used to perform the outbound operation.

## Optional parameters for a Domino activity

The following are the optional parameters that are defined for update activity.

Table 1. Optional parameters

Parameter Name	Description
----------------	-------------

<b>Parameter Name</b>	<b>Description</b>
MarkAsRead	Specifies if the document is to be marked as read during an update operation. It is of type Boolean.
MakeResponse	Specifies if the document is to be made available as the response of the saved document even if another user modifies and saves the document. It is of type Boolean.
ForceSave	Specifies if the document is to be force saved during a conflict of an update operation. It is of type Boolean.
databaseName	databaseName is the name of the database in which the document is updated. If a value is set for this parameter, then the value of the database in the configure panel is overwritten. This parameter is useful when documents with the same structure (Form) must be updated in multiple databases, using the same orchestration.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in the endpoint page, add the new optional parameters in `dominoConnectionProperties` of map inputs. The parameters for `dominoConnectionProperties` are described in the following table:

Table 2. Optional connection parameters

<b>Parameters</b>	<b>Description</b>
dominoConnectionProperties parameters	
hostName	Specifies the host name or IP address of the machine on which Domino server is running.
diiopPort	Specifies the Domino Internet Inter-ORB Protocol (DIIOP) port that allows Java™ applets or applications to access Domino data remotely using CORBA. The default value is 63148.
username	Specifies the user name to connect to the Domino server.
password	Specifies the password that is associated with the user name to connect to the Domino server.
connectionPool parameters	
minimumConnections	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
maximumConnections	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.

Parameters	Description
maxIdleTime	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool —no idle time. The default value is 120 minutes.
maxWait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
reclaimConnections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.

## Specifying the map outputs for a Domino activity

1. Click **Map output** from the **Checklist** pane.

The output parameters for the Domino activity are displayed under the **From Activity** pane.

Note: You can map the output parameters of the activity that is based on your requirement.

## Summary flag (field flag) behavior

When a document is updated for a form containing fields of type Authors, Readers, or Names; and data is set for these fields in the Map Input, the summary flag is set with proper permissions based on the Domino field type. This feature is supported from Domino server version 8.5.3 onwards.

For example:

1. If a Domino field of type `Authors` is set with a value `CN=SYSTEM/O=IBM`, the summary flag will be **SUMMARY READ/WRITE-ACCESS NAMES "CN=SYSTEM/O=IBM"**.
2. If a Domino field of type `Readers` is set with a value `CN=SYSTEM/O=IBM`, the summary flag will be **SUMMARY READ-ACCESS NAMES "CN=SYSTEM/O=IBM"**.
3. If a Domino field of type `Names` is set with a value `CN=SYSTEM/O=IBM`, the summary flag will be **SUMMARY NAMES "CN=SYSTEM/O=IBM"**.

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_update\\_outactivity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_update_outactivity.html)

## Retrieving a Domino document

Using the Retrieve Activity, you can retrieve a document from a Domino® database. Each retrieved document is uniquely identified by its UniversalID or NotesID. The retrieval is done based on the input, that is, either the UniversalID or the NotesID.

## Using the retrieve activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Retrieve Activity from the Domino folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. The Checklist pane lists the tasks(Summary, Pick Endpoint, Configure, Map inputs, Map outputs) that you must perform to complete the configuration of the outbound activity.
5. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

6. Click Configure from the Checklist. The Configure pane is displayed.
  - o Click Browse to select an existing database from the Browse Domino databases pane. The Browse Domino databases display all the databases for the selected endpoint.
  - o Click Next to select an existing form from the Browse Domino Forms pane. The Browse Domino Forms displays all the forms present in the selected database of the Domino server.  
Note: The Next button is enabled only after you select the database name.
  - o Fields with canonical names accept fields that may have canonical names such as John Smith/IBM/COUNTRY as values, which are separated by commas. Specify the canonical names in this field if you want to convert the values in these fields to internet mail addresses, such as johnsmith@country.ibm.com. Some of the field name examples are To, From, CC, Chair, Required Attendees, and so on.

## Specifying the map inputs for the retrieve activity

The input parameter for Retrieve activity is either UniversalID or NotesID. When both are given, UniversalID is used to retrieve the Domino document.

1. Click Map Input from the Checklist pane.  
The input parameters for the specific Domino activity are displayed under the To Activity pane. Some of the common input parameters are defined in the following table.

Parameter Name	Description
UniversalID	The UniversalID parameter is a read/write property that uniquely identifies a document across all replicas of a database. In character format, the unique ID parameter is a 32-character combination of hexadecimal digits (0-9, A-F). The UniversalID is also known as the unique ID or UNID. The data type is string.
NotesID	The Notes® ID of a document is a read only property and has a hexadecimal value of up to 8 characters, which uniquely identifies a document within a particular database. The Notes ID

sID	represents the location of a document within a specific database file. So the documents that are replicas of one another generally have different Notes IDs. A Notes ID does not change, unless the document is deleted.
-----	--

Note: You *must* map the input parameters of the activity.

For Form Types that are same across multiple databases, you can now specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this, you must specify the database name in the `databaseName` optional parameter (described in Table 1). If the `databaseName` parameter is populated with a value, the outbound operation is performed on the database specified in the `databaseName` parameter. If there is no value specified, the database name that is specified during configuration is used to perform the outbound operation.

### Optional parameters

The optional input parameter is described in the following table:

Table 1. Optional parameters

Parameter name	Description
<code>databaseName</code>	<code>databaseName</code> is the name of the database from which the document is retrieved. If a value is set for this parameter, then the value of the database in the configure panel is overwritten. This parameter is useful when documents with the same structure (Form) must be retrieved from multiple databases, using the same orchestration.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in the endpoint page, add the new optional parameters in `dominoConnectionProperties` of map inputs. The parameters of `dominoConnectionProperties` are described in the following table:

Table 2. Optional connection parameters

Parameters	Description
<code>dominoConnectionProperties</code> parameters	
<code>hostName</code>	Specifies the host name or IP address of the machine on which Domino server is running.
<code>diiopPort</code>	Specifies the Domino Internet Inter-ORB Protocol (DIIOP) port that allows Java™ applets or applications to access Domino data remotely using CORBA. The default value is 63148.
<code>username</code>	Specifies the user name to connect to the Domino server.
<code>password</code>	Specifies the password that is associated with the user name to connect to the Domino server.
<code>connectionPool</code> parameters	
<code>minimumConnections</code>	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
<code>maximumConnections</code>	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.

Parameters	Description
<code>maxIdleTime</code>	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool —no idle time. The default value is 120 minutes.
<code>maxWait</code>	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
<code>reclaimConnections</code>	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.

## Specifying the map outputs for the retrieve activity

1. Click Map output from the Checklist pane.

The output parameters for the Domino activity are displayed under the From Activity pane.

Note: You can map the output parameters of the activity that is based on your requirement.

Note: Dynamically added fields present in the Domino document and not generated in the map input/output structures are handled by the Domino connector. While retrieving documents using this activity, the data for these fields are available in the map outputs section under `AdditionalFields`.

**Parent topic:** [Domino Activities](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_retrieve\\_outactivity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_retrieve_outactivity.html)

## Querying Domino documents

The Query Document activity is used to query documents from the database in the Lotus® Domino® server that matches the values that are specified in the document fields.

You can specify one or more of the following criteria in the input data that is sent with the outbound request.

- **Document business data:** When you specify the document business data in the Map Input section, the connector reads all the valid data from the map input. The connector searches the database for documents that match these valid data. All the matching documents that can be represented using the map output schema are returned as a response.
- **ParentDocumentUNID:** When you specify a valid `ParentDocumentUNID` in the Map Input section, the connector queries all the child documents to this parent document. All the matching documents, which can be represented using the map output schema are returned as a response.

- No data set: When you do not provide a data in the map input, the connector queries the documents that can be represented using the map output schema.

You can search for documents based on two types of search methods:

1. **Database Search method:** Given selection criteria for a document, returns all documents in a database that meet the criteria. By default, the activity uses the Database Search method to search for documents. To explicitly set the search to this type, set the value of `searchType` optional parameter to `NORMAL_SEARCH` in the map input section. This method supports the search of documents that are based on the following types of search criteria:
  - a. **Single values:** You can specify a single value in the search criteria. For example, the connector can query documents that are based on the single word, number, or date that is specified in the search field. You can find more information about the search values that can be specified in the Number and Date type fields in the following points.
    - **Numbers:** You can specify a double digit number or an integer value as the search criteria in the Numbers type field. You can use this search function to query documents where a Number type field equals to a certain value. For example, to query documents where employee salary equals to 1234.56, enter the value 1234.56 in the `EmployeeSalary` field.
    - **Date:** You can specify a date as the search criteria in any Date type field. For example, to query documents where birthday equals to 1982/11/22, specify the value 1982/11/22 in the `Birthday` field.
  - b. **Multiple values:** You can specify multiple values as the search criteria for any Lotus® Domino® field types. This feature can be used to find the documents with the specified values at run time. For example, you can configure the connector to retrieve documents that match the words that are specified in the search criteria.
  - c. **Text search for rich text contents:** You can specify the texts to search documents that have rich text contents at run time. The connector conducts a search by using the texts that are specified in the `RichText` field and all matching documents are retrieved by the connector. The connector supports both single and multiple text content searches for the `RichText` field. You can also provide wildcard suffixes, such as \* for searching documents in the `RichText` field.
  - d. **Search using multiple fields:** You can specify search values in more than one field. In this configuration, the activity uses the logical `AND` operator to group the search strings. For instance, you can specify a single value, multiple values, `RichText`, or `ParentDocumentUNID` in different fields. The activity returns only the search content that matches all the specified criteria.
2. **Database FTSearch/Indexed Search method:** Conducts a full text search of all the documents in a database. When the database is fully indexed, the indexed search method is faster compared to the Database Search method. The method sorts the output data by relevance score. When the collection is sorted by relevance, the highest relevance appears first. To explicitly set the search to this type, set the value of `searchType` optional parameter to `FULL_TEXT_SEARCH` in the map input section.
  - a. **Search using multiple fields:** The indexed search method also supports search using multiple fields. You can specify the search values in more than one field. In this configuration, the connector uses the logical `AND` operator to group the search strings. For instance, you can specify a single value, multiple values, or `ParentDocumentUNID` in different fields. The connector returns a logical `AND` operation of all the specified search criteria, returning exact and close matches for string type fields and exact matches for numeric type fields.

Note: The indexed search method does not work for `RichText`, `Attachments`, and `Date` fields.

### Using the Query Document activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.

3. Drag Query Activity from the Domino folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

5. Click Configure from the Checklist. The Configure pane is displayed.
  - o Click Browse to select an existing database from the **Browse Domino database** pane. The Browse Domino databases display all the databases for the selected endpoint.
  - o Click Next to select an existing form from the **Browse Domino Forms** pane. The Browse Domino Forms displays all the forms present in the selected database of the Domino server.  
Note: The Next button is enabled only after you have selected the database name.
  - o Fields with canonical names accept fields that may have canonical names such as John Smith/IBM/COUNTRY as values, which are separated by commas. Specify the canonical names in this field if you want to convert the values in these fields to internet mail addresses, such as johnsmith@country.ibm.com. Some of the field name examples are To, From, CC, Chair, Required Attendees, and so on.
6. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Query Documents activity are displayed as nodes under the request input parameter in the To Activity panel.

For Form Types that are same across multiple databases, you can specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this, you must specify the database name in the `databaseName` optional parameter (described in Table 1). If the `databaseName` parameter is populated with a value, the outbound operation is performed on the database specified in the `databaseName` parameter. If there is no value specified, the database name that is specified during configuration is used to perform the outbound operation.

The optional input parameter is described in the following table:

Table 1. Optional input parameter

Parameter name	Description
<code>databaseName</code>	<code>databaseName</code> is the name of the database from which the document is queried. If a value is set for this parameter, then the value of the database given in the configure panel will be overwritten. This parameter is useful when documents with the same structure (Form) need to be queried from multiple databases, using the same orchestration.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in the endpoint page, add the new optional parameters in `dominoConnectionProperties` of map inputs. The parameters of `dominoConnectionProperties` are described in the following table:

Table 2. Optional connection parameters

Parameters	Description
<code>dominoConnectionProperties</code>	parameters

Parameters	Description
hostName	Specifies the host name or IP address of the machine on which Domino server is running.
diiopPort	Specifies the Domino Internet Inter-ORB Protocol (DIIOP) port that allows Java™ applets or applications to access Domino data remotely using CORBA. The default value is 63148.
username	Specifies the user name to connect to the Domino server.
connectionPool parameters	
minimumConnections	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
maximumConnections	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
maxIdleTime	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool —no idle time. The default value is 120 minutes.
maxWait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
reclaimConnections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.
password	Specifies the password that is associated with the user name to connect to the Domino server.

7. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
8. Select the search type to be used for the activity:

Table 3. Search type

Parameter Name	Description
searchType	Specifies the search type to be used for this activity. The values are: <ul style="list-style-type: none"> <li>○ NORMAL_SEARCH: Uses Domino Database Search method.</li> <li>○ FULL_TEXT_SEARCH: Uses Domino Database FTSearch method.</li> </ul> When no value is specified NORMAL_SEARCH is used.

9. Select the Map Outputs in the checklist. The XML schemas generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.

Note: Dynamically added fields present in the Domino document and not generated in the map input/output structures are handled by the Domino connector. While retrieving documents using this activity, the data for these fields are available in the map outputs section under `AdditionalFields`.

`queryUsingTimestamp` is the parameter that is used to query documents that are based on time stamps. The `timestamp` property is a recursive property. You can define `groupFields`, `name`, `operator`, and `value` under the `timestamp` property.

The optional output parameters are described in the following table:

Parameter Name	Description										
<code>queryUsingTimestamp</code>	<p>The following are the <code>timestamp</code> properties:</p> <p style="text-align: center;"><b>Table 4. timestamp properties</b></p> <table border="1"> <thead> <tr> <th>Property</th> <th>Values</th> </tr> </thead> <tbody> <tr> <td><code>groupFields</code></td> <td>You can specify multiple values such as: AND, OR, (, ), AND (, OR (, ) AND, ) OR, ) AND (, and ) OR (. Note: You can have multiple conditions. <code>groupFields</code> must be used when you have multiple conditions.</td> </tr> <tr> <td><code>name</code></td> <td>Specify one of these values: <code>createdTimestamp</code> or <code>lastModifiedTimestamp</code></td> </tr> <tr> <td><code>operator</code></td> <td>Specify one of these values: <code>GREATER_THAN</code>, <code>GREATER_THAN_OR_EQUAL_TO</code>, <code>EQUAL_TO</code>, <code>LESS_THAN</code>, <code>LESS_THAN_OR_EQUAL_TO</code>, and <code>NOT_EQUAL_TO</code></td> </tr> <tr> <td><code>value</code></td> <td>Specify the date and time values. For example, <code>26-09-2013 12:05:00 PM EST</code>. Note: If you do not mention the timezone, by default, the timezone of the server is considered.</td> </tr> </tbody> </table> <p>Note:</p> <ul style="list-style-type: none"> <li>Querying documents that are based on the <code>NOT_EQUAL_TO</code> operator (<code>!=</code>) is not supported in Full Text Search.</li> <li>Querying documents using time is not supported in Full Text Search. For example, <code>[_RevisionDate] = 05/06/2013 09:30:00</code>.</li> <li>Querying documents using the <code>EQUAL_TO</code> operator with timestamp does not work with the Normal Search type. For example, <code>@Modified = [05/06/2013 09:14:22]</code>.</li> <li>Querying documents using Full Text Search as the Search Type, you can query documents that are only based on Date; and not DateTime. For example, <code>lastModifiedDateTime &gt;= 05/20/2013 20:00:00</code> is not supported in Full Text Search.</li> </ul>	Property	Values	<code>groupFields</code>	You can specify multiple values such as: AND, OR, (, ), AND (, OR (, ) AND, ) OR, ) AND (, and ) OR (. Note: You can have multiple conditions. <code>groupFields</code> must be used when you have multiple conditions.	<code>name</code>	Specify one of these values: <code>createdTimestamp</code> or <code>lastModifiedTimestamp</code>	<code>operator</code>	Specify one of these values: <code>GREATER_THAN</code> , <code>GREATER_THAN_OR_EQUAL_TO</code> , <code>EQUAL_TO</code> , <code>LESS_THAN</code> , <code>LESS_THAN_OR_EQUAL_TO</code> , and <code>NOT_EQUAL_TO</code>	<code>value</code>	Specify the date and time values. For example, <code>26-09-2013 12:05:00 PM EST</code> . Note: If you do not mention the timezone, by default, the timezone of the server is considered.
Property	Values										
<code>groupFields</code>	You can specify multiple values such as: AND, OR, (, ), AND (, OR (, ) AND, ) OR, ) AND (, and ) OR (. Note: You can have multiple conditions. <code>groupFields</code> must be used when you have multiple conditions.										
<code>name</code>	Specify one of these values: <code>createdTimestamp</code> or <code>lastModifiedTimestamp</code>										
<code>operator</code>	Specify one of these values: <code>GREATER_THAN</code> , <code>GREATER_THAN_OR_EQUAL_TO</code> , <code>EQUAL_TO</code> , <code>LESS_THAN</code> , <code>LESS_THAN_OR_EQUAL_TO</code> , and <code>NOT_EQUAL_TO</code>										
<code>value</code>	Specify the date and time values. For example, <code>26-09-2013 12:05:00 PM EST</code> . Note: If you do not mention the timezone, by default, the timezone of the server is considered.										

10. Create a map between the output parameters and orchestration variables.

You have configured the Domino Query Documents activity.

**Parent topic:** [Domino Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

## Querying views for Domino documents

The Query Views activity is used to query views from the database in the Lotus® Domino® server that matches the values that are specified in the document fields that are present in the view.

### Using the Query Document activity

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Query Views from the Domino® folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
4. Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

5. Click Configure from the Checklist. The Configure pane is displayed.

Note: The Next button is enabled only after you have selected the database name.

- o Click Browse to select an existing database from the **Browse Domino Database** pane. The Browse Domino databases display all the databases for the selected endpoint.
  - o Click Browse to select an existing view from the **Browse Domino Views** pane. The Browse Domino Views display all the views for the selected endpoint and in the selected database.
  - o Click Next to select an existing form from the **Browse Domino Forms** pane. The Browse Domino Forms displays all the forms related to the documents in that view.
6. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Query Views activity are displayed as nodes under the request input parameter in the To Activity panel.

For Form Types that are same across multiple databases, you can specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this, you must specify the database name in the `databaseName` optional parameter (described in Table 1). If the `databaseName` parameter is populated with a value, the outbound operation is performed on the database that is specified in the `databaseName` parameter. If there is no value specified, the database name that is specified during configuration is used to perform the outbound operation.

The optional input parameter is described in the following table:

Table 1. Database name optional parameter

Parameter Name	Description
<code>databaseName</code>	Specifies the database name that can be dynamically added in map inputs to enable a single orchestration to perform outbound operations across multiple databases that have the same Form Type.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in the endpoint panel, add the new optional parameters in `dominoConnectionProperties` of map inputs. The parameters for `dominoConnectionProperties` are described in the following table:

Table 2. Optional connection parameters

Parameters	Description
dominoConnectionProperties parameters	
hostName	Specifies the host name or IP address of the machine on which the Domino server is running.
diiopPort	Specifies the Domino Internet Inter-ORB Protocol (DIIOP) port that allows Java™ applets or applications to access Domino data remotely using CORBA. The default value is 63148.
username	Specifies the user name to connect to the Domino server.
password	Specifies the password that is associated with the user name to connect to the Domino server.
connectionPool parameters	
minimumConnections	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
maximumConnections	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
maxIdleTime	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool —no idle time. The default value is 120 minutes.
maxWait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
reclaimConnections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.

7. Map the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

8. Specify the values as described in Table 3:

Table 3. Search type

Parameter Name	Description
KeyValue s	Specify the value for which you want to run a search.
ExactMat ch	Specify the value as <code>False</code> to return all possible values related to the search term. For an exact match to be returned, specify the value as <code>True</code> .

Parameter Name	Description
SearchFormula	Specify a formula for a detailed search as per your requirement.

- Select the Map Outputs in the checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.  
Note: Dynamically added fields present in the Domino document and not generated in the map input/output structures are handled by the Domino connector. While retrieving documents using this activity, the data for these fields are available in the map outputs section under `AdditionalFields`.
- Create a mapping between the output parameters and orchestration variables.

You have configured the Domino Query Views activity.

## Deleting a Domino document

---

Use the Delete Activity to delete a document from the Domino® database. Each deleted document must be uniquely identifiable by its `UniversalID` or `NotesID`.

### Using the delete activity

---

- Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
- Select the Activities tab and expand the Domino folder.
- Drag Delete Activity from the Domino folder onto the orchestration. A graphical representation of the orchestration along with the **Checklist** is displayed.
- The Checklist pane lists the tasks (Summary, Pick Endpoint, Configure, Map inputs, Map outputs) that you must perform to complete the configuration of the outbound activity.
- Click Pick Endpoint, and then select a Domino endpoint.

For instructions on creating or editing a Domino endpoint, see [Creating or editing an endpoint for a Domino activity](#).

- Click Configure from the Checklist. The Configure pane is displayed.
  - Click Browse to select an existing database from the Browse Domino databases pane. The Browse Domino databases display all the databases for the selected endpoint.
  - Click Next to select an existing form from the Browse Domino Forms pane. The Browse Domino Forms displays all the forms present in the selected database of the Domino server.  
Note: The Next button is enabled only after you have selected the database name.

### Specifying the map inputs for the delete activity

---

- Click Map Input from the **Checklist**.

The input parameters for the specific Domino activity are displayed under the To Activity pane. Some of the common input parameters are defined in the following table.

Parameter Name	Description
UniversalID	The <code>UniversalID</code> parameter is a read/write property that uniquely identifies a document across all replicas of a database. In character format, the unique ID parameter is a 32-character combination of hexadecimal digits (0-9, A-F). The <code>UniversalID</code> is also known as the unique ID or UNID. The data type is string.
NotesID	The Notes® ID of a document is a read only property and has a hexadecimal value of up to 8 characters, which uniquely identifies a document within a particular database. The <code>NotesID</code> represents the location of a document within a specific database file. So the documents that are replicas of one another generally have different Notes IDs. A Notes ID does not change, unless the document is deleted.

Note: You must map the input parameters of the activity.

For Form Types that are same across multiple databases, you can now specify the database name as part of the optional parameters in map inputs, wherein the same orchestration can be used to perform outbound operations on different databases. To do this, you must specify the database name in the `databaseName` optional parameter (described in Table 1). If the `databaseName` parameter is populated with a value, the outbound operation is performed on the database specified in the `databaseName` parameter. If there is no value specified, the database name that is specified during configuration is used to perform the outbound operation.

### Optional parameters

The optional input parameters are described in the following table:

Table 1.

Input Parameters	Description
deleted	This property specifies if the document is to be deleted during a conflict of delete operation. It is of type boolean.
databaseName	<code>databaseName</code> is the name of the database from which the document is deleted. If a value is set for this parameter, then the value of the database given in the configure panel will be overwritten. This parameter is useful when documents with the same structure (Form) need to be deleted from multiple databases, using the same orchestration.

The Domino connector also supports dynamic endpoint connection to a different Domino server. During run time, if you want to dynamically connect to a Domino server other than the one that is configured in the endpoint page, add the new optional parameters in `dominoConnectionProperties` of map inputs. The parameters of `dominoConnectionProperties` are described in the following table:

Table 2. Optional connection parameters

Parameters	Description
dominoConnectionProperties parameters	
hostName	Specifies the host name or IP address of the machine on which Domino server is running.
diiopPort	Specifies the Domino Internet Inter-ORB Protocol (DIIOP) port that allows Java™ applets or applications to access Domino data remotely using CORBA. The default value is 63148.
username	Specifies the user name to connect to the Domino server.
password	Specifies the password that is associated with the user name to connect to the Domino server.
connectionPool parameters	
minimumConnections	Specifies the lowest number of Domino server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
maximumConnections	Specifies the maximum number of Domino server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
maxIdleTime	Specifies the amount of time in minutes that a Domino server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool—no idle time. The default value is 120 minutes.
maxWait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
reclaimConnections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.

## Specifying the map outputs for the delete activity

1. Click Map output from the Checklist.

The output parameters for the Domino activity are displayed under the From Activity pane.

Note: You can map the output parameters of the activity that is based on your requirement.

## Specifying Retry and Delivery Options for Domino activities

Specifying the Retry and Delivery parameters is one of the tasks to configure a Domino® activity configuration.

### About this task

This section contains the procedures for configuring the Domino outbound and inbound activities.

### Procedure

To specify the retry options for inbound and outbound Domino activities:

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry options for connecting to a Domino server as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ second(s) between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Domino server.
Try to connect __ times before failing .	<p>Specifies the retry count — the maximum number of times the Integration Appliance attempts to establish a connection to the Domino server before issuing the following errors:</p> <ul style="list-style-type: none"> <li>○ When you set this parameter to "0", Studio does not try to reconnect.</li> <li>○ When you set this parameter to a value less than "0", Studio retries the connection indefinitely.</li> </ul> <p>If an orchestration that starts with an inbound Domino activity is deployed and the Integration Appliance cannot connect to the specified Domino server, the Integration Appliance logs the connection errors as warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system log, resets the connection error count to zero, and continues to attempt to establish a connection to the Domino server.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

### Domino inbound activities

#### Procedure

To specify the delivery rules options for Domino inbound activities:

1. Select the Delivery Rules task from the Checklist. The delivery rules pane is displayed.
2. Configure the delivery rules options to select the activity's behavior as described in the following table:

Table 2. Delivery Rules options

<b>Delivery Rules Fields</b>	<b>Description</b>
Polling Interval	Specifies the time interval to poll event view in Adapter for Lotus® Domino(WALD) inbound event table of the Domino server. (For example, the Get created documents activity polls for create trigger events at the specified time interval.) Time can be selected in the format days, hours, minutes, and seconds.
Fetch size	Specifies how many events the activity must retrieve from the WALD inbound event table of the Domino server in each poll cycle.
<b>Delivery Messages</b>	
ATMOST_ONCE	A non-persistent mode in which a document is either processed once or not processed at all.
ATLEAST_ONCE	A persistent mode, in which a Domino document is not lost. As a result, there are chances that the orchestration can process the document once or more than once.

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_Specifying\\_Retry\\_Parameters\\_for\\_Domino\\_Activities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_Specifying_Retry_Parameters_for_Domino_Activities.html)

## Prerequisites to use Domino inbound activities

---

This section contains the prerequisites for configuring the Domino® inbound activities:

### Configuring the Domino server

---

1. Copy the native library mentioned in the following table from <STUDIO ROOT>/etc/domino/<platform> directory to the Domino servers root directory. The native library is selected based on the platform on which Domino server is running.

Library file	Supported operating systems
waldinbound.dll	Windows 32 bit
waldinbound.dll	Windows 64 bit
libwaldinbound_r.a	AIX® 32 bit
libwaldinbound.so	Redhat 32 bit
libwaldinbound.so	Suse 32 bit
libwaldinbound.so	Solaris 32 bit

2. Search for notes.ini file in the Domino server. Open the file and add an entry at the end of the file.

```
EXTMGR_ADDINS=waldinbound
```

3. Copy the inbound event database (filename : waldinbound.nsf) from the (<STUDIO ROOT>/etc/domino/) to the Domino server's data directory (<DominoRoot>/data).

4. Open the inbound event database (waldinbound.nsf) by using Lotus Notes® and configure the event activity.

5. The following are the steps for configuring WALD inbound event table.

- Select the EventTriggerConfigurationView. If there is an entry, edit it. If there is no entry, create a new configuration.
- Enter a value for connector ID. This is optional.
- Enter the database name and form (both are case sensitive) for which events need to be generated for the field 'Monitored documents'. The same database and form will be selected during discovery of the inbound activity. The syntax is shown below.
  - DatabaseName:formName
  - SampleDatabase.nsf:Employee
  - TestDatabase.nsf:Form1:TestDatabase.nsf:Form2. (For this, events will be generated for both Form1 and Form2.)

6. Select the event type interested.

Note: The selected event type corresponds to the starter activities (Get Created Documents or Get Updated Documents or Get Deleted Documents).

7. Save the configuration (Ctrl + S). Events from the selected databases and forms get triggered and are available in the EventView of the inbound event database.

8. Restart Domino server. Test from Lotus Notes by using sample data and make sure that the events are getting generated for the configuration.

9. Configure the starter activity in Studio. Then create or update or delete a document (based on the configuration chosen in EventTriggerConfigurationView) for the configured Domino databases, which triggers an event. The event is picked by the Domino starter activity and processed.

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_activity\\_implementation\\_for\\_inbound\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_activity_implementation_for_inbound_activity.html)

## Get Created Documents activity

---

Use the Get Created Documents activity to get the documents (which are of interest) that were created on the Domino® server. The activity polls the event table in the Domino server for new events periodically and process them.

Note: Before you configure and use the get created documents activity, refer to [Prerequisites to use Domino inbound activities](#) on the Domino server.

## Adding an inbound Domino activity to the orchestration

---

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Get Created Documents activity from the Domino folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
4. The Checklist pane lists the tasks (Summary, Pick Endpoint, Configure, Map outputs) that you must perform to complete the configuration of the inbound activity.

## Naming or renaming a Domino activity

---

1. Click Summary from the Checklist pane. The Summary pane is displayed.
  - o Specify the name of the activity in the Activity Name text box.

## Specifying the endpoint for a Domino activity

---

1. Click Pick Endpoint from the Checklist pane. The Pick Endpoint pane is displayed.
2. Click one of the following options:
  - o Browse... - To select an existing endpoint from the Project Explorer. The Project Explorer shows all the Domino endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint pane. To edit the endpoint properties, click Edit.
  - o New... - To create a new endpoint. The Create Endpoint window is displayed.
  - o Edit... - To edit an existing endpoint. The Edit Endpoint window is displayed.

Note: Any changes that you make to the endpoint, including configuration properties, affects all orchestrations that use that endpoint. The edits are global, not local.

## Specifying the database and form for a Domino activity

---

1. Click Configure from the Checklist pane. The Configure pane is displayed.
  - o Click Browse to select an existing database from the Browse Domino databases pane. The Browse Domino databases display all the databases for the selected endpoint.
  - o Click Next to select an existing Form from the Browse Domino Forms pane. The Browse Domino Forms displays all the forms in the project available for the activity.  
Note: The Next button is enabled only after you have selected the database name.
  - o Optional: Specify the names of the Additional Databases from which you would like to poll the documents of the form that is selected in the Form field. The databases must be separated by commas. For example, `Admin.nsf, names.nsf,`. The databases will be polled one after the other. All the databases that are specified in the Additional Database field must have a Form similar to the one configured in the Browse Domino Forms.
  - o Optional: Fields with canonical names accept fields that may have canonical names such as `John Smith/IBM/COUNTRY` as values, which are separated by commas. Specify the canonical names in

this field if you want to convert the values in these fields to internet mail addresses, such as johnsmith@country.ibm.com. Some of the field name examples are: To, From, CC, Chair, Required Attendees, and so on.

## Specifying the map outputs for a Domino activity

---

1. Click Map output from the Checklist pane.

The output parameters for the Domino activity are displayed under the From Activity pane.

Note: You can map the output parameters of the activity that is based on your requirement.

Note: Dynamically added fields present in the Domino document and not generated in the map input/output structures are handled by the Domino connector. While retrieving documents using this activity, the data for these fields are available in the map outputs section under `AdditionalFields`.

**Parent topic:** [Domino Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

## Get Updated Documents activity

---

Use the Get Updated Documents activity to get the documents (which are of interest) that got updated on the Domino® server. The activity polls the event table in the Domino server for new events periodically and process them.

Note: Before you configure and use the get updated documents activity, refer to [Prerequisites to use Domino inbound activities](#) on the Domino server.

## Adding an inbound Domino activity to the orchestration

---

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Get Updated Documents activity from the Domino folder onto the orchestration. The graphical representation of the orchestration along with the Checklist pane is displayed.
4. The Checklist pane lists the tasks (Summary, Pick Endpoint, Configure, Map outputs) that you must perform to complete the configuration of the inbound activity.

## Naming or renaming a Domino activity

---

1. Click Summary from the Checklist pane. The Summary pane is displayed.
  - o Specify the name of the activity in the Activity Name text box.

## Specifying the endpoint for a Domino activity

---

1. Click Pick Endpoint from the Checklist pane. The Pick Endpoint pane is displayed.
2. Click one of the following options:
  - Browse... - To select an existing endpoint from the Project Explorer. The Project Explorer displays all the Domino endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint pane. To edit the endpoint properties, click Edit.
  - New... - To create a new endpoint. The Create Endpoint window is displayed.
  - Edit... - To edit an existing endpoint. The Edit Endpoint window is displayed.

Note: Any changes that you make to the endpoint, including configuration properties, affects all orchestrations that use that endpoint. The edits are global, not local.

## Specifying the database and form for a Domino activity

---

1. Click Configure from the Checklist pane. The Configure pane is displayed.
  - Click Browse to select an existing database from the Browse Domino databases pane. The Browse Domino databases display all the databases for the selected endpoint.
  - Click Next to select an existing Form from the Browse Domino Forms pane. The Browse Domino Forms displays all the forms in the project available for the activity.  
Note: The Next button is enabled only after you select the database name.
  - Optional: Specify the names of the Additional Databases from which you would like to poll the documents of the form that is selected in the Form field. The databases must be separated by commas. For example, `Admin.nsf, names.nsf,`. The databases will be polled one after the other. All the databases that are specified in the Additional Database field must have a Form similar to the one configured in the Browse Domino Forms.
  - Optional: Fields with canonical names accept fields that may have canonical names such as `John Smith/IBM/COUNTRY` as values, which are separated by commas. Specify the canonical names in this field if you want to convert the values in these fields to internet mail addresses, such as `johnsmith@country.ibm.com`. Some of the field name examples are To, From, CC, Chair, Required Attendees, and so on.

## Specifying the map outputs for a Domino activity

---

1. Click Map output from the Checklist pane.

The output parameters for the Domino activity are displayed under the From Activity pane.

Note: You can map the output parameters of the activity that is based on your requirement.

Note: Dynamically added fields present in the Domino document and not generated in the map input/output structures are handled by the Domino connector. While retrieving documents using this activity, the data for these fields are available in the map outputs section under `AdditionalFields`.

## Get Deleted Documents activity

---

Use the Get Deleted Documents activity to get the documents (which are of interest) that were deleted on the Domino® server. The activity polls the event table in the Domino server for new events periodically and process them.

Note: Before you configure and use the get deleted documents activity, refer to [Prerequisites to use Domino inbound activities](#) on the Domino server.

## Adding an inbound Domino activity to the orchestration

---

1. Right-click Orchestration in the Project pane and click New Orchestration to create or open an orchestration. The orchestration pane is displayed.
2. Select the Activities tab and expand the Domino folder.
3. Drag Get Deleted Documents activity from the Domino folder onto the orchestration. The graphical representation of the orchestration along with the Checklist pane is displayed.
4. The Checklist pane lists the tasks (Summary, Pick Endpoint, Configure, Map outputs) that you must perform to complete the configuration of the inbound activity.

## Naming or renaming a Domino activity

---

1. Click Summary from the Checklist pane. The Summary pane is displayed.
  - Specify the name of the activity in the Activity Name text box.

## Specifying the endpoint for a Domino activity

---

1. Click Pick Endpoint from the Checklist pane. The Pick Endpoint pane is displayed.
2. Click one of the following options:
  - Browse... - To select an existing endpoint from the Project Explorer. The Project Explorer shows all the Domino endpoints in the project available for the activity. When you select an endpoint, the endpoint properties display in the Pick Endpoint pane. To edit the endpoint properties, click Edit.
  - New... - To create a new endpoint. The Create Endpoint window is displayed.
  - Edit... - To edit an existing endpoint. The Edit Endpoint window is displayed.

Note: Any changes that you make to the endpoint, including configuration properties, affects all orchestrations that use that endpoint. The edits are global, not local.

## Specifying the database and form for a Domino activity

---

1. Click Configure from the Checklist pane. The Configure pane is displayed.
  - Click Browse to select an existing database from the Browse Domino databases pane. The Browse Domino databases display all the databases for the selected endpoint.
  - Click Next to select an existing Form from the Browse Domino Forms pane. The Browse Domino Forms displays all the forms in the project available for the activity.  
Note: The Next button is enabled only after you have selected the database name.
  - Optional: Specify the names of the Additional Databases from which you would like to poll the documents of the form that is selected in the Form field. The databases must be separated by commas. For example, `Admin.nsf, names.nsf, .` The databases will be polled one after the other. All the databases that are specified in the Additional Database field must have a Form similar to the one configured in the Browse Domino Forms.
  - Optional: Fields with canonical names accept fields that may have canonical names such as `John Smith/IBM/COUNTRY` as values, which are separated by commas. Specify the canonical names in this field if you want to convert the values in these fields to internet mail addresses, such as

johnsmith@country.ibm.com. Some of the field name examples are To, From, CC, Chair, Required Attendees, and so on.

## Specifying the map outputs for a Domino activity

---

1. Click Map output from the Checklist pane.

The output parameters for the Domino activity are displayed under the From Activity pane.

Note: You can map the output parameters of the activity that is based on your requirement.

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_delete\\_inbound\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_delete_inbound_activity.html)

## Handling Date/Time and Time zone data types

---

In the Lotus Domino form, a field of Date/Time type can be configured to represent only a date value, time value, or both date and time values. This configuration is done while creating/editing the form in Domino Designer. So, when a document is created for such a form, the value can be a date, time, or a datetime.

For example, if a form representing a Calendar has the following fields:

Table 1. Example

Fields	Domino Data type
startDate	Date/Time (represents only date)
startTime	Date/Time (represents only time)
endDate	Date/Time (represents only date)
endTime	Date/Time (represents only time)
bothDateAndTime	Date/Time (represents both date and time)
timeZone	Time zone
Subject	Text
Body	Text

If a valid document is created for this form, then:

- `startDate` and `endDate` will only accept a date value
- `startTime` and `endTime` will only accept a time value
- `bothDateAndTime` will only accept date and time
- `timeZone` will only accept a time zone value

From Cast Iron version 6.1.0.9 onwards, Date/Time data type is handled as described in the following points:

1. A Domino field of type Date/Time is represented as `xsd:string` in the map input and map output of the activity.
2. The only supported syntax of the input values for the Date/Time fields in map input are:
  - a. If the field represents only date: `MM/dd/yyyy`. Example : 05/27/2012.
  - b. If the field represents only time (24 hour format): `HH:mm:ss`. Example: 22:15:30.
  - c. If the field represents both date and time (24 hour format): `MM/dd/yyyy HH:mm:ss`. Example: 05/31/2012 23:59:59.
3. The output from the activity also follows the same syntax as the Date/Time fields, in most cases.
4. The preceding syntax is used by the map input and output irrespective of:
  - a. The date and time format of the operating system on which the Domino server is running.
  - b. The date and time format settings configured when creating the form in Domino designer.
5. The Time zone value is also represented as `xsd:string` in the map input and output. The following technote from Lotus Domino gives more information about the syntax: <http://www-01.ibm.com/support/docview.wss?uid=swg21163045>. For more information about `Time zone` in Lotus Domino, see Lotus Domino documentation.

Note:

1. In the Cast Iron 6.1.0.6 version and the earlier versions, the Domino Date/Time field was generated as `xsd:date`, which was not able to handle all combinations of the input values.
2. Old projects developed using the 6.1.0.6 version or earlier versions that are already running, will work fine with same old behavior, that is, Date/Time represented as `xsd:date`).
3. For all the orchestrations created newly using the 6.1.0.9 version and later versions, Date/Time field will be generated as `xsd:string`.
4. If the old projects require the new behavior, that is, to generate Date/Time as `xsd:string`, then the objects need to be refreshed from the Configure panel of the activity in the Studio 6.1.0.9 version or later versions. Mapping must be validated after this change.

## Rich text support for Domino connector

---

The Domino connector supports RichText type in forms. Fields of RichText type can store both text and attachments as part of the document. The connector supports attachments only for the Retrieve and Query Document activities. Text content can be used for the Create, Update, Retrieve, and Query Document activities.

The following figure describes the structure of the RichText field when a form is discovered and the map input and output are generated.

MAP INPUT/OUTPUT STRUCTURE	TYPE	DESCRIPTION
<p><i>RichTextFieldName</i></p> <ul style="list-style-type: none"> <li><i>Text</i></li> <li><i>Overwrite</i></li> <li><i>Attachments</i> <ul style="list-style-type: none"> <li><i>FilePath</i></li> <li><i>RetrievedContentSize</i></li> <li><i>RetrievedContent</i></li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li><i>string[]</i></li> <li><i>boolean</i></li> <li><i>Attachments[]</i></li> <li><i>string</i></li> <li><i>decimal</i></li> <li><i>base64Binary</i></li> </ul>	<ul style="list-style-type: none"> <li>Represents the text content present in the RichText field. This field is used during the Create, Update, Retrieve and Query activities.</li> <li>Used in the Update documents activity. If set to true, the existing RichText field is overwritten else the content is appended.</li> <li>Represents the attachments present in the RichText field. Each element represents an attachment.</li> <li>Represents the absolute path of the file to be attached to this field. Used during the Create Documents activity.</li> <li>Represents the size of the attachment retrieved during the Retrieve and Query Documents activities.</li> <li>Represents the actual content of the attachment. This property is used during Retrieve and Query Documents activities.</li> </ul>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino\\_RichText.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Domino_RichText.html)

## Troubleshooting and support

Troubleshooting techniques and self-help information help you identify and solve problems quickly. This topic provides potential solutions for issues you would have with the Domino® connector.

### New fields added to the calendar object

From Cast Iron® version 6.3.0.2 onwards, you can get the invitee details, date/time, and the room details, in response to retrieving and querying a calendar entry using the Domino connector.

### Static subform behavior

In the earlier versions of Domino connector (before v7.0.0.0), the fields present in a subform (statically embedded in the main form) were generated as strings in Map Inputs/Map Outputs, irrespective of the datatypes that are defined for the fields. This issue is fixed in v7.0.0.0 and the data type of the fields are generated correctly.

## Email Activities

---

- [Creating or editing an email endpoint](#)  
Studio and the Integration Appliance use the connection information that email endpoints provide to connect to POP3 or SMTP servers.
- [Get Email activity](#)  
The **Get Email** activity is a starter activity. When an orchestration that starts with an **Get Email** activity is deployed to the Integration Appliance, the Integration Appliance polls the POP3 server for email message or messages for the specified account at the specified interval.
- [Send Email activity](#)  
An orchestration that contains the **Send Email** activity is acting as an email client during run time.
- [Testing an SSL email connection](#)  
After creating an endpoint for an email server, you must import the CA certificate for the email server into Studio and then test the SSL connection to the email server.

---

### [Feedback](#) | [Notices](#)

## Creating or editing an email endpoint

---

Studio and the Integration Appliance use the connection information that email endpoints provide to connect to POP3 or SMTP servers.

Note: For some email systems, the POP3 server and the SMTP server can have the same name, for example: mail.acmecompany.com.

Note: *Email connector base library is changed from V7.5 and because of this user might see a difference in the way attachments were retrieved separately using ReadMime and other activities. User has to re verify the values obtained from the headers and use / map them appropriately if they see and difference in the output*

### Creating or editing an email endpoint

---

1. In the Create Endpoint or Edit Endpoint pane, configure the fields as described in the following table.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. When complete, click Test Connection to confirm that you can connect to the POP3 or SMTP server. The **Get Email** activity connects to a POP3 server while the **Send Email** activity connects to a SMTP server.
3. Click OK.

Table 1.

Field Name	Description
<b>Location</b>	
Get Email From Server	<b>Get Email</b> activity - The <b>Get Email</b> From Server option is automatically selected for an email endpoint used with the <b>Get Email</b> activity. During run time, the <b>Get Email</b> activity gets email from the specified POP3 server.
Send Email To Server	<b>Send Email</b> activity - The <b>Send Email</b> To Server option is automatically selected for an endpoint used with the <b>Send Email</b> activity. During run time, the <b>Send Email</b> activity sends email to the specified SMTP server.
Host Name	<b>Get Email</b> activity - The Host Name or IP address for the POP3 server.  <b>Send Email</b> activity- The Host Name or IP address for the SMTP server.
Port	Specify the port number to access the POP3 or SMTP Server. By default, the port for a POP3 server is 110.
<b>Login</b>	
User Name and Password not required	<b>Get Email</b> activity - This is option not available for an endpoint of a <b>Get Email</b> activity. You must specify a User Name and Password for an email endpoint used with the <b>Get Email</b> activity.  <b>Send Email</b> activity - Select this option if you want connect to the SMTP server using an anonymous login instead of a username and password. Select this option only if SMTP server the supports anonymous logins (where a user account is not required).
Log In to the Server Using a User Name and Password	<b>Get Email</b> activity - This option is automatically selected for an email endpoint used with the <b>Get Email</b> activity. To connect to the POP3 server using a user account, you must enter values into the User Name and Password fields to specify the account used to connect to the POP3 Server.  <b>Send Email</b> activity - Select this option to connect to the SMTP server using a user account. If this option is selected, you must enter values into the User Name and Password fields for the account used to connect to the SMTP Server.
User Name	<b>Get Email</b> activity - Enter the User Name for the account used to connect to the POP3 Server.  <b>Send Email</b> activity - Enter the User Name for the account used to connect to the SMTP Server.

Field Name	Description
Password	<p><b>Get Email</b> activity - Enter the Password for the account used to connect to the POP3 Server.</p> <p><b>Send Email</b> activity - Enter the Password for the account used to connect to the SMTP Server.</p>
<b>Security</b>	
Normal Email	Specifies that email runs without SSL.
Email over SSL	Specifies that email runs with SSL. For more information, see <a href="#">Testing an SSL email connection</a> .
Implicit or Explicit	Implicit means that SSL is turned as soon as a connection is made. Explicit requires that the client issue a command to the server requesting that SSL be used.
Client Certificate Alias Name	Specifies the client alias used to access the trusted certificate in the keystore. Must be enabled for client authorization by the server. By default, when you select the Client Certificate Alias Name option, Studio provides the following name: Factory Supplied Identity. The alias name you specify in this field should match the value you created when creating the certificate in the keystore.
Additional Parameters	<p>Specifies additional parameters for SMPT processing. The following table lists the parameters:</p> <p>smtpNewConnEveryTime  <b>Default:</b> false  <b>Description:</b> Specifies creation of a new connection everytime. If set to true, does not use a connection pool</p> <p>smtpPoolMinConnections  <b>Default:</b> 1  <b>Description:</b> Connection pool option - Minimum Connections</p> <p>smtpPoolMaxConnections  <b>Default:</b> 25  <b>Description:</b> Connection pool option - Maximum Connections</p> <p>smtpPoolMaxIdleTime  <b>Default:</b> 7200  <b>Description:</b> Connection pool option - Maximum Idle Time in seconds</p> <p>smtpPoolMaxWaitTime  <b>Default:</b> 300  <b>Description:</b> Connection pool option - Max Wait Time in seconds</p> <p>smtpPoolReclaimConnections  <b>Default:</b> 60  <b>Description:</b> Connection pool option - Reclaim Connections Time in seconds</p>

Field Name	Description
	<p>When using <b>Get Email</b>, choose a polling frequency so that the email server does not close the connection between polls (GetMail activity &gt; Delivery Rules). Some email servers will lock the account or not permit log in if there are frequent openings and closings of connections. Read your email providers documentation to ensure that you set the properties correctly for your email server. To enable a connection pool, you must first set <code>smtpNewConnEveryTime</code> to false, and then set the required connection pool properties.</p>
<b>Connection Timeout</b>	
<p>Time out after ___ second(s) when establishing a connection to the endpoint.</p>	<p>Specifies the number of seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For email activities, the amount of time the Integration Appliance attempts to establish a connection to the SMTP or the POP3 server before timing out.</p> <p>A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an endpoint and the time it takes the endpoint to respond.</p> <p>You set the activity timeout in <b>Retry</b> task of the <a href="#">Get Email activity</a> or <a href="#">Send Email activity</a>.</p>

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/email\\_create\\_edit\\_endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/email_create_edit_endpoint.html)

## Get Email activity

---

The **Get Email** activity is a starter activity. When an orchestration that starts with an **Get Email** activity is deployed to the Integration Appliance, the Integration Appliance polls the POP3 server for email message or messages for the specified account at the specified interval.

Note: The Get Email activity requires the POP3 server to support the TOP and UIDL commands. While these are optional in the POP3 protocol, most servers will support these.

The polled POP3 server and email account is defined in the email endpoint associated with the **Get Email** activity.

During run time, the **Get Email** activity polls a POP3 server for incoming email messages of a particular email account, as shown in the following diagram.

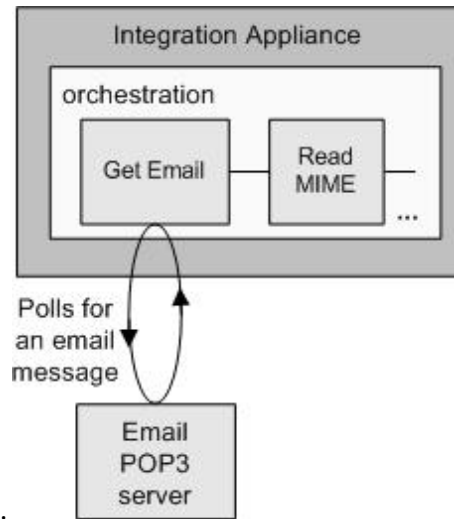

Figure 1.

If any email messages are found the following action occurs for each email message: The regular expression defined for the **Subject** field is checked against the subject of the incoming mail message and the regular expression defined for the **From** field is checked against the sender email account of the incoming mail message. If both regular expressions match, an orchestration job is created to process the email, and the mail is marked for deletion on POP3 Server. When the process is completed, the email is deleted from the POP3 server. For more information about regular expression matching, see the [Configuring the activity](#) procedure. Note: Two **Get Email** activities should not poll from the same POP3 server at the same time using the same email account even if the regular expressions specified in the **Configure** task of the activity are different. If two **Get Email** activities are attempting to get email using the same email account, when the first **Get Email** activity process the email from the POP3 server and removes the email from the server, the second **Get Email** activity keeps retrying to retrieve the email from the POP3 server and the following exception may be thrown:

```
Protocol exception: com.jscape.inet.pop.PopException:  
Error in TOP 671 0: -ERR The requested message is no  
longer available; it may have been deleted.
```

## Accessing an email message attachment

To access the attachment of a incoming email message, you must add a **Read MIME** activity in the orchestration after the **Get Email** activity as shown in the preceding figure. In addition, you must map the two output parameters of the **Get Email** activity to variables in the orchestration and then map those variables to the input parameters of the **Read MIME** activity. During run time, the **Read MIME** activity reads the MIME Header and the body of the message and then breaks up the attachments contained in the body of the message and places the result into the parts XML output parameter. For more information, see **Read MIME Activity**.

## Adding a Get Email activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the **Activities** tab and expand the Email folder.
3. Drag the **Get Email** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

## Creating, selecting, or editing an email endpoint

- Click Pick Endpoint task from the **Checklist** and choose from one of the following actions:
  - Select an existing endpoint:
    - Select Browse. The Project Explorer is displayed.
    - Select an existing endpoint and click OK. Complete the [Configuring the activity](#) steps.
  - Select an existing endpoint and edit the endpoint:
    - Select Browse. The Project Explorer is displayed.
    - Select an existing endpoint and click OK.
    - Click Edit. The **Edit Endpoint** pane is displayed.
  - Create a new endpoint: Select New. The **Create Endpoint** pane is displayed.
- Create or edit an email endpoint. For more information, see [Creating or editing an email endpoint](#).

## Configuring the activity

- Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
- Configure all the fields in this pane as described in the following table. In this task, you specify the regular expressions used to match against the Subject and From fields of polled email messages. A regular expression must be specified for both of these fields, even if the regular expression is equal to \*, which means that all strings match. In order for an incoming mail to be processed, both the Subject and the From strings of the mail must match their respective regular expressions. In each of the regular expression fields, the following wildcards are supported:
  - \* (asterisk) - for zero or more characters
  - ? (question mark) - for zero or one character

Table 1.

Field	Description
Subject matches	Enter a regular expression that matches the subjects of email messages that start an orchestration job to process the email message. In the regular expression, you can specify a combination of characters and wildcards.
From matches	Enter a regular expression defines the sender email address of the email messages that start an orchestration job to process the email message. In the regular expression, you can specify a combination of characters and wildcards.

The following table shows some example regular expressions and the result of matching the regular expressions to sample text.

Table 2.

Regular Expression	Sample Text	Result
*test*	test	matches
*test*	ttttesttt	matches
test	test	matches
test	ttttesttt	does not match, has to exactly match the regular expression string: test
test	est	does not match, has to exactly match the regular expression string: test
?est	test	matches
?est	best	matches

Regular Expression	Sample Text	Result
?est	est	matches

## Specifying the delivery rules

1. Select the **Delivery Rules** task from the **Checklist**. The Delivery Rules pane is displayed.
2. Specify the time interval to poll the POP3 server for new email messages:
  - a. Select a time unit from the menu: seconds, minutes, hours, or days.
  - b. Specify the amount of time using one of the following input options:
    - By clicking in the Poll for changes every field and entering a new value.
    - Using the up and down arrows.

For more information, see [Polling interval behavior](#).

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to a POP3 server. The following table defines the retry options for a connection to an POP3 server:

Table 3.

Field	Description
Retry	
1) Wait — secon d(s) betwe en each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the POP3 server.
2) Try to conne ct — times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the POP3 server before issuing an error.</p> <p>If an orchestration that starts with a <b>Get Email</b> activity is deployed and the Integration Appliance cannot connect to the specified POP3 server, the Integration Appliance logs the connections errors as warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system log, resets the connection error count to zero, and continues to attempt to establish a connection to the POP3 server.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as Warnings. The Integration Appliance logs the fourth connection error as an error and resets the connection error count to zero. Therefore, the fifth connection error generates a warning in the system log. The Integration Appliance continues to attempt to establish a connection to the POP3 server.</p>

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane.
2. In this task, you map the **mailheader** (of type XML) and **body** (of type string) output parameters to variables. You must map the output parameters of the activity in order for the orchestration to be valid. See [Creating a map](#) for general instructions on mapping. The **mailheader** output parameter contains meta information about the email message, for example the email addresses that the message is being sent to and the MIME header of the message itself. The **body** output parameter contains the body of the email message and associated attachments.

**CAUTION:**

The order of the attachments and the body in the body output depend on the email client that sent the message and the type of message (plain text or HTML.).

Note: When using a non-English payload, the **mailheader**, **mimeHeader** and **otherheaders** need to be mapped into the orchestration in the getEmail activity, and mapped from the orchestration back into the sendMail activity.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/email\\_get\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/email_get_activity.html)

## Send Email activity

---

An orchestration that contains the **Send Email** activity is acting as an email client during run time.

The **Send Email** activity connects to the SMTP server, and sends a message to the server as shown in the following figure.

Figure 1.

The steps for adding and configuring a **Send Email** activity are described in the following procedures.

### Adding a Send Email activity to the orchestration

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the **Email** folder.
3. Drag the **Send Email** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

## Creating, selecting, or editing an email endpoint

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Complete the [Configuring the activity](#) steps.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an email endpoint. For more information, see [Creating or editing an email endpoint](#).

## Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields in this pane as described in the following table:

Table 1.

Field	Description
From Address	Specifies the sender address for the email message. You must specify the email address using the standard email format: <code>email@domain.extension</code> . This field is required.
To	Specifies the recipient's addresses for the email message. You must specify the email addresses using the standard email format: <code>email@domain.extension</code> . One or more addresses can be specified. Separate the addresses with commas or semicolons. You must specify at least one address. This field is required.
CC	Specifies the carbon copy's addresses for the email message. You must specify the email addresses using the standard email format: <code>email@domain.extension</code> . One or more addresses can be specified. Separate the addresses with commas or semicolons. This field is optional.
Subject	Specifies the subject of the email message.

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an SMTP Server. The following table describes the retry options for connecting to an SMTP Server:

Table 2.

Field	Description
Retry	

Field	Description
1) Wait ___ second (s) between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the SMTP Server.
2) Try to connect ___ times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the SMTP Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an <b>Send Email</b> activity and the Integration Appliance cannot connect to the specified SMTP Server, the Integration Appliance logs the connections errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

## Mapping the input of the activity

1. Select the **Map Inputs** task in the **Checklist**. The input parameters of the activity are displayed in the To Activity pane.
2. In this task, you map variables to the following input parameters of the activity:
  - o The **body** input parameter contains the body of the email message and associated attachments. The **body** input parameter is of type string. You must map a variable or assign a default value to the **body** input parameter.
  - o The optional **mailheader** input parameter contains meta information about the email message, for example the email addresses that the message is being sent to and the **mimeHeader** of the message itself. The **mailheader** input parameter is optional, you do not have to map a variable or assign default values to the **mailheader** input parameter.

If the optional **mailheader** input parameter is not listed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active.

You can optionally override the settings you specified in the **Configure** task of the **Checklist** dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the setting for the From Address field by mapping a variable to the from node of the **mailheader** input parameter. During run time, the value of the variable is the from address in the sent email message.

Table 3.

Nodes of the mailheader Input Parameter	Description	Overrides what settings in the Configuring task?

Nodes of the mailheader Input Parameter	Description	Overrides what settings in the Configuring task?
from	Specifies the sender address for the email message. You must specify the email address using the standard email format: email@domain.extension.	The <b>from</b> node of the <b>mailheader</b> input parameter overrides the <b>From Address</b> field specified in the <b>Configure</b> task.
to	Specifies the recipient addresses for the email message. You must specify the email addresses using the standard email format: email@domain.extension. One or more addresses can be specified. Separate the addresses with commas or semicolons.	The <b>to</b> node of the <b>mailheader</b> input parameter overrides the <b>To</b> field specified in the <b>Configure</b> task.
cc	Specifies the carbon copy addresses for the email message. You must specify the email addresses using the standard email format: email@domain.extension. One or more addresses can be specified. Separate the addresses with commas or semicolons.	The <b>cc</b> node of the <b>mailheader</b> input parameter overrides the <b>CC</b> field specified in the <b>Configure</b> task.
subject	Specifies the subject of the email message.	The <b>subject</b> node of the <b>mailheader</b> input parameter overrides the <b>Subject</b> field specified in the <b>Configure</b> task.
mimeHeader	Specifies the MIME header of the email message.	None.

Nodes of the mailheader Input Parameter	Description	Overrides what settings in the Configuring task?
otherHeaders	<p>Specifies an element that contains a set of MIME headers as name/value pairs not already specified in the <b>mimeHeader</b> node. For example the MIME header: Content-Location is not specified in the MIME header, so the following headerItem node could be equal to the following values:</p> <p><b>otherheaders/headerItem/name</b> is equal to Content-Location</p> <p><b>otherHeaders/headerItem/value</b> is equal to the value of the Content-Location MIME header, for example the string: RN-Preamble Multiple MIME headers can be specified, so this is a recurring node.</p>	None.

Note: You can use the **Write MIME** activity to build the contents of the **mimeHeader** node of the optional **mailheader** input parameter. For example, you could add a **Write MIME** activity to the orchestration before the **Send Email** activity and have the **Write MIME** activity populate the contents of the **mimeHeader** XML variable and then passes the **mimeHeader** variable to the **Send Email** activity.

See [Creating a map](#) for more information

Note: When using a non-English payload, the **mailheader**, **mimeHeader** and **otherheaders** need to be mapped into the orchestration in the **getEmail** activity, and mapped from the orchestration back into the **sendMail** activity.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/email\\_send\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/email_send_activity.html)

## Testing an SSL email connection

---

After creating an endpoint for an email server, you must import the CA certificate for the email server into Studio and then test the SSL connection to the email server.

## About this task

---

Complete the following procedure to import the email servers CA certificate and then test the SSL connection to the email server:

## Procedure

---

1. Open a command window.
2. Navigate to the email server, and locate the certificate file ca-cert stored in the server.
3. Copy this file and then navigate to the workstation where Studio is installed.
4. Using the command window, paste the ca-cert copy in the home directory of Studio: C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x
5. Browse to the security directory of Studio: C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x\security
6. Run the following command to import the ca-cert file into Studio: `..\jre\bin\keytool.exe -import -v -keystore cacerts -storepass changeit -file ..\castiron_ca_cert.pem -alias alias_name` Where *alias\_name* is the alias of the email servers CA certificate.
7. When you are prompted for a yes or no, enter 'Y'.
8. Exit the command window.
9. Open the endpoint for the email server.
10. Verify the following login credentials for the email connection: Email server, Port, User, and Password.
11. Click Test Connection.
12. If the connection is successful, use this endpoint in Studio orchestrations, then use the Verify tab features to evaluate the orchestration.

---

# Preparing Data for the Force.com Bulk API connector

---

The Force.com Bulk API connector supports both XML and CSV input data. Following are the details to prepare data for these formats.

---

## Preparing data for XML input

---

If you are using the XML data as input to the Force.com Bulk API connector, you can either create an XML schema, which can be mapped to the Force.com Bulk API activity or directly map from the previous activity's result to Force.com Bulk API activities.

### Preparing data for CSV input

Force.com Bulk API connector supports CSV input data from connector version 2.2. If you have the CSV data, you can directly map the CSV content to Force.com Bulk API activities. To do so, Force.com Bulk API connector activities expose two new fields, `object` and `data`, in the Map Inputs section. You must map the CSV content to `data` field and provide the selected object name in the `object` field.

Following is the sample for the CSV data, for Account object.

```
Name,BillingStreet,BillingCity,BillingState,BillingCountry  
XYZ,vvnagara,Bangalore,KA,India
```

Note:

1. In the CSV data, the first line must contain comma separated field names of the selected object, and from the second line, the actual data must be populated.
2. The order of the data fields must match that of the header field names.

**Parent topic:** [Force.com Bulk API Activities](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SFDCBulkAPI\\_preparing\\_data.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SFDCBulkAPI_preparing_data.html)

## Creating a Force.com Bulk API endpoint

---

Force.com Bulk API endpoints contain the connection information that studio and the Integration Appliance use to connect to the Salesforce.com server. You can create multiple endpoints that refer to separate instances.

### About this task

---

Use this task to create or edit an Force.com Bulk API endpoint.

Note:

Any changes you make to the Force.com Bulk API endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

### Procedure

---

1. Drag an activity from the Force.com Bulk API folder in the Activities tab to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. Browse - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
  - b. New - To create a new endpoint. The Create Endpoint window opens.
  - c. Edit - To edit the existing endpoint. The Edit Endpoint window opens.
4. Complete the fields defined in the following table:

Table 1. Connection Details

Field Name	Description
Connection Details	
User Name	Specifies the user name to connect to the Salesforce.com server.
Password	Specifies the password associated with the user name to connect to the Salesforce.com server.
URI	Specifies the host URI of the Salesforce.com instance

5. When finished, click Test Connection to confirm that you can connect to the Force.com Bulk API system.
6. Click OK.

**Parent topic:** [Force.com Bulk API Activities](#)

## Specifying the Retry options for Force.com Bulk API activities

Specifying the Retry parameters is one of the tasks to configure an Force.com Bulk API activity.

### About this task

Use this task to configure the retry options for configuring Force.com Bulk API activities. The Force.com Bulk API connector uses a single login session for all connections to a Force.com Bulk API endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

### Procedure

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry and timeout options for connecting to an Force.com Bulk API instance, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ second(s) between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Force.com Bulk API instance.
Try to connect __ times before failing.	Specifies the retry count — the maximum number of times the Integration Appliance attempts to establish a connection to the Force.com Bulk API instance before issuing an error and stopping the processing of the current orchestration job. Note: If you deploy an orchestration that contains the Force.com Bulk API activity and the Integration Appliance cannot connect to the specified Force.com Bulk API instance, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
Activity Timeout	

Retry Fields	Description
Timeout after ----- second(s) when the endpoint does not respond to a request.	Specifies the number of seconds the Integration Appliance waits before timing out, when the endpoint does not respond to a request. The default is 300 seconds.

## Using the Force.com Bulk API Batch Insert activity

---

Use the Force.com Bulk API Batch Insert activity to insert or create a large number of objects in Salesforce.com.

### About this task

---

Use this task to insert or create a large number of objects in Salesforce.com. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Force.com Bulk API folder contents.
2. Drag the Batch Insert activity icon onto the orchestration. The Force.com Bulk API Batch Insert Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Force.com Bulk API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
 Note: For more information, see [Creating a Force.com Bulk API endpoint](#).

8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Force.com Bulk API window is displayed.
11. In Browse Force.com Bulk API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Force.com Bulk API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Batch Insert activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Force.com Bulk API Batch Insert activity.

## Using the Force.com Bulk API Batch Update activity

---

Use the Force.com Bulk API Batch Update activity to update a large number of objects in Salesforce.com.

### About this task

---

Use this task to update a large number of objects in Salesforce.com. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Force.com Bulk API folder contents.
2. Drag the Batch Update activity icon onto the orchestration. The Force.com Bulk API Batch Update Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Force.com Bulk API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating a Force.com Bulk API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Force.com Bulk API window is displayed.
11. In Browse Force.com Bulk API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Force.com Bulk API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Batch Update activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Using the Force.com Bulk API Batch Upsert activity

---

Use the Force.com Bulk API Batch Upsert activity to update and insert a large number of objects in Salesforce.com.

## About this task

---

Use this task to update and insert a large number of objects in Salesforce.com. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Force.com Bulk API folder contents.
2. Drag the Batch Upsert activity icon onto the orchestration. The Force.com Bulk API Batch Upsert Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Force.com Bulk API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating a Force.com Bulk API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Force.com Bulk API window is displayed.
11. In Browse Force.com Bulk API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Force.com Bulk API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Batch Upsert activity are displayed as nodes under the request input parameter in the To Activity panel.  
Note: The *externalIDFieldName* identifies whether a record must be updated or inserted. If you specify a value for the *externalIDFieldName*, then the record is updated in Salesforce.com. If there is no value set for *externalIDFieldName*, a record is inserted in Salesforce.com.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

## Using the Force.com Bulk API Batch Delete activity

---

Use the Force.com Bulk API Batch Delete activity to delete a large number of objects in Salesforce.com.

### About this task

---

Use this task to delete a large number of objects in Salesforce.com. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Force.com Bulk API folder contents.
2. Drag the Batch Delete activity icon onto the orchestration. The Force.com Bulk API Batch Delete Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Force.com Bulk API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating a Force.com Bulk API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Batch Delete activity are displayed as nodes under the request input parameter in the To Activity panel.  
Note: The input data for the delete activity is a list of IDs and the object name. All the objects that match the object name and ID are deleted from Salesforce.com.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

### Results

## Using the Force.com Bulk API Get Batch Status activity

---

Use the Force.com Bulk API Get Batch Status activity to get the status of an individual batch or the status of all the batches that are part of the job in Salesforce.com.

### About this task

---

Use this task to get the status of an individual batch or the status of all the batches that are part of the job in Salesforce.com. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Force.com Bulk API folder contents.
2. Drag the Get Batch Status activity icon onto the orchestration. The Force.com Bulk API Get Batch Status Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Force.com Bulk API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating a Force.com Bulk API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get Batch Status activity are displayed as nodes under the request input parameter in the To Activity panel.  
Note: The Bulk API activities return JobInfo, which contains JobId. The job ID can be used to invoke the *getBatchStatus* or *getBatchResult* activities.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.

12. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Force.com Bulk API Get Batch Status activity.

## Using the Force.com Bulk API Get Batch Results activity

---

Use the Force.com Bulk API Get Batch Results activity to retrieve the batch result to check the status of individual records, when a batch is completed in Salesforce.com.

### About this task

---

Use this task to retrieve the batch result to check the status of individual records, when a batch is completed in Salesforce.com. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Force.com Bulk API folder contents.
2. Drag the Get Batch Results activity icon onto the orchestration. The Force.com Bulk API Get Batch Results Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Force.com Bulk API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating a Force.com Bulk API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get Batch Results activity are displayed as nodes under the request input parameter in the To Activity panel.  
Note: The Bulk API activities return JobInfo, which contains JobId. The job ID can be used to invoke the *getBatchStatus* or *getBatchResult* activities.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node.

During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Force.com Bulk API Get Batch Results activity.

## FTP Activities

---

- [Creating or Editing an FTP endpoint](#)  
FTP endpoints provide the connection information that Studio and the Integration Appliance use to connect to FTP Servers.
- [Configuring the FTP endpoint for the Parse Directory Listing Example](#)  
To run the Parse Directory Listing Example in your environment, configure the values of the configuration properties used by the FTP Endpoint to point to your FTP Server. In addition, your FTP Server must produce the directory listing in the same format as expected by the Flat File Schema.
- [FTP Poll Directory activity](#)  
During run time, the FTP Poll Directory activity connects to FTP Server and polls for the existence of the specified file or files at the specified location. After reading the contents of the file or files and mapping the contents into variable or variables of the orchestration, the **FTP Poll Directory** activity may delete the file or files, move the file or files, or leave the file or files in the directory of the FTP Server.
- [FTP Put File activity](#)  
During run time, the **FTP Put File** activity takes data from variables of the orchestration, places the data into a file, and connects to an FTP Server and places the file in the specified directory location.
- [FTP Get File activity](#)  
During run time, the **FTP Get File** activity connects to an FTP Server and attempts to get a single file at the specified location. You can configure the **FTP Get File** activity to return the contents of the file into a variable of the orchestration. In addition, you can configure the **FTP Get File** activity to return the timestamp of the file returned by the FTP Server into a variable of the orchestration.
- [FTP Delete File activity](#)  
Use the the **FTP Delete File** activity to delete specific files from the specific directories, during run time.
- [FTP List Files activity](#)  
During run time, the **FTP List Files** activity connects to an FTP Server and generates a list of files from the specified directory location using the specified regular expression. The **FTP List Files** activity returns the list of files to the orchestration using either the directoryListing or fileListing output parameter.
- [FTP Rename File activity](#)  
Use the **FTP Rename File** activity to rename and/or move a file to a different directory, during run time.

- [Parse directory listing example](#)  
This example gets a directory listing from an FTP directory using the **FTP List Files** activity, parses the long directory listing using Flat File Scheme, iterates through the list of files, based on the properties of each file.
- [Testing an FTPS server connection](#)  
After successfully running a "test connection", you can use Studio verify tools on FTPS orchestrations before publishing a project.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_FTPactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_FTPactivities.html)

## Creating or Editing an FTP endpoint

---

FTP endpoints provide the connection information that Studio and the Integration Appliance use to connect to FTP Servers.

1. In the Create Endpoint or Edit Endpoint pane, configure the fields as described in the following table.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project as the edits are global, not local.
2. When you had entered the field values, click Test Connection to confirm that you can connect to the FTP Server.
3. Click OK.

Table 1.

Field Name	Description
<b>Location</b>	
Host Name	Specifies the Host Name or IP address for the FTP Server.
Port	Specifies the port number for the specified host name. The default is 21, the standard port for FTP traffic. The default port for SFTP traffic is 22.
<b>Login</b>	<b>Description</b>
Log into the Server as an Anonymous User	This option is only available with the Normal FTP option. Select this option only if the FTP Server allows anonymous logins (where a user account is not required).

<b>Field Name</b>	<b>Description</b>
Log into the Server with User Name and Password	Select this option to specify a user account to log in into the FTP Server. Enter the user name and password for the account used to connect to the FTP Server.
<b>Security</b>	<b>Description</b>
Normal FTP	Select the Normal FTP option for an unsecured connection.
Secure FTP	Select the Secure FTP option to secure the communication between the Integration Appliance and the FTP Server by sending and receiving the data over SSH. The SSH File Transfer Protocol (SFTP) is a network protocol that provides file transfer over a reliable data stream. Note: Certificate authentication for SFTP is not supported.
FTPS	Select the FTPS option to secure the communication between the Integration Appliance and the FTP Server using the SSL protocol. The SSL protocol supports mutual authentication between the Integration Appliance and FTP Server using an authenticated and encrypted connection. Choose one of the following authentication modes: <ul style="list-style-type: none"> <li>• Implicit</li> <li>• Explicit (SSL) - Starts an FTP session and uses SSL security to authenticate an endpoint and encrypts data before transfer.</li> <li>• Explicit (TLS) - Starts an FTP session and uses TLS security to authenticate the endpoint and encrypts data before transfer.</li> </ul> <p>Important: Before you can deploy a project using FTPS, you must upload and register a certificate on the Integration Appliance. For more information about uploading and registering a certificate, see the CLI Command Reference.</p>
Client Certificate Alias Name	When the FTPS server is configured to authenticate a client, select this option and specify a client certificate alias name. By default, when you select the Client Certificate Alias Name option, Studio provides the following name: <code>Factory Supplied Identity</code>  The client certificate alias name that you specify in this field should match the value you specified for the client certificate name using the Cast Iron® command line interface (CLI), when you uploaded or imported the certificate. In the CLI, if you mapped the client certificate name to the default alias name, accept the default name that Studio provides and configure the Connection Timeout for the endpoint.
<b>FTP Mode</b>	<b>Description</b> If your FTP Server supports Active mode transfers, you can configure an FTP endpoint in Studio to use the Active mode to transfer data to and from an FTP Server and the Integration Appliance. By default, FTP endpoints support passive mode transfers. Note: Active mode is not supported for SFTP.
Active FTP	Select this option to enable the Active mode. When you enable the Active mode option, you can specify the external IP and port range for incoming connections. By default, this option is not selected and the FTP endpoint supports passive mode transfers.

Field Name	Description
External IP	(Optional) Specifies the client IP address from which the FTP Server will respond to connection attempts.
Port Range/Start Port	(Optional) Specifies the lowest port number of the predetermined range assigned to incoming connections. If you enter a start port number, you must also enter the end port number. Important: This number cannot be less than 1024.
Port Range/End Port	(Optional) Specifies the highest port number of the predetermined range assigned to incoming connections. If you enter an end port number, you must also enter the start port number. Important: This number cannot be greater than 65535.
Connection Timeout	Description
Time out after _____ second(s) when establishing a connection to the Endpoint.	<p>The number of seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For an FTP activity, the amount of time the Integration Appliance attempts to establish a connection to the FTP Server before timing out. A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an endpoint and the time it takes the endpoint to respond. You set the activity timeout in <b>Retry</b> task of the following FTP activities:</p> <ul style="list-style-type: none"> <li>• FTP Poll Directory activity</li> <li>• FTP Put File activity</li> <li>• FTP Get File activity</li> <li>• FTP Delete File activity</li> <li>• FTP List Files activity</li> <li>• FTP Rename File activity</li> </ul>

Note: For some of the fields in the endpoint, you can define configuration properties to supply the values for these fields. The

icon is displayed when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ftp\\_create\\_edit\\_endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ftp_create_edit_endpoint.html)

## Configuring the FTP endpoint for the Parse Directory Listing Example

---

To run the Parse Directory Listing Example in your environment, configure the values of the configuration properties used by the FTP Endpoint to point to your FTP Server. In addition, your FTP Server must produce the directory listing in the same format as expected by the Flat File Schema.

## About this task

---

Complete following steps only if you plan on running the Parse Directory Listing Example:

- [To edit and test the FTP configuration properties of the FTPParseDirListingExample in Studio](#)
- [To configure the root directory of the FTP Server](#)
- [To determine if your FTP Server generates the file listing in the same format as the Flat File Schema included in this example](#)
- [To run the FTPParseDirListingExample](#)

To only view and learn more about the example, complete the procedure in the [Parse Directory Listing Example](#) section.

**Edit and test the FTP configuration properties of the FTPParseDirListingExample in Studio:**

## Procedure

---

1. Open **FTPParseDirListingExample**. For instructions see steps 1-2 in [Parse Directory Listing Example](#).
2. From the toolbar menu, select Project > Configuration Properties. The Configuration Properties dialog box is displayed.
3. Edit the values of the properties to reflect your FTP Server.
4. In the Project tab, double-click the FTP Endpoint. The FTP Endpoint tab is displayed.
5. To verify that you entered the correct FTP information, click Test. If Studio connects to your FTP Endpoint, an Information dialog box is displayed with the message that you have successfully connected to the endpoint.
6. In the Project tab, double-click on the **processBids** orchestration. The **processBids** orchestration tab is displayed.

## What to do next

---

Configure the root directory of the FTP Server:

1. Add the additional directories to your FTP Server. Mirror the directory structure and also provided in the FTPServerDirStructure directory. If you accepted the defaults during the installation of Studio, this directory is located in the following location: C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\FTPParseDirListing\FTPServerDirStructure  
During run time, the Parse Directory Listing Example expects the root directory of the FTP Server to contain the following directory structure:

```
\input
\processFailed
\processWidgetRUs
\processAcmeInc
\processNewCompany
```

2. Move a copy of the bid\*.txt files to the \input directory on your FTP Server. If you accepted the defaults during the installation of Studio, these files provided in the following directory location: C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\FTPParseDirListing\FTPServerDirStructure\input  
Before running the example, a copy of the following files must be located in the \input directory of the FTP Server.
  - o bidAcmeInc.txt

- o bidCrankCo.txt
- o bidWidgetRUs.txt
- o bidBudgetManufacture.txt
- o bidSamAndSons.txt

Determine if your FTP Server generates the file listing in the same format as the Flat File Schema included in this example:

1. Open **FTPParseDirListingExample**. For instructions see steps 1-2 in [Parse Directory Listing Example](#).
2. In the Project tab, double-click the **processBids** orchestration. The **processBids** orchestration tab is displayed.
3. Click the **FTP List Files** activity labeled `List Files Full Dir Listing`.
4. Click Test.
5. Determine if the format of the directory listing matches the following directory listing:

```
-rw-r--r--  1 551      551          65 May  3 11:39 bidAcmeInc.txt
-rw-r--r--  1 551      551          43 May  3 11:39 bidBudgetManufacture.txt
-rw-r--r--  1 551      551           0 May  3 11:39 bidCrankCo.txt
-rw-r--r--  1 551      551          73 May  3 11:39 bidSamAndSons.txt
-rw-r--r--  1 551      551          33 May  3 11:39 bidWidgetRUs.txt
```

If the directory format is different, you can alter the Flat File Schema called **parseDirListing**.

**CAUTION:**

Changing the nodes of the Flat File Schema may affect other entities in the orchestration. You may need to update the orchestration to reflect these changes.

For more information, see [Flat File Schema Editor Overview](#).

To open the Flat File Schema used in this example, in the Project tab, double-click on the `parseDirListing` in the Flat File Schema folder. Copy and paste the output of the Test button of the **FTP List Files** activity to a file and then open the file in the Test tab of the Flat File Schema Editor. Change the nodes of the Flat File Schema to reflect the directory listing. The size node is used by the "If size less or equal 0" branch of the **If..Then** activity. Make sure a value is provided for the size node during run time.

**Run the FTPParseDirListingExample:**

1. From Studio, publish the **FTPParseDirListingExample** project. From the Studio toolbar, select File > Publish Project... .
2. From the Web Management Console (WMC), deploy the **FTPParseDirListingExample** project. For more information, see the WMC Online help or Step 11: Publish and Deploy the Completed Integration Project in the **Developing the BookOrder Project** section of the **Getting Started Guide**.

**Parent topic:** [FTP Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring\\_the\\_FTP\\_Endpoint\\_for\\_the\\_Parse\\_Directory\\_Listing\\_Example.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring_the_FTP_Endpoint_for_the_Parse_Directory_Listing_Example.html)

## FTP Poll Directory activity

---

During run time, the FTP Poll Directory activity connects to FTP Server and polls for the existence of the specified file or files at the specified location. After reading the contents of the file or files and mapping the contents into variable or variables of the orchestration, the **FTP Poll Directory** activity may delete the file or files, move the file or files, or leave the file or files in the directory of the FTP Server.

The FTP Poll Directory activity is a starter activity. When an orchestration that starts with an **FTP Poll Directory** activity is deployed to the Integration Appliance, the Integration Appliance polls for file or files to be added to a specific directory on the FTP Server. When a file or files is shown on the FTP Server, an orchestration job is started to processes the file or files and the rest of the activities in the orchestration. For more information, see [Polling Interval Behavior](#). For an example of an orchestration using the **FTP Poll Directory** activity, see the **Getting Started Guide**.

Depending on your application requirements, you can process a list of files in an FTP directory using one of the following methods:

- For some cases, you can use only the **FTP Poll Directory** activity to process a set of files found in an FTP directory.
- In other cases, you must use the **FTP List Files** activity in conjunction with the **FTP Get File**, **FTP Put File**, **FTP Delete File**, and **FTP Rename File** activities.

Use the **FTP Poll Directory** activity to process a set of files found in an FTP directory when the following conditions are true:

- **The FTP Poll Directory activity supports the format of the directory listing of your FTP Server.** - The format of directory listings are different for the FTP Servers supported on different operating systems. The **FTP Poll Directory** activity supports many types of FTP Servers but if the directory listing format your FTP Server cannot be parsed by the **FTP Poll Directory** activity, use the **FTP List Files** activity with a Flat File Schema and the **FTP Get File**, **FTP Put File**, **FTP Delete File**, and **FTP Rename File** activities, to provide the same functionality as the **FTP Poll Directory** activity as shown in the Parse Directory Listing Example: [Parse directory listing example](#).
- **After reading each file in the list, each file in the list can be post-processed with the same action.** - For example, while processing a set of files from a FTP directory, if each file in the list can be moved to the same directory, you can use the **FTP Poll Directory** activity to process the set of files. If however, you need to process a different action based on the properties of a file, you must use the **FTP List Files** activity in conjunction with the **FTP Get File**, **FTP Put File**, **FTP Delete File**, and **FTP Rename File** activities. For example, if you must move files to different directories based on the filename, use the **FTP List Files** activity in conjunction with the **FTP Get File**, **FTP Put File**, **FTP Delete File**, and **FTP Rename File** activities as shown in the Parse Directory Listing Example: [Parse directory listing example](#).

## Symbolic links

---

The support for symbolic links by the **FTP Poll Directory** activity during run time is dependent on the following factors:

- The types of symbolic links supported by operating system that hosts the FTP Server.
- The types of symbolic links supported by the FTP Server itself.
- The types of symbolic links supported by the **FTP Poll Directory** activity, as listed in the following table:

Table 1.

Symbolic Links to...	Hard Symbolic Links	Soft Symbolic Links	Notes®
Files	Not Supported	Not Supported	The <b>FTP Poll Directory</b> activity does not interpret symbolic links to files as files and therefore symbolic links to files are not processed by the <b>FTP Poll Directory</b> activity during run time.
Directories	Supported	Supported	

To determine the specific symbolic link support for a specific FTP Server on a specific operating system, see your operating system and FTP Server documentation.

## Persistence

You should enable persistence for the FTP Poll Directory activity:

- If you have an orchestration job with a FTP Poll Directory activity that is processing large input files. Otherwise, you can experience problems like "Variable 'Lotdata' is too large, please turn on persistence for this orchestration".
- If you disable persistence and have an orchestration job with a FTP Poll Directory activity with the Keep in place option selected, and during run time if a failure occurs that causes the job to stop, when the orchestration is restarted it processes the file again. The state of the job is lost and Integration Appliance does not know that it has already processed the file.

For more information, see [Enabling persistence](#).

## Processing subdirectories with the Microsoft FTP Endpoint

For the Microsoft IIS (Internet Information Services) FTP Endpoint, the run time behavior of the **FTP Poll Directory** activity when processing subdirectories and the files in subdirectories depends on the regular expression specified in the File Named field of the Configure task of the activity, as described in the following cases:

- When the regular expression is equal to the string: \*, the orchestration job processes the subdirectories in the specified directory.
- When the regular expression is equal to the string: \*.\* , the orchestration job does not process the subdirectories in the specified directory.
- When the regular expression is blank, the orchestration job does not process the subdirectories in the specified directory

## Adding an FTP Poll Directory activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the FTP folder.
3. Drag the **Poll Directory** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

## Creating, selecting, or editing an FTP endpoint

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:

- o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.  
CAUTION:  
Specifying a new FTP endpoint with a different directory structure than the original FTP endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the "Configure the activity" procedure.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.  
CAUTION:  
Specifying a new FTP endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the "Configure the activity" procedure. Click Edit. The Edit Endpoint pane is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an FTP endpoint.

## Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields in this pane as described in the following table:

Table 2.

Field	Description
Filename	<p>Specifies a pattern or regular expression that defines the filename or filenames to get from the FTP Server. The processing of the regular expression is done by the FTP Server. For more information, see the FTP Server documentation on regular expressions . Typically, FTP Servers support the following wildcards in their regular expressions:</p> <ul style="list-style-type: none"> <li>o * - zero or more characters</li> <li>o ? - zero or one character</li> </ul> <p>Note: Because the processing of the regular expression is done on the FTP Server, the case sensitivity is determined by FTP Server. If the FTP Server is case sensitive, the file matching done by the FTP Poll Directory activity is also case sensitive.</p>
In Directory	<p>Specifies the directory where the Integration Appliance looks for files on the FTP Server. You can specify a directory using one of the following options:</p> <ul style="list-style-type: none"> <li>o Directly enter directory path by clicking in the field and typing in one of the following directory paths:           <ul style="list-style-type: none"> <li>▪ Relative directory path, for example: input. (Assumes that FTP home has been configured for the user account that connects to the FTP Server. See "<b>Note</b>" for more information.)</li> <li>▪ Complete directory path, for example on a UNIX machine: /home/user/input.</li> </ul> </li> <li>o Click Browse... to populate the drop-down list of available directories. Select the appropriate directory from the drop-down list.</li> </ul> <p>Note: <b>UNIX:</b> If you specify a relative directory path when connecting to an FTP Server on a UNIX machine, verify that the FTP home directory has been correctly specified in the /etc/passwd file for the user account connecting to the FTP Server.</p>

Field	Description
Test	After a regular expression has been specified in the File Named field and the directory to look for files on the FTP Server has been specified in the In Directory field, click Test to test the regular expression against the set of files in the specified directory on the FTP Server. A dialog box will appear listing any matching files.
Options	<p>Specifies how to read in the contents of the file - either as binary data or encoded text. If the Text option is selected, set the encoding type using one of the following options:</p> <ul style="list-style-type: none"> <li>○ From the encoded with drop-down list, select one of the default encoding types.</li> <li>○ Enter your encoding type directly by clicking in the encoded with field and typing in your encoding type.</li> </ul> <p>Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see <a href="#">Using the Shift-JIS encoding</a>.</p>
	<p><b>CAUTION:</b></p> <p>You must specify the Transfer as Text (ASCII) option for FTP activities when retrieving text files and placing text files on an FTP Server for Endpoints that manipulate text data while transferring data from/to the FTP endpoint in ASCII mode. For example, mainframe and DOS FTP Endpoints manipulate ASCII data when passing data in ASCII mode. For example, if your orchestration retrieves ASCII files using the FTP Poll Directory activity and places ASCII files using the FTP Put File activity to a mainframe FTP Server, you must specify the options in the following tasks in Studio:</p> <ul style="list-style-type: none"> <li>○ In the Configure task of an FTP Poll Directory activity, for the Of Type field select the Text option.</li> <li>○ In the Delivery Rules task of an FTP Poll Directory activity, for the File Transfer Type field select the Transfer as Text (ASCII) option.</li> <li>○ In the Configure task of an FTP Put File activity, for the Of Type field select the Text option.</li> <li>○ In the Delivery Rules task of an FTP Put File activity, for the File Transfer Type field select the Transfer as Text (ASCII) option.</li> </ul>
After reading the file	<p><b>Delete it</b> - Delete the file after the file has been read.</p> <p><b>Move to directory</b> - Move the file to the specified directory after the file has been read.</p> <p>Specify the directory that the file is moved to during run time, using one of the following options:</p> <ul style="list-style-type: none"> <li>○ Directly enter a directory path by clicking in the field and typing in one of the following directory paths: <ul style="list-style-type: none"> <li>■ Relative directory path, for example: input/. (Assumes that FTP home has been configured for the user account that connects to the FTP Server. See "<b>Note</b>" for more information.)</li> <li>■ Complete directory path, for example on a UNIX machine: /home/user/input/.</li> </ul> </li> <li>○ Click Browse... to populate the drop-down list of available directories. Select the appropriate directory from the drop-down list.</li> </ul>

<b>Field</b>	<b>Description</b>
	<p>Attention: Specify the directory separator after the last listed directory name. For example, to move a file to the processed/acme directory in a relative path, specify the following directory in the Move to directory field: processed/acme/</p> <p>Optional - Specify the format of the file name after it has been renamed. From the Pattern drop-down list, select the desired pattern. To specify the character used to separate the sub-fields in the file name, enter a character in the Pattern Separator field. Specify the run time behavior when a file with the same file name exists:</p> <ul style="list-style-type: none"> <li>○ Select the Overwrite check box to specify that the existing file should be overwritten if a file with the same name already exists.</li> <li>○ Clear the Overwrite check box to specify that the existing file should not be overwritten if a file with the same name already exists.</li> </ul> <p>Note: The first time the <b>FTP Poll Directory</b> activity polls during run time, if the activity is unable to move the file because the specified move to directory does not exist, a warning is logged (not an error) to the Web Management Console (WMC) and the file stays in place. For all subsequent polls, the activity does not attempt to move the same file and an info level message is logged to the WMC stating that the file has already been processed.</p> <p><b>Keep in place</b> - Leave the file in the input directory after the file has been read.</p>
<b>Advanced Options</b>	<b>Description</b>
Duplicate List Size	Size of the internal list used by the Integration Appliance to keep track of which files on the FTP Server have been polled or not. The default value is 10000. You should only specify a size larger than the default.

## Specifying the delivery rules

1. Select the Delivery Rules task from the **Checklist**. The Delivery Rules pane is displayed.
2. Specify the time interval to poll for the files on the FTP Server:

- a. Select a time unit from the drop-down menu: seconds, minutes, hours, or days.
- b. Specify the amount of time by clicking in the Polling Interval field and entering a value or using the up and down arrows.

For more information, see [Polling interval behavior](#).

3. If security is not enabled for the FTP endpoint, the Transfer as Text (ASCII) and Transfer as Binary (BINARY) options are enabled in the Delivery Rules task. If security is enabled for the FTP Endpoint, the file transfer type is always binary.

Select the type of file transfer between the Integration Appliance and the FTP Server from one of the following options:

- o **Transfer as Text (ASCII)** - Only seven bits of each character in the file is transferred from the FTP Server to the Integration Appliance. This option is used for transferring ASCII files such as HTML and text files. **WARNING:** Using this option with binary files can result in a loss of data.
- o **Transfer as Binary (BINARY)** - All eight bits of each byte in the file is transferred from the FTP Server to the Integration Appliance. This option is used for transferring binary files.  
 Note: Setting the transfer mode in the Delivery Rules task is equivalent to setting the transfer mode via a command line session with an FTP Server using the following commands:
  - `ascii`
  - `binary`

Note: Cast Iron FTP connector SFTP endpoint supports only client side SFTP protocol version 3. Hence, the SFTP protocol does not support ASCII/text mode file transfer. Make sure to set the File Transfer Type to Transfer as Binary (BINARY) in the Checklist > Delivery Rules.

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an FTP Server. The following table defines the retry options for a connection to an FTP Server:

Table 3.

Field	Description
Retry	
1) Wait — second(s) ) between each retry .	The number of seconds that the Integration Appliance waits before trying to establish a connection to the FTP Server.

Field	Description
2) Try to connect ___ times before failing.	Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the FTP Server before issuing an error. If an orchestration that starts with an <b>FTP Poll Directory</b> activity is deployed and the Integration Appliance cannot connect to the specified FTP Server, the Integration Appliance logs the connection errors as warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system log, resets the connection error count to zero, and continues to attempt to establish a connection to the FTP Server.  For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and resets the connection error count to zero. Therefore, the fifth connection error generates a warning in the system log. The Integration Appliance continues to attempt to establish a connection to the FTP Server.

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane as listed in the following table:

Table 4.

Output Parameter	Description
file name	Provides the name of the file found on the FTP Server.
data	Provides the contents of the file.
timestamp	Provides the date and time as a string in the XML Schema dataType format (YYYY-MM-DDhh:mm:ss, where YY is the year, MM is the month, DD is the day, hh is the timezone, mm is the minutes, and ss is the seconds.)  Note: If the timestamp output parameter is mapped in the <b>Map Outputs</b> task but the MDTM (return the modification time of a file) functionality is not available or is not enabled for the FTP Server, during run time the orchestration will stop processing due to this error. A warning is generated and the Epoch date (1/1/1970) is returned in the timestamp output parameter.

2. You are not required to map the output parameters of the activity. See [Creating a map](#) for general instructions on mapping.

Parent topic: [FTP Activities](#)

[Feedback](#) | [Notices](#)

## FTP Put File activity

---

During run time, the **FTP Put File** activity takes data from variables of the orchestration, places the data into a file, and connects to an FTP Server and places the file in the specified directory location.

For an example of using the **FTP Put File** activity, see the **Getting Started Guide**.

## Transfer interruption

---

The file transfer done by the **FTP Put File** activity during run time is non-transactional and therefore is not guaranteed. For example, if an **FTP Put File** activity transfers a file from the Integration Appliance to an FTP server and the transfer of the file is interrupted because the Integration Appliance is rebooted, it is not guaranteed that the entire file is transferred.

## Symbolic link

---

The FTP Put File activity supports symbolic links to directories if the symbolic links to directories are supported by the operating system that hosts the FTP Server and the symbolic links to directories are supported by the FTP Server itself. To determine the specific symbolic link support for a specific FTP Server on a specific operating system, see your operating system and FTP Server documentation.

## Adding an FTP Put File activity to the orchestration

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the FTP folder.
3. Drag the **Put File** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

## Creating, selecting, or editing an FTP endpoint

---

1. Click Pick Endpoint task from the **Checklist** and choose one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.  
Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the To configure the activity procedure.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.  
Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the "Configure the activity" procedure.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.

2. Create or edit an FTP endpoint: [Creating or Editing an FTP endpoint](#)

## Specifying the delivery rules

1. Select the **Delivery Rules** task from the **Checklist**. The Delivery Rules pane is displayed. If security is not enabled for the FTP endpoint, the Transfer as Text (ASCII) and Transfer as Binary (BINARY) options are enabled. If security is enabled for the FTP endpoint, the file transfer type is always binary.
2. Select the type of file transfer between the Integration Appliance and the FTP Server from one of the following options:

- o **Transfer as Text (ASCII)** - This option is used for transferring files such as HTML, XML, and other text files. Line endings are converted as required and other text file conventions are followed.

CAUTION:

Using this option with binary files can result in a loss of data.

- o **Transfer as Binary (BINARY)** - This option is used for transferring binary files. Using this option the Integration Appliance transfers data with no conversions.

Note: Cast Iron FTP connector SFTP endpoint supports only client side SFTP protocol version 3. Hence, the SFTP protocol does not support ASCII/text mode file transfer. Make sure to set the File Transfer Type to Transfer as Binary (BINARY) in the Checklist > Delivery Rules.

## Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure the fields in this pane as described in the following table:

Table 1.

Field	Description
<b>Save</b>	
File Named	This field is not used for this activity. You specify the name of the output file using the <b>filename</b> input parameter of the <b>Map Input</b> task.
In Directory	<p>Specifies the directory on the FTP server where the Integration Appliance places the file generated in this activity. You can specify a directory using one of the following options:</p> <ul style="list-style-type: none"> <li>o Directly enter directory path by clicking in the field and typing in one of the following directory paths: <ul style="list-style-type: none"> <li>▪ Relative directory path, for example: <code>/output.</code> (Assumes that FTP home has been configured for the user account that connects to the FTP Server. See "<b>Note</b>" for more information.)</li> <li>▪ Complete directory path, for example on a UNIX machine: <code>/home/user/output.</code></li> </ul> </li> <li>o Click Browse... to populate the down-down list of available directories. Select the appropriate directory from the drop-down list.</li> </ul> <p>Note: <b>UNIX:</b> If you specify a relative directory path when connecting to an FTP Server on a UNIX machine, verify that the FTP home directory has been correctly specified in the <code>/etc/passwd</code> file for the user account connecting to the FTP Server.</p>

Field	Description
Of Type	<p>Specifies how to read in the contents of the file - either as binary data or encoded text. If the Text option is selected, set the encoding type using one of the following options:</p> <ul style="list-style-type: none"> <li>○ From the encoded with drop-down list, select one of the default encoding types.</li> <li>○ Enter your encoding type directly by clicking in the encoded with field and typing in your encoding type.</li> </ul> <p>Note: Some double-byte characters are not converted using the SHIFT-JIS encoding. For more information, see <a href="#">Using the Shift-JIS encoding</a>.</p>
	<p>Attention: You must specify the Transfer as Text (ASCII) option for FTP activities when retrieving text files and placing text files on an FTP Server for Endpoints that manipulate text data while transferring data from/to the FTP Endpoint in ASCII mode. For example, mainframe and DOS FTP Endpoints manipulate ASCII data when passing data in ASCII mode. For example, if your orchestration retrieves ASCII files using the <b>FTP Poll Directory</b> activity and places ASCII files using the FTP Put File activity to a mainframe FTP Server, you must specify the options in the following tasks in Studio:</p> <ul style="list-style-type: none"> <li>○ In the <b>Configure</b> task of an <b>FTP Poll Directory</b> activity, for the Of Type field select the Text option.</li> <li>○ In the <b>Delivery Rules</b> task of an <b>FTP Poll Directory</b> activity, for the File Transfer Type field select the Transfer as Text (ASCII) option.</li> <li>○ In the <b>Configure</b> task of an <b>FTP Put File</b> activity, for the Of Type field select the Text option.</li> <li>○ In the <b>Delivery Rules</b> task of an <b>FTP Put File</b> activity, for the File Transfer Type field select the Transfer as Text (ASCII) option.</li> </ul>
<p><b>Options</b> - Select one of the following options to define the behavior when a file of the same name already exists in the specified output directory:</p>	
Overwrite Existing File if Duplicate File Name is Found	Specifies if the file already exists, destroys the contents of the original file with new data returned from the activity.
Append to Existing File	Specifies if the file already exists, keeps the original data in the file and appends the new data (returned from the activity) to the end of the file.
Raise Error if File with Duplicate Name is Found	<p>Specifies if the file already exists, keeps the original data in the file, throws an error, and does nothing with the new data returned from the activity.</p> <p>Note: When you select this option, the FTP Put File activity checks if the file exists on the server before uploading the file. In some FTP servers you may not have the permission to check if the file exists before uploading it. This is also referred to as Blind FTP. In such cases, the file is overwritten, even if you have selected the Raise Error if File with Duplicate Name is Found option.</p>

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an FTP Server. The following table describes the retry options for connecting to an FTP Server:

Table 2.

Field	Description
Retry	
1) Wait ___ second (s) between each retry.	The number of seconds that the Integration Appliance waits before trying to establish a connection to the FTP Server.
2) Try to connect ___ times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the FTP Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an <b>FTP Put File</b> activity and the Integration Appliance cannot connect to the specified FTP Server, the Integration Appliance logs the connections errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors are shown in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

## Mapping the input of the activity

1. Select the **Map Inputs** task in the **Checklist**. The Retry pane is displayed. The input parameters of the activity are displayed in the To Activity pane.
2. You are not required to map all the input parameters of the activity. The following parameters are the required:
  - o filename
  - o data

All other parameters are optional. See [Creating a map](#) for general instructions on mapping.

If the input parameter listed in the following table are not displayed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active.

You can optionally override the settings you specified in the **Configure** and **Pick Endpoint** task of the **Checklist** dynamically during run time, using the input parameters defined in the following table.

For example, the directory on the FTP Server where the Integration Appliance places the file generated in this activity, could be set in the **Configure** task to the directory called output. During run time, the directory name: outputXML could be passed into the activity using the directory input parameter. The directory name specified dynamically during run time overrides the original setting specified in the Configure pane. In this example, the file would be placed in the outputXML directory.

Table 3.

Input Parameter Name /Node	Description	Overrides the Setting in Task?
directory	Specifies the directory on the FTP server where the Integration Appliance places the file generated in this activity.	The directory input parameter overrides the In Directory field of the <b>Configure</b> task.
encoding	Specifies how the outgoing data is written out to the file: <ul style="list-style-type: none"> <li>• If no encoding is required, specify the string: <code>binary</code>.</li> <li>• If encoding is required, specify the encoding type that should be used to encode the outgoing data, for example: <code>UTF-8</code>, <code>US-ASCII</code>, <code>ISO_8859-1</code>, <code>EBCDIC-US</code>, or <code>SHIFT-JIS</code>.</li> </ul>	The encoding input parameter overrides the encoding specified in the Of Type field of the <b>Configure</b> task but if the Binary option is selected in the Of Type field of the <b>Configure</b> task, the encoding specified by the encoding input parameter is ignored.
overwrite	Specifies the behavior when a existing file of the same name already exists in the specified output directory. Specify one of the following values: <ul style="list-style-type: none"> <li>• <b>y</b> - Specifies if the file already exists, destroy the contents of the original file with new data returned from the activity.</li> <li>• <b>a</b> - Specifies if the file already exists, keep the original data in the file and append the new data (returned from the activity) to the end of the file.</li> <li>• <b>n</b> - Specifies if the file already exists, keep the original data in the file and do nothing with the new data returned from the activity.</li> </ul>	The overwrite input parameter overrides the Options field of the <b>Configure</b> task.
connection/timeout	Specifies the connection timeout - the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For the <b>FTP Put File</b> activity, the amount of time the Integration Appliance attempts to establish a connection to the FTP Server before timing out.	The <b>timeout</b> node of the connection input parameter overrides the Connection Timeout -Time out after ___ second(s) when establishing a connection to the Endpoint field of the FTP endpoint.
connection/host	Specifies the Host Name or IP address for the FTP server.	The <b>host</b> node of the connection input parameter overrides the Host Name field of the FTP endpoint.

Input Parameter Name /Node	Description	Overrides the Setting in Task?
connection/port	Specifies the port number for the specified host name. The standard port for FTP traffic is 21. The default port for SFTP traffic is 22.	The <b>port</b> node of the connection input parameter overrides the Port field of the FTP endpoint.
connection/username	Specify a user name for the account used to connect to the FTP Server.	The <b>username</b> node of the connection input parameter overrides the User Name field of the FTP endpoint.
connection/password	Specify a password for the account used to connect to the FTP Server.	The <b>password</b> node of the connection input parameter overrides the Password field of the FTP endpoint.

Parent topic: [FTP Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ftp\\_put\\_file\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ftp_put_file_activity.html)

## FTP Get File activity

---

During run time, the **FTP Get File** activity connects to an FTP Server and attempts to get a single file at the specified location. You can configure the **FTP Get File** activity to return the contents of the file into a variable of the orchestration. In addition, you can configure the **FTP Get File** activity to return the timestamp of the file returned by the FTP Server into a variable of the orchestration.

The **FTP Get File** activity differs from the **FTP Poll Directory** activity in the following ways:

- The **FTP Get File** activity does not poll for a file or files in the specified directory. Instead the **FTP Get File** activity checks for the file a single time and if the file is not found, it throws an error and the orchestration job continues to processing.
- The **FTP Get File** activity is not a starter activity, so it cannot be the first activity in an orchestration.
- The **FTP Get File** activity does not move or delete files on the FTP server.

## Symbolic link

The support for symbolic links by the **FTP Get File** activity during run time is dependant on the following factors:

- The types of symbolic links supported by operating system that hosts the FTP Server.
- The types of symbolic links supported by the FTP Server itself.
- The types of symbolic links supported by the **FTP Get File** activity, as listed in the following table:

Table 1.

Symbolic Links to...	Hard Symbolic Links	Soft Symbolic Links	Notes®
Files	Not Supported	Not Supported	The <b>FTP Get File</b> activity does not interpret symbolic links to files as files and therefore symbolic links to files are not processed by the <b>FTP Get File</b> activity during run time.
Directories	Supported	Supported	

To determine the specific symbolic link support for a specific FTP Server on a specific operating system, see your operating system and FTP Server documentation.

## Adding an FTP Get File activity in the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the FTP folder.
3. Drag the **Get File** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

## Creating, selecting, or editing an FTP endpoint

1. Click Pick Endpoint task from the **Checklist** and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.  
Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the Configuring the activity procedure.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.  
Attention: Specifying a new FTP Endpoint with a different directory structure than the original FTP Endpoint can cause the orchestration job to fail during run time. You must either specify a new FTP Server that matches the directory structure of the originally

- specified FTP Server or change the configured directory of the In Directory field by clicking Browse as described in the "Configure the activity" procedure.
  - c. Click Edit. The Edit Endpoint pane is displayed.
    - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an FTP endpoint: [Creating or Editing an FTP endpoint](#)

## Specifying the delivery rules

1. Select the **Delivery Rules** task from the **Checklist**. The Delivery Rules pane is displayed. If security is not enabled for the FTP endpoint, the Transfer as Text (ASCII) and Transfer as Binary (BINARY) options are enabled. If security is enabled for the FTP endpoint, the file transfer type is always binary.
2. Select the type of file transfer between the Integration Appliance and the FTP Server from one of the following options:
  - o **Transfer as Text (ASCII)** - Only seven bits of each character in the file is transferred by the Integration Appliance to the FTP Server. This option is used for transferring ASCII files such as HTML and text files.  
CAUTION:  
Using this option with binary files can result in a loss of data.
  - o **Transfer as Binary (BINARY)** - All eight bits of each byte in the file is transferred by the Integration Appliance to the FTP Server. This option is used for transferring binary files.

Note: Setting the transfer mode in the Delivery Rules task is equivalent to setting the transfer mode via a command line session with an FTP Server using the following commands:

  - o `ascii`
  - o `binary`

Note: Cast Iron FTP connector SFTP endpoint supports only client side SFTP protocol version 3. Hence, the SFTP protocol does not support ASCII/text mode file transfer. Make sure to set the File Transfer Type to Transfer as Binary (BINARY) in the Checklist > Delivery Rules.

## Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields in this pane as described in the following table:

Table 2.

Field	Description
Filename	This field is not used for this activity. You specify the name of the output file using the filename input parameter of the <b>Map Input</b> task.

Field	Description
From Directory	<p>Specifies the directory on the FTP server where the Integration Appliance places the file generated in this activity. You can specify a directory using one of the following options:</p> <ul style="list-style-type: none"> <li>○ Directly enter directory path by clicking in the field and typing in one of the following directory paths: <ul style="list-style-type: none"> <li>▪ Relative directory path, for example: /output. (Assumes that FTP home has been configured for the user account that connects to the FTP Server. See "<b>Note</b>" for more information.)</li> <li>▪ Complete directory path, for example on a UNIX machine: /home/user/output.</li> </ul> </li> <li>○ Click Browse... to populate the down-down list of available directories. Select the appropriate directory from the drop-down list.</li> </ul> <p>Note: <b>UNIX:</b> If you specify a relative directory path when connecting to an FTP Server on a UNIX machine, verify that the FTP home directory has been correctly specified in the /etc/passwd file for the user account connecting to the FTP Server.</p>
Of Type	<p>Specifies how to read in the contents of the file - either as binary data or encoded text. If the Text option is selected, set the encoding type using one of the following options:</p> <ul style="list-style-type: none"> <li>○ From the encoded with drop-down list, select one of the default encoding types.</li> <li>○ Enter your encoding type directly by clicking in the encoded with field and typing in your encoding type.</li> </ul>
	<p>Attention: You must specify the Transfer as Text (ASCII) option for FTP activities when retrieving text files and placing text files on an FTP Server for Endpoints that manipulate text data while transferring data from/to the FTP Endpoint in ASCII mode. For example, mainframe and DOS FTP Endpoints manipulate ASCII data when passing data in ASCII mode.</p> <p>For example, if your orchestration retrieves ASCII files using the <b>FTP Poll Directory</b> activity and places ASCII files using the FTP Put File activity to a mainframe FTP Server, you must specify the options in the following tasks in Studio:</p> <ul style="list-style-type: none"> <li>○ In the <b>Configure</b> task of an <b>FTP Poll Directory</b> activity, for the Of Type field select the Text option.</li> <li>○ In the <b>Delivery Rules</b> task of an <b>FTP Poll Directory</b> activity, for the File Transfer Type field select the Transfer as Text (ASCII) option.</li> <li>○ In the <b>Configure</b> task of an <b>FTP Put File</b> activity, for the Of Type field select the Text option.</li> <li>○ In the <b>Delivery Rules</b> task of an <b>FTP Put File</b> activity, for the File Transfer Type field select the Transfer as Text (ASCII) option.</li> </ul>

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an FTP Server. The following table defines the retry options for a connection to an FTP Server:

Table 3.

Field	Description
Retry	

Field	Description
1) Wait ___ second (s) between each retry.	The number of seconds that the Integration Appliance waits before trying to establish a connection to the FTP Server.
2) Try to connect ___ times before failing.	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the FTP Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an <b>FTP Get File</b> activity and the Integration Appliance cannot connect to the specified FTP Server, the Integration Appliance logs the connections errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

## Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The input parameters of the activity are displayed in the To Activity pane.
2. The filename parameter is the only parameter you are required to provide an value in the activity. All other parameters are optional. The filename parameter specifies the name of the file to get from the FTP Server. You provide a value for the filename parameter by either by creating a link from the filename input parameter to a variable or by defining a default value for the filename input parameter.

If the optional input parameter listed in the following table are not displayed in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active.

You can optionally override the settings you specified in the **Configure** and **Pick Endpoint** task of the **Checklist** dynamically during run time, using the input parameters defined in the following table.

For example, the directory on the FTP Server where the Integration Appliance gets the file, could be set in the **Configure** task to the directory called input. During run time, the directory name: inputXML could be passed into the activity using the directory input parameter. The directory name specified dynamically during run time overrides the original setting specified in the Configure pane. In this example, the Integration Appliance attempts to get the file from the inputXML directory.

Table 4.

Input Parameter Name /Node	Description	Overrides the Setting in Task?
directory	Specifies the directory on the FTP server where the Integration Appliance places the file generated in this activity.	The directory input parameter overrides the From Directory field of the <b>Configure</b> task.
encoding	<p>Specifies how the outgoing data is written out to the file:</p> <ul style="list-style-type: none"> <li>• If no encoding is required, specify the string: <code>binary</code>.</li> <li>• If encoding is required, specify the encoding type that should be used to encode the outgoing data, for example: <code>UTF-8</code>, <code>US-ASCII</code>, <code>ISO_8859-1</code>, <code>EBCDIC-US</code>, or <code>SHIFT-JIS</code>.</li> </ul>	The encoding input parameter overrides the encoding specified in the Of Type field of the <b>Configure</b> task but if the Binary option is selected in the Of Type field of the <b>Configure</b> task, the encoding specified by the encoding input parameter is ignored.
connection/timeout	Specifies the connection timeout — the number of seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For the <b>FTP Get File</b> activity, the amount of time the Integration Appliance attempts to establish a connection to the FTP Server before timing out.	The timeout node of the connection input parameter overrides the Connection Timeout -Time out after ___ second(s) when establishing a connection to the Endpoint field of the FTP endpoint.
connection/host	Specifies the Host Name or IP address for the FTP server.	The <b>host</b> node of the connection input parameter overrides the Host Name field of the FTP endpoint.
connection/port	Specifies the port number for the specified host name. The standard port for FTP traffic is 21. The default port for SFTP traffic is 22.	The <b>port</b> node of the connection input parameter overrides the Port field of the FTP endpoint.
connection/username	Specify a user name for the account used to connect to the FTP Server.	The <b>username</b> node of the connection input parameter overrides the User Name field of the FTP endpoint.

con nec tio n/p ass wo rd	Specify a password for the account used to connect to the FTP Server.	The <b>password</b> node of the connection input parameter overrides the Password field of the FTP endpoint.
---	---	--

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane as described in the following table:

Table 5.

Output Parameter Name	Description
data	Contains the contents of the file.
timestamp	Contains the timestamp for the file returned from the FTP Server, typically the creation date or last modified date of the file.

2. Map the desired output parameters to variables.

Parent topic: [FTP Activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ftp\\_get\\_file\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ftp_get_file_activity.html)

## Parse directory listing example

This example gets a directory listing from an FTP directory using the **FTP List Files** activity, parses the long directory listing using Flat File Scheme, iterates through the list of files, based on the properties of each file.

### About this task

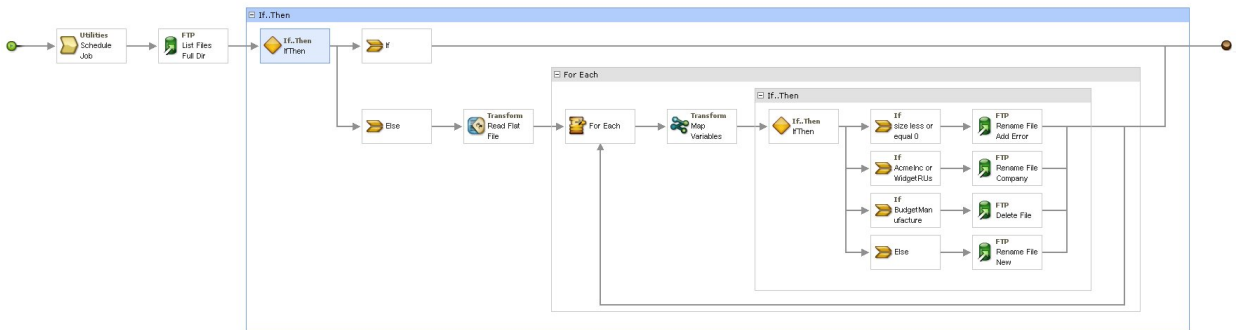

Based on the properties of each file, one of the following actions occurs:

- Move the file to a new directory using the [FTP Rename File activity](#).
- Rename the file using the [FTP Rename File activity](#).
- Delete the file using the [FTP Delete File activity](#).

To open, view, and learn more about the FTTParseDirListingExample:

## Procedure

1. Extract the FTTParseDirListingExample project:
  - a. Find the Default Create Path defined in Studio, the directory that new projects are created in. To view the current Default Create Path, select File > Preferences... from the Studio toolbar menu. The Preferences window is displayed. The current Default Create Path displays at the end of the pane. By default, the Default Create Path is located in the following directory: C:\Documents and Settings\*myLogin*\My Documents Where *myLogin* represents your Windows login name.
  - b. Find the FTTParseDirListingExample.zip file that contains the files that make up the FTTParseDirListingExample project. If you accepted the defaults during the installation of Studio, this file is located in the following directory: C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\FTTParseDirListing
  - c. Copy the FTTParseDirListingExample.zip file from the FTTParseDirListing directory to the Default Create Path directory.
  - d. Extract the contents of FTTParseDirListingExample.zip file into the Default Create Path directory.
2. Open the FTTParseDirListingExample project:
  - a. Select File > Open Project... from the Studio toolbar menu. The Open dialog box is displayed.
  - b. Browse for and open the FTTParseDirListingExample directory.
  - c. Click on the FTTParseDirListingExample.sp3 file and click Open. The project is displayed.
3. In the Project tab, double-click the **processBids** orchestration. The **processBids** orchestration tab displays the activities of the orchestration, as shown in the following figure:

4. Click the **Schedule Job** activity. Click the **Configure** task in the **Checklist**. During run time, this activity starts an orchestration job every 5 minutes.
5. Click the **FTP List Files** activity labeled List Files Full Dir Listing. Click the **Configure** task in the **Checklist**. This activity gets a long directory listing of the files in the /input directory on the FTP Server and returns the listing as one string in the dirListing output parameter. In this example, the string returned in the directoryListing output parameter is stored in the fullDirectoryListing string variable.

If the [FTP Endpoint has been configured for the Parse Directory Listing Example](#), click Test in the **Configure** task to get the directory listing. The List Only Files (NLST) check box determines if the directory listing contains just the list of files or a full directory listing. For this example, clear the List Only Files (NLST) check box.

6. Expand the **If...Then** activity. During run time, this activity checks the value of the fullDirectoryListing string variable and if the value is empty, the **If** path is run and the orchestration ends. If the fullDirectoryListing string is not empty, the **Else** path is run and the orchestration parses the directory.

7. Click the **Read Flat File** activity. Click the **Map Inputs** task in the **Checklist**. During run time, the long directory listing created in the **FTP List Files** activity, is passed to the **Read Flat File** activity via the **Data** input parameter.
8. Click the **Map Outputs** task in the **Checklist**. During run time, the **Read Flat File** activity parses the directory string into the repeating node structure displayed in the **Map Outputs** task.
9. Click the **For Each** activity. During run time, the **For Each** activity iterates through the repeating node structure that stores the directory listing. Each iteration is equivalent to a single file and the properties of that file.
10. Click the **Map Variables** activity. During run time, the **Map Variables** activity converts the size of the current file into a decimal number.
11. Click on the **If..Then** activity. During run time, the **If..Then** activity starts the following **If..Then** branches.

## Results

---

- If the size of the file is equal to 0, the [FTP Rename File activity](#) moves the file to the /processFailed directory and renames the file by adding the ERROR prefix to the file name.
- If the file name contains a string representing one of the approved supplies (AcmeInc or WidgetRUs), the [FTP Rename File activity](#) based on the file name, moves the file to the appropriate directory either /processAcmeInc or /processWidgetRUs.
- If the file name contains the string representing the Budget Manufacture supplier, the [FTP Delete File activity](#) removes the file because Budget Manufacture is on the unapproved supplier list.
- If the file is not processed by any of the three previous conditions, the **Else** clause is called and the [FTP Rename File activity](#) moves the file to the /processNewCompany directory.

To run the Parse Directory Listing Example, see the procedures provided in the [Configuring the FTP Endpoint for the Parse Directory Listing Example](#) section.

## Testing an FTPS server connection

---

After successfully running a "test connection", you can use Studio verify tools on FTPS orchestrations before publishing a project.

### About this task

---

If you configure an endpoint that represents an FTPS server, you can use it in a Studio project to create orchestrations. You will not, however, be able to verify the orchestration behavior in Studio until you import a copy of the FTPS certificate into Studio, as detailed in this help topic.

Note: The following procedure refers to a FTPS server named: "<ftps>" in a domain named "<domain.com>".

To test an FTPS Server connection:

## Procedure

---

1. Open a command window.
2. Navigate to the FTPS host, and locate the certificate file ca-cert stored in the FTP server <ftps>, in this directory: /var/www/covalent/servers/<ftps.domain.com>/ssl/caerts/castiron\_ca\_cert.pem
3. Substitute the actual server and domain name of your FTPS installation.
4. Copy this file and navigate to the Studio workstation.
5. Using the command window, paste the ca-cert copy in the home directory of Studio: C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x
6. Navigate to the security directory of Studio: C:\Program Files\IBM\WebSphere Cast Iron Studio x.x.x\security
7. Run the following command to import the ca-cert file into Studio: `..\jre\bin\keytool.exe -import -v -keystore cacerts -storepass changeit -file ..\castiron_ca_cert.pem -alias alias_name`
8. When you are prompted for a yes or no, type yes (Y) and press Enter.
9. Exit the command window.
10. Restart Studio.
11. Open the endpoint for this FTPS server.
12. Verify the following login credentials for the FTPS connection: FTP server, Port, User, and Password.
13. Click Test Connection. If the connection is successful, use this endpoint in Studio orchestrations, then use the Verify tab features to evaluate the orchestration.

## HTTP Activities

---

- [Creating or editing an HTTP endpoint](#)  
HTTP endpoints provide the connection information that Studio and the Integration Appliance use to connect to an HTTP server. An HTTP endpoint also specifies the connection information so the Integration Appliance can act as HTTP listener.
- [HTTP Receive Request activity](#)  
Use the HTTP **Receive Request** activity to configure the Integration Appliance to act as an HTTP listener
- [Decompression with the HTTP Receive Request activity](#)  
The **HTTP Receive Request** activity supports decompression with the gzip format only. The **HTTP Receive Request** activity does not support the deflate format or the common UNIX file compression format called compress.
- [HTTP Send Response activity](#)  
The HTTP **Send Response** activity sends a reply back to the sender of an HTTP request.
- [Compression/Decompression with the HTTP Send Response activity](#)  
During runtime, the **HTTP Send Response** activity sends an HTTP response complaint with the

HTTP/HTTPS 1.0 protocol to the HTTP client.

- [HTTP Post Request activity](#)  
The HTTP **Post Request** activity sends a **Post Request** to the specified location (the HTTP endpoint) and receives an HTTP response back from that location.
- [HTTP Get Request activity](#)  
The HTTP **Get Request** activity sends a **Get Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.
- [HTTP Head Request activity](#)  
The HTTP **Head Request** activity sends a **Head Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.
- [HTTP Invoke Request activity](#)  
The HTTP **Invoke Request** activity sends a HTTP request to the specified location, the HTTP endpoint, and receives a HTTP response back from that location.
- [HTTP Put Request activity](#)  
The HTTP **Put Request** activity sends a **Put Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.
- [HTTP Delete Request activity](#)  
The HTTP **Delete Request** activity sends a **Delete Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.
- [Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity](#)  
During runtime, the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity sends a HTTP request compliant with the HTTP/HTTPS 1.1 protocol to the HTTP Server.
- [Troubleshooting and support](#)  
Troubleshooting techniques and self-help information help you identify and solve problems quickly. Here, you can find potential solutions for issues you would have with the HTTP connector.

---

## Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_HTTPactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_HTTPactivities.html)

## Creating or editing an HTTP endpoint

---

HTTP endpoints provide the connection information that Studio and the Integration Appliance use to connect to an HTTP server. An HTTP endpoint also specifies the connection information so the Integration Appliance can act as HTTP listener.

1. In the Create Endpoint or Edit Endpoint pane, configure the fields as described in the following table.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project as the edits are global, not local.
2. When finished, if available click Test Connection to confirm that you can connect to the HTTP server.  
Note: The Test Connection button is only available when configuring an endpoint for the HTTP Post Request activity - when Location is set to the Remote Server option.
3. Click OK.

Table 1.

<b>Field Name</b>	<b>Description</b>
<b>Location</b>	
Integration Appliance Receives Request	This option specifies that the Integration Appliance is acting as an HTTP listener. For an HTTP endpoint used with the <b>HTTP Receive Request</b> activity, Location is automatically set to the Integration Appliance Receives Request option.
Remote Server	This option specifies that the Integration Appliance is sending and receiving requests from a remote HTTP server. For an HTTP endpoint used with the <b>HTTP Post Request</b> activity, Location is automatically set to the Remote Server option.
Host Name	Required for the Remote Server option only - Specify the host name or IP address for the HTTP server that this endpoint connects to.
Port	For the <b>HTTP Receive Request</b> activity - Specify the port number of the Integration Appliance acting as an HTTP listener. For the <b>HTTP Post Request</b> activity - Specify the port number of the remote HTTP server.
<b>Login</b>	<b>Description</b>
Log into the Server as an Anonymous User	Available for the Remote Server option only. Select this option to connect to the HTTP server anonymously (where a user account is not required).
Log into the Server with User Name and Password	Available for the Remote Server option only. Select this option to connect to the HTTP server using a user account. Enter the User Name and Password.
Authentication	Allows you to select the type of authentication that the Integration Appliance uses when connecting to a remote server. From the list, select one of the following authentication options: <ul style="list-style-type: none"> <li>• <b>Basic</b> - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure. Note: Basic authentication is now made available for HTTP Receive Request activity.</li> <li>• <b>Digest</b> - Encrypts the user name and password you specify before sending the user name and password to the server. This authentication option is more secure than Basic authentication.</li> <li>• <b>NTLM</b> - Requires an instance of NTCredentials to be available for the domain name of the server. This authentication is the most secure authentication option. When you choose the NTLM authentication option, the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server. Note: Do not prefix the user name with the domain.</li> <li>• <b>Kerberos</b> - The Kerberos protocol requires a trusted third party which is referred to as the Kerberos server. The Kerberos server name and realm are configured on the WMC Security:Kerberos panel instead of on the HTTP or Web Services end point.</li> </ul>

<b>Field Name</b>	<b>Description</b>
Realm / Domain	If you select the Basic or Digest authentication option, specify a realm. If you select the NTLM authentication option, specify a domain.
User Name	Available for the Remote Server option only - Specify the User Name for the account used to connect to the HTTP Server.
Password	Available for the Remote Server option only - Specify the Password for the account used to connect to the HTTP Server.
<b>Log into the Server using OAuth 2.0</b>	<b>Description</b>
Grant Type	Cast Iron OAuth2.0 client supports two grants to request an access token. The authorization request can be made directly to the resource owner or through the authorization server. Select one of the following grant types: <ul style="list-style-type: none"> <li>password - Requires either a combination of Authorization Server URL, Username and password or just the Access Token. If the Access Token is temporary, the authorization server URL, username and password must be provided so as to regenerate the expired access token</li> <li>authorization_code - Requires an Access Token and/or the combination of Refresh Token and Authorization Server URL in order to refresh temporary access tokens post expiry.</li> </ul>
Scope	Specify the scope of the access request using the scope request parameter. The authorization server uses this to inform the client about the scope of the access token issued.
Username	Specify the user name used to log on to the resource server. For resource owner password credential grant, the user name will be used as a part of the access token request.
Password	Specify the password used to logon to the resource server. For resource owner password credential grant, the password will be used as a part of the access token request.
Client ID	Specify the client ID issued by the authorization server during registration. Client ID is a unique string containing the registration information provided to the client by the authorization server. The client ID is not a secret; it is exposed to the resource owner and must not be used only for client authentication.
Client Secret	Specify the client secret. The client secret is confidential.
Access Token	Specify the Access Token. Access tokens are credentials representing the authorization issued to the client. Tokens represent specific scopes and the duration of access.
Auth Server URL	Specify the Authorization Server URL. Authorization Server URL is the URL for the authorization server or token endpoint responsible for issuing and refreshing access tokens.
Refresh Token	Specify the refresh token. Refresh tokens are used to obtain access tokens when the current access token has expired.
For more information about OAuth 2.0, see <a href="http://tools.ietf.org/html/rfc6749">http://tools.ietf.org/html/rfc6749</a> .	
<b>Security</b>	<b>Description</b>
None	Select the None option if no security is required.

Field Name	Description
HTTPS	<p>Select the HTTPS option to enable secure HTTP over SSL.</p> <ul style="list-style-type: none"> <li>• Available for the Integration Appliance Receives Request option only - When server authentication is required, select the Server Certificate Alias Name check box to specify that the Integration Appliance acting as a server should provide a certificate to the client. If selected, the name of the certificate must be provided. A certificate specified at the endpoint level with this check box takes precedence over certificates specified on the <b>Security &gt; Certificates &gt; Settings &gt; Server SSL</b> over data NIC entry in the WMC.</li> <li>• Available for the Remote Server option only - When client authentication is required, select the Client Certificate Alias Name check box to specify that the Integration Appliance acting as a client should provide a certificate to the HTTP Server. If selected, the name of the certificate must be provided. (For information about how to import a client certificate and private key for use with client authentication, see <a href="#">Importing an end-entity certificate</a>). A certificate specified at the endpoint level with this check box takes precedence over certificates specified on the <b>Security &gt; Certificates &gt; Settings &gt; Client SSL</b> entry in the WMC</li> </ul>
Protocol Version	Select the protocol used for secure HTTP over SSL. By default, the protocol version used is SSL_TLSv2.
<b>Connection Pool Options</b>	
Maximum Connections	Specifies the maximum number of HTTP server connections that the Integration Appliance can keep open in the connection pool. The default value is 25.
<b>Connection Timeout - The following Connection field is available for the Remote Server option only.</b>	
Time out after ___ seconds when establishing a connection to the Endpoint.	The number of seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the endpoint to respond to the connection request. For an HTTP activity, the amount of time the Integration Appliance attempts to establish a connection to the HTTP Server before timing out. A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an endpoint and the time it takes the endpoint to respond. You set the activity timeout in the <b>Retry</b> task of the HTTP Post Request Activity.

Field Name	Description
<b>Proxy - The following Proxy fields are available for the Remote Server option only.</b>	
<b>Login</b>	<b>Description</b>
Log into the Server as an Anonymous User	Available for the Remote Server option only. Select this option to connect to the HTTP server anonymously (where a user account is not required).
Log into the Server with User Name and Password	Available for the Remote Server option only. Select this option to connect to the HTTP server using a user account. Enter the User Name and Password.
Authentication	<p>Allows you to select the type of authentication that the Integration Appliance uses when connecting to a remote server. From the drop-down list, select one of the following authentication options:</p> <ul style="list-style-type: none"> <li>• <b>Basic</b> - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure.</li> <li>• <b>Digest</b> - Encrypts the user name and password you specify before sending the user name and password to the server. This authentication option is more secure than Basic authentication.</li> <li>• <b>NTLM</b> - Requires an instance of NTCredentials to be available for the domain name of the server. This authentication is the most secure authentication option as the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server. Note: Do not prefix the user name with the domain.</li> </ul>
Realm / Domain	If you select the Basic or Digest authentication option, specify a realm. If you select the NTLM authentication option, specify a domain.
User Name	Available for the Remote Server option only - Specify the User Name for the account used to connect to the HTTP Server.
Password	Available for the Remote Server option only - Specify the Password for the account used to connect to the HTTP Server.
<b>Security</b>	<b>Description</b>

Field Name	Description
None	Select the None option if no security is required.
<b>Connection Timeout - The following Connection field is available for the Remote Server option only.</b>	
Time out after ___ second(s) when establishing a connection to the Endpoint.	Specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. For an HTTP activity, the amount of time the Integration Appliance attempts to establish a connection to the HTTP Server before timing out. A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an endpoint and the time it takes the endpoint to respond. You set the activity timeout in <b>Retry</b> task of the HTTP Post Request Activity.
Host	Specifies the host name of the proxy server. This field is required.
Port	Specifies the port number to use to connect to the proxy server. This field is required
Username	Specifies the username to use for proxy server authentication. This field is optional if your proxy server does not require authentication
Password	Specifies the password to use for proxy server authentication. This field is optional if your proxy server does not require authentication.

Note: For some of the fields in the endpoint, you can define configuration properties to supply the values for these fields. The

icon is displayed when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.

**Parent topic:** [HTTP Activities](#)

---

[Feedback](#) | [Notices](#)

Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http\\_create\\_edit\\_endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_create_edit_endpoint.html)

## HTTP Receive Request activity

Use the HTTP **Receive Request** activity to configure the Integration Appliance to act as an HTTP listener

The following figure shows the Integration Appliance acting as an HTTP listener.

Figure 1.

The HTTP **Receive Request** activity is a starter activity. When an orchestration that starts with an HTTP **Receive Request** activity is deployed to the Integration Appliance, the Integration Appliance acts as an HTTP listener waiting for HTTP requests. When a HTTP request is received, the following actions occur:

1. An orchestration job is started.
2. The HTTP **Receive Request** activity processes the incoming HTTP request and maps the HTTP request to the output parameters of the activity.
3. The output parameters are mapped to the specified orchestration variables. During design time in the **Map Outputs** task of the **Checklist**, the mapping between the output parameters and the orchestration variables is defined.
4. The remaining activities in the orchestration are processed. (In the graphical representation of the orchestration, the remaining activities are the activities located on the right side of the HTTP **Receive Request** activity).

By default, decompression is enabled for the HTTP **Receive Request** activity. For more information, see [Decompression with the HTTP Receive Request activity](#).

You cannot deploy two HTTP Receive Request activities to the appliance with the same endpoint details, URL and method.

### For single HTTP Receive Request activity

If you deploy only one HTTP Receive Request activity for a URL, the orchestration accepts all requests of those URLs starting with that *base URL*. For example, if you deploy `/customer` then it accepts requests for `/customer`, `/customer/21`, `/customer/21/dept`, and so on.

If you deploy an HTTP Receive Request activity for a URL with path parameters, then the orchestration accepts only those requests whose URLs match with the configured URL with values for path parameters. For example, if you deploy `/customer/{custid}` then it accepts requests such as `/customer/10`, `/customer/21`, `/customer/dept`. The following URLs are not accepted: `/customer`, `/customer/21/dept`, and so on.

### For multiple HTTP Receive Request activities

If you deploy two HTTP Receive Request activities that are configured with the same base URL, and one with path parameter, then the activities accept requests whose URLs strictly match with the configured URL. For example, if you deploy `/customer` and `/customer/{path parameter}`, and if `/customer` is invoked the request goes to the activity configured with `/customer`. If `/customer/007` is invoked, the request goes to the activity configured with `/customer/{path parameter}`. Also, if you invoke the following URLs: `/customer/dept/1` or `/customer/12/21`, none of the activities accept the requests.

**Note:** If you deploy two activities, the first one as `/customer/department` and the second one as `/customer/{path parameter}`, and if `/customer/department` is invoked, then the request goes to the

activity which was deployed first (/customer/department). If /customer/{path parameter} is deployed first, then the request goes to /customer/{path parameter}.

Note: It is also recommended that you do not deploy the same URL for Web Services and HTTP.

*Base URL* - Part of the URL before path parameters. For example - If the configured URL is /employee/manager/{id}, then Base URL will be /employee/manager.

## Adding an HTTP Receive Request activity to the orchestration

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Receive Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed with the **Summary** task active in the properties pane. The Properties pane is located under the graphical representation of the orchestration in the Workspace.

## Creating, selecting, or editing an HTTP endpoint

---

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint, see [Creating or editing an HTTP endpoint](#).

## Configuring the activity

---

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field	Description
-------	-------------

Field	Description
URL (Path)	<p>Specifies the resource path where the Integration Appliance listens for inbound HTTP requests, for example: /mypath. The string you specify in this field must exclude the string: http://, the hostname, and the port number of the Integration Appliance. The full URL that the Integration Appliance uses to listen for inbound HTTP requests is automatically constructed from the hostname of the Integration Appliance, the port number specified in the HTTP endpoint, and the path specified in this field. For example, if the full URL that the Integration Appliance listens for HTTP requests is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the HTTP <b>Receive Request</b> activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format, url/ {path}? name1=value1&amp;name2=value2. This allows you to map a string value to the "{path}" parameter and to specify query parameter names: <i>name1</i> and <i>name2</i> in this example. If you choose to declare multiple "{path}" parameters, it is recommended that each parameter has a unique name. Parameters with the same name are represented by only one node in the map. The path parameters are displayed under /httpheaders/pathParameters in Map Output. Query parameters are displayed under /httpheaders/queryParameters in Map output.</p> <p>Note: In the URL, any value assigned to a query parameter is not passed to the mapper. The value comes from the server based on the actual incoming request.</p> <p>Note: The path that the Integration Appliance listens for inbound HTTP requests is a resource path string that you specify and does not correspond to actual directory path on the Integration Appliance.</p>
Method	Specifies which HTTP method is accepted by the listening server.
Of Type	Specifies the expected message type of the HTTP request - either Text or Binary.
Requires Reply	<p>Specifies if a reply should be sent to the sender of the request.</p> <p>Note: If this check box is selected, you must add and configure a HTTP <b>Send Response</b> activity in your orchestration.</p>

Field	Description
Use Compression/Decompression	Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see <a href="#">Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity</a>

## Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you may be prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

## Specifying Swagger information

1. Select the Swagger task from the **Checklist** to set sample message.
2. Specify the Request sample (JSON) and Response sample (JSON) information. If you do not specify any request sample, the Swagger Output will display with empty sample objects.
3. Click on Generate Swagger button which will display the code in the Swagger Output textbox. You can also click Download Swagger to download and share the file, if required.

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 2.

Output Parameter	Description
httpheaders	Specifies the header of the HTTP request.
body	Specifies the body of the HTTP request message.

The following table defines the nodes of the optional httpheaders output parameter.

Table 3.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path of the incoming request, for example: /myPath.
httpheaders/method	Specifies the type of HTTP request.
httpheaders/host	Specifies the IP address or the host name of the client.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/<configured_header_name>	If you configured at least one request header in Request Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/pathParameters	If you configured path parameters in the URL in the Configure step, each is displayed here. If no path parameter is specified, this node does not display.
httpheaders/queryParameters	If you configured query parameters in the URL in Configure step, each is displayed here. If no query parameter is specified, this node does not display.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

Note: To test your orchestration that starts with the **HTTP Receive Request** activity, you can use the HTTP Post Utility included with the Studio installation, to send HTTP requests to the listening Integration Appliance during run time. You can access the HTTP Post Utility from the start menu, select Programs > IBM > Cast Iron Studio > HTTP Post Utility option. The URL you specify in the URL of the inbound connector field must contain the full URL, for example: http://myAR:myPort/myPath.

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http\\_receive\\_request\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_receive_request_activity.html)

## Decompression with the HTTP Receive Request activity

The **HTTP Receive Request** activity supports decompression with the gzip format only. The **HTTP Receive Request** activity does not support the deflate format or the common UNIX file compression format called

compress.

The **HTTP Receive Request** activity only supports receiving HTTP requests using HTTP/HTTPS 1.0 protocol.

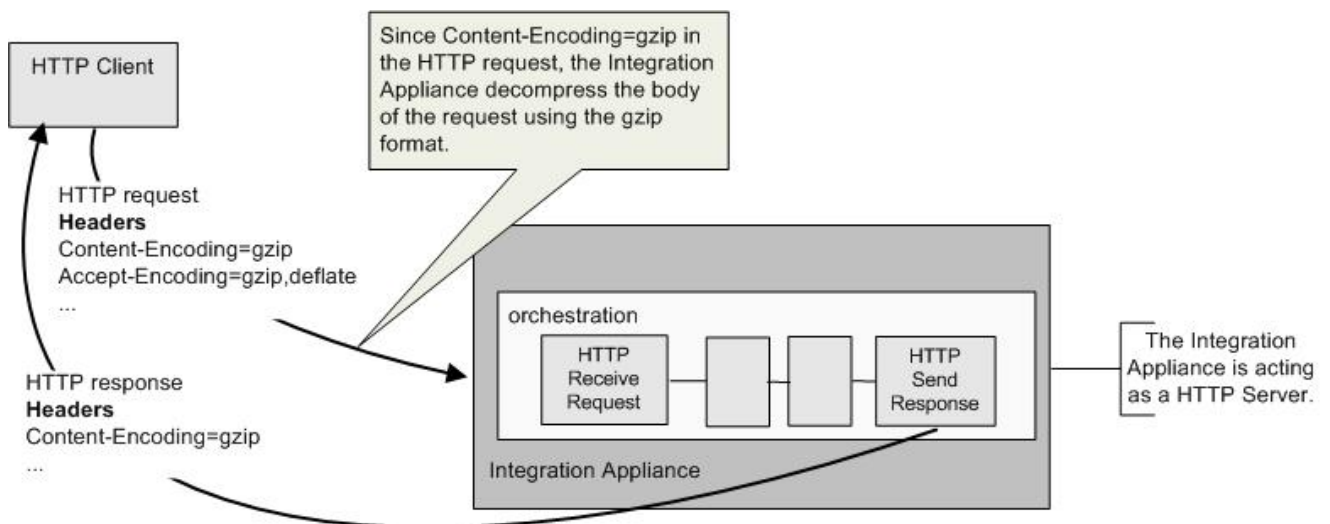

The decompression runtime behavior of the **HTTP Receive Request** activity when receiving a HTTP request is dependant on the following conditions:

- [The value of the Content-Encoding at the message level](#)
- [The setting of the Use Compression/Decompression check box at the activity level](#)

The affect of these conditions on the decompression runtime behavior of the **HTTP Receive Request** activity are described in the following sections and in the table provided in the [runtime Decompression Behavior](#) section.

## Content-Encoding value at the message level

The value of the Content-Encoding HTTP Header Parameter of the HTTP request can determine if the Integration Appliance decompresses the body of the HTTP request that is received from the HTTP Client as shown in the following figure.

The value of the Content-Encoding header is represented by the third column labeled **Content-Encoding Value** in the table provided in the [Run-time Decompression Behavior](#) section.

## Setting decompression at the activity level

By default, decompression is turned on at the activity level for the **HTTP Receive Request** activity. You can turn off decompression at the activity level by selecting the Use Compression/Decompression check box. The Use Compression/Decompression check box is available in the **Configure** task of the activity. The second column labeled Use Compression/Decompression Check Box in the table provided in the [runtime Decompression Behavior](#) section, represents the setting of the Use Compression/Decompression check box.

## runtime decompression behavior

The following table describes the decompression runtime behavior when the Integration Appliance receives a HTTP request from the HTTP Client:

<b>Use Compression/Decompression Check Box (Activity Level)</b>	<b>Content-Encoding Value (Message Level)</b>	<b>Integration Appliance Decompression runtime Behavior</b>
selected	gzip	The Integration Appliance decompresses the body of the request using the gzip format. The value of Content-Encoding is set to gzip in the httpheaders output parameter returned from the activity.
selected	not set	The Integration Appliance sends the body of the request as is (unchanged). The value of Content-Encoding is not set in the httpheaders output parameter returned from the activity.
selected	identity	The Integration Appliance does not decompress the body of the request. The value of the Content-Encoding is set to identity in the httpheaders output parameter returned from the activity.
selected	any other string besides gzip or identity	The Integration Appliance sends the 415 (Unsupported Media Type) Response Code.
cleared	value is not significant	The Integration Appliance does not decompress the body of the request and the current value of Content-Encoding in the request is passed as is to the <b>httpheaders</b> output parameter of the activity. For example, if the value of the Content-Encoding is set to gzip but the Use Compression/Decompression check box is cleared, the Integration Appliance does not decompress the body of the request but Content-Encoding is set to gzip in the httpheaders output parameter of the activity.

Note: The Use Compression/Decompression check box will be deprecated in a future release. Use the Content-Encoding HTTP Parameter in the HTTP request to specify how to decompresses the body of the HTTP request.

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/decompression\\_with\\_the\\_http\\_receive\\_request\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/decompression_with_the_http_receive_request_activity.html)

## HTTP Send Response activity

---

The HTTP **Send Response** activity sends a reply back to the sender of an HTTP request.

The following figure shows the HTTP **Send Response** activity sending a reply back to the sender of an HTTP request.

Figure 1.

The HTTP **Send Response** activity must be used in conjunction with an HTTP **Receive Request** activity in an orchestration as shown in the preceding figure. If you add a HTTP **Send Response** activity to orchestration, you must select the Requires a Reply check box in the **Configure** task of the HTTP **Receive Request** activity.

By default, compression is not enabled for the HTTP **Send Response** activity. For more information, see [Compression/Decompression with the HTTP Send Response activity](#).

## Adding an HTTP Send Response activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Send Response** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed with the **Configure** task active in the properties pane. The properties pane is located beneath the graphical representation of the orchestration.

## Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field	Description
To	Specifies the <b>HTTP Receive Request</b> activity associated with this HTTP <b>Send Response</b> activity. During run time, the associated HTTP <b>Receive Request</b> activity receives the request from the client and the HTTP <b>Send Response</b> activity sends the response back to the client. Note: This field is populated only if you select the Requires a Reply check box in the <b>Configure</b> task of the HTTP <b>Receive Request</b> activity.
Of Type	Specifies the message type of the HTTP response - either Text or Binary.
Use Compression/Decompression	Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see <a href="#">Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity</a> .

## Specifying the response headers

1. Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

## Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is mandatory and at least one variable must be mapped to it. The body input parameter contains the body of the HTTP response message sent back to the client.
2. To view the optional input parameter in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The httpheaders input parameter is displayed.

The following table defines the nodes of the optional httpheaders input parameter:

Table 2.

Nodes of the httpheaders Input Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/method	Specifies the type of HTTP response, for example: POST.
httpheaders/Via	Contains the time taken by each of the activities present between HTTP Receive and HTTP Send Response. For example, <code>FTP Put(uploadfile):50ms;Send Email(postinfo):30ms;</code> . There are two activities, FTP Put and Send Email, that are present between HTTP Receive and HTTP Send Response activities. So, when a job is processed, the Via header response will contain this value. It means that FTP Put activity takes 50 milliseconds and the Send Email activity takes 30 milliseconds, respectively, to complete the activity.

<b>Nodes of the httpheader Input Parameter</b>	<b>Description</b>
httpheaders/ <configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header name you selected or entered.
httpheaders/ other Headers/ headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs for the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so this is a recurring node.
httpheaders/ other Headers/ headerItem/ name	Specifies the name of the HTTP parameter.
httpheaders/ other Headers/ headerItem/ value	Specifies the value of the HTTP parameter.

3. Create a map between the orchestration variable or variables and the input parameter or parameters. See [Creating a map](#) for general instructions on mapping

## Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.

3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

**Parent topic:** [HTTP Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http\\_send\\_response\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_send_response_activity.html)

## Compression/Decompression with the HTTP Send Response activity

---

During runtime, the **HTTP Send Response** activity sends an HTTP response complaint with the HTTP/HTTPS 1.0 protocol to the HTTP client.

Note: The **HTTP Send Response** activity supports compression with the gzip format only. It does not support the deflate format or the common UNIX file compression format called compress.

The compression runtime behavior of the **HTTP Send Response** activity is dependant on the following conditions:

- [At the message level, the value of the Accept-Encoding header in the original HTTP request](#) received by the **HTTP Receive Request** activity is passed to the **HTTP Send Response** activity to determine if the body of the HTTP response is compressed or not compressed as shown in the following figure.
- [The setting of the Use Compression/Decompression check box at the activity level](#)

The affect of these conditions on the compression runtime behavior of the **HTTP Send Response** activity are described in the following sections and in the table provided in the [runtime Compression Behavior](#) section.

### Accept-Encoding value at the message level

---

During runtime, a **HTTP Receive Request** activity receives a HTTP request from a HTTP client. In the same orchestration, a **HTTP Send Response** activity sends a HTTP response back to the original client. The value of the Accept-Encoding header in the original request received by the **HTTP Receive Request** activity is stored internally on the Integration Appliance. The stored value is passed to the **HTTP Send Response** activity and is used to determine if the body of the response is compressed or not and the encoding type, as shown in the following figure.

If values for the Content-Encoding or Accept-Encoding headers are explicitly set using the optional `httpheaders` input parameter of the **HTTP Send Response** activity, these new values override the default settings of these headers passed-in via the request. For example, if Accept-Encoding is set to `gzip, deflate` in the request but is explicitly set to `identity` in the `httpheaders` input parameter of the **HTTP Send Response** activity, the Integration Appliance does not compress the body of the response.

To explicitly set the Accept-Encoding header, provide the following values in a `headerItem` node in the **Map Inputs** task of the **HTTP Post Request** activity:

- `httpheaders/httpheaders/otherHeaders/headerItem/name` is set to the string: `Accept-Encoding`
- `httpheaders/httpheaders/otherHeaders/headerItem/value` is set to the encoding type, for example the string: `identity`.

## Setting Compression/Decompression at the activity level

By default, compression is turned on at the activity level for the **HTTP Send Response** activity. You can turn off compression at the activity level by clearing the Use Compression/Decompression check box. The Use Compression/Decompression check box is available in the **Configure** task of the activity. The second column labeled `HTTP Compression CLI Command` in the following table represents the setting of the Use Compression/Decompression check box.

## Runtime compression behavior

The following table describes the compression runtime behavior when the Integration Appliance sends a HTTP response to the HTTP Client:

Use Compression/Decompression Check Box (Activity Level)	Accept-Encoding Value of the HTTP Request (Message Level)	Integration Appliance Compression Runtime Behavior

Use Compression/Decompression Check Box (Activity Level)	Accept-Encoding Value of the HTTP Request (Message Level)	Integration Appliance Compression Runtime Behavior
selected	gzip or gzip,deflate	The Integration Appliance sends the body of the response compressed in the gzip format and the Content-Encoding header is set to gzip in the response.
selected	identity	The Integration Appliance sends the body of the response uncompressed and the Content-Encoding header is set to identity in the response.
selected	not set, or any other string except gzip or identity	The Integration Appliance sends the body of the response uncompressed and the Content-Encoding header is set to identity in the response.
cleared	value is not significant	The Integration Appliance sends the body of the response as is (unchanged) and the Content-Encoding header is as is in the response. (The value of the Content-Encoding header in the request is passed unchanged to the response.)

Note: The Use Compression/Decompression check box will be deprecated in a future release. Use the Content-Encoding and Accept-Encoding HTTP Parameters in the HTTP request to specify how to decompresses the body of the HTTP request and compress the body of the HTTP response.

**Parent topic:** [HTTP Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/compression\\_with\\_the\\_http\\_send\\_response\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/compression_with_the_http_send_response_activity.html)

## HTTP Post Request activity

---

The HTTP **Post Request** activity sends a **Post Request** to the specified location (the HTTP endpoint) and receives an HTTP response back from that location.

### Adding an HTTP Post Request activity to the orchestration

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Post Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

### Creating, selecting or editing an HTTP endpoint

---

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:

- Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint, see [Creating or editing an HTTP endpoint](#).

## Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description
URL (Path after Host nam e)	<p>Specifies the resource path that the <b>Post Request</b> activity sends the request to, for example: /mypath. The string you specify in this field must exclude the string: http://, the host name, and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint, and the path specified in this field. For example, if the full URL that the <b>Post Request</b> activity sends the request to is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the <b>Post Request</b> activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format: url/{path}?name1=value1&amp;name2=value2. This allows you to map a string value to the "{path}" parameter and to specify query parameter names: <i>name1</i> and <i>name2</i> in this example. If you choose to declare multiple "{path}" parameters, each parameter should have a unique name. Parameters with the same name are represented by only one node in the map. The path parameters are displayed under /httpheaders/pathParameters in Map Input. Query parameters are displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper or define a default value.</p>
Where Request Message is Of Type	Specifies the expected message type of the HTTP request - either Text or Binary.

Field or Check Box	Description
Where Reply Message is Of Type	Specifies the message type of the HTTP reply - either Text or Binary.
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> <li>○ <b>Stop Processing the Orchestration Job</b> - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the <b>Post Request</b> activity and the activities after the <b>Post Request</b> activity in the orchestration are not processed and a failed exception is thrown.</li> <li>○ <b>Continue Processing and Return the HTTP Error code</b> - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the <b>Post Request</b> activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessage output parameters, respectively.</li> </ul>
Use Compression/Decompression	<p>Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see <a href="#">Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity</a>.</p>

## Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.

- To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

## Specifying the response headers

- Select the **Response Headers** task from the Checklist. The **Response Headers pane** is displayed. A Custom Headers table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle, and a **Standard Headers** table is displayed at the bottom.
- Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.
- To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

## Specifying the retry options

- Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
- Configure the retry options for connecting to an HTTP Server. The following table defines the retry options for a connection to an HTTP Server:

Table 2.

Fields	Description
<b>Retry</b>	
1) Wait  — secon ds betwe en each retry.	The number of seconds that the Integration Appliance waits before trying to establish a connection to the HTTP Server.
2) Try to conne ct — times before failing .	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an HTTP <b>Post Request</b> activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

Fields	Description
<b>Activity Timeout</b>	
3) Timeout after _____ seconds when the Endpoint does not respond to a request.	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the <b>Post Request</b> activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in HTTP Endpoint tab. For more information about connection timeouts, see <a href="#">Creating or editing an HTTP endpoint</a> .

## Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is mandatory and at least one variable must be mapped to it. The body input parameter contains the body of the HTTP request message sent to the HTTP server.
2. To view the optional input parameters in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The httpheaders and httpConnParameter input parameters display.

The following table defines the nodes of the optional httpheaders input parameter:

Table 3.

Nodes of the httpheaders Input Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one request header in Request Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/path Parameters	If you configured path parameters in the URL in Configure step, each is displayed here. If no path parameter is specified, this node does not display.
httpheaders/query Parameters	If you configured query parameters in the URL in Configure step, each is displayed here. If no query parameter is specified, this node does not display.

<b>Nodes of the httpheaders Input Parameter</b>	<b>Description</b>
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

**Note:** If the Content-Length header is explicitly set using the httpheaders/otherHeaders/headerItem/name and httpheaders/otherHeaders/headerItem/value, during run time this value is ignored. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional httpConnParameter input parameter. You can optionally override the settings you specified in the **Pick Endpoint** task of the **Checklist** dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the httpConnParameter input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 4.

<b>Nodes of the httpConnParameter Input Parameter</b>	<b>Description</b>	<b>Overrides what settings in the HTTP endpoint?</b>
timeout	Specifies the amount of time in seconds before a timeout occurs.	
host	Specifies the host name or IP address of the remote HTTP server.	The <b>host</b> node of the httpConnParameter input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server.	The <b>port</b> node of the httpConnParameter input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The <b>isSecure</b> node of the httpConnParameter input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The <b>username</b> node of the httpConnParameter input parameter overrides the User Name field in the HTTP endpoint.
password	Specifies the password for the account used to connect to the HTTP Server.	The <b>password</b> node of the httpConnParameter input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and input parameter or parameters. See [Creating a map](#) for general instructions on mapping.

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 5.

Output Parameter	Description
httpheaders	Specifies the header of the HTTP response.
body	Specifies the body of the HTTP response message.
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time.
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the httpheaders output parameter:

Table 6.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies a set of name/value pairs that contain the HTTP parameters of the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so headerItem is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

## Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http\\_post\\_request\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_post_request_activity.html)

## HTTP Get Request activity

---

The HTTP **Get Request** activity sends a **Get Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.

### Adding an HTTP Get Request activity to the orchestration

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Get Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

### Creating, selecting, or editing an HTTP endpoint

---

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint. See [Creating or editing an HTTP endpoint](#).

### Configuring the activity

---

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description

Field or Check Box	Description
URL (Path after Host name )	<p>Specifies the resource path that the <b>Get Request</b> activity sends the request to, for example: /mypath. The string you specify in this field must exclude the string: http://, the hostname, and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint and the path specified in this field. For example, if the full URL that the <b>Get Request</b> activity sends the request to is http://myAR:myPort/myPath, in this field, you only need to specify the string: /myPath. The specified path must be unique for the <b>Get Request</b> activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format: url/{path}?name1=value1&amp;name2=value2. This allows you to map a string value to the "{path}" parameter and to specify query parameter names: <i>name1</i> and <i>name2</i> in this example. If you choose to declare multiple "{path}" parameters, it is recommended that each parameter has a unique name. Parameters with the same name are represented by only one node in the map. The path parameters will be displayed under /httpheaders/pathParameters in Map Input. And query parameters will be displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper, or define a default value.</p>
Where Request Message is Of Type	Specifies the message type of the HTTP response - either Text or Binary.
Where Reply Message is Of Type	Specifies the message type of the HTTP reply - either Text or Binary..

Field or Check Box	Description
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> <li>○ <b>Stop Processing the Orchestration Job</b> - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the HTTP <b>Get Request</b> activity and the activities after the HTTP <b>Get Request</b> activity in the orchestration are not processed and a failed exception is thrown.</li> <li>○ <b>Continue Processing and Return the HTTP Error code</b> - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the HTTP <b>Get Request</b> activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessage output parameters, respectively.</li> </ul>
Use Compression/Decompression	<p>Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see <a href="#">Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity</a>.</p>

## Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Duplicate header names are not allowed (ignoring the case difference) and if duplicated headers appear in the **Custom Headers** table, you are prompted to remove them. The selected HTTP headers are displayed under /httpheaders in Map Input.

## Specifying the response headers

1. Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is

- displayed in the middle, and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.
  3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Duplicate header names are not allowed (ignoring the case difference) and if duplicated headers appear in the **Custom Headers** table, you are prompted to remove them. The selected HTTP headers are displayed under /httpheaders in Map Output.

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options to connect to an HTTP Server. The following table defines the retry options for connecting to an HTTP Server:

Field	Description
Retry	
1) Wait --- seconds between each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the HTTP server.
2) Try to connect --- times before failing .	Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an HTTP <b>Get Request</b> activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
3) Time out after --- seconds when the Endpoint does not respo	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the HTTP <b>Get Request</b> activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in HTTP Endpoint tab. For more information about connection timeouts, see, <a href="#">Creating or Editing a Web Services Endpoint</a> .

nd to a reque st.	
----------------------------	--

## Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is optional. The body input parameter contains the body of the HTTP response message sent back to the HTTP server.
2. To view the optional input parameter in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The `httpheaders` and **httpConnParameter** input parameters are displayed.

The following table defines the nodes of the optional `httpheaders` input parameter:

Table 2.

Nodes of the <code>httpheaders</code> Input Parameter	Description
<code>httpheaders/uri</code>	Specifies the resource path, for example: <code>/myPath</code> .
<code>httpheaders/&lt;configured_header_name&gt;</code>	If you configured at least one request header in the Request Headers step, each is displayed here. <code>&lt;configured_header_name&gt;</code> is replaced with the actual header names you selected or entered.
<code>httpheaders/pathParameters</code>	If you configured path parameters in the URL in the Configure step, each is displayed here. If no path parameter is specified, this node does not display.
<code>httpheaders/queryParameters</code>	If you configured query parameters in the URL in the Configure step, each is displayed here. If no query parameter is specified, this node does not display.
<code>httpheaders/otherHeaders/headerItem</code>	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP parameters can be specified in the HTTP response, so this is a recurring node.
<code>httpheaders/otherHeaders/headerItem/name</code>	Specifies the name of the HTTP header parameter.
<code>httpheaders/otherHeaders/headerItem/value</code>	Specifies the value of the HTTP parameter.

**Note:** If the Content-Length header is explicitly set using the `httpheaders/otherHeaders/headerItem/name` and `httpheaders/otherHeaders/headerItem/value`, this value is ignored during run time. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional `httpConnParameter` input parameter. You can optionally override the settings you specified in the Pick Endpoint task of the Checklist dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the `httpConnParameter` input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 3.

<b>Nodes of the httpConnParameter Input Parameter</b>	<b>Description</b>	<b>Overrides what settings in the HTTP endpoint?</b>
timeout	Specifies the amount of time in seconds before a timeout occurs.	
host	Specifies the host name or IP address of the remote HTTP server.	The host node of the <code>httpConnParameter</code> input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server.	The port node of the <code>httpConnParameter</code> input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The <code>isSecure</code> node of the <code>httpConnParameter</code> input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The username node of the <code>httpConnParameter</code> input parameter overrides the User Name field in the HTTP endpoint.
password	Specifies the password for the account used to connect to the HTTP Server.	The password node of the <code>httpConnParameter</code> input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and the input parameter or parameters. See [Creating a map](#) for general instructions on mapping

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 4.

<b>Output Parameter</b>	<b>Description</b>
httpheaders	Specifies the header of the HTTP request.
body	Specifies the body of the HTTP request message.
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time.
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the optional `httpheaders` output parameter.

Table 5.

<b>Nodes of the httpheaders Output Parameter</b>	<b>Description</b>
httpheaders/uri	Specifies the resource path of the incoming request, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

## Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

**Parent topic:** [HTTP Activities](#)

---

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http\\_get\\_request\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_get_request_activity.html)

## HTTP Head Request activity

The HTTP **Head Request** activity sends a **Head Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.

### Adding an HTTP Head Request activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Head Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

## Creating, selecting, or editing an HTTP endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint. See [Creating or editing an HTTP endpoint](#).

## Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description
URL (Path after Host name)	<p>Specifies the resource path that the <b>Head Request</b> activity sends the request to, for example: /myPath. The string you specify in this field must exclude the string: http://, the hostname and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint and the path specified in this field. For example, if the full URL that the <b>Head Request</b> activity sends the request to is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the <b>Head Request</b> activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format: url/{path}?name1=value1&amp;name2=value2. This allows you to map a string value to the "{path}" parameter and to specify query parameter names: <i>name1</i> and <i>name2</i> in this example. If you choose to declare multiple "{path}" parameters, each parameter should have a unique name. Parameters with the same name are represented by only one node in the map. The path parameters are displayed under /httpheaders/pathParameters in Map Input. And query parameters will be displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper, or define a default value.</p>

Field or Check Box	Description
Where Request Message is Of Type	Specifies the expected message type of the HTTP response - either Text or Binary.
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> <li>○ <b>Stop Processing the Orchestration Job</b> - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the <b>Head Request</b> activity and the activities after the <b>Head Request</b> activity in the orchestration are not processed and a failed exception is thrown.</li> <li>○ <b>Continue Processing and Return the HTTP Error code</b> - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the <b>Head Request</b> activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessage output parameters, respectively.</li> </ul>
Use Compression/Decompression	<p>Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see <a href="#">Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity</a>.</p>

## Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.

- To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you may be prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

## Specifying the response headers

- Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A Custom Headers table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle, and a **Standard Headers** table is displayed at the bottom.
- Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
- To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

## Specifying the retry options

- Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
- Configure the retry options to connect to an HTTP Server. The following table defines the retry options for connecting to an HTTP Server:

Field	Description
Retry	
1) Wait --- secon ds betwe en each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the HTTP server.
2) Try to conne ct ___ times before failing .	Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an HTTP <b>Head Request</b> activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
3) Time out after ---	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the HTTP <b>Head Request</b> activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection

seconds when the Endpoint does not respond to a request.	timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in HTTP Endpoint tab. For more information about connection timeouts, see, <a href="#">Creating or Editing a Web Services Endpoint</a> .
--	--

## Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is optional. The body input parameter contains the body of the HTTP response message sent back to the HTTP server.
2. To view the optional input parameter in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The `httpheaders` and **httpConnParameter** input parameters are displayed.

The following table defines the nodes of the optional `httpheaders` input parameter:

Table 2.

Nodes of the <code>httpheaders</code> Input Parameter	Description
<code>httpheaders/uri</code>	Specifies the resource path, for example: <code>/myPath</code> .
<code>httpheaders/&lt;configured_header_name&gt;</code>	If you configured at least one request header in Request Headers step, each one of them will be displayed here. <code>&lt;configured_header_name&gt;</code> will be replaced with the actual header names you selected or entered.
<code>httpheaders/pathParameters</code>	If you configured path parameters in the URL in the Configure step, each is displayed here. If no path parameter is specified, this node does not display.
<code>httpheaders/queryParameters</code>	If you configured query parameters in the URL in Configure step, each is displayed here. If no query parameter is specified, this node does not display.
<code>httpheaders/otherHeaders/headerItem</code>	Specifies an element that contains a set of HTTP header parameters as name/value pairs for the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so this is a recurring node.
<code>httpheaders/otherHeaders/headerItem/name</code>	Specifies the name of the HTTP parameter.
<code>httpheaders/otherHeaders/headerItem/value</code>	Specifies the value of the HTTP parameter.

**Note:** If the Content-Length header is explicitly set using the `httpheaders/otherHeaders/headerItem/name` and `httpheaders/otherHeaders/headerItem/value`, during run time this value is ignored. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional `httpConnParameter` input parameter. You can optionally override the settings you specified in the Pick Endpoint task of the Checklist dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the `httpConnParameter` input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 3.

<b>Nodes of the httpConnParameter Input Parameter</b>	<b>Description</b>	<b>Overrides what settings in the HTTP endpoint?</b>
timeout	Specifies the amount of time in seconds before a timeout occurs.	
host	Specifies the host name or IP address of the remote HTTP server.	The host node of the <code>httpConnParameter</code> input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server.	The port node of the <code>httpConnParameter</code> input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The <code>isSecure</code> node of the <code>httpConnParameter</code> input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The <code>username</code> node of the <code>httpConnParameter</code> input parameter overrides the User Name field in the HTTP endpoint.
password	Specifies the password for the account used to connect to the HTTP Server.	The <code>password</code> node of the <code>httpConnParameter</code> input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and the input parameter or parameters. See [Creating a map](#) for general instructions on mapping

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 4.

<b>Output Parameter</b>	<b>Description</b>
httpheaders	Specifies the header of the HTTP request.
body	Specifies the body of the HTTP request message.

Output Parameter	Description
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time.
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the optional httpheaders output parameter.

Table 5.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path of the incoming request, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name>will be replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

## Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

**Parent topic:** [HTTP Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

## HTTP Invoke Request activity

---

The HTTP **Invoke Request** activity sends a HTTP request to the specified location, the HTTP endpoint, and receives a HTTP response back from that location.

### Adding an HTTP Invoke Request activity to the orchestration

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Invoke Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

### Creating, selecting, or editing an HTTP endpoint

---

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint, see [Creating or editing an HTTP endpoint](#).

### Configuring the activity

---

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description
--------------------	-------------

Field or Check Box	Description
URL (Path after Host name)	<p>Specifies the resource path that the <b>Invoke Request</b> activity sends the request to, for example: /mypath. The string you specify in this field must exclude the string: http://, the host name, and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint, and the path specified in this field. For example, if the full URL that the <b>Invoke Request</b> activity sends the request to is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the <b>Invoke Request</b> activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format: url/{path}?name1=value1&amp;name2=value2. This allows you to map a string value to the "{path}" parameter and to specify query parameter names: <i>name1</i> and <i>name2</i> in this example. If you choose to declare multiple "{path}" parameters, it is recommended that each parameter has a unique name. Parameters with the same name are represented by only one node in the map. The path parameters are displayed under /httpheaders/pathParameters in Map Input. Query parameters are displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper, or define a default value.</p>
Where Request Message is Of Type	Specifies the expected message type of the HTTP request - either Text or Binary.
Where Reply Message is Of Type	Specifies the message type of the HTTP reply - either Text or Binary.

Field or Check Box	Description
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> <li>○ <b>Stop Processing the Orchestration Job</b> - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the <b>Invoke Request</b> activity and the activities after the <b>Invoke Request</b> activity in the orchestration are not processed and a failed exception is thrown.</li> <li>○ <b>Continue Processing and Return the HTTP Error code</b> - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the <b>Invoke Request</b> activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessage output parameters, respectively.</li> </ul>
Use Compression/Decompression	<p>Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see <a href="#">Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity</a>.</p>

## Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

## Specifying the response headers

1. Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to an HTTP Server. The following table defines the retry options for a connection to an HTTP Server:

Table 2.

Fields	Description
<b>Retry</b>	
1) Wait  -- secon ds  betwe en each retry.	The number of seconds that the Integration Appliance waits before trying to establish a connection to the HTTP Server.
2) Try to conne ct -- times before failing .	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an HTTP Post Request activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>
<b>Activi ty Timeo ut</b>	

Fields	Description
3) Time out after ____ secon ds when the Endpo int does not respo nd to a reque st.	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the <b>Invoke Request</b> activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in HTTP Endpoint tab. For more information about connection timeouts, see <a href="#">Creating or editing an HTTP endpoint</a> .

## Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is mandatory and at least one variable must be mapped to it. The body input parameter contains the body of the HTTP request message sent to the HTTP server.
2. To view the optional input parameters in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The httpheaders and httpConnParameter input parameters display.

The following table defines the nodes of the optional httpheaders input parameter:

Table 3.

Nodes of the httpheaders Input Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/method	Specifies the type of HTTP request. If no value is mapped, the default method is POST.
httpheaders/<configured_header_name>	If you configured at least one request header in Request Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered
httpheaders/pathParameters	If you configured path parameters in the URL in Configure step, each is displayed here. If no path parameter is specified, this node does not display.
httpheaders/queryParameters	If you configured query parameters in the URL in Configure step, each is displayed here. If no query parameter is specified, this node does not display.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.

<b>Nodes of the httpheaders Input Parameter</b>	<b>Description</b>
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

**Note:** If the Content-Length header is explicitly set using the httpheaders/otherHeaders/headerItem/name and httpheaders/otherHeaders/headerItem/value, during run time this value is ignored. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional httpConnParameter input parameter. You can optionally override the settings you specified in the **Pick Endpoint** task of the **Checklist** dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the httpConnParameter input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 4.

<b>Nodes of the httpConnParameter Input Parameter</b>	<b>Description</b>	<b>Overrides what settings in the HTTP endpoint?</b>
timeout	Specifies the amount of time in seconds before a timeout occurs.	
host	Specifies the host name or IP address of the remote HTTP server.	The <b>host</b> node of the httpConnParameter input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server.	The <b>port</b> node of the httpConnParameter input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The <b>isSecure</b> node of the httpConnParameter input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The <b>username</b> node of the httpConnParameter input parameter overrides the User Name field in the HTTP endpoint.
password	Specifies the password for the account used to connect to the HTTP Server.	The <b>password</b> node of the httpConnParameter input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and input parameter or parameters. See [Creating a map](#) for general instructions on mapping.

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 5.

Output Parameter	Description
httpheaders	Specifies the header of the HTTP response.
body	Specifies the body of the HTTP response message.
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time.
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the httpheaders output parameter:

Table 6.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/method	Specifies the type of HTTP response.
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies a set of name/value pairs that contain the HTTP parameters of the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so headerItem is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

## Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http\\_invoke\\_request\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_invoke_request_activity.html)

## HTTP Put Request activity

---

The HTTP **Put Request** activity sends a **Put Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.

### Adding an HTTP Put Request activity to the orchestration

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Put Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

### Creating, selecting, or editing an HTTP endpoint

---

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint. See [Creating or editing an HTTP endpoint](#).

### Configuring the activity

---

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description
--------------------	-------------

Field or Check Box	Description
URL (Path after Host name )	<p>Specifies the resource path that the <b>Put Request</b> activity sends the request to, for example: /mypath. The string you specify in this field must exclude the string: http://, the hostname and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint and the path specified in this field. For example, if the full URL that the <b>Put Request</b> activity sends the request to is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the <b>Put Request</b> activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format, "url/{path}?name1=value1&amp;name2=value2". This allows you to map a string value to the "{path}" parameter and to specify query parameter names: "name1" and "name2" in this example. If you choose to declare multiple "{path}" parameters, it is recommended that each parameter has a unique name. Parameters with the same name are represented by only one node in the map. The path parameters will be displayed under /httpheaders/pathParameters in Map Input. And query parameters will be displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper, or define a default value.</p>
Where Request Message is Of Type	Specifies the message type of the HTTP response - either Text or Binary.
Where Reply Message is Of Type	Specifies the message type of the HTTP reply - either Text or Binary..

Field or Check Box	Description
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> <li>○ <b>Stop Processing the Orchestration Job</b> - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the <b>Put Request</b> activity and the activities after the <b>Put Request</b> activity in the orchestration are not processed and a failed exception is thrown.</li> <li>○ <b>Continue Processing and Return the HTTP Error code</b> - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the <b>Put Request</b> activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessage output parameters, respectively.</li> </ul>
Use Compression/Decompression	<p>Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see <a href="#">Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity</a>.</p>

## Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

## Specifying the response headers

1. Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is

- displayed in the middle, and a **Standard Headers** table is displayed at the bottom.
- Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise, enter your own description for your headers.
  - To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you may be prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

## Specifying the retry options

- Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
- Configure the retry options to connect to an HTTP Server. The following table defines the retry options for connecting to an HTTP Server:

Field	Description
Retry	
1) Wait --- seconds between each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the HTTP server.
2) Try to connect --- times before failing .	Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an HTTP <b>Put Request</b> activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
3) Time out after --- seconds when the Endpoint does not respo	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the HTTP <b>Put Request</b> activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in HTTP Endpoint tab. For more information about connection timeout, see <a href="#">Creating or Editing a Web Services Endpoint</a> .

nd to a reque st.	
----------------------------	--

## Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is mandatory and at least one variable must be mapped to it. The body input parameter contains the body of the HTTP response message sent back to the HTTP server.
2. To view the optional input parameter in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The **httpheaders** and **httpConnParameter** input parameters are displayed.

The following table defines the nodes of the optional httpheaders input parameter:

Table 2.

Nodes of the httpheaders Input Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one request header in Request Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/pathParameters	If you configured path parameters in the URL in Configure step, each is displayed here. If no path parameter is specified, this node does not display.
httpheaders/queryParameters	If you configured query parameters in the URL in Configure step, each one of them will be displayed here. If no query parameter is specified, this node does not display.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs for the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP parameter.

**Note:** If the Content-Length header is explicitly set using the `httpheaders/otherHeaders/headerItem/name` and `httpheaders/otherHeaders/headerItem/value`, during run time this value is ignored. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional httpConnParameter input parameter. You can optionally override the settings you specified in the Pick Endpoint task of the Checklist dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the httpConnParameter input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 3.

<b>Nodes of the httpConnParameter Input Parameter</b>	<b>Description</b>	<b>Overrides what settings in the HTTP endpoint?</b>
timeout	Specifies the amount of time in seconds before a timeout occurs.	
host	Specifies the host name or IP address of the remote HTTP server.	The host node of the httpConnParameter input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server.	The port node of the httpConnParameter input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The isSecure node of the httpConnParameter input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The username node of the httpConnParameter input parameter overrides the User Name field in the HTTP endpoint.
password	Specifies the password for the account used to connect to the HTTP Server.	The password node of the httpConnParameter input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and the input parameter or parameters. See [Creating a map](#) for general instructions on mapping

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 4.

<b>Output Parameter</b>	<b>Description</b>
httpheaders	Specifies the header of the HTTP request.
body	Specifies the body of the HTTP request message.
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time.
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the optional httpheaders output parameter.

Table 5.

<b>Nodes of the httpheaders Output Parameter</b>	<b>Description</b>
httpheaders/uri	Specifies the resource path of the incoming request, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

## Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

**Parent topic:** [HTTP Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http\\_put\\_request\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_put_request_activity.html)

## HTTP Delete Request activity

The HTTP **Delete Request** activity sends a **Delete Request** to the specified location (the HTTP endpoint) and receives a HTTP response back from that location.

### Adding an HTTP Delete Request activity to the orchestration

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the HTTP folder.
3. Drag the **Delete Request** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

## Creating, selecting, or editing an HTTP endpoint

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit a HTTP endpoint. See [Creating or editing an HTTP endpoint](#).

## Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description
URL (Path after Host name)	<p>Specifies the resource path that the <b>Delete Request</b> activity sends the request to, for example: /myPath. The string you specify in this field must exclude the string: http://, the hostname, and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number specified in the HTTP endpoint and the path specified in this field. For example, if the full URL that the <b>Delete Request</b> activity sends the request to is http://myAR:myPort/myPath, in this field you only need to specify the string: /myPath. The specified path must be unique for the <b>Delete Request</b> activities that are deployed at the same time on the same Integration Appliance using the same port.</p> <p>To make use of path parameters and query parameters, enter a URL in this format, "url/{path}?name1=value1&amp;name2=value2". This allows you to map a string value to the "{path}" parameter and to specify query parameter names: <i>name1</i> and <i>name2</i> in this example. If you choose to declare multiple "{path}" parameters, each parameter should have a unique name. Parameters with the same name are represented by only one node in the map. The path parameters are displayed under /httpheaders/pathParameters in Map Input. Query parameters are displayed under /httpheaders/queryParameters in Map Input.</p> <p>Note: In the URL, any value you assign to a query parameter is not passed to the mapper. To assign a value to the query parameter, either explicitly map a value to the query parameter in the mapper, or define a default value.</p>

Field or Check Box	Description
Where Request Message is Of Type	Specifies the message type of the HTTP response - either Text or Binary.
Where Reply Message is Of Type	Specifies the message type of the HTTP reply - either Text or Binary.
Stop Processing the Orchestration Job or Continue Processing and Return the HTTP Error code	<p>Specifies the run time behavior of the activity if an error response is returned from the HTTP Server:</p> <ul style="list-style-type: none"> <li>○ <b>Stop Processing the Orchestration Job</b> - Select this option if the orchestration job should stop processing when an error response is received from the HTTP Server during run time. The orchestration stops processing in the <b>Delete Request</b> activity and the activities after the <b>Delete Request</b> activity in the orchestration are not processed and a failed exception is thrown.</li> <li>○ <b>Continue Processing and Return the HTTP Error code</b> - Select this option if the orchestration job should continue processing when an error response is received from the HTTP Server during run time. The orchestration job should continue processing activities after the <b>Post Request</b> activity in the orchestration and the error response code and the error response message is returned in the responsecode and responsemessage output parameters, respectively.</li> </ul>
Use Compression/Decompression	<p>Specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is clear and compression/decompression is disabled for this activity. Select the Use Compression/Decompression check box to enable compression/decompression for this activity. For more information, see <a href="#">Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity</a></p>

## Specifying the request headers

1. Select the **Request Headers** task from the Checklist. The **Request Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Input.

## Specifying the response headers

1. Select the **Response Headers** task from the Checklist. The **Response Headers** pane is displayed. A **Custom Headers** table is displayed at the top, a **Include pre-defined standard headers** checkbox is displayed in the middle, and a **Standard Headers** table is displayed at the bottom.
2. Click the **Add** button to add a header to the **Custom Headers** table. Click on the new entry to enter a header name or select a header name from the drop down list. If the header name is a pre-defined header name, a description is displayed in the **Description** column, otherwise enter your own description for your headers.
3. To use the pre-defined standard headers, check the **Include pre-defined standard headers** checkbox. Note that duplicate header names are not allowed (ignoring the case difference) and you are prompted to remove any duplicate headers in the **Custom Headers** table. The selected HTTP headers are displayed under /httpheaders in Map Output.

## Specifying the retry options

1. Select the **Retry** task from the **Checklist**. The **Retry** pane is displayed.
2. Configure the retry options to connect to an HTTP Server. The following table defines the retry options for connecting to an HTTP Server:

Field	Description
Retry	
1) Wait ____ seconds between each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the HTTP server.
2) Try to connect ____ times before	Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the HTTP Server before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an HTTP <b>Delete Request</b> activity and the Integration Appliance cannot connect to the specified HTTP Server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops

<p>failing .</p>	<p>processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>
<p>3) Time out after --- secon ds when the Endpo int does not respo nd to a reque st.</p>	<p>Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the HTTP <b>Delete Request</b> activity, the activity timeout is the amount of time that the Integration Appliance waits for a response from the HTTP Server after sending a HTTP request, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the endpoint and the time it takes for the endpoint to respond to the connection request. You set the connection timeout in HTTP Endpoint tab. For more information about connection timeouts, see, <a href="#">Creating or Editing a Web Services Endpoint</a>.</p>

## Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The body input parameter is displayed in the To Activity pane of the **Map Inputs** task. The body input parameter is optional. The body input parameter contains the body of the HTTP response message sent back to the HTTP server.
2. To view the optional input parameter in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs pane to make this option active. The **httpheaders** and **httpConnParameter** input parameters are displayed.

The following table defines the nodes of the optional httpheaders input parameter:

Table 2.

<b>Nodes of the httpheaders Input Parameter</b>	<b>Description</b>
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one request header in Request Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/pathParameters	If you configured path parameters in the URL in Configure step, each is displayed here. If no path parameter is specified, this node does not display.
httpheaders/query Parameters	If you configured query parameters in the URL in Configure step, each one of them will be displayed here. If no query parameter is specified, this node does not display.

<b>Nodes of the httpheaders Input Parameter</b>	<b>Description</b>
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs for the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP parameter.

**Note:** If the Content-Length header is explicitly set using the `httpheaders/otherHeaders/headerItem/name` and `httpheaders/otherHeaders/headerItem/value`, during run time this value is ignored. This activity automatically sets the Content-Length header to the size of the body.

The following table defines the nodes of the optional `httpConnParameter` input parameter. You can optionally override the settings you specified in the Pick Endpoint task of the Checklist dynamically during run time by passing in values from variables into the nodes specified in the following table. For example during run time, you can override the Host Name specified in the endpoint, by mapping a variable to the host node of the `httpConnParameter` input parameter. During run time, the value of the variable is the host name used to connect the HTTP server.

Table 3.

<b>Nodes of the httpConnParameter Input Parameter</b>	<b>Description</b>	<b>Overrides what settings in the HTTP endpoint?</b>
timeout	Specifies the amount of time in seconds before a timeout occurs.	
host	Specifies the host name or IP address of the remote HTTP server.	The host node of the <code>httpConnParameter</code> input parameter overrides the Host Name field of the HTTP endpoint.
port	Specifies the port number of the remote HTTP server.	The port node of the <code>httpConnParameter</code> input parameter overrides the Port field of the HTTP endpoint.
isSecure	Set this boolean equal to true to enable HTTPS - secure HTTP over SSL. Set this boolean equal to false to disable security.	The isSecure node of the <code>httpConnParameter</code> input parameter overrides the Security option in the HTTP endpoint.
username	Specifies the user name for the account used to connect to the HTTP server.	The username node of the <code>httpConnParameter</code> input parameter overrides the User Name field in the HTTP endpoint.
password	Specifies the password for the account used to connect to the HTTP Server.	The password node of the <code>httpConnParameter</code> input parameter overrides the Password field in the HTTP endpoint.

3. Create a map between the orchestration variable or variables and the input parameter or parameters. See [Creating a map](#) for general instructions on mapping

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 4.

Output Parameter	Description
httpheaders	Specifies the header of the HTTP request.
body	Specifies the body of the HTTP request message.
responsecode	Specifies the HTTP Response Code that is returned from the HTTP Server during run time.
responsemessage	Specifies the message associated with the HTTP Response Code.

The following table defines the nodes of the optional httpheaders output parameter.

Table 5.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path of the incoming request, for example: /myPath.
httpheaders/<configured_header_name>	If you configured at least one response header in Response Headers step, each is displayed here. <configured_header_name> is replaced with the actual header names you selected or entered.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

## Using certificates with Microsoft Internet Explorer

If you have selected the HTTPS security option in the HTTP endpoint, note that Microsoft Internet Explorer does not recognize a modified certificate and caches the SSL state. If you modify certificates, you must clear the SSL state. To clear the SSL state in Microsoft Internet Explorer:

1. From the Microsoft Internet Explorer toolbar menu, select Tools > Internet Options.... The Internet Options pane is displayed.
2. Click the Content tab.
3. In the **Certificates** section, click Clear SSL State. The SSL Cache Cleared Successfully dialog box is displayed.
4. Click OK and click OK.

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http\\_delete\\_request\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/http_delete_request_activity.html)

## Compression/Decompression with the HTTP Invoke/Get/Post/Head/Put/Delete Request activity

---

During runtime, the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity sends a HTTP request compliant with the HTTP/HTTPS 1.1 protocol to the HTTP Server.

Note: The **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity supports compression/decompression with the gzip or the deflate formats. It does not support the common UNIX file compression format called compress.

The compression/decompression runtime behavior of the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity is dependant on the following conditions:

- [If the endpoint supports compression/decompression](#)
- [The values of the Content-Encoding and Accept-Encoding headers at the message level](#)
- [The setting of the Use Compression/Decompression check box at the activity level](#)

The affect of these conditions on the compression/decompression runtime behavior of the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity are described in the following sections and in the tables provided in the [Runtime Compression/Decompression Behavior](#) section.

### Endpoint support for compression/decompression

---

The Integration Appliance determines whether or not the HTTP Endpoint supports compression when the Integration Appliance sends the first HTTP request in the compressed format to the HTTP Endpoint (the HTTP Server), if the HTTP Server returns an error code indicating that HTTP Server does not support compression or does not support the specified Content-Encoding type, the Integration Appliance re-sends the first request in uncompressed format and all subsequent requests to this Endpoint are sent in the uncompressed format. In addition, the HTTP response sent by the HTTP Server is not decompressed when received by Integration Appliance.

Endpoint support for compression/decompression is represented by the column labeled **Endpoint Supports Compression?** in the tables provided in the [Runtime Compression/Decompression Behavior](#) section.

### Content-Encoding and Accept-Encoding values at the message level

---

The value of the Content-Encoding header in the HTTP request determines if the body of the request is compressed and the type of encoding that is used. For example, if the Content-Encoding is equal to deflate, the Integration Appliance sends the body of the request compressed in the deflate format as shown in the second row of the first table labeled [Compression Behavior When Sending a Request](#) and in the following figure.

The value of the Accept-Encoding header in the request defines the types of encoding that the HTTP client accepts in the response. For example, if the Accept-Encoding is equal to **gzip,deflate** in the request, the HTTP server can send the body of the response compressed in gzip or deflate formats to the Integration Appliance (acting as a client) as shown in the following figure:

Figure 1.

By default, if nothing is mapped to the optional **httpheaders** input parameter in the **Map Inputs** task of the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity, a set of default headers are created. For example, the URL header is automatically set with the value provided in the Configure pane of the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity.

The values for the Accept-Encoding and Content-Encoding headers for the request can be explicitly set using name/value pairs in the optional **httpheaders** input parameter of the **Map Inputs** task in the **HTTP Invoke/Get/Post/Head/Put/Delete Request** activity. For example, to set the Content-Encoding to **deflate**, set the following name/value pair in the optional **httpheaders** input parameter:

- **httpheaders/httpheaders/otherHeaders/headerItem/name** is set to the string: Content-Encoding
- **httpheaders/httpheaders/otherHeaders/headerItem/value** is set to the encoding type, for example the string: deflate.

If unsupported values or no values are set for the Accept-Encoding and Content-Encoding headers of the request, default values are provided as shown in the following tables:

- [Compression behavior when sending a request](#)
- [Accept-Encoding Header value passed to the request](#)

The values of the Accept-Encoding and Content-Encoding headers in the request are used by the Integration Appliance and the HTTP server to determine the compression/decompression behavior.

## Setting compression/decompression at the activity level

By default, compression/decompression is not used for all HTTP activities. You can select compression or decompression at the activity level by using the Use Compression/Decompression check box that is displayed in the **Configure** task of the activity. The column labeled Use Compression/Decompression Check Box in the table shown in [Runtime Compression/Decompression Behavior](#) represents the setting of the Use Compression/Decompression check box.

Note: The Use Compression/Decompression check box will be deprecated in a future release for the HTTP activities. Use the Content-Encoding and Accept-Encoding HTTP Parameters in the HTTP request to specify how to decompresses the body of the HTTP request and compress the body of the HTTP response.

## Runtime compression/decompression behavior

The table provided in the [Compression behavior when sending a request](#) section describes the compression runtime behavior when the Integration Appliance sends a HTTP request to the HTTP server.

The table provided in the [Accept-Encoding Header value passed to the request](#) section describes the value of the Accept-Encoding header passed in the HTTP request.

The table provided in the [Decompression behavior when receiving a response](#) section describes the decompression runtime behavior when the Integration Appliance receives the HTTP response from the HTTP server.

## Compression behavior when sending a request

The following table describes the compression runtime behavior when the Integration Appliance sends a HTTP request to the HTTP server.

Use Compression/Decompression Check Box (Activity Level)	Content-Encoding Value in the HTTP Request (Message Level)	Endpoint Supports Compression?	Integration Appliance Compression Runtime Behavior When Sending a Request
selected	gzip, not set, or any other string except deflate or identity	yes	The Integration Appliance sends the body of the request compressed in the <b>gzip</b> format. The Content-Encoding header is set to <b>gzip</b> in the request.
selected	deflate	yes	The Integration Appliance sends the body of the request compressed in the <b>deflate</b> format. The Content-Encoding header is set to <b>deflate</b> in the request.
selected	identity	yes	The Integration Appliance sends the body of the request uncompressed. The Content-Encoding header is set to <b>identity</b> in the request.
selected	value is not significant	no	The Integration Appliance sends the body of the request uncompressed. The Content-Encoding header is set to <b>identity</b> in the request.
cleared	value is not significant	value is not significant	The Integration Appliance sends the body of the request <b>as is</b> (unchanged). The current value of the Content-Encoding header is passed <b>as is</b> in the request.

## Accept-Encoding Header value passed to the request

The following table describes the value of the Accept-Encoding header passed in the HTTP request.

Use Compression/Decompression Check Box (Activity Level)	Initial Accept-Encoding Value	Endpoint Supports Compression?	Accept-Encoding Value Passed In the HTTP Request to the Server
selected	gzip	yes	The Accept-Encoding header is set to <b>gzip</b> in the request.
selected	deflate	yes	The Accept-Encoding header is set to <b>deflate</b> in the request.
selected	gzip,deflate	yes	The Accept-Encoding header is set to <b>gzip,deflate</b> in the request.
selected	deflate,gzip	yes	The Accept-Encoding header is set to <b>deflate,gzip</b> in the request.
selected	identity	yes	The Accept-Encoding header is set to <b>identity</b> in the request.
selected	not set, or any other string except deflate, gzip, or identity	yes	The Accept-Encoding header is set to <b>gzip,deflate</b> in the request.
selected	value is not significant	no	The current value of the Accept-Encoding header is passed <b>as is</b> in the request.
cleared	value is not significant	value is not significant	The current value of the Accept-Encoding header is passed <b>as is</b> in the request.

## Decompression behavior when receiving a response

The following table describes the decompression runtime behavior when the Integration Appliance receives the HTTP response from the HTTP Server.

Use Compression/Decompression Check Box (Activity Level)	Content-Encoding Value in the HTTP Response (Message Level)	Endpoint Supports Compression?	Integration Appliance Decompression Runtime Behavior When Receiving a Response
selected	gzip	yes	The Integration Appliance decompresses the body of the response using the gzip format.
selected	deflate	yes	The Integration Appliance decompresses the body of the response using the deflate format.
selected	identity	yes	The Integration Appliance does not decompress the body of the response.
selected	value not listed in the Accept-Encoding header	yes	The Integration Appliance logs an error that the response data was received in an unsolicited content encoding type.
selected	value is not significant	no	The Integration Appliance does not decompress the body of the response. The current value of the Content-Encoding header is passed as is in the response.

Use Compression/Decompression Check Box (Activity Level)	Content-Encoding Value in the HTTP Response (Message Level)	Endpoint Supports Compression?	Integration Appliance Decompression Runtime Behavior When Receiving a Response
cleared	value is not significant	value is not significant	The Integration Appliance does not decompress the body of the response. The current value of the Content-Encoding header is passed as is in the response.

## Troubleshooting and support

Troubleshooting techniques and self-help information help you identify and solve problems quickly. Here, you can find potential solutions for issues you would have with the HTTP connector.

### Inconsistent behaviour of query parameters

**Problem:** The behavior of the query parameters passed to the HTTP receiver varies with the input. This inconsistency occurs for HTTP Put, Get, Invoke, Header, and Delete outbound activities. For these activities the URL with query parameters can be set at two places:

- Checklist > Configure panel > URL (Path After Hostname)
- Checklist > Map Inputs panel > To Activity section > httpheaders > uri

However, the query parameters set in the steps mentioned above can be replaced or overwritten in the Map Inputs panel > To Activity section > httpheaders > queryParameters. The behavior of the query parameters passed to the HTTP Receiver varies with the input.

**Solution:** Consider the following points when setting values:

- If the value of the URL is mapped and the value of the parameters are empty, then the URL is passed as is to the HTTP Receiver.
- If the value of the URL and the value of the parameter in the map are also assigned, then the HTTP Receiver gets the values. The URL with parameter values are appended to the URL.
- If value of the URL is not mapped, the url is build dynamically using the parameter values in the input map.

**Example:**

Configure panel URI: `/xyz/test?query2=c&query3=c&query5=c&query6=c`

Map Inputs URI: `/xyz/test?query4=u&query3=u`

Map Inputs Query Parameter: query2=m and query3=m

End URL: /xyz/test?query4=u&query3=m&query2=m&query5=&query6=

## HTTP connector uses ISO-8859-1 as default character encoding value.

---

HTTP connector now uses ISO-8859-1 as default character encoding in place of UTF-8.

You can use any one of the following method to change this character encoding value:

- **Method 1:** To resolve the issue, please follow steps below:
  1. Go to the HTTP Send Response activity
  2. Add response header "Content-Type"
  3. In Map Inputs, To Activity body, right click on the body element and click on "Show Optional Parameters"
  4. Expand the (optional)httpheaders, and assign default value below to the "Content-Type" element:

```
text/plain;charset=UTF-8
```

- **Method 2:** Introduced new JVM level configuration property. You can change this to the required value. If you set any value in the HTTP activity, that will take highest priority. Next priority is given to the JVM level property (if available). If nothing is set in either place, then default value "ISO-8859-1" is used for content encoding.

- **Studio**

```
Property name: "ContentEncoding"  
Default value: "ISO-8859-1"
```

Once the Studio is launched, run `jConsole` in bin directory of JDK. In New Connection screen, under Local Process, select the process corresponding to the Studio and click Connect. Under MBeans tab, navigate to `HttpModule > HTTP Loopback > Attributes > ContentEncoding`. Change the default value to the required value.

- **Appliance**

```
Property name: HTTP_CHARACTER_ENCODING  
Default value: ""
```

Setting this attribute on the appliance will require system shell access to enable/disable `jmxport`. In system shell, issue the following command to check if any value is set for the property:

```
ihconfutil lookup /var/sysconf sysconf.db HTTP_CHARACTER_ENCODING
```

User will get output like:

```
ContentEncodingv: []
```

Now, try to set the value true to this property.

```
ihconfutil add /var/sysconf sysconf.db HTTP_CHARACTER_ENCODING <new value>
```

Now verify the value set using:

```
ihconfutil lookup /var/sysconf sysconf.db HTTP_CHARACTER_ENCODING
```

This results in

```
ContentEncodingv: [<new value>]
```

The hierarchy in appliance is

1. Jconsole property
2. Config property
3. Default value

If you want to change the value at runtime without restarting appliance you can use jconsole for appliance, but if you want to set the value and make it permanent, then you have to set in config properties. If nothing is set for both properties default (ISO-8859-1) is used.

## Overview of the JD Edwards (JDE) connector

---

The JD Edwards (JDE) connector provides the ability for the appliance to interact with the JD Edwards EnterpriseOne server and perform certain business functions, without the need for special coding. The connector works with the JD Edwards EnterpriseOne server by sending requests to it and by monitoring and responding to events that occur in the JD Edwards EnterpriseOne server.

You can complete the following activities using the JDE connector:

- [Invoke Business Function](#)
- [Poll Real-Time Events](#)

The JDE connector supports the following versions of JDE Tools: 8.97, 8.98, and 9.1 (for Invoke Business Function). The connector is compatible with any version of JD Edwards EnterpriseOne that works with the supported versions of EnterpriseOne Tools.

The JDE connector requires JDE library files to connect to the JDE server. For more information, see [Installing JAR files to connect to the JDE server](#) and [Importing JDE Libraries](#).

## Creating or editing an endpoint for a JDE activity

---

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a JD Edwards EnterpriseOne transaction server (JDE server).

1. In the Create Endpoint or Edit Endpoint pane, configure the JDE server as described in the following table. The endpoint pane contains Connection Information, Connection Pool Options and Remote Endpoint Configuration.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the JDE server successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
<b>Connection Information</b>	
Environment	Specifies the JD Edwards EnterpriseOne environment name.

Field Name	Description
Role	Specifies the name of the role that is associated with the user name used to access the JD Edwards EnterpriseOne environment.
User Name	Specifies the user name to connect to the JDE server.
Password	Specifies the password associated with the user name to connect to the JDE server.
<b>Connection Pool options</b>	
Minimum Connections	Specifies the lowest number of JDE server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
Maximum Connections	Specifies the maximum number of JDE server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
Maximum Idle Time	Specifies the amount of time in minutes that a JDE server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool – no idle time. The default value is 120 minutes.
Maximum Wait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
Reclaim Connections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.
Note: The Connection pool properties need to be configured as per the load (number of concurrent requests) on the endpoint.	
<b>Remote Endpoint Configuration</b>	
Endpoint Runs Behind Firewall	Enables the secure connector name property so that secure connector can be used if the JDE server is running behind a firewall.
Secure Connector Name	Specifies the name of the secure connector that is used to connect to the JDE server running behind a firewall. For example, if an orchestration containing JDE activity is deployed on to Cast Iron Live (cloud), then the secure connector needs to be configured.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JDEnew\\_creating\\_an\\_endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JDEnew_creating_an_endpoint.html)

## Importing JDE Libraries

---

You must import JDE instance-specific libraries on both Studio and the Integration Appliance before you can configure JDE endpoints, build orchestrations that use the JDE Connector, and deploy projects using the JDE Connector.

## About this task

---

For information about installing the required library files on the Integration Appliance using the Web Management Console (WMC), see the WMC Online Help

## Procedure

---

To get copies of the required JDE provider modules:

1. Log on to the instance of your JDE system.
2. Import the following JDE files to the workstation where Studio is installed:

- ApplicationAPIs\_JAR.jar
- ApplicationLogic\_JAR.jar
- Base\_JAR.jar
- BizLogicContainer\_JAR.jar
- BizLogicContainerClient\_JAR.jar
- BusinessLogicServices\_JAR.jar
- castor.jar
- classes12.zip
- commons-httpclient-3.0.jar
- Connector.jar
- EventProcessor\_EJB.jar
- EventProcessor\_JAR.jar
- Generator\_JAR.jar
- JdbjBase\_JAR.jar
- JdbjInterfaces\_JAR.jar
- JdeNet\_JAR.jar
- jmxremote.jar
- jmxremote\_optional.jar
- jmxri.jar
- log4j.jar
- ManagementAgent\_JAR.jar
- Metadata.jar
- MetadataInterface.jar
- ojdbc14.jar
- PMApi\_JAR.jar
- Spec\_JAR.jar
- System\_JAR.jar
- SystemInterfaces\_JAR.jar
- xalan.jar
- xerces.jar
- xmlparserv2.jar
- jdelog.properties
- tnsnames.ora
- jdbj.ini
- jdeinterop.ini

**Note:** You also need to add database driver JAR files. These JAR files depend on the JD Edwards Enterprise One server version and the database used. For more information about the required JAR list, contact the Oracle Support team.

3. After retrieving the required files, use the Add Providers dialog box to [install the JDE files](#) into Studio.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JDEnew\\_Importing\\_JDE\\_Libraries.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JDEnew_Importing_JDE_Libraries.html)

## Installing JAR files to connect to the JDE server

---

You must copy the JDE JAR files on the same workstation as your Cast Iron Studio installation before you can connect to a JD Edwards EnterpriseOne transaction server (JDE server).

### Before you begin

---

- The JAR files can be obtained from the JDE system administrator.
- The JAR files must be on the same computer as the studio installation.
- The JAR files must be from the same version as the JDE server you connect to.

For more information about importing the JAR files, see [Importing JDE Libraries](#).

### About this task

---

### Procedure

---

1. Open studio and select Tools > Install Module Providers.
2. When the Add Provider(s) dialog box is displayed, click the plus (+) button under JDE. A field and a Browse button appears.
3. Click Browse, and use the browse dialog box to locate and select the JAR files.
4. Click Open to import the selected files.
5. When the JAR files are listed in the Add Provider(s) dialog box, click OK.

### Results

---

A prompt is displayed to restart studio and activate the changes.

### What to do next

---

You can now create JDE endpoints and orchestrations.

**Parent topic:** [JDE Activities](#)

---

[Feedback](#) | [Notices](#)

## Using the JDE Invoke Business Function activity

---

Use the JDE Invoke Business Function activity to call a specific JDE business function. You can map the resulting output from this activity to an orchestration.

### Before you begin

---

Ensure that you have:

- Imported the JDE library files required to connect to the JDE server. For more information, see [Installing JAR files to connect to the JDE server](#).
- Valid connection details to connect to the JDE server.

### About this task

---

Use this task to call a specific JDE business function from the JDE server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the JDE folder.
2. Drag the Invoke Business Function activity icon onto the orchestration. The JDE Invoke Business Function Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant JDE endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for a JDE activity](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. In the JDE Business Function panel, click Browse to browse for business function names.
11. In Browse JDE Business Functions dialog, select one or more business functions from the *Business Function List*, and add it to the Selected Business Functions pane.
12. The Business Function Container field gets populated based on the first business function selected and click OK. You can also type the desired business function container name.

The selected business functions are displayed in the Configure panel.

13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery Options for JDE Activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Invoke Business Function activity are displayed as nodes under the request input parameter in the To Activity panel.

15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the JDE Invoke Business Function activity.

**Parent topic:** [JDE Activities](#)

---

## Using the JDE Poll Real-Time Events activity

---

Use the JDE Poll Real-Time Events activity to poll real-time events from JD Edwards EnterpriseOne transaction server. A real-time event is a business transaction that provides information from the JD Edwards EnterpriseOne server that can be used to interoperate with a vendor system. Real-time events can be generated wherever business functions run, such as HTML, WIN32, and enterprise servers. Real-time events are useful for producing notifications in real-time.

## Before you begin

---

Ensure that you have:

- Imported the JDE library files required to connect to the JDE server. For more information, see [Installing JAR files to connect to the JDE server](#).
- Valid connection details to connect to the JDE server.

## About this task

---

Use this task to poll real-time events from JD Edwards EnterpriseOne transaction server.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the JDE folder.
2. Drag the Poll Real-Time Events activity icon onto the orchestration. The JDE Poll Real-Time Events Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.

5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant JDE endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for a JDE activity](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. In the JDE Real-Time Events panel, click Browse to browse for real-time events. The Browse JDE Real-Time Events dialog is displayed.
11. In Browse JDE Real-Time Events dialog, select a real-time event from the list and click OK. The selected real-time event is displayed in the Configure panel.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery Options for JDE Activities](#).
13. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
14. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the JDE Poll Real-Time Events activity.

**Parent topic:** [JDE Activities](#)

## Specifying Retry and Delivery Options for JDE Activities

---

Specifying the Retry and Delivery parameters is one of the tasks to configure a JDE activity configuration.

### About this task

---

This section contains the procedure for configuring the retry options for JDE outbound and inbound activities.

### Procedure

---

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry options for connecting to a JD Edwards EnterpriseOne transaction server as described in the following table.

Table 1. Retry options

Ret ry Fie lds	Description

<b>Retry Fields</b>	<b>Description</b>
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the JD Edwards EnterpriseOne transaction server.
Retry count	Specifies the retry count — the maximum number of times the Integration Appliance attempts to establish a connection to the JDE server before issuing an error and stopping the processing of the current orchestration job. Note: If you deploy an orchestration that contains the inbound or outbound JDE activity and the Integration Appliance cannot connect to the specified JDE server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.

Parent topic: [JDE Activities](#)

## Specifying the delivery rules options for JDE inbound activities

### About this task

This section contains the procedure for configuring the delivery rule options for JDE inbound activities.

### Procedure

1. Select the Delivery Rules task from the Checklist. The delivery rules pane is displayed.
2. Configure the delivery rules options to select the activity's behavior as described in the following table.

Table 2. Delivery rules

<b>Delivery Rules Fields</b>	<b>Description</b>
Poll for changes every _____ days/hours/minutes/seconds	Specifies the time interval to poll for real-time events in the JD Edwards EnterpriseOne transaction server. Time can be selected in the format days, hours, minutes, or seconds.
Fetch _____ rows per poll	Specifies how many real-time events the activity should retrieve from the JD Edwards EnterpriseOne transaction server in each poll cycle.
<b>Delivery Messages</b>	

Delivery Rules Fields	Description
ATMOST_ONCE	A non-persistent mode in which a JDE real-time event is either delivered once or not delivered at all.
Wait time on JDE transaction server_____seconds	Specifies the time interval that the connector waits to get an event from the JD Edwards EnterpriseOne transaction server.

---

## JMS Activities

---

- [Creating or editing a JMS endpoint](#)  
JMS endpoints provide information that Studio and the Integration Appliance use to connect to a JMS instance.
- [Specifying delivery rules and retry parameters for JMS activities](#)  
The JMS Connector uses a single login session for all connections to a JMS endpoint. If a session expires, the connector automatically establishes a new session. The JMS Connector does not count the initial attempt to reacquiring the session as a retry attempt. The JMS Connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.
- [Get Message activity](#)  
You can use the Get Message activity to get a message from the queue. If there is no message present the activity can time out.
- [Poll Message activity](#)  
The Poll Message activity is a starter activity that polls the configured queue for the message. This activity supports the ATLEAST ONCE and EXACTLY ONCE delivery semantics. The Poll Message Activity supports batching, if the batching option is selected.
- [Publish Message activity](#)  
The Publish Message activity is an executable activity that allows you to publish data on the configured topic. This activity supports the ATLEAST ONCE and ATMOST ONCE delivery semantics.
- [Send Message activity](#)  
The Send Message activity is an executable activity that sends message to the configured queue. The Send Message activity supports the AT LEAST and AT MOST ONCE delivery semantics. Request-reply use cases can use the Poll Message and Send Message activity; there is no separate activity for reply.
- [Subscribe Message activity](#)  
The Subscribe Message activity is a starter activity that allows you to subscribe to a JMS topic. This activity supports the ATLEAST ONCE and EXACTLY ONCE delivery semantics.
- [Creating a JMS endpoint to a WebLogic server](#)  
You can define a JMS endpoint to an existing WebLogic server, by completing the following steps in IBM Cast Iron Studio.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_JMSactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_JMSactivities.html)

## Creating or editing a JMS endpoint

JMS endpoints provide information that Studio and the Integration Appliance use to connect to a JMS instance.

### About this task

Any changes you make to the endpoint, including configuration properties, affects all orchestrations that use that endpoint as the edits are global, not local.

### Procedure

1. Drag an activity from the JMS folder of the Activities tab onto the orchestration.
2. The Summary panel is displayed along with a Checklist, which outlines what you must do to configure the activity.
3. Click Pick Endpoint from the Checklist. The Pick Endpoint panel opens.
4. Click one of the following options:
  - Browse - To select an existing endpoint from the Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel. To edit the endpoint properties, click Edit.
  - New - To create a new endpoint. The Create Endpoint window opens.
  - Edit - To edit the existing endpoint. The Edit Endpoint window opens.  
 Note: Editing an endpoint affects all orchestrations that use that endpoint in the project as the edits are global, not local.
5. In the Create Endpoint window, specify connection parameters or select a configuration property by clicking the icon to the right of the fields. Required fields are denoted by the following icon 

Connection Parameter Fields	Description
JNDI Initial Factory	Specifies the context factory class Studio retrieves from JNDI. Studio uses the class to lookup JMS connection factory and JMS destinations (Queue or Topic).
Provider URL	Specifies the URL of the JMS server.
Provider Package	An optional parameter, where you can specify a provider package name.
Factory Name	Use your own connection factory or use one of the default factories that comes preconfigured with the endpoint system: JBOSS, ActiveMQ, or WebLogic.

- Specify Provider login information, which includes user name and password.
- Specify Connection Pool Options.

Connection Pool Options	Description
Minimum Connections	Specifies the minimum number of connections that Studio uses to connect to a JMS instance. By default, there is a minimum of 1 connection.

Maximum Connections	Specifies the maximum number of connections that Studio uses to connect to a JMS instance. By default, there is a maximum of 25 connections.
Maximum Idle Time	By default, maximum idle time is 120 minutes.
Maximum Wait	By default, maximum wait time is 300 seconds.

6. Specify properties for the JNDI Provider, so you can set implementation specific JNDI initial context properties for tasks such as authentication.
  - a. Click  to add a field in the JNDI Provider table. A new row is displayed in the table.
  - b. Enter a property name and value.
7. Specify properties for the Connection Factory, so you can set implementation specific connection properties.
  - a. Click  to add a field in the Connection Factory table. A new row is displayed in the table.
  - b. Enter a property name and value.
8. Click Test Connection to confirm that the parameters you specified so that the project can access a JMS instance.

Note: When you configure an endpoint using configuration properties, verify that the configuration properties have valid values. If the configuration property value is invalid or does not exist, the connection test fails.

## Specifying delivery rules and retry parameters for JMS activities

---

The JMS Connector uses a single login session for all connections to a JMS endpoint. If a session expires, the connector automatically establishes a new session. The JMS Connector does not count the initial attempt to reacquiring the session as a retry attempt. The JMS Connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

- [Specifying delivery rules parameters for JMS activities](#)  
 Specifying the Delivery Rules parameters is one of the tasks you must complete to configure a JMS activity.

- [Specifying retry parameters for JMS activities](#)

Specifying the Retry parameters is one of the tasks you must complete to configure a JMS activity.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS\\_Specifying\\_Delivery\\_Rules\\_and\\_Retry\\_Parameters\\_for\\_JMS\\_Activities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS_Specifying_Delivery_Rules_and_Retry_Parameters_for_JMS_Activities.html)

## Specifying delivery rules parameters for JMS activities

Specifying the Delivery Rules parameters is one of the tasks you must complete to configure a JMS activity.

### About this task

For more information about the configuration tasks in the Checklist, see the help topic for the specific JMS activity.

### Procedure

1. In the Checklist, select Delivery Rules. The Delivery Rules panel opens.
2. For the Poll Message activity only, specify the polling interval. By default, the activity polls for changes every second.
3. Select Batch objects to process the job as a batch.
4. Select one of the following delivery options.

Note: The delivery options available depend on the JMS activity. Not all delivery options are available for every JMS activity.

<b>Delivery Option</b>	<b>Description</b>
ATLEAST_ONCE	A persistent mode, in which the JMS Provider insures that a message is not lost. As a result, there are chances that the client can receive multiple copies of a single message.
ALMOST_ONCE	In this non-persistent mode, a message may be lost, but JMS does not deliver multiple copies of a message.
EXACTLY_ONCE	In this persistent mode, JMS delivers a message once and only once.

**Parent topic:** [Specifying delivery rules and retry parameters for JMS activities](#)

[Feedback](#) | [Notices](#)

## Specifying retry parameters for JMS activities

---

Specifying the Retry parameters is one of the tasks you must complete to configure a JMS activity.

### About this task

---

For more information about the configuration tasks in the Checklist, see the help topic for the specific JMS activity.

### Procedure

---

1. In the Checklist, select Retry. The Retry panel opens.
2. Configure the retry options for connecting to a JMS instance. The following table describes the retry options for connecting to a JMS instance:

Retry Fields	Description
Wait __ second(s) between each retry.	The number of seconds that the Integration Appliance waits before trying to establish a connection to the JMS instance. By default, this parameter is set to 30 seconds
Try to connect __ times before failing.	Specifies the retry count, the maximum number of times that the Integration Appliance attempts to establish a connection to the JMS instance before issuing an error and stopping the processing of the current orchestration job. By default this parameter is set to 5 attempts.

3. For the Get Message activity, specify a value for the Activity Timeout parameter.

**Parent topic:** [Specifying delivery rules and retry parameters for JMS activities](#)

#### Feedback | Notices

## Get Message activity

---

You can use the Get Message activity to get a message from the queue. If there is no message present the activity can time out.

## About this task

---

The Get Message Activity supports batching, if the batching option is selected. When the batching option is selected, if there is more than one message in the queue, the activity processes all the messages at once, instead of processing them one at a time.

Important: This orchestration must already have a JMS endpoint representing the data source. Otherwise, input and output mapping is disabled.

## Changing the Activity Name

---

### Procedure

---

1. In the Checklist, click Summary.
2. Review the contents of the Activity Name field and make any required changes.

**Parent topic:** [Get Message activity](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS\\_Get\\_Changing\\_Activity\\_Name.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS_Get_Changing_Activity_Name.html)

## Picking a JMS endpoint

---

### Procedure

---

1. In the Checklist, click Pick Endpoint.
2. Click Browse and use the Project Explorer dialog box to select the relevant JMS endpoint.  
Tip: You can create the needed endpoint at this time by clicking New.
3. When you click OK, the endpoint-specific configuration options are displayed in a read-only state.  
Note: If changes are required to the selected endpoint configuration, click Edit to activate the options.  
Any changes you make globally affects all uses of the endpoint in active orchestrations.

**Parent topic:** [Get Message activity](#)

---

## Configuring the Get Message activity

---

### Procedure

---

1. In the Checklist, click Configure.
2. In the Queue field, specify the provider-specific name of the queue to be polled.
3. Open the Message Data menu and choose the format the message takes, whether Bytes or Text.
4. In the Message Selector field, enter the text of a message header.

Using the JMS message selector a client can specify, by submitting the text of a message header, those messages it is interested in. Only messages whose headers and properties match the selector are delivered. Message selectors cannot reference message body values. The message selector string must follow JMS selector syntax.

5. In the Checklist, click Delivery Rules.
6. Click the Batch Objects checkbox to activate the option, which enables the activity to batch-process multiple messages.
7. Open the Deliver menu and choose either option: ATLEAST\_ONCE or ATMOST\_ONCE
8. In the Checklist, click Retry.
9. Review the default settings and make any needed changes.

For more information, see [Specifying retry parameters for JMS activities](#)

## Mapping the Inputs

---

Inputs represent data that is transmitted from the orchestration (variables) to the JMS endpoint (parameters).

### Before you begin

---

If required, you can create a custom mapping variable in Source or Destination column by following the steps in [Creating variables](#).

### Procedure

---

1. In the Checklist, click Map Inputs. A set of options is displayed, and the To Activity list shows the JMS variables.
2. Click Select Inputs.

The Select Inputs dialog box lists all the variables.

3. Choose a variable, then click OK.
4. To link the activities, click and drag a variable from the From Orchestration list onto a parameter listed in the To Activity list.

If the link is viable, a line is displayed, linking the two.

5. Repeat this procedure to link other orchestration variables to JMS parameters.
6. To test the input links, click the Test button.

The Input Test Files table lists all linked variables/parameters.

7. In the Location column, click the small blue button.
8. Use the Browse dialog box to select an input test file.
9. Click Run Test. Test results are displayed in the columns underneath.

Tip: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#).

**Parent topic:** [Get Message activity](#)

## Mapping the Outputs

---

Outputs represent data that is transmitted from the JMS activity (parameters) to the orchestration (variables).

### Before you begin

---

If required, you can create a custom mapping variable in the Source or Destination column by following the steps in [Creating variables](#)

### Procedure

---

1. In the Checklist, click Map Outputs.
2. Review the parameters listed in the From Activity list.
3. If you want to create new orchestration variables that match the output parameters of the current activity, select a parameter and then click Copy.
4. In the Copy Parameters dialog box, choose one or more parameters, then click OK to add them to the To Orchestration list. The data type, schema, or schema fragment of the selected output parameter is applied to the new variable.
5. Click Select Inputs.

The Select Inputs dialog box lists all the variables associated with the other endpoint.

6. Choose one or more variables, then click OK to add them to this list.
7. Drag a parameter from the From Activity list onto a variable listed in the To Orchestration list.

If the link is viable, a line is displayed, linking the two.

8. Repeat this procedure to link other parameters and variables.
9. To test the output links, click the Test button. A variable is listed in an Input Test Files table.
10. In the Location column, click the small blue button.
11. Use the Browse dialog box to select an input test file.

12. Click Run Test. Test results are displayed in the columns underneath.

Tip: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#).

## Poll Message activity

---

The Poll Message activity is a starter activity that polls the configured queue for the message. This activity supports the ATLEAST ONCE and EXACTLY ONCE delivery semantics. The Poll Message Activity supports batching, if the batching option is selected.

### About this task

---

The EXACTLY ONCE delivery semantic is handled through the message acknowledgement. Since the JMS provider must never deliver a copy of an acknowledged message, the Poll Message activity leverages the provider for the EXACTLY\_ONCE delivery semantic. When the batching option is selected, if there is more than one message in the queue, the activity processes all the messages at once, instead of processing them one at a time.

Important: This orchestration must have a JMS endpoint representing the data source, otherwise, output mapping is disabled.

## Configuring the Publish Message activity

---

### Procedure

---

1. In the Checklist, click Configure.
2. In the Topic field, specify a provider-specific name that identifies a topic to the JMS system.
3. Open the Message Data menu and choose the format the message takes, whether Byte or Text.
4. In the Reply To field, specify the name of the destination receiving the reply message.
5. In the Time to Live field, specify the time in seconds until the message expires (0 sets a no-expiry state).

6. In the Priority field, select a number that represents the message priority (0-4: lower priorities, 5-9: higher priorities).
7. In the Checklist, click Delivery Rules.
8. Click the Batch Objects checkbox to enable the activity to batch-process multiple messages.
9. Open the Deliver menu and choose either option: ATLEAST\_ONCE or ATMOST\_ONCE
10. In the Checklist, click Retry.
11. Review the default settings and make any required changes.

For more information, see [Specifying retry parameters for JMS activities](#)

## Mapping the Inputs

---

Inputs represent data that is transmitted from the orchestration (variables) to the JMS endpoint (parameters).

### Before you begin

---

If required, you can create a custom mapping variable in Source or Destination column by following the steps in [Creating variables](#).

### Procedure

---

1. In the Checklist, click Map Inputs. A set of options is displayed, and the To Activity list shows the JMS variables.
2. Click Select Inputs.

The Select Inputs dialog box lists all the variables.

3. Choose a variable, then click OK.
4. To link the activities, click and drag a variable from the From Orchestration list onto a parameter listed in the To Activity list.

If the link is viable, a line is displayed, linking the two.

5. Repeat this procedure to link other orchestration variables to JMS parameters.
6. To test the input links, click the Test button.

The Input Test Files table lists all linked variables/parameters.

7. In the Location column, click the small blue button.
8. Use the Browse dialog box to select an input test file.
9. Click Run Test. Test results are displayed in the columns underneath.

Tip: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#).

## Send Message activity

---

The Send Message activity is an executable activity that sends message to the configured queue. The Send Message activity supports the AT LEAST and AT MOST ONCE delivery semantics. Request-reply use cases can use the Poll Message and Send Message activity; there is no separate activity for reply.

### About this task

---

This orchestration must already have a JMS endpoint representing the data source, otherwise, input mapping is disabled.

<file:///dcs/markdown/workspace/Transform/out.html>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS\\_Subscribe\\_Picking\\_JMS\\_Endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/JMS_Subscribe_Picking_JMS_Endpoint.html)

## Configuring the Subscribe Message activity

---

### Procedure

---

1. In the Checklist, click Configure.
2. In the Topic field, specify a provider-specific name that identifies a topic to the JMS system.
3. Open the Message Data menu and choose the format the message takes, whether Bytes or Text.
4. In the Message Selector field, enter the text of a message header.

Using a JMS message selector a client can specify, by submitting the text of a message header, those messages it is interested in. Only messages whose headers and properties match the selector are delivered. Message selectors cannot reference message body values. The message selector string must follow JMS selector syntax.

5. In the Client ID field, specify the unique client identifier assigned to this JMS connection.

A client's identifier is configured in a client-specific ConnectionFactory and transparently assigned to the connection it creates. Alternatively, a client can set a connection's client identifier using a provider-specific value.

6. In the Checklist, click Delivery Rules.
7. Open the Deliver menu and choose either option: ATLEAST\_ONCE, ATMOST\_ONCE or EXACTLY\_ONCE
8. In the Checklist, click Retry.
9. Review the default settings and make any required changes.

For more information, see [Specifying retry parameters for JMS activities](#)

**Parent topic:** [Subscribe Message activity](#)

---

## Feedback | Notices

## Mapping the Outputs

---

Outputs represent data that is transmitted from the JMS activity (parameters) to the orchestration (variables).

### Before you begin

---

If required, you can create a custom mapping variable in the Source or Destination column by following the steps in [Creating variables](#)

### Procedure

---

1. In the Checklist, click Map Outputs.
2. Review the parameters listed in the From Activity list.
3. If you want to create new orchestration variables that match the output parameters of the current activity, select a parameter and then click Copy.
4. In the Copy Parameters dialog box, choose one or more parameters, then click OK to add them to the To Orchestration list. The data type, schema, or schema fragment of the selected output parameter is applied to the new variable.
5. Click Select Inputs.

The Select Inputs dialog box lists all the variables associated with the other endpoint.

6. Choose one or more variables, then click OK to add them to this list.
7. Drag a parameter from the From Activity list onto a variable listed in the To Orchestration list.

If the link is viable, a line is displayed, linking the two.

8. Repeat this procedure to link other parameters and variables.
9. To test the output links, click the Test button. A variable is listed in an Input Test Files table.
10. In the Location column, click the small blue button.
11. Use the Browse dialog box to select an input test file.
12. Click Run Test. Test results are displayed in the columns underneath.

Tip: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#).

**Parent topic:** [Subscribe Message activity](#)

## Creating a JMS endpoint to a WebLogic server

You can define a JMS endpoint to an existing WebLogic server, by completing the following steps in IBM Cast Iron Studio.

### Before you begin

Install the following JAR files in IBM Cast Iron Studio and the Integration Appliance run time:

- wlclient.jar
- wljmsclient.jar

### Procedure

1. In Studio, drag an activity from the JMS folder of the Activities tab onto the orchestration.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel opens.
3. To create an endpoint, click New. The Create Endpoint window opens.
4. In the Create Endpoint window, specify the following connection parameters.

Connection parameter fields	Description
JNDI Initial Factory	Specify the context factory class that Studio retrieves from JNDI:  <code>weblogic.jndi.WLInitialContextFactory</code>  This JNDI factory class is configured during the JMS WebLogic server installation
Provider URL	Specify the URL of the JMS server in the following format:  <code>t3://:7001</code>  Where 7001 is the default port.
Provider Package	Optionally, you can specify a provider package name.
Factory Name	Use one of the supplied default factories that is configured with the WebLogic endpoint system:  <code>weblogic.examples.jms.QueueConnectionFactory</code>

5. To validate the parameters you specified, click Test Connection.  
Note: When you configure an endpoint by using configuration properties, verify that the configuration properties have valid values. If the configuration property value is invalid or does not exist, the connection test fails.
6. In the Checklist, click Configure.
7. In the Topic field, select the following topic from the Preconfigured or custom Topic/Queues list:

`weblogic.examples.jms.exampleQueue`

This topic is preconfigured to use a JMS WebLogic server.

8. Open the Message Data menu and choose the format the message takes, whether Bytes or Text.
9. In the Message Selector field, you can enter the text of a message header.  
By submitting the text of a message header in a JMS message selector, a client can specify the messages it is interested in. Only messages with headers and properties that match the selector are delivered. Message selectors cannot reference message body values. The message selector string must comply with the JMS selector syntax.  
Note: Message selector can be blank
10. In the Client ID field, specify the unique client identifier assigned to this JMS connection.
11. In the Checklist, click Delivery Rules.
12. Open the Deliver menu and choose the option: ATMOST\_ONCE
13. In the Checklist, click Retry.
14. If there are any problems, review the default settings and make the required changes.

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_MQactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_MQactivities.html)

## Creating or editing a MQ Activity endpoint

MQ activities handle flat file, XML, or raw messages to or from an MQ queue. The MQ system handles routing of messages through the network of queues. All three of the MQ activities, MQ Get Message, MQ Poll Queue, and MQ Put Message use the same endpoint creation dialog box.

### Before you begin

For MQ activities to be fully functional, ensure that the Queue Manager, Channel Name, and other queue names are configured correctly. For more information on MQ configuration, see WebSphere MQ Help.

### Procedure

1. Drag an MQ connection activity from the Activities tab onto the orchestration.

The Summary panel is displayed along with a Checklist which outlines what you must do to configure the activity.

2. Click Endpoint from the Checklist and select one of the following options:
  - Browse to add an endpoint from the endpoint repository. Once added, you can click Edit to edit it. Note: Editing an endpoint affects all orchestrations that use it. The edits are global, not local.
  - New to create a new endpoint.
  - Edit to edit the existing endpoint.

The Create Endpoint panel is displayed.

3. Fill in the fields defined in the following table.
4. Click OK when finished.

Table 1. Queue Manager Details

Field	Description
<b>Location</b>	
Host Name	Specifies the host name for the MQ Queue Manager.
Port	Specifies the port number to connect to the Queue Manager. Defaults to 1414, the default for Queue Managers.
Queue Manager	Specifies the name of the Queue Manager to connect to. The name can have a maximum length of 48 characters.
Channel Name	Specifies the channel name to use to connect to the Queue Manager. The name can have a maximum length of 20 characters.

Field	Description
<b>Login</b>	
User Name	User name for the account used to connect to the Queue Manager. The name has a maximum length of 12 characters. This account must be defined in the mqm group in MQ
	Note: For some of the fields in the endpoint, you can <a href="#">define configuration properties</a> to supply the values for these fields. The  icon is displayed when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.
<b>Connection Pool Options</b>	(Default values are provided for the connection pool options, but can be changed.)
Minimum Connections	Specifies the number of connections in the connection pool that the Integration Appliance always keeps open. Specifying 0 is supported.
Maximum Connections	Specifies the maximum number of connections that the Integration Appliance has open in the connection pool. If you change the default value, the value must be greater than or equal to the value specified for Minimum Connections. Valid values are 1 - 50. If you enter a value greater than 50, the value is reset to 50.
Maximum Idle Time	Specifies the amount of time that a connection can be open and idle before being closed by the Integration Appliance. Specifying 0 means that the connections are closed when they are returned to the pool —no idle time.

## Installing JAR files to connect to the MQ system

---

To connect to the MQ system from Studio, you must have the MQ connector-specific JAR files on the same workstation as your Studio installation. These files must be present in Studio to enable configuration of the endpoints and orchestrations.

### About this task

---

The two JAR files to be installed for WebSphere MQ version 5.x and 6.x are:

- connector.jar
- com.ibm.mq.jar

## Procedure

---

1. Open Studio, select Tools > Install Module Providers.
2. When the Add Provider(s) dialog box is displayed, click the plus (+) button under MQ Connector. A field and a Browse button is displayed.
3. Click Browse, and use the browse dialog box to locate and select both the JAR files.
4. Click Open to import the contents of the JAR files.
5. When the JAR files are listed in the Add Providers dialog box, click OK.

## Results

---

A prompt is displayed to restart Cast Iron Studio and activate the changes.

Note: You must manually restart Studio after it shuts down to apply the changes.

## What to do next

---

You can now create MQ connector endpoints and orchestrations.

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ\\_installing\\_jarfiles.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ_installing_jarfiles.html)

## Defining and loading an XML schema for a MQRFH2 header

---

To include additional metadata or parameters in an MQ message, you must define an MQRFH2 header that defines the your parameters. Typically, these parameters are specific to an application but do not occur in the data of the message itself.

### About this task

---

Each parameter, which MQ calls a folder, is passed as an XML fragment along with other MQRFH2 header data. Each parameter can have its own unique XML structure.

Because the Integration Appliance works with XML messages, each of these parameter fragments must be extracted from the MQRFH2 header. The fragments are consolidated into one fragment and passed as the MQRFH2 parameter to the Integration Appliance.

To make these parameters accessible, both Studio and the Integration Appliance need access to an XML Schema that defines the structures of all the parameters. Complete the following procedure to create that XML Schema and load it into the project.

## Procedure

---

1. Create an XML Schema that defines the parameters of your MQRFH2 header using an XML Schema editor or text editor. For an example XML Schema, see [MQRFH2 XML data and schema examples](#). Your XML Schema must be customized for your application's parameters.

Create the XML Schema according to the following guidelines:

- Define the consolidated structure as a single `NameValueData` element.
  - List all the parameters, in the order they occur in the MQRFH2 header, as elements inside `NameValueData` element.
  - Parameter names must be unique.
  - Parameter, group, and property names must be valid XML names. See the XML specification or MQ documentation for more information.
  - Each parameter must be wrapped in a single element. MQ documentation refers to this parameter element as a folder.
  - Parameters may contain properties, groups, or both.
  - Groups and properties may repeat.
  - Groups can nest inside other groups.
  - Properties must be defined as type `MQRFHQPropertyType`.
2. Add this XML Schema to the project. See [Uploading Files into a Project](#) for more information.
  3. The XML Schema is now available in the Browse for Schema Type Element dialog box. In the Configure pane of the MQ activities, this dialog box appears when you click the Schema Fragment for MQRFH2 Header check box and then click [...]. In the Browse For Schema Type Element dialog box find the XML Schema that defines the header, select `NameValueData` element in that XML Schema, and click OK.

## MQ Get Message activity

---

Use the MQ Get Message activity retrieves messages from an MQ queue during run time.

Note: You must have [created an endpoint for the MQ activity](#) before configuring the activity.

The Configure task has three sections:

- [Queue and Message details](#) - where you specify properties for queue and message details.
- [Delivery rules](#) - where you specify how you want messages delivered.
- [Retry options](#) - where you specify how long to wait between retries and the number of time to retry before failing.

After completing the Configure tasks, [Mapping inputs](#) and [Mapping outputs](#) of the activity.

Note: The maximum message size is 100 MBytes.

### Queue and Message details

---

Specify the Queue and Message details for the fields in the following table. Required fields are marked with an asterisk.

Field	Description
Queue Name *	Specifies the name of the MQ queue where Integration Appliance attempts to retrieve the message from.
Timeout	<p>The number of seconds before a timeout occurs between the MQ Get Message activity requesting to retrieve a message from the queue and the time it takes for the message to be returned. If this timeout period expires and no message is returned from the queue, the Integration Appliance waits the specified retry time before attempting to retrieve a message again. For a detail explanation of the timeouts and retry options, see <a href="#">Timeout and Retry options</a>.</p> <p>To specify the number of seconds that the Integration Appliance should wait before issuing a timeout, select the After option and enter the number seconds in the Seconds field. By default the Never option is selected, this option specifies the Integration Appliance waits indefinitely to retrieve a message from the queue —there is no timeout period.</p>
Payload Data Type	Specifies the datatype of the message payload, either binary or string.
Schema Fragment for MQRFH2 Header	<p>Specifies if an MQRFH2 header is included in the message. If the message includes a MQRFH2 header, select this check box and click [...]. In the Browse For Schema Type Element dialog box to find the XML Schema that defines the header, select the NameValueData element in that XML Schema, and click OK. The schema fragment is the NameValueData element and all its child elements.</p> <p>Note: The XML Schema that defines the header must first be created and loaded into the project before you can select it. For more information see <a href="#">Defining and loading an XML schema for a MQRFH2 header</a>.</p>

## Delivery rules

Field	Description
Deliver Messages	<p>The options available here depend on whether the Unique ID's checkbox is selected. If selected, all three options are available. If not, only At Least Once is displayed.</p> <ul style="list-style-type: none"> <li>• At least once - Specifies that the message is delivered at least once but can be delivered more than once. Connection or Integration Appliance failures can result in messages being retrieved and processed more than once. This delivery option is typically used when the receiving system can detect or tolerate duplicate messages</li> <li>• At most once - Specifies the message is delivered only once or not at all. Connection or Integration Appliance failures can result in messages being missed. This delivery option is typically used when the receiving system cannot tolerate duplicate messages but can tolerate lost messages.</li> <li>• Exactly once - Specifies the message is delivered once and only once. Connection or Integration Appliance failures do not affect delivery with this option. The Integration Appliance uses MQ message IDs to ensure that every message is retrieved and processed exactly once.</li> </ul> <p>Note: If you select the Exactly Once option, you must enable persistence. For more information, see <a href="#">Enabling Persistence</a>.</p>
Where message	Specifies if the messages on the queue have unique IDs.

s have Unique ID's	
--------------------------	--

## Retry options

Configure the retry options for getting a message from the MQ queue as described in the following table:

Retry Options	Description
1) Wait ___ seconds between each retry.	The number of seconds that the Integration Appliance waits before attempting to retrieve a message from the queue. To learn more about how this option relates to the Timeout field in the Configure pane or the timeout input parameter, see <a href="#">Timeout and Retry options</a> .
2) Try to connect ___ times before failing.	<p>Specifies the maximum number of times the Integration Appliance attempts to retrieve a message from the queue before issuing an error and stops the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an MQ Get Message activity and the Integration Appliance cannot connect to the specified MQ Server or cannot get a message from the queue, the Integration Appliance logs the errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third errors appear in the system log as warnings. The Integration Appliance logs the fourth error as an error and stops processing the current orchestration job.</p> <p>To learn more about how this option relates to the Timeout field in the Configure pane or the timeout input parameter, see <a href="#">Timeout and Retry Options</a>.</p>

## Mapping inputs

1. Select the Map Inputs task in the Checklist. The Retry panel opens.

The input parameters of the activity are displayed in the To Activity panel.

2. All the input parameters of the MQ Get Message activity are optional. If the input parameter listed in the following table are not displayed in the To Activity pane of the Map Inputs panel, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity panel and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs panel to activate this option.

You can constrain the type of message returned by the MQ Get Message activity by mapping any combination of the following nodes of the mqmdheader optional input parameter:

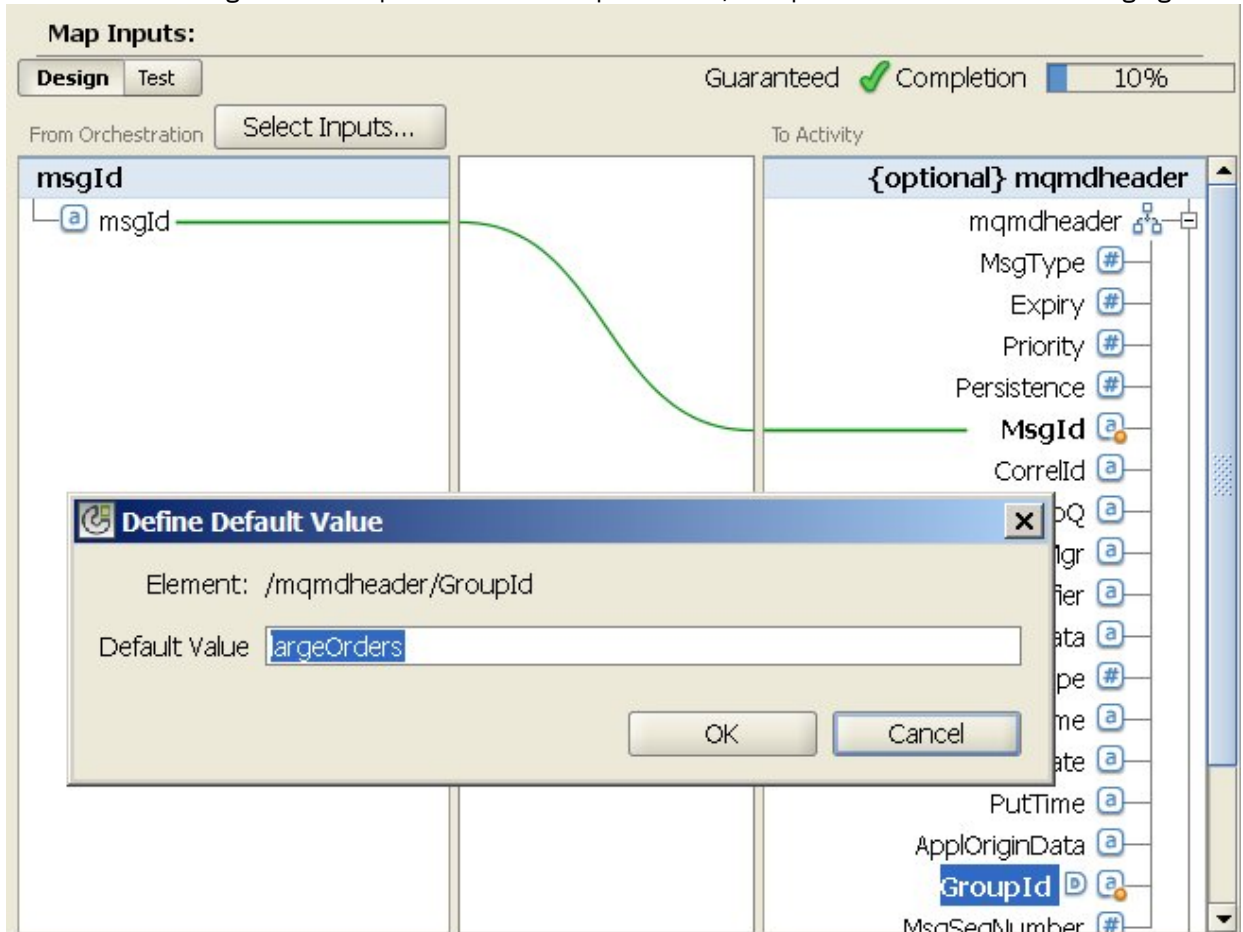

- o mqmdheader/MsgId
- o mqmdheader/CorreId
- o mqmdheader/GroupId
- o mqmdheader/MsgSeqNumber

During run time, the activity iterates sequentially through the messages in the queue. If nothing is mapped to these nodes, nothing is constrained so the first message in the queue is returned by the MQ Get Message activity and next activity in the orchestration is processed.

If any of these nodes are mapped, during run time the MQ Get Message activity iterates through each message in the queue until it finds the first message that matches the run time values of all the mapped nodes. The first matching message is returned by the MQ Get Message activity and next activity in the orchestration is processed.

For example in the Map Inputs task, mqmdheader/MsgId is mapped to the string called msgId and a default value of largeOrders is specified for the mqmdheader/GroupId as shown in the following figure:

During run time, the MQ Get Message activity returns the first message in the queue that satisfies both of the following conditions:

- The run time value specified of the string variable called msgId is equal message ID of the message in the queue.
- The group ID of the message equals largeOrders.

You can optionally override the settings you specified for the Queue Name and the Timeout in the Configure task of the Checklist dynamically during run time, using the input parameters defined in the following table.

For example, the MQ queue name can be set in the Configure task to poqueue. During run time, the MQ queue name: newqueue could be passed into the activity using the queueName input parameter. The queue name specified dynamically during run time overrides the original setting specified in the Configure panel. In this example, the Integration Appliance looks at the MQ queue named newqueue for messages.

#### Optional Input Parameters that Override the Settings in the Configure Task

--	--	--

Input Parameter Name/Node	Description	Overrides the Setting in Task?
timeout	<p>Specifies the amount of time that the Integration Appliance waits after requesting to retrieve a message from the queue before retrying.</p> <p>Specify a negative number to specify no timeout period — the Integration Appliance waits indefinitely to retrieve a message from the queue. Specifying a negative number is equal to specifying the Never option in the Configure task.</p>	The timeout input parameter overrides the Timeout field of the Configure task.
queue name	Specifies the name of the MQ queue where the Integration Appliance looks for messages.	The queue name input parameter overrides the encoding specified in the Queue Name field of the Configure task.

See [Creating a Map](#) for general instructions on mapping.

## Mapping outputs

You are not required to map the output parameters for this activity. See [Creating a Map](#) for general instructions on mapping.

## Timeout and Retry options

The timeout specified in the Timeout field in the Configure task or the timeout input parameter specifies the number of seconds before a timeout occurs between the MQ Get Message activity requesting to retrieve a message from the queue and the time it takes for the message to be returned. If this timeout period expires and no message is returned from the queue, the Integration Appliance waits the amount of time specified in the 1) Wait \_\_\_ second(s) between each retry option before attempting to retrieve a message, again. The Integration Appliance keeps attempting to get the message up to the specified retry count. The retry count is specified with the 2) Try to connect \_\_\_ times before failing. The 1) Wait \_\_\_ second(s) between each retry and 2) Try to connect \_\_\_ times before failing options are specified in the [Retry options](#) task.

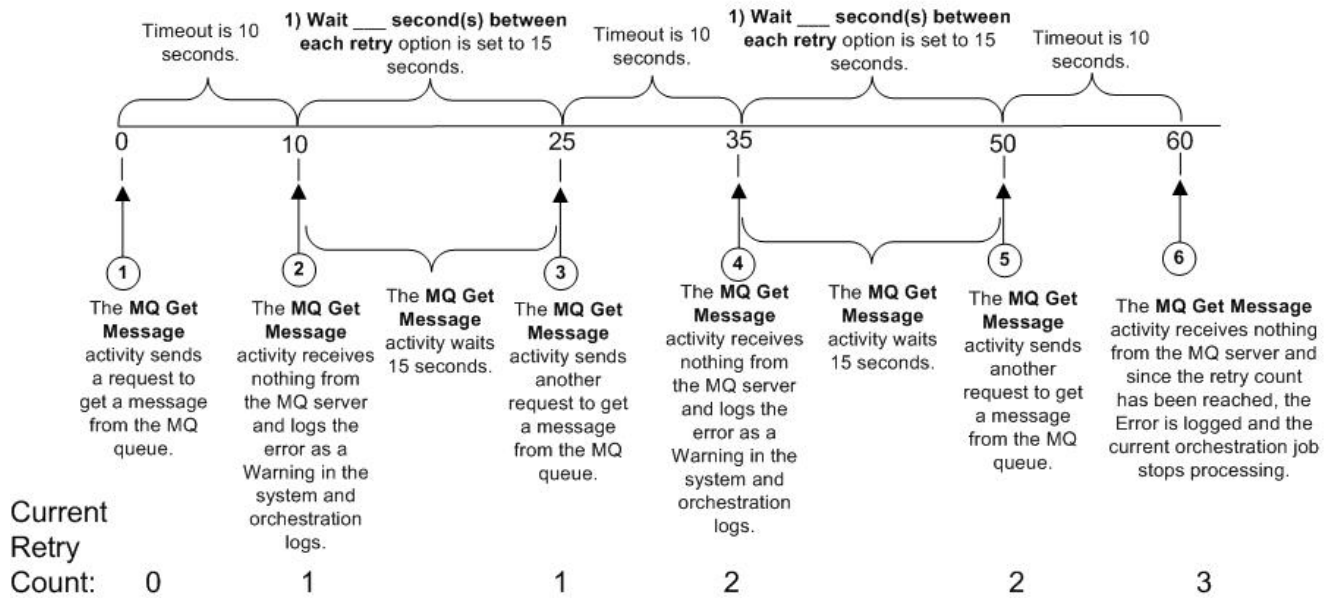

For example, a MQ Get Message activity is configured with the following options:

- The Timeout field in the Configure task is set to 10 seconds and the optional timeout input parameter is not mapped and no default value is defined.
- The 1) Wait \_\_\_ second(s) between each retry option is set to 15 seconds.
- The 2) Try to connect \_\_\_ times before failing option is set to 2.

During run time, if the MQ Get Message activity is continuously unable to retrieve a message from the queue, as shown in the following figure:

# Time Line

Time in seconds →

## Feedback | Notices

Last updated: Wednesday, 15 June 2016  
 file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ\\_Get\\_Message\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ_Get_Message_Activity.html)

## MQ Put Message activity

Use the MQ Put Message activity sends a message to the specified queue during run time.

Note: You must have [created an endpoint for the MQ activity](#) before configuring the activity. The Configure task has three sections:

- [Queue and Message details](#) - where you specify properties for queue and message details.
- [Delivery rules](#) - where you specify how you want messages delivered.
- [Retry options](#) - where you specify how long to wait between retries and the number of time to retry before failing.

After completing the Configure tasks, and [Mapping inputs](#) for the activity.

Note: The maximum message size is 100 MBytes.

## Queue and Message details

Specify the Queue and Message details using the fields in the following table. Required fields are marked with an asterisk.

--	--

Field	Description
Queue Name *	Specifies the name of the queue where the messages are put.
Payload Data Type	Specifies the datatype of the message payload, either binary or string.
Message Type	<p>Datagram - Select if the message should be sent and no reply is needed.</p> <p>Request - Select if the message should have a reply. Be sure to set the Reply to Queue property for request messages.</p> <p>Response - Select if the message is a reply to a previous request.</p>
Reply to Queue	Specifies the queue the reply should be sent to for request messages.
Reply to Queue Manager	Specifies the name of the Queue Manager that the queue (specified in the Reply to Queue field) belongs to.
Persistent	<ul style="list-style-type: none"> <li>• True - Messages are restored to queues if the Queue Manager crashes.</li> <li>• False - Messages may be lost from the queue if the Queue Manager crashes.</li> <li>• Default - Messages use the persistence setting for the queue (this is the default).</li> </ul>
Priority	<p>Specifies the priority of the message. By default, the message priority defaults to the default priority for the queue. If the queue uses priorities to order messages and this message should have a specific priority set, select Specify and enter the priority. Priorities can range from 1 (lowest) up to 9 (highest).</p> <p>Note: The priority should not exceed the maximum priority number set for the MQ queue. Check with your MQ system administrator for this information.</p>
Message Expiration	<p>The number of seconds that messages are kept in the queue before expiring. Defaults to Never, which ensures that the message is delivered and waits on the queue until it is retrieved, no matter how long that may take.</p> <p>If messages for this queue should expire and be discarded after some period of time, select Specify and enter the maximum number of Seconds that the message should be kept in the queue.</p>
Schema Fragment for MQRFH2 Header	<p>Specifies if an MQRFH2 header is included in the message. If the message is an XML message and includes a MQRFH2 header, select this check box and click [...]. In the Browse For Schema Type Element dialog box find the XML Schema that defines the header, select the NameValueData element in that XML Schema, and click OK. The schema fragment is the NameValueData element and all its child elements.</p> <p>Note: The XML Schema that defines the header must first be created and loaded into the project before you can select it. For more information see <a href="#">Defining and loading an XML schema for a MQRFH2 header</a>.</p>

## Delivery rules

Field	Description
Delivery	The options available here are:

Messages	<ul style="list-style-type: none"> <li>• At least once - Specifies that the message is delivered at least once but can be delivered more than once. Connection or Integration Appliance failures can result in messages being retrieved and processed more than once. This delivery option is typically used when the receiving system can detect or tolerate duplicate messages.</li> <li>• At most once - Specifies the message is delivered only once or not at all. Connection or Integration Appliance failures can result in messages being missed. This delivery option is typically used when the receiving system cannot tolerate duplicate messages but can tolerate lost messages.</li> </ul>
----------	--

## Retry options

Configure the retry options for connecting to a MQ Server. The following table describes the retry options for connecting to a MQ Server:

Retry Options	Description
1) Wait ___ second(s) between each retry.	The number of seconds that the Integration Appliance waits before attempting to contact the Queue manager to send a message to MQ Server, again.
2) Try to connect ___ times before failing.	<p>Specifies the maximum number of times the Integration Appliance attempts to contact the Queue manager to send a message to the MQ Server before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains an MQ Put Message activity and the Integration Appliance cannot connect to the Queue manager of the specified MQ Server, the Integration Appliance logs the errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth error as an error and stops processing the current orchestration job.</p>

## Mapping inputs

You are required to map input parameters for this activity. The following parameter is required and must be mapped in order for the configuration to be complete. All other parameters are optional. See [Creating a Map](#) for more information.

Required Input Parameters:  
payload

To view the optional input parameters in the To Activity panel of the Map Inputs panel, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity panel and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click on a node in the Map Inputs panel to activate this option.

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ\\_Put\\_Message\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ_Put_Message_Activity.html)

## MQ Poll Queue activity

---

Use the MQ Poll Queue activity periodically checks the MQ Queue for messages based on a specified retry interval during runtime.

Note: You must have [created an endpoint for the MQ activity](#) before configuring the activity. The Configure task has three sections:

- [Queue and Message details](#) - where you specify properties for queue and message details.
- [Delivery rules](#) - where you specify how you want messages delivered.
- [Retry options](#) - where you specify how long to wait between retries and the number of time to retry before failing.

After completing the Configure tasks, [Mapping outputs](#) for the activity.

Note: The maximum message size is 100 MBytes.

### Queue and Message details

---

Specify Queue and Message details for the fields in the following table. Required fields are marked with an asterisk.

Field	Description
Queue Name *	Specifies the name of the queue which is polled for messages.
Payload Data Type	Specifies the datatype of the message payload, either binary or string.
Schema Fragment for MQRFH2 Header	Specifies if an MQRFH2 header is included in the message. If the message is an XML message and includes a MQRFH2 header, select this check box and click [...]. In the Browse For Schema Type Element dialog box find the XML Schema that defines the header, select the NameValueData element in that XML Schema, and click OK. The schema fragment is the NameValueData element and all its child elements. Note: The XML Schema that defines the header must first be created and loaded into the project before you can select it. For more information see <a href="#">Defining and loading an XML schema for a MQRFH2 header</a> .

### Delivery rules

---

Field	Description
-------	-------------

Poll for changes	Specifies how often the Integration Appliance should poll the queue for changes. For more information, see <a href="#">Polling Interval Behavior</a> .
Where messages have Unique ID's	Specifies if the messages on the queue have unique IDs.
Deliver Messages	<p>The options available here depend on whether the Unique ID's checkbox is selected. If selected, all three options are available. If not, only At Least Once is displayed.</p> <ul style="list-style-type: none"> <li>• At least once - Specifies that the message is delivered at least once but can be delivered more than once. Connection or Integration Appliance failures can result in messages being retrieved and processed more than once. This delivery option is typically used when the receiving system can detect or tolerate duplicate messages.</li> <li>• At most once - Specifies the message is delivered only once or not at all. Connection or Integration Appliance failures can result in messages being missed. This delivery option is typically used when the receiving system cannot tolerate duplicate messages but can tolerate lost messages.</li> <li>• Exactly once - Specifies the message is delivered once and only once. Connection or Integration Appliance failures do not affect delivery with this option. The Integration Appliance uses MQ message IDs to ensure that every message is retrieved and processed exactly once.</li> </ul> <p>Note: If you select the Exactly Once option, you must enable persistence. For more information, see <a href="#">Enabling Persistence</a>.</p>

## Retry options

Configure the retry options of the MQ Poll Queue activity, as defined in the following table:

Retry Options	Description
1) Wait ___ second(s) between each retry.	The number of seconds that the Integration Appliance waits before attempting to retrieve messages from MQ Server, again.
2) Try to connect ___ times before failing.	<p>Specifies the maximum number of times the Integration Appliance attempts to retrieve messages from the MQ Server before failing.</p> <p>If an orchestration that starts with an MQ Poll Queue activity is deployed and the Integration Appliance cannot connect to the specified MQ server or cannot retrieve messages from queue, the Integration Appliance logs the errors as warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system log, resets the current retry count to zero, and continues to attempt to establish a connection to the MQ server.</p>

For example, you set the retry count to 3. The first, second, and third errors appear in the system log as warnings. The Integration Appliance logs the fourth error as an error and resets the current retry count to zero. Therefore, the fifth connection error generates a warning in the system log. The Integration Appliance continues to attempt to retrieve messages from the queue.

## Mapping outputs

---

You are not required to map output parameters for this activity. However, if you do map any of these parameters, note the following points:

Parameters:

- payload and mqmdheader parameters are obtained from the message that is received from the queue.
- rfh2header is obtained if the schema for the RFH2 Header is specified in the Configure task.

**Parent topic:** [MQ Activities](#)

---

### Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ\\_Poll\\_Message\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ_Poll_Message_Activity.html)

## MQRFH2 XML data and schema examples

---

This section contains the following examples:

- [Example XML data that contains MQRFH2 parameters](#)
- [Example XML Schema that defines MQRFH2 parameters](#)

### Example XML data that contains MQRFH2 parameters

---

Note the following characteristics about the example XML data:

- ParameterA contains only properties.
- ParameterB contains groups with properties.
- ParameterC contains both a group and a property.
- Property4 repeats several times within groupDtl.

Example XML Data that Contains MQRFH2 Parameters:

```
<?xml version="1.0" encoding="UTF-8"?>
<NameValueData>
  <parameterA>
    <property1>value</property1>
    <property2 datatype="nt">345</property2>
```

```

</parameterA>
<parameterB>
  <groupHeader>
    <property3>>true</property3>
  </groupHeader>
  <groupDtl>
    <property4>ANR</property4>
    <property4>BYC</property4>
    <property4>ENN</property4>
  </groupDtl>
</parameterB>
<parameterC>
  <groupNew>
    <property5>01/15/2004</property5>
  </groupNew>
  <property1>value</property1>
</parameterC>
</NameValueData>

```

## Example XML Schema that defines MQRFH2 parameters

---

The following example XML Schema defines the three parameters displayed in [Example XML data that contains MQRFH2 parameters](#). The type for all of the property elements: MQRFH2PropertyType, provides the datatype attribute shown on property2 in the preceding example. The MQRFH2PropertyType type also ensures that the elements can contain values.

The repetition for property4 in groupDtl is handled with the minOccurs and maxOccurs attributes. You can also set maxOccurs to unbounded to allow an unlimited number of repetitions.

An Example XML Schema that defines MQRFH2 Parameters:

```

<xsd:schema elementFormDefault="qualified"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  xmlns:rfh="http://www.approuter.com/samples/MQ"
  targetNamespace="http://www.approuter.com/samples/MQ">
  <xsd:complexType name="MQRFH2PropertyType">
    <xsd:simpleContent>

```

```

<xsd:extension base="xsd:string">
  <xsd:attribute name="dt" type="xsd:string" use="optional"/>
</xsd:extension>
</xsd:simpleContent>
</xsd:complexType>
<xsd:element name="NameValueData">
  <xsd:complexType>
    <xsd:sequence>
      <xsd:element name="parameterA">
        <xsd:complexType>
          <xsd:sequence>
            <xsd:element name="property1" type="rfh:MQRFH2PropertyType"/>
            <xsd:element name="property2" type="rfh:MQRFH2PropertyType"/>
          </xsd:sequence>
        </xsd:complexType>
      </xsd:element>
      <xsd:element name="parameterB">
        <xsd:complexType>
          <xsd:sequence>
            <xsd:element name="groupHeader">
              <xsd:complexType>
                <xsd:sequence>
                  <xsd:element name="property3" type="rfh:MQRFH2PropertyType"/>
                </xsd:sequence>
              </xsd:complexType>
            </xsd:element>
            <xsd:element name="groupDtl">
              <xsd:complexType>
                <xsd:sequence>
                  <xsd:element name="property4" type="rfh:MQRFH2PropertyType" minOccurs="1"
                    maxOccurs="5"/>
                </xsd:sequence>
              </xsd:complexType>
            </xsd:element>
          </xsd:sequence>
        </xsd:complexType>
      </xsd:element>
    </xsd:sequence>
  </xsd:complexType>
</xsd:element>

```

```
        </xsd:sequence>
    </xsd:complexType>
</xsd:element>
</xsd:sequence>
</xsd:complexType>
</xsd:element>
<xsd:element name="parameterC">
    <xsd:complexType>
        <xsd:sequence>
            <xsd:element name="groupNew">
                <xsd:complexType>
                    <xsd:sequence>
                        <xsd:element name="property5" type="rfh:MQRFH2PropertyType"/>
                    </xsd:sequence>

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ\\_MQRFH2\\_Schema\\_Fragment\\_Examples.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/MQ_MQRFH2_Schema_Fragment_Examples.html)

# NetSuite Activities

---

- [Creating or editing a NetSuite endpoint](#)  
Endpoints provide the NetSuite connection information that Studio and the Integration Appliance use to connect with NetSuite.
- [Add Records activity](#)  
Use the Add Records activity to add one or more new records to NetSuite. Each added record must be uniquely identifiable by its name, type, and hierarchy. If two or more records have the same identifiers, a SOAP fault is posted. The records to be added must be of the same record type.
- [Attach Records activity](#)  
The Attach Records activity can be used to define a relationship between two records. For example, a Contact record can be associated with a Vendor record. A Contact record can be associated with all entity records except for other Contact records and Group records.
- [Delete Records activity](#)  
The Delete Records activity can delete one or more records from NetSuite. Each deleted record must be uniquely identifiable by its name, type, and hierarchy. If two or more records have the same identifiers, a SOAP fault is posted. The records to be deleted must be of the same record type.
- [Detach Records activity](#)  
The detach records activity can be used to remove a relationship between two records. For example, a Contact record associated with a Vendor record can be removed. The Detach Records activity can also detach files, such as Word or PDF files, from a NetSuite record.
- [Get Records activity](#)  
The Get Records activity retrieves one or more records based on the records unique IDs. If any of the IDs are invalid, valid IDs are processed and a warning for invalid IDs is sent in the response.
- [Initialize Record activity](#)  
Use the Initialize Record activity to populate a transaction record with input from another related record. For example, you can populate a Sales Order record with input from the related Estimate record before submitting the Sales Order record to NetSuite.
- [Search Records activity](#)  
The Search Records activity searches for a specific record type based on search criteria that you specify.
- [Update Records activity](#)  
The Update Records activity can update one or more records. Only fields that are populated are updated in NetSuite. For fields that are not populated, the previous value in NetSuite is maintained. If a field is populated with an empty string, the value of the field in NetSuite is replaced with an empty string.
- [Upsert Records Activity](#)  
The Upsert Records activity can update a record if the record already exists in the database, or to insert the record if it does not. Only fields that are populated are updated in NetSuite. For fields that are not populated, the previous value in NetSuite is maintained. If a field is populated with an empty string, the value of the field in NetSuite is replaced with an empty string.
- [Troubleshooting and support](#)  
Troubleshooting techniques and self-help information help you identify and solve problems quickly. This topic provides potential solutions for issues you would have with the NetSuite connector.

# Creating or editing a NetSuite endpoint

Endpoints provide the NetSuite connection information that Studio and the Integration Appliance use to connect with NetSuite.

## Procedure

1. Select an activity from the NetSuite folder of the Activities tab.
2. Drag the activity onto the orchestration.

The Summary panel is displayed along with a Checklist that lists the tasks that must be performed to configure the activity.

3. Click the Endpoint task from the Checklist and choose one of the following options:
  - o Browse - To select an existing endpoint from the project.
  - o New - To create a new endpoint.
  - o Edit - To edit an existing endpoint.  
Note: Edits are global, not local. Editing an endpoint affects all orchestrations that use that endpoint in the Project.
4. When the NetSuite endpoint screen is displayed, complete, or edit, the information in the following fields:

Field	Description
Email Address	E-mail address used to login to NetSuite
Password	Password for E-mail address
Account Number	Account number associated with E-mail address

- o Login Options - Choose either Login normally or Login in to the specified URL and specified version.

If you purchased the Web Services Concurrent License, click Web Services Plus License.

- o Connection Pool Options - Leave the default values or change the values for the Connection Pool Options:

Field	Description
Minimum Connections	The default is 1.
Maximum Connections	The default is 1. If Web Services Plus License (Concurrent Web Services User preference) is selected, the default is 5.
Maximum Idle Time	The maximum number of minutes, the session can remain idle before ending the session. The default is 120 minutes. NetSuite enforces a 120 minute maximum.
Maximum Wait	Maximum Wait The maximum number of seconds to wait for the session to start. The default is 300 seconds.

- Connection Timeout - Use the up and down arrows to select the number of seconds, that you want to wait to establish a connection to the endpoint before ending the attempt.
- Proxy - To use a proxy server to connect with NetSuite, select Connect via a Proxy Server.

For Authentication, click the arrow and choose the mode, either Basic or NTLM.

For Realm, if you choose Basic authentication, you can specify a realm. If you do not specify a realm, the endpoint authenticates to 'any realm'.

Complete the following fields:

Field	Description
Host Name	The name of the proxy server or the IP address of the proxy server.
Port	The port number used by the proxy server to connect with NetSuite.
User Name	The ID used to login to the proxy server.
Password	The password for User Name.

- Update - Use the Update WSDL to\_2011\_1 button to upgrade the NetSuite WSDL. The button is inactive if WSDL\_2011\_1 is already present. After clicking the button, you will be presented with a list of project entities that will be affected by this update. At that point, you can decline to update to WSDL\_2011\_1 or proceed with the update.

Click Test Connection to verify that a connection can be established.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/netsuite\\_Add\\_Records\\_Activity\\_ov.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/netsuite_Add_Records_Activity_ov.html)

## Using the Add Records activity

---

To use the Add Records activity complete the following steps.

### Procedure

---

1. In the Activities tab, expand the NetSuite directory and locate the Add Records activity.
2. Add the Add Records activity to your orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. In the Checklist, click Pick Endpoint.
4. Select one of the following options:
  - Browse - to select a NetSuite endpoint from the Project Explorer.
  - New - to create a new NetSuite endpoint using the Create Endpoint dialog.

For instructions on creating a NetSuite endpoint, see [Creating or editing a NetSuite endpoint](#).

- Edit - to edit an existing NetSuite endpoint using the Edit Endpoint dialog.  
For instructions on editing a NetSuite endpoint, see [Creating or editing a NetSuite endpoint](#).  
Note: Edits are global, not local. Editing an endpoint affects all orchestrations that use that endpoint in the project.
5. In the Checklist, click Configure.
6. Click Browse to display the Browse NetSuite dialog.
7. In the Browse NetSuite dialog, click Show Record Types and select one of the following options:
  - All – to view all record types.
  - Only Custom – to view only custom records.
  - Only Standard – to view only standard NetSuite record types.

Note: To use custom records, you must enter the internal ID in the recType/internalId node.
8. To view custom fields in standard records, select the Generate custom fields for standard record types checkbox.

This option does not apply to custom record types. The state of the checkbox is saved.

9. In the Browse NetSuite dialog, select a record type by completing one of the following tasks:
  - Enter the first few letters of a record type in the Search for a Record Type field, select the record type in the Record Type scroll list and then click Select.
  - Scroll through the Record Type scroll list until you find the required record type, click the record type, and then click Select.
10. To refresh the maps in NetSuite, in the Configure pane, click Refresh after the record type is set.
11. In the Checklist, click Retry.
12. In the Retry section:
  - Set the number of seconds, between each retry to connect with NetSuite. The default is 30 seconds.
  - Set the number of times you want to retry before failing. The default is 5 times.

In the Activity Timeout section:

- o Set the Activity Timeout, the number of seconds, to wait when the endpoint does not respond to a request. The default is 300 seconds.
13. Mapping inputs. See [Mapping the inputs for the Add Records activity](#) for more information.
  14. Mapping outputs. See [Mapping the outputs for the Add Records activity](#) for more information.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/netsuite\\_Add\\_Records\\_Map\\_Output.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/netsuite_Add_Records_Map_Output.html)

## Attach Records activity

---

The Attach Records activity can be used to define a relationship between two records. For example, a Contact record can be associated with a Vendor record. A Contact record can be associated with all entity records except for other Contact records and Group records.

## About this task

---

The Attach Records activity can also attach files, such as Word or PDF files, to a NetSuite record. Any file that is in the NetSuite file cabinet can be attached to any record except for custom records.

The following list describes the nodes for the Attach Records activity in the Checklist > Map Inputs > To Activity panel:

- {RecordRef} attachTo - this node specifies the record to which the attachment is attached.
  - @type – In the Define Default Value, select the type of record.
  - @externalId – Either externalId or internalId must be specified for the RecordRef.
  - @internalID – Either externalId or internalId must be specified for the RecordRef.
- contact – This node specifies the record to associate with or the file to attach to the attachTo record.
  - @internalID – Either externalId or internalId must be specified for the RecordRef.
  - @externalId – Either externalId or internalId must be specified for the RecordRef.
  - @type – In the Define Default Value, select the type of record.
  - name – Enter the name of the contact or the file name.
- contactRole – This node specifies the role in the user defined Contact List located in the NetSuite UI at List > Relationships > Contacts.
  - exists – a Boolean used to indicate whether the Contacts List exists or not.
  - @internalID – Either externalId or internalId must be specified for the role.
  - @externalId – Either externalId or internalId must be specified for the role.
  - name – The title of the role such as Primary Contact.

## Mapping the outputs for the Detach Records activity

---

To map the outputs for the detach records activity, complete the following steps.

### Procedure

---

1. In the Checklist, click the Map Outputs task.
2. Click Copy.
3. Select detachListResponse and click Create to copy the detachListResponse from the Activity panel to the Orchestration panel.

**Parent topic:** [Detach Records activity](#)

---

## Get Records activity

---

The Get Records activity retrieves one or more records based on the records unique IDs. If any of the IDs are invalid, valid IDs are processed and a warning for invalid IDs is sent in the response.

- [Using the Get Records activity](#)  
To use the Get Records activity complete the following steps.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/netsuite\\_Get\\_Records\\_Activity\\_ov.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/netsuite_Get_Records_Activity_ov.html)

## Using the Get Records activity

---

To use the Get Records activity complete the following steps.

### Procedure

---

1. In the Activities tab, expand the NetSuite directory and locate the Get Records activity.
2. Add the Get Records activity to your orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. In the Checklist, click Pick Endpoint.
4. Select one of the following options:
  - Browse - to select a NetSuite endpoint from the Project Explorer.
  - New - to create a new NetSuite endpoint using the Create Endpoint dialog.

For instructions on creating a NetSuite endpoint, see [Creating or editing a NetSuite endpoint](#).

- Edit - to edit an existing NetSuite endpoint using the Edit Endpoint dialog.  
For instructions on editing a NetSuite endpoint, see [Creating or editing a NetSuite endpoint](#).  
Note: Edits are global, not local. Editing an endpoint affects all orchestrations that use that endpoint in the project.
5. In the Checklist, click Configure.
6. Click Browse to display the Browse NetSuite dialog.
7. In the Browse NetSuite dialog, click Show Record Types and select one of the following:
  - All – to view all record types.
  - Only Custom – to view only custom records.
  - Only Standard – to view only standard NetSuite record types.

Note: To use custom records, you must enter the internal ID in the recType/internalId node.
8. To view custom fields in standard records, select the Generate custom fields for standard record types checkbox.

This option does not apply to custom record types. The state of the checkbox is saved.

9. In the Browse NetSuite dialog, choose a record type by performing one of the following tasks:
  - Enter the first few letters of a record type in the Search for a Record Type field, select the record type in the Record Type scroll list and then click Select.
  - Scroll through the Record Type scroll list until you find the record type you want, click the record type, and then click Select.
10. To refresh the maps in NetSuite, after the record type is set in the Configure panel, click Refresh.
11. In the Checklist, click Retry.
12. In the Retry section:

- Set the number of seconds, between each retry to connect with NetSuite. The default is 30 seconds.
- Set the number of times you want to retry before failing. The default is 5 times.

In the Activity Timeout section:

- Set the Activity Timeout, in seconds, you want to wait when the endpoint does not respond to a request. The default is 300 seconds.
13. Map inputs. See [Mapping the inputs for the Get Records activity](#) for more information.
  14. Map outputs. See [Mapping the outputs for the Get Records activity](#) for more information.

**Parent topic:** [Get Records activity](#)

## Initialize Record activity

---

Use the Initialize Record activity to populate a transaction record with input from another related record. For example, you can populate a Sales Order record with input from the related Estimate record before submitting the Sales Order record to NetSuite.

### About this task

---

The following table lists the transaction records with the related record types that can be used to populate the transaction records.

<b>Transaction Record Type</b>	<b>Related Initialization Record</b>
Customer Refund	Cash Sale
Customer Refund	Return Authorization
Cash Sale	Customer
Cash Sale	Estimate
Cash Sale	Opportunity
Cash Sale	Sales Order
Credit Memo	Customer
Credit Memo	Invoice
Credit Memo	Return Authorization
Customer Payment	Customer
Customer Payment	Invoice
Estimate	Opportunity
Invoice	Customer
Invoice	Estimate

Transaction Record Type	Related Initialization Record
Invoice	Opportunity
Invoice	Sales Order
Item Fulfillment	Sales Order
Item Receipt	Return Authorization
Item Receipt	Purchase Order
Return Authorization	Cash Sale
Return Authorization	Invoice
Return Authorization	Sales Order
Sales Order	Estimate
Sales Order	Opportunity
Vendor Bill	Purchase Order

## Search Records activity

---

The Search Records activity searches for a specific record type based on search criteria that you specify.

### About this task

---

You specify search criteria by expanding an element node and then specifying the operator and search value. For example, for a record type having an account number node:

1. Expand the accountNumber node.
2. Click operator and then right-click operator.
3. Select Define Default Value.
4. In the Default Value field, click the arrow and select an operator from the list.
5. Click OK.
6. Click searchValue.
7. Select Define Default Value.
8. In the Default Value field, enter the account number.
9. Click OK.

The Search Records activity supports searching on fields with a null value using the operator noneOf. This search returns all records for which the field does not have a null value.

To retrieve values from lists, use the Get Records activity as the Search Records activity does not support lists.

You define the search criteria during the Map Inputs task in the To Activity panel.

4. Select one of the following options:
  - o Browse - to select a NetSuite endpoint from the Project Explorer.
  - o New - to create a new NetSuite endpoint using the Create Endpoint dialog.

For instructions on creating a NetSuite endpoint, see [Creating or editing a NetSuite endpoint](#).

- o Edit - to edit an existing NetSuite endpoint using the Edit Endpoint dialog.  
For instructions on editing a NetSuite endpoint, see [Creating or editing a NetSuite endpoint](#).  
Note: Edits are global, not local. Editing an endpoint affects all orchestrations that use that endpoint in the project.
5. In the Checklist, click Configure.
6. Click Browse to display the Browse NetSuite dialog.
7. In the Browse NetSuite dialog, click Show Record Types and select one of the following options:
  - o All – to view all record types.
  - o Only Custom – to view only custom records.
  - o Only Standard – to view only standard NetSuite record types.

Note: To use custom records, you must enter the internal ID in the recType/internalId node.
8. To view custom fields in standard records, select the Generate custom fields for standard record types checkbox.

This option does not apply to custom record types. The state of the checkbox is saved.

9. In the Browse NetSuite dialog, choose a record type by performing one of the following tasks:
  - o Enter the first few letters of a record type in the Search for a Record Type field, select the record type in the Record Type scroll list and then click Select.
  - o Scroll through the Record Type scroll list until you find the record type you want, click the record type, and then click Select.
10. To refresh the maps in NetSuite, after the record type is set in the Configure panel, click Refresh.
11. In the Checklist, click Retry.
12. In the Retry section:
  - o Set the number of seconds, between each retry to connect with NetSuite. The default is 30 seconds.
  - o Set the number of times you want to retry before failing. The default is 5 times.

In the Activity Timeout section:

  - o Set the Activity Timeout, in seconds, you want to wait when the endpoint does not respond to a request. The default is 300 seconds.
13. Map inputs. See [Mapping the inputs for the Upsert Records activity](#) for more information.
14. Map outputs. See [Mapping the outputs for the Upsert Records activity](#) for more information.

**Parent topic:** [Upsert Records Activity](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/netsuite\\_Upsert\\_Records\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/netsuite_Upsert_Records_Activity.html)

## Mapping the inputs for the Upsert Records activity

---

To map the inputs for the update records activity, complete the following steps.

### Procedure

---

1. In the Checklist, click the Map Inputs task.
2. Click Select Inputs... and select the input variables for the map.

For instructions on how to create variables, see [Creating Variables](#).

3. Map the elements in the From Orchestration panel to the NetSuite elements in the To Activity panel.

The elements in the To Activity panel are determined by the NetSuite record type you selected in the Configure task. For mapping instructions, see [Creating a Map](#).

**Parent topic:** [Upsert Records Activity](#)

## Mapping the outputs for the Upsert Records activity

---

To map the outputs for the update records activity, complete the following steps.

### Procedure

---

1. In the Checklist, click the Map Outputs task.
2. Click Copy.
3. Select either or both upsertListResponse or headers\_x and click Create to copy your choices from the Activity panel to the Orchestration panel.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_oracleCRMactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_oracleCRMactivities.html)

## Creating or editing an Oracle CRM On Demand endpoint

---

Oracle CRM On Demand endpoints contain the connection information that studio and the Integration Appliance use to connect to the Oracle CRM On Demand Server. You can create multiple endpoints that refer to separate instances.

### About this task

---

Use this task to create or edit an Oracle CRM On Demand endpoint.

Note:

Any changes you make to the Oracle CRM On Demand endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

## Procedure

---

1. Drag an activity from the Oracle CRM On Demand folder under the Activities tab to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. Browse - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
  - b. New - To create a new endpoint. The Create Endpoint window opens.
  - c. Edit - To edit the existing endpoint. The Edit Endpoint window opens.
4. Complete the fields defined in the following table:

Table 1. Connection Details

Field Name	Description
Connection Details	
OracleCRM HostName	Specifies the host name of the Oracle CRM On Demand instance.
User Name	Specifies the user name to connect to the OracleCRM On Demand server.
Password	Specifies the password associated with the user name to connect to the OracleCRM On Demand server.

5. When finished, click Test Connection to confirm that you can connect to the Oracle CRM On Demand system.
6. Click OK.

**Parent topic:** [Oracle CRM On Demand Activities](#)

## Specifying the Retry options for Oracle CRM On Demand activities

---

Specifying the Retry parameters is one of the tasks to configure an Oracle CRM On Demand activity.

### About this task

---

Use this task to configure the retry options for the Oracle CRM On Demand activities. The Oracle CRM On Demand connector uses a single login session for all connections to an Oracle CRM On Demand endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

## Procedure

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry and timeout options for connecting to an Oracle CRM On Demand instance, as described in the following table:

Table 1. Retry options

<b>Retry Fields</b>	<b>Description</b>
Wait ___ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Oracle CRM On Demand instance.
Try to connect ___ times before failing.	Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the Oracle CRM On Demand instance before issuing an error and stopping the processing of the current orchestration job. Note: If you deploy an orchestration that contains the Oracle CRM On Demand activity and the Integration Appliance cannot connect to the specified Oracle CRM On Demand instance, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
<b>Activity Timeout</b>	
Timeout after _____ seconds when the endpoint does not respond to a request.	Specifies the number of seconds the Integration Appliance waits before timing out, when the endpoint does not respond to a request. The default is 300 seconds.

## Using the Oracle CRM On Demand Insert Object activity

---

Use the Oracle CRM On Demand Insert Object activity to insert or create objects in the Oracle CRM On Demand instance.

### About this task

---

Use this task to insert or create objects in the Oracle CRM On Demand instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Oracle CRM On Demand folder contents.
2. Drag the Insert Object activity icon onto the orchestration. The Oracle CRM On Demand Insert Object Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle CRM On Demand endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an Oracle CRM On Demand endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse OracleCRMOD window is displayed.
11. In Browse OracleCRMOD, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Oracle CRM On Demand activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Insert Object activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Oracle CRM On Demand Insert Object activity.

**Parent topic:** [Oracle CRM On Demand Activities](#)

## Using the Oracle CRM On Demand Query Object activity

---

Use the Oracle CRM On Demand Query Object activity to query objects in the Oracle CRM instance.

### About this task

---

Use this task to query objects in the Oracle CRM On Demand instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Oracle CRM On Demand folder contents.
2. Drag the Query Object activity icon onto the orchestration. The Oracle CRM On Demand Query Object Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle CRM On Demand endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an Oracle CRM On Demand endpoint](#).

8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse OracleCRMOD window is displayed.
11. In Browse OracleCRMOD, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Oracle CRM On Demand activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Query Object activity are displayed as nodes under the request input parameter in the To Activity panel.

Perform the following steps to type the query strings in the SearchSpec of the To Activity pane:

- a. Right-click a SearchSpec and select the Define Default Value option.
- b. Specify the Default Value in the Define Default Value window. For example, to query for contact objects whose given name begins with *Jo*, then type the query string "`[ContactFirstName] = 'Jo*'`". To query for contact objects whose given name is *John*, type "`[ContactFirstName] = 'John'`". To query for contact objects whose name is *Jane Doe*, type the query string "`([ContactFirstName] = 'Jane') AND ([ContactLastName] = 'Doe')`".
- c. Click OK.

Note: To get the value of the object name field, you must specify a blank value in the Name field of the Map Inputs section.

15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Oracle CRM On Demand Query Object activity.

# Overview of the Oracle E-Business Suite connector

---

With the Oracle E-Business Suite connector, you can interact and exchange information with Oracle E-Business Suite. By using the connector, you can send requests to the underlying Oracle database, without special coding.

You can perform the following activities by using the Oracle E-Business Suite connector:

- Outbound Activities
  - [Create Objects](#)
  - [Update Objects](#)
  - [Delete Objects](#)
  - [Retrieve Objects](#)
- Inbound Activities
  - [Get Created Objects](#)
  - [Get Updated Objects](#)
  - [Get Deleted Objects](#)

The versions of Oracle E-Business Suite application that is supported by the connector are 11.5,12.0, and 12.1.

## Installing JAR files to connect to Oracle E-Business Suite

---

You must copy the Oracle JDBC driver JAR file on the same workstation as your Cast Iron Studio installation before you can connect to the Oracle E-Business Suite application.

### Before you begin

---

- The JAR files can be obtained from the Oracle system administrator.
- The JAR files must be on the same computer as the studio installation.
- The JAR files must be from the same version as the Oracle E-Business Suite application you connect to.

Note: The Oracle E-Business Suite connector uses the Oracle thin driver to connect and work with the database.

### About this task

---

### Procedure

---

1. Open studio and select Tools > Install Module Providers.
2. When the Add Provider(s) dialog box is displayed, click the plus (+) button under Oracle E-Business Suite. A field and a Browse button appears.
3. Click Browse, and use the browse dialog box to locate and select the JAR file.

4. Click Open to import the selected file.
5. When the JAR file is listed in the Add Provider(s) dialog box, click OK.

## Results

---

A prompt is displayed to restart studio and activate the changes.

## What to do next

---

You can now create Oracle E-Business Suite endpoints and orchestrations.

**Parent topic:** [Oracle E-Business Suite Activities](#)

# Creating or editing an endpoint for an Oracle E-Business Suite activity

---

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to an Oracle database.

## Selecting or editing an Oracle E-Business Suite endpoint

---

1. In the Create Endpoint or Edit Endpoint pane, configure the Oracle database as described in the following table. In addition to these fields, the endpoint pane contains Connection pool options and Remote Endpoint Configuration.  
 Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the Oracle database successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
<b>Oracle E-Business Suite connector - Connection Information</b>	
Interface	Specifies the interface used to communicate with Oracle E-Business Suite. Currently, only database is supported, which uses JDBC API to communicate with Oracle E-Business Suite.
Host Name	Specifies the host name or IP address of the machine on which the Oracle database is running.
Port Number	Specifies the Oracle Internet port that allows Java™ applets or applications to access the database.

Field Name	Description
System ID	Specifies the system ID (SID) to connect to the Oracle database.
User Name	Specifies the user name to connect to the Oracle database.
Password	Specifies the password associated with the user name to connect to the Oracle database.
Additional Properties	Specifies the additional properties to be set when connecting to the database using the JDBC driver.
<b>Connection Pool options</b>	
Minimum Connections	Specifies the lowest number of Oracle database connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
Maximum Connections	Specifies the maximum number of Oracle database connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
Maximum Idle Time	Specifies the amount of time in minutes that a Oracle database connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool —no idle time. The default value is 120 minutes.
Maximum Wait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
Reclaim Connections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minutes.
Note: The Connection pool properties need to be configured as per the load (number of concurrent requests) on the endpoint.	
<b>Remote Endpoint Configuration</b>	
Endpoint Runs Behind Firewall	Enables the secure connector name property so that secure connector can be used if the Oracle database is installed behind a firewall.
Secure Connector Name	Specifies the name of the secure connector that is used to connect to the Oracle database is installed behind a firewall.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/OracleEBS\\_creating\\_an\\_endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/OracleEBS_creating_an_endpoint.html)

## Using the Oracle E-Business Suite Create Objects activity

Use the Create Objects activity to create rows in database tables corresponding to the business object in the request. You can create rows to flat tables/views that have a primary key defined.

## About this task

---

Use this task to create objects in the Oracle E-Business Suite application. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Oracle E-Business Suite folder contents.
2. Drag the **Create Objects** activity from the Oracle E-Business Suite folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle E-Business Suite endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for an Oracle E-Business Suite activity](#).
8. To make the required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the Oracle table/view name in the Oracle Table/View field.
11. In Browse Oracle Database Tables/Views dialog:
  - o Select a user schema from the Filter by user schema drop-down list.
  - o Select either `Tables` or `Views` from Database object type.
  - o Use Filter tables/views by name to filter the tables/views during selection.
  - o Select a table/view.
12. Click OK.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery options for Oracle E-Business Suite activities](#).
14. Select Map Inputs in the Checklist. The XML schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Oracle E-Business Suite Create Objects activity.

**Parent topic:** [Oracle E-Business Suite Activities](#)

## Using the Oracle E-Business Suite Update Objects activity

---

Use the Update Objects activity to update rows in the database tables corresponding to the business object in the request. You can update rows of flat tables that have a primary key defined.

### About this task

---

Use this task to update objects in the Oracle E-Business Suite application. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Oracle E-Business Suite folder contents.
2. Drag the **Update Objects** activity from the Oracle E-Business Suite folder onto the orchestration. The graphical representation of the orchestration, including the checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Oracle E-Business Suite endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for an Oracle E-Business Suite activity](#).
8. To make the required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the Oracle table/view name in the Oracle Table/View field.
11. In Browse Oracle Database Tables/Views dialog:
  - o Select a user schema from the Filter by user schema drop-down list.
  - o Select either `Tables` or `Views` from Database object type.
  - o Use Filter tables/views by name to filter the tables/views during selection.
  - o Select a table/view.
12. Select a table and click OK.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery options for Oracle E-Business Suite activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Update Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel. Create a map between the output parameters and orchestration variables.

## Results

# Specifying Retry and Delivery options for Oracle E-Business Suite activities

Specifying the Retry and Delivery parameters is one of the tasks to configure a Oracle E-Business Suite activity configuration.

## About this task

This section contains the procedures for configuring the Oracle E-Business Suite activities.

## Procedure

To specify the retry options for Oracle E-Business Suite activities:

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry options for connecting to a Oracle E-Business Suite server as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ second(s) between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Oracle E-Business Suite application.
Try to connect __ times before failing.	<p>Specifies the retry count – the maximum number of times the Integration Appliance attempts to establish a connection to the Oracle E-Business Suite application before issuing the following errors:</p> <ul style="list-style-type: none"><li>◦ When you set this parameter to 0, Studio does not try to reconnect.</li><li>◦ When you set this parameter to a value less than 0, Studio retries the connection indefinitely.</li></ul> <p>If an orchestration that starts with an outbound Oracle E-Business Suite activity is deployed and the Integration Appliance cannot connect to the specified Oracle E-Business Suite application, the Integration Appliance logs the connection errors as warnings in the system log until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system log, resets the connection error count to zero, and continues to attempt to establish a connection to the Oracle E-Business Suite application.</p> <p>For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>

## Specifying the delivery rules options for Oracle E-Business Suite inbound activities

---

### About this task

This section contains the procedure for configuring the delivery rule options for Oracle E-Business Suite inbound activities.

### Procedure

1. Select the Delivery Rules task from the Checklist. The delivery rules pane is displayed.
2. Configure the delivery rules options to select the activity's behavior as described in the following table.

Table 2. Delivery rules

<b>Delivery Rules Fields</b>	<b>Description</b>
Poll for changes every _____ days/hours/minute s/seconds	Specifies the time interval to poll for objects in the Oracle database. (For example, the Get created object activity polls for create objects at the specified time interval.) Time can be selected in the format days, hours, minutes, or seconds.
Fetch _____ rows per poll	Specifies how many objects or components the activity should retrieve from the Oracle database in each poll cycle.
<b>Delivery Messages</b>	
ATMOST_ONCE	A non-persistent mode in which a row from the Oracle table is either delivered once or not delivered at all.
ATLEAST_ONCE	A persistent mode, in which a row from the Oracle table is not lost. As a result, there are chances that the orchestration can receive events once or more than once.

## Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_peoplesoftactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_peoplesoftactivities.html)

## Overview of the PeopleSoft connector

---

The PeopleSoft connector enables you to create integrated processes that exchange information with PeopleSoft Enterprise through a standard interface. This interface shields the client application from analyzing lower-level details about implementation of the application or data structures used on the PeopleSoft Enterprise server.

You can perform the following activities using the PeopleSoft connector:

- Outbound Activities
  - [Create Component Interface](#)

- [Update Component Interface](#)
- [Delete Component Interface](#)
- [Get Component Interface](#)
- [Find Component Interface](#)
- Inbound/Starter Activities
  - [Get Created Component Interface](#)
  - [Get Updated Component Interface](#)
  - [Get Deleted Component Interface](#)

The PeopleSoft connector supports the following versions of the PeopleTools: 8.22, 8.40 - 8.49, 8.50, and 8.51.

Note: The connector is compatible with any version of PeopleSoft Applications that works with the version of PeopleTools supported by the adapter.

The PeopleSoft connector requires PeopleSoft JAR files to connect to the PeopleSoft server. For more information, see [Installing JAR files to connect to the PeopleSoft server](#) and [Creating events table and compiling PeopleSoft JAR files](#).

## Creating or editing an endpoint for a PeopleSoft activity

Endpoints provide the configuration information that Studio and the Integration Appliance use to connect to a PeopleSoft server.

### Selecting or editing a PeopleSoft endpoint

1. In the Create Endpoint or Edit Endpoint pane, configure the PeopleSoft server as described in the following table. In addition to these fields, the endpoint pane contains Connection pool options and Remote Endpoint Configuration.  
 Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
2. Click Test Connection to confirm that the connection details are valid and you are able to connect to the PeopleSoft server successfully.
3. Click OK.

Table 1. Connection properties

Field Name	Description
<b>PeopleSoft Server Configuration</b>	
Host Name	Specifies the host name or IP address of the machine on which PeopleSoft server is running.

Field Name	Description
Port	Specifies the PeopleSoft Internet port that allows Java™ applets or applications to access PeopleSoft data.
User Name	Specifies the user name to connect to the PeopleSoft server.
Password	Specifies the password associated with the user name to connect to the PeopleSoft server.
Language Code	Specifies the language code to connect to the PeopleSoft server. There are 22 language codes listed. The default code is ENG.
<b>Connection Pool options</b>	
Minimum Connections	Specifies the lowest number of PeopleSoft server connections that the Integration Appliance keeps open in the connection pool. Entering 0 (zero) is supported. The default value is 5.
Maximum Connections	Specifies the maximum number of PeopleSoft server connections that the Integration Appliance can keep open in the connection pool. Entering 0 (zero) means the maximum number of connections is unbounded. The default value is 25.
Maximum Idle Time	Specifies the amount of time in minutes that a PeopleSoft server connection can be open in an idle state before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool —no idle time. The default value is 120 minutes.
Maximum Wait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
Reclaim Connections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections is reached, as specified in the Minimum Connections parameter. The default value is 5 minute.
Note: The Connection pool properties need to be configured as per the load (number of concurrent requests) on the endpoint.	
<b>Remote Endpoint Configuration</b>	
Endpoint Runs Behind Firewall	Enables the secure connector name property so that secure connector can be used if the PeopleSoft server is running behind a firewall.
Secure Connector Name	Specifies the name of the secure connector that is used to connect to the PeopleSoft server running behind a firewall. For example, if an orchestration containing PeopleSoft activity is deployed on to Cast Iron Live (cloud), then the secure connector needs to be configured.

# Installing JAR files to connect to the PeopleSoft server

---

You must copy two JAR files on the same workstation as your Cast Iron Studio installation before you can connect to a PeopleSoft server.

## Before you begin

---

- The JAR files can be obtained from the PeopleSoft system administrator.
- The JAR files must be on the same computer as the studio installation.
- The JAR files must be from the same version as the PeopleSoft server you connect to.

For more information about creating event tables and compiling PeopleSoft JAR files, see [Creating events table and compiling PeopleSoft JAR files](#).

## About this task

---

The files to be installed are:

- PSFTCI.jar
- psjoa.jar

## Procedure

---

1. Open studio and select Tools > Install Module Providers.
2. When the Add Provider(s) dialog box is displayed, click the plus (+) button under PeopleSoft Connector. A field and a Browse button appears.
3. Click Browse, and use the browse dialog box to locate and select the JAR files.
4. Click Open to import the selected files.
5. When the JAR files are listed in the Add Provider(s) dialog box, click OK.

## Results

---

A prompt is displayed to restart studio and activate the changes.

## What to do next

---

You can now create PeopleSoft endpoints and orchestrations.

**Parent topic:** [PeopleSoft activities](#)

# Using the PeopleSoft Create Component Interface activity

---

Use the PeopleSoft Create Component Interface activity to create new component interfaces on the PeopleSoft server. The newly created component contains data that represent a business entity.

## Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the PeopleSoft server. For more information, see [Installing JAR files to connect to the PeopleSoft server](#).
- Valid connection details to connect to the PeopleSoft server.

## About this task

---

Use this task to create component interfaces on the PeopleSoft server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the PeopleSoft folder contents.
2. Drag the Create Component Interface activity icon onto the orchestration. The PeopleSoft Create Component Interface Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant PeopleSoft endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for a PeopleSoft activity](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the component interface name in the Component Interface field. Component interface name is populated with a default value, which represents the PeopleSoft interface. Browse for the component interface name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this component interface.
11. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry and Delivery Options for PeopleSoft Activities](#).
12. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Component Interface activity are displayed as nodes under the request input parameter in the To Activity panel.  
Note: The PeopleSoft connector generates a single input schema for all the objects used by the activities. There may be some fields that are redundant and not applicable for this activity.
13. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
14. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
15. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the PeopleSoft Create Component Interface activity.

**Parent topic:** [PeopleSoft activities](#)

## Using the PeopleSoft Update Component Interface activity

---

Use the PeopleSoft Update Component Interface activity to update component interfaces on the PeopleSoft server. This activity updates the corresponding PeopleSoft component with the incoming business object.

### Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the PeopleSoft server. For more information, see [Installing JAR files to connect to the PeopleSoft server](#).
- Valid connection details to connect to the PeopleSoft server.

### About this task

---

Use this task to update component interfaces on the PeopleSoft server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the PeopleSoft folder contents.
2. Drag the Update Component Interface activity icon onto the orchestration. The PeopleSoft Update Component Interface Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant PeopleSoft endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for a PeopleSoft activity](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the component interface name in the Component Interface field. Component interface name is populated with a default value, which represents the PeopleSoft interface.

- a. In the Browse component interface window, browse for the component interface name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this component interface.
  - b. Click Next. The Preserve child relationship window is displayed.
  - c. Select the child business objects from the populated list, and click Finish to complete configure.
11. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry and Delivery Options for PeopleSoft Activities](#).
12. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Update Component Interface activity are displayed as nodes under the request input parameter in the To Activity panel.
13. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
14. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
15. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the PeopleSoft Update Component Interface activity.

### Feedback | Notices

 Last updated: Wednesday, 15 June 2016

<file:///dcs/markdown/workspace/Transform/out.html>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PeopleSoft\\_update\\_component.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PeopleSoft_update_component.html)

## Using the PeopleSoft Delete Component Interface activity

---

Use the PeopleSoft Delete Component Interface activity to delete component interfaces from the PeopleSoft server. This activity deletes the PeopleSoft components and its children. Because the connector supports only logical deletes, the components are marked as deleted, but not removed.

### Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the PeopleSoft server. For more information, see [Installing JAR files to connect to the PeopleSoft server](#).
- Valid connection details to connect to the PeopleSoft server.

### About this task

---

Use this task to delete component interface from the PeopleSoft server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the

orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the PeopleSoft folder contents.
2. Drag the Delete Component Interface activity icon onto the orchestration. The PeopleSoft Delete Component Interface Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant PeopleSoft endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for a PeopleSoft activity](#).
8. To make required changes to the selected endpoint configuration, click Edit and access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the component interface name in the Component Interface field. Component interface name is populated with a default value, which represents the PeopleSoft interface.
  - a. In the Browse component interface window, browse for the component interface name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this component interface.
  - b. Click Next. The Logical delete window is displayed.
  - c. Select a field from the Field name for logical delete drop-down list.
  - d. Specify the value of the deleted object in the Value to indicate deleted object field, and click Finish to complete configure.
11. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry and Delivery Options for PeopleSoft Activities](#).
12. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Delete Component Interface activity are displayed as nodes under the request input parameter in the To Activity panel.
13. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
14. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
15. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the PeopleSoft Delete Component Interface activity.

**Parent topic:** [PeopleSoft activities](#)

---

## Using the PeopleSoft Get Component Interface activity

---

Use the PeopleSoft Get Component Interface activity to retrieve component interfaces from the PeopleSoft server. With this activity you can access the PeopleSoft component and retrieve values from the PeopleSoft server.

### Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the PeopleSoft server. For more information, see [Installing JAR files to connect to the PeopleSoft server](#).
- Valid connection details to connect to the PeopleSoft server.

### About this task

---

Use this task to retrieve component interfaces from the PeopleSoft server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the PeopleSoft folder contents.
2. Drag the Get Component Interface activity icon onto the orchestration. The PeopleSoft Get Component Interface Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant PeopleSoft endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for a PeopleSoft activity](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the component interface name in the Component Interface text box. Component interface name is populated with a default value, which represents the PeopleSoft interface. Browse for the component interface name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this component interface.
11. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry and Delivery Options for PeopleSoft Activities](#).
12. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get Component Interface activity are displayed as nodes under the request input parameter in the To Activity panel.  
Note: The PeopleSoft connector generates a single input schema for all the objects used by the activities. There may be some fields that are redundant and not applicable for this activity. You must set the GETKEYS field for this activity. For Wbi\_Customer\_Ci component interface, you must specify the value for the customerid field.

13. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
14. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
15. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the PeopleSoft Get Component Interface activity.

**Parent topic:** [PeopleSoft activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
<file:///dcs/markdown/workspace/Transform/out.html>

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PeopleSoft\\_get\\_component.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PeopleSoft_get_component.html)

## Using the PeopleSoft Find Component Interface activity

---

Use the PeopleSoft Find Component Interface activity to retrieve all the component interfaces from the PeopleSoft server. This activity behaves like the PeopleSoft Get Component Interface activity, except that it retrieves multiple instances of the same PeopleSoft component that match the input criteria.

### Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the PeopleSoft server. For more information, see [Installing JAR files to connect to the PeopleSoft server](#).
- Valid connection details to connect to the PeopleSoft server.

### About this task

---

Use this task to find component interfaces in the PeopleSoft server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the PeopleSoft folder contents.
2. Drag the Find Component Interface activity icon onto the orchestration. The PeopleSoft Find Component Interface Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.

6. Click Browse and use the Project Explorer dialog box to select the relevant PeopleSoft endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for a PeopleSoft activity](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Browse for the component interface name in the Component Interface text box. Component interface name is populated with a default value, which represents the PeopleSoft interface. Browse for the component interface name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this component interface.
11. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry and Delivery Options for PeopleSoft Activities](#).
12. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Find Component Interface activity are displayed as nodes under the request input parameter in the To Activity panel. The PeopleSoft connector generates a single input schema for all the objects used by the activities. There may be some fields that are redundant and not applicable for this activity. You must set the `FINDKEYS` field for this activity For the `Wbi_Customer_Ci` component interface, you must specify either the `customerid` field or the `customerfirstname` field value, or both.
13. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
14. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
15. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the PeopleSoft Find Component Interface activity.

**Parent topic:** [PeopleSoft activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PeopleSoft\\_find\\_component.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/PeopleSoft_find_component.html)

## Creating events table and compiling PeopleSoft JAR files

---

The first of the two required JAR files, which will be named `PSFTCI.jar`, must be manually built and compiled.

PeopleSoft connector polls the PeopleSoft Enterprise server at specified intervals for events. When the connector detects an event, it converts the event data into a business object and sends it to the client application. To use this scenario, you must create a custom event project in PeopleSoft Enterprise server.

## Event store

The event store is a table that holds events that represent data changes until the polling connector can process them. The connector uses the event store to keep track of event entities. To use inbound processing, you must use PeopleTools Application Designer to create a custom project for event notification. The custom project creates the event store the connector needs for inbound processing. Each time a business object is created, updated, or deleted, the PeopleCode function used in the project and then added to the component interface inserts a new record in the event store, with the appropriate object name, keys, and status value.

During inbound processing, the connector polls the events from the event store at configured poll intervals. In each poll call, a configured number of events are processed by the connector. The order of event processing is based on the ascending order of priority and the ascending order of the event time stamp. The events with the Ready for poll (0) status are picked up for polling in each poll cycle. The connector uses the object name and object key to retrieve the corresponding business object. As events are retrieved from the event store and processed, the status of the event changes to reflect its state, as shown in the following table.

Table 1. Event status values

Status short name	Description	Event Table Value
Error processing event	An error occurred during event processing.	-1
Ready for poll	The event is ready to be picked up.	0
Success	The event has been delivered to the event manager.	1
Deleted	The event has been processed successfully and is removed from the event store.	4

## I. To create the events table

Ensure that the following steps are met for configuring and compiling the PeopleSoft JAR files.

- Creating Events Table
  - Add the trigger to WBI\_CUSTOMER\_COMP component
  - Create the Java™ API for Component Interface
1. Copy WBI\_CUST\_PROJ project located at <Cast Iron Installation directory>\etc\peoplesoft\scripts to a temp directory (C:\Projects) on the machine where the PeopleTools runs.
  2. Log on to the PeopleSoft application designer, and select Tools > Copy Project > From File.
  3. Browse to C:\Projects directory. From the Select Project from the List Below, double-click WBI\_CUST\_PROJ.
  4. In the Copy From File dialog, click Copy. Wait for the operation to complete.
  5. Select WBI\_CUST\_PROJ in the left panel, and then select Build > Project from the main menu.
  6. In the Build panel, select the following check boxes:
    - Create Tables
    - Create Views
    - Create Trigger
    - Run and build script
  7. Click Build, to begin to build the project.
  8. Click Close, to exit the Build Progress dialog.
  9. In the Build Log view of the application designer, check the log messages to confirm that three records were processed correctly.
  10. Select File > Save All to save the changes.

11. To configure the user security for the Component Interfaces, log onto PeopleSoft Web Client with the URL: `http://localhost/ps/ps/?cmd=login`.
12. Go to PeopleTools > Security > Permissions & Roles > Permission Lists.
13. Specify `PTPT1200` in the edit box of begins with and click Search.
14. Go to the Component Interfaces tab, click + to add the Component Interface `WBI_CUSTOMER_COMP_INTERFACE`.
15. Click Edit of `WBI_CUSTOMER_COMP_INTERFACE`.
16. Select Full Access for all methods and click OK.
17. Go back to the Component Interfaces tab, click + to add the Component Interface `IBM_EVENT_CI`.
18. Click Edit of `IBM_EVENT_CI`.
19. Select Full Access for all methods and click OK.
20. Go back to the Component Interfaces tab and press Save button to save the changes.

## II. To add triggers

---

1. In PeopleSoft application designer, open `WBI_CUST_PROJ` project.
2. In the left panel, right-click on `WBI_CUSTOMER_COMP` and select View PeopleCode.
3. In the PeopleCode edit window, select `SavePostChange` in the right panel.
4. Type the following PeopleCode in the edit window.

```

Declare Function IBMPublishEvent PeopleCode IBM_FETCH_ID.IBM_NEXT_EVENT_ID
FieldFormula;
Component string &BONAME1; Component string &KEYLIST1;
&BONAME1 = "WbiCustomerCompInterface";
&KEYLIST1 = "WBI_CUSTOMER.WBI_CUSTOMER_ID"; /* Check if Component Changed
before calling function*/ If ComponentChanged() And %UserId &lt;> "C" Then /*
Publish this event to the IBM WebSphere IBM_EVENT_TBL for polling */
IBMPublishEvent(&BONAME1; &KEYLIST1); End-If;

```

5. Select File > Save All to save the changes.
6. To ensure the trigger that was created in the steps above can work well, you need to do some initialization work. Connect to the database that PeopleTools uses, and run the following SQL statement:

```

$ insert into PS_IBM_FETCH_ID values(1000);
$ commit;

```

## III. To create the Java API for Component Interface

---

The Component Interface API provides access to all the objects and PeopleCode methods. You can manually generate these API using the application designer, and then compile them to a `PSFTCI.jar` file.

1. In PeopleSoft application designer, open `IBM_EVENT_CI` Component Interface.
2. Select Build > PeopleSoft API from the main menu.
3. In the Build PeopleSoft API Bindings dialog, make sure only the Build check box under Java Classes is selected. Set the Target Directory for storing the generated Java files.  
In the Select API to Build list, select the following items:
  - o `CompIntfc.CompIntfcPropertyInfo`
  - o `CompIntfc.CompIntfcPropertyInfoCollection`
  - o All beginning with `CompIntfc.IBM_EVENT_CI`
  - o All beginning with `CompIntfc.WBI_CUSTOMER_COMP_INTERFACE`
4. Click OK. Check the target directory to make sure the Java files are generated correctly.
5. Copy the generated Java files to `C:\Temp` directory, then copy `psjoa.jar` file from `<PeopleTools_HOME>\web\psjoa` to `C:\Temp` directory.
6. Enter directory as `C:\Temp` and run the following commands to build the Java files.

```
$ javac -classpath .\psjoa.jar PeopleSoft\Generated\CompIntfc\*.java
$ jar -cvf PSFTCI.jar PeopleSoft\Generated\CompIntfc\*.class
```

These two JAR files `psjoa.jar` and `PSFTCI.jar` would be used by PeopleSoft connector to access the PeopleSoft Enterprise application.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Peoplesoft\\_compiling\\_jars.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Peoplesoft_compiling_jars.html)

## Using the PeopleSoft Get Created Component Interface activity

---

Use the Get Created Component Interface activity to poll for created objects in the PeopleSoft server.

### Before you begin

---

Ensure that you have:

- Installed the necessary vendor software JAR files.
- The valid connection details to connect to the PeopleSoft server.
- Configured the *EventStore* business objects and triggers to generate events. For more information, see [Creating events table and compiling PeopleSoft JAR files](#).

### About this task

---

Use this task to poll for events created on the PeopleSoft server.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the PeopleSoft folder contents.
2. Drag the Get Created Component Interface activity icon onto the orchestration. The PeopleSoft Get Created Component Interface Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant PeopleSoft endpoint.
7. You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for a PeopleSoft activity](#).
8. To make any required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.

10. Specify the Event Store Name configured in the PeopleSoft server. The activity polls this event store for new events. The Event Store Name field is populated with a default value, specify the event store name configured in PeopleSoft server if it is not same as the default value.
11. Specify the component interface name in the Component Interface field, or browse for the required component interface.
12. In the Checklist, click Retry. Review the default settings and make the required changes. Similarly, configure the **Delivery Rules** panel. For more information, see [Specifying retry and Delivery Options for PeopleSoft Activities](#).

The activity polls the event store at configured interval for create events and fetches the actual object for that event. This object is sent to the orchestration. After processing, the event is marked as archived in the event store.

13. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
14. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the PeopleSoft Get Created Component Interface activity.

**Parent topic:** [PeopleSoft activities](#)

## Using the PeopleSoft Get Deleted Component Interface activity

---

Use the Get Deleted Component Interface activity to poll for deleted events in the PeopleSoft server.

### Before you begin

---

Ensure that you have:

- Installed the necessary vendor software JAR files.
- The valid connection details to connect to the PeopleSoft server.
- Configured the *EventStore* business objects and triggers to generate events. For more information, see [Creating events table and compiling PeopleSoft JAR files](#).

## About this task

---

Use this task to poll for events deleted on the PeopleSoft server.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the PeopleSoft folder contents.
2. Drag the Get Deleted Component Interface activity icon onto the orchestration. The PeopleSoft Get Deleted Component Interface Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant PeopleSoft endpoint.
7. You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing an endpoint for a PeopleSoft activity](#).
8. To make any required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Specify the Event Store Name configured in the PeopleSoft server. The activity polls this event store for new events. The Event Store Name field is populated with a default value, specify the event store name configured in PeopleSoft server if it is not same as default value.
11. Specify the component interface name in the Component Interface field, or browse for the required component interface.
12. In the Checklist, click Retry. Review the default settings and make the required changes. Similarly, configure the **Delivery Rules** panel. For more information, see [Specifying retry and Delivery Options for PeopleSoft Activities](#).

The activity polls the event store at configured interval for create events and fetches the actual object for that event. This object is sent to the orchestration. After processing, the event is marked as archived in the event store.

13. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
14. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the PeopleSoft Get Deleted Component Interface activity.

**Parent topic:** [PeopleSoft activities](#)

## Specifying retry and Delivery Options for PeopleSoft Activities

Specifying the Retry and Delivery parameters is one of the tasks to configure a PeopleSoft activity configuration.

### About this task

This section contains the procedure for configuring the retry options for PeopleSoft outbound and inbound activities.

### Procedure

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry options for connecting to a PeopleSoft server as described in the following table.

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the PeopleSoft server.
Try to connect __ times before failing.	Specifies the retry count — the maximum number of times the Integration Appliance attempts to establish a connection to the PeopleSoft server before issuing an error and stopping the processing of the current orchestration job. Note: If you deploy an orchestration that contains the inbound or outbound PeopleSoft activity and the Integration Appliance cannot connect to the specified PeopleSoft server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.

## Specifying the delivery rules options for PeopleSoft inbound activities

---

### About this task

This section contains the procedure for configuring the delivery rule options for PeopleSoft inbound activities.

### Procedure

1. Select the Delivery Rules task from the Checklist. The delivery rules pane is displayed.
2. Configure the delivery rules options to select the activity's behavior as described in the following table.

Table 2. Delivery rules

<b>Delivery Rules Fields</b>	<b>Description</b>
Poll for changes every _____ days/hours/minutes/seconds	Specifies the time interval to poll for objects in the PeopleSoft server. (For example, the Get Component Interfaces activity polls for Create Component Interfaces activity at the specified time interval.) Time can be selected in the format days, hours, minutes, or seconds.
Fetch _____ rows per poll	Specifies how many objects or components the activity should retrieve from the PeopleSoft server in each poll cycle.
<b>Delivery Messages</b>	
ATMOST_ONCE	A non-persistent mode in which a PeopleSoft component interfaces is either delivered once or not delivered at all.

## Overview of the RightNow SOAP API connector

---

The RightNow SOAP API connector enables a two-way communication between Cast Iron and the RightNow server. This connector uses the RightNow SOAP APIs.

You can perform the following activities using the RightNow SOAP API connector:

- [Create Objects](#)
- [Get Objects](#)
- [Query Objects](#)
- [Update Objects](#)
- [Destroy Objects](#)

The versions of RightNow supported by the connector depend on the support life cycle of RightNow. The SOAP API version of RightNow currently supported is v1\_2.

## Creating and editing a RightNow SOAP API endpoint

RightNow SOAP API endpoints contain the connection information that Studio and the Integration Appliance use to connect to the RightNow CRM instance. You can create multiple endpoints that refer to separate instances.

### About this task

Use this task to create or edit a RightNow SOAP API endpoint. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Note:

Any changes you make to the RightNow SOAP API endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

To create and edit a RightNow SOAP API endpoint, complete the following steps:

### Procedure

1. Drag an activity from the RightNow SOAP API folder under the Activities tab, to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. **Browse** - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
  - b. **New** - To create a new endpoint. The Create Endpoint window opens.
  - c. **Edit** - To edit the existing endpoint. The Edit Endpoint window opens.
4. In the Create Endpoint window, complete the fields defined in the following table:

Table 1. Connection details

Field Name	Description
<b>Connection Details</b>	
URL	Specifies the URL of the RightNow instance.
User Name	Specifies the user name to connect to the RightNow instance.
Password	Specifies the password associated with the user name to connect to the RightNow instance.
<b>Proxy Connection Details</b>	
Proxy Host	Specifies the host name of the proxy server.
Proxy Port	Specifies the port number needed to connect to the proxy server.
Proxy User Name	Specifies the user name needed to connect to the proxy server.
Proxy Password	Specifies the password needed to connect to the proxy server.

5. When finished, click Test Connection to confirm that you can connect to the RightNow system.
6. Click OK.

## Results

---

You have created or edited a RightNow SOAP API endpoint.

**Parent topic:** [RightNow SOAP API Activities](#)

## Using the RightNow SOAP API Create Objects activity

---

Use the RightNow SOAP API Create Objects activity to create objects such as Account, Answer, Contact, Incident, Meta Answer, Opportunity, Organization, Purchased Product, Sales Product, Task and so on, in the RightNow server.

### About this task

---

Use this task to create objects in the RightNow server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the RightNow SOAP API Create Objects activity, complete the following steps:

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the RightNow SOAP API folder contents.
2. Drag the Create Objects activity icon onto the orchestration. The RightNow SOAP API Create Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant RightNow SOAP API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a RightNow SOAP API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse RightNow SOAP API window is displayed.
11. In Browse RightNow SOAP API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.

13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for RightNow SOAP API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for an element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the RightNow SOAP API Create Objects activity.

## Using the RightNow SOAP API Update Objects activity

---

Use the RightNow SOAP API Update Objects activity to update objects such as Account, Answer, Contact, Incident, Meta Answer, Opportunity, Organization, Purchased Product, Sales Product, Task, and so on in the RightNow server.

### About this task

---

Use this task to update objects in the RightNow server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the RightNow SOAP API Update Objects activity, complete the following steps:

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the RightNow SOAP API folder contents.
2. Drag the Update Objects activity icon onto the orchestration. The RightNow SOAP API Update Objects activity Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant RightNow SOAP API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a RightNow SOAP API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse RightNow SOAP API window is displayed.
11. In Browse RightNow SOAP API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for RightNow SOAP API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Update Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Using the RightNow SOAP API Destroy Objects activity

---

Use the RightNow SOAP API Destroy Objects activity to delete objects such as Account, Answer, Contact, Incident, Meta Answer, Opportunity, Organization, Purchased Product, Sales Product, Task and so on, from the RightNow server. If you delete the primary object, all the corresponding sub objects related to the primary object will also be deleted.

### About this task

---

Use this task to delete objects in the RightNow server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the RightNow SOAP API Destroy Objects activity, complete the following steps:

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the RightNow SOAP API folder contents.
2. Drag the Destroy Objects activity icon onto the orchestration. The RightNow SOAP API Destroy Objects activityChecklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant RightNow SOAP API endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a RightNow SOAP API endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse RightNow SOAP API window is displayed.
11. In Browse RightNow SOAP API, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for RightNow SOAP API activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Destroy Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Specifying retry parameters for RightNow SOAP API activities

---

Specifying the retry parameters is one of the tasks you must complete to configure a RightNow activity.

### About this task

---

The RightNow SOAP API connects to the RightNow server to execute the activities. If a connection is lost or timed out, the connector automatically establishes a new connection based on the parameters described in Table 1. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

For more information about the configuration tasks in the Checklist, see the help topic for the specific RightNow SOAP API activity.

To specify the retry parameters, complete the following steps:

### Procedure

---

1. In the Checklist, select Retry. The Retry panel is displayed.
2. Configure the retry options for connecting to a RightNow application.

The following table describes the retry options for connecting to a RightNow application:

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the RightNow application. By default, this parameter is set to 30 seconds.
Try to connect __ times before failing.	Specifies the maximum number of times that the Integration Appliance attempts to establish a connection to the RightNow application before issuing an error and stopping the processing of the current orchestration job. By default this parameter is set to 5 attempts.
<b>Activity Timeout</b>	
Time out after __ seconds when the endpoint does not respond to a request.	Specifies the number of seconds the Integration Appliance waits before timing out, when the endpoint does not respond to a request. The default is 300 seconds.

## Results

You have configured the retry parameters for the RightNow SOAP API activities.

**Parent topic:** [RightNow SOAP API Activities](#)

## Salesforce.com activities

- [Creating or editing a Salesforce.com endpoint](#)  
Salesforce.com endpoints provide information that Studio and the Integration Appliance use to connect to a Salesforce.com instance.
- [Configuring Salesforce.com activities](#)  
Selecting fields from the Salesforce.com object to map is one of the tasks you must complete to configure a Salesforce.com activity. For more information about the configuration tasks in the Checklist, see the help topic for the specific Salesforce.com activity.
- [Migrating Salesforce.com projects](#)
- [Setting Salesforce.com configuration properties](#)  
Any changes you make to configuration properties affects all orchestrations that use that endpoint. The edits are global, not local.
- [Specifying the Retry and Time Out parameters for Salesforce.com activities](#)  
Specifying the Retry and Time Out parameters is one of the tasks you must complete to configure a Salesforce.com activity. The Salesforce.com Connector uses an HTTP 1.1 persistent connection over SSL

to make all connections to the Salesforce.com server. The Salesforce.com connector compresses all data for requests and responses using the gzip format.

- [Understanding and setting polling preferences for the Salesforce.com connector](#)
- [Convert Lead activity](#)

Use this activity to convert leads into accounts, contacts, or opportunities in Salesforce.com. While the Salesforce.com API limits the number of objects that it can convert in a single call to 100 objects, the Cast Iron® Salesforce.com connector does not have such a limit. You can use the **Convert Lead** activity to convert an unlimited number of objects.
- [Set password activity](#)

Use this activity to change the password of a user or SelfServiceUser to a value that you specify.
- [Reset password activity](#)

Use this activity to reset the password of the user to a system-generated value.
- [Send email activity](#)

Use this activity to send single or multiple emails. The emails include all standard email attributes such as the email address, subject line, and carbon copies.
- [Create Objects activity](#)

Use this activity to create one or more Salesforce.com objects. In the Activities tab, open the Salesforce.com directory to find the Create Objects activity.
- [Delete Objects activity](#)

Use this activity to delete one or more objects in Salesforce.com. While the Salesforce.com API limits the number of objects that it can delete in a single call to 200 objects, the Cast Iron Salesforce.com connector does not have such a limit. You can use the **Delete Objects** activity to delete an unlimited number of objects.
- [Get Deleted Objects](#)

This activity retrieves the list of individual objects that have been deleted within the specified time-span for the specified object.
- [Get Updated Objects](#)
- [Get User Information activity](#)

Use this activity to get user information from the Salesforce.com server. In the Activities tab, open the Salesforce.com directory to find the Get User Information activity.
- [Get Server Timestamp activity](#)

Use this activity to get the current time from the Salesforce.com server. In the Activities tab, open the Salesforce.com directory to find the Get Server Timestamp activity.
- [Merge Objects Activity](#)

Use this activity to merge Salesforce.com objects into a single record.
- [Poll Deleted Objects activity](#)

This activity polls the Salesforce.com Server for objects that have been recently deleted and returns IDs to the Integration Appliance.
- [Poll Updated Objects activity](#)

This activity polls the Salesforce.com Server for objects that have been recently created or updated and returns all the object fields that you selected in the configuration panel to the Integration Appliance. In Studio, configure the polling interval for the activity.
- [Query Objects activity](#)

Use the Sforce Object Query Language (SOQL) to run a query on one or more Salesforce.com object types from this activity and return a results set. The Query Objects activity automatically runs a query or queryAll call, followed by continuous queryMore calls for all children and objects returned from Salesforce.com.
- [Configuring the Query Objects activity](#)

You must create a SForce Object Search Language (SOSL) query to configure the **Search Objects** activity. The following sections discuss the steps to configure the **Search Objects** activity, create an SOSL query, and provide SOSL syntax rules for IBM® Cast Iron.
- [Retrieve Objects activity](#)

Use this activity to retrieve one or more Salesforce.com objects of a specified type. While the

Salesforce.com API limits the number of objects that it can retrieve in a single call to 2,000 objects, the Cast Iron Salesforce.com connector does not have such a limit. You can use the **Retrieve Objects** activity to retrieve an unlimited number of objects.

- [Search Objects activity](#)
- [Undelete Objects activity](#)
- [Configuring the Search Objects activity](#)

You must create an SForce Object Search Language (SOSL) query to configure the **Search Objects** activity.

- [Update Objects activity](#)

Use this activity to update existing objects in Salesforce.com.

- [Upsert Objects activity](#)

Use this activity to update existing objects or create new objects in Salesforce.com.

---

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_salesforceactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_salesforceactivities.html)

## Creating or editing a Salesforce.com endpoint

---

Salesforce.com endpoints provide information that Studio and the Integration Appliance use to connect to a Salesforce.com instance.

### About this task

---

Any changes you make to the endpoint, including configuration properties, affects all orchestrations that use that endpoint as the edits are global, not local.

### Procedure

---

1. Drag an activity from the Salesforce.com folder of the Activities tab onto the orchestration.

The Summary panel is displayed along with a Checklist which lists the tasks that you must perform to configure the activity.

2. Click Pick Endpoint task from the Checklist. The Pick Endpoint panel opens.
3. Click one of the following options:
  - Browse...: To select an existing endpoint from the Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel. To edit the endpoint properties, click Edit. Go to step 5.
  - New: To create a new endpoint. The Create Endpoint window opens. Go to step 5.
  - Edit: To edit an existing endpoint. The Edit Endpoint window opens. Go to step 5.

Note: Editing an endpoint affects all orchestrations that use that endpoint in the project as the edits are global, not local.

4. In the endpoint window, specify a user name and a password to access a Salesforce.com instance.

- a. Type a user name or click the icon to the right of the User Name field to select the sfdc\_login configuration property.
- b. Type a password or click the icon to the right of the Password field to select the sfdc\_password configuration property.

5. Choose a login option:

<b>Login Options</b>	<b>Description</b>
Login normally	By default, Login is selected. At run time, the Integration Appliance accesses a production instance of Salesforce.com.
Login to Salesforce.com Sandbox	At run time, the Integration Appliance accesses a copy of the production system. You can run tests in the Sandbox without affecting production data.
Login to specified Partner WSDL Login URL	At run time, the Integration Appliance accesses the URL you specify in the Login URL field.
Login URL	Only required when you choose the Login to specified Partner WSDL Login URL option.

6. Specify the Connection Timeout parameter. By default, the Integration Appliance times out if it is unable to connect to the Salesforce.com endpoint after 300 seconds.

7. To connect through a proxy server, complete the fields described in the following table:

<b>Option</b>	<b>Description</b>
<b>Field name</b>	<b>Description</b>
<b>Connect via a Proxy Server</b>	Select this check box to enable the fields to connect through a proxy server.
<b>Authentication</b>	Allows you to select the type of authentication that the Integration Appliance uses when connecting to a proxy server. From the list, select one of the following authentication options: <ul style="list-style-type: none"> <li>○ Basic - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure.</li> <li>○ NTLM - Requires an instance of NTCredentials to be available for the domain name of the server. This authentication is the most secure authentication option. When you choose the NTLM authentication option, the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server.</li> </ul>

Option	Description
Realm/Domain	If you select the <b>Basic</b> authentication option, specify a realm. If you select the <b>NTLM</b> authentication option, specify a domain.
Host Name	Specify the host name of the proxy server.
Port	Specify the port number needed to connect to the proxy server.
User Name	Specify the user name needed to connect to the proxy server.
Password	Specify the password needed to connect to the proxy server.

- Click Test Connection to confirm that the parameters you specified allow the project to access a Salesforce.com instance.

Note: When you configure a Salesforce.com endpoint to use configuration properties, verify that the configuration properties have valid values. If the configuration property value is invalid or does not exist, the connection test fails.

## Configuring Salesforce.com activities

---

Selecting fields from the Salesforce.com object to map is one of the tasks you must complete to configure a Salesforce.com activity. For more information about the configuration tasks in the Checklist, see the help topic for the specific Salesforce.com activity.

### About this task

---

For some of the fields in the endpoint, you can [create configuration properties](#) to supply the values for these fields. An icon is displayed when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.

## Procedure

---

1. In the Checklist, select Configure. The Configure panel opens.
2. Click Browse... to select a Salesforce.com object type. The Choose a Salesforce.com Object window shows all the Salesforce.com objects that are associated with the Studio activity.
3. Select an object type from the list.

Note: Custom object types end with a double underscore c ( \_\_c ). For example: *CustomerPriority\_\_c*

Enter a character or string in the Search for an Object Type field and Studio filters the object types and only shows the object types that match the filter criteria. (Optional) Click the refresh icon to retrieve the latest Salesforce.com object types.

4. Click OK.

All the fields associated with the object type you selected are displayed.

5. In the Object Field Preferences section, select the fields to map.

By default, all fields are selected. You can choose to clear any field that you do not want to show in the map. A global checkbox allows you to select and clear all fields at once.

Note: The Id field is required for many activities. For these activities, the Id field is disabled and you cannot clear this field.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring\\_SalesforceCom\\_Activities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring_SalesforceCom_Activities.html)

## Migrating Salesforce.com projects

---

### About this task

---

In Studio version 3.6.2, the Salesforce.com connector version 3.0 is built-in and does not require additional installation as the previous version required.

Salesforce.com Connector Version	Studio Version	Installation Type
3.0X	3.6.2 and higher	built-in (no additional installation)
2.0X	3.5 and higher	add-on (separate installation)
1.0X	3.5 and higher	add-on (separate installation)

Studio does not automatically migrate projects containing Salesforce.com connector version 1.x or Salesforce.com connector version 2.x. However, the latest version of Studio can support any manually migrated projects that contain orchestrations using add-on versions of the connector. Therefore, it is possible to use both the built-in and add-on versions of the Salesforce.com connector in the same orchestration.

## Setting Salesforce.com configuration properties

---

Any changes you make to configuration properties affects all orchestrations that use that endpoint. The edits are global, not local.

### Procedure

---

1. Select Project > Configuration Properties. The Configuration Properties window opens.
2. Click the Value field for the sfdc\_password property and type a valid password.
3. Click the Value field for the sfdc\_login property and type a valid Salesforce.com login.
4. Click OK.

## Specifying the Retry and Time Out parameters for Salesforce.com activities

---

Specifying the Retry and Time Out parameters is one of the tasks you must complete to configure a Salesforce.com activity. The Salesforce.com Connector uses an HTTP 1.1 persistent connection over SSL to make all connections to the Salesforce.com server. The Salesforce.com connector compresses all data for requests and responses using the gzip format.

### About this task

---

The Salesforce.com connector uses a single login session for all connections to a Salesforce.com endpoint. If a session expires, the connector automatically establishes a new session. The Salesforce.com connector does not count the initial attempt to reacquire the session as a retry attempt. The Salesforce.com connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

For more information about the configuration tasks in the **Checklist**, see the help topic for the specific Salesforce.com activity.

## Procedure

---

1. In the Checklist, select Retry. The Retry panel open.
2. Configure the retry options for connecting to a Salesforce.com instance.

The following table describes the retry options for connecting to a Salesforce.com instance:

Retry Fields	Description
Wait __ second(s) between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Salesforce.com instance.  By default, this parameter is set to 30 seconds.
Try to connect __ times before failing.	Specifies the maximum number of times that the Integration Appliance attempts to establish a connection to the Salesforce.com instance before issuing an error and stopping the processing of the current orchestration job.  By default this parameter is set to 5 attempts.
Activity Timeout Field	Description
Time out after __ seconds when the Endpoint does not respond to a request.	Specifies the number of seconds before a time out occurs between the activity making a request on an endpoint and the time it takes the endpoint to respond.  By default this parameter is set to 300 seconds.

## Understanding and setting polling preferences for the Salesforce.com connector

---

### About this task

---

The Salesforce.com connector contains two activities that poll the Salesforce.com server for changes:

- **Poll Deleted Objects** activity
- **Poll Updated Objects** activity

These activities have the following startup behavior:

- For an orchestration that has never been deployed, the baseline time stamp is established when the activity is activated for the first time. The activity uses the baseline time stamp as the start time to poll for changes after the poll interval elapses. After the poll completes, the activity stores the last poll time.
- For a previously deployed orchestration, the activity uses the last poll time and the current time to poll for changes after the poll interval elapses.
- Salesforce.com requires at least 60 seconds between each poll. If less than 60 seconds have transpired, then the activity ignores the current polling interval until the next polling interval elapses.

## Procedure

---

1. In the Checklist, select Polling.

The Polling Preferences panel opens.

2. Set the polling preferences for the following parameters:

Polling Preference	Description
Poll for changes every <i>&lt;i&gt;</i>	Specifies the polling interval for which the Integration Appliance polls the Salesforce.com Server for objects that have been created or updated since the last poll.
Where <i>&lt;i&gt;</i> is the polling interval. The interval can be specified in minutes, hours, or days	By default, the Integration Appliance polls the Salesforce.com Server every 5 minutes.
Batch up to <i>&lt;n&gt;</i> objects per orchestration	Specifies the maximum number of object records per orchestration job, during a polling interval. By default, the Integration Appliance processes 1 record per orchestration job. Use this preference to tune the performance of the Integration Appliance.
Where <i>&lt;n&gt;</i> is the number of objects in a batch.

## Convert Lead activity

---

Use this activity to convert leads into accounts, contacts, or opportunities in Salesforce.com. While the Salesforce.com API limits the number of objects that it can convert in a single call to 100 objects, the Cast Iron® Salesforce.com connector does not have such a limit. You can use the **Convert Lead** activity to convert an unlimited number of objects.

## Procedure

---

1. In the Activities tab, open the Salesforce.com directory to find the Convert Lead activity.

2. Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or Editing a Salesforce.com Endpoint](#).

4. Specify the Retry and Time out parameters for the activity.
5. Map the input of the activity.
6. Map the output of the activity.

- [Map the input of the Convert Lead activity](#)
- [Map the output of the Convert Lead activity](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Convert\\_Lead\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Convert_Lead_Activity.html)

## Map the input of the Convert Lead activity

---

### Procedure

---

1. In the Checklist, select Map Inputs.

The convertLead element displays in the To Activity pane. The parameters displayed correspond to the structure of the input to the Salesforce.com convertLead operation.

2. (Optional) Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - CallOptions
  - connection
  - sessionInfo

3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

**Parent topic:** [Convert Lead activity](#)

---

## Map the output of the Convert Lead activity

---

### Procedure

---

1. In the Checklist, select Map Outputs.

The convertLeadResponse element is displayed in the From Activity panel. The parameters displayed correspond to the convertLeadResponse structure, which is returned by the convertLead operation.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

## Set password activity

---

Use this activity to change the password of a user or SelfServiceUser to a value that you specify.

Note: You must have the administrative permission to change the password for the users.

### To use the Set Password activity:

---

1. In the Activities tab, open the Salesforce.com directory to find the Set Password activity.
2. Drag the Set Password activity onto the orchestration.

The Summary and Checklist for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

Note: No additional configuration is required for this activity in the Configure section.

4. Specify the Retry and Activity Timeout parameters for the activity.
5. Map the inputs of the activity.
6. Map the outputs of the activity.

## To map the input of the Set Password activity:

---

1. In the Checklist, select Map Inputs.

The userId and password parameters are displayed in the To Activity pane.

2. (Optional) Right-click the default node and choose Show Optional Parameters, to display these optional input parameters for this activity:
  - o CallOptions
  - o connection
  - o sessionInfo
3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

## To map the output of the Set Password activity:

---

1. In the Checklist, select Map Outputs.

The sessionInfo element is displayed in the From Activity pane.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

## Reset password activity

---

Use this activity to reset the password of the user to a system-generated value.

Note: You must have the administrative permission to reset the password for the users.

## To use the Reset Password activity:

---

1. In the Activities tab, open the Salesforce.com directory to find the Reset Password activity.
2. Drag the Reset Password activity onto the orchestration.

The Summary and Checklist for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

Note: No additional configuration is required for this activity in the Configure section.

4. Specify the Retry and Activity Timeout parameters for the activity.
5. Map the inputs of the activity.
6. Map the outputs of the activity.

## To map the input of the Reset Password activity:

---

1. In the Checklist, select Map Inputs.

The userId parameter is displayed in the To Activity pane.

2. (Optional) Right-click the default node and choose Show Optional Parameters, to display these optional input parameters for this activity:
  - o CallOptions
  - o EmailHeader
  - o connection
  - o sessionInfo

3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

## To map the output of the Reset Password activity:

---

1. In the Checklist, select Map Outputs.

The password and sessionInfo elements are displayed in the From Activity pane.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

## Send email activity

---

Use this activity to send single or multiple emails. The emails include all standard email attributes such as the email address, subject line, and carbon copies.

### To use the email activity:

---

1. In the Activities tab, open the Salesforce.com directory to find the Send Email activity.
2. Drag the Send Email activity onto the orchestration.

The Summary and Checklist for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

4. In the Configure section, select the Send Mass Emails check box if you want to send multiple emails.
5. Specify the Retry and Activity Timeout parameters for the activity.
6. Map the inputs of the activity.
7. Map the outputs of the activity.

### To map the input of the Send Email activity:

---

1. In the Checklist, select Map Inputs.

The emails parameter is displayed in the To Activity pane.

2. (Optional) Right-click the default node and choose Show Optional Parameters, to display these optional input parameters for this activity:
  - o connection
  - o sessionInfo
3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

### To map the output of the Send Email activity:

---

1. In the Checklist, select Map Outputs.

The results and sessionInfo elements are displayed in the From Activity pane.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

## Map the input of the Create Objects activity

---

## Procedure

---

1. In the Checklist, select Map Inputs.

The Objects element is displayed in the To Activity panel. The parameters displayed correspond to the structure of the input to the Salesforce.com Objects operation.

2. (Optional) Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - o AssignmentRuleHeader
  - o MruHeader
  - o EmailHeader
  - o CallOptions
  - o connection
  - o sessionInfo

3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

*Optional* and *nillable* field elements have the following behavior:

- o The Integration Appliance does not update an optional field, when the Salesforce.com server does not provide a value for the field.
- o If you set the `xsi:nil` attribute to `true` on a nillable field, the Integration Appliance sets the field to null during an update.

Note: Setting a field to an empty string does not set a field to null.

## Map the output of the Create Object activity

---

### Procedure

---

1. In the Checklist, select Map Outputs.

The saveResults element is displayed in the From Activity panel. The parameters displayed correspond to the saveResults structure, which is returned by the create activity.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

# Get Updated Objects

---

## Procedure

---

1. In the Activities tab, open the Salesforce.com directory to find the Get Updated Objects activity.
2. Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

4. Configure the activity, by choosing a Salesforce.com object type and object field preferences. You can only select object types and fields that the Integration Appliance can update. The input map contains the object type with elements that correspond to the fields you select during this configuration step.

Note: The Integration Appliance cannot create auto-number fields.

5. Specify the Retry and Time out parameters for the activity.
6. Map the input of the activity.

The input map consists of an object's input parameter. This parameter consists of a single root element that has a single repeating element, named after the object type you selected, containing all the fields you selected in the Object Field Preferences table.

7. Map the output of the activity.

## Merge Objects Activity

---

Use this activity to merge Salesforce.com objects into a single record.

### About this task

---

You can merge two or more of the following Salesforce.com objects into a single record:

- Account
- Contact
- Leads

After the activity merges the objects, it deletes the pre-merge records and re-parents any duplicates.

While the Salesforce.com API limits the number of requests that it can merge in a single call to 200, the Cast Iron® Salesforce.com connector does not have such a limit. You can use the **Merge Objects** activity to process an unlimited number of merge requests.

### Procedure

---

1. In the Activities tab, open the Salesforce.com directory to find the Merge Objects activity.
2. Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

4. Configure the activity, by choosing a Salesforce.com object type and object field preferences.

You can only select Account, Contact, and Lead object types and fields that the Appliance can update. Fields such as auto-number fields might not be available to select.

5. Specify the Retry and Time out parameters for the activity.
6. Map the input of the activity.
7. Map the output of the activity.

- [Map the input of the Merge Objects activity](#)
- [Map the output of the Merge Object activity](#)

# Map the input of the Merge Objects activity

---

## Procedure

---

1. In the Checklist, select Map Inputs.

The Merge element is displayed in the To Activity panel.

2. (Optional) Right-click the default node and choose Show Optional Parameters, to display these optional input parameters for this activity:
  - AssignmentRuleHeader
  - MruHeader
  - EmailHeader
  - CallOptions
  - connection
  - sessionInfo

3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

*Optional* and *nillable* field elements have the following behavior:

- The Integration Appliance does not update an optional field, when the Salesforce.com server does not provide a value for the field.
- If you set the `xsi:nil` attribute to `true` on a nillable field, the Integration Appliance sets the field to null during an update.

Note: Setting a field to an empty string does not set a field to null.

**Parent topic:** [Merge Objects Activity](#)

## Poll Deleted Objects activity

---

This activity polls the Salesforce.com Server for objects that have been recently deleted and returns IDs to the Integration Appliance.

### Procedure

---

1. In the Activities tab, open the Salesforce.com directory to find the Poll Deleted Objects activity.
2. Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

4. Configure the activity by choosing a Salesforce.com object type and object field preferences.
5. Specify the Polling preferences for the activity.
6. Specify the Retry and Time out parameters for the activity.
7. Map the output of the activity.

- [Map the output of the Poll Deleted Object activity](#)

**Parent topic:** [Salesforce.com activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Poll\\_Deleted\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Poll_Deleted_Objects_Activity.html)

## Map the output of the Poll Deleted Object activity

---

### Procedure

---

1. In the Checklist, select Map Outputs.

The objects element is displayed in the From Activity panel.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

The output map can have *nillable* field elements have the following behavior:

- If the field being retrieved is null, the Integration Appliance sets the xsi:nil attribute to true in the result.
- If the input ID is not valid or does not represent the object type you specified, then for the entire object element the Integration Appliance sets xsi:nil to true for that element's position in the result set.

## Query Objects activity

---

Use the Sforce Object Query Language (SOQL) to run a query on one or more Salesforce.com object types from this activity and return a results set. The Query Objects activity automatically runs a query or queryAll call, followed by continuous queryMore calls for all children and objects returned from Salesforce.com.

Note: Running the Query Objects activity can result in a cursor being opened by Salesforce.com to track the query results. If the activity reaches the cursor limit that Salesforce.com allots to each user or if the cursor expires, the Integration Appliance tries the activity again.

### Using the Query Objects activity

---

1. In the Activities tab, open the Salesforce.com directory to find the Query Objects activity.
2. Add the activity to your orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

4. Configure the activity, by specifying a query and setting query options.
5. Specify the Retry and Time out parameters for the activity.
6. Map the input of the activity.
7. Map the output of the activity.

### Map the input of the Query Objects activity

---

1. In the Checklist, select Map Inputs.

The parameters element is displayed in the To Activity panel. The parameters element has a child element for each parameter you specified in the SOQL query. The context for the parameter in the query determines the parameter type. If you did not specify any parameters, then no child elements are displayed under the parameters element.

2. Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - o MruHeader

- CallOptions
  - connection
  - sessionInfo
3. Click Select Inputs... and select the input variable or variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variable or variables.

For mapping instructions, see [Creating a Map](#).

## Map the output of the Query Objects activity

---

1. In the Checklist, select Map Outputs.

The objects element is displayed in the From Activity panel. The result parameter has a single element named objects with a single repeating element named after the driving object of the query. The driving object is the first object named in the FROM clause of the query. For example, in the following SOQL statement Account is the driving object:

```
Select Name from Account, Account.Contacts
```

The driving object has child elements that correspond to the fields or relationships listed in the `SELECT` clause of a query. The schema is defined as follows:

- For fields, the field type matches the SOAP type of the field. The field type is nillable if the SOAP type is nillable.
  - For relationships for parent elements, the element name is the name of the parent. If there is no parent when the activity runs the query, then the element is absent. The fields or relationships of the parent is displayed immediately underneath the relationship element.
  - For relationships for child elements, the element name is the name of the child. The relationship element has a single repeating element named after the object type of the child object. The fields and relationship of the child is displayed underneath the object type element. If there are no children when the activity runs the query, then the element is absent.
  - If you did not select any fields or relationships, but instead request the `count()` in the `SELECT` clause, the entire object type element is replaced with an element named count of type `unsignedInt`.
2. Click Select Outputs... and select the output variable or variables for the map.
- For instructions about creating variables, see [Creating Variables](#).
3. As appropriate, map the output parameters to the variable or variables.
- For mapping instructions, see [Creating a Map](#).

## Configuring the Query Objects activity

---

You must create a SForce Object Search Language (SOSL) query to configure the **Search Objects** activity. The following sections discuss the steps to configure the **Search Objects** activity, create an SOSL query, and provide SOSL syntax rules for IBM® Cast Iron®.

### Procedure

---

1. In the Checklist, select Configure.

The Specify Query window opens.

2. Create an SOSL query in the Specify Query window.
3. (Optional) You can specify dynamic parameters in the search clause of the SOSL statement. You can then map these parameters dynamically as the input parameters for the activity, which allows the activity to dynamically control the query based upon the input to the orchestration. Use a (\$) dollar sign to denote a parameter and follow it with the parameter name.
4. Click the Validate icon  , to validate the query.  
If the query is invalid, the Validation Feedback icon  displays in the lower left corner of the Specify Query window. For invalid queries:
  - a. Click the Validation Feedback icon in the lower left corner of the Specify Query window for a list of validation errors.
  - b. Use the Refresh icon  to refresh meta data and revalidate the SOSL statement.
5. In the Checklist, select Query to configure specific query options.

The Query Options pane opens.

6. Select Include deleted items in query (execute a queryAll operation), to query for deleted records in addition to existing records. If you do not select this option, the Integration Appliance only queries existing records.
7. Specify a Query batch size between 200-2,000 queries to help tune the performance of the Integration Appliance.

The option determines the batch size to use in the QueryOptions SOAP header for all query calls and does not affect the number of results returned by the activity. By default, this option is set to 500 queries.

**Parent topic:** [Salesforce.com activities](#)

### Creating SOSL Queries

---

When creating a SOQL query, you can use dynamic parameters in the WHERE clause of the SOQL statement. Studio can then dynamically map these parameters as the input parameters for the activity. This allows for dynamic control of the query based upon input to the orchestration.

#### About this task

The SForce Object Query Language does not define a syntax for parameterized queries; however, Cast Iron does enforce some proprietary SOQL syntax rules. You can use parameters in either simple expressions or set expressions.

## SOSL Syntax Rules for Cast Iron

- Use a (\$) dollar sign to denote a parameter. After the (\$) dollar sign, specify a string of alphanumeric characters. The first character must be a letter [a-zA-Z], optionally followed by one or more letters [a-zA-Z], digits [0-9], or ( \_ ) underscores.

Note: Parameter names are case-sensitive; therefore, the parameters \$a and \$A are considered to be different parameters.

The following table contains examples of valid and invalid parameter declarations:

Parameter	Valid or Invalid
\$AnAccount	valid
\$a123_456	valid
\$123a	invalid
\$_id	invalid

- You must declare parameters on the right-hand side of an expression in a WHERE clause.
- Parameters can appear more than once in a given SOQL statement. However, even though the parameter appears more than once in the SOQL statement, it only appears once in the input parameter map. The activity substitutes the same value for all locations where the parameter is used at runtime.

Note: When you use the same parameter name and there is a type mismatch, an error occurs. For example, the following SOQL generates an error because \$param is used as both a string and date type:

```
SELECT Name from Account where Name like $param and createdDate > $param
```

- The type of the field in which a parameter is being compared determines the type of the parameter and whether the parameter is being used in a simple expression, a set expression, or part of a set expression.

Type of Expression	Description
Simple Expressions	<p>For example: Select ID from Account where Name = \$NameParam</p> <p>The SoapType of the field on the left-hand side of the expression determines the parameter type. If the field type is nillable and the operator is (=) or (!=), then the parameter is nillable. Setting xsi:nil=true on the parameter sets the parameter value to null when it is substituted. If the parameter's type requires it to be enclosed in (') single quotes, then the parameter's value is enclosed in single quotes during substitution and its contents are escaped automatically.</p> <p>For SOQL, the (\) backslash and (') single-quote will be escaped.</p>
Set Expressions	<p>For example: Select ID From Account where ID in \$idList</p> <p>The parameter's type is a repeating sequence of the SoapType of the field on the left-hand side of the expression. The parameter is not nillable and has minOccurs=1, maxOccurs=unbounded on the element.</p> <p>The sequence is expanded at runtime to be a proper set value, for example:</p> <p>Select Id From Account where Id in ('value1','value2')</p>
Parameters	Parameters inside a set list are treated like a simple expression parameter type, for example:

t of	SELECT Name from Account where BillingState IN ('California', \$state2)
a	
Set	In this example, the \$state2 parameter type is the SoapType of the Account BillingState field and
Ex	is not a repeating element. The parameter is not nillable.

## Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring\\_the\\_Query\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring_the_Query_Objects_Activity.html)

## Retrieve Objects activity

---

Use this activity to retrieve one or more Salesforce.com objects of a specified type. While the Salesforce.com API limits the number of objects that it can retrieve in a single call to 2,000 objects, the Cast Iron® Salesforce.com connector does not have such a limit. You can use the **Retrieve Objects** activity to retrieve an unlimited number of objects.

### Using the Retrieve Objects activity

---

1. In the Activities tab, open the Salesforce.com directory to find the Retrieve Objects activity.
2. Add the activity to your orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

4. Configure the activity, by choosing a Salesforce.com object type and object field preferences.

Only object types that the Integration Appliance is able to retrieve via the Salesforce.com API display.

5. Specify the Retry and Time out parameters for the activity.
6. Map the input of the activity.
7. Map the output of the activity.

### Map the input of the Retrieve Objects activity

---

1. In the Checklist, select Map Inputs.

The ids element is displayed in the To Activity pane. The element contains the collection of IDs that the Integration Appliance retrieves from Salesforce.com

2. (Optional) Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - o MruHeaderUser
  - o CallOptions
  - o connection
  - o sessionInfo
3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

*Optional* and *nillable* field elements have the following behavior:

- If the field being retrieved is null, the Integration Appliance sets the xsi:nil attribute to `true` in the result.
- If the input ID is not valid or does not represent the object type you specified, then for the entire object element the Integration Appliance sets xsi:nil to `true` for that element's position in the result set.

## Map the output of the Retrieve Objects activity

---

1. In the Checklist, select Map Outputs.

The objects element is displayed in the From Activity panel. The element contains all fields that you selected in the field preferences table, during the configuration steps.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

**Parent topic:** [Salesforce.com activities](#)

## Search Objects activity

---

### About this task

---

Use the Sforce Object Search Language (SOSL) to run a search query on one or more Salesforce.com object types from this activity and return a results set.

Note: You can only search objects that are configured as searchable or eSearchable. You cannot search attachment objects.

Using the Search Objects activity:

## Procedure

---

1. In the Activities tab, open the Salesforce.com directory to find the **Search Objects** activity.
2. Add the activity to an orchestration. The **Checklist** and **Summary** for the activity is displayed beneath the orchestration.

## Results

---

1. Select a Salesforce.com endpoint. For instructions on creating or editing a Salesforce.com endpoint, see [Creating or Editing a Salesforce.com Endpoint](#).
2. [Configure](#) the activity, by specifying a search query and setting search query options.
3. [Specify](#) the Retry and Time out parameters for the activity.
4. Map the input of the activity.
5. Map the output of the activity.

### Map the input of the Search Objects activity:

1. In the **Checklist**, select Map Inputs. The parameters element is displayed in the To Activity panel. The parameter element has a child element for each parameter you specified in the SOSL query. The context for the parameter in the query determines the parameter type. If you did not specify any parameters, then no child elements are displayed under the parameters element.
2. Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - o CallOptions
  - o connection
  - o sessionInfo
3. Click Select Inputs... and select the input variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
4. As appropriate, map the input parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

### Map the output of the Search Objects activity:

1. In the **Checklist**, select Map Outputs. The **objects** element is displayed in the From Activity panel.
2. Click Select Outputs... and select the output variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
3. As appropriate, map the output parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

**Parent topic:** [Salesforce.com activities](#)

# Undelete Objects activity

---

## About this task

---

Use this activity to restore one or more objects that you deleted in Salesforce.com.

To use the Undelete Objects activity complete the following steps:

## Procedure

---

1. In the Activities tab, open the Salesforce.com directory to find the **Undelete Objects** activity. Add the activity to an orchestration. The **Checklist** and **Summary** for the activity are displayed beneath the orchestration.
2. Select a Salesforce.com endpoint. For instructions on creating or editing a Salesforce.com endpoint, see [Creating or Editing a Salesforce.com Endpoint](#).
3. [Specify](#) the Retry and Time out parameters for the activity.
4. Map the input of the activity.
5. Map the output of the activity.

## Results

---

### Map the input of the Undelete Objects activity

1. In the **Checklist**, select Map Inputs. The **ids** element is displayed in the To Activity panel.
2. Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - o CallOptions
  - o connection
3. Click Select Inputs... and select the input variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
4. As appropriate, map the input parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

### Map the output of the Undelete Objects activity

1. In the **Checklist**, select Map Outputs. The **results** element is displayed in the From Activity panel.
2. Click Select Outputs... and select the output variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
3. As appropriate, map the output parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

## About this task

The following sections discuss the steps to configure the **Search Objects** activity, create an SOSL query, and provide SOSL syntax rules for IBM® Cast Iron®.

To configure the Search Objects activity complete the following steps:

## Procedure

1. In the Checklist, select Configure. The Specify Query window opens.
2. **Create** an SOSL query in the Specify Query window.
3. Optional: You can specify dynamic parameters in the search clause of the SOSL statement. You can then map these parameters dynamically as the input parameters for the activity, which allows the activity to dynamically control the query based upon the input to the orchestration. Use a (\$) dollar sign to denote a parameter and follow it with the parameter name.
4. Click the Validate icon , to validate the query. If the query is invalid, the Validation Feedback icon  shows in the lower left corner of the Specify Query window. For invalid queries:
  - o Click the Validation Feedback icon in the lower left corner of the Specify Query window for a list of validation errors.
  - o Use the Refresh icon  to refresh meta data and revalidate the SOSL statement.

**Parent topic:** [Salesforce.com activities](#)

## Creating SOSL queries

### About this task

When creating a SForce Object Search Language (SOSL) query, you can use dynamic parameters in the WHERE clause of the SOSL statement. Studio can then dynamically map these parameters as the input parameters for the activity. This allows for dynamic control of the query based upon input to the orchestration.

The SForce Object Search Language does not define a syntax for parameterized queries; however, IBM Cast Iron does enforce a few proprietary SOSL syntax rules. You can use parameters in either simple expressions or set expressions.

### SOSL syntax rules for IBM Cast Iron

#### About this task

- Use a (\$) dollar sign to denote a parameter. After the (\$) dollar sign, specify a string of alphanumeric characters. The first character must be a letter [a-zA-Z], optionally followed by one or more letters [a-zA-Z], digits [0-9], or ( \_ ) underscores.  
Note: Parameter names are case-sensitive; therefore, the parameters \$a and \$A are considered to be different parameters.

The following table contains examples of valid and invalid parameter declarations:

Parameter	Valid or Invalid
\$AnAccount	valid

Parameter	Valid or Invalid
\$a123_456	valid
\$123a	invalid
\$_id	invalid

- You must declare parameters in the Search Query portion of the SOSL statement. Curly braces ( { } ) demarcate the Search Query portion of the SOSL statement.  
Important: Do not use double-quotes ( " " ) to enclose parameters. If you enclose parameters in double-quotes, the activity treats the parameter as a string search literal.
- The parameter type is always xsd:string. During substitution, the activity escapes any parameter that you declare using a reserved character. Reserved characters include the following characters:

Reserved Characters	Description
&	ampersand
*	asterisk
\	back slash
[ ]	box brackets
:	colon
,	comma
{ }	curly braces
"	double quote
!	exclamation mark
-	minus sign
+	plus sign
'	single quote
~	tilda
^	up arrow
	vertical bar

- Parameters can appear more than once in a given SOQL statement. However, even though the parameter appears more than once in the SOQL statement, it only appears once in the input parameter map. The activity substitutes the same value for all locations where the parameter is used at runtime.

---

## Feedback | Notices

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring\\_the\\_Search\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Configuring_the_Search_Objects_Activity.html)

# Update Objects activity

---

Use this activity to update existing objects in Salesforce.com.

## About this task

---

While the Salesforce.com API limits the number of objects that it can update in a single call to 200 objects, the Cast Iron® Salesforce.com Connector does not have such a limit. You can use the Update Objects activity to update an unlimited number of objects.

Using the Update Objects activity.

## Procedure

---

1. In the Activities tab, open the Salesforce.com directory to find the **Update Objects** activity.
2. Add the activity to an orchestration. The **Checklist** and **Summary** for the activity are displayed beneath the orchestration.
3. Select a Salesforce.com endpoint. For instructions on creating or editing a Salesforce.com endpoint, see [Creating or Editing a Salesforce.com Endpoint](#).
4. [Configure](#) the activity by choosing a Salesforce.com object type and object field preferences. You can only select object types and fields that the Integration Appliance can update. The input map contains the object type with elements that correspond to the fields you select during this configuration step. Note: The Integration Appliance cannot create auto-number fields.
5. [Specify](#) the **Retry** and **Time out** parameters for the activity.
6. Map the input of the activity. The input map consists of an object's input parameter. This parameter consists of a single root element that has a single repeating element, named after the object type you selected, containing all the fields you selected in the Object Field Preferences table.
7. Map the output of the activity.

## Results

---

### Map the input of the Update Objects activity

1. In the **Checklist**, select Map Inputs. The **objects** element is displayed in the To Activity pane.
2. Right-click the default node and choose Show Optional Parameters to show the optional input parameters for this activity:
  - AssignmentRuleHeader
  - MruHeader
  - EmailHeader
  - CallOptions
  - connection
  - sessionInfo
3. Click Select Inputs... and select the input variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
4. As appropriate, map the input parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

Optional and nillable field elements have the following behavior:

- The Integration Appliance does not update an optional field, when the Salesforce.com server does not provide a value for the field.
- If you set the xsi:nil attribute to true on a nillable field, the Integration Appliance sets the field to null during an update.

Note: Setting a field to an empty string does not set a field to null.

### Map the output of the Update Objects activity

1. In the **Checklist**, select Map Outputs. The **saveResults** element is displayed in the From Activity panel.
2. Click **Select Outputs...** and select the output variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
3. As appropriate, map the output parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

**Parent topic:** [Salesforce.com activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Update\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Update_Objects_Activity.html)

## Upsert Objects activity

---

Use this activity to update existing objects or create new objects in Salesforce.com.

### About this task

---

The activity uses an external ID, usually a foreign key, to determine whether to update an existing object or create a new object in Salesforce.com.

While the Salesforce.com API limits the number of objects that it can create in a single upsert call to 200 objects, the Cast Iron® Salesforce.com connector does not have such a limit. You can use the **Upsert Objects** activity to create an unlimited number of objects.

To use the **Upsert Objects** activity:

### Procedure

---

1. In the Activities tab, open the Salesforce.com directory to find the **Upsert Objects** activity.
2. Add the activity to an orchestration. The **Checklist** and **Summary** for the activity are displayed beneath the orchestration.
3. Select a Salesforce.com endpoint. For instructions on creating or editing a Salesforce.com endpoint, see [Creating or Editing a Salesforce.com Endpoint](#).
4. [Configure](#) the activity, by choosing a Salesforce.com object type and object field preferences.  
Note: You can only choose object types that the Integration Appliance can update or create and contain at least one External ID field. When you select the object type, Studio displays the external IDs defined on the object type in the External ID field of the Configure pane. You cannot edit the IDs listed in the External ID list. The external ID that you select becomes a required field, you cannot clear this field from the Object Field Preferences table. If only one external ID is available, Studio automatically selects this field in the Object Field Preferences table.
5. [Specify](#) the **Retry** and **Time out** parameters for the activity.
6. Map the input of the activity.
7. Map the output of the activity.

### Map the input of the Upsert Objects activity

1. In the **Checklist**, select Map Inputs. The **objects** element is displayed in the To Activity panel.
2. Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - o AssignmentRuleHeader
  - o MruHeader
  - o EmailHeader
  - o CallOptions
  - o connection
  - o sessionInfo
3. Click Select Inputs... and select the input variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
4. As appropriate, map the input parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

This activity supports the following optional input parameters:

- AssignmentRuleHeader
- EmailHeader
- MruHeader

Optional and nillable field elements have the following behavior:

- The Integration Appliance does not update an optional field, when the Salesforce.com server does not provide a value for the field.
- If you set the xsi:nil attribute to true on a nillable field, the Integration Appliance sets the field to null during an update.

Note: Setting a field to an empty string does not set a field to null.

### Map the output of the Upsert Objects activity

1. In the **Checklist**, select Map Outputs. The **upsertResults** element is displayed in the From Activity panel.
2. Click Select Outputs... and select the output variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
3. As appropriate, map the output parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

## Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_sapactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_sapactivities.html)

## Overview of the SAP connector

---

The SAP connector enables a two-way communication between Cast Iron and the SAP instance. The connector supports Business Application Programming Interface (BAPI), Remote Function Call (RFC), and Intermediate Document (IDOC) interfaces.

You can perform the following activities using the SAP connector:

- Outbound Activities
  - [Invoke BAPI](#)

- [Invoke RFC](#)
- [Send IDOC](#)
- Inbound/Starter Activities
  - [Receive IDOC](#)

The SAP connector supports SAP Java Connector (JCo) libraries to work with SAP via IDOC, RFC and BAPI interfaces.

The SAP connector requires the SAP JCo libraries to connect to the SAP instance. The connector supports JCo version 3.0.x or later versions. For more information, see [Downloading and installing the SAP Jar Files and DLLs](#).

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP\\_Overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP_Overview.html)

## Creating or editing a SAP endpoint

Endpoints provide the SAP connection information that Studio and the Integration Appliance use to connect to the SAP system.

### Procedure

1. Drag an activity from the SAP folder of the Activities tab onto the orchestration.

The Summary pane is displayed along with a Checklist which outlines what you must do to configure the activity.

2. Click Endpoint task from the Checklist and click on one of the following options:
  - Browse —To select an existing endpoint from the Project Explorer. Once a SAP endpoint has been added, you can click Edit to edit it.  
 Note: Editing an endpoint affects all orchestrations that use that endpoint in the project. The edits are global, not local.
  - New —To create a new endpoint. The Create Endpoint window is displayed.
  - Edit —To edit the existing endpoint. The Edit Endpoint window is displayed.
3. Complete the fields defined in the tables below.
4. When finished, click Test Connection to confirm that you can connect to the SAP System.
5. Click OK.

Table 1. SAP Options

Field	Description
<b>Location</b>	
Host Name	Specifies the IP Address or the machine name that contains the SAP system.
System Number	Specifies the number that identifies the specific instance of the SAP system that Studio should connect to. Your SAP administrator must supply this information.

Field	Description
<b>Client Information</b>	
SAP Client	Specifies a number that identifies Studio and the Integration Appliance as a client for the SAP system. Your SAP administrator must supply this information.
Language	Specifies the message language option for SAP. For example, EN is the ISO code for English.
<b>SAP Login Details</b>	
Username/Password based authentication	Specifies the user name and password of the user account of the SAP connector on the SAP system.
User name	Specifies the user name to use when connecting to the SAP system.
Password	Specifies the password to the user name when connecting to the SAP system.
SSO Token based authentication	Specifies that this option needs to be selected if the SSO Token is to be specified to log on to the SAP system.
SSO Token	Specifies the single sign-on (SSO) token.
Secure Network Connection (SNC)	Indicates that this check box must be selected for SNC. Note: When the SNC check box is selected, the Username/Password based authentication is cleared. To use this option, you must select it again.
Secure Network Connection (SNC) name	Specifies the distinguished name of the SNC connection.
Secure Network Connection (SNC) partner	Specifies the distinguished name of the SNC partner.
Secure Network Connection (SNC) security level	Specifies the level of security of SNC.
X509 Certificate	Specifies the X509 certificate to be used as the logon ticket. This field is optional only if Username/Password based authentication is used with SNC.
For more information about configuring SSO and SNC, see <a href="#">Configuring Single Sign-on (SSO) and Secure Network Communications (SNC) for SAP connector</a>	
<b>Connection Pool Options</b>	
Maximum Connections	Specifies the additional SAP connections, up to the specified amount, that the Integration Appliance opens based on the message load.
Maximum Idle Time	Specifies the number of minutes that a SAP connection can be open and idle before being closed by the Integration Appliance.

Field	Description
<b>Inbound Gateway</b>	
Note: The values specified in this section are only used by the Receive IDOC activity.	
Enable inbound gateway	Select this check box if this endpoint is used by a Receive IDOC activity and Receive RFC activity.
Host	Specifies the hostname of the SAP gateway.
Server Instances	Specifies the maximum number of Servers that can be registered with the same programID within an SAP instance.
Program ID	Specifies the ID of the registered Server. This ID is assigned when the RFC destination port is configured. SAP Program Ids cannot start with the exclamation (!) character. Note: For SAP systems, the Program ID name is case sensitive. For example, the Program ID name: Aaa is not equivalent to the Program ID name: aaa.
Service	Specifies the name of the SAP gateway service.
Retry Interval	Specifies the number of seconds that the Integration Appliance should wait before trying to re-establish a connection to the gateway of the SAP system.
<b>Remote Endpoint Configuration</b>	
Endpoint Runs Behind Firewall	Enables the secure connector name property so that secure connector can be used if the SAP application is running behind a firewall.
Secure Connector Name	Specifies the name of the secure connector that is used to connect to the SAP application running behind a firewall. For example, if an orchestration containing an SAP activity is deployed on to Cast Iron Live (cloud), then the secure connector needs to be configured.

Note: For some of the fields in the endpoint, you can [define configuration properties](#) to supply the values for these fields. The  icon is displayed when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.

**Parent topic:** [SAP activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP\\_Creating\\_or\\_Editing\\_a\\_SAP\\_Endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP_Creating_or_Editing_a_SAP_Endpoint.html)

## Downloading and installing the SAP Jar Files and DLLs

To connect to an SAP system from studio, you must install SAP DLLs and jar files onto your Windows development machine. You must have the SAP login credentials to enter the SAP Support Portal and download

the files.

## About this task

---

To download and install the SAP jar files and DLLs:

1. Contact SAP Technical Support to obtain the compressed files for the following SAP Components:
  - o **SAP JCo - based on the platform on which studio is running.**
  - o **SAP Java IDoc Class Library**

Note: Latest version of JCo jar available: 3.0.14, IDoc version 3.0.12.

2. Uncompress the SAP JCo compressed file:
  - o Double-click the `sapjdoc30P_x-1000xxxx.zip` file.
  - o Use the decompression tool to extract the contents of the compressed file to a temporary directory. This compressed file contains another compressed file `sapjco3-NTintel-3.0.x.zip`. Extract this compressed file to a temporary directory, for example: `C:\temp\sapjco3-NTintel-3.0.x`. This directory contains the required libraries `sapjco3.jar` and `sapjco3.dll`.
3. Uncompress the SAP IDoc JCo compressed file:
  - o Double-click the `sapjdoc30P_x-1000xxxx.zip` file.
  - o Use the decompression tool to extract the contents of the compressed file to a temporary directory, for example, `C:\temp\sapjdoc30P_x-1000xxxx`. This directory contains the required library `sapidoc3.jar`.

Note: If you are using Cast Iron Studio version 6.4 or earlier versions, you must download and install the 32 bit SAP libraries. For Cast Iron version 7.0 onwards, you must download and install the 64 bit SAP libraries.

## Procedure

---

1. Open studio, select Tools > Install Module Providers.
2. When the Add Providers dialog box is displayed, click the plus (+) button beneath SAP Connector.

A text entry field and a Browse button is displayed.

3. Click Browse, and use the browse dialog box to locate and select the `sapjco3.jar` file.
4. Click Open to import the jar file contents.
5. Click the next available plus (+) button to add the `sapidoc3.jar` and `sapjco3.dll` files.
6. When the jar file is listed in the Add Providers dialog box, click OK.

## Results

---

A prompt is displayed to restart studio and activate the changes.

## What to do next

---

You can now create SAP endpoints and orchestrations.

**Parent topic:** [SAP activities](#)

---

[Feedback](#) | [Notices](#)

## Configuring Single Sign-on (SSO) and Secure Network Communications (SNC) for SAP connector

---

### Before you begin

---

In Cast Iron version 6.3.0.2 and later versions, you can connect to SAP through the SAP connector in the following ways:

- By providing user name and password
- By providing an SSO ticket (for Invoke RFC, Invoke BAPI, and Send IDOC activities only).  
Note: Enable the SAP server for SSO. The SAP SSO ticket can be obtained by logging into the SAP system using a web browser and fetching the value of session cookie named `MYSAPSSO2`.
- Using the SNC feature, by providing the SNC name, the SNC partner name, and one of the following:
  - X509 certificate
  - X509 certificate, username (user of the certificate), and a dummy password
  - User name and password

Note: Enable the SAP server for SNC.

### Procedure

---

For SNC:

1. Add `SECUDIR` as a system variable and set it to the `PATH: WHERE SECUDIR = <PATH OF EXTRACTED SAP CRYPTO lib file>`.
2. Add the system credentials to the `.pse` file: `sapgenpse seclogin -p <PSE LOCATION>.pse -O <SYSTEM USERNAME>`.
3. In Cast Iron Studio, go to Tools > Install Module Providers and upload `sapcrypto.dll` file of the respective version of studio (32 bit/64 bit) to the SAP connector.
4. In the endpoint page, complete the following:
  - a. Specify the distinguished name for client PSE (created while generating client PSE) in the SNC name field.
  - b. Specify the distinguished name for client PSE (created while generating client PSE) in the SNC partner field.
  - c. Specify the level of security in SNC security level. Security level support is provided by Cryptographic Library and all security levels may not be supported by a particular library file. Select the required option from the drop-down list.
  - d. Optional: Specify the X509 certificate to be used as the log on ticket, if required. Remove the extra lines such that the certificate is in a single line.
  - e. Complete the rest of the fields and click Test Connection.

**Parent topic:** [SAP activities](#)

## SAP Invoke BAPI activity

---

Use the SAP Invoke BAPI activity to call a Business Object Method (BAPI), that is remotely enabled at the specified SAP Endpoint, during run time.

Note: To connect to the SAP System from Studio, you must download and install the SAP Jar files and DLLs onto your Window's development machine. For more information, see [Downloading and installing the SAP Jar Files and DLLs](#).

### Adding a SAP Invoke BAPI activity in the orchestration

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the SAP folder.
3. Drag the SAP Invoke BAPI activity onto the orchestration.
4. Select the activity. The Checklist is displayed.

### Creating, selecting, or editing a SAP endpoint

---

1. Click Pick Endpoint task from the Checklist and select one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Go to the Configuring the activity procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint panel is displayed.
2. [Create or Edit a SAP endpoint](#).

### Configuring the activity

---

1. Select the Configure task from the Checklist. The Configure panel is displayed.
2. In the Object Name field click Browse.... The BAPI List dialog box is displayed.
3. Search for a Business Object. Click a Business Object in the list and enter the starting characters of the Business Object name.
4. Expand the Business Object to view the associated BAPI methods.
5. Select a Business Object and Method and click OK.
6. Select one of the following Transaction Options:
  - o Do Nothing (Transaction handled by BAPI directly) - During run time, the Integration Appliance calling the BAPI does no transaction processing. If a transaction is associated with the BAPI, the BAPI must completely handle the transaction
  - o Commit transaction after completion - During run time, the Integration Appliance calls the BAPI and waits for a return message from the SAP System. The return code of the message returned from the SAP System determines if the Integration Appliance sends another message requesting that the SAP System to commit or rollback the transaction:
    - If the return code passed back from the BAPI indicates success, the Integration Appliance sends another message requesting that the SAP System commit the transaction and immediately starts processing the next activity in the orchestration.

- If the return code passed back from the BAPI indicates failure, the Integration Appliance sends a rollback request to the SAP System and immediately starts processing the next activity in the orchestration.
  - Commit transaction and wait upon completion - During run time, the Integration Appliance invokes the BAPI and waits for a return message from the SAP System. The return code of the message returned from the SAP System determines if the Integration Appliance sends another message requesting that the SAP System to commit or rollback the transaction:
    - If the return code passed back from the BAPI indicates success, the Integration Appliance sends another message requesting that the SAP System commit the transaction. The orchestration waits until the SAP System sends a second message indicating that the transaction has been committed before processing the next activity in the orchestration.
    - If the return code passed back from the BAPI indicates failure, the Integration Appliance sends a rollback request to the SAP System. The orchestration waits until the SAP System sends a second message indicating that the rollback of the transaction has occurred before processing the next activity in the orchestration.

## Specifying the retry options

1. Select the Retry task from the Checklist. The Retry panel is displayed.
2. Configure the retry options for connecting to an SAP System. The following table describes the retry options for connecting to an SAP System:

Re try op tio ns	Description
1) Wa it — — — se co nd s be tw ee n ea ch ret ry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the SAP System.
2) Try to co nn ect — — — ti	Specifies the maximum number of times the Integration Appliance attempts to establish a connection to the SAP System before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an SAP Invoke BAPI activity and the Integration Appliance cannot connect to the specified SAP System, the Integration Appliance logs the connections errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the

me s be for e fail ing .	system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
---	--

## Mapping the inputs of the activity

1. Select the Map Inputs task in the Checklist. The XML Schemas generated from the input parameters of the BAPI are displayed as nodes under the request input parameter in the To Activity panel. In addition if the BAPI contains tables, the XML Schemas representing the tables of the BAPI , are displayed as nodes under the request input parameter in the To Activity panel.

The SAP connector also supports dynamic endpoint connection to a different SAP system. During run time, add optional parameters in `sapConnectionProperties` of map inputs, if you want to dynamically connect to an SAP system other than the one configured in the endpoint panel, if you want to connect to the same SAP system with a different user name and password other than the fields used in the endpoint panel, or if you want a different SSO token other than the one added in the endpoint panel. The parameters of `sapConnectionProperties` are described in the following table:

Table 1. Connection properties

Optional parameter	Description
<code>sapConnectionProperties</code> parameters	
<code>hostName</code>	Specifies the IP Address or the machine name that contains the SAP system.
<code>systemNumber</code>	Specifies the number that identifies the specific instance of the SAP system that Studio should connect to. Your SAP administrator must supply this information.
<code>client</code>	Specifies a number that identifies Studio and the Integration Appliance as a client for the SAP system. Your SAP administrator must supply this information.
<code>language</code>	Specifies the message language option for SAP. For example, EN is the ISO code for English.
<code>basicAuthentication</code> parameters	
<code>username</code>	Specifies the user name to use when connecting to the SAP system.
<code>password</code>	Specifies the password to the user name when connecting to the SAP system.
<code>ssoAuthentication</code> parameters	
<code>ssotoken</code>	Specifies the single sign-on (SSO) token.
<code>sncAuthentication</code> parameters	
<code>sncmode</code>	Specifies if the Secure Network Connections (SNC) mode is enabled.
<code>sncname</code>	Specifies the distinguished name of the SNC connection.
<code>partner</code>	Specifies the distinguished name of the SNC partner.
<code>qop</code>	Specifies the level of security of SNC.
<code>X509 Certificate</code>	Specifies the X509 certificate to be used as the logon ticket. This field is optional only if Username/Password based authentication is used with SNC.

Optional parameter	Description
connectionPool parameters	
maximumConnections	Specifies the additional SAP connections, up to the specified amount, which the Integration Appliance opens based on the message load.
maxIdleTime	Specifies the number of minutes that a SAP connection can be open and idle before being closed by the Integration Appliance.

2. Create a map between orchestration variables and the BAPI input parameters and tables. See [Creating a map](#) for general instructions on mapping.

Values must be provided at run time for any mandatory elements of the BAPI input parameters or tables. A value can be provided by specifying a default value for element or by linking the element with input node. During run time if no value is provided for a mandatory element, the activity throws an exception during run time which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional element of the BAPI input parameters or tables, no exception is thrown during run time.

## Mapping the outputs of the activity

1. Select the Map Outputs task in the Checklist. The XML Schema generated from return types of the BAPI display as nodes under the response output parameter in the From Activity panel. In addition, if the BAPI contains tables, the XML Schemas representing the tables are displayed as nodes under the response node in the From Activity.
2. Create a map between the BAPI output parameters and tables and orchestration variables. See [Creating a map](#) for general instructions on mapping.

## Note about deploying a SAP orchestration

Before you can deploy an orchestration with SAP activities using the WMC, the Integration Appliance must first be able to establish a connection to the SAP System. If the Integration Appliance is unable to establish the connection to the SAP System, the orchestration is not deployed.

**Parent topic:** [SAP activities](#)

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP\\_Invoke\\_BAPI\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP_Invoke_BAPI_Activity.html)

## SAP Invoke RFC activity

Use the SAP Invoke RFC activity to call a Remote Function Call (RFC), that is remotely enabled at the specified SAP endpoint, during run time.

Note: To connect to the SAP System from Studio, you must download and install the SAP Jar files and DLLs onto your Window's development machine. For more information, see [Downloading and installing the SAP Jar](#)

## Adding a SAP Invoke RFC activity to the orchestration

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the SAP folder.
3. Drag the SAP Invoke RFC activity onto the orchestration.
4. Select the activity. The Checklist is displayed.

## Creating, selecting, or editing a SAP endpoint

---

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Go to the Configuring the activity procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint panel is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint panel is displayed.
2. [Create or Edit a SAP endpoint](#).

## Configuring the activity

---

1. Select the Configure task from the Checklist. The Configure panel is displayed.
2. In the RFC Name field, click Browse.... The RFC List dialog box is displayed.
3. In the RFC Search Function field, enter a combination of characters and the \* wildcard character to find the desired RFC name as shown in the following examples:
  - o AB\* —Finds all the RFC whose names begin with the AB prefix.
  - o AB\*TRANSACTION —Finds all the RFC whose begin with the AB prefix and end with the string: TRANSACTION.

The SAP system is interrogated and the RFC names that match the wildcard expression are listed in the Matching SAP Functions table.

4. From the Matching SAP Functions table, select one of the SAP Functions and click OK.

## Specifying the retry options

---

1. Select the Retry task from the Checklist. The Retry panel is displayed.
2. Configure the retry options for connecting to an SAP System. The following table describes the retry options for connecting to an SAP System:

<b>Re try op tio ns</b>	<b>Description</b>
1) Wa it — — — se	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the SAP System.

co nd s be tw ee n ea ch ret ry.	
2) Try to co nn ect ____ _ti me s be for e fail ing .	Specifies the maximum number of times the Integration Appliance attempts to establish a connection to the SAP System before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an SAP Invoke RFC activity and the Integration Appliance cannot connect to the specified SAP System, the Integration Appliance logs the connections errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.

## Mapping the inputs of the activity

1. Select the Map Inputs task in the Checklist. The XML Schemas generated from the input parameters of the RFC are displayed as nodes under the request input parameter in the To Activity pane. In addition if the RFC contains tables, the XML Schemas representing the tables of the RFC, are displayed as nodes under the request input parameter in the To Activity panel.
2. Create a map between orchestration variables and the RFC input parameters and tables. See [Creating a map](#) for general instructions on mapping.

Values must be provided at run time for any mandatory elements of the RFC input parameters or tables. A value can be provided by specifying a default value for the element or by linking the element with input node. During run time if no value is provided for a mandatory element, the activity throws an exception during run time which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional element of the RFC input parameters or tables, no exception is thrown during run time.

### Transaction Options:

1. In the Map Inputs of the activity, right click the To Activity section and select Show Optional Parameters. A variable `transactionOptions` appears in the map input. This property is available from Cast Iron Studio version 6.1.0.12 only.
2. Select one of the following values:

**Note:** If you do not set any value for the `transactionOptions` property, the `COMMIT_HANDLED_BY_RFC` value will be used.

Table 1.

Value	Description
COMMIT_HANDED_BY_RFC	The commit of RFC is taken care by the RFC itself. The connector does not do any explicit commit calls.
COMMIT_TRANSACTION_COMPLETED	During run time, the SAP connector calls the RFC and waits for a return message from the SAP System. The return code of the message returned by the SAP system determines if the SAP connector sends another call requesting the SAP system to commit or rollback the transaction: <ul style="list-style-type: none"> <li>○ If the return code passed from the RFC indicates success, the SAP connector makes another call requesting the SAP system to commit the transaction, and immediately starts processing the next activity in the orchestration.</li> <li>○ If the return code passed from the RFC indicates failure, the SAP connector makes a rollback request to the SAP system, and immediately starts processing the next activity in the orchestration.</li> </ul>
COMMIT_TRANSACTION_WAIT_UPON_COMPLETION	During run time, the SAP connector invokes the RFC and waits for a return message from the SAP system. The return code of the message returned by the SAP system determines if the SAP connector sends another message requesting the SAP system to commit or rollback the transaction: <ul style="list-style-type: none"> <li>○ If the return code passed back from the RFC indicates success, the SAP connector makes another call requesting the SAP system to commit the transaction. The orchestration waits until the SAP System sends a second message indicating that the transaction has been committed before processing the next activity in the orchestration.</li> <li>○ If the return code passed back from the RFC indicates failure, the SAP connector makes a rollback request to the SAP system. The orchestration waits until the SAP system sends a second message indicating that the rollback of the transaction has occurred before processing the next activity in the orchestration.</li> </ul>

3. After the transaction operations are selected, fill in the input data for RFC.

The SAP connector also supports dynamic endpoint connection to a different SAP system. During run time, add optional parameters in `sapConnectionProperties` of map inputs, if you want to dynamically connect to an SAP system other than the one configured in the endpoint panel, if you want to connect to the same SAP system with a different user name and password other than the fields used in the endpoint panel, or if you want a different SSO token other than the one added in the endpoint panel. The parameters of `sapConnectionProperties` are described in the following table:

Table 2. Connection properties

Optional parameter	Description
<code>sapConnectionProperties</code> parameters	
hostName	Specifies the IP Address or the machine name that contains the SAP system.
systemNumber	Specifies the number that identifies the specific instance of the SAP system that Studio should connect to. Your SAP administrator must supply this information.
client	Specifies a number that identifies Studio and the Integration Appliance as a client for the SAP system. Your SAP administrator must supply this information.
language	Specifies the message language option for SAP. For example, EN is the ISO code for English.
<code>basicAuthentication</code> parameters	

Optional parameter	Description
username	Specifies the user name to use when connecting to the SAP system.
password	Specifies the password to the user name when connecting to the SAP system.
ssoAuthentication parameters	
ssotoken	Specifies the single sign-on (SSO) token.
sncAuthentication parameters	
sncmode	Specifies if the Secure Network Connections (SNC) mode is enabled.
sncname	Specifies the distinguished name of the SNC connection.
partner	Specifies the distinguished name of the SNC partner.
qop	Specifies the level of security of SNC.
X509 Certificate	Specifies the X509 certificate to be used as the logon ticket. This field is optional only if Username/Password based authentication is used with SNC.
connectionPool parameters	
maximumConnections	Specifies the additional SAP connections, up to the specified amount, which the Integration Appliance opens based on the message load.
maxIdleTime	Specifies the number of minutes that a SAP connection can be open and idle before being closed by the Integration Appliance.

## Mapping the outputs of the activity

1. Select the Map Outputs task in the Checklist. The XML Schema generated from return types of the RFC are displayed as nodes under the request output parameter in the From Activity panel. In addition, if the RFC contains tables, the XML Schemas representing the tables are displayed as nodes under the request node in the From Activity.
2. Create a map between the RFC output parameters and tables and orchestration variables. See [Creating a map](#) for general instructions on mapping.

## Note about Deploying a SAP Orchestration

Before you can deploy an orchestration with SAP activities using the WMC, the Integration Appliance must first be able to establish a connection to the SAP System. If the Integration Appliance is unable to establish the connection to the SAP System, the orchestration is not deployed.

**Parent topic:** [SAP activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP\\_Invoke\\_RFC\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP_Invoke_RFC_Activity.html)

## SAP Receive IDOC activity

---

Use the SAP Receive IDOC activity to act as a server and listen on the configured SAP endpoint, during run time. The activity receives an IDOC from the specified SAP endpoint and converts it to XML data. The SAP Receive IDOC activity is a starter activity.

If you receive your SAP data directly from the SAP system using an RFC port, you must use the SAP Receive IDOC activity. If you receive your SAP data as a file through a SAP File Port to the SAP system, you must use the Project > Import > SAP IDOC Schema toolbar menu option during design time to generate a Flat File Schema for your IDOC metadata and use the Read Flat File activity to read the SAP data. For more information, see [Generating a Flat File Schema from an IDOC](#).

For the SAP Receive IDOC activity only, you must specify an inbound gateway connection parameters. For more information, see [Creating or editing a SAP endpoint](#).

In order to connect to the SAP System from Studio, you must download and install the SAP Jar files and DLLs on your Windows development machine. For more information, see [Downloading and installing the SAP Jar Files and DLLs](#).

Note: An orchestration that contains an SAP Receive IDOC activity must have persistence enabled. For more information, see [Enabling persistence](#).

### Adding a SAP Receive IDOC activity in the orchestration

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the SAP folder.
3. Drag the Receive IDOC activity onto the orchestration.
4. Select the activity. The Checklist is displayed.

### Creating, selecting, or editing a SAP endpoint

---

1. Click Pick Endpoint task from the Checklist and select one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Go to the Configuring the activity procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint panel is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint panel is displayed.
2. [Create or Edit a SAP endpoint](#).

### Configuring the activity

---

1. Select the Configure task from the Checklist. The Configure panel is displayed.
2. Click Browse....
3. Select an IDOC row and click OK. The Message Type, IDOC Type, and IDOC Extended Type in the Configure task are populated.

### Mapping the outputs of the activity

---

1. Select the Map Outputs task in the Checklist.

The output parameter of the activity is displayed in the From Activity panel. The XML Schema generated from the selected IDOC Type and IDOC Extended Type becomes the output parameter of the activity.

2. Create a map between the IDOC XML Schema and orchestration variables. See [Creating a map](#) for general instructions on mapping.

## Note about Deploying a SAP Orchestration

---

Before you can deploy an orchestration with SAP activities using the Web Management Console, the Integration Appliance must first be able to establish a connection to the SAP System. If the Integration Appliance is unable to establish the connection to the SAP System, the orchestration is not deployed.

**Parent topic:** [SAP activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP\\_Receive\\_IDOC\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP_Receive_IDOC_Activity.html)

## SAP Send IDOC activity

---

Use the SAP Send IDOC activity to send an IDOC to the specified SAP endpoint, during run time.

If you send your SAP data directly to the SAP system using an RFC port, you must use the SAP Send IDOC activity. If you send your SAP data as a file through a SAP File Port to the SAP system, you must use the Project > Import > SAP IDOC Schema toolbar menu option during design time to generate a Flat File Schema for your IDOC metadata and use the Write Flat File activity to write the SAP data. For more information, see [Generating a Flat File Schema from an IDOC](#).

To connect to the SAP System from Studio, you must download and install the SAP Jar files and DLLs on your Window's development machine. For more information, see [Downloading and installing the SAP Jar Files and DLLs](#).

During run time, if the SAP Send IDOC activity processes two instances of an IDOC, where both instances have the same IDOC number, the SAP Send IDOC activity appends the data segment of the second instance to the first instance.

Note: An orchestration that contains a SAP Send IDOC activity must have persistence enabled. For more information, see [Enabling persistence](#).

The steps for adding and configuring a SAP Send IDOC activity to an orchestration are described in the following procedures:

- [Adding a SAP Send IDOC activity to the orchestration](#)
- [Creating, selecting, or editing a SAP endpoint](#)
- [Configuring the activity](#)
- [Specifying the retry options](#)
- [Mapping the inputs of the activity](#)

## Adding a SAP Send IDOC activity to the orchestration

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the SAP folder.
3. Drag the Send IDOC activity onto the orchestration.
4. Select the activity. The Checklist is displayed.

## Creating, selecting, or editing a SAP endpoint

---

1. Click Pick Endpoint task from the Checklist and select one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Go to the [Configuring the activity](#) procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint panel is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint panel is displayed.
2. [Create or Edit a SAP endpoint](#).

## Configuring the activity

---

1. Select the Configure task from the Checklist. The Configure panel is displayed.
2. Click Browse....
3. Select an IDOC row and click OK. The Message Type, IDOC Type, and IDOC Extended Type in the Configure task are populated.

## Specifying the retry options

---

1. Select the Retry task from the Checklist. The Retry panel is displayed.
2. Configure the retry options for connecting to an SAP System. The following table describes the retry options for connecting to an SAP System:

Re try op tio ns	Description
1) Wa it — — — se co nd s be tw ee n ea ch ret ry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the SAP System.

2) Try to co nn ect __ _ ti me s be for e fail ing .	Specifies the maximum number of times the Integration Appliance attempts to establish a connection to the SAP System before issuing an error and stopping the processing of the current orchestration job. If you deploy an orchestration that contains an SAP Send IDOC activity and the Integration Appliance cannot connect to the specified SAP System, the Integration Appliance logs the connections errors as warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an error in the system and orchestration logs and the stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
--	---

## Mapping the inputs of the activity

1. Select the Map Inputs task in the Checklist. The input parameter of the activity are displayed in the To Activity panel. The XML Schema generated from selected IDOC Type and IDOC Extended Type becomes the input parameter of the activity.
2. Right-click the To Activity section and select Show Optional Parameters.

The SAP connector also supports dynamic endpoint connection to a different SAP system. During run time, add optional parameters in `sapConnectionProperties` of map inputs, if you want to dynamically connect to an SAP system other than the one configured in the endpoint panel, if you want to connect to the same SAP system with a different user name and password other than the fields used in the endpoint panel, or if you want a different SSO token other than the one added in the endpoint panel. The parameters of `sapConnectionProperties` are described in the following table:

Table 1. Connection properties

Optional parameter	Description
<code>sapConnectionProperties</code> parameters	
<code>hostName</code>	Specifies the IP Address or the machine name that contains the SAP system.
<code>systemNumber</code>	Specifies the number that identifies the specific instance of the SAP system that Studio should connect to. Your SAP administrator must supply this information.
<code>client</code>	Specifies a number that identifies Studio and the Integration Appliance as a client for the SAP system. Your SAP administrator must supply this information.
<code>language</code>	Specifies the message language option for SAP. For example, EN is the ISO code for English.
<code>basicAuthentication</code> parameters	
<code>username</code>	Specifies the user name to use when connecting to the SAP system.
<code>password</code>	Specifies the password to the user name when connecting to the SAP system.
<code>ssOAuthentication</code> parameters	
<code>ssotoken</code>	Specifies the single sign-on (SSO) token.

Optional parameter	Description
sncAuthentication parameters	
sncmode	Specifies if the Secure Network Connections (SNC) mode is enabled.
sncname	Specifies the distinguished name of the SNC connection.
partner	Specifies the distinguished name of the SNC partner.
qop	Specifies the level of security of SNC.
X509 Certificate	Specifies the X509 certificate to be used as the logon ticket. This field is optional only if Username/Password based authentication is used with SNC.
connectionPool parameters	
maximumConnections	Specifies the additional SAP connections, up to the specified amount, which the Integration Appliance opens based on the message load.
maxIdleTime	Specifies the number of minutes that a SAP connection can be open and idle before being closed by the Integration Appliance.

3. Create a map between orchestration variables and the IDOC input parameters and tables. See [Creating a map](#) for general instructions on mapping.

## Note about Deploying a SAP Orchestration

Before you can deploy an orchestration with SAP activities using the Web Management Console, the Integration Appliance must first be able to establish a connection to the SAP System. If the Integration Appliance is unable to establish the connection to the SAP System, the orchestration is not deployed.

**Parent topic:** [SAP activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP\\_Send\\_IDOC\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP_Send_IDOC_Activity.html)

## SAP Receive RFC activity

Use the SAP Receive RFC activity to act as a server and listen on the configured SAP endpoint, during run time. The activity receives RFC from the specified SAP endpoint and converts it to XML data. The SAP Receive RFC activity is a starter activity. This activity can be configured in both synchronous and asynchronous mode.

For the SAP Receive RFC activity, you must specify the inbound gateway connection parameters. The Receive RFC activity accepts requests only from the configured Program ID in the endpoint. For more information see [Creating or editing a SAP endpoint](#).

To connect to the SAP system from Studio, you must download and install the SAP Jar files and DLLs on your Window's development machine. For more information, see [Downloading and installing the SAP Jar Files and DLLs](#).

Note: An orchestration that contains an SAP Receive RFC activity must have persistence enabled to run in asynchronous mode. For more information, see [Enabling persistence](#).

## Adding a SAP Receive RFC activity to the orchestration

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the SAP folder.
3. Drag the Receive RFC activity onto the orchestration.
4. Select the activity. The Checklist is displayed.

## Creating, selecting, or editing a SAP endpoint

---

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Go to the Configuring the activity procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint panel is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint panel is displayed.
2. [Create or Edit a SAP endpoint](#).

## Configuring the activity

---

1. Select the Configure task from the Checklist. The Configure panel is displayed.
2. In the RFC Name field, click Browse.... The RFC List dialog box is displayed.
3. In the RFC Search Pattern field, enter a combination of characters and the \* wildcard character to find the desired RFC name as shown in the following examples:
  - o AB\* —Finds all the RFC names that begin with the AB prefix.
  - o AB\*TRANSACTION —Finds all the RFC names that begin with the AB prefix and end with the string: TRANSACTION.

The SAP system is interrogated and the RFC names that match the wildcard expression are listed in the Matching SAP Functions table.

4. In the Options panel, you can either select the Synchronous mode check box or clear it. The processing can be handled either synchronously or asynchronously. By default, the Receive RFC activity is configured to the asynchronous mode.
  - o **Synchronous mode** - Both SAP and Cast Iron (the SAP Receive RFC activity) must be available during processing. SAP sends an RFC request to Cast Iron and waits for a response from the Receive RFC activity.
  - o **Asynchronous mode** - The SAP Receive RFC activity need not be available when SAP invokes the function call. SAP sends an RFC request to Cast Iron and does not wait for a response from the Receive RFC activity.
5. From the Matching SAP Functions table, select one of the SAP Functions and click OK.

## Mapping the outputs of the activity

---

1. Select the Map Outputs task in the Checklist. The output parameter of the activity is displayed in the From Activity panel. The XML Schema generated from the selected RFC becomes the output parameter of the activity.

2. Create a map between the RFC output parameters and tables and orchestration variables. See [Creating a map](#) for general instructions on mapping.

## Note about Deploying a SAP Orchestration

---

Before you can deploy an orchestration with SAP activities using the WMC, the Integration Appliance must first be able to establish a connection to the SAP System. If the Integration Appliance is unable to establish the connection to the SAP System, the orchestration is not deployed.

**Parent topic:** [SAP activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP\\_Receive\\_RFC\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP_Receive_RFC_Activity.html)

## SAP Send RFC Response activity

---

The SAP **Send RFC Response** activity sends a reply back to the sender (SAP) of the SAP Receive RFC request.

The **Send RFC Response** activity must be used in conjunction with a **Receive RFC** activity in an orchestration. If you add a **Send RFC Response** activity to orchestration, you must select the Synchronous mode check box in the **Configure** task of the **Receive RFC** activity.

## Adding a Send RFC Response activity to the orchestration

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the SAP folder.
3. Drag the **Send RFC Response** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed with the **Configure** task active in the properties pane. The properties pane is located below the graphical representation of the orchestration.

## Configuring the activity

---

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field	Description
-------	-------------

<b>F i e l d</b>	<b>Description</b>
T	<p>Specifies the SAP Receive RFC activity associated with this Send RFC Response activity. During run time, the associated Receive RFC activity receives the request from SAP, processes the request, and sends the output to Send RFC Response. The Send RFC Response activity sends the response back to SAP.</p> <p>Note: This field gets populated only if you select the Synchronous mode check box in the <b>Configure</b> task of the SAP <b>Receive RFC</b> activity.</p>

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP\\_Send\\_Response\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SAP_Send_Response_Activity.html)

## Troubleshooting and support

Troubleshooting techniques and self-help information help you identify and solve problems quickly. This topic provides potential solutions for issues you would have with the SAP connector.

### Getting EDI\_DC40 IDOC control record structure with WebSphere Cast Iron SAP Connector

EDI\_DC40 is a standard SAP structure used to store IDoc Control Record for Interface to External System information. With the SAP connector using non-Unicode SAP server as endpoint in WebSphere Cast Iron Studio version 7002 for the Receive IDoc and Send IDoc activities, supports Control record name as EDI\_DC40.

Customer who are getting the EDI\_DC as their standard structure name, are requested to use the latest version of 7501/7510 Studio and reconfigure the object in their orchestration and map it accordingly.

#### Older behavior:

With the Old Behavior for non-Unicode machine the control record name was EDI\_DC instead of EDI\_DC40.

```
-ALEREQ01
|_SAPTransactorID
|_qRECQueueName
|_IDOC
|_@Begin
|_EDI_DC
|_@Segment
|_TABNAM
|_MANDT
```

.....  
.....

### New behavior:

With the new behavior for both Unicode and non-Unicode SAP server, the control record name will be EDI\_DC40.

```
-ALEREQ01
|_SAPTransactorID
|_qRECQueueName
|_IDOC
|_@Begin
|_EDI_DC40
|_@Segment
|_TABNAM
|_MANDT
.....
.....
```

## Dependency JCo Jar files - Version Specific Information

---

Install and use the latest patch level of the SAP Java Connector 3.0. Latest version of JCo jar available: 3.0.14, IDoc version 3.0.12.

You need to have these 3 files: sapjco3.jar, sapjco3.dll (for Windows) or sapjco3.so (for Appliance), and sapidoc3.jar.

For downloading SAP JCo jar (2 files), follow these steps with specific to version:

- Download latest the SAP Java Connector 3.0.14 from the SAP Service Marketplace at <http://service.sap.com/connectors>. You will find the download package with the latest patch level for various platform by navigating to SAP Java Connector > Tools & Services > Download SAP JCo Release 3.0. An installation guide is included in the download archive.
  - For Studio 32 bit Version, download the JCo jar zip file under Microsoft Windows and Windows Server > 32bit for 32 bit version of WebSphere Cast Iron Studio.
  - For Studio 64 bit Version, download the JCo jar zip file under Microsoft Windows and Windows Server > 64bit x86 for 64 bit version of WebSphere Cast Iron Studio.
  - For WebSphere Cast Iron Appliance, download the JCo jar zip file under Linux (for Intel compatible processors)> 64bit x86 for Appliance.

For downloading SAP IDoc jar (1 file), follow these steps with specific to version:

- Download latest the SAP Java Connector 3.0.14 from the SAP Service Marketplace at <http://service.sap.com/connectors>. You will find the download package with the latest patch level for various platform by navigating to SAP Java Connector > Tools & Services > SAP Java IDoc Class Library.
  - For all platforms, SAP Java IDoc Class Library 3.0.12 zip file will contain the SAP IDoc jar file.

## Exception thrown when trying to browse for IDoc/BAPI/RFC of an orchestration (new/existing) for 6.1.0.15 studio projects in later studio versions

---

### Problem:

Null point exception is thrown when a 6.1.0.15 studio project is opened in any other later versions of studio and when a browse for IDoc/BAPI/RFC is done in a new or an existing orchestrations.

Error shown in studio error.log file:

```
WARNING: Unable to find entry: /.configuration-wizard -- err msg: Unable to locate
entry
/.configuration-wizard java.util.concurrent.ExecutionException:
```

```

java.lang.NullPointerException at
java.util.concurrent.FutureTask.report(FutureTask.java:134) at
java.util.concurrent.FutureTask.get(FutureTask.java:200) at
com.approuter.studio.gui.FutureBusyView$1.run(FutureBusyView.java:72) at

java.util.concurrent.ThreadPoolExecutor.runWorker(ThreadPoolExecutor.java:1157) at

java.util.concurrent.ThreadPoolExecutor$Worker.run(ThreadPoolExecutor.java:627) at
java.lang.Thread.run(Thread.java:798) Caused by:
java.lang.NullPointerException at
com.approuter.studio.connectors.sap.WSSapConnection.<init>
(WSSapConnection.java:88) at

com.approuter.studio.connectors.sap.endpoint.SapEndpointProjectNode$3.call(SapEndpoi
ntProjectNode.java:345)
at

com.approuter.studio.connectors.sap.endpoint.SapEndpointProjectNode$3.call(SapEndpoi
ntProjectNode.java:342)
at java.util.concurrent.FutureTask.run(FutureTask.java:274)

```

**Cause:**

Enhanced authentication mechanisms in higher versions of Cast Iron Studio.

**Solution:**

After opening the project in later version of Studio, navigate to any of the respective Endpoints displayed on the right side of the project tab and come back to the Configure tab of the orchestration.

Now you are enabled with browsing for the IDoc/BAPI/RFC for that orchestration.

## Supported formats of the date and time field values

---

The following table describes the supported formats of the date and time field values for all activities of the SAP connector:

Table 1. Formats for Date and Time field values

Field	Input parameter (non-starter activities)	Output parameter (starter and non-starter activities)
Date	yyyy-mm-dd or yyyymmdd	yyyymmdd
Time	hh:mm:ss or hhmmss	hhmmss

The supported formats for the input and output parameters of the date and time field values in the SAP connector version 6.0.x and earlier versions are: yyyy-mm-dd and hh:mm:ss, respectively.

## Exception thrown when you deploy orchestrations with Receive RFC and Receive IDOC activities using the same RFC Program ID

---

**Problem:** When you deploy orchestrations with Receive RFC and Receive IDOC activities with the same SAP RFC Program ID, the following exception is thrown:

```

java.lang.RuntimeException: An attempt to start a JCoIDocServer failed. There might
be an existing JCoServer with the same server configuration, else try restarting
your server
at
com.ibm.j2ca.sap.inbound.SapJCoServerBuilder.verfiyServerConfiguration(SapJCoServerB
uilder.java:403)
at
com.ibm.j2ca.sap.inbound.SapJCoServerBuilder.createServer(SapJCoServerBuilder.java:9
6)
at
com.ibm.j2ca.sap.inbound.SAPEventListenerManager.buildEventListener(SAPEventListene
rManager.java:149)
at
com.ibm.j2ca.sap.inbound.SAPEventListenerManager.startEventListeners(SAPEventListene
rManager.java:132)
at com.ibm.j2ca.sap.inbound.EndpointManager.addEndpoint(EndpointManager.java:68)
at
com.ibm.j2ca.sap.SAPResourceAdapter.endpointActivation(SAPResourceAdapter.java:266)
at
com.approuter.module.sap.activity.ReceiveIDOCActivity.activate(ReceiveIDOCActivity.j
ava:222)
at com.approuter.maestro.activities.BaseModule.activate(BaseModule.java:296)
at com.approuter.maestro.vm.Program.start(Program.java:796)
at com.approuter.maestro.vm.Kernel.startOrchestration(Kernel.java:704)
at com.approuter.maestro.management.Loader$1.run(Loader.java:461)
at java.lang.Thread.run(Thread.java:736)

```

**Cause:** SAP JCo allows only one instance of JCoServer with a given set of server configuration to run within a Java virtual machine (JVM); another JCoServer with same server configuration cannot run in the same JVM. JCo throws an error indicating that the server cannot be restarted. The Receive IDOC activity and Receive RFC activity do not support the same SAP Program ID used during orchestration.

**Solution:** Ensure that you deploy orchestrations having Receive RFC and Receive IDOC activities using different SAP Program IDs, and create separate end points for IDOC/RFC.

## Recommended configurations to avoid 'Maximum number of 202 conversations exceeded' error

---

When working with the SAP connector, the following are the recommended configurations to be done if the 'Maximum number of 202 conversations exceeded' error is displayed:

### Error:

```

LOCATION      CPIC (TCP/IP) on local host with Unicode
ERROR       max no of 202 conversations exceeded
TIME        <Day> <Date> <Time> <Year>
RELEASE     720
COMPONENT   CPIC (TCP/IP) with Unicode

```

The following recommendations depend on the load and the number of parallel requests:

1. Reduce the timeout value in the endpoint configuration so that the unused connections are terminated automatically.
2. Configure Cast Iron runtime and SAP gateway to support more RFC connections.
  - a. Set the environment value `CPIC_MAX_CONV` to `>100` on Cast Iron runtime. Update `maestro.sh` to set the environment variable. The steps are described in Schedule A.
  - b. Increase the profile value `gw/max_conn` and `gw/max_sys` on the SAP gateway to support many parallel connections. Also, if you run into memory bottlenecks increase the values of `gw/max_overflow_size` and `gw/max_shm_req`.

- c. Set maximum connections value in SAP endpoint to a realistic value. Depending on the load and parallel requests, appliance either generates or receives.
- d. Set the number of Server Instance value in SAP endpoint to 10.

### 3. Sample Values:

```
SAP-Gateway
gw/max_conn=2000, gw/max_sys=1200
gw/max_overflow_size =40000000, gw/max_shm_req = 200 (this is to adjust the
memory allocation)
CPIC_MAX_CONV=5000
```

### Schedule A:

1. Log on into the appliance shell (contact IBM support to get appliance shell key in order to log on to the system shell).
2. Go to the `/usr/ironhide/bin` folder. Take a back up of `maestro.sh` (copy `maestro.sh` to `maestro.sh.old`).
3. Edit `maestro.sh`.

```
move to line
# Version of java currently in use.
if [ -z $JAVA_HOME ]; then
    JAVA_HOME=/usr/java/default
fi
JAVA="{JAVA_HOME}/bin/java"
```

4. Add the following line:

```
## maximum SAP conversations allowed
export CPIC_MAX_CONV=500
```

5. Save and exit.
6. Exit system shell and run the command `system restart` in order to restart the appliance runtime.

## Upgrading JRE from 32 bit to 64 bit

---

**Problem:** If you have an SAP project running on an earlier version of the appliance, when you upgrade the appliance to version 7.0 or later, the SAP projects will not start and the following errors occur:

- Examples of errors thrown in WMC:

```
Start of Orchestration config-
url://SAP_BAPI/1.0/Default/Orchestrations/Orchestration failed:
java.lang.ExceptionInInitializerError: Error
getting the version of the native layer:
java.lang.UnsatisfiedLinkError: sapjco3
(/usr/ironhide/lib/thirdparty/libsapjco3.so:
wrong ELF class: ELFCLASS32).

Required SAP JCO library is not found.
Install version 3.x SAP JCO library (.dll or .so based on platform)
```

- Examples of exceptions recorded in the `maestro.out` log:

```
java.lang.UnsatisfiedLinkError: sapjco3
(/usr/ironhide/lib/thirdparty/libsapjco3.so: wrong ELF class: ELFCLASS32)
    at java.lang.ClassLoader.loadLibraryWithPath(ClassLoader.java:1030)

**Cause:**

In the earlier versions of Cast Iron appliance (version 6.4 and earlier versions), 32 bit SAP JCo libraries were used. From Cast Iron appliance version 7.0 onwards, you must use the 64 bit SAP JCo libraries.

**Solution:**

You need to delete the 32 bit SAP JCo libraries, `sapjco3.jar` and `libsapjco3.so`, and load the 64 bit SAP JCo libraries.

Upgrading SAP JCo libraries:

In case of any issue after applying 64 bit JCo libraries, contact IBM Technical Support for further assistance.

## ServiceMax activities

---

- [Creating or editing a ServiceMax endpoint](#)  
ServiceMax endpoints provide information that Studio and the Integration Appliance use to connect to a ServiceMax instance.
- [Configuring ServiceMax activities](#)  
Selecting fields from the ServiceMax object to map is one of the tasks you must complete to configure a ServiceMax activity. For more information about the configuration tasks in the Checklist, see the help topic for the specific ServiceMax activity.
- [Setting ServiceMax configuration properties](#)  
Any changes you make to configuration properties affects all orchestrations that use that endpoint. The edits are global, not local.
- [Specifying the Retry and Time Out parameters for ServiceMax activities](#)  
Specifying the Retry and Time Out parameters is one of the tasks you must complete to configure a ServiceMax activity. The ServiceMax Connector uses an HTTP 1.1 persistent connection over SSL to make all connections to the ServiceMax server. The ServiceMax connector compresses all data for requests and responses using the gzip format.
- [Understanding and setting polling preferences for the ServiceMax connector](#)
- [Poll Updated Objects activity](#)  
This activity polls the ServiceMax Server for objects that have been recently created or updated and returns all the object fields that you selected in the configuration panel to the Integration Appliance. In Studio, configure the polling interval for the activity.
- [Get Updated Objects](#)
- [Poll Deleted Objects activity](#)  
This activity polls the ServiceMax Server for objects that have been recently deleted and returns IDs to the Integration Appliance.
- [Get Deleted Objects](#)  
This activity retrieves the list of individual objects that have been deleted within the specified time-span for the specified object.
- [Create Objects activity](#)  
Use this activity to create one or more ServiceMax objects. In the Activities tab, open the ServiceMax directory to find the Create Objects activity.
- [Update Objects activity](#)  
Use this activity to update existing objects in ServiceMax.
- [Upsert Objects activity](#)  
Use this activity to update existing objects or create new objects in ServiceMax.
- [Delete Objects activity](#)  
Use this activity to delete one or more objects in ServiceMax. While the Salesforce.com API limits the number of objects that it can delete in a single call to 200 objects, the Cast Iron® ServiceMax connector does not have such a limit. You can use the **Delete Objects** activity to delete an unlimited number of objects.
- [Undelete Objects activity](#)
- [Retrieve Objects activity](#)  
Use this activity to retrieve one or more ServiceMax objects of a specified type. While the Salesforce.com API limits the number of objects that it can retrieve in a single call to 2,000 objects, the Cast Iron ServiceMax connector does not have such a limit. You can use the **Retrieve Objects** activity to retrieve an unlimited number of objects.
- [Query Objects activity](#)  
Use the Sforce Object Query Language (SOQL) to run a query on one or more Salesforce.com object types from this activity and return a results set. The Query Objects activity automatically runs a query or

queryAll call, followed by continuous queryMore calls for all children and objects returned from Salesforce.com.

- [Configuring the Query Objects activity](#)

You must create a Sforce Object Search Language (SOSL) query to configure the **Search Objects** activity. The following sections discuss the steps to configure the **Search Objects** activity, create an SOSL query, and provide SOSL syntax rules for IBM® Cast Iron.

- [Search Objects activity](#)

- [Configuring the Search Objects activity](#)

You must create an Sforce Object Search Language (SOSL) query to configure the **Search Objects** activity.

- [Convert Lead activity](#)

Use this activity to convert leads into accounts, contacts, or opportunities in ServiceMax. While the Salesforce.com API limits the number of objects that it can convert in a single call to 100 objects, the Cast Iron ServiceMax connector does not have such a limit. You can use the **Convert Lead** activity to convert an unlimited number of objects.

- [Merge Objects Activity](#)

Use this activity to merge ServiceMax objects into a single record.

- [Get User Information activity](#)

Use this activity to get user information from the ServiceMax server. In the Activities tab, open the ServiceMax directory to find the Get User Information activity.

- [Get Server Timestamp activity](#)

Use this activity to get the current time from the ServiceMax server. In the Activities tab, open the ServiceMax directory to find the Get Server Timestamp activity.

- [Send email activity](#)

Use this activity to send single or multiple emails. The emails include all standard email attributes such as the email address, subject line, and carbon copies.

- [Set password activity](#)

Use this activity to change the password of a user or `SelfServiceUser` to a value that you specify.

- [Reset password activity](#)

Use this activity to reset the password of the user to a system-generated value.

---

## Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_servicemaxactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_servicemaxactivities.html)

## Creating or editing a ServiceMax endpoint

---

ServiceMax endpoints provide information that Studio and the Integration Appliance use to connect to a ServiceMax instance.

### About this task

---

Any changes that you make to the endpoint, including configuration properties, affects all orchestrations that use that endpoint as the edits are global, not local.

### Procedure

---

1. Drag an activity from the ServiceMax folder of the Activities tab onto the orchestration.

The Summary panel is displayed along with a Checklist, which lists the tasks that you must perform to configure the activity.

2. Click Pick Endpoint task from the Checklist. The Pick Endpoint panel opens.
3. Click one of the following options:
  - o Browse...: To select an existing endpoint from the Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel. To edit the endpoint properties, click Edit. Go to step 5
  - o New: To create a new endpoint. The Create Endpoint window opens. Go to step 5
  - o Edit: To edit an existing endpoint. The Edit Endpoint window opens. Go to step 5

Note: Editing an endpoint affects all orchestrations that use that endpoint in the project as the edits are global, not local.

4. In the endpoint window, specify a user name and a password to access a ServiceMax instance.
  - a. Type a user name or click the icon to the right of the User Name field to select the configuration property.
  - b. Type a password or click the icon to the right of the Password field to select the configuration property.
5. Choose a login option:

Login Options	Description
Login normally	By default, Login is selected. At run time, the Integration Appliance accesses a production instance of ServiceMax.
Login to ServiceMax sandbox	At run time, the Integration Appliance accesses a copy of the production system. You can run tests in the sandbox without affecting production data.
Login to specified Partner WSDL Login URL	At run time, the Integration Appliance accesses the URL you specify in the Login URL field.
Login URL	Only required when you choose the Login to specified Partner WSDL Login URL option.

6. Specify the Connection Timeout parameter. By default, the Integration Appliance times out if it is unable to connect to the ServiceMax endpoint after 300 seconds.
7. To connect through a proxy server, complete the fields that are described in the following table:

Option	Description
Connect via a Proxy Server	Select this check box to enable the fields to connect through a proxy server.

Option	Description
<b>Authentication</b>	Indicates the type of authentication that the Integration Appliance uses when connecting to a proxy server. From the list, select one of the following authentication options: <ul style="list-style-type: none"> <li>○ <b>Basic</b> - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure.</li> <li>○ <b>NTLM</b> - Requires an instance of NTCredentials to be available for the domain name of the server. This authentication is the most secure authentication option. When you choose the NTLM authentication option, the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time that a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server.</li> </ul>
<b>Realm/Domain</b>	If you select the <b>Basic</b> authentication option, specify a realm. If you select the <b>NTLM</b> authentication option, specify a domain.
<b>Host name</b>	Specify the host name of the proxy server.
<b>Port</b>	Specify the port number that is required to connect to the proxy server.
<b>Username</b>	Specify the user name that is required to connect to the proxy server.
<b>Password</b>	Specify the password that is required to connect to the proxy server.

8. Click Test Connection to confirm that the parameters you specified allow the project to access a ServiceMax instance.

Note: When you configure a ServiceMax endpoint to use configuration properties, verify that the configuration properties have valid values. If the configuration property value is invalid or does not exist, the connection test fails.

# Configuring ServiceMax activities

---

Selecting fields from the ServiceMax object to map is one of the tasks you must complete to configure a ServiceMax activity. For more information about the configuration tasks in the Checklist, see the help topic for the specific ServiceMax activity.

## About this task

---

For some of the fields in the endpoint, you can [create configuration properties](#) to supply the values for these fields. An icon is displayed when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.

## Procedure

---

1. In the Checklist, select Configure. The Configure panel opens.
2. Click Browse... to select a ServiceMax object type. The Choose a ServiceMax Object window shows all the ServiceMax objects that are associated with the Studio activity.
3. Select an object type from the list.

Note: Custom object types end with a double underscore c ( \_\_c ). For example: *CustomerPriority\_\_c*

Enter a character or string in the Search for an Object Type field and Studio filters the object types and only shows the object types that match the filter criteria. (Optional) Click the refresh icon to retrieve the latest ServiceMax object types.

4. Click OK.

All the fields that are associated with the object type you selected are displayed.

5. In the Object Field Preferences section, select the fields to map.

By default, all fields are selected. You can choose to clear any field that you do not want to show in the map. A global check box allows you to select and clear all fields at once.

Note: The Id field is required for many activities. For these activities, the Id field is disabled and you cannot clear this field.

## Setting ServiceMax configuration properties

---

Any changes you make to configuration properties affects all orchestrations that use that endpoint. The edits are global, not local.

## Procedure

---

1. Select Project > Configuration Properties. The Configuration Properties window opens.
2. Click the Value field for the servicemax\_password property and type a valid password.
3. Click the Value field for the servicemax\_login property and type a valid ServiceMax login.
4. Click OK.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax\\_Setting\\_Configuration\\_Properties.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax_Setting_Configuration_Properties.html)

## Specifying the Retry and Time Out parameters for ServiceMax activities

---

Specifying the Retry and Time Out parameters is one of the tasks you must complete to configure a ServiceMax activity. The ServiceMax Connector uses an HTTP 1.1 persistent connection over SSL to make all connections to the ServiceMax server. The ServiceMax connector compresses all data for requests and responses using the gzip format.

### About this task

---

The ServiceMax connector uses a single login session for all connections to a ServiceMax endpoint. If a session expires, the connector automatically establishes a new session. The ServiceMax connector does not count the initial attempt to reacquire the session as a retry attempt. The ServiceMax connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

For more information about the configuration tasks in the **Checklist**, see the help topic for the specific ServiceMax activity.

## Procedure

---

1. In the Checklist, select Retry. The Retry panel opens.
2. Configure the retry options for connecting to a ServiceMax instance.

The following table describes the retry options for connecting to a ServiceMax instance:

Retry fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the ServiceMax instance.  By default, this parameter is set to 30 seconds.

Retry fields	Description
Try to connect __ times before failing.	Specifies the maximum number of times that the Integration Appliance attempts to establish a connection to the ServiceMax instance before issuing an error and stopping the processing of the current orchestration job.  By default this parameter is set to 5 attempts.
Activity Timeout field	Description
Time out after __ seconds when the Endpoint does not respond to a request.	Specifies the number of seconds before a time-out occurs between the activity making a request on an endpoint and the time it takes the endpoint to respond.  By default this parameter is set to 300 seconds.

## Understanding and setting polling preferences for the ServiceMax connector

---

### About this task

---

The ServiceMax connector contains two activities that poll the ServiceMax server for changes:

- **Poll Deleted Objects** activity
- **Poll Updated Objects** activity

These activities have the following startup behavior:

- For an orchestration that has never been deployed, the baseline time stamp is established when the activity is activated for the first time. The activity uses the baseline time stamp as the start time to poll for changes after the poll interval elapses. After the poll completes, the activity stores the last poll time.
- For a previously deployed orchestration, the activity uses the last poll time and the current time to poll for changes after the poll interval elapses.
- ServiceMax requires at least 60 seconds between each poll. If less than 60 seconds have transpired, then the activity ignores the current polling interval until the next polling interval elapses.

### Procedure

---

1. In the Checklist, select Polling.

The Polling Preferences panel opens.

2. Set the polling preferences for the following parameters:

Polling Preference	Description
Poll for changes every <i>&lt;i&gt;</i>	Specifies the polling interval for which the Integration Appliance polls the ServiceMax Server for objects that have been created or updated since the last poll.
Where <i>&lt;i&gt;</i> is the polling interval. The interval can be specified in minutes, hours, or days	By default, the Integration Appliance polls the ServiceMax Server every 5 minutes.
Batch up to <i>&lt;n&gt;</i> objects per orchestration	Specifies the maximum number of object records per orchestration job, during a polling interval. By default, the Integration Appliance processes one record per orchestration job. Use this preference to tune the performance of the Integration Appliance.
Where <i>&lt;n&gt;</i> is the number of objects in a batch.

## Poll Updated Objects activity

---

This activity polls the ServiceMax Server for objects that have been recently created or updated and returns all the object fields that you selected in the configuration panel to the Integration Appliance. In Studio, configure the polling interval for the activity.

### Procedure

---

1. In the Activities tab, open the ServiceMax directory to find the Poll Updated Objects activity.
2. Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a ServiceMax endpoint.

For instructions on creating or editing a ServiceMax endpoint, see [Creating or editing a ServiceMax endpoint](#).

4. Configure the activity by choosing a ServiceMax object type and object field preferences.
5. Specify the Polling preferences for the activity.
6. Specify the Retry and Time out parameters for the activity.

### What to do next

---

Map the output of the Poll Updated Objects activity.

**Parent topic:** [ServiceMax activities](#)

## Mapping the output of the Poll Updated Object activity

---

### Procedure

1. In the Checklist, select Map Outputs.

The objects element is displayed in the From Activity panel.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

The output map can have *nillable* field elements have the following behavior:

- If the field that is being retrieved is null, the Integration Appliance sets the `xsi:nil` attribute to true in the result.

---

## Get Updated Objects

---

### Procedure

1. In the Activities tab, open the ServiceMax directory to find the Get Updated Objects activity.
2. Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a ServiceMax endpoint.

For instructions on creating or editing a ServiceMax endpoint, see [Creating or editing a ServiceMax endpoint](#).

4. Configure the activity, by choosing a ServiceMax object type and object field preferences.  
You can only select object types and fields that the Integration Appliance can update. The input map contains the object type with elements that correspond to the fields you select during this configuration step.

Note: The Integration Appliance cannot create auto-number fields.

5. Specify the Retry and Time out parameters for the activity.

## 6. Map the input of the activity.

The input map consists of an object's input parameter. This parameter consists of a single root element that has a single repeating element, named after the object type you selected, containing all the fields you selected in the Object Field Preferences table.

## What to do next

---

Map the input of the Get Updated Objects.

**Parent topic:** [ServiceMax activities](#)

## Mapping the input of the Get Updated Objects activity

---

### Procedure

#### 1. In the Checklist, select Map Inputs.

The `startDateTime` element is displayed in the To Activity panel.

#### 2. Optional: Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:

- `endTime`
- `CallOptions`
- `connection`
- `sessionInfo`

#### 3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

#### 4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

*Optional* and *nillable* field elements have the following behavior:

- The Integration Appliance does not update an optional field, when the ServiceMax server does not provide a value for the field.
- If you set the `xsi:nil` attribute to `true` on a `nillable` field, the Integration Appliance sets the field to null during an update.

Note: Setting a field to an empty string does not set a field to null.

## What to do next

Map the output of the Get Updated Object activity.

## Mapping the output of the Get Updated Object activity

---

### Procedure

#### 1. In the Checklist, select Map Outputs.

The `saveResults` element is displayed in the From Activity panel.

#### 2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

## Update Objects activity

---

Use this activity to update existing objects in ServiceMax.

### About this task

---

While the Salesforce.com API limits the number of objects that it can update in a single call to 200 objects, the Cast Iron® ServiceMax connector does not have such a limit. You can use the Update Objects activity to update an unlimited number of objects.

Using the Update Objects activity.

### Procedure

---

1. In the Activities tab, open the ServiceMax directory to find the **Update Objects** activity.
2. Add the activity to an orchestration. The **Checklist** and **Summary** for the activity are displayed beneath the orchestration.
3. Select a ServiceMax endpoint. For instructions on creating or editing a ServiceMax endpoint, see [Creating or editing a ServiceMax endpoint](#).
4. [Configure](#) the activity by choosing a ServiceMax object type and object field preferences. You can only select object types and fields that the Integration Appliance can update. The input map contains the object type with elements that correspond to the fields you select during this configuration step.  
Note: The Integration Appliance cannot create auto-number fields.
5. [Specify](#) the **Retry** and **Time out** parameters for the activity.
6. Map the input of the activity. The input map consists of an object's input parameter. This parameter consists of a single root element that has a single repeating element, which is named after the object type you selected, containing all the fields you selected in the Object Field Preferences table.
7. Map the output of the activity.

### Results

---

#### Map the input of the Update Objects activity

1. In the **Checklist**, select Map Inputs. The **objects** element is displayed in the To Activity pane.
2. Right-click the default node and choose Show Optional Parameters to show the optional input parameters for this activity:
  - o AssignmentRuleHeader
  - o MruHeader
  - o EmailHeader
  - o CallOptions
  - o connection
  - o sessionInfo
3. Click Select Inputs... and select the input variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
4. As appropriate, map the input parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

Optional and nillable field elements have the following behavior:

- The Integration Appliance does not update an optional field, when the ServiceMax server does not provide a value for the field.
- If you set the `xsi:nil` attribute to true on a `nillable` field, the Integration Appliance sets the field to null during an update.

Note: Setting a field to an empty string does not set a field to null.

### Map the output of the Update Objects activity

1. In the **Checklist**, select Map Outputs. The **saveResults** element is displayed in the From Activity panel.
2. Click **Select Outputs...** and select the output variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
3. As appropriate, map the output parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax\\_Update\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax_Update_Objects_Activity.html)

## Upsert Objects activity

---

Use this activity to update existing objects or create new objects in ServiceMax.

### About this task

---

The activity uses an external ID, usually a foreign key, to determine whether to update an existing object or create a new object in ServiceMax.

While the Salesforce.com API limits the number of objects that it can create in a single upsert call to 200 objects, the Cast Iron® ServiceMax connector does not have such a limit. You can use the **Upsert Objects** activity to create an unlimited number of objects.

To use the **Upsert Objects** activity:

## Procedure

---

1. In the Activities tab, open the ServiceMax directory to find the **Upsert Objects** activity.
2. Add the activity to an orchestration. The **Checklist** and **Summary** for the activity are displayed beneath the orchestration.
3. Select a ServiceMax endpoint. For instructions on creating or editing a ServiceMax endpoint, see [Creating or editing a ServiceMax endpoint](#).
4. [Configure](#) the activity, by choosing a ServiceMax object type and object field preferences.  
Note: You can only choose object types that the Integration Appliance can update or create and contain at least one External ID field. When you select the object type, Studio displays the external IDs defined on the object type in the External ID field of the Configure pane. You cannot edit the IDs listed in the External ID list. The external ID that you select becomes a required field, you cannot clear this field from the Object Field Preferences table. If only one external ID is available, Studio automatically selects this field in the Object Field Preferences table.
5. [Specify](#) the **Retry** and **Time out** parameters for the activity.
6. Map the input of the activity.
7. Map the output of the activity.

## Results

---

### Map the input of the Upsert Objects activity

1. In the **Checklist**, select Map Inputs. The **objects** element is displayed in the To Activity panel.
2. Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - AssignmentRuleHeader
  - MruHeader
  - EmailHeader
  - CallOptions
  - connection
  - sessionInfo
3. Click Select Inputs... and select the input variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
4. As appropriate, map the input parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

This activity supports the following optional input parameters:

- AssignmentRuleHeader
- EmailHeader
- MruHeader

Optional and nillable field elements have the following behavior:

- The Integration Appliance does not update an optional field, when the ServiceMax server does not provide a value for the field.
- If you set the `xsi:nil` attribute to true on a `nillable` field, the Integration Appliance sets the field to null during an update.  
Note: Setting a field to an empty string does not set a field to null.

### Map the output of the Upsert Objects activity

1. In the **Checklist**, select Map Outputs. The **upsertResults** element is displayed in the From Activity panel.
2. Click Select Outputs... and select the output variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
3. As appropriate, map the output parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

## Retrieve Objects activity

---

Use this activity to retrieve one or more ServiceMax objects of a specified type. While the Salesforce.com API limits the number of objects that it can retrieve in a single call to 2,000 objects, the Cast Iron® ServiceMax connector does not have such a limit. You can use the **Retrieve Objects** activity to retrieve an unlimited number of objects.

### Using the Retrieve Objects activity

---

1. In the Activities tab, open the ServiceMax directory to find the Retrieve Objects activity.
2. Add the activity to your orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a ServiceMax endpoint.

For instructions on creating or editing a ServiceMax endpoint, see [Creating or editing a ServiceMax endpoint](#).

4. Configure the activity, by choosing a ServiceMax object type and object field preferences.

Only object types that the Integration Appliance is able to retrieve through the Salesforce.com API display.

5. Specify the Retry and Time out parameters for the activity.

## Mapping the input of the Retrieve Objects activity

---

1. In the Checklist, select Map Inputs.

The `ids` element is displayed in the To Activity pane. The element contains the collection of IDs that the Integration Appliance retrieves from ServiceMax.

2. (Optional) Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:

- `MruHeaderUser`
- `CallOptions`
- `connection`
- `sessionInfo`

3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

*Optional* and *nillable* field elements have the following behavior:

- If the field being retrieved is null, the Integration Appliance sets the `xsi:nil` attribute to `true` in the result.
- If the input ID is not valid or does not represent the object type that you specified, then for the entire object element the Integration Appliance sets `xsi:nil` to `true` for that element's position in the result set.

## Mapping the output of the Retrieve Objects activity

---

1. In the Checklist, select Map Outputs.

The `objects` element is displayed in the From Activity panel. The element contains all fields that you selected in the field preferences table, during the configuration steps.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax\\_Retrieve\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax_Retrieve_Objects_Activity.html)

## Query Objects activity

---

Use the Sforce Object Query Language (SOQL) to run a query on one or more Salesforce.com object types from this activity and return a results set. The Query Objects activity automatically runs a query or queryAll call, followed by continuous queryMore calls for all children and objects returned from Salesforce.com.

Note: Running the Query Objects activity can result in a cursor being opened by Salesforce.com to track the query results. If the activity reaches the cursor limit that Salesforce.com allots to each user or if the cursor expires, the Integration Appliance tries the activity again.

### Using the Query Objects activity

---

1. In the Activities tab, open the Salesforce.com directory to find the Query Objects activity.
2. Add the activity to your orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a Salesforce.com endpoint.

For instructions on creating or editing a Salesforce.com endpoint, see [Creating or editing a Salesforce.com endpoint](#).

4. Configure the activity, by specifying a query and setting query options.
5. Specify the Retry and Time out parameters for the activity.
6. Map the input of the activity.
7. Map the output of the activity.

### Map the input of the Query Objects activity

---

1. In the Checklist, select Map Inputs.

The parameters element is displayed in the To Activity panel. The parameters element has a child element for each parameter you specified in the SOQL query. The context for the parameter in the query determines the parameter type. If you did not specify any parameters, then no child elements are displayed under the parameters element.

2. Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - o MruHeader
  - o CallOptions
  - o connection
  - o sessionInfo

3. Click Select Inputs... and select the input variable or variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variable or variables.

For mapping instructions, see [Creating a Map](#).

## Map the output of the Query Objects activity

---

1. In the Checklist, select Map Outputs.

The objects element is displayed in the From Activity panel. The result parameter has a single element named objects with a single repeating element named after the driving object of the query. The driving object is the first object named in the FROM clause of the query. For example, in the following SOQL statement Account is the driving object:

```
Select Name from Account, Account.Contacts
```

The driving object has child elements that correspond to the fields or relationships listed in the SELECT clause of a query. The schema is defined as follows:

- For fields, the field type matches the SOAP type of the field. The field type is nillable if the SOAP type is nillable.
- For relationships for parent elements, the element name is the name of the parent. If there is no parent when the activity runs the query, then the element is absent. The fields or relationships of the parent is displayed immediately underneath the relationship element.
- For relationships for child elements, the element name is the name of the child. The relationship element has a single repeating element named after the object type of the child object. The fields and relationship of the child is displayed underneath the object type element. If there are no children when the activity runs the query, then the element is absent.
- If you did not select any fields or relationships, but instead request the count() in the SELECT clause, the entire object type element is replaced with an element named count of type unsignedInt.

2. Click Select Outputs... and select the output variable or variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variable or variables.

For mapping instructions, see [Creating a Map](#).

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Query\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Query_Objects_Activity.html)

# Configuring the Query Objects activity

---

You must create a Sforce Object Search Language (SOSL) query to configure the **Search Objects** activity. The following sections discuss the steps to configure the **Search Objects** activity, create an SOSL query, and provide SOSL syntax rules for IBM® Cast Iron®.

## Procedure

---

1. In the Checklist, select Configure.

The Specify Query window opens.

2. Create an SOSL query in the Specify Query window.
3. Optional: You can specify dynamic parameters in the search clause of the SOSL statement. You can then map these parameters dynamically as the input parameters for the activity, which allows the activity to dynamically control the query that is based on the input to the orchestration. Use a (\$) dollar sign to denote a parameter and follow it with the parameter name.
4. Click the Validate icon , to validate the query.  
If the query is invalid, the Validation Feedback icon  displays in the lower left corner of the Specify Query window. For invalid queries:
  - a. Click the Validation Feedback icon in the lower left corner of the Specify Query window for a list of validation errors.
  - b. Use the Refresh icon  To refresh metadata and revalidate the SOSL statement.
5. In the Checklist, select Query to configure specific query options.

The Query Options pane opens.

6. Select Include deleted items in query (execute a queryAll operation), to query for deleted records in addition to existing records. If you do not select this option, the Integration Appliance only queries existing records.
7. Specify a Query batch size between 200-2000 queries to help tune the performance of the Integration Appliance.

The option determines the batch size to use in the QueryOptions SOAP header for all query calls and does not affect the number of results that are returned by the activity. By default, this option is set to 500 queries.

**Parent topic:** [ServiceMax activities](#)

## Creating SOSL Queries

---

When creating a SOQL query, you can use dynamic parameters in the WHERE clause of the SOQL statement. Studio can then dynamically map these parameters as the input parameters for the activity. This allows for dynamic control of the query that is based on input to the orchestration.

### About this task

The SForce Object Query Language does not define a syntax for parameterized queries; however, Cast Iron does enforce some proprietary SOQL syntax rules. You can use parameters in either simple expressions or set expressions.

SOSL Syntax Rules for Cast Iron

- Use a (\$) dollar sign to denote a parameter. After the (\$) dollar sign, specify a string of alphanumeric characters. The first character must be a letter [a-zA-Z], optionally followed by one or more letters [a-zA-Z], digits [0-9], or ( \_ ) underscores.

Note: Parameter names are case-sensitive; therefore, the parameters \$a and \$A are considered to be different parameters.

The following table contains examples of valid and invalid parameter declarations:

Parameter	Valid or Invalid
\$AnAccount	valid
\$a123_456	valid
\$123a	invalid
\$_id	invalid

- You must declare parameters on the right side of an expression in a WHERE clause.
- Parameters can appear more than once in a given SOQL statement. However, even though the parameter appears more than once in the SOQL statement, it only appears once in the input parameter map. The activity substitutes the same value for all locations where the parameter is used at run time.

Note: When you use the same parameter name and there is a type mismatch, an error occurs. For example, the following SOQL generates an error because \$param is used as both a string and date type:

```
SELECT Name from Account where Name like $param and createdDate > $param
```

- The type of the field in which a parameter is being compared determines the type of the parameter and whether the parameter is being used in a simple expression, a set expression, or part of a set expression.

Type of Expression	Description
Simple Expressions	<p>For example: Select ID from Account where Name = \$NameParam</p> <p>The SoapType of the field on the left side of the expression determines the parameter type. If the field type is nillable and the operator is (=) or (!=), then the parameter is nillable. Setting xsi:nil=true on the parameter sets the parameter value to null when it is substituted. If the parameter's type requires it to be enclosed in (') single quotation marks, then the parameter's value is enclosed in single quotation marks during substitution and its contents are escaped automatically.</p> <p>For SOQL, the (\) backslash and (') single quotation mark is escaped.</p>
Set Expressions	<p>For example: Select ID From Account where ID in \$idList</p> <p>The parameter's type is a repeating sequence of the SoapType of the field on the left side of the expression. The parameter is not nillable and has minOccurs=1, maxOccurs=unbounded on the element.</p> <p>The sequence is expanded at run time to be a proper set value, for example:</p> <p>Select Id From Account where Id in ('value1','value2')</p>
Part of	<p>Parameters inside a set list are treated like a simple expression parameter type, for example:</p> <p>SELECT Name from Account where BillingState IN ('California', \$state2)</p>

a Set Ex pre ssi on	In this example, the \$state2 parameter type is the SoapType of the Account BillingState field and is not a repeating element. The parameter is not nillable.
------------------------------------	---

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax\\_Configuring\\_the\\_Query\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax_Configuring_the_Query_Objects_Activity.html)

## Search Objects activity

---

### About this task

---

Use the Sforce Object Search Language (SOSL) to run a search query on one or more ServiceMax object types from this activity and return a results set.

Note: You can only search objects that are configured as searchable or eSearchable. You cannot search attachment objects.

Using the Search Objects activity:

### Procedure

---

1. In the Activities tab, open the ServiceMax directory to find the **Search Objects** activity.
2. Add the activity to an orchestration. The **Checklist** and **Summary** for the activity is displayed beneath the orchestration.

### Results

---

1. Select a ServiceMax endpoint. For instructions on creating or editing a ServiceMax endpoint, see [Creating or editing a ServiceMax endpoint](#).
2. [Configure](#) the activity, by specifying a search query and setting search query options.
3. [Specify](#) the Retry and Time out parameters for the activity.
4. Map the input of the activity.
5. Map the output of the activity.

#### Mapping the input of the Search Objects activity:

1. In the **Checklist**, select Map Inputs. The parameters element is displayed in the To Activity panel. The parameter element has a child element for each parameter you specified in the SOSL query. The context for the parameter in the query determines the parameter type. If you did not specify any parameters, then no child elements are displayed under the parameters element.

2. Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - o CallOptions
  - o connection
  - o sessionInfo
3. Click Select Inputs... and select the input variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
4. As appropriate, map the input parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

#### Mapping the output of the Search Objects activity:

1. In the **Checklist**, select Map Outputs. The **objects** element is displayed in the From Activity panel.
2. Click Select Outputs... and select the output variable or variables for the map. For instructions about creating variables, see [Creating variables](#).
3. As appropriate, map the output parameters to the variable or variables. For mapping instructions, see [Creating a map](#).

**Parent topic:** [ServiceMax activities](#)

---

## Configuring the Search Objects activity

---

You must create an Sforce Object Search Language (SOSL) query to configure the **Search Objects** activity.

### About this task

---

The following sections discuss the steps to configure the **Search Objects** activity, create an SOSL query, and provide SOSL syntax rules for IBM® Cast Iron®.

To configure the Search Objects activity complete the following steps:

### Procedure

---

1. In the Checklist, select Configure. The Specify Query window opens.
2. [Create](#) an SOSL query in the Specify Query window.
3. Optional: You can specify dynamic parameters in the search clause of the SOSL statement. You can then map these parameters dynamically as the input parameters for the activity, which allows the activity to dynamically control the query that is based on the input to the orchestration. Use a (\$) dollar sign to denote a parameter and follow it with the parameter name.
4. Click the Validate icon , to validate the query. If the query is invalid, the Validation Feedback icon  shows in the lower left corner of the Specify Query window. For invalid queries:
  - o Click the Validation Feedback icon in the lower left corner of the Specify Query window for a list of validation errors.

- Use the Refresh icon  to refresh metadata and revalidate the SOSL statement.

Parent topic: [ServiceMax activities](#)

## Creating SOSL queries

---

### About this task

When creating a Sforce Object Search Language (SOSL) query, you can use dynamic parameters in the WHERE clause of the SOSL statement. Studio can then dynamically map these parameters as the input parameters for the activity. This allows for dynamic control of the query that is based on input to the orchestration.

The Sforce Object Search Language does not define a syntax for parameterized queries; however, IBM Cast Iron does enforce a few proprietary SOSL syntax rules. You can use parameters in either simple expressions or set expressions.

### SOSL syntax rules for IBM Cast Iron

#### About this task

- Use a (\$) dollar sign to denote a parameter. After the (\$) dollar sign, specify a string of alphanumeric characters. The first character must be a letter [a-zA-Z], optionally followed by one or more letters [a-zA-Z], digits [0-9], or ( \_ ) underscores.

Note: Parameter names are case-sensitive; therefore, the parameters \$a and \$A are considered to be different parameters.

The following table contains examples of valid and invalid parameter declarations:

Parameter	Valid or Invalid
\$AnAccount	valid
\$a123_456	valid
\$123a	invalid
\$_id	invalid

- You must declare parameters in the Search Query portion of the SOSL statement. Curly braces ({} ) demarcate the Search Query portion of the SOSL statement.  
Important: Do not use double quotation marks (" ") to enclose parameters. If you enclose parameters in double quotation marks, the activity treats the parameter as a string search literal.
- The parameter type is always xsd:string. During substitution, the activity escapes any parameter that you declare using a reserved character. Reserved characters include the following characters:

Reserved Characters	Description
&	ampersand
*	asterisk
\	back slash
[ ]	box brackets
:	colon
,	comma
{ }	curly braces

Reserved Characters	Description
"	Double quotation mark
!	exclamation mark
-	minus sign
+	plus sign
'	Single quotation mark
~	tilde
^	up arrow
	vertical bar

- Parameters can appear more than once in a given SOQL statement. However, even though the parameter appears more than once in the SOQL statement, it only appears once in the input parameter map. The activity substitutes the same value for all locations where the parameter is used at run time.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax\\_Configuring\\_the\\_Search\\_Objects\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax_Configuring_the_Search_Objects_Activity.html)

## Convert Lead activity

---

Use this activity to convert leads into accounts, contacts, or opportunities in ServiceMax. While the Salesforce.com API limits the number of objects that it can convert in a single call to 100 objects, the Cast Iron® ServiceMax connector does not have such a limit. You can use the **Convert Lead** activity to convert an unlimited number of objects.

### Procedure

---

1. In the Activities tab, open the ServiceMax directory to find the Convert Lead activity.
2. Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a ServiceMax endpoint.

For instructions on creating or editing a ServiceMax endpoint, see [Creating or editing a ServiceMax endpoint](#).

4. Specify the Retry and Time out parameters for the activity.

### What to do next

---

Map the inputs of the Convert Lead activity.

## Mapping the input of the Convert Lead activity

---

### Procedure

1. In the Checklist, select Map Inputs.

The `convertLead` element displays in the To Activity pane. The parameters that are displayed correspond to the structure of the input to the ServiceMax `convertLead` operation.

2. Optional: Right-click the default node and choose Show Optional Parameters, to show the optional input parameters for this activity:
  - `CallOptions`
  - `connection`
  - `sessionInfo`

3. Click Select Inputs... and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

### What to do next

Map the output of the Convert Lead activity.

## Mapping the output of the Convert Lead activity

### Procedure

1. In the Checklist, select Map Outputs.

The `convertLeadResponse` element is displayed in the From Activity panel. The parameters that are displayed correspond to the `convertLeadResponse` structure, which is returned by the `convertLead` operation.

2. Click Select Outputs... and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

---

### [Feedback](#) | [Notices](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax\\_Convert\\_Lead\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SerMax_Convert_Lead_Activity.html)

# Merge Objects Activity

---

Use this activity to merge ServiceMax objects into a single record.

## About this task

---

You can merge two or more of the following ServiceMax objects into a single record:

- Account
- Contact
- Leads

After the activity merges the objects, it deletes the pre-merge records and reparents any duplicates.

While the Salesforce.com API limits the number of requests that it can merge in a single call to 200, the Cast Iron® ServiceMax connector does not have such a limit. You can use the **Merge Objects** activity to process an unlimited number of merge requests.

## Procedure

---

1. In the Activities tab, open the ServiceMax directory to find the Merge Objects activity.
2. Add the activity to an orchestration.

The Checklist and Summary for the activity are displayed beneath the orchestration.

3. Select a ServiceMax endpoint.

For instructions on creating or editing a ServiceMax endpoint, see [Creating or editing a ServiceMax endpoint](#).

4. Configure the activity, by choosing a ServiceMax object type and object field preferences.

You can only select Account, Contact, and Lead object types and fields that the Appliance can update. Fields such as auto-number fields might not be available to select.

5. Specify the Retry and Time out parameters for the activity.

## What to do next

---

Map the input of the Merge Objects activity.

**Parent topic:** [ServiceMax activities](#)

## Mapping the input of the Merge Objects activity

---

### Procedure

1. In the Checklist, select Map Inputs.

The Merge element is displayed in the To Activity panel.

2. Optional: Right-click the default node and choose Show Optional Parameters, to display these optional input parameters for this activity:
  - AssignmentRuleHeader
  - MruHeader
  - EmailHeader

- `CallOptions`
  - `connection`
  - `sessionInfo`
3. Click **Select Inputs...** and select the input variables for the map.

For instructions about creating variables, see [Creating Variables](#).

4. As appropriate, map the input parameters to the variables.

For mapping instructions, see [Creating a Map](#).

*Optional* and *nillable* field elements have the following behavior:

- The Integration Appliance does not update an optional field, when the ServiceMax server does not provide a value for the field.
- If you set the `xsi:nil` attribute to `true` on a `nillable` field, the Integration Appliance sets the field to null during an update.

Note: Setting a field to an empty string does not set a field to null.

## Mapping the output of the Merge Object activity

---

### Procedure

1. In the Checklist, select **Map Outputs**.

The results element is displayed in the **From Activity** panel. The parameters that are displayed correspond to the structure of the `ServiceMaxMergeResults` schema.

2. Click **Select Outputs...** and select the output variables for the map.

For instructions about creating variables, see [Creating Variables](#).

3. As appropriate, map the output parameters to the variables.

For mapping instructions, see [Creating a Map](#).

---

## Siebel activities

---

- [Overview of the Siebel connector](#)
- [Installing JAR files to connect to the Siebel server](#)

You must copy two JAR files on the same workstation as your Cast Iron Studio installation before you can connect to a Siebel server. Also, you can copy the `Siebel.properties` file, which is optional, to configure the connection timeout, transaction timeout, and the Siebel properties.
- [Creating or editing a Siebel endpoint](#)

Siebel endpoints contain the connection information that Studio and the Integration Appliance use to connect to a Siebel Business Applications Server. You can create multiple endpoints that refer to separate instances.
- [Using the Siebel Create Objects activity](#)

Use the Siebel Create Objects activity to work with either Siebel Business Objects, Business Components, or Siebel Integration Objects.
- [Using the Siebel Update Objects activity](#)

Use the Siebel Update Objects activity to work with either Siebel Business Objects, Business Components, or Siebel Integration Objects.
- [Using the Siebel Delete Objects activity](#)

Use the Siebel Delete Objects activity to work with either Siebel Business Objects, Business Components, or Siebel Integration Objects.
- [Using the Siebel Query Objects activity](#)

Use the Siebel Query Objects activity to work with either Siebel Business Objects, Business Components, or Siebel Integration Objects.
- [Using the Siebel Execute Business Service activity](#)

The Siebel execute business service activity is used to run a Siebel business service on the Siebel Business Applications server.
- [Prerequisites for starter activities in Siebel](#)
- [Using the Siebel Get Created Objects activity](#)

Use the Get Created Objects activity to poll for Siebel Business Objects, Business Components, or Siebel Integration Objects from the Siebel server.
- [Using the Siebel Get Updated Objects activity](#)

Use the Get Updated Objects activity to poll for events that were updated on the Siebel Sever.
- [Using the Siebel Get Deleted Objects activity](#)

Use the Get Deleted Objects activity to poll for deleted Siebel Business Objects, Business Components, or Siebel Integration Objects from the Siebel server.
- [Specifying Retry and Delivery Options for Siebel Activities](#)

Specifying the Retry and Delivery parameters is one of the tasks to configure a Siebel activity

configuration.

- [Siebel properties file](#)

The Siebel connector uses Siebel API (Java™ Data Bean) to interact with the Siebel server. Siebel API also provides a way to configure the connection settings on the client side. The `siebel.properties` file located in your classpath, can be used to provide default parameters for client applications connecting to Siebel applications using the Java Data Bean.

---

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_siebelactivities.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_siebelactivities.html)

## Overview of the Siebel connector

---

The Siebel connector enables a two-way communication between Cast Iron and the Siebel business applications server. The connector supports Business Object/Business Component (BO/BC), Integration Objects (IO), and Business Service (BS) interfaces.

You can perform the following activities using the Siebel connector:

- Outbound Activities
  - [Create Objects \(uses BO/BC or IO\)](#)
  - [Update Objects \(uses BO/BC or IO\)](#)
  - [Delete Objects \(uses BO/BC or IO\)](#)
  - [Query Objects \(uses BO/BC or IO\)](#)
  - [Execute Business Service \(uses BS\)](#)
- Inbound/Starter Activities
  - [Get Created Objects \(uses BO/BC or IO\)](#)
  - [Get Updated Objects \(uses BO/BC or IO\)](#)
  - [Get Deleted Objects \(uses BO/BC or IO\)](#)

The Siebel connector supports the following versions of the Siebel server: 7.0.5, 7.5.x, 7.7.x, 7.8.x, 8.0, 8.1, and 8.1.1.

The Siebel connector requires Siebel JAR files to connect to the Siebel server. For more information, see [Installing JAR files to connect to the Siebel server](#).

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel\\_Overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel_Overview.html)

# Installing JAR files to connect to the Siebel server

---

You must copy two JAR files on the same workstation as your Cast Iron Studio installation before you can connect to a Siebel server. Also, you can copy the `Siebel.properties` file, which is optional, to configure the connection timeout, transaction timeout, and the Siebel properties.

## Before you begin

---

- The JAR files can be obtained from the Siebel system administrator.
- The JAR files must be on the same computer as the studio installation.
- The JAR files must be from the same version as the Siebel server you connect to.
- The `Siebel.properties` file must have properties for that particular version of the Siebel server.

## About this task

---

The files to be installed are:

- `Siebel.jar`
- A language specific JAR file. For example, the English language JAR file is named `SiebelJI_enu.jar`
- `Siebel.properties` - This is an optional file. For more information about the `Siebel.properties` file, see [Siebel properties file](#).

## Procedure

---

1. Open studio and select Tools > Install Module Providers.
2. When the Add Provider(s) dialog box is displayed, click the plus (+) button under Siebel Connector. A field and a Browse button appears.
3. Click Browse, and use the browse dialog box to locate and select the JAR files and the properties file (optional).
4. Click Open to import the contents of the selected files.
5. When the two JAR files and the properties file (optional) are listed in the Add Provider(s) dialog box, click OK.

## Results

---

A prompt is displayed to restart studio and activate the changes.

## What to do next

---

You can now create Siebel endpoints and orchestrations.

**Parent topic:** [Siebel activities](#)

# Creating or editing a Siebel endpoint

Siebel endpoints contain the connection information that Studio and the Integration Appliance use to connect to a Siebel Business Applications Server. You can create multiple endpoints that refer to separate instances.

## About this task

Use this task to create or edit a Siebel endpoint.

Note: Any changes you make to the Siebel endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

## Procedure

1. Drag an activity from the Siebel folder under the Activities tab to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint under Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. Browse - To select an existing endpoint from Project Explorer. The Project Explorer window shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
  - b. New - To create a new endpoint. The Create Endpoint window opens.  
Note: In Version 6.1.0.1, select the first Siebel entry in the list. For more information, see the technote <http://www-01.ibm.com/support/docview.wss?uid=swg21516320>.
  - c. Edit - To edit the existing endpoint. The Edit Endpoint window opens.
4. Complete the fields defined in the following table:

Table 1. Connection properties

Field Name	Description
Connection information	
Connection URL	<p>Specifies the connection URL to connect to the Siebel server. The connection URLs for all versions of Siebel follow this format:</p> <pre>siebel[.transport][.encryption][.compression]://host[:port]/EnterpriseServer/AppObjMgr</pre> <p>The default port number is 2320. For Siebel version 7.5x and earlier versions, the port number (2320) and the server name are specified.</p> <p>For Siebel version 7.8, the port and the server name are not specified.</p> <p>If you do not select the default port, you can specify another port number (for example, 2321).</p> <p>The following are the examples of connection URIs for different versions of the Siebel server:</p> <ul style="list-style-type: none"><li>o For Siebel 7.5: siebel://&lt;IP_address&gt;:2320/siebel/SSEObjMgr_ENU/sebldev1</li><li>o For Siebel 7.8: siebel://&lt;IP_address&gt;:/Sieb78/SSEObjMgr_enu</li><li>o For Siebel 8: siebel://&lt;IP_address&gt;:2321/SBA_80/SSEObjMgr_enu</li></ul>

<b>Field Name</b>	<b>Description</b>
Language Code	Specifies the language code to log on to the Siebel server. If the system locale is English, the value for this property is ENU (English).
User Name	Specifies the user name to connect to the Siebel server.
Password	Specifies the password associated with the user name to connect to the Siebel server.
Code page	<p>Specifies the character encoding (code page) of the Siebel Server. The character encoding (code page) of the Siebel Server and the character encoding of the Siebel client (machine on which Siebel connector is used) must be the same. This allows the Siebel client and the Siebel Server to communicate correctly. Change the character encoding of the Siebel client if it is different from that of the Siebel server.</p> <p>The Siebel Java™ Data Bean supports a limited list of code page settings. If the current code page setting of your run time is not supported, the connector may not be able to connect to the Siebel server. For more details refer to the Siebel Java Data Bean documentation.</p>
Load Balancing	
Use Resonate for load balancing on Siebel server	Specifies the option (select the check box) if the Siebel system uses resonate for load balancing. The connector takes advantage of the load balancing feature to connect to the Siebel Business Applications server efficiently.
Connection pool options	
Minimum Connections	Specifies the minimum number of connections available in the connection pool. The activity uses the connections to connect to a Siebel server. The default value is 5.
Maximum Connections	Specifies the maximum number of connections available in the connection pool. The activity uses the connections to connect to a Siebel server. The default value is 25.
Maximum Idle Time	Specifies the amount of time in minutes an open connection can be idle before being closed by the Integration Appliance. Entering 0 (zero) means that the connections are closed when they are returned to the pool - no idle time. The default value is 120 minutes.
Maximum Wait	Specifies the amount of time in seconds that the Integration Appliance waits for a connection when all the connections in the pool are exhausted. If no connection is obtained after the wait time, an exception is thrown. The default value is 300 seconds.
Reclaim Connections	Specifies the interval at which the connector checks for idle connections. Idle connections are reclaimed until the minimum number of connections, as specified in the Minimum Connections parameter, is reached. By default, the connector reclaims connections at five minutes interval.
	Note: The Connection pool properties need to be configured as per the load (number of concurrent requests) on the endpoint.
Remote endpoint configuration	

Field Name	Description
Endpoint Runs Behind Firewall	Enables the secure connector name property so that secure connector can be used if the Siebel Business Applications server is running behind a firewall.
Secure Connector Name	Specifies the name of the secure connector that is used to connect to the Siebel Business Applications server running behind a firewall. For example, if an orchestration containing Siebel activity is deployed on to Cast Iron® Live (cloud), then the secure connector needs to be configured.

5. When finished, click Test Connection to confirm that you can connect to the Siebel system.

6. Click OK.

**Parent topic:** [Siebel activities](#)

## Using the Siebel Create Objects activity

---

Use the Siebel Create Objects activity to work with either Siebel Business Objects, Business Components, or Siebel Integration Objects.

### Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the Siebel server. For more information, see [Installing JAR files to connect to the Siebel server](#).
- Valid connection details to connect to the Siebel server.

### About this task

---

Use this task to create either a Business Component hierarchy or an Integration Object on the Siebel server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Siebel folder contents.
2. Drag the Create Objects activity icon onto the orchestration. The Siebel create objects Checklist is displayed.

3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Siebel endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing a Siebel endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Enter the repository name in the Repository Name text box. Repository name is populated with a default value, which represents the Siebel Repository. Enter the repository name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this repository.
11. Select one of the following objects for integration.

To work with **Business Object/Business Component**:

- a. Select the Object Type as Business Object / Business Component.
- b. Click Browse to display the list of Business Objects.
- c. Use the Business Object Filter to filter the business objects during selection.
- d. Optional: Click Refresh to update the current object list from the Siebel server.
- e. Select a Business Object from the business object list and click Next.
- f. The list of business components for the selected business object is displayed. Select a business component and click Finish to generate schemas for the map input and map output.
- g. If the selected business component is a child of a parent business component, then both the parent and the child business components are generated with a relation between them.

Note: Each of the child object attributes created in the map input is processed by the activity as follows:

- The key attributes are not set on the parent business component. Siebel generates the key attributes when a record is created. If the key attributes are set, Siebel returns an exception and sets the read-only fields populated with values.
- If the child object is a business component of a Picklists, and you want to select an existing child instance, do not create a new child object. Instead, set the value on the parent. For example, if you select an existing Business Address under Account, set the PrimaryAddressId instead of creating a Business Address. However, to create a new child instance, you must populate the non-key attributes in the child business component so that the activity tries to create the corresponding child instance in the Siebel application.
- If there are static Picklists, then the corresponding simple attribute in the object is required. If a value is not listed in the Picklist's list of values, the activity tries to populate the value. If the list is unbounded and Insert is enabled, the activity processing is successful. If the activity is unable to populate the value by itself, the operation fails.
- The child record is created with multi-value links. If the create operation for the child record fails, the child record is rolled back. If the create operation for the parent record fails, all the child and the parent records are rolled back.
- The connector attempts to select an existing child business component (for example, Association) based on the values of all the attributes in the corresponding input child object. If a matching child business component is found, it is associated with the parent. If a matching child business component is not found, a new child business component is created and associated with the parent business component.
- If the child create operation fails, the child is rolled back. If the parent create operation fails, only the parent is rolled back. Because association components can also be individual components, as well as children of other components, a child, or parent cannot be rolled back once an associated child has been created.

To work with Integration Object:

- a. For Siebel Integration Object, select the Object Type as Integration Object.
  - b. Click Browse to display the list of integration objects.
  - c. Use Integration Object Filter to filter the integration objects during selection.
  - d. Optional: Click Refresh to update the current object list from the Siebel server.
  - e. Select an integration object and click Finish to generate schemas for the map input and map output. During processing, the selected business service is executed and the output is sent back to the orchestration.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery Options for Siebel Activities](#).
  13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
  14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
  15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
  16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Siebel Create Objects activity.

**Parent topic:** [Siebel activities](#)

## Using the Siebel Update Objects activity

---

Use the Siebel Update Objects activity to work with either Siebel Business Objects, Business Components, or Siebel Integration Objects.

### Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the Siebel server. For more information, see [Installing JAR files to connect to the Siebel server](#).
- Valid connection details to connect to the Siebel server.

### About this task

---

Use this task to update either a Business Component hierarchy or an Integration Object on the Siebel server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Siebel folder contents.
2. Drag the Update Objects activity icon onto the orchestration. The Siebel Update Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Siebel endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing a Siebel endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Enter the repository name in the Repository Name text box. Repository name is populated with a default value, which represents the Siebel Repository. Enter the repository name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this repository.
11. Select one of the following objects for integration.

### To work with **Business Object/Business Component**:

- a. Select the Object Type as Business Object / Business Component.
- b. Click Browse to display the list of Business Objects.
- c. Use the Business Object Filter to filter the business objects during selection.
- d. Optional: Click Refresh to update the current object list from the Siebel server.
- e. Select a Business Object from the business object list and click Next.
- f. The list of business components for the selected business object is displayed. Select a business component and click Finish to generate schemas for the map input and map output.

During processing, the business component hierarchy is retrieved from the Siebel server and compared to the incoming top-level business object hierarchy of the activity. The child objects are created, updated, and deleted based on the results of this comparison. The Update activity fails if the key attributes (for example, ID) are not set correctly.

### To work with Integration Object:

- a. For Siebel Integration Object, select the Object Type as Integration Object.
  - b. Click Browse to display the list of integration objects.
  - c. Use Integration Object Filter to filter the integration objects during selection.
  - d. Optional: Click Refresh to update the current object list from the Siebel server.
  - e. Select an integration object and click Finish to generate schemas for the map input and map output. During processing, the selected business service is executed and the output is sent back to the orchestration.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery Options for Siebel Activities](#).
  13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Update Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
  14. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

15. Select the Map Outputs in the checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Siebel Update Objects activity.

**Parent topic:** [Siebel activities](#)

---

### Feedback | Notices

## Using the Siebel Delete Objects activity

---

Use the Siebel Delete Objects activity to work with either Siebel Business Objects, Business Components, or Siebel Integration Objects.

### Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the Siebel server. For more information, see [Installing JAR files to connect to the Siebel server](#).
- Valid connection details to connect to the Siebel server.

### About this task

---

Use this task to delete either a Business Component hierarchy or an Integration Object on the Siebel server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Siebel folder contents.
2. Drag the Delete Objects activity icon onto the orchestration. The Siebel Delete Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Siebel endpoint.

7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing a Siebel endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Enter the repository name in the Repository Name text box. Repository name is populated with a default value, which represents the Siebel Repository. Enter the repository name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this repository.
11. Select one of the following objects for integration.

To work with **Business Object/Business Component**:

- a. Select the Object Type as Business Object / Business Component.
- b. Click Browse to display the list of Business Objects.
- c. Use the Business Object Filter to filter the business objects during selection.
- d. Optional: Click Refresh to update the current object list from the Siebel server.
- e. Select a Business Object from the business object list and click Next.
- f. The list of business components for the selected business object is displayed. Select a business component and click Finish to generate schemas for the map input and map output.

The Delete activity deletes the top-level business objects and its children. This results in a physical delete, and the record is removed from the Siebel application. The Delete activity fails if the key attributes (for example, ID) are not set correctly.

To work with Integration Object:

- a. For Siebel Integration Object, select the Object Type as Integration Object.
  - b. Click Browse to display the list of integration objects.
  - c. Use Integration Object Filter to filter the integration objects during selection.
  - d. Optional: Click Refresh to update the current object list from the Siebel server.
  - e. Select an integration object and click Finish to generate schemas for the map input and map output. During processing, the selected business service is executed and the output is sent back to the orchestration.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery Options for Siebel Activities](#).
  13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Delete Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
  14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
  15. Select the Map Outputs in the checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
  16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Siebel Delete Objects activity.

**Parent topic:** [Siebel activities](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel\\_delete\\_outactivity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel_delete_outactivity.html)

## Using the Siebel Query Objects activity

---

Use the Siebel Query Objects activity to work with either Siebel Business Objects, Business Components, or Siebel Integration Objects.

### Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the Siebel server. For more information, see [Installing JAR files to connect to the Siebel server](#).
- Valid connection details to connect to the Siebel server.

### About this task

---

Use this task to query either a Business Component hierarchy or an Integration Object on the Siebel server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Siebel folder contents.
2. Drag the Query Objects activity icon onto the orchestration. The Siebel Query Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Siebel endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing a Siebel endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Enter the repository name in the Repository Name text box. Repository name is populated with a default value, which represents the Siebel Repository. Enter the repository name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this repository.
11. Select one of the following objects for integration.

To work with **Business Object/Business Component**:

- a. Select the Object Type as Business Object / Business Component.
- b. Click Browse to display the list of Business Objects.
- c. Use the Business Object Filter to filter the business objects during selection.
- d. Optional: Click Refresh to update the current object list from the Siebel server.
- e. Select a Business Object from the business object list and click Next.
- f. The list of business components for the selected business object is displayed. Select a business component and click Finish to generate schemas for the map input and map output.

The Query activity retrieves the Siebel business component for the specified key in the map input. The following occurs during the Query activity:

- The keys are set on the top-level business component to search for records. If the record is not found, an error message is logged, and the job fails. If the record is found, the simple attribute values are retrieved from the top-level business component and set to the map output.  
Note: A simple PickList attribute is retrieved differently from other simple attributes. The simple PickList attribute is retrieved by obtaining the value of the PickListKey from the child picklist component. To retrieve a child picklist component, the FieldName value must be used.
- Child business components are retrieved based on the type of relationship they have with the parent business component.
- Child PickList instances are retrieved.
- If the child record is found with multi-value link and association, the attribute value is set to the parent.

To work with Integration Object:

- a. For Siebel Integration Object, select the Object Type as Integration Object.
  - b. Click Browse to display the list of integration objects.
  - c. Use Integration Object Filter to filter the integration objects during selection.
  - d. Optional: Click Refresh to update the current object list from the Siebel server.
  - e. Select an integration object and click Finish to generate schemas for the map input and map output. During processing, the selected business service is executed and the output is sent back to the orchestration.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying Retry and Delivery Options for Siebel Activities](#).
  13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Query Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
  14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console (WMC). If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
  15. Select the Map Outputs in the checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
  16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Siebel Query Objects activity.

**Parent topic:** [Siebel activities](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel\\_query\\_outactivity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel_query_outactivity.html)

## Using the Siebel Execute Business Service activity

---

The Siebel execute business service activity is used to run a Siebel business service on the Siebel Business Applications server.

### Before you begin

---

Ensure that you have:

- Installed the JAR files required to connect to the Siebel server. For more information, see [Installing JAR files to connect to the Siebel server](#).
- The valid connection details to connect to the Siebel server.
- 

### About this task

---

The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration. The business service can be a standard business service like Siebel Contact or a custom business service where the integration object needs to be selected.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Siebel folder contents.
2. Drag the Execute Business Service activity icon onto the orchestration.
3. When the activity shows in the orchestration, the Siebel Execute Business Service Checklist is displayed.
4. In the Checklist, click Summary.
5. Review the contents of the Activity Name field, and make the required changes.
6. In the Checklist, click Pick Endpoint.
7. Click Browse and use the Project Explorer dialog box to select the relevant Siebel endpoint.
8. You can create the endpoint by clicking New and enter the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing a Siebel endpoint](#).
9. To make any required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
10. In the Checklist, click **Configure**.
11. Type the repository name in the Repository Name text box. The repository name is populated with a default value, which represents the Siebel Repository. Specify the repository name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this repository.
12. Select the business service.
  - a. Click Browse to display the list of Business Services.
  - b. Use the Business Service Filter to filter the business services during selection.
  - c. Optional: Click **Refresh** to update the current object list from the Siebel server.
  - d. Select a Business Service from the business service list and click Next. The list of business operations for the selected business service is displayed.

- If the business service has a fixed integration object associated with it then after selecting the business operation, click Finish to generate the schemas for the map input/output.
  - If the business service has no fixed integration object associated with it then after selecting the business operation click Next and select the integration objects for the input/output message.
13. Select Map Inputs from the Checklist. The XML Schemas generated from the selected service of the Execute Business Service activity are displayed as nodes under the request input parameter in the To Activity panel.
  14. Create a map between orchestration variables and the input parameter of the activity.

Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with input node. During run time if no value is provided for a mandatory element, the activity throws an exception which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

15. Select the Map Outputs from the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and the orchestration variables.

## Results

---

You have configured the Siebel Execute Business Service activity.

**Parent topic:** [Siebel activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel\\_business\\_service.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel_business_service.html)

## Prerequisites for starter activities in Siebel

---

This section contains the prerequisites to configure the Siebel inbound activities.

You must create an event store in Siebel as a prerequisite for using the starter activities.

### Creating the Event Store in Siebel

---

This procedure uses the Siebel Sales Enterprise application as an example. For convenience, whenever we say Siebel application, it means Siebel Sales Enterprise application in the following chapter. IBM Events are used as the event store name in this example. This name can be changed based on the end user needs.

To create an 'Event Store' and 'Object' in Siebel Business Applications, perform the following procedure in Siebel tools:

1. Using New Object Wizard, create a stand-alone table CX\_IBM\_EVENT.
2. Create these columns in your new table:

Table 1. Columns for the event table

Column Name / User Name	Type	Length	Physical Type	Required	Nullable	Status
DESCRIPTION	Data (public)	255	Varchar		√	Active
EVENT_ID	Data (public)	30	Varchar	√		Active
CONNECTOR_ID	Data (public)	255	Varchar		√	Active
EVENT_TYPE	Data (public)	20	Varchar	√		Active
OBJECT_KEY	Data (public)	255	Varchar	√		Active
OBJECT_NAME	Data (public)	255	Varchar	√		Active
PRIORITY	Data (public)	10	Number		√	Active
STATUS	Data (public)	20	Number	√		Active
XID	Data (public)	255	Varchar	√		Active

3. Create a new Business Component (BC) IBM Events based on your new table. All fields are single value fields.
4. In addition to the fields in BC, create a new field Event Time Stamp and map it to CREATED column in from CX\_IBM\_EVENT. The Type of this field should be DTYPE\_UTCDATETIME.
5. Create a new Business Object (BO) IBM Events.
6. Associate IBM Events BC to IBM Events BO.
7. Create IBM Event List Applet based on IBM Events BC.
8. Create IBM Event List View based on IBM Events BO.
9. Create IBM Events Screen and associate it to the IBM Event List View in Screen View.
10. Create a page tab as follows:
  - a. Access the Application > Siebel Sales Enterprise > Page tab.
  - b. Right-click and select New Record from the menu.
  - c. Enter IBM Events as the screen name and IBM Events for the Text-String Override.
  - d. Leave the inactive field unchecked
11. Create a screen menu item as follows:
  - a. Access the Application > Siebel Sales Enterprise > Screen Menu Item.
  - b. Right-click and select new record.
  - c. Enter IBM Events as the screen name and IBM Events for the Text-String Override.
  - d. Leave the inactive field unchecked.
12. Create a new Business Object Schema Version for IBM project and associate it to Schema Version BC.
13. Apply the physical schema for the new tables in your local database. You can do this by querying on the new table, CX\_IBM\_EVENT. Select the current query to create a physical schema. Make sure that you leave the table space and index space blank.
14. Activate the new schema using Activate.
15. Add or modify the Siebel VB or e-scripts for the BC that corresponds to the business objects used at your site. Siebel scripts triggers event notification for the configured objects (sample scripts are in the

- <studio\_root>/etc/Siebel folder). In the Siebel script, ensure that the event will not get created for the connector user name to prohibit the ping-pong effect.
16. Compile the updated and locked projects in your local database to create a new Siebel repository (.srf) file.
  17. Open Siebel Sales Enterprise in your local database. You need to have administrative privileges to perform the following:
    - a. Create a new view called IBM Event List View.
    - b. Create a new responsibility called IBM Responsibility for IBM Event List View.
    - c. Add the employees or teams who are responsible for receiving events to the newly created IBM Responsibility.
    - d. Create the IBMCONN (or your connector user name) user and add it to IBM Responsibility and Administrative Responsibility.
  18. Test the application in your local environment. Ensure that you have the visibility to IBM Event List View and that an event is generated in the view after you create a record in supported object. For example, create a new account in Siebel and check if a new account event appears in the IBM Event List View.
  19. Check-in the new and updated projects into your development server.
  20. Activate the new tables in the development database.
  21. Compile a new Siebel.srf file and deploy it on the server.

You have successfully created the event store in the Siebel server.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel\\_prerequisites\\_inbound\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Siebel_prerequisites_inbound_activity.html)

## Using the Siebel Get Created Objects activity

---

Use the Get Created Objects activity to poll for Siebel Business Objects, Business Components, or Siebel Integration Objects from the Siebel server.

### Before you begin

---

Ensure that you have:

- Installed the necessary vendor software JAR files.
- The valid connection details to connect to the Siebel server.
- Configured the *EventStore* business objects and triggers to generate events. For more information, see [Prerequisites for starter activities in Siebel](#).

### About this task

---

Use this task to poll for either a Business Component hierarchy or an Integration Object, created on the Siebel server.

1. In an active orchestration, open the Activities tab and expand the Siebel folder contents.
2. Drag the Get Created Objects activity icon onto the orchestration. The Siebel Get Created Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Siebel endpoint.
7. You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing a Siebel endpoint](#).
8. To make any required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Specify the repository name in the Repository Name text box. Repository name is populated with a default value, which represents the Siebel Repository. Specify the repository name if it is not the same as the default value. All the metadata needed for discovering the objects are retrieved from this repository.
11. Specify the Event Store name configured in the Siebel server. The activity polls this Event Store for new events.
12. Select one of the following objects for integration.

To work with **Business Object/Business Component**:

- a. Select the Object Type as Business Object / Business Component.
- b. Click Browse to display the list of Business Objects.
- c. Use the Business Object Filter to filter the business objects during selection.
- d. Optional: Click Refresh to update the current object list from the Siebel server.
- e. Select a Business Object from the business object list and click Next.
- f. The list of business components for the selected business object is displayed. Select a business component and click Finish to generate schemas for the map output.
- g. If the selected business component is a child of a parent business component, then both the parent and the child business components are generated with a relation between them.

To work with Integration Object:

- a. Select the Object Type as Integration Object.
  - b. Click Browse to display the list of integration objects.
  - c. Use Integration Object Filter to filter the integration objects during selection.
  - d. Optional: Click Refresh to update the object list from the Siebel server.
  - e. Select an integration object and click Finish to generate schemas for the map output.
13. In the Checklist, click Retry. Review the default settings and make the required changes. Similarly, configure the **Delivery Rules** panel. For more information, see [Specifying Retry and Delivery Options for Siebel Activities](#).

The activity polls the event store at configured interval for create events and fetches the actual object for that event. This object is sent to the orchestration. After processing, the event is marked as archived in the event store.

14. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
15. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Siebel Get Create Objects activity.

**Parent topic:** [Siebel activities](#)

## Using the Siebel Get Updated Objects activity

---

Use the Get Updated Objects activity to poll for events that were updated on the Siebel Sever.

### Before you begin

---

Ensure that you have:

- Installed the necessary vendor software JAR files.
- The valid connection details to connect to the Siebel server.
- Configured the *EventStore* business objects and triggers to generate events. For more information, see [Prerequisites for starter activities in Siebel](#)

### About this task

---

Use this task to get updated Business Component hierarchy or updated Integration Objects on the Siebel server.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Siebel folder contents.
2. Drag the Get Updated Objects activity icon onto the orchestration. The Siebel Get Updated Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click **Pick Endpoint**.
6. Click Browse and use the Project Explorer dialog box to select the relevant Siebel endpoint.
7. You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing a Siebel endpoint](#).
8. To make any required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Enter the repository name in the Repository Name text box. Repository name is populated with a default value, which represents the Siebel Repository. Enter the repository name if it is not same as the default

- value. All the metadata needed for discovering the objects are retrieved from this repository.
11. Specify the Event Store name which is configured in the Siebel server. The activity polls this Event Store for new events.
  12. Select one of the following objects for integration.

To work with **Business Object/Business Component**:

- a. Select the Object Type as Business Object / Business Component.
- b. Click Browse to display the list of Business Objects.
- c. Use the Business Object Filter to filter the business objects during selection.
- d. Optional: Click Refresh to update the current object list from the Siebel server.
- e. Select a Business Object from the business object list and click Next
- f. The list of business components for the selected business object is displayed. Select a business component and click Finish to generate schemas for the map input and map output.
- g. If the selected business component is a child of a parent business component, then both the parent and the child business components are generated with a relation between them.

To work with Integration Object:

- a. Select the Object Type as Integration Object.
  - b. Click Browse to display the list of integration objects.
  - c. Use Integration Object Filter to filter the integration objects during selection.
  - d. Optional: Click Refresh to update the object list from the Siebel server.
  - e. Select an integration object and click Finish to generate schemas for the map output.
13. In the Checklist, click Retry. Review the default settings and make the required changes. Similarly, configure the **Delivery Rules** panel. For more information, see [Specifying Retry and Delivery Options for Siebel Activities](#)
  14. The activity polls the event store at configured intervals for update events, and fetches the actual object for that event. This object is sent to the orchestration. After processing, the event is marked as archived in the event store.
  15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
  16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Siebel Get Updated Objects activity.

**Parent topic:** [Siebel activities](#)

## Using the Siebel Get Deleted Objects activity

---

Use the Get Deleted Objects activity to poll for deleted Siebel Business Objects, Business Components, or Siebel Integration Objects from the Siebel server.

## Before you begin

---

Ensure that you have:

- Installed the necessary vendor software JAR files.
- The valid connection details to connect to the Siebel server.
- Configured the *EventStore* business objects and triggers to generate events. For more information, see [Prerequisites for starter activities in Siebel](#)

## About this task

---

Use this task to poll for events that are generated because of a delete operation performed on the Siebel Business Application server.

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Siebel folder contents.
2. Drag the Get Deleted Objects activity icon onto the orchestration. The Siebel Get Deleted Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Siebel endpoint.
7. You can create the endpoint by clicking New and enter the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating or editing a Siebel endpoint](#).
8. To make any required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Enter the repository name in the Repository Name text box. Repository name is populated with a default value, which represents the Siebel Repository. Specify the repository name if it is not same as the default value. All the metadata needed for discovering the objects are retrieved from this repository.
11. Specify the event store name which is configured in the Siebel server. The activity polls this event store for new events.
12. Select one of the following objects for integration.

To work with **Business Object/Business Component**:

- a. Select the Object Type as Business Object / Business Component.
- b. Click Browse to display the list of Business Objects.
- c. Use the Business Object Filter to filter the business objects during selection.
- d. Optional: Click Refresh to update the current object list from the Siebel server.
- e. Select a Business Object from the business object list and click Next.
- f. The list of business components for the selected business object is displayed. Select a business component and click Finish to generate schemas for the map input and map output.
- g. If the selected business component is a child of a parent business component, then both the parent and the child business components are generated with a relation between them.

To work with Integration Object:

- a. Select the Object Type as Integration Object.
- b. Click Browse to display the list of integration objects.
- c. Use Integration Object Filter to filter the integration objects during selection.

- d. Optional: Click Refresh to update the object list from the Siebel server.
- e. Select an integration object and click Finish to generate schemas for the map output.
- 13. In the Checklist, click Retry. Review the default settings and make the required changes. Similarly, configure the **Delivery Rules** panel. For more information, see [Specifying Retry and Delivery Options for Siebel Activities](#)
- 14. The activity polls the event store at configured interval for delete events and fetches the actual object for that event. This object is sent to the orchestration. After processing, the event is marked as archived in the event store.
- 15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
- 16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Siebel Get Deleted Objects activity.

**Parent topic:** [Siebel activities](#)

## Specifying Retry and Delivery Options for Siebel Activities

---

Specifying the Retry and Delivery parameters is one of the tasks to configure a Siebel activity configuration.

### About this task

---

This section contains the procedure for configuring the retry options for Siebel outbound and inbound activities.

### Procedure

---

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry options for connecting to a Siebel server as described in the following table.

Table 1. Retry options

Retry Fields	Description

<b>Retry Fields</b>	<b>Description</b>
Wait__seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Siebel server.
Retry count	Specifies the retry count — the maximum number of times the Integration Appliance attempts to establish a connection to the Siebel server before issuing an error and stopping the processing of the current orchestration job. Note: If you deploy an orchestration that contains the inbound or outbound Siebel activity and the Integration Appliance cannot connect to the specified Siebel server, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3. The first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.

## Specifying the delivery rules options for Siebel inbound activities

### About this task

This section contains the procedure for configuring the delivery rule options for Siebel inbound activities.

### Procedure

1. Select the Delivery Rules task from the Checklist. The delivery rules pane is displayed.
2. Configure the delivery rules options to select the activity's behavior as described in the following table.

Table 2. Delivery rules

<b>Delivery Rules Fields</b>	<b>Description</b>
Poll for changes every _____ days/hours/minutes/seconds	Specifies the time interval to poll for objects in the Siebel server. (For example, the Get created object activity polls for create objects at the specified time interval.) Time can be selected in the format days, hours, minutes, or seconds.

<b>Delivery Rules Fields</b>	<b>Description</b>
Fetch _____ rows per poll	Specifies how many objects or components the activity should retrieve from the Siebel server in each poll cycle.
<b>Delivery Messages</b>	
ATMOST_ONCE	A non-persistent mode in which a Siebel business object or business component is either delivered once or not delivered at all.
ATLEAST_ONCE	A persistent mode, in which the Siebel business objects or business components are not lost. As a result, there are chances that the orchestration can receive events once or more than once.

---

## Siebel properties file

---

The Siebel connector uses Siebel API (Java™ Data Bean) to interact with the Siebel server. Siebel API also provides a way to configure the connection settings on the client side. The `siebel.properties` file located in your classpath, can be used to provide default parameters for client applications connecting to Siebel applications using the Java Data Bean.

The following table describes the properties of the `siebel.properties` file:

Table 1. Siebel.properties file description

<b>Property Type</b>	<b>Property</b>	<b>Description</b>
Siebel Connection Manager Connection properties	siebel.c onmgr.t xtimeou t	Indicates the transaction timeout (in milliseconds). The default value is 600000 = 10 minutes.
	siebel.c onmgr.p oolsize	Indicates the connection pool size. Connection pool maintains a set of connections to a specific server process. the default value is 2. Max connection pool size is 500.
	siebel.c onmgr.s esstime out	Indicates the transaction timeout (in seconds) on the client side. The default value is 2700 = 45 minutes.
	siebel.c onmgr.r etry	Indicates the number of open session retries. The default value is 3.

Property Type	Property	Description
	siebel.conmgr.jce	Indicates the usage of Java Cryptography Extension. 1 for jce usage and 0 for no usage.
	siebel.conmgr.virtualhosts	Indicates the list of virtual servers representing a group of similar servers that perform the same function, for example, call center functions.  An incoming login for the call center Virtual Server tries servers from the list in a round-robin fashion. An example of such a list is as follows:  <code>VirtualServer1=sid1:host:port,sid2:host:port...;VirtualServer2=...</code> , where Virtual Servers is an assigned list of real Siebel Servers with host names and port numbers (of the local SCB).
Siebel Generated code for JCA/JDB properties	Siebel connection string  siebel.username	Indicates the Siebel connection string.  Indicates the user name to be used for logging on to Object Manager.
	siebel.user.password	Indicates the password to be used for logging on to Object Manager.
	siebel.user.language	Indicates the preferred language of the user.
	siebel.user.encrypted	Indicates whether the user name and password are encrypted.
	siebel.jdb.classname	Indicates the default JDB classname.
Java System Properties Note: Java System Properties are System Properties, not Siebel Properties.	file.encoding	Indicates the code page on the client side. For example, cp1252, utf8, unicodeBig, cp942.

The following is a sample siebel.properties file:

```
siebel.conmgr.txttimeout = 3600
siebel.conmgr.poolsize = 5
siebel.conmgr.sesstimeout = 300000
```

## Security Token Service (STS) activities

---

- [Creating or editing an STS endpoint](#)  
A Security Token Service (STS) endpoint provides the connection information that Studio and the Integration Appliance use to connect to an STS. You can request for a SAML 2.0 token/assertion from STS, which complies to WS-Trust specification.
- [Using the STS Get SAML 2.0 Token activity](#)  
The **Get SAML 2.0 Token** activity is used to send a request that conforms to WS-Trust standard specification, to the Secure Token Service (STS) Provider. The request message is called the Request Security Token (RST). On receiving the request, the STS generates the requested token and sends it as part of the response, called the Request Security Token Response (RSTR). For this activity, the only token that is requested is SAML 2.0 token/assertion.

## Creating or editing an STS endpoint

---

A Security Token Service (STS) endpoint provides the connection information that Studio and the Integration Appliance use to connect to an STS. You can request for a SAML 2.0 token/assertion from STS, which complies to WS-Trust specification.

1. In the Create Endpoint or Edit Endpoint pane, configure the fields as described in the following table.  
Note: Changing the configuration properties of an endpoint affects all orchestrations that use that endpoint in the project as the edits are global, not local.

Table 1. Endpoint field description

Field Name	Description
Location	
Host Name	Specify the host name or IP address of the STS that this endpoint connects to.
Port	Specify the port number of the STS.
Login	Description

<b>Field Name</b>	<b>Description</b>
Log into the Server as an Anonymous User	Select this option to connect to STS anonymously (where user account is not required).
Log into the Server with User Name and Password	Select this option to connect to STS using a user account. Specify the User Name and Password.
Authentication	Allows you to select the type of authentication that the Integration Appliance uses when connecting to an STS server. From the list, select one of the following authentication options: <ul style="list-style-type: none"> <li>• <b>Basic</b> - Sends the user name and password you specify unencrypted to the server. This authentication scheme is the least secure.</li> </ul>
User Name	Specify the User Name for the account used to connect to the STS.
Password	Specify the Password for the account used to connect to the STS.
<b>Security</b>	<b>Description</b>
None	Select the None option if no security is required.
HTTPS	Select the HTTPS option to enable secure HTTP over SSL. <ul style="list-style-type: none"> <li>• When client authentication is required, select the Client Certificate Alias Name check box to specify that the Integration Appliance acting as a client should provide a certificate to STS. If selected, the name of the certificate must be provided. (For information about how to import a client certificate and private key for use with client authentication, see <a href="#">Importing an end-entity certificate</a>). A certificate specified at the endpoint level with this check box takes precedence over certificates specified on the <b>Security &gt; Certificates &gt; Settings &gt; Client SSL</b> entry in the WMC.</li> </ul>
Protocol Version	Select the protocol used for secure HTTP over SSL. By default, the protocol version used is SSL_TLSv2.
<b>Connection Timeout - The following Connection field is available for the Remote Server option only.</b>	

Field Name	Description
Time out after ___ seconds when establishing a connection to the Endpoint.	The number of seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the endpoint to respond to the connection request. For an STS activity, the amount of time the Integration Appliance attempts to establish a connection to STS before timing out. A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an endpoint and the time it takes the endpoint to respond.
<b>Proxy - The following Proxy fields are available for the Remote Server option only.</b>	
Login	Description
Connect via a Proxy Server	Select this check box if the request has to be routed through a proxy server.
Authentication	<p>Allows you to select the type of authentication that the Integration Appliance uses when connecting to a remote server. From the drop-down list, select one of the following authentication options:</p> <ul style="list-style-type: none"> <li>• <b>Basic</b> - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure.</li> <li>• <b>NTLM</b> - Requires an instance of NTCredentials to be available for the domain name of the server. This authentication is the most secure authentication option as the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server. Note: Do not prefix the user name with the domain.</li> </ul>
Realm / Domain	If you select the Basic authentication option, specify a realm. If you select the NTLM authentication option, specify a domain.
Host Name	Specify the host name or IP address of the proxy server that the request is routed through.
Port	Specify the port number of the proxy server that the request is routed through.
User Name	Specify the User Name for the account used to connect to the proxy server.
Password	Specify the Password for the account used to connect to the proxy server.
<b>Remote Endpoint Configuration</b>	

Field Name	Description
Endpoint Runs Behind Firewall	Select the check box to enable the secure connector name property so that secure connector can be used if STS is running behind a firewall.
Secure Connector Name	Specify the name of the secure connector that is used to connect to STS running behind a firewall. For example, if an orchestration containing an STS activity is deployed on to Cast Iron Live (cloud), then the secure connector needs to be configured.

Note: For some of the fields in the endpoint, you can define configuration properties to supply the values for these fields. The

icon is displayed when you click in a field that supports a configuration property and a configuration property of the same type has already been configured for the project.

## Feedback | Notices

Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/sts\\_create\\_edit\\_endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/sts_create_edit_endpoint.html)

## Using the STS Get SAML 2.0 Token activity

---

The **Get SAML 2.0 Token** activity is used to send a request that conforms to WS-Trust standard specification, to the Secure Token Service (STS) Provider. The request message is called the Request Security Token (RST). On receiving the request, the STS generates the requested token and sends it as part of the response, called the Request Security Token Response (RSTR). For this activity, the only token that is requested is SAML 2.0 token/assertion.

### Configuring the Get SAML 2.0 Token activity in the orchestration

---

1. Create or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the STS folder.
3. Drag the **Get SAML 2.0 Token** activity onto the orchestration.
4. Select the activity. The **Checklist** is displayed.

The Get SAML 2.0 Token activity requires an endpoint to be configured, to send the request for a security token to the external STS (Secure Token Service). The endpoint that is used in this activity is called the STS endpoint. The configuration parameters and functions of this endpoint are similar to the HTTP endpoint. However, this endpoint has properties that are specific to the Get SAML 2.0 activity.

### Creating, selecting, or editing an STS endpoint

---

1. Click **Pick Endpoint** task from the **Checklist** and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the "Configure the activity" procedure.
  - o Select an existing endpoint and edit the endpoint:

- a. Select Browse. The Project Explorer is displayed.
  - b. Select an existing endpoint and click OK.
  - c. Click Edit. The Edit Endpoint pane is displayed.
  - o Create a new endpoint: Select New. The Create Endpoint pane is displayed.
2. Create or edit an STS endpoint. See [Creating or editing an STS endpoint](#).

## Configuring the activity

1. Select the **Configure** task from the **Checklist**. The Configure pane is displayed.
2. Configure all the fields and check boxes in this pane as described in the following table:

Table 1.

Field or Check Box	Description
<b>Request</b>	
URL (Pathname)	Specifies the URI path that the <b>Get SAML 2.0 Token</b> activity sends the request to, for example: TrustServerWST13/services/RequestSecurityToken. The string that you specify in this field must exclude the protocol, for example: http://, the host name, and the port number of the Integration Appliance. The full URL is automatically constructed from the host name of the Integration Appliance, the port number that is specified in the STS endpoint, and the URI path that is specified in this field. For example, if the complete URL that the <b>Get SAML 2.0 Token</b> activity sends the request to, is http://<applianceHost>:<appliancePort>/<URI>, in this field, you must only specify the URI.
<b>SAML Security Token Service Properties</b>	
Request Type	This activity supports only issuing of SAML 2.0 token/assertion. The default value is <code>http://docs.oasis-open.org/ws-sx/ws-trust/200512/Issue</code> .

<b>Fi el d or C h e c k B o x</b>	<b>Description</b>
<b>Request</b>	
A p p l i e s T o	The recipient endpoint reference/entity of SAML 2.0 token/assertion.
I s s u e r	The authority responsible for issuing SAML 2.0 token/assertion.
T o k e n T y p e	This activity issues SAML 2.0 token/assertion. The default value is <code>SAML v2.0</code> . If you select <code>None</code> as the Token Type, then, no token type is sent as a part of the request. Note: Some STS services do not require a token type, but issues tokens that are based on the configurations in STS.

## Mapping the input into the activity

1. Select the **Map Inputs** task in the **Checklist**. The header input parameter is displayed in the To Activity pane of the **Map Inputs** task. The header input parameter is mandatory. The header input parameter contains the WSSE standard `Username Token`.
2. To view the optional input parameter in the To Activity pane of the Map Inputs pane, select `Map > Show Optional Parameters` from the toolbar menu or right-click in the To Activity pane and select the `Show Optional Parameters` option. If the `Map > Show Optional Parameters` option is not selectable in the toolbar menu, click a node in the Map Inputs pane to make this option active. The `requestSecurityToken`, `location`, `httpheaders`, and `proxyConnection` input parameters are displayed.

The following table defines the nodes of the optional `httpheaders` input parameter:

Table 2.

Input parameter	Description
<code>requestSecurityToken</code>	<code>requestSecurityToken</code> is sent as a SOAP body, which is interpreted by STS. Based on the input, STS issues the SAML 2.0 token/assertion. Note: If the values are populated in <code>requestSecurityToken</code> , the values that are provided in the Configure panel will not be considered.

3. Create a map between the orchestration variable or variables and the input parameter or parameters. See [Creating a map](#) for general instructions on mapping

## Mapping the output of the activity

1. Select the **Map Outputs** task in the **Checklist**. The output parameters of the activity are displayed in the From Activity pane of the **Map Outputs** task as described in the following table:

Table 3.

Output Parameter	Description
httpheaders	Specifies the HTTP header of the response.
assertion	Contains the SAML 2.0 token/assertion.

2. Create a map between the output parameter or parameters of the activity and orchestration variable or variables. See [Creating a map](#) for general instructions on mapping.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/sts\\_get\\_saml\\_20\\_token.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/sts_get_saml_20_token.html)

## SugarCRM activities

---

- [Creating and editing a SugarCRM endpoint](#)  
SugarCRM endpoints contain the connection information that studio and the Integration Appliance use to connect to the SugarCRM Server. You can create multiple endpoints that refer to separate instances.
- [Using the SugarCRM Upsert Object activity](#)  
Use the SugarCRM Upsert Object activity to update or insert objects in the SugarCRM instance.
- [Using the SugarCRM Get Reports activity](#)  
Use the SugarCRM Get Reports activity to retrieve specific reports from the SugarCRM server.
- [Using the SugarCRM Delete Object activity](#)  
Use the SugarCRM Delete Object activity to delete objects from the SugarCRM server.
- [Using the SugarCRM Get Object activity](#)  
Use the SugarCRM Get Object activity to get objects from the SugarCRM server.
- [Using the SugarCRM Query Object activity](#)  
Use the SugarCRM Query Object activity to query objects in the SugarCRM server.
- [Using the SugarCRM Get ServerInfo activity](#)  
Use the SugarCRM Get ServerInfo activity to retrieve server information such as *flavor*, *version*, and *GMT time* from the SugarCRM server.
- [Using the SugarCRM Get UserInfo activity](#)  
Use the SugarCRM Get UserInfo activity to retrieve user information such as *userId*, *userTeamId*, and so on from the SugarCRM server.
- [Using the SugarCRM Search activity](#)  
Use the SugarCRM Search activity to search for objects from specified records. This activity searches for details based on a query.
- [Using the SugarCRM Set Relationship activity](#)  
Use the SugarCRM Set Relationship activity to set a single relationship between two records.
- [Using the SugarCRM Delete Relationship activity](#)  
Use the SugarCRM Delete Relationship activity to delete a relationship between two records.
- [Using the SugarCRM Get Relationship activity](#)  
Use the SugarCRM Get Relationship activity to retrieve the relationship data between two records. For

example, you can use this activity to retrieve the contact details of a particular account and also retrieve the e-mail address and the opportunities information for that contact.

- [Specifying the Retry options for SugarCRM activities](#)

Specifying the Retry parameters is one of the tasks to configure an SugarCRM activity. The SugarCRM connector uses a single login session for all connections to an SugarCRM endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

## Creating and editing a SugarCRM endpoint

SugarCRM endpoints contain the connection information that studio and the Integration Appliance use to connect to the SugarCRM Server. You can create multiple endpoints that refer to separate instances.

---

### About this task

Use this task to create or edit a SugarCRM endpoint.

Note:

Any changes you make to the SugarCRM endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

---

### Procedure

1. Drag an activity from the SugarCRM folder under the Activities tab to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. Browse - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
  - b. New - To create a new endpoint. The Create Endpoint window opens.
  - c. Edit - To edit the existing endpoint. The Edit Endpoint window opens.
4. Complete the fields defined in the following table:

Table 1. Connection Details

Field Name	Description
Connection Details	
SugarCRM URL	Specify the SOAP URL of your SugarCRM instance. For example, <code>http://&lt;sugar-server&gt;/&lt;sugar-path&gt;/soap.php</code> .
User Name	Specifies the user name to connect to the SugarCRM server.

Field Name	Description
Password	Specifies the password associated with the user name to connect to the SugarCRM server.
Application Name	Indicates the name of the application used. The application name is populated automatically as <i>sugarCRM</i> .
Version	Indicates the version of the application used. The version number is populated automatically as <i>2.0</i> .

- When finished, click Test Connection to confirm that you can connect to the SugarCRM system.
- Click OK.

**Parent topic:** [SugarCRM activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SugarCRM\\_creating\\_an\\_endpoint\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SugarCRM_creating_an_endpoint_activity.html)

## Using the SugarCRM Upsert Object activity

---

Use the SugarCRM Upsert Object activity to update or insert objects in the SugarCRM instance.

### About this task

---

Use this task to update or insert objects in the SugarCRM instance. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

- In an active orchestration, open the Activities tab and expand the SugarCRM folder contents.
- Drag the Upsert Object activity icon onto the orchestration. The SugarCRM Upsert Object Checklist is displayed.
- In the Checklist, click Summary.
- Review the contents of the Activity Name field, and make the required changes.
- In the Checklist, click Pick Endpoint.
- Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM endpoint.
- Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a SugarCRM endpoint](#).
- To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
- In the Checklist, click Configure.
- Click Browse to select the object type. The Browse SugarCRM window is displayed.
- In Browse SugarCRM, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field

- preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
  13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for SugarCRM activities](#).
  14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Upsert Object activity are displayed as nodes under the request input parameter in the To Activity panel.
  15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
  16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
  17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the SugarCRM Upsert Object activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

**Parent topic:** [SugarCRM activities](#)

## Using the SugarCRM Get Reports activity

---

Use the SugarCRM Get Reports activity to retrieve specific reports from the SugarCRM server.

### About this task

---

Use this task to retrieve specific reports from the SugarCRM server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the SugarCRM folder contents.
2. Drag the Get Reports activity icon onto the orchestration. The SugarCRM Get Reports Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.

6. Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a SugarCRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get Reports activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the SugarCRM Get Reports activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

## Using the SugarCRM Query Object activity

---

Use the SugarCRM Query Object activity to query objects in the SugarCRM server.

### About this task

---

Use this task to query objects in the SugarCRM server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the SugarCRM folder contents.
2. Drag the Query Object activity icon onto the orchestration. The SugarCRM Query Object Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a SugarCRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse SugarCRM window is displayed.
11. In Browse SugarCRM, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list.
12. Click OK. The object field preferences are displayed.
13. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
14. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for SugarCRM activities](#).
15. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Query Object activity are displayed as nodes under the request input parameter in the To Activity panel.  
Note: To retrieve all deleted objects, set the required string in the QueryString, under Map Inputs. For example, to retrieve all deleted account objects, the query string should be `accounts.deleted=1`.
16. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
18. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the SugarCRM Query Object activity.

## Using the SugarCRM Get ServerInfo activity

---

Use the SugarCRM Get ServerInfo activity to retrieve server information such as *flavor*, *version*, and *GMT time* from the SugarCRM server.

### About this task

---

Use this task to retrieve server information such as *flavor*, *version*, and *GMT time* from the SugarCRM server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the SugarCRM folder contents.
2. Drag the Get ServerInfo activity icon onto the orchestration. The SugarCRM Get ServerInfo Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a SugarCRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get ServerInfo activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
11. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the SugarCRM Get ServerInfo activity.

## Using the SugarCRM Get UserInfo activity

---

Use the SugarCRM Get UserInfo activity to retrieve user information such as *userId*, *userTeamId*, and so on from the SugarCRM server.

### About this task

---

Use this task to retrieve user information such as such as *userId*, *userTeamId*, and so on from the SugarCRM server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the SugarCRM folder contents.
2. Drag the Get UserInfo activity icon onto the orchestration. The SugarCRM Get UserInfo Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a SugarCRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get UserInfo activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
11. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the SugarCRM Get UserInfo activity.

## Using the SugarCRM Search activity

---

Use the SugarCRM Search activity to search for objects from specified records. This activity searches for details based on a query.

### About this task

---

Use this task to to search for objects from specified records. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the SugarCRM folder contents.
2. Drag the Search activity icon onto the orchestration. The SugarCRM Search Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a SugarCRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Search activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the SugarCRM Search activity.

## Using the SugarCRM Set Relationship activity

---

Use the SugarCRM Set Relationship activity to set a single relationship between two records.

### About this task

---

Use this task to set a single relationship between two records. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the SugarCRM folder contents.
2. Drag the Set Relationship activity icon onto the orchestration. The SugarCRM Set Relationship Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a SugarCRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse SugarCRM window is displayed.
11. In Browse SugarCRM, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list.
12. Click OK. The object field preferences are displayed.
13. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
14. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for SugarCRM activities](#).
15. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Set Relationship activity are displayed as nodes under the request input parameter in the To Activity panel.
16. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
18. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the SugarCRM Set Relationship activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

# Using the SugarCRM Delete Relationship activity

---

Use the SugarCRM Delete Relationship activity to delete a relationship between two records.

---

## About this task

---

Use this task to delete a relationship between two records. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

---

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the SugarCRM folder contents.
2. Drag the Delete Relationship activity icon onto the orchestration. The SugarCRM Delete Relationship Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a SugarCRM endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse SugarCRM window is displayed.
11. In Browse SugarCRM, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list.
12. Click OK. The object field preferences are displayed.
13. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
14. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for SugarCRM activities](#).
15. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Delete Relationship activity are displayed as nodes under the request input parameter in the To Activity panel.
16. Create a map between the orchestration variables and the input parameter of the activity.

Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
18. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the SugarCRM Delete Relationship activity.

## Using the SugarCRM Get Relationship activity

---

Use the SugarCRM Get Relationship activity to retrieve the relationship data between two records. For example, you can use this activity to retrieve the contact details of a particular account and also retrieve the e-mail address and the opportunities information for that contact.

### About this task

---

Use this task to retrieve the relationship data between two records. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the SugarCRM folder contents.
2. Drag the Get Relationship activity icon onto the orchestration. The SugarCRM Get Relationship Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant SugarCRM endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a SugarCRM endpoint](#).

8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse SugarCRM window is displayed.
11. In Browse SugarCRM, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list.
12. Click OK. The object field preferences are displayed.
13. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
14. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for SugarCRM activities](#).
15. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get Relationship activity are displayed as nodes under the request input parameter in the To Activity panel.
16. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
17. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
18. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the SugarCRM Get Relationship activity.

Note: You can add more than one object as input to this activity. To add more than one object as input, right click the object in the To Activity pane of Map Inputs, and select Expand Occurrences. Only multiple objects of the same type is supported.

**Parent topic:** [SugarCRM activities](#)

### [Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SugarCRM\\_get\\_relationship\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/SugarCRM_get_relationship_activity.html)

## Specifying the Retry options for SugarCRM activities

---

Specifying the Retry parameters is one of the tasks to configure an SugarCRM activity. The SugarCRM connector uses a single login session for all connections to an SugarCRM endpoint. If a session expires, the connector automatically establishes a new session. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

### About this task

---

Use this task to configure the Retry options for SugarCRM activities.

## Procedure

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry and timeout options for connecting to an SugarCRM instance, as described in the following table:

Table 1. Retry options

<b>Retry Fields</b>	<b>Description</b>
Wait ___ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the SugarCRM instance.
Try to connect ___ times before failing.	<p>Specifies the retry count — the maximum number of times the Integration Appliance attempts to establish a connection to the SugarCRM instance before issuing an error and stopping the processing of the current orchestration job.</p> <p>Note: If you deploy an orchestration that contains the SugarCRM activity and the Integration Appliance cannot connect to the specified SugarCRM instance, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.</p>
<b>Activity Timeout</b>	
Timeout after _____ seconds when the endpoint does not respond to a request.	Specifies the number of seconds the Integration Appliance waits before timing out, when the endpoint does not respond to a request. The default is 300 seconds.

## Taleo activities

---

- [Creating and editing a Taleo endpoint](#)  
Taleo endpoints contain the connection information that Studio and the Integration Appliance use to connect to the Taleo HR Community, Resources, Application, and Recruitment database. You can create multiple endpoints that refer to separate instances.
- [Using the Taleo Create Attachments activity](#)  
Use the Taleo Create Attachments activity to create appended files associated with an object. For example, creating interview letters and appointment orders for a candidate in the Taleo server.
- [Using the Taleo Create Objects activity](#)  
Use the Taleo Create Objects activity to create objects such as Employee, Task, Calendar Event, Account, Candidate, Contact, Interview, Requisition, and User in the Taleo server.
- [Using the Taleo Get Objects activity](#)  
Use the Taleo Get Objects activity to get objects such as Employee, Task, Calendar Event, Account, Candidate, Contact, Interview, Requisition, and User from the Taleo server.
- [Using the Taleo Search Objects activity](#)  
Use the Taleo Search Objects activity to search for objects based on the search value entered in the field name, in the Taleo server.
- [Using the Taleo Delete Objects activity](#)  
Use the Taleo Objects activity to delete objects such as Employee, Task, Calendar Event, Account, Candidate, Contact, Interview, Requisition, and User from the Taleo server.
- [Using the Taleo Set Associated Users activity](#)  
Use the Taleo Set Associated Users activity to set an association with specific users and requisitions, in the Taleo server. Requisitions contain details of all the job openings that you want to track in Taleo.
- [Using the Taleo Set Binary Resume activity](#)  
Use the Taleo Set Binary Resume activity to append resumes in a binary format (Word, PDF, and so on) to Candidate IDs in the Taleo server.
- [Using the Taleo Submit Candidates activity](#)  
Use the Taleo Submit Candidates activity to submit candidates (Candidate ID) who are either applicants, employee referrals, sourced prospects, or agency submissions, for requisitions (job openings) in the Taleo server.
- [Using the Taleo Update Attachments activity](#)  
Use the Taleo Update Attachments activity to update attachments associated with Candidates in the Taleo server. The update request replaces the existing attachment file.
- [Using the Taleo Update Objects activity](#)  
Use the Taleo Update Objects activity to update objects such as Employee, Task, Calendar Event, Account, Candidate, Contact, Interview, Requisition, and User in the Taleo server.
- [Using the Taleo Upsert Objects activity](#)  
Use the Taleo Upsert Objects activity to insert or update employee records in the Taleo server.
- [Specifying retry parameters for Taleo activities](#)  
Specifying the retry parameters is one of the tasks you must complete to configure a Taleo activity.

---

## Creating and editing a Taleo endpoint

---

Taleo endpoints contain the connection information that Studio and the Integration Appliance use to connect to the Taleo HR Community, Resources, Application, and Recruitment database. You can create multiple endpoints that refer to separate instances.

### About this task

---

Use this task to create or edit a Taleo endpoint. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

Note:

Any changes you make to the Taleo endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

To create and edit a Taleo endpoint, complete the following steps:

### Procedure

---

1. Drag an activity from the Taleo folder under the Activities tab, to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. **Browse** - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
  - b. **New** - To create a new endpoint. The Create Endpoint window opens.
  - c. **Edit** - To edit the existing endpoint. The Edit Endpoint window opens.
4. In the Create Endpoint window, complete the fields defined in the following table:

Table 1. Connection details

Field Name	Description
<b>Connection Details</b>	
Instance Name	Specifies the name of the Taleo instance.
User Name	Specifies the user name to connect to the Taleo server.
Password	Specifies the password associated with the user name to connect to the Taleo server.

5. When finished, click Test Connection to confirm that you can connect to the Taleo system.
6. Click OK.

### Results

---

You have created or edited a Taleo endpoint.

**Parent topic:** [Taleo activities](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Taleo\\_creating\\_an\\_endpoint\\_activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Taleo_creating_an_endpoint_activity.html)

## Using the Taleo Create Attachments activity

---

Use the Taleo Create Attachments activity to create appended files associated with an object. For example, creating interview letters and appointment orders for a candidate in the Taleo server.

### About this task

---

Use this task to create attachments in the Taleo server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Taleo Create Attachments activity, complete the following steps:

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Taleo folder contents.
2. Drag the Create Attachments activity icon onto the orchestration. The Taleo Create Attachments Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Taleo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Taleo endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Attachments activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

### Results

---

You have configured the Taleo Create Attachments activity.

## Using the Taleo Create Objects activity

---

Use the Taleo Create Objects activity to create objects such as Employee, Task, Calendar Event, Account, Candidate, Contact, Interview, Requisition, and User in the Taleo server.

### About this task

---

Use this task to create objects in the Taleo server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Taleo Create Objects activity, complete the following steps:

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Taleo folder contents.
2. Drag the Create Objects activity icon onto the orchestration. The Taleo Create Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Taleo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Taleo endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Taleo window is displayed.
11. In Browse Taleo, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.
12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for Taleo activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which

is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.

16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Taleo Create Objects activity.

## Using the Taleo Get Objects activity

---

Use the Taleo Get Objects activity to get objects such as Employee, Task, Calendar Event, Account, Candidate, Contact, Interview, Requisition, and User from the Taleo server.

### About this task

---

Use this task to get objects from the Taleo server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure Taleo Get Objects, complete the following steps:

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Taleo folder contents.
2. Drag the Get Objects activity icon onto the orchestration. The Taleo Get Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Taleo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Taleo endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Taleo window is displayed.
11. In Browse Taleo, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK. The object field preferences are displayed.

12. In Object Field Preferences, select the fields that you would like to map by selecting the corresponding field name check boxes.
13. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying retry parameters for Taleo activities](#).
14. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Get Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
15. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
16. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
17. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Taleo Get Objects activity.

## Using the Taleo Search Objects activity

---

Use the Taleo Search Objects activity to search for objects based on the search value entered in the field name, in the Taleo server.

### About this task

---

Use this task to search for objects in the Taleo server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Taleo Search Objects activity, complete the following steps:

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Taleo folder contents.
2. Drag the Search Objects activity icon onto the orchestration. The Taleo Search Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Taleo endpoint.

7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Taleo endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Search Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

## Results

## Using the Taleo Set Associated Users activity

---

Use the Taleo Set Associated Users activity to set an association with specific users and requisitions, in the Taleo server. Requisitions contain details of all the job openings that you want to track in Taleo.

### About this task

---

Use this task to set an association with users and requisitions. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Taleo Set Associated Users activity, complete the following steps:

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Taleo folder contents.
2. Drag the Set Associated Users activity icon onto the orchestration. The Taleo Set Associated Users Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Taleo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Taleo endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Set Associated Users activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

## Results

## Using the Taleo Submit Candidates activity

---

Use the Taleo Submit Candidates activity to submit candidates (Candidate ID) who are either applicants, employee referrals, sourced prospects, or agency submissions, for requisitions (job openings) in the Taleo server.

## About this task

---

Use this task to submit candidates in the Taleo server. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Taleo Submit Candidates activity, complete the following steps:

## Procedure

---

1. In an active orchestration, open the Activities tab and expand the Taleo folder contents.
2. Drag the Submit Candidates activity icon onto the orchestration. The Taleo Submit Candidates Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Taleo endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Taleo endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Submit Candidates activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
11. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

## Results

## Specifying retry parameters for Taleo activities

Specifying the retry parameters is one of the tasks you must complete to configure a Taleo activity.

### About this task

The Taleo connector connects to the Taleo application to execute the activities. If a connection is lost or timed out, the connector automatically establishes a new connection based on the parameters described in Table 1. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

For more information about the configuration tasks in the Checklist, see the help topic for the specific Taleo activity.

To specify the retry parameters, complete the following steps:

### Procedure

1. In the Checklist, select Retry. The Retry panel is displayed.
2. Configure the retry options for connecting to a Taleo application.  
 The following table describes the retry options for connecting to a Taleo application:

Table 1. Retry options

Retry Fields	Description
Wait __ second(s) between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to the Taleo application. By default, this parameter is set to 30 seconds.

Retry Fields	Description
Try to connect ___ times before failing.	Specifies the maximum number of times that the Integration Appliance attempts to establish a connection to the Taleo application before issuing an error and stopping the processing of the current orchestration job. By default this parameter is set to 5 attempts.
<b>Activity Timeout</b>	
Time out after ___ second(s) when the endpoint does not respond to a request.	Specifies the number of seconds the Integration Appliance waits before timing out, when the endpoint does not respond to a request. The default is 300 seconds.

## Results

You have configured the retry parameters for Taleo activities.

**Parent topic:** [Taleo activities](#)

## Web Services Activities

- [Creating or Editing a Web Services Endpoint](#)  
You can define two types of Web Services endpoints.
- [Updating a Changed WSDL](#)  
If you created a project that uses a WSDL and the WSDL changes, you can attempt to update the existing WSDL with the new WSDL.
- [Web Services Invoke Service Activity](#)  
During run time, the Web Services **Invoke Service** activity starts an outside Web Service.
- [Compression/Decompression with the Web Services Invoke Service Activity](#)  
During run time, the Web Services Invoke Service activity sends a HTTP request complaint with the HTTP/HTTPS 1.1 protocol to the Web Service. The Invoke Service activity supports compression with the gzip format only and decompression with the gzip or the deflate formats.
- [Web Services Provide Service Activity](#)  
During run time the Provide Service activity provides a Web Service that can be started from an outside client.
- [Decompression with the Web Services Provide Service Activity](#)  
The Web Services Provide Service activity supports decompression with the gzip format only.
- [Web Services Send Reply Activity](#)  
During run time, the Send Reply activity returns a response for a Provide Service activity.
- [Web Services Send Reply with Fault Activity](#)  
During run time, the Send Reply with Fault activity returns a fault to the calling orchestration. This activity provides SOAP functionality as a reply configuration option.

- [Compression with the Web Services Send Reply Activity](#)  
During run time, the Web Services Send Reply activity sends an HTTP response complaint with the HTTP/HTTPS 1.0 protocol to the client. The Send Reply activity supports compression with the gzip format only.
- [Troubleshooting and support](#)  
Troubleshooting techniques and self-help information help you identify and solve problems quickly. Here, you can find potential solutions for issues you would have with the Web Services connector.

## Creating or Editing a Web Services Endpoint

---

You can define two types of Web Services endpoints.

### About this task

---

For the **Invoke Service** activity - the endpoint defines the remote Web Service server and service that is started during run time.

For the **Provide Service** activity - the endpoint defines the port number and the path of the service provided by the Integration Appliance.

- [Creating or editing an endpoint for an Invoke Service activity](#)  
Create or edit a Web Service endpoint for a **Invoke Service** activity.
- [Creating or editing an endpoint for a Provide Service activity](#)  
Create or edit a Web Service endpoint for a Provide Service activity.

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_creating\\_an\\_endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_creating_an_endpoint.html)

## Creating or editing an endpoint for an Invoke Service activity

---

Create or edit a Web Service endpoint for a **Invoke Service** activity.

### Procedure

---

1. In the Create Endpoint or Edit Endpoint pane, select the Remote Server option and click Browse. The Project Explorer displays.
2. In the Project Explorer pane, you can select one of the following options to select a WSDL file:
  - o In the Project Explorer pane, select an existing WSDL file that has already been [uploaded into the project](#).
  - o Select a WSDL file from the file system: Click Add. In the Add dialog box, browse for the WSDL file and click Add.
  - o Download a WSDL file from a URL: Click Add URL. In the Add field, enter the URL of the WSDL to download. Click OK.

**Note:**

- o The WSDL file you select must be compatible with the WSDL 1.1 and WS-I Basic Profile 1.1 specifications.
- o While editing an existing Web Service endpoint that is referenced by an Invoke Service activity, if you select a different WSDL for the endpoint, you must select the appropriate operation in the Configure task of the [Web Services Invoke Service Activity](#).

The WSDL Name, Service, Port, and Location fields display with the values specified in the WSDL file as described in the following list:

**WSDL Name**

**XML element in the WSDL file that defines this field:**

```
<definitions targetNamespace="http://www.acme.com/wsdl/hello.wsdl"
  xmlns="http://schemas.xmlsoap.org/wsdl/"
  xmlns:tns="http://www.acme.com/wsdl/hello.wsdl"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema">
  xmlns:soap="http://schemas.xmlsoap.org/wsdl/soap/
  ...</definitions>
```

**Description:** Specifies the name of the Web Service and the namespaces used in the WSDL. In addition, the definitions element is the root element for the rest of the elements that define the Web Service. These other elements are contained within the </definitions> elements in WSDL.

**Service**

**XML element in the WSDL file that defines this field:**

```
<service name="HelloWorld">
  <port name="HelloWorld" binding="s0:HelloWorld">
<soap:address location="http://localhost:7001/WS/HelloWorld.jws"/>
</port>
</service>
```

**Description:** Specifies the name of the service. In the WSDL, the service element contains the port and location elements that define the location of the service. One or more services can be defined in a WSDL. If more than one service is defined, you can select a service by selecting the menu in the Service field of the endpoint pane.

**Port**

**XML element in the WSDL file that defines this field:**

```
<port name="HelloWorld" binding="s0:HelloWorld">
<soap:address location="http://localhost:7001/WS/HelloWorld.jws"/>
</port>
```

**Description:** Specifies the binding of the service. One or more ports can be defined per service in a WSDL. If more than one port is defined for the service, you can select a port by selecting the menu in the Port field of the endpoint pane.

**Location**

**XML element in the WSDL file that defines this field:**

```
<soap:address location="http://localhost:7001/WS/HelloWorld.jws"/>
```

**Description:** Specifies the address for starting the specified service. Typically this is the URL for starting the Soap service.

3. Select a service from the Service list. See the previous table for details.
  4. Select a port from the Port list. See the previous table for details.
  5. Choose a Login option and specify settings described in the following table as needed.
- Note: These options are only available when you select the Remote Server Location option.

Table 1. Login options

Option/Field Name	Description
Log into the Server as an Anonymous User	Select this option to connect to the server anonymously. No user account information is required.
Log into the Server with User Name and Password	Select this option to connect to the server using a user account. When you select this option, you must choose an authentication mode and specify a user name and password.
Authentication	<p>Allows you to select the type of authentication that the Integration Appliance uses when connecting to a remote server. From the list, select one of the following authentication modes:</p> <ul style="list-style-type: none"> <li>◦ Basic - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure. Note: If the Remote Server is Cast Iron Live web service provider, then use the IBM ID credential for basic authentication.</li> <li>◦ Digest - Encrypts the user name and password you specify before sending the user name and password to the server. This authentication option is more secure than Basic authentication.</li> <li>◦ NTLM - Requires an instance of NTCredentials to be available for the domain name of the server. This authentication is the most secure authentication option. When you choose the NTLM authentication option, the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server. Note: Do not prefix the user name with the domain.</li> </ul>
Realm/Domain	<ul style="list-style-type: none"> <li>◦ If you select the Basic or Digest authentication option, you can specify a realm. When you do not specify a realm, the activity authenticates to 'any realm'.</li> <li>◦ If you select the NTLM authentication option, you must specify a domain. If you do not specify a domain, the endpoint configuration is not valid and an error occurs.</li> </ul>

Option/Field Name	Description
User Name	Specifies the User Name for the account used to connect to the Server.
Password	Specifies the Password for the account used to connect to the HTTP Server.

6. Specify security options.

When client authentication is required, select the Client Certificate Alias Name check box to specify that the Integration Appliance acting as a client should provide a certificate to the HTTP Server. If selected, the name of the certificate must be provided. A certificate specified at the activity level with this check box takes precedence over a certificate specified on the **Security-> Certificates-> Settings-> Client SSL** entry in the WMC.

Select the `Protocol Version` used for secure HTTP over SSL. By default, the protocol version used is `SSL_TLSv2`.

7. For the Connection Pool Options, specify the maximum number of connections.

This value specifies the maximum number of connections that the Integration Appliance has open in the connection pool. By default, the Integration Appliance can have 25 connections open.

8. Specify the Connection Timeout. The connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. For a Web Services activity, the amount of time the Integration Appliance attempts to establish a connection to the Web Service before timing out. A connection timeout is different from an activity timeout because an activity timeout occurs after the connection to the Endpoint has already been established. An activity timeout specifies the amount of time in seconds before a timeout occurs between the activity invoking a request on an Endpoint and the time it takes the Endpoint to respond. You set the activity timeout in Retry task of the [Web Services Invoke Service Activity](#).

9. Optional - To connect the Web Service through a proxy server, select the Connect via a Proxy Server check box and specify the fields defined in the following table:

Figure 1. Web Service options

Table 2.

Field name in Endpoint pane	Description	Required or Optional?
Host Name	Specifies the hostname of the proxy server.	Required
Port	Specifies the port number to use to connect to the proxy server.	Required
User Name	Specifies the username to use for proxy server authentication.	Optional - If your proxy server does not require authentication
Password	Specifies the password to use for proxy server authentication.	Optional - If your proxy server does not require authentication

Parent topic: [Creating or Editing a Web Services Endpoint](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

## Creating or editing an endpoint for a Provide Service activity

Create or edit a Web Service endpoint for a Provide Service activity.

### Procedure

1. In the Create Endpoint or Edit Endpoint pane, select the Provide option and configure the relevant fields.  
Note: Changing the configuration properties of an endpoint affects all of the orchestrations that use that endpoint in the project. These changes are global, not local.

2.

#### Transport

Select one of the following transport options:

- HTTP : Select this option if the Web Service provide project is to be deployed on an Integration Appliance .
- Cast Iron Cloud : Select this option if the Web Service provide project is to be deployed on Cast Iron Live.
- Local : Select this option if this orchestration is called locally by other orchestrations. It can be used in Studio and on an Integration Appliance.

#### Port

Specifies the port number to communicate with the Integration Appliance acting as the Web Service.

#### CAUTION:

This port number is different to the port name specified in the WSDL.

#### Path

The path string specified in this field is added to the URL of the Integration Appliance to form the location element of the generated WSDL. For example, if your Integration Appliance is named:

`myAR.myCompany.com` and the string specified in the Path field is `/services/myservice/1.0`, the resulting location element in the WSDL file is equal to the following string:

`http://myAR.myCompany.com/services/myservice/1.0`

#### Login

- Select the Log into the Server as an Anonymous User option to connect to the endpoint server anonymously (where a user account is not required).
- Select the Log into the Server with User Name and Password option connect to the endpoint server using a user account. Specify the User Name and Password.
- Select the type of Authentication to authenticate with the remote server.
  - **Basic** - Sends the user name and password you specify, base64 encoded as part of the HTTP Authorization header to the server.
- Specify the Realm.
- Specify the User Name for the account used to connect to the endpoint server.
- Specify the Password for the account used to connect to the endpoint server.

#### Security

- Select the None option if no security is required.
- Select the HTTPS option to enable secure Web Service over SSL.

- Available for the HTTP transport option only. When server authentication is required, select the Server Certificate Alias Name check box to specify that the Integration Appliance acting as a server provides a certificate to the client. This certificate is used by the client for authentication and encryption. If this check box is selected, the name of the certificate must be provided. A certificate specified at the activity level with this check box, takes precedence over certificates specified on the Security > Certificates > Settings > Server SSL over data NIC entry in the WMC.
    - Select the Protocol Version used for secure HTTP over SSL. By default, the protocol version used is SSL\_TLSv2.

#### Connection Pool Options

The Maximum Connections parameter specifies the maximum number of connections that the Integration Appliance can open in the connection pool. By default, the Integration Appliance can have 25 connections open.

Note: For some of the fields in the endpoint, you can define configuration properties to supply the values for these fields. The  icon displays when you click in a field that supports a configuration property and a configuration property of the same type is already configured for the project.

## Updating a Changed WSDL

If you created a project that uses a WSDL and the WSDL changes, you can attempt to update the existing WSDL with the new WSDL.

### About this task

Updating a WSDL means that any entities that interface with the WSDL might be affected by the change. For example, the WSDL defines the input and output parameters of the operation and if the schema that defines these parameters changes in the new WSDL, the nodes that represent these parameters in the **Map Inputs** and **Map Outputs** tasks of the Web Services activities might no longer exist and any links to these nodes are no longer valid. You must recreate the links in order for the orchestration to be valid again. Updating a WSDL might require other changes to the project besides recreating links, for details see Table 1. In some cases, the new WSDL is not loaded as described in the first three rows in the following table.

Note: Updating an existing WSDL is different from loading multiple WSDLs into a project by either dragging a file into the Project tab or right-clicking on the WSDL folder in the Project tab and selecting Add Document. Updating a WSDL replaces the existing WSDL in the project, while uploading the same file into the Project tab creates two instances of the WSDL in the project.

Table 1.

Change in WSDL	New WSDL replaces the initial WSDL?	How is the project affected?
New WSDL is not a valid WSDL. For example the final <code>&lt;/definitions&gt;</code> tag is missing at the end of the WSDL.	No, the update does not occur	None, the new WSDL is not loaded. No updates occur to any of the project entities.
Uploading the new WSDL to replace the existing one, would result in an invalid project.	No, the update does not occur	None, the new WSDL is not loaded. No updates occur to any of the project entities.
Attempt to update the current WSDL with a different WSDL and an orchestration or an endpoint in the project refers to the current WSDL. Note: You can load multiple WSDLs into a project.	No, the update does not occur	None, the new WSDL is not loaded. No updates occur to any of the project entities.

<p>The Service Binding definition of the WSDL is defined by the service, port, and location elements. If the values of the service, port and location elements in the WSDL change, the values for these elements that are stored in the Web Service endpoint must be updated.</p>	<p>Yes , up date occ urs</p>	<p>The values in the Web Service endpoint are updated with the newest values specified in the WSDL. For details about these elements, see <a href="#">Creating or Editing a Web Services Endpoint</a>.</p>
<p>The name of an operation changes in the WSDL and the orchestration is starting that operation in an <b>Invoke Service</b> activity.</p>	<p>Yes , up date occ urs</p>	<p>If the name of the operation changes and the operation is used by the <b>Invoke Service</b> activity, the first operation in the WSDL is by default assigned to the <b>Invoke Service</b> activity. This reassigning to the first operation might not be the wanted result. The input and output parameters of the first operation in the WSDL might be different than the operation originally specified and therefore the links might no longer exist in the <b>Map Inputs</b> and <b>Map Outputs</b> tasks. You must configure the <b>Invoke Service</b> activity again for the orchestration to be valid.</p>
<p>The name of one of the operation changes in the WSDL but the orchestration is not starting that operation in any <b>Invoke Service</b> activities.</p>	<p>Yes , up date occ urs</p>	<p>If the name of the operation changes and that operation is not used any <b>Invoke Service</b> activities, this change to the WSDL has no affect.</p>
<p>Additional <i>&lt;part&gt;</i> elements are added to the elements that define the input or output parameters of the operation. This change affects any project entity that references this part of the WSDL. The following is a list of possible affected entities:</p> <ul style="list-style-type: none"> <li>• Standalone Maps</li> <li>• <b>Map Variables</b> activity</li> <li>• Variables based on this part of the WSDL</li> <li>• An orchestration that contains an <b>Invoke Service</b> activity which starts an operation that uses this message type. For example, to the following example <i>&lt;message&gt;</i> element</li> </ul> <p>For example, see <a href="#">Figure 1</a>.</p>	<p>Yes , up date occ urs</p>	<p>Since new <i>&lt;part&gt;</i> elements have only been added to the <i>&lt;message&gt;</i> element, typically this change has no affect on the existing maps and variables based on the WSDL. For the <i>&lt;Helloin&gt;</i> message example, adding the new city element has no affect on links to the existing address <i>&lt;part&gt;</i> element in the <b>Map Inputs</b> or <b>Map Outputs</b> tasks of the <b>Invoke Service</b> activity. If required, you can create links to the new element.</p>

<p>Change the type of a <code>&lt;part&gt;</code> element in a <code>&lt;message&gt;</code> element that define the input and output parameters of the operation. This change affects any project entity that references this part of the WSDL. The following is a list of possible affected entities:</p> <ul style="list-style-type: none"> <li>• Standalone Maps</li> <li>• <b>Map Variables</b> activity</li> <li>• Variables based on this part of the WSDL</li> <li>• An orchestration that contains an <b>Invoke Service</b> activity which starts an operation that uses this message type.</li> </ul>	<p>Yes, update occurs</p>	<p>Any existing links in the maps are not removed even though the type might have changed.</p> <p><b>CAUTION:</b></p> <p>The type change might have run time impact, resulting in potentially bad output data. Check that any type conversions done in the links of maps do not result in bad output data being returned at run time.</p>
<p>Change the <code>&lt;message&gt;</code> element of the input or output parameter of the operation.</p> <p>This change affects any project entity that references this part of the WSDL. The following is a list of possible affected entities:</p> <ul style="list-style-type: none"> <li>• Standalone Maps</li> <li>• <b>Map Variables</b> activity</li> <li>• Variables based on this part of the WSDL</li> <li>• An orchestration that contains an <b>Invoke Service</b> activity which starts an operation that uses this message type.</li> </ul>	<p>Yes, update occurs</p>	<p>Links to the input or output parameter that has changed in the map are removed. You must create links to the changed parameter in maps. For example, if the <code>&lt;message&gt;</code> element changes for the input parameter of the operation called by an <b>Invoke Service</b> activity, the links to the nodes in the <b>Map Inputs</b> task of the <b>Invoke Service</b> activity are removed. You must create links from variables to the new set of nodes that show in the To Activity pane of the <b>Map Inputs</b> task.</p>

Figure 1. Additional `<part>` elements example

```
<message name="HelloIn">
  <part name="address" type="xsd:string">
</message>
```

Add the following additional `<part>` element

```
<message name="HelloIn">
<part name="address" type="xsd:string">
<part name="city" type="xsd:string">
</message>
```

- [Updating a changed WSDL](#)

To update a WSDL, start the upgrade WSDL process using one of the following options:

**Parent topic:** [Web Services Activities](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_updating\\_a\\_changed\\_WSDL\\_ov.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_updating_a_changed_WSDL_ov.html)

## Updating a changed WSDL

---

To update a WSDL, start the upgrade WSDL process using one of the following options:

### Procedure

---

1. Use one of the following options to start the upgrade:
  - Double click an existing WSDL in the WSDLs folder of the Project tab. A WSDL tab displays with a graphical view of the WSDL. Drag a WSDL file from the local file system onto the WSDL open in the WSDL tab.
  - Double click an existing WSDL in the WSDLs folder of the Project tab. A WSDL tab displays with a graphical view of the WSDL. Click on a node of the WSDL in the WSDL tab. Select the File > Update WSDL or XML Schema option from Studio toolbar menu. The Update the Current WSDL Document dialog box displays. In the Location field, [specify the location of the new WSDL from an external web location or from the file system](#) and click OK.
  - Double click an existing WSDL in the WSDLs folder of the Project tab. A WSDL tab displays with a graphical view of the WSDL. Right-click a node in the WSDL tab and from the menu and select the Update option. The Update the Current WSDL Document dialog box displays. In the Location field, [specify the location of the new WSDL from an external web location or from the file system](#) and click OK.
  - Right-click an existing WSDL in the WSDLs folder of the Project tab and from the menu select the Update option. The Update the Current® WSDL Document dialog box displays. In the Location field, [specify the location of the new WSDL from an external web location or from the file system](#) and click OK.

The Updating the WSDL Affects the Listed Dependant Project Entities dialog box displays and project entities that are affected by the replacement of the original WSDL with the new WSDL are listed.

2. Optional - In the dialog box, click any of the listed dependant entities to view the entity in Studio.
3. Click Update. Studio attempts to update the project with the new WSDL and the result of the attempted update depends on the following conditions:
  - If any of the changes in the WSDL would result in a corrupt project after the update or the new WSDL is invalid, an Error dialog box displays describing the problem with the WSDL. Click OK and click Close. The update is canceled, the WSDL reverts to the original WSDL, and the project is not changed.
  - If none of the changes to the WSDL would result in a corrupt project, the update occurs and the original WSDL is replaced by the new WSDL. Some of the project entities might be invalid after the update and could require clean up.
  - Click Close.

 file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_updating\\_a\\_changed\\_WSDL.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_updating_a_changed_WSDL.html)

## Web Services Invoke Service Activity

During run time, the Web Services **Invoke Service** activity starts an outside Web Service.

### About this task

The Web Services connection activity is a single-operation activity. It connects to a single service on a single portType in a Web Service. If you specify a WSDL containing more than one operation, select which operation the activity should start.

Note: Web Services Basic Profile 1.1 2nd Edition is supported. SOAP encoding arrays are not supported in the Web Services Basic Profile 1.1.

By default, compression and decompression are enabled for the **Invoke Service** activity. For more information, see Compression/Decompression with the Web Services **Invoke Service** activity.

The steps for adding and configuring an Invoke **Service** activity to an orchestration are described in the following procedures:

- [Adding an activity](#)  
Add a Web Services **Invoke Service** activity in the orchestration.
- [Creating an endpoint](#)  
Create, select, or edit a Web Services endpoint.
- [Configuring the activity](#)  
Configure the **Invoke Service** activity.

- [Specifying the retry options](#)  
Specify the retry options for the **Invoke Service** activity.
- [Mapping the inputs of the activity](#)  
Map the inputs of the **Invoke Service** activity.
- [Mapping the outputs of the activity](#)  
Map the output of the **Invoke Service** activity.
- [Invoking an Orchestration with Web Services Provide Service Starter Activity](#)  
Invoke Service tool enables in house invocation of an orchestration with Web Services Provide Activity.

## Adding an activity

---

Add a Web Services **Invoke Service** activity in the orchestration.

### Procedure

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration displays.
2. Select the Activities tab and expand the Web Services folder.
3. Drag the Invoke Service activity onto the orchestration.
4. Select the activity. The Checklist is displayed.

**Parent topic:** [Web Services Invoke Service Activity](#)

## Creating an endpoint

---

Create, select, or edit a Web Services endpoint.

### Procedure

---

1. Click Pick Endpoint task from the Checklist and choose from one of the following actions:
  - Select an existing endpoint:

- a. Select Browse. The Project Explorer displays.
    - b. Select an existing endpoint and click OK. Skip to the [Configuring the activity](#) procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer displays.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane displays.
  - o Create a new endpoint: Select New. The Create Endpoint pane displays.
2. [Create or edit a Web Services endpoint](#).

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_Invoke\\_Create\\_WS\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_Invoke_Create_WS_Activity.html)

## Configuring the activity

---

Configure the **Invoke Service** activity.

### Procedure

---

1. Select the Configure task from the Checklist. The Configure pane is displayed.
2. Select a single operation to start on the Web Service.
3. The Use Compression/Decompression check box specifies if compression/decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is selected. Clear the Use Compression/Decompression check box to disable compression and decompression for this activity. For more information, see [Compression/Decompression with the Web Services Invoke Service Activity](#).
4. The Message Transmission Optimization Mechanism (MTOM) when checked specifies using MTOM to efficiently send SOAP messages containing binary data.

**Parent topic:** [Web Services Invoke Service Activity](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_Invoke\\_Configure\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_Invoke_Configure_Activity.html)

## Specifying the retry options

---

Specify the retry options for the **Invoke Service** activity.

## Procedure

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to a Web Service. The following table describes the retry options for connecting to a Web Service:

Field	Description
Retry	
Wait ____ second(s) between each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the Web Service.
Try to connect ____ times before failing .	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the Web Service before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains a Web Services Invoke Service activity and the Integration Appliance cannot connect to the specified Web Service, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, the retry count is set to 3. The first, second, and third connection errors are shown in the system log as Warnings. The Integration Appliance logs the fourth connection error as an Error and stops processing the current orchestration job.</p>
Time out after ____ seconds when the Endpoint does not respond to a request.	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the Web Services Invoke Service, the activity timeout is the amount of time that the Integration Appliance waits for a response from the Web Service after attempting to start the Web Service, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the Endpoint has been established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. Set the connection timeout in Web Services Endpoint tab. For more information about connection timeouts, see <a href="#">Creating or Editing a Web Services Endpoint</a> .

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_Invoke\\_Retry\\_Options.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_Invoke_Retry_Options.html)

## Mapping the inputs of the activity

---

Map the inputs of the **Invoke Service** activity.

### About this task

---

The XML input parameter for the operation selected in the Configure task is shown beneath the body input parameter listed in the To Activity pane of the Map Inputs task.

To view the optional input parameters called location, header, and httpheaders in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click a node in the Map Inputs pane to make this option active.

You can override the setting of the location element specified in the WSDL using the optional location input parameter. The location element in the WSDL, specifies the URL endpoint. A request to start a Web Services is made to the URL Endpoint.

The schema of the header input parameter is defined by WSDL. The header input parameter is optional because Web Service you start might not require a header.

The following table defines the nodes of the optional httpheaders input parameter.

<b>Nodes of the httpheaders Input Parameter</b>	<b>Description</b>
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/method	Specifies the type of HTTP request.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, so this is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

Note: If the Content-Length header is explicitly set using the httpheaders/otherHeaders/headerItem/name and httpheaders/otherHeaders/headerItem/value, during run time this value is ignored. This activity automatically sets the Content-Length header to the size of the body.

You can optionally override the settings you specified for the proxy server in the Configure and Pick Endpoint task of the Checklist by providing values for the proxyConnection input parameter dynamically during run time.

The following table defines the nodes of the optional proxyConnection input parameter:

Input Parameter Name/Node	Description	Overrides the Setting in Task?
proxyConnection/host	Specifies the hostname of the proxy server.	The host node of the proxyConnection input parameter overrides the Proxy Host Name field of the Web Services Endpoint.
proxyConnection/port	Specifies the port number to use to connect to the proxy server.	The port node of the proxyConnection input parameter overrides the Proxy Port field of the Web Services Endpoint.
proxyConnection/username	Specifies the username to use for proxy server authentication. This field is optional if your proxy server does not require authentication.	The username node of the proxyConnection input parameter overrides the Proxy User Name field of the Web Services Endpoint.
proxyConnection/password	Specifies the password to use for proxy server authentication. This field is optional if your proxy server does not require authentication.	The password node of the proxyConnection input parameter overrides the Proxy Password field of the Web Services Endpoint.

## Mapping the outputs of the activity

---

Map the output of the **Invoke Service** activity.

### Procedure

---

1. Select the Map Outputs task in the Checklist. The output parameters of the activity display in the From Activity pane of the Map Outputs task as described in the following table.

Output Parameter	Description
body	Contains the body of the response from the Web Service. The nodes that defines the return parameter or parameters of the Web Service operation displays under the body output parameter.
header	Contains the header of the SOAP Envelope.
httpheaders	Contains the header of the HTTP response.

The following table defines the nodes of the httpheaders output parameter.

<b>Nodes of the httpheaders Output Parameter</b>	<b>Description</b>
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/method	Specifies the type of HTTP response.
httpheaders/otherHeaders/headerItem	Specifies a set of name/value pairs that contain the HTTP parameters of the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so headerItem is a recurring node.
httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP parameter.

2. Map the output nodes of the activity to orchestration variables. See [Creating a Map](#) for general instructions on mapping.

## Invoking an Orchestration with Web Services Provide Service Starter Activity

---

Invoke Service tool enables in house invocation of an orchestration with Web Services Provide Activity.

### About this task

---

Use this task to create/ modify SOAP request based on configured schema for starter Web Services Provide Activity, and then invoke an orchestration that handle responses.

### Procedure

---

To Invoke an Orchestration, complete the following steps:

1. Open an orchestration with Web Services Provide Service Starter Activity. A graphical representation of the orchestration is displayed in the Studio Workspace.

2. Right-click Provide Service activity and select Invoke Service. The Invoke Service pane is displayed.
3. This pane displays a generated template request message. You can either fill the required details in the template request message or click Open to select a different text request message.
4. Click Save to save the current request message.
5. Click Execute to invoke a web service and hence an orchestration. It also enables you to retest a particular activity with the current request message by saving the request message across the Studio Start up.
6. Click Show Response to view the web service response.

Note: Click Reset to reset the current request message to the template request message.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_invoke\\_service.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_invoke_service.html)

# Compression/Decompression with the Web Services Invoke Service Activity

---

During run time, the Web Services Invoke Service activity sends a HTTP request complaint with the HTTP/HTTPS 1.1 protocol to the Web Service. The Invoke Service activity supports compression with the gzip format only and decompression with the gzip or the deflate formats.

Note: The Invoke Service activity does not support the common UNIX file compression format called compress. The compression/decompression run-time behavior of the Invoke Service activity is dependant on the following conditions:

- [If the Endpoint supports compression/decompression](#)
- [Content-Encoding and Accept-Encoding Values at the Message Level](#)
- [The setting of the Use Compression/Decompression check box at the activity level](#)

The affect of these conditions on the compression/decompression run-time behavior of the Invoke Service activity are described in the following sections and in the tables provided in the [Run-time Compression/Decompression Behavior](#) section.

## Endpoint Support for Compression/Decompression

---

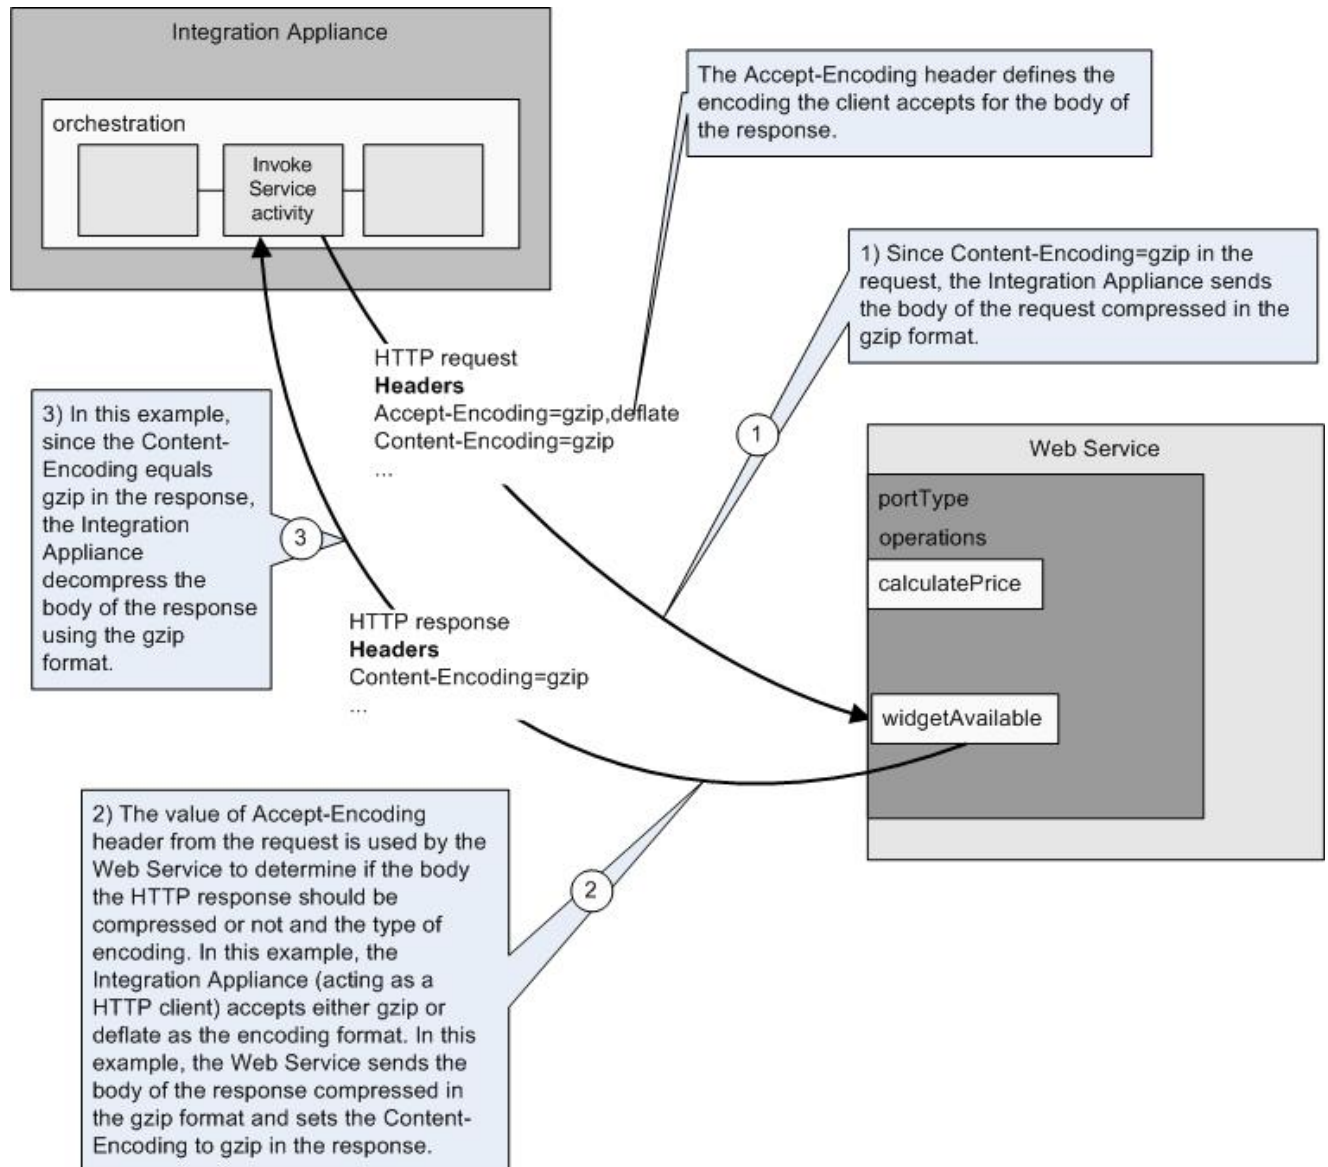

The Integration Appliance determines whether or not the HTTP Endpoint supports compression when the Integration Appliance sends the first HTTP request in the compressed format to the HTTP Endpoint (the Web Service), if the Web Service returns an error code indicating that Web Service does not support compression or does not support the specified Content-Encoding type, the Integration Appliance resends the first request in uncompressed format and all subsequent requests to this Endpoint are sent in the uncompressed format. In addition, the HTTP response sent by the Web Service is not decompressed when received by Integration Appliance.

Endpoint support for compression/decompression is represented by the fourth column labeled Endpoint Supports Compression? in the tables provided in the [Run-time Compression/Decompression Behavior](#) section.

## Content-Encoding and Accept-Encoding Values at the Message Level

The value of the Content-Encoding header in the HTTP request determines if the body of the request is compressed or not using. For the Invoke Service activity, the Integration Appliance sets the Content-Encoding to gzip and sends the body of the request compressed in the gzip format as shown in the second row of the first table labeled [Compression Behavior When Sending a Request](#) and in the following figure.

The value of the Accept-Encoding header in the request defines the types of encoding that the HTTP client accepts in the response. For the Invoke Service activity, the Integration Appliance sets the Accept-Encoding equal to gzip,deflate in the request and the Web Service sends the body of the response compressed in either the gzip or the deflate format to the Integration Appliance (acting as a client) as shown in the following figure:

The values of the Accept-Encoding and Content-Encoding headers in the request are used by the Integration Appliance and the Web Service to determine the compression/decompression behavior.

## Setting Compression/Decompression at the Activity Level

By default, compression and decompression are turned on at the activity level for the Invoke Service activity. You can turn off compression/decompression at the activity level by clearing the Use Compression/Decompression check box. The Use Compression/Decompression check box is available in the

Configure task of the activity. The second column labeled Use Compression/Decompression check box in the following tables provided in the [Run-time Compression/Decompression Behavior](#) section, represents the setting of the Use Compression/Decompression check box.

Deprecation Note: The Use Compression/Decompression check box will be deprecated in a future release. Use the Content-Encoding and Accept-Encoding HTTP Parameters in the HTTP request to specify how to decompresses the body of the HTTP request and compress the body of the HTTP response.

## Run-time Compression/Decompression Behavior

The first table provided in the [Compression Behavior When Sending a Request](#) section, describes the compression run-time behavior when the Integration Appliance sends a HTTP request to the Web Service.

The second table provided in the [Accept-Encoding Header Value Passed to the Request](#) section, describes the value of the Accept-Encoding header passed in the HTTP request.

The third table provided in the [Decompression Behavior When Receiving a Response](#) section, describes the decompression run-time behavior when the Integration Appliance receives the HTTP response from the Web Service.

## Compression Behavior When Sending a Request

The following table describes the compression run-time behavior when the Integration Appliance sends a HTTP request to the Web Service.

Use Compression/Decompression Check Box (Activity Level)	Content-Encoding Value in the HTTP Request (Message Level)	Endpoint Supports Compression?	Integration Appliance Compression Run-Time Behavior When Sending a Request
selected	gzip	yes	The Integration Appliance sends the body of the request compressed in the gzip format. The Content-Encoding header is set to gzip in the request.
selected	value is not significant	no	The Integration Appliance sends the body of the request uncompressed. The Content-Encoding header is set to identity in the request.
cleared	value is not significant	value is not significant	The Integration Appliance sends the body of the request as is (unchanged). The current value of the Content-Encoding header is passed as is in the request

## Accept-Encoding Header Value Passed to the Request

The following table describes the value of the Accept-Encoding header passed in the HTTP request.

Use Compression/Decompression Check Box (Activity Level)	Initial Accept-Encoding Value	Endpoint Supports Compression?	Accept-Encoding Value Passed in the HTTP Request to the Web Service
selected	gzip,deflate	yes	The Accept-Encoding header is set to gzip,deflate in the request.
value is not significant	value is not significant	no	The current value of the Accept-Encoding header is passed as is in the

			request.
cleared	value is not significant	value is not significant	The current value of the Accept-Encoding header is passed as is in the request.

## Decompression Behavior When Receiving a Response

The following table describes the decompression run-time behavior when the Integration Appliance receives the HTTP response from the Web Service.

Use Compression/Decompression Check Box (Activity Level)	Content-Encoding Value in the HTTP Response (Message Level)	Endpoint Supports Compression?	Integration Appliance Decompression Run-Time Behavior When Receiving a Response
selected	gzip	yes	The Integration Appliance decompresses the body of the response using the gzip format.
selected	deflate	yes	The Integration Appliance decompresses the body of the response using the deflate format.
selected	identity	yes	The Integration Appliance does not decompress the body of the response.
selected	value not listed in the Accept-Encoding header	yes	The Integration Appliance logs an error that the response data was received in an unsolicited content encoding type.
selected	value is not significant	no	The Integration Appliance does not decompress the body of the response. The current value of the Content-Encoding header is passed as is in the response.
cleared	value is not significant	value is not significant	The Integration Appliance does not decompress the body of the response. The current value of the Content-Encoding header is passed as is in the response.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_Compression\\_Decompression\\_wit\\_h\\_the\\_WS\\_Invoke\\_Service\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_Compression_Decompression_wit_h_the_WS_Invoke_Service_Activity.html)

## Web Services Provide Service Activity

During run time the Provide Service activity provides a Web Service that can be started from an outside client.

### About this task

Figure 1. Provide Service activity

The Provide Service activity is an inbound Web Service activity. It is a starter activity that listens for Web Service requests at the specified port.

Based on the configuration information you provide in Studio about the Web Service, the WMC generates a WSDL file that describes the Web Service Interface available during run time.

When a project with a WSDL is deployed, the Web Service interface defined by the WSDL is available. You can export and then view the WSDL file that has been generated for the Web Service from the WMC.

During run time, when a client sends a request to the Web Service, the Integration Appliance starts processing the Provide Service activity and the rest of the activities that make up the orchestration.

You can only specify one input and one output XML Schema for the Provide Service activity, so the generated WSDL defines only one request header and one response header. The WMC generates a WSDL with one operation. In [tFigure 1](#), the Web Service calculatePrice operation is derived from the name of the Provide Service activity. There is a one-to-one relationship between the Web Service operation and the Provide Service activity.

By default, decompression is enabled for the Provide Service activity. For more information, see [Decompression with the Web Services Provide Service Activity](#).

The steps for adding and configuring a Provide Service activity to an orchestration are described in the following procedures.

- [Adding an activity](#)  
Add a Web Services **Provide Service** activity in the orchestration.
- [Creating an endpoint](#)  
Create, select, or edit a Web Services endpoint.
- [Configuring the activity](#)  
Configure the **Provide Service** activity.
- [Mapping the outputs of the activity](#)  
Map the output of the **Provide Service** activity.

## Adding an activity

---

Add a Web Services **Provide Service** activity in the orchestration.

### Procedure

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration displays.
2. Select the Activities tab and expand the Web Services folder.
3. Drag the Provide Service activity onto the orchestration.
4. Select the activity. The Checklist is displayed.

**Parent topic:** [Web Services Provide Service Activity](#)

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_Provide\\_Add\\_WS\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_Provide_Add_WS_Activity.html)

## Creating an endpoint

---

Create, select, or edit a Web Services endpoint.

### Procedure

---

1. Click the Pick Endpoint task from the Checklist and choose from one of the following actions:
  - o Select an existing endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK. Skip to the [Configuring the activity](#) procedure.
  - o Select an existing endpoint and edit the endpoint:
    - a. Select Browse. The Project Explorer is displayed.
    - b. Select an existing endpoint and click OK.
    - c. Click Edit. The Edit Endpoint pane displays.
  - o Create a new endpoint: Select New. The Create Endpoint pane displays.
2. [Create or edit a Web Services endpoint](#).

**Parent topic:** [Web Services Provide Service Activity](#)

## Configuring the activity

Configure the **Provide Service** activity.

### Procedure

1. Select the Configure task from the Checklist. The Configure pane is displayed.
2. Configure all the fields in this pane as described in the following table.

Field	Description
Receive Request with	
Schema	Defines the XML Schema of incoming XML data to the operation of the Web Service. <ul style="list-style-type: none"> <li>◦ Click Browse... to select a schema.</li> <li>◦ Click Clear to disassociate the selected schema from the activity.</li> </ul>
Soap Header	Defines the XML Schema of the incoming Soap Header. <ul style="list-style-type: none"> <li>◦ Click Browse... to select a schema.</li> <li>◦ Click Clear to disassociate the selected schema from the activity.</li> </ul>
This activity	
Requires a Reply	This check box specifies to send a reply to the sender of the request. If this option is selected, you must add a Web Services Send Reply activity to your orchestration to send a reply to the client that started it.
Schema	Defines the XML Schema of the returned XML data from the operation of the Web Service. (The XML data is returned by the associated Send Reply activity.) <ul style="list-style-type: none"> <li>◦ Click Browse... to select a schema.</li> <li>◦ Click Clear to disassociate the selected schema from the activity.</li> </ul>
Soap Header	Defines the XML Schema of the returned Soap Header of the Web Service. (The SOAP Header is returned by the associated Send Reply activity.) <ul style="list-style-type: none"> <li>◦ Click Browse... to select a schema.</li> <li>◦ Click Clear to disassociate the selected schema from the activity.</li> </ul>
May throw the following Faults	
Fault Name	Specifies user-defined fault name for the activity.
Fault	Click Browse to display the schema and select the element for which the fault is thrown.

Element	
Options	
Use Compression / Decompression	Specifies if decompression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is selected. Clear the Use Compression/Decompression check box to disable decompression for this activity. For more information, see <a href="#">Decompression with the Web Services Provide Service Activity</a> .

## Mapping the outputs of the activity

---

Map the output of the **Provide Service** activity.

### Procedure

---

1. Select the Map Outputs task in the Checklist. The output parameters of the activity display in the From Activity pane of the Map Outputs task as described in the following table.

Output Parameter	Description
body	Contains the body of the response from the Web Service. The nodes that defines the return parameter or parameters of the Web Service operation displays under the body output parameter.
header	Contains the header of the SOAP Envelope.
httpheaders	Contains the header of the HTTP response.

The following table defines the nodes of the httpheaders output parameter.

Nodes of the httpheaders Output Parameter	Description
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/method	Specifies the type of HTTP response.
httpheaders/host	Specifies the IP address or the host name of the client.

httpheaders/other Headers/headerItem	Specifies a set of name/value pairs that contain the HTTP parameters of the HTTP response. Multiple HTTP parameters can be specified in the HTTP response, so headerItem is a recurring node.
httpheaders/other Headers/headerItem/name	Specifies the name of the HTTP parameter.
httpheaders/other Headers/headerItem/value	Specifies the value of the HTTP parameter.

2. Map the output nodes of the activity to orchestration variables. See [Creating a Map](#) for general instructions on mapping.

**Parent topic:** [Web Services Provide Service Activity](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_Provide\\_Map\\_Outputs.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_Provide_Map_Outputs.html)

## Decompression with the Web Services Provide Service Activity

---

The Web Services Provide Service activity supports decompression with the gzip format only.

Note: The Provide Service activity does not support the deflate format or the common UNIX file compression format called compress.

The **Provide Service** activity only supports receiving HTTP requests using HTTP/HTTPS 1.0 protocol.

The decompression run time behavior of the Provide Service activity when receiving an HTTP request is dependent on the following conditions:

- The value of the Content-Encoding at the message level.
- The setting of the Use Compression/Decompression check box at the activity level.

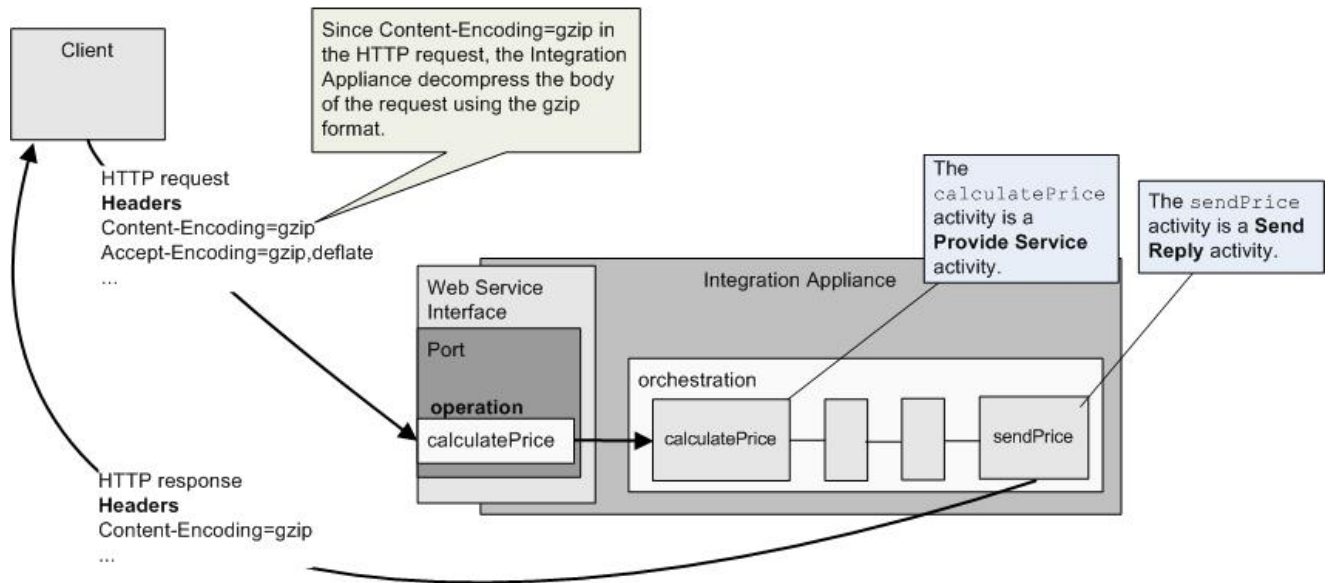

These conditions affect the decompression run time behavior of the **Provide Service** activity and are described in the following sections and in the table provided in the [Run time Decompression Behavior](#) section.

### Content-Encoding Value at the Message Level

---

The value of the Content-Encoding header of the HTTP request can determine if the Integration Appliance decompresses the body of the HTTP request that is received from the client as shown in [Figure 1](#).

Figure 1. HTTP request

The value of the Content-Encoding header is represented by the third column labeled Content-Encoding Value in the table provided in the [Run time Decompression Behavior](#) section.

## Setting Decompression at the Activity Level

By default, decompression is turned on at the activity level for the **Provide Service** activity. You can turn off decompression at the activity level by clearing the Use Compression/Decompression check box. The Use Compression/Decompression check box is available in the **Configure** task of the activity. The second column labeled Use Compression/Decompression check box in the table provided in the [Run time Decompression Behavior](#) section, represents the setting of the Use Compression/Decompression check box.

## Run time Decompression Behavior

The following table describes the decompression run time behavior when the Integration Appliance receives an HTTP request from the HTTP Client:

<b>Use Compression/Decompression Check Box (Activity Level)</b>	<b>Content-Encoding Value (Message Level)</b>	<b>Integration Appliance Decompression Run Time Behavior</b>
selected	gzip	The Integration Appliance decompresses the body of the request using the gzip format. The value of Content-Encoding is set to gzip in the headers output parameter returned from the activity.
selected	not set	The Integration Appliance sends the body of the request as is (unchanged). The value of Content-Encoding is not set in the headers output parameter returned from the activity.
selected	identify	The Integration Appliance sends the body of the request as is (unchanged). The value of Content-Encoding is not set in the headers output parameter returned from the activity.
selected	any other string	The Integration Appliance sends the 415 (Unsupported Media Type) Response Code.

	beside s gzip or identit y	
cleared	value is not signifi cant	The Integration Appliance does not decompress the body of the request and the current value of Content-Encoding in the request is passed as is to the headers output parameter of the activity. For example, if the value of the Content-Encoding is set to gzip but the Use Compression/Decompression check box is cleared, the Integration Appliance does not decompress the body of the request but Content-Encoding is set to gzip in the headers output parameter of the activity.

## Compression Behavior When Sending a Request

The following table describes the compression run time behavior when the Integration Appliance sends an HTTP request to the Web Service.

### Accept-Encoding Header Value Passed to the Request

The following table describes the value of the Accept-Encoding header passed in the HTTP request.

<b>Use Compression/ Decompression Check Box (Activity Level)</b>	<b>Initial Accept- Encoding Value</b>	<b>Endpoint Supports Compression?</b>	<b>Accept-Encoding Value Passed in the HTTP Request to the Web Service</b>
selected	gzip,deflate	yes	The Accept-Encoding header is set to gzip,deflate in the request.
value is not significant	value is not significant	no	The current value of the Accept-Encoding header is passed as is in the request.
cleared	value is not significant	value is not significant	The current value of the Accept-Encoding header is passed as is in the request.

## Decompression Behavior When Receiving a Response

The following table describes the decompression run time behavior when the Integration Appliance receives the HTTP response from the Web Service.

<b>Use Compression/ Decompression Check Box (Activity Level)</b>	<b>Content-Encoding Value in the HTTP Response (Message Level)</b>	<b>Endpoint Supports Compress ion?</b>	<b>Integration Appliance Decompression Run Time Behavior When Receiving a Response</b>
selected	gzip	yes	The Integration Appliance decompresses the body of the response using the gzip format.
selected	deflate	yes	The Integration Appliance decompresses the body of the response using the deflate format.
selected	identity	yes	The Integration Appliance does not decompress the body of the response.
selected	value not listed in the Accept-Encoding	yes	The Integration Appliance logs an error that the response data was received in an unsolicited

	header		content encoding type.
selected	value is not significant	no	The Integration Appliance does not decompress the body of the response. The current value of the Content-Encoding header is passed as is in the response.
cleared	value is not significant	value is not significant	The Integration Appliance does not decompress the body of the response. The current value of the Content-Encoding header is passed as is in the response.

# Web Services Send Reply Activity

During run time, the Send Reply activity returns a response for a Provide Service activity.

## About this task

Figure 1. Send Reply activity

As shown in [Figure 1](#), the client runs the calculatePrice Web Service operation (a Provide Service activity) by sending a request. The Integration Appliance receives the request and starts processing the activities in the orchestration. When the sendPrice activity (a Send Reply activity) is started, it returns a response to the client.

By default, compression is enabled for the Send Reply activity. For more information, see [Compression with the Web Services Send Reply Activity](#).

The steps for adding and configuring a Send Reply activity to an orchestration are described in the following procedures.

- [Adding an activity](#)  
Add a Web Services **Send Reply** activity in the orchestration.
- [Configuring the activity](#)  
Configure the **Send Reply** service activity.
- [Mapping the inputs of the activity](#)  
Map the inputs of the **Send Reply** service activity.

**Parent topic:** [Web Services Activities](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_Send\\_Reply\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_Send_Reply_Activity.html)

## Adding an activity

---

Add a Web Services **Send Reply** activity in the orchestration.

### Procedure

---

1. [Create](#) or open an orchestration. A graphical representation of the orchestration is displayed.
2. Select the Activities tab and expand the Web Services folder.
3. Drag the Send Reply activity onto the orchestration. The Send Reply activity is used in conjunction with Provide Service activity to send a reply back to the client that started it. Place the Send Reply activity after the Provide Service activity.
4. Select the activity. The Checklist is displayed.

**Parent topic:** [Web Services Send Reply Activity](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_Send\\_Add\\_WS\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_Send_Add_WS_Activity.html)

## Configuring the activity

---

Configure the **Send Reply** service activity.

## Procedure

1. Select the Configure task from the Checklist. The Configure pane opens.
2. Select a Provide Service to which this Send Reply activity is returning the reply.
3. The Use Compression/Decompression check box specifies if compression is turned on or off at the activity level. By default, the Use Compression/Decompression check box is selected. Clear the Use Compression/Decompression check box to disable compression/decompression for this activity. For more information, see [Compression with the Web Services Send Reply Activity](#).
4. The Message Transmission Optimization Mechanism (MTOM) when checked specifies using MTOM to efficiently send SOAP messages containing binary data.

## Mapping the inputs of the activity

Map the inputs of the **Send Reply** service activity.

### About this task

The return parameter for the operation selected in the Requires a Reply Schema field of the [Configure](#) task of the associated Provide Service activity, is shown beneath the body input parameter listed in the To Activity pane of the Map Inputs task.

To view the optional input parameters called header and httpheaders in the To Activity pane of the Map Inputs pane, select Map > Show Optional Parameters from the toolbar menu or right-click in the To Activity pane and select the Show Optional Parameters option. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click a node in the Map Inputs pane to make this option active.

If a Soap Header XML Schema was selected in the Requires a Reply SOAP Header field of the [Configure](#) task of the associated Provide Service activity, this schema is shown beneath the header input parameter listed in the To Activity pane of the Map Inputs task.

The following table defines the nodes of the optional httpheaders input parameter.

<b>Nodes of the httpheaders Input Parameter</b>	<b>Description</b>
httpheaders/uri	Specifies the resource path, for example: /myPath.
httpheaders/method	Specifies the type of HTTP request.
httpheaders/otherHeaders/headerItem	Specifies an element that contains a set of HTTP header parameters as name/value pairs. Multiple HTTP header parameters can be specified in the HTTP request, and is a recurring node.

httpheaders/otherHeaders/headerItem/name	Specifies the name of the HTTP header parameter.
httpheaders/otherHeaders/headerItem/value	Specifies the value of the HTTP header parameter.

## Web Services Send Reply with Fault Activity

---

During run time, the Send Reply with Fault activity returns a fault to the calling orchestration. This activity provides SOAP functionality as a reply configuration option.

### About this task

---

The **WS Provide** activity must have previously been added as the starter activity to the active orchestration, since a Send Reply with Fault activity depends on a **WS Provide** activity.

The steps for creating and configuring a Send Reply with Fault activity to an orchestration are described in the following procedures.

- [Creating the Required Fault Names](#)  
Create the required fault names using the following procedure.
- [Configuring the Activity](#)  
Configure the **Send Reply** activity with the fault names.
- [Map the Inputs of the Activity](#)  
Map the inputs for the **Send Reply** activity with the fault names.

**Parent topic:** [Web Services Activities](#)

---

[Feedback](#) | [Notices](#)

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_Send\\_Reply\\_with\\_Fault\\_Activity.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_Send_Reply_with_Fault_Activity.html)

## Creating the Required Fault Names

---

Create the required fault names using the following procedure.

## Procedure

---

1. In an active orchestration, click the WS Provide activity.
2. In the Checklist, click Configure.
3. In the Configure options, select Requires Reply.
4. Click Add Fault. The Add Fault dialog box is displayed.
5. Browse and select a valid schema. Repeat the preceding steps to create as many faults as are required.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS\\_Fault\\_Activity\\_Create.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WS_Fault_Activity_Create.html)

## Configuring the Activity

---

Configure the **Send Reply** activity with the fault names.

## Procedure

---

1. Open the Activities tab.
2. Expand the Web Services folder contents and drag Send Reply with Fault into the orchestration, following the existing **Web Services Provide Service** activity.
3. In the Checklist, click Configure.

The Reply To text area is displayed and lists the name of the preceding **Web Services Provide Service** activity.

4. In the With Fault section, select a fault name from the Fault Name list.
5. In the Options section, select Use Compression/Decompression to activate this feature.
6. Select Use Soap Message Transmission Optimization Mechanism (MTOM) to activate this feature.
7. In the Threshold field, enter the preferred value in a range of 1 to 9,999,999.

# Map the Inputs of the Activity

---

Map the inputs for the **Send Reply** activity with the fault names.

## Procedure

---

1. In the Checklist, click Map Inputs.
2. The To Activity column lists the schema associated with the previously selected fault name.
3. In the From Orchestration column, select the variable that would be used to provide input values.
4. If no variables are listed, click Select Inputs, above the From Orchestration list.  
The Select Inputs dialog box is displayed and lists available variables.  
Tip: If needed, you can create a custom mapping variable in Source or Destination column by following the steps in [Creating Variables](#).
- 5.
6. Choose a variable, then click OK.
7. In the To Activity field, right-click faultcode and choose Define Default value. When the Define Default Value dialog box is displayed, select one of the predefined values.
8. To view any optional parameters, right-click either node and choose Show Optional Parameters. These are displayed in the To Activity column.
9. Map the variables from the Orchestration column to the parameters in the Activity column. For more information, see [Mapping Techniques](#).

## Compression with the Web Services Send Reply Activity

---

During run time, the Web Services Send Reply activity sends an HTTP response complaint with the HTTP/HTTPS 1.0 protocol to the client. The Send Reply activity supports compression with the gzip format only.

Note: The Send Reply activity does not support the deflate format or the common UNIX file compression format called compress.

The compression run time behavior of the Send Reply activity is dependent on the following conditions:

- At the message level, the value of the Accept-Encoding header in the original HTTP request received by the Web Services Provide Service activity is passed to the Send Reply activity to determine if the body of the HTTP response is compressed or not compressed as shown in [Figure 1](#).
- The setting of the Use Compression/Decompression check box at the activity level.

These conditions affect the compression run time behavior of the Send Reply activity are described in the following sections and in the table provided in the [Run time Compression Behavior](#) section.

### Accept-Encoding Value at the Message Level

---

During run time, a Web Services Provide Service activity receives an HTTP request from a client. In the same orchestration, a Send Reply activity sends a response back to the original client. The value of the Accept-Encoding header in the original request received by the Provide Service activity is stored internally on the Integration Appliance. The stored value is passed to the Send Reply activity and is used to determine if the body of the response is compressed or not and the encoding type, as shown in Figure 1.

Figure 1. The Accept-Encoding header

## Setting Compression/Decompression at the Activity Level

By default, compression is turned on at the activity level for the Send Reply activity. You can turn off compression at the activity level by clearing the Use Compression/Decompression check box. The Use Compression/Decompression check box is available in the Configure task of the activity. The second column labeled HTTP Compression CLI Command in the following table represents the setting of the Use Compression/Decompression check box.

## Run time Compression Behavior

The following table describes the compression run time behavior when the Integration Appliance sends an HTTP response to the client:

Use Compression/Decompression Check Box (Activity Level)	Accept-Encoding Value of the HTTP Request (Message Level)	Integration Appliance Compression Run Time Behavior
selected	gzip or gzip,deflate	The Integration Appliance sends the body of the response compressed in the gzip format and the Content-Encoding header is set to gzip in the response.
selected	identity	The Integration Appliance sends the body of the response uncompressed and the Content-Encoding header is set to identity in

		the response.
selected	not set, or any other string except gzip or identity	The Integration Appliance sends the body of the response uncompressed and the Content-Encoding header is set to identity in the response.
cleared	value is not significant	The Integration Appliance sends the body of the response as is (unchanged) and the Content-Encoding header is as is in the response. (The value of the Content-Encoding header in the request is passed unchanged to the response.)

Note: The Use Compression/Decompression check box will be deprecated in a future release. Use the Content-Encoding and Accept-Encoding HTTP Parameters in the HTTP request to specify how to decompress the body of the HTTP request and compress the body of the HTTP response.

## Troubleshooting and support

---

Troubleshooting techniques and self-help information help you identify and solve problems quickly. Here, you can find potential solutions for issues you would have with the Web Services connector.

### Exception thrown when Web Services Provide Service activity is processed

---

**Problem:** An Illegal Argument Exception is thrown during the processing of the Provide Service activity, if the Path name ends with a forward slash /.

**Cause:** This exception is caused because `ContextHandler context = new ContextHandler(); context.setContextPath(listenerDetails.getUri());` when the `contextPath` is being set. `ContextHandler` is a class in the `jetty-6.1.6` JAR file.

**Solution:** Ensure that you specify the Path name such that the slash / is followed by a path string. For example, `/abc` or `/abc/def`.

# Creating and editing a Workday endpoint

Workday endpoints contain the connection information that studio and the Integration Appliance use to connect to the Workday application. You can create multiple endpoints that refer to separate instances.

## About this task

Use this task to create or edit Workday endpoint.

Note:

Any changes you make to Workday endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

## Procedure

1. Drag an activity from Workday folder in the Activities tab to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. Browse - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
  - b. New - To create a new endpoint. The Create Endpoint window opens.
  - c. Edit - To edit the existing endpoint. The Edit Endpoint window opens.
4. Complete the fields defined in the following table:

Table 1. Connection Details

Field Name	Description
Workday	
Domain Name	Specifies the domain name of your Workday endpoint. You can either specify the domain name of your choice or use the sandbox domain name given as a watermark reference.
Tenant Name	Specifies the tenant name of your Workday endpoint. You can either specify the tenant name of your choice or use the sandbox tenant name given as a watermark reference.
Login	
User Name	Specifies the user name to connect to the Workday application. You can either specify the user name of your choice or use the user name given as a watermark reference.
Password	Specifies the password associated with the user name to connect to the Workday application. You can either specify the password of your choice or use the password given as a watermark reference.
Connection Timeout	
Timeout after ..... seconds when establishing a connection to the endpoint	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. The default is 300 seconds.
Proxy	

Field Name	Description
Connect via a Proxy Server	Allows you to enable the proxy connection details.
Authentication	<p>Allows you to select the type of authentication that the Integration Appliance uses when connecting to a remote server. From the list, select one of the following authentication modes:</p> <ul style="list-style-type: none"> <li>○ Basic - Sends the user name and password you specify unencrypted to the server. This authentication schema is the least secure.</li> <li>○ Digest - Encrypts the user name and password you specify before sending the user name and password to the server. This authentication option is more secure than Basic authentication.</li> <li>○ NTLM - Requires an instance of NTCredentials to be available for the domain name of the server. This authentication is the most secure authentication option.</li> </ul> <p>When you choose the NTLM authentication option, the Integration Appliance authenticates a connection and not a request; therefore, the Integration Appliance authenticates every time a new connection is made. The connection must remain open during the authentication process. You cannot use NTLM to authenticate with both a proxy and server.</p> <p>Note: Do not prefix the user name with the domain.</p>
Realm	If you select the Basic or Digest authentication option, you can specify a realm. When you do not specify a realm, the activity authenticates to 'any realm'. If you select the NTLM authentication option, you must specify a domain. If you do not specify a domain, the endpoint configuration is not valid and an error occurs.
Host Name	Specifies the host name of the proxy server.
Port	Specifies the port number needed to connect to the proxy server.
User Name	Specifies the user name needed to connect to the proxy server.
Password	Specifies the password needed to connect to the proxy server.

5. When finished, click Test Connection to confirm that you can connect to Workday application.
6. Click OK.

**Parent topic:** [Workday Activities](#)

---

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Workday\\_Creating\\_or\\_Editing\\_an\\_Endpoint.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Workday_Creating_or_Editing_an_Endpoint.html)

## Using the Invoke Workday activity

---

The Invoke Workday activity allows you to browse and execute operations in Workday management services related to human resources, finance, and so on. You can also fetch custom report operations and work with it.

## About this task

---

Use this task to browse and execute operations in Workday management services related to human resources, finance and so on.

## Procedure

---

To configure Invoke Workday activity, complete the following steps:

1. In an active orchestration, open the Activities tab and expand the Workday folder contents.
2. Drag the Invoke Workday activity icon onto the orchestration. The Invoke Workday Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make the required changes.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Workday endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Workday endpoint](#).
8. In the Checklist, click Configure.
9. In the Workday Service pane, complete one of the following:
  - a. Click the Service option and select the required Workday services from the list.
  - b. Click the Custom Report Name field and specify the name of the report.
10. Click Fetch Workday Operations to populate the Workday operations pane with operations from the module selected in the Service option.
11. Optional: Click Workday Help to view the Workday help pages for the operation you have selected. If you click the help button before selecting an operation, you can view the Workday help page which displays information about all the Workday services.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the retry options for Workday activity](#).
13. Select the required Workday operation and click Map Inputs from the Checklist. The XML Schemas generated from the selected operation of the Invoke Workday activity are displayed as nodes under the request input parameter in the To Activity panel. The Version field will be populated automatically with the latest version of Workday supported by the connector.

The user name and password in the map inputs are populated based on the details provided in the endpoint screen.

14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time if no value is provided for a mandatory element, the activity throws an exception, which is reported by the Web Management Console. If a value is not provided at run time for an optional input parameter, no exception is thrown during run time.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Invoke Workday activity.

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WorkDay\\_invoke\\_service.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/WorkDay_invoke_service.html)

## Specifying the retry options for Workday activity

Specify the retry options for the **Invoke Workday** activity.

### Procedure

1. Select the **Retry** task from the **Checklist**. The Retry pane is displayed.
2. Configure the retry options for connecting to the Workday application. The following table describes the retry options for connecting to the Workday application:

Field	Description
Retry	
1) Wait --- secon d(s) betwe en each retry.	Specifies the amount of time (in seconds) that the Integration Appliance waits before trying to establish a connection to the Workday application.
2) Try to conne ct ___ times before failing .	<p>Specifies the retry count - the maximum number of times the Integration Appliance attempts to establish a connection to the Workday application before issuing an error and stopping the processing of the current orchestration job.</p> <p>If you deploy an orchestration that contains a Invoke Workday activity and the Integration Appliance cannot connect to the specified the Workday service, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and the stops processing the current orchestration job.</p> <p>For example, the retry count is set to 5. The first, second, third, fourth, and fifth, connection errors are shown in the system log as Warnings. The Integration Appliance logs the sixth connection error as an Error and stops processing the current orchestration job.</p>
3) Time out after --- secon	Specifies the amount of time in seconds before a timeout occurs between the activity making a request on an Endpoint and the time it takes the Endpoint to respond. For the Invoke Workday, the activity timeout is the amount of time that the Integration Appliance waits for a response from the Workday application after attempting to start the Workday service, before the Integration Appliance issues a timeout error. An activity timeout is different from a connection timeout because an activity timeout occurs after the connection to the Endpoint has been

ds when the Endpo int does not respo nd to a reque st.	established. A connection timeout specifies the amount of time in seconds before a timeout occurs between the Integration Appliance attempting to establish a connection to the Endpoint and the time it takes for the Endpoint to respond to the connection request. Set the connection timeout in Workday Endpoint tab. For more information about connection timeouts, see <a href="#">Creating and editing a Workday endpoint</a> .

## Overview of the Zuora connector

---

The Zuora connector enables a two-way communication between Cast Iron and the Zuora application. You can create and modify objects within the Z-Billing and Z-Payment applications in Zuora, using the Zuora connector.

You can perform the following outbound activities using the Zuora connector:

- [Create Objects](#)
- [Update Objects](#)
- [Delete Objects](#)
- [Query Objects](#)
- [Amend Subscription](#)
- [Create Subscription](#)
- [Generate Invoice](#)

The Zuora connector supports version 41.0 of the Zuora application. For more information, see <http://knowledgecenter.zuora.com/>.

## Creating and editing a Zuora endpoint

---

Zuora endpoints contain the connection information that studio and the Integration Appliance use to connect to the Zuora application. You can create multiple endpoints that refer to separate instances.

## About this task

---

Use this task to create or edit Zuora endpoint.

Note:

Any changes you make to Zuora endpoint, including configuration properties, affects all the orchestrations that use that endpoint, as the edits are global, not local.

## Procedure

---

1. Drag an activity from Zuora folder in the Activities tab to the Orchestration window. The Summary panel is displayed.
2. Click Pick Endpoint from the Checklist. The Pick Endpoint panel is displayed.
3. Click one of the following buttons:
  - a. Browse - To select an existing endpoint from Project Explorer. The Project Explorer shows all the endpoints in the project available for the activity. When you select an endpoint, the endpoint properties are displayed in the Pick Endpoint panel.
  - b. New - To create a new endpoint. The Create Endpoint window opens.
  - c. Edit - To edit the existing endpoint. The Edit Endpoint window opens.
4. Complete the fields defined in the following table:

Table 1. Connection Details

Field Name	Description
Provide Connection Information	
URL	Specifies the URL of the Zuora application. By default, the value of the production environment in Zuora <code>https://www.zuora.com/apps/services/a/41.0</code> is displayed.
User Name	Specifies the user name to connect to the Zuora application.
Proxy Connection Details	
Password	Specifies the password associated with the user name to connect to the Zuora application.
Proxy Host	Specifies the host name of the proxy server.
Proxy Port	Specifies the port number needed to connect to the proxy server.
Proxy User Name	Specifies the user name needed to connect to the proxy server.
Proxy Password	Specifies the password needed to connect to the proxy server.

5. When finished, click Test Connection to confirm that you can connect to Zuora application.
6. Click OK.

## Using the Zuora Create Objects activity

---

Use the Zuora Create Objects activity to create objects such as Account, Amendment, Contact, InvoiceAdjustment, InvoiceItemAdjustment, InvoicePayment, Payment, PaymentMethod, Product, ProductRatePlan, ProductRatePlanCharge, ProductRatePlanChargeTier, RatePlan, RatePlanCharge, RatePlanChargeTier, Refund, and Usage in the Zuora application.

### About this task

---

Use this task to create objects in the Zuora application. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Zuora Create Objects activity, complete the following steps:

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Zuora folder contents.
2. Drag the Create Objects activity icon onto the orchestration. The Zuora Create Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make required changes if necessary.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Zuora endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click Test Connection to test that you have connected successfully to the Zuora application. Click OK to save and use the endpoint for this configuration.  
Note: For more information, see [Creating and editing a Zuora endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Zuora window is displayed.
11. In Browse Zuora, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Zuora activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Create Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time, if no value is provided for a mandatory element, the activity will be completed and the result of createResponse will be populated with an error message. By reviewing the response of the activity, you can know if the request had failed or was successful.
15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
16. Create a map between the output parameters and orchestration variables.

## Results

---

You have configured the Zuora Create Objects activity.

## Using the Zuora Update Objects activity

---

Use the Zuora Update Objects activity to update objects such as Account, Amendment, Contact, Invoice, InvoiceAdjustment, InvoiceItemAdjustment, Payment, PaymentMethod, Product, ProductRatePlan, ProductRatePlanCharge, ProductRatePlanChargeTier, RatePlanCharge, and Subscription in the Zuora application.

### About this task

---

Use this task to update objects in the Zuora application. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Zuora Update Objects activity, complete the following steps:

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Zuora folder contents.
2. Drag the Update Objects activity icon onto the orchestration. The Zuora Update Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make required changes if necessary.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Zuora endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click Test Connection to test that you have connected successfully to the Zuora application. Click OK to save and use the endpoint for this configuration.  
**Note:** For more information, see [Creating and editing a Zuora endpoint](#).
8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes you make globally affects all uses of the endpoint in active orchestrations.
9. In the Checklist, click Configure.
10. Click Browse to select the object type. The Browse Zuora window is displayed.
11. In Browse Zuora, you can either filter the object type by specifying the object type in the Search for an object type field, or select the object type from the object type list. Click OK.
12. In the Checklist, click Retry. Review the default settings and make the required changes. For more information, see [Specifying the Retry options for Zuora activities](#).
13. Select the Map Inputs in the Checklist. The XML Schemas generated from the selected object of the Update Objects activity are displayed as nodes under the request input parameter in the To Activity

- panel.
14. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time, if no value is provided for a mandatory element, the activity will be completed and the result of `updateResponse` will be populated with an error message. By reviewing the response of the activity, you can know if the request had failed or was successful.
  15. Select the Map Outputs in the Checklist. The XML Schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
  16. Create a map between the output parameters and orchestration variables.

## Results

## Using the Zuora Query Objects activity

---

Use the Zuora Query Objects activity to query for objects such as Product, Account, or RatePlan from the Zuora application. The query string that you specify for this operation must adhere to the Zuora Object Query Language standard.

### About this task

---

Use this task to query objects from the Zuora application. The call to this activity is a synchronous call where the input data is sent to the activity for processing and the response is sent back to the orchestration.

To configure the Zuora Query Objects activity, complete the following steps:

### Procedure

---

1. In an active orchestration, open the Activities tab and expand the Zuora folder contents.
2. Drag the Query Objects activity icon onto the orchestration. The Zuora Query Objects Checklist is displayed.
3. In the Checklist, click Summary.
4. Review the contents of the Activity Name field, and make required changes if necessary.
5. In the Checklist, click Pick Endpoint.
6. Click Browse and use the Project Explorer dialog box to select the relevant Zuora endpoint.
7. Optional: You can create the endpoint by clicking New and specifying the required connection details. Click Test Connection to test that you have connected successfully to the Zuora application. Click OK to

save and use the endpoint for this configuration.

Note: For more information, see [Creating and editing a Zuora endpoint](#).

8. To make required changes to the selected endpoint configuration, click Edit to access the options in a separate window. Any changes that you make globally affects all uses of the endpoint in active orchestrations.
9. Select the Map Inputs in the Checklist. The XML schemas generated from the selected object of the Query Objects activity are displayed as nodes under the request input parameter in the To Activity panel.
10. Create a map between the orchestration variables and the input parameter of the activity.  
Note: Values must be provided at run time for any mandatory elements of the input structure. A value can be provided by specifying a default value for element or by linking the element with an input node. During run time, if no value is provided for a mandatory element, the activity is completed and the result of queryResponse is populated with an error message. By reviewing the response of the activity, you can know if the request had failed or was successful.
11. Select the Map Outputs in the Checklist. The XML schema generated to hold the response of the activity is displayed as nodes under the response output parameter in the From Activity panel.
12. Create a map between the output parameters and orchestration variables.

Note: The output of the Query Objects activity is `queryResponse`, which has a generic structure. If the output of the Query Objects activity must be used in a later activity, direct mapping cannot be done. The data must be extracted from the `queryResponse` with the help of the Apply XSLT activity.

Sample XSLT that can be used to extract specific data:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0" xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
xmlns:ns1="http://api.zuora.com/" xmlns:ns2="http://object.api.zuora.com/">
<xsl:template match="/ns1:queryResponse/ns1:result">
<xsl:element name="Products">
<xsl:apply-templates select="ns1:records" />
</xsl:element>
</xsl:template>
<xsl:template match="ns1:records">
<xsl:element name="Product">
<xsl:element name="Id">
<xsl:value-of select="ns2:Id"/>
</xsl:element >
<xsl:element name="Name">
<xsl:value-of select="ns2:Name"/>
</xsl:element >
<xsl:element name="SKU">
<xsl:value-of select="ns2:SKU"/>
</xsl:element >
<xsl:element name="EffectiveStartDate">
<xsl:value-of select="ns2:EffectiveStartDate"/>
</xsl:element >
<xsl:element name="EffectiveEndDate">
<xsl:value-of select="ns2:EffectiveEndDate"/>
</xsl:element >
<xsl:element name="Description">
<xsl:value-of select="ns2:Description"/>
</xsl:element >
</xsl:template>
</xsl:stylesheet>
```

## Results

## Specifying the Retry options for Zuora activities

---

Specifying the Retry parameters is one of the tasks to configure Zuora activity.

### About this task

---

Use this task to configure the retry options for the Zuora activities. The Zuora connector obtains a new session for each activity. If the connector fails to obtain a session in the first attempt due to network issues, retry occurs. The connector does not count the initial attempt to reacquiring the session as a retry attempt. The connector assumes the typical connector retry behavior after the initial attempt to reacquire a session fails.

### Procedure

---

1. Select the Retry task from the Checklist. The retry pane is displayed.
2. Configure the retry and timeout options for connecting to Zuora application, as described in the following table:

Table 1. Retry options

Retry Fields	Description
Wait __ seconds between each retry.	Specifies the number of seconds that the Integration Appliance waits before trying to establish a connection to Zuora application.

<b>Retry Fields</b>	<b>Description</b>
Try to connect ___ times before failing.	Specifies the retry count — the maximum number of times the Integration Appliance attempts to establish a connection to Zuora application before issuing an error and stopping the processing of the current orchestration job. Note: If you deploy an orchestration that contains Zuora activity and the Integration Appliance cannot connect to the specified Zuora application, the Integration Appliance logs the connections errors as Warnings in the system and orchestration logs until the retry count value is reached. When the retry count is reached, the Integration Appliance logs an Error in the system and orchestration logs and stops processing the current orchestration job. For example, you set the retry count to 3, the first, second, and third connection errors appear in the system log as warnings. The Integration Appliance logs the fourth connection error as an error and stops processing the current orchestration job.
<b>Activity Timeout</b>	
Timeout after ----- seconds when the endpoint does not respond to a request.	Specifies the number of seconds the Integration Appliance waits before timing out, when the endpoint does not respond to a request. The default is 300 seconds.

## Using Secure Connectors

---

A Secure Connector facilitates the secure transfer of data between the IBM® WebSphere® Cast Iron® appliance and an endpoint that is located behind a firewall. You can perform the run time verification of the orchestration against an endpoint behind a firewall from Studio, using Secure Connectors. This feature of discovering Secure Connectors and verifying the orchestrations in Studio, is applicable only for the Integration Appliance and not for Cast Iron Live.

### Before you begin

---

To verify the orchestration in Studio using Secure Connector, you must complete the following tasks:

- Create a Secure Connector on the appliance.
- Download the configuration file and the installer for the Secure Connector from the appliance, and install it on a machine behind the firewall.
- Start the Secure Connector that was installed in the earlier step, and ensure that the status of the Secure Connector in the Integration Appliance, is displayed as "running".

## Procedure

---

Configure the orchestration with a locally accessible endpoint, which is a replica of the endpoint behind the firewall.

To use Secure Connectors for the verification of the orchestration from Studio for the compatible Cast Iron connectors, such as, the HTTP connector, complete the following:

1. Edit the endpoint details of the activity, to use the other endpoint behind firewall.
2. Go to the Remote Endpoint Configuration section.
3. Select the Endpoint Runs Behind Firewall check box to enable the Secure Connector Name field.
4. Click Browse and specify the details of the Integration Appliance, where the Secure Connectors are registered. The Discover Secure Connectors dialog is displayed.

The appliance users of the Publisher or Admin group can connect to the appliance through Studio, to discover the Secure Connectors.

5. Click Discover. The Integration Appliance displays the list of all the Secure Connectors that are actively running.
6. Select the Secure Connector that corresponds to the environment where the endpoint is running.
7. Save the project and perform the verification of the orchestration.

During the verification of the orchestration in the Studio environment, the connector will execute the activity using the Secure Connector that you configured through the Integration appliance. You can now test the orchestration against an environment situated on a different network other than the Studio environment.

Note:

- The Discover Secure Connectors dialog displays only those Secure Connectors that are currently in the "running" state. So, ensure that the Secure Connector is started in the on-premise environment.
- The communication between Studio and Appliance is through HTTP transport.
- For an old project, you must import the project into the Studio and perform the steps described above.
- The test connection and discovery of the artifacts through a Secure Connector is not currently supported from the Studio environment.

---

---

## About variables

In orchestrations, variables provide temporary storage locations to hold the input and output data of activities.

This is shown in the example orchestration of the following figure:

During run time, this orchestration extracts data from and stores data into variables as described in the following steps:

1. The FTP Poll Directory activity polls for a Flat File on an FTP Server and places the contents of the Flat File into the data output parameter. The data output parameter is mapped to the string variable called *flatFileRawContent*.
2. The Flat File data returned from the FTP Poll Directory activity is stored as a string into the *flatFileRawContent* variable.
3. The *flatFileRawContent* variable is mapped to the Data input parameter of the Read Flat File activity. The Flat File data is parsed by the Read Flat File activity and returned from the activity in the XML output parameter.
4. The XML output parameter is mapped to the *batchOrderXML* Flat File Schema variable. The data is available in the orchestration from the *batchOrderXML* Flat File Schema variable. For example, if an activity is added to the orchestration to the right of the Read Flat File activity, it can use this data as input.

Variables must be initialized in an orchestration in order for the orchestration to be considered valid. This includes variables that are initialized in the branches of an If.. Then activity. The variable must be initialized in all branches. For more information see [Validating the orchestration](#).

## Variable scope

Variables defined within the Group, Try/Catch, If Then, While Loop, or For Each activities are considered as local variables. When such a variable is used as an input of a Map Inputs Tasks activity or a Map Variables activity that is outside of, and following the Group, Try/Catch, If Then, While Loop, or For Each activity, the variable is considered as uninitialized because it is outside the scope of the activities where it was declared. Therefore, these variables must be initialized with a default value.

For more information about specifying a default value, see the [Specifying a default value](#) section.

## The Variables tab

The Variables tab contains the following panes:

- Variables: Displays the variables that are defined and available for use in the Mapping Editor. A predefined variable called *JobInfo* is available in the Variables pane of the Variables tab by default.
- Schema of <variable>: Displays the schema for the selected variable.
- Activities using <variable>: Displays all activities in the orchestration which use the variable.
- Properties of <variable>: Where you define or edit variable properties or specify a default value.

## The JobInfo variable

By default, Studio provides the *JobInfo* variable. The Integration Appliance provides the values for the *JobInfo* nodes during run time. The *JobInfo* variable contains the nodes defined in the following table:

JobInfo Node Name	Data Type	Description
jobId	String	Contains the job ID number assigned to the instance of the orchestration. When the orchestration starts processing the activities contained in the orchestration, a job ID number is assigned to that instance of the orchestration. This job ID number is also visible from the Web Management Console (WMC).

JobInfo Node Name	Data Type	Description
jobStartTime	XML Schema data type xsd:dateTime	Contains the date and time that the instance of the orchestration started processing. Note: The <i>jobStartTime</i> is the date and time that the orchestration starts processing the messages or events and is assigned a job ID number. The <i>jobStartTime</i> is not the date and time that orchestration was deployed on the Integration Appliance and became active —ready to start processing messages and events. For example, an orchestration contains a FTP Poll Directory activity (a starter activity) that is deployed on the Integration Appliance. The orchestration becomes active waiting for a file to show on the FTP Server in a particular directory. When the orchestration determines that a file has been placed in a particular directory on the FTP Server, it starts processing the FTP Poll Directory activity. When the orchestration starts processing, the current date and time is stored in the <i>jobStartTime</i> node.
projectName	String	The name of the project that contains the current orchestration.
configurationName	String	The name of the configuration associated with the current instance of the orchestration. Different configurations of projects are created using the Web Management Console (WMC).
orchestrationName	String	The name of the orchestration currently processing.
routerHostName	String	The host name of the Integration Appliance that the current instance of the orchestration is running on.

Note: The *JobInfo* variable or the nodes of the *JobInfo* variable cannot be removed.

## Create a new variable using the Create New Variable option

---

### About this task

---

To create a new variable using the Create New Variable option of the Variables pane:

### Procedure

---

1. Open an orchestration and select the Variables tab.
2. Right-click the Variables pane and select the Create New Variable option from the list. The "Create New Variables Step 1 of 2" dialog box is displayed.
3. Select a data type or schema to base the new variable:
  - For a variable based on a primitive data type:
    - a. Scroll to the end of the "Create New Variables Step 1 of 2" dialog box.
    - b. Select a primitive data type from the Primitive Types folder.
    - c. Click Next.
  - For a variable based on a schema:
    - a. Optional: [To search for a node by name, click Find.](#)
    - b. From the schema, select a node to be the root of the new variable.
    - c. Click Next.
4. Enter a name for the new variable and click Finish. The new variable is added to Variables toolbox, and the schema opens in the Schema of pane on the Variables tab.

Attention: Do not create a variable in the following format: `__variableName__`. Variable names that start with two underscore characters ( `_` ) and ends with two underscore characters ( `_` ) are not supported. If an orchestration contains variable names using this format, [the orchestration fails to validate](#).

**Parent topic:** [Creating variables](#)

# Create a new variable using the Select Inputs or Select Outputs buttons

---

## About this task

---

To add a new variable using the Select Inputs or Select Outputs buttons in the mapping panes of activities:

## Procedure

---

1. Open an orchestration.
2. Double-click an activity.
3. Select a mapping task in the Checklist.
4. Add a variable to the map:
  - o To add an input variable to the map, click Select Inputs.
  - o To add an output variable to the map, click Select Outputs.
5. Click New. The "Create New Variables Step 1 of 2" dialog box opens.
6. Select a data type or schema to base the new variable:
  - o For a variable based on a primitive data type:
    - a. Scroll to the end of the "Create New Variables Step 1 of 2" dialog box.
    - b. Select a primitive data type from the Primitive Types folder.
    - c. Click Next.
  - o For a variable based on a schema:
    - a. Optional: [To search for a node by name, click Find](#)
    - b. From the schema, select a node to be the root of the new variable.
    - c. Click Next.
7. Enter a name for the new variable and click Finish.

The new variable is added to Variables toolbox, and the schema displays in the Schema of pane on the Variables tab. The new variable is also added to the mapping pane.

Attention: Do not create a variable in the following format: `__variableName__`. Variable names that start with two underscore characters ( `_` ) and ends with two underscore characters ( `_` ) are not supported. If an orchestration contains variable names using this format, [the orchestration fails to validate](#).

## Create a new variable using the toolbar menu

---

### About this task

---

To add a new variable using the Map > Add options available from the toolbar menu:

### Procedure

---

1. Open a mapping pane of an activity.
2. Click a node in the mapping pane.
3. Select an active Map toolbar menu option
  - o Map > Add Input Variables
  - o Map > Add Output VariablesThe "Add Variables" dialog box is displayed.
4. Click New. The "Create New Variables Step 1 of 2" dialog box is displayed.
5. Select a data type or schema to base the new variable:
  - o For a variable based on a primitive data type:
    - a. Scroll to the end of the "Create New Variables Step 1 of 2" dialog box.
    - b. Select a primitive data type from the Primitive Types folder.
    - c. Click Next.
  - o For a variable based on a schema:
    - a. Optional: [To search for a node by name, click Find](#).
    - b. From the schema, select a node to be the root of the new variable.
    - c. Click Next.

6. Enter a name for the new variable and click Finish. The new variable is added to Variables toolbox, and the schema is displayed in the Schema of pane on the Variables tab. The new variable is also added to the mapping pane.

Attention: Do not create a variable in the following format: `__variableName__`. Variable names that start with two underscore characters (`_`) and ends with two underscore characters (`_`) are not supported. If an orchestration contains variable names using this format, [the orchestration fails to validate](#).

## Create a new variable using the Copy menu option

---

### About this task

---

To create a new variable using the Copy menu option while viewing the graphical representation of an XML Schema:

### Procedure

---

1. Open an orchestration.
2. Select the Project tab and double-click an XML Schema in the XML Schemas folder to open it. A schema tab opens with a graphical representation of the XML Schema.
3. Select the Variables tab.
4. Select a node in the schema to be the root of the new variable. Right-click the node in the schema tab (displayed on the left) and from the menu select Copy.
5. Select an orchestration tab and then select the Variables tab.
6. Click the Variables pane of the Variables tab and paste fragment of the schema using one of the following options:
  - o Right-click and from the menu select Paste.
  - o From the toolbar menu, select Edit > Paste.
7. Optional: Rename the variable by clicking in the Name field of the "Properties of" pane of the Variables tab.

Attention: Do not create a variable in the following format: `__variableName__`. Variable names that start with two underscore characters (`_`) and ends with two underscore characters (`_`) are not supported. If an orchestration contains variable names using this format, [the orchestration fails to validate](#).

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/creating\\_variables\\_using\\_copybutton.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/creating_variables_using_copybutton.html)

## Primitive Data Types

---

The following table lists primitive data types that can be used when creating a variable:

Primitive Data Type	Description
base64 binary	Base64-encoded arbitrary binary data The <code>·value space·</code> of <code>base64Binary</code> is the set of finite-length sequences of binary octets. For <code>base64Binary</code> data the entire binary stream is encoded using the Base64 Alphabet in [RFC 2045].
anyType	A concrete <code>ur-<code>Type</code></code> , which can serve either as a complex type (non-scalar data, means elements), or as a simple type (scalar data) depending on the context.
dateTime	Specific instant of time. ISO 8601 extended format CCYY-MMDDThh:mm:ss
QName /qname	XML qualified names.
int	<code>int</code> is derived from <code>long</code> by setting the value of <code>·maxInclusive·</code> to be 2147483647 and <code>·minInclusive·</code> to be -2147483648
string	The <code>string</code> datatype represents character strings in XML
boolean	This data type has two possible values: true or false. It is typically used to track true or false conditions.
decimal	A subset of the real numbers, which can be represented by decimal numerals

file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/creating\\_variables\\_primitivedatatypes.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/creating_variables_primitivedatatypes.html)

## Configuring variable properties

---

Configure variable properties from the Properties of pane on the Variables tab.

## About this task

---

When using variables within the Group or Try/Catch activities, these variables are regarded as local variables. When these variables are used outside of the scope of the activities where they were declared, they are considered to be uninitialised. If a variable defined within the Group or Try/Catch activities is used as an input of a Map Inputs Tasks activity or a Map Variables activity that is outside of, and following, the Group or Try/Catch activity, the variable is considered as uninitialised.

## Procedure

---

1. Click the Name field and enter a name for the variable.
2. Click the Data Type field and select a Data Type from the list. In addition to the default Data Types, the list lists the names of the root nodes of the Flat File Schemas, XML Schemas, and DTD files that have been defined or uploaded into the project. The following default Data Types are listed in the menu:
  - o DateTime: a date and time stored as an XML Schema xs:dateTime data type
  - o AnyType: any type of data can be stored in this catch-all (XML Schema xs:anyType) data type
  - o String: text characters (primitive)
  - o Integer: integers (primitive)
  - o Base64Binary: base64 binary encoded data stored as an XML Schema xs:base64Binary data type
  - o [Browse for Schema....](#): use this option to redefine the schema or schema fragment that the variable is based on
3. Optional: Click the Default Value field and [specify a default value](#) for the variable.
4. Click the Shared field to specify to share this variable across orchestration jobs. By default, variables are not shared (False). To share this variable across all the orchestration jobs of this type of orchestration, select the True option from the list. If the Shared field is set to True, the Process Orchestration Jobs Sequentially check box becomes automatically selected.  
Note: Variables based on schema fragments can be created by [dragging a node from the Schema of pane into the Variables pane of the Variables tab](#).  
Note: Shared variables are sometimes used with scheduled orchestrations to maintain state information for each scheduled invocation of the orchestration job.

**Parent topic:** [Variables](#)

## Removing Variables

---

You can remove a specific variable, or all unused variables from the orchestration, as described in this section.

## About this task

---

Remove variables from the orchestration in one of the following methods:

To remove a specific variable:

1. Select the variable from the Variables pane inside of the Variables tab.
2. Right-click and select Remove Variable from the list

Note: Removing a variable can modify any maps that refer to it.

To remove variables not used in the orchestration:

1. Right-click the Variables pane inside of the Variables tab.
2. Select Remove Unused Variable(s).

**Parent topic:** [Variables](#)

---

## Specifying a default value

---

Specify a default value for a variable which is appropriate for its data type.

### About this task

---

The value you supply as a default must match the data type of the variable. You can enter a default value or you can select a default value from a file. Typically you select a default value from a file for variables that are based on schemas. For variables based on an XML Schema, you load an XML file that is valid to the XML Schema.

Specify a default value using one of the following methods:

To enter a default value manually:

1. Click the Default Value field of the "Properties of" pane.
2. Enter a value.

To select a default value from a file:

1. Click [...] in the Default Value field. The Default Value dialog box is displayed.
2. Click Upload. The Open Sample Document dialog box opens.
3. Select a sample file and click Open. The contents of the file show in the Default Value dialog box.
4. Click OK. The OK button is located at the end of the pane.

**Parent topic:** [Variables](#)

## Browse for Schema Element

---

Select a root element of a schema or fragment of a schema.

### About this task

---

The Browse for Schema Type Element dialog box shows the current nodes of the different schemas available in the project. You can select either a root element of the schema or a fragment of the schema (a child node of the root element). To upload a new schema into the project, see [Uploading Files into a Project](#).

To select the root of a schema or a schema fragment:

### Procedure

---

1. In the Browse for Schema Type Element dialog box select either a root element of the schema or a fragment of the schema (a child node of the root element).
2. Expand the schema to view the nodes that make up the schema. To find a particular node in the schema, enter the beginning characters of the node name.
3. Click OK.

## Selecting a Substitution Type for Variables

---

When an XML Schema defines an XML element based on derived types, you must specify the derived type (or substitution type) expected during run time.

### About this task

---

The XML Schema specification supports the ability to derive complex types by extension. For more general information about type substitution and about using type substitution in mapping panes, see [Selecting a Substitution Type](#).

When an XML Schema defines an XML element based on derived types, you must specify the derived type (or substitution type) expected during run time. In Studio, you must specify the expected substitution type for the XML element of the variable using the Substitute Node With ... menu option as described in the following procedure.

To select a substitution type for a variable:

## Procedure

1. Upload an XML Schema that contains an XML element-based derived types into the project. For more information, see [Uploading Files into a Project](#).
2. [Create a variable](#) that contains an XML element based on derived types. The schema associated with the node displays in the "Schema of" pane of the Variables tab.

For the example XML Schema provided in [Selecting a Substitution Type](#), create a variable based on the <shape> element. The schema associated with the <shape> element is displayed in the "Schema of" pane of the Variables tab as shown in [Figure 1](#):

Figure 1. The schema associated with the shape element as displayed by the Schema of pane.

Note that the child elements of the derived types are not listed in the "Schema of" pane. In this example, the child element of circle which is named diameter is not listed, nor are the child elements of rectangle which are named width and length.

3. In the "Schema Of" pane of the Variables tab, select the derived type expected during run time, by right-clicking the node and from the menu selecting the Substitute Node With ... option.

The Substitute Node with a Derived Type dialog box is displayed. In the menu, the available derived types for the node as defined by the XML Schema are listed. For this example, the two derived types are available from the menu as shown in [Figure 2](#):

Figure 2. The figure shows the two derived types for the Node: circle and rectangle.

4. Select one of the derived types. The selected derived type determines the expected type of XML instance document during run time.

In this example, the circle derived type is selected, so the XML data expected for this variable during run time is of type circle.

In addition to the child elements of the base type, the child elements of the derived type are displayed in the "Schema of" pane. In this example, the child element named diameter is displayed with the child element named color (inherited from the base type) in the "Schema of" pane of the Variables tab as shown in [Figure 3](#):

Figure 3. Variables tab

## What to do next

When a derived type has been selected for a node of a variable using the Substitute Node With ... option, you can remove the association between the node of a variable and the derived type by right-clicking the node and selecting the Unsubstitute Node option from the menu. An Unsubstitute dialog box opens. Click Yes.

**Parent topic:** [Variables](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc\\_flatfileschemas.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_flatfileschemas.html)

# Flat File Schema Editor Overview

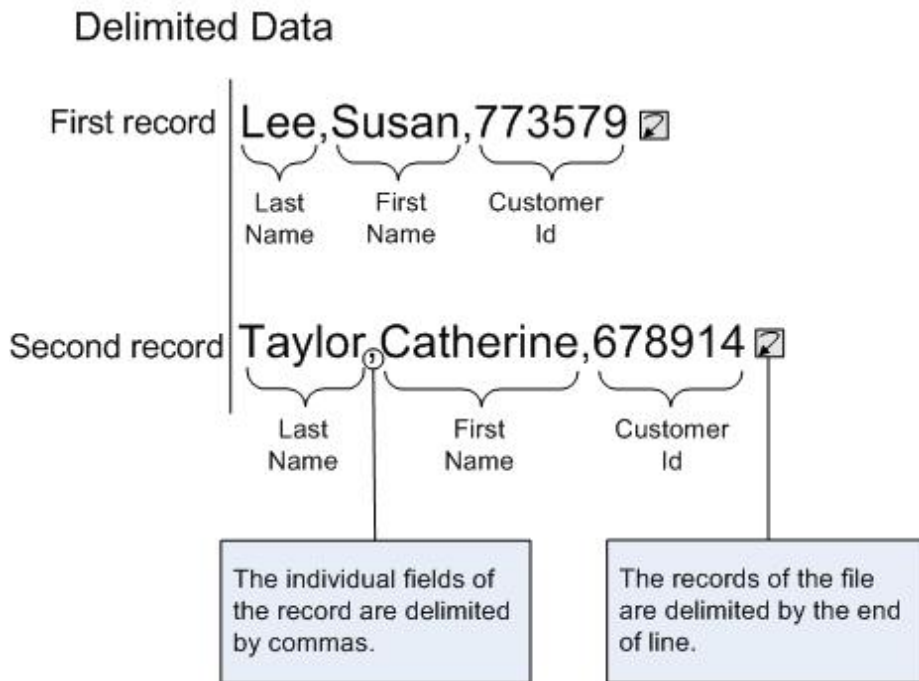

A Flat File Schema is metadata that describes the format and structure of Flat File data processed by the Integration Appliance. When you create a Flat File Schema, a corresponding internal XML Schema-based representation of the metadata is also generated.

During run time, the Integration Appliance uses the Flat File Schema for the following actions:

- Parse incoming Flat File data (valid to the Flat File Schema) and convert it to XML data. This parsing is done in the Read Flat File activity of an orchestration. The converted XML data is valid to the generated internal XML Schema generated from the Flat File Schema. For an example orchestration that reads Flat File data, see the "Developing the BookOrder Project" section of the *Getting Started Guide*.
- Convert XML data into outgoing Flat File data valid to a Flat File Schema. This conversion is done in the Write Flat File activity of an orchestration.

Use the Flat File Schema Editor to create Flat File Schemas to describe the following types of data:

- **Delimited** data - A Flat File Schema can describe data that is defined using delimiters, for example: EDI data or by comma-separated values (CSV). A CSV file containing delimited data is shown in the following figure:

For an example Flat File Schema that parses delimited fields and contains repeating records, see "Developing the BookOrder Project" section of the *Getting Started Guide*.

- **Fixed length or 'positional'** data: A Flat File Schema can describe fixed length or positional data. Many mainframe applications use positional data. Fixed-length data is shown in the following figure:

- [Mixed positional and delimited data](#) - A Flat File Schema can describe a mix of both delimited and positional data as shown in the following figure:

### Mix of Positional and Delimited Data

Parent topic: [Flat File Schemas](#)

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_Flat\\_File\\_Definition\\_Editor\\_Overview.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Flat_File_Definition_Editor_Overview.html)

## About delimited data

Delimited data is a collection of records or fields with variable lengths. Delimiters are used to signal the beginning or end of the record or field as shown in the following figure:

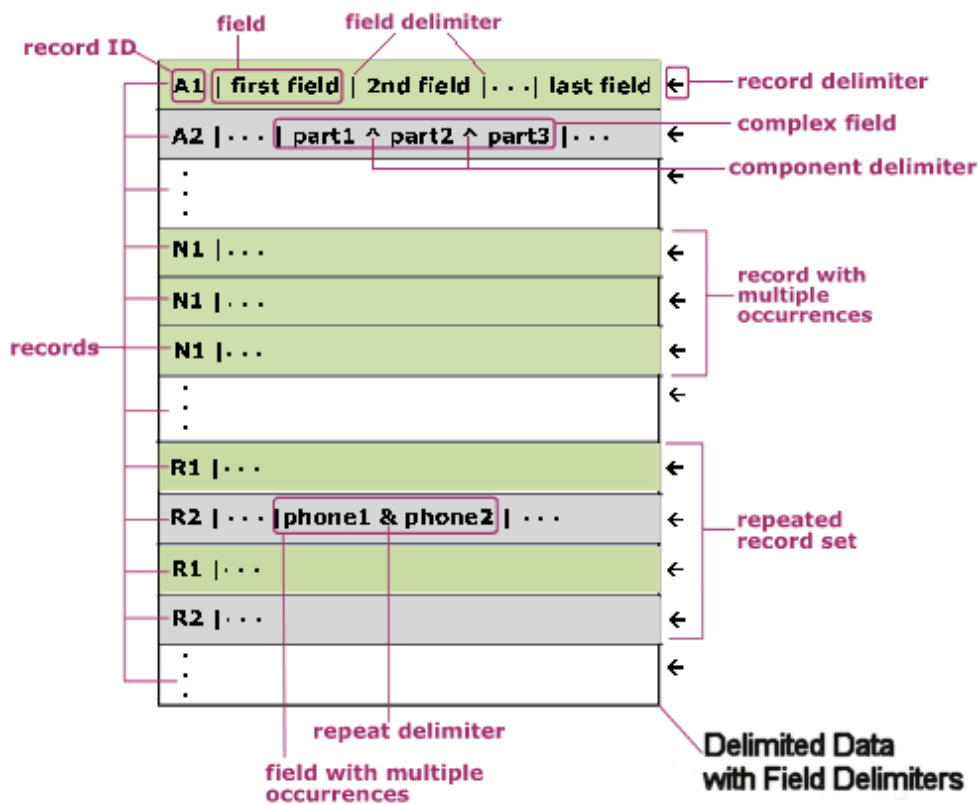

Figure 1. An example of delimited data where individual fields of the record are delimited by commas (LastName, FirstName and CustomerId), and the records of the file are delimited by the end of line.

## Delimited Data

Records can also have identifying codes, known as records IDs. In the data in [Figure 2](#), each record begins with a record ID and ends with a delimiter.

Figure 2. Records with identifying codes

As shown in [Figure 2](#), records can repeat individually; the end of the repetition is marked by the record ID of the next record. Records can also repeat as a set of records; the end of the repetition is marked by the record ID of the next record that is not in the set.

Records contain fields; each field begins with a field delimiter. Fields end with either the delimiter beginning in the next field or with the end of the record.

Fields can be complex, containing components that are delimited with a component delimiter. Fields can also contain multiple data values - they repeat and use a repeat delimiter between values as shown with the phone1 and phone2 fields.

To implement a Flat File Schema for this sample data with record IDs, you would map each characteristic of the data as shown in the following table:

Flat File Characteristic	Flat File Schema Implementation
Delimited format for the highest level of structure in the data	For the <a href="#">root node</a> set the Structure property to Delimited
Record delimiter	For the root node or a <a href="#">record node</a> set the child delimiter
Record IDs	<ul style="list-style-type: none"> <li>• For the root node or a <a href="#">record node</a>, set the record identifier property to the respective ID value</li> <li>• For the root node or a <a href="#">record node</a>, set the record identifier offset to 1</li> </ul>
Repeating records	For <a href="#">record nodes</a> , set the maximum occurrence property to unbounded or to a specific value
Repeating sets of records	Create a group node for each set and make the records in the set the content of the group
Field delimiter	Record nodes, set the child delimiter property
Repeating fields	Record nodes, set the repeat delimiter property
Complex fields	Define each as a subrecord that is child to the record containing the field
Components within complex fields	Define as field children in the subrecord
Component delimiter	Record node for the complex field, set the child delimiter property

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_About\\_Delimited\\_Data.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_About_Delimited_Data.html)

## About fixed length or 'positional' data

---

Fixed length or positional data are simple collections of records where each record has a known length. For example, the lastName field could contain the characters found between the 1 and the 16 character positions, as shown in [Figure 1](#):

Figure 1. Positional or Fixed Length Data example where a limited number of cells or boxes is allocated to each category, in this example: lastName, firstName, and customerID.

### Positional or Fixed Length Data

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35
First record	H	A	N	F	O	R	D										S	U	S	A	N									7	7	3	5	7	9
Second record	T	A	Y	L	O	R											C	A	T	H	E	R	I	N	E					6	7	8	9	1	4

lastName
firstName
customerID

As shown in [Figure 1](#), delimiters are not used to separate the characters between the following fields:

- lastName
- firstName
- customerID

For this example, the end-of-line delimiter is used to separate the data in the first and second records. You can define a Flat File Schema for a mix of positional and delimited data.

All data in the record is required because omitting the data would change the position of subsequent fields. If data is not available, spaces or zeros are added to pad out the field lengths as shown for the nickname and age fields in the following figure:

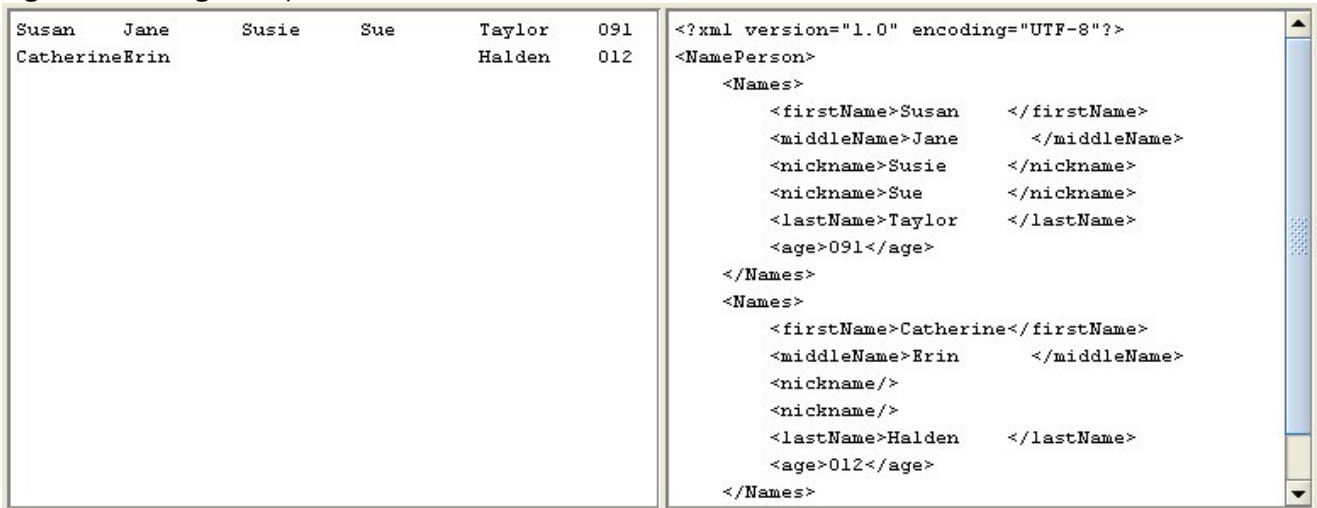

Figure 2. Padding using spaces or zeros

<pre>Susan   Jane     Susie   Taylor   091 CatherineErin          Halden   012</pre>	<pre>&lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;NamePerson&gt;   &lt;Names&gt;     &lt;firstName&gt;Susan   &lt;/firstName&gt;     &lt;middleName&gt;Jane   &lt;/middleName&gt;     &lt;nickname&gt;Susie   &lt;/nickname&gt;     &lt;lastName&gt;Taylor   &lt;/lastName&gt;     &lt;age&gt;091&lt;/age&gt;   &lt;/Names&gt;   &lt;Names&gt;     &lt;firstName&gt;Catherine&lt;/firstName&gt;     &lt;middleName&gt;Erin   &lt;/middleName&gt;     &lt;nickname/&gt;     &lt;lastName&gt;Halden   &lt;/lastName&gt;     &lt;age&gt;012&lt;/age&gt;   &lt;/Names&gt; &lt;/NamePerson&gt;</pre>
--	---

In the second line of data in the previous figure, no name is specified in for the nickname field - instead, there are spaces to pad out the missing nickname, so the string: Halden is correctly parsed as a last name. In addition, an extra zero was added to the front of the ages because the age field is three characters but the ages 12 and 91 are only two characters long.

Fields and records can repeat, but the number of repetitions must be predefined in Studio and each record must have the same number of fields. For example, if you specified that the number of occurrences of the nickname field was equal to two, each record in the field must specify two nicknames or add spaces to pad for the missing nickname as shown in the following figure:

Figure 3. Padding with spaces

For an example of parsing positional data, see the originNode of the [Mixed positional and delimited example](#).

**Parent topic:** [Flat File Schemas](#)

## Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/about\\_fixed\\_length\\_or\\_positional\\_data.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/about_fixed_length_or_positional_data.html)

# Mixed positional and delimited example

---

## About this task

---

This example shows how to build a Flat File Schema to parse a mix of positional and delimited data. To create a Flat File Schema, you must first analyze your Flat File data to determine what fields and nodes to added to the Flat File Schema. In this example, you create a Flat File Schema for the following two lines of data:

```
BuyRight Pharmacy;USACAMVI334;!389!22;34980;
```

```
Taylor Drugs;USANJWLB128;!778!23!523;5667;
```

Use a top-down approach for defining the records and fields of the Flat File Schema as shown in the following steps:

## Procedure

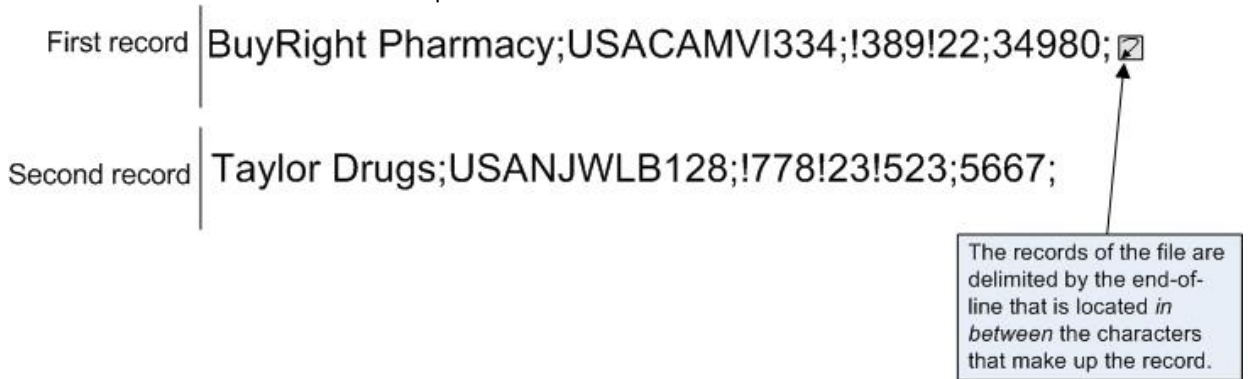

---

1. Create a root node:
  - a. In the Project tab, right-click the Flat File Schemas folder and select New Flat File Schema. The Basic Wizard dialog box opens.
  - b. Enter `Order` in the Name field.
  - c. Click OK. The Flat File Schema Editor opens and the Flat File Schema is displayed beneath the Flat File Schemas folder in the Project tab. In addition, a root node of the same name shows in

the Schema Layout tab.

2. Determine the highest level of structure in the data. In this example the largest structure is the two lines that each represent a record. The two records in this Flat File data are delimited by an end-of-line that is located in between the two records, as shown in [Figure 1](#):

Figure 1. Mixed example 1: the records of the file are delimited by the end-of-line that is located between the characters that make up the record.

3. Configure the root node called Order to parse the child repeating records using the following criteria:
  - o Separate the data into records using a delimiter.
  - o Expect the document to end with an EOS (End Of Stream) because the last record does not end with a delimiter.
  - o Use the end-of-line delimiter to delimit any child records.
  - o Expect the delimiter in between the data.
  - o Expect repeating child records.
  - o Use the end-of-line delimiter to delimit the child repeating records.

Using these criteria, specify the following values for the Basic Properties and Delimiters pane of the Order node as shown in [Figure 2](#):

Figure 2. Mixed example pane 1 where Structure is Delimited and Document ends with EOS box ticked. The Line End option is selected and Child Delimiter position is set to In Between

4. Add a child node to the root node to represent the records. In the Schema Layout tab, right-click the Order node. From the menu, select New Child > Record, enter `purchaseOrder`, and click OK.
5. Determine the next level of structure in data. In this example, the next level of structure are the fields delimited by semicolons as shown in [Figure 3](#):

Figure 3. Mixed example 2: The individual fields of the record are delimited by semicolons.

6. Configure the purchaseOrder node to parse these fields as described by following criteria:
  - o The purchaseOrder node can have one or more occurrences.
  - o Parse the data of the record into child fields using a delimiter.
  - o Use the semicolon as the delimiter between the data.
  - o Expect the delimiter after the data.

Using these criteria, specify the following values for the Basic Properties and Delimiters pane of the purchaseOrder node as shown in Figure 4:

Figure 4. Mixed example pane 2: Structure is set to Delimited, Maximum unbounded and Character option selected. Child Delimiter Position is set to After.

**Basic Properties**

Name: purchaseOrder Type: None

Structure: Delimited

Record Identifier: Record ID Starting Position: 0

Occurrences: Minimum: 1 Maximum: Unbounded

**Delimiters**

Child: Character ;

Include Trailing Delimiters for Empty Data:

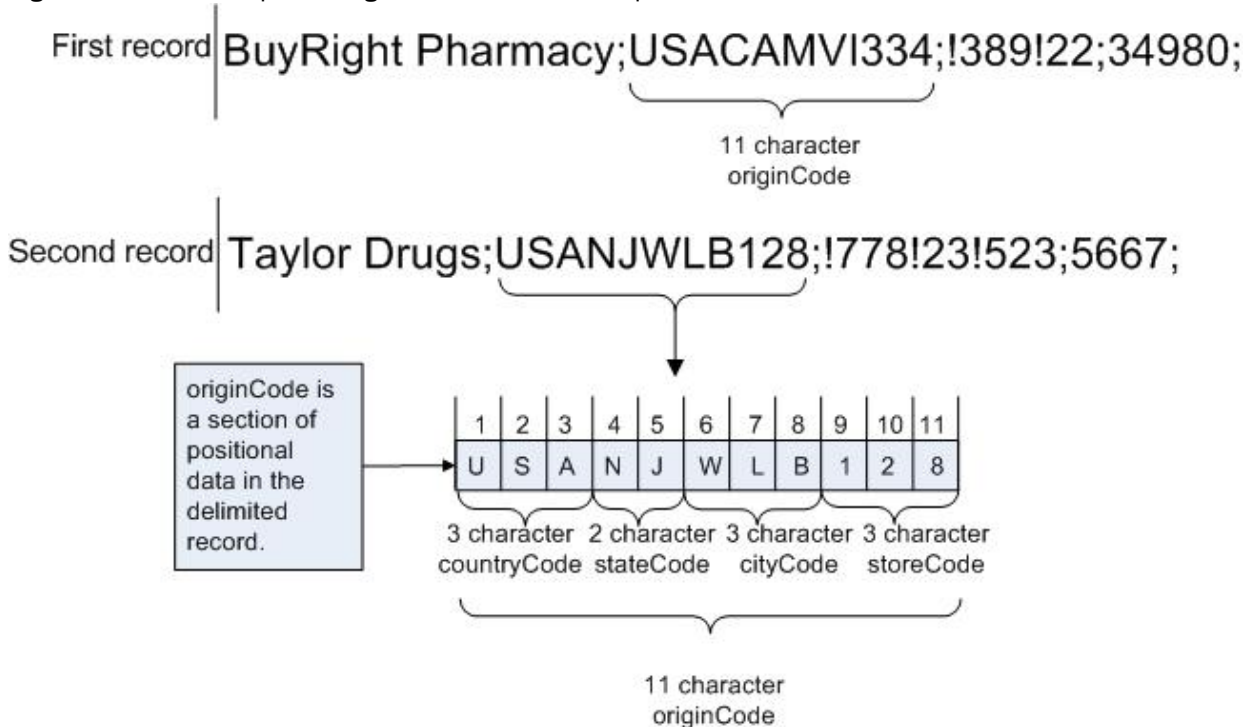

Child Delimiter Position: After

Repeat: Character

7. Add the fields of the purchaseOrder node by right-clicking the purchaseOrder node in the Schema Layout tab and selecting the New Children option from the list. The Bulk Add dialog box is displayed.
8. In the Bulk Add dialog box, add all the child records and fields of the purchaseOrder node:
  - o Click Add and change field1 to storeName. Leave the Node Type set to Field.
  - o Click Add and change field2 to originCode. Change the Node Type to Record.
  - o Click Add and change field3 to items. Change the Node Type to Record.
  - o Click Add and change field4 to orderID. Leave the Node Type set to Field.
  - o Click OK.
9. Determine the next level of structure in data. In this example, the next level of structure is a set of positional data found in the originCode record as shown in Figure 5:

Figure 5. Mixed example 3: originCode is a section of positional data in the delimited record.

10. Configure the originCode record to be positional:
  - a. In the Schema Layout tab, select the originCode node. The Basic Properties are displayed.
  - b. In the Structure list, select Positional.
11. Add the positional fields of the originCode node by right-clicking the originCode node in the Schema Layout tab and selecting the New Children option from the list. The Bulk Add dialog box opens.
12. In the Bulk Add dialog box, add all the child records and fields of the originCode node:
  - a. Click Add and change field1 to countryCode. Leave the Node Type set to Field.
  - b. Click Add and change field2 to stateCode. Leave the Node Type set to Field.
  - c. Click Add and change field3 to cityCode. Leave the Node Type set to Field.
  - d. Click Add and change field4 to storeCode. Leave the Node Type set to Field.
  - e. Click OK.
13. Configure the Positional Properties of each positional field. For each child node of the originCode node, click the node in the Schema Layout tab and at the end of the properties pane set the values of the Field Offset and Field Length as shown in the following list:

- o **countryCode** -

**Positional Properties**

Field Offset:  Field Length:

- o **stateCode** -

**Positional Properties**

Field Offset:  Field Length:

- o **cityCode** -

**Positional Properties**

Field Offset:  Field Length:

- o **storeCode** -

### Positional Properties

Field Offset:  Field Length:

The Field Offset is calibrated from the current character location as the originCode string is being processed and not from the beginning of the originCode string for each field. In this example, the countryCode is processed and the first three characters of the originString are assigned to the countryCode. When the stateCode is processed, the current character location is already at the 3 character location, so the Field Offset of 1 of stateCode is added to the current character location to get the starting point for processing the stateCode string as shown in [Figure 6](#):

Figure 6. Mixed Example 4 shows current cursor location and Field Offset.

14. Determine the next level of structure in data. In this example, the next level of structure are the repeating fields delimited by exclamation points as shown in [Figure 7](#):

Figure 7. Mixed example 5 where delimited data is indicated by exclamation points.

15. Configure the items node to parse child repeating records using the following criteria:
- Separate the data into fields using a delimiter.
  - Use exclamation points as delimiters to delimit any child fields.
  - Expect the delimiter before the data.
  - Expect one or more repeating child fields.
  - Use exclamation points as delimiters to delimit the child repeating fields.

Using these criteria, specify the following values for the Basic Properties and Delimiters pane of the items node as shown in [Figure 8](#):

Figure 8. Mixed example pane 3 where Child Delimiter Position is set to Before.

16. Add the repeating child field to the items node by right-clicking the items node in the Schema Layout tab and selecting the New Child > Field option from the list. The New Field dialog box opens.
17. In Field Name enter `item` and click OK.
18. Configure the item node to contain one or more occurrences as shown in [Figure 9](#):

Figure 9. Mixed example pane 4 where Maximum Repeat is set to Unbounded.

The Flat File Schema is complete and ready to test.

19. Paste the following text into the left sub-pane of the test pane:

```
BuyRight Pharmacy;USACAMVI334;!389!22;34980;
Taylor Drugs;USANJWLB128;!778!23!523;5667;
```

This data is also provided in the mixedData.txt file. If you accepted the defaults during the installation of Studio, this file is located in the following directory: C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\FlatFileSchema

Attention: Do not add a carriage return after the last line.

20. Click the Test icon.

The Save Confirmation dialog box opens.

21. Click Yes. The following XML representation of the data is shown within the test pane:

```
<?xml version="1.0" encoding="UTF-8"?>
<Order>
  <purchaseOrder>
    <storeName>BuyRight Pharmacy</storeName>
    <originCode>
      <countryCode>USA</countryCode>
      <stateCode>CA</stateCode>
      <cityCode>MVI</cityCode>
      <storeCode>334</storeCode>
    </originCode>
    <items>
      <item>389</item>
      <item>22</item>
    </items>
    <orderId>34980</orderId>
  </purchaseOrder>
</Order>
```

```

    </purchaseOrder>
  </purchaseOrder>
    <storeName>Taylor Drugs</storeName>
    <originCode>
      <countryCode>USA</countryCode>
      <stateCode>NJ</stateCode>
      <cityCode>WLB</cityCode>
      <storeCode>128</storeCode>
    </originCode>
    <items>
      <item>778</item>
      <item>23</item>
      <item>523</item>
    </items>
    <orderId>5667</orderId>
  </purchaseOrder>
</Order>

```

22. In the Schema Layout tab, click the item node. In the right sub-pane of the test pane, the data parsed into the item node is highlighted as shown in [Figure 10](#):

Figure 10. The item node is highlighted

23. Click the state node to view the data assigned into the state node.

Note: A reference implementation of the Order Flat File Schema is provided in the FlatFileSchemasExample project. To view and open the FlatFileSchemasExample project, follow steps 1 and 2 in the [Group Example](#) and double-click the Order Flat File Schema. The nodes of the Order Flat File Schema are displayed in the Schema Layout tab and the properties of the Order root node show in the right pane.

## Creating a flat file schema

## About this task

To create a Flat File Schema:

## Procedure

1. Select the Project tab from the Toolbox located on the right side of the main Studio pane.
2. To create a new Flat File Schema, choose from one of the following options:
  - o In the Project tab, right-click the Flat File Schemas folder and from the list select New Flat File Schema.
  - o In the Project tab, click New Flat File Schema ().The Basic Wizard dialog box is displayed.
3. Enter a [valid node name](#) for the Flat File Schema in the Name field.
4. Optional: If you want to use an existing Flat File Schema as a starting point, select the Inherit from an existing Flat File Schema check box. Click [...] to browse for the existing Flat File Schema from the Project Explorer dialog box, and click OK.
5. Click OK and press Enter. The Flat File Schema Editor opens and the Flat File Schema is displayed beneath the Flat File Schemas folder in the Project tab. In addition, a root node of the same name as the one shown in the Schema Layout tab.
6. Configure the root node:
  - a. Click the root node in the Schema Layout tab. The properties for the root node are displayed.
  - b. Configure the [root node properties](#).
7. Define the records, fields, and groups of the Flat File Schema for your Flat File data. Start from the outermost structure of data and work inwards. For an example on how to build a Flat File Schema from data see [Mixed positional and delimited example](#) or the "Developing the BookOrder Project" section of the *Getting Started Guide*.
8. Optional: You can select the Type Library tab and define the shared record types, group types, and field types for the data:
  - o [Add a Record Type](#) to define common record properties or content.
  - o [Add a Group Type](#) to define common group properties or content.
  - o [Add a Field Type](#) to define common field properties.
9. Select the Schema Layout tab, and add records, groups, and fields to the root node:
  - o [Add a Record](#) to define the major components of the message or for fields with complex structure.
  - o [Add a Group](#) to define a set of records or groups that repeat as a set.
  - o [Add a Field](#) to define the data within each record.
  - o [Add Several Children](#), of any type, to quickly build the content of records or groups.
10. [Test](#) the Flat File Schema.

The icons representing fields, field types, records, record types, groups, and group types are displayed in the Schema Layout and Type Library tabs as shown in the following table:

Node Type	Icon Displayed in Tabs
Field or field type that is not based on a field type	
Field or field type that is based on a field type	
Record or record type that is not based on a record type	
Record or record type that is based on a record type	
Group or group type that is not based on a group type	
Group or group type that is based on a group type

## Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/testing\\_flat\\_file\\_schemas.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/testing_flat_file_schemas.html)

# Load input test data

---

## About this task

---

The format of the test data depends on how the Flat File Schema is used in your orchestration as described in the following examples:

- If your orchestration contains a Read Flat File activity that reads in Flat File data, test the Flat File Schema using the incoming Flat File Data. The resulting data from the test is XML data.
- If your orchestration contains a Write Flat File activity that writes in a Flat File data file, test the Flat File Schema using the incoming XML data. The resulting data from the test is Flat File data.

In the left input sub-pane of the test pane, you can enter the test data directly or load a test data from a file on the file system:

## Procedure

---

1. In the test pane, specify the path and the filename for the data file using one of the following options:
  - o Enter the path and file name for the input data file into the Test File field.
  - o Click Browse to navigate to the file:
    - a. In the Open Sample Data File dialog box, select the input data file.
    - b. Optional: Select an encoding for the input data, using one of the following options:
      - From the encoding list located in the upper left side of the dialog box, select one of the default encoding types.
      - Enter your encoding type directly by clicking in the encoding field and typing in your encoding type
    - c. Click Open.

Note: The size of the data displayed and transformed is determined by the settings of the Flat File preferences. These settings are important when loading very large data files. For more information, see the Flat File section of the table in [Setting Preferences](#).

2. Optional: You can change the how the input data is displayed by clicking the Display in Hexadecimal (  ) icon to toggle between displaying the text in the following two ways:
  - o Display just the text.
  - o Display the hexadecimal representation next to the text.

Note: If the input data is displayed in hexadecimal form, you cannot test or edit the data.

**Parent topic:** [Testing flat file schemas](#)

## Test a Flat File Schema

---

### About this task

---

To test a Flat File Schema:

## Procedure

---

1. Click the Test (  ) icon. The results pane is located on the right side of the test pane and shows the results of converting the sample data:
  - o If the incoming data is Flat File data, the resulting data is an XML data.
  - o If the incoming data is XML, the resulting data is Flat File data.
2. Optional: Change the font used to display the input and output data is displayed by clicking the following icons:

- Click the Monospace font () button to display data using a font that displays each character with the same width. This option is useful for viewing positional text.
  - Click the Unicode font () button to display the input data using a font that supports double-byte characters.
3. Optional: Change the formatting used to display output data by clicking the following icons:
- Click the Formatted () button to display XML output data formatted with carriage returns with indentation spacing of the XML elements.
  - Click the Unformatted () button to display the XML output data unformatted. During run time, the Integration Appliance produces the output XML data unformatted as shown when the Unformat button is selected.

## Save test output data to a file

---

### About this task

---

To save the test output data to a file:

### Procedure

---

1. Test sample data as described in [Test a Flat File Schema](#).
2. To save the test result data unformatted without carriage returns and indentation spacing of the XML elements, click the Unformat () button. During run time, the Integration Appliance produces the output XML data unformatted. If the Format () button is select before saving the file, the carriage returns and spaces using to indent the XML elements are saved to the file.
3. When the resulting data displays in the results pane, click the Save () icon. The Save Test Result dialog box opens.
4. Browse for a directory on your computer where you want to save the result data file.
5. Enter the name and file extension for the result data file.
6. Click Save.

## Root node properties

When a root node is selected in the Schema Layout tab, the following two sections of properties are available in the pane: Basic Properties and Delimiters.

### Basic Properties

The Basic Properties of the root node are defined in the following table:

Property	Definition
Name	Specifies the name assigned to this Flat File Schema. When you create a Flat File Schema in the Project tab the name entered for the Flat File Schema is the default name of the root node. Attention: The root node name for a Flat File Schema must be a <a href="#">valid node name</a> .
Type	Optional: Specifies to record type used as a basis for the root node. Attention: Selecting a new type might reset some of the existing properties of the record with the new settings.
Reset	Resets properties that were set locally for this record to the values for the selected type. Reset is only active if a record type has been selected from the Type list.
Structure	<ul style="list-style-type: none"> <li>• Select <a href="#">Delimited</a> from the list if the outermost level of structure in the data is determined by delimiters.</li> <li>• Select <a href="#">Positional</a> from the list if the outermost level of the structure in the data is determined by their position.</li> </ul>
Write Line Ends as CRLF	Specifies how the Integration Appliance should write end of line characters when a Write Flat File activity creates outgoing data. If the receiving system for this data is a Windows platform, the Integration Appliance must write Line End characters as carriage return, line feed (CRLF). The default is to write Line End characters as a line feed (LF), the default for UNIX. The Integration Appliance accepts both line end characters (LF and CRLF) when parsing data.

Property	Definition
Document Ends with EOS (end of stream)	Specifies that the end of the data is delimited with an end-of-stream (EOS) character for parsing incoming Flat File data in the Read Flat File activity or when producing Flat File data in the Write Flat File activity. End-of-stream might need to be specified for data where the transport mechanism treats the data as a stream rather than a file.

## Delimiters

---

If the Delimited option is selected for the Structure property for the root node, the following root node delimiter properties are active:

- Child Delimiter
- Include Trailing Delimiters for Empty Data
- Child Delimiter Position
- Repeat Delimiter

### Child Delimiters

The Child property defines the character that delimits children of the root node. This character is commonly called the record delimiter, segment delimiter, or line delimiter.

Specify the type of child delimiter by selecting one type from the three options listed in the following table:

Option	Definition
--------	------------

Option	Definition
Character	<p>Specifies the character for the child delimiter. If the Character option is selected for the Child Delimiter, you must enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type in the Unicode value of the character. For example, enter /u0020 for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed.</li> </ul> <p>Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character.</p> <p>For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at:  <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a>.</p>
Line End	<p>Specifies that the child delimiter is the end of the line, either a LF (line feed) or CRLF (carriage return, line feed). If the children are delimited with just a CR (carriage return), select the Character option and specify a CR (carriage return) character as the delimiter. The Integration Appliance accepts both line end characters (LF and CRLF) when parsing data. When writing data, the character used for line ends is determined by the Write Line Ends As CRLF property.</p>

Option	Definition
Dynamic Position	<p>Specifies that the character used as the child delimiter is defined dynamically within the data. Dynamic delimiters must show at a specific position within the first record of the data, such as in EDI or HL7 data. How the character is used by the Integration Appliance depends if the Flat File data is incoming or outgoing:</p> <ul style="list-style-type: none"> <li>• While parsing incoming Flat File data in the Read Flat File activity, the Integration Appliance reads the character is the specified position of the first record and uses it as a child delimiter to parse the rest of the data. The Write Default text field is not used when incoming Flat File data is read.</li> <li>• While writing outgoing Flat File data in the Write Flat File activity, the Integration Appliance uses the character specified in the Write Default text field to delimit the children of the root node. In addition, the specified character is written at the specified position of the first record in the outgoing data.</li> </ul>

Option	Definition
Write Default	<p>Specifies the character that should be used as the child delimiter when the Integration Appliance writes outgoing data in the Write Flat File activity of the root node. In addition, the specified character is written at the specified position of the first record in the outgoing data. The character specified in this field is not used when incoming Flat File data is read in the Read Flat File activity.</p> <p>In the Write Default text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type in the Unicode value of the character. For example, enter <code>/u0020</code> for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might display for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a></li> </ul>

**Include Trailing Delimiters for Empty Data**

Select the Include Trailing Delimiters for Empty Data check box to specify that delimiters for empty optional children must be present at the end of the record or field when the Integration Appliance writes outgoing Flat File data in the Write Flat File activity.

Clear this check box, if delimiters for empty optional children may be omitted.

This check box does not affect how the Integration Appliance reads incoming data because when reading data the Integration Appliance accepts either the absence or presence of delimiters with empty data.

**Child Delimiter Position**

This property defines the position of record delimiters for data. Select one option from the following table:

Position	Definition
----------	------------

Position	Definition
After	<p>Specifies that the child delimiter marks the end of a child, including the last child in the data, as shown in the following example where the comma delimiter is shown after the fields: <code>field1,field2,field3,</code></p> <p>After is the most common position for record delimiters.</p>
Before	<p>Specifies that the child delimiter indicates the beginning of a child. The end of the last child is marked by the parent's delimiter as shown in the following example where the exclamation point delimiter is shown in <a href="#">Figure 1</a>.</p>
In between	<p>Specifies that delimiters are placed between children but do not show at either the beginning of the first child nor the end of the last child as shown in the following example, where the comma delimiter show in between the fields:</p> <p><code>field1,field2,field3</code></p>

Figure 1. Exclamation point delimiter in the Before position

```
!field1of1stRecord!field2of1stRecord!field3of1stRecord
!field1of2ndRecord!field1of2ndRecord!field1of2ndRecord
```

For an example with all three types of child delimiter positions, see [Mixed positional and delimited example](#).

**Repeat Delimiter**

This property determines the delimiter used between repeated occurrences of one record in the Flat File data. Select one option from the following table:

Header	Header
--------	--------

Header	Header
Character	<p>Specifies the character for the repeat delimiter. If the Character option is selected for the Repeat Delimiter, you must enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type in the Unicode value of the character. For example, enter /u0020 for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed.</li> </ul> <p>Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character.</p> <p>For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at:  <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a>.</p>
Line End	<p>Specifies that the repeat delimiter is the end of the line, either a LF (line feed) or CRLF (carriage return, line feed). If the children are delimited with just a CR (carriage return), select the Character option and specify a CR (carriage return) character as the delimiter. The Integration Appliance accepts both line end characters (LF and CRLF) when parsing data. When writing data, the character used for line ends is determined by the Write Line Ends As CRLF property.</p>

Header	Header
Dynamic Position	<p>Specifies that the character used as the repeat delimiter is defined dynamically within the data. Dynamic delimiters must show at a specific position within the first record of the data, such as in EDI or HL7 data. How the character is used by the Integration Appliance depends if the Flat File data is incoming or outgoing:</p> <ul style="list-style-type: none"> <li>• While parsing incoming Flat File data in the Read Flat File activity, the Integration Appliance reads the character is the specified position of the first record and uses it as a repeat delimiter to parse the rest of the data. The Write Default text field is not used when incoming Flat File data is read.</li> <li>• While writing outgoing Flat File data in the Write Flat File activity, the Integration Appliance uses the character specified in the Write Default text field to delimit the repeating children of the root node. In addition, the specified character is written at the specified position of the first record in the outgoing data.</li> </ul>

Header	Header
Write Default	<p>Specifies the character that should be used as the child delimiter when the Integration Appliance writes outgoing data in the Write Flat File activity of the root node. In addition, the specified character is written at the specified position of the first record in the outgoing data. The character specified in this field is not used when incoming Flat File data is read in the Read Flat File activity.</p> <p>In the Write Default text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type if the Unicode value of the character. For example, enter /u0020 for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might display for this character. For more information on any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a></li> </ul>

## Adding Fields or Field Types

---

### About this task

---

Why add fields?

You can define a field based on one of the following simple data types:

- boolean - true or false
- string - text in the specified encoding
- integer - whole numbers
- numeric - decimal numbers

You create fields in the Schema Layout tab. Fields are displayed in the Schema Layout tab using the following icon:

Fields that are based on a field type are displayed in the Schema Layout tab using the following icon:

Use records to model flat File data fields that have complex structures, such as components or subcomponents.

Why add Field Types?

You can define a field type with particular properties to be reused later. For example, if you wanted to create many fields that all use a double quotation mark as an encapsulation character, you could define a field type with the encapsulation character set to the double-quotes character and then create multiple fields based on this field type.

You create field types in the Type Library tab. Field types are displayed in the Type Library tab using the following icon:

Field types that are based on a field type are displayed in the Type Library tab using the following icon:

Adding Fields or Field Types

The procedure for adding fields and field types is identical except for the tab you initially select as described in the following procedure.

## Procedure

---

1. Open a Flat File Schema from the Project tab.
2. Select the appropriate tab:
  - To add a field, select the Schema Layout tab.
  - To add a field type, select the Type Library tab.
3. Select one of the following options from the list:
  - New Child > Field: To add a field as a child of the current node.
  - New Sibling > Field: To add a field as a sibling of the current node.
  - **New Children**: to add child fields and records in bulk.
4. In the New Field dialog box, enter a valid node name in the Field Name field.
5. If this field should be based on a field type, select the field type from the Based on Field list.
6. Click OK. The field node () shows in the appropriate tree (Schema Layout or Type Library) and the field properties show in the properties pane to the right of the tree.
7. Specify the properties for the field or field type.

## Field properties

---

When a field is selected in the Schema Layout tab or a field type is selected in the Type Library tab, the following properties sections display in the pane:

- Basic Properties
- Padding and Trimming
- Delimiters
- Positional Properties

### Basic Properties

---

The Basic Properties of a field are defined in the following table:

Property	Description
Name	Specifies the name of this field. Attention: The field name must be a <a href="#">valid node name</a> .
Type	Optional: Specifies the field type used as a basis for the field. The Type list is only active if a field type has been created. Attention: Selecting a new type might reset some of the existing properties of the field with the new settings.
Reset	Resets properties that have been set locally for this field to the values for the selected type.
Type	Specifies one of the following data types for the field: <ul style="list-style-type: none"> <li>• <b>string</b> - text in the specified encoding</li> <li>• <b>boolean</b> - <i>true</i> or <i>false</i></li> <li>• <b>integer</b> - any whole number</li> <li>• <b>numeric</b>- any decimal number</li> </ul>
Occurs Optional	For delimited data, this check box specifies that both the field and its delimiter can be omitted from the data. For positional data there is no delimiter so just the field is just omitted. If the field can be empty but the delimiter must be present, then the field is considered required and this check box should not be selected. Attention: When specifying the optional property for a field, be careful not to create an ambiguous grammar for the Flat File Schema. For more information, see <a href="#">Specifying Optional Fields and Records</a> .
Repeat Minimum	Specifies the minimum number occurrences of the field.

Property	Description
Repeat Maximum	<p>Controls repetitions of this single field. Select one of the following options:</p> <ul style="list-style-type: none"> <li>Unbounded - Specifies this field can repeat any number of times</li> <li>Range - Specify the maximum number of repetitions for this field. The actual occurrences of the field can be less than or equal to this number.</li> </ul> <p>Note: Multiple occurrences are only allowed when the parent node has specified a repeat delimiter.</p>

## Padding and Trimming

Whether data is trimmed or padded depends on the following conditions:

- In the Read Flat File activity, when converting Flat File data to XML data, the characters of the Flat File field are *trimmed* before being placed into the corresponding XML field.
- In the Write Flat File activity, when converting XML data to Flat File Data, the characters of the XML element are *padded* before being placed into the corresponding Flat File field.

The Padding and Trimming properties of a field are defined in the following table:

Property	Description
Padding/Trim Character	<p>Specifies the single character used to pad the length of, or to trim from a field.</p> <p>In the Character text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>Type in the character.</li> <li>Type if the Unicode value. For example, enter <code>/u0020</code> for the space character.</li> <li>Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a></li> </ul>

Property	Description
Pad to Length	<p>Specifies the final length of data for the field when converting XML data to Flat File Data in the Write Flat File activity. The specified padding characters are added to the data for the field up to this length. Typically the size of the padding is the same as the field.</p> <p>Note: This value specified in this field is not used while trimming Flat File data to XML data in the Read Flat File activity.</p>
Justification	<p>Specifies how what side of the field is padded or trimmed:</p> <ul style="list-style-type: none"> <li>• Left - When the Left option is specified, the action that occurs depends on if the field is read or written: <ul style="list-style-type: none"> <li>◦ Read Flat File activity - When the field is read, the specified trim characters are trimmed from the end of the field. For example, if the trim character is equal to a hyphen character, the Field Length is equal to 10, and the Flat File input field is equal to ---1234---. The result is the following XML element: &lt;element&gt;---1234&lt;/element&gt;.</li> <li>◦ Write Flat File activity - When the field is written, the padding is added after the field data. For example, if the pad character is equal to a hyphen character, the Pad to Length is equal to 10, and the input XML element is equal to &lt;element&gt;1234&lt;/element&gt;, the result is the following Flat File field: 1234-----.</li> </ul> </li> </ul>
	<ul style="list-style-type: none"> <li>• Right - When the Right option is specified, the action that occurs depends on if the field is being read or written: <ul style="list-style-type: none"> <li>◦ Read Flat File activity - When the field is read, padding characters are trimmed from the beginning of the field. For example, if the trim character is equal to a hyphen character, the Field Length is equal to 10, and the Flat File input field is equal to ---1234---. The result is the following XML element: &lt;element&gt;1234---&lt;/element&gt;.</li> <li>◦ Write Flat File activity - When the field is written, padding is added before the field data. For example, if the pad character is equal to a hyphen character, the Pad to Length is equal to 10, and the input XML element is equal to &lt;element&gt;1234&lt;/element&gt;, the result is the following Flat File field: -----1234.</li> </ul> </li> </ul>

## Delimiters

The Escape and Encapsulation Delimiters of a field are defined in the following table. These properties are only used if the parent record has the Delimited option selected for Structure property.

Property	Description

Property	Description
Escape Character	<p>Specifies the single character used to escape delimiters within the data of the field. During run time, the Integration Appliance parses the character directly after this delimiter as a character, not as a delimiter. In the Character text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type in the Unicode value of the character. For example, enter <code>/u0020</code> for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a></li> </ul>
	<p>For example, how is the following record parsed when no escape character is defined and the delimiter of the record is a colon?</p> <pre>135:Caving: What You Really Need to Know:10</pre> <p>The preceding record would be parsed into the following 4 fields:</p> <ul style="list-style-type: none"> <li>• 135</li> <li>• Caving</li> <li>• What You Really Need to Know</li> <li>• 10</li> </ul> <p>If you do not want the <i>Caving What You Really Need to Know</i> title broken up into two fields, you can specify an escape character of backslash and preface the colon with a backslash character as shown in the following record:</p> <pre>135:Caving/: What You Really Need to Know:10</pre> <p>When this Flat File record is parsed with the escape character before the colon, the title is not broken up into two sections even though the record uses the colon as a delimiter.</p>

Property	Description
Dynamic Position	<p>Specifies the character position, starting from 1, where the escape character is defined in the first record. The escape character is determined at run time using the character found at the specified character position. For example, how is the following record parsed when no encapsulation character is defined and the delimiter of the record is a colon?</p> <pre>135:Caving: What You Really Need to Know:10</pre> <p>The preceding record would be parsed into the following 4 fields:</p> <ul style="list-style-type: none"> <li>• 135</li> <li>• Caving</li> <li>• What You Really Need to Know</li> <li>• 10</li> </ul> <p>If you do not want the <i>Caving What You Really Need to Know</i> title broken up into two fields, you can specify a Dynamic Position of 11 and add a backslash character before the colon as shown in the following record:</p> <pre>135:Caving/: What You Really Need to Know:10</pre> <p>The escape character is now equal to the 11th character in the record: the backslash character. When this Flat File record is now parsed with the escape character is equal to the backslash character, the colon after Caving does not break this field into two sections even though the record uses the colon as a delimiter.</p>

Property	Description
Write Default	<p>Specifies the escape character to use when writing this field as Flat File data. Write Default is only used in the Write Flat File activity when converting XML data to Flat File data. Write Default is not used when converting Flat File data to XML data in the Read Flat File activity.</p> <p>In the Write Default text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type in the Unicode value of the character. For example, enter /u0020 for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a></li> </ul> <p>For example, you wanted to escape the colon with a backslash in the &lt;title&gt;Caving: What You Really Need to Know&lt;/title&gt;. XML element, when converting it to Flat File data, specify a backslash in the Write Default field. The run-time result for this field is the following string:</p> <pre>Caving\: What You Need to Know</pre> <p>The character position specified in the Dynamic Position field is not used when an XML element is converted to Flat File data.</p>
Encapsulation Character	<p>Specifies a delimiter character to encapsulate data in the field because the field could contain character(s) that are being used to delimit this field in the parent record.</p> <p>In the Character text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type in the Unicode value of the character. For example, enter /u0020 for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a></li> </ul>

Property	Description
	<p>For example, how is the following record parsed when no encapsulation character is defined and the delimiter of the record is a colon?</p> <pre>135:Caving: What You Really Need to Know:10</pre> <p>The preceding record would be parsed into the following 4 fields</p> <ul style="list-style-type: none"> <li>• 135</li> <li>• Caving</li> <li>• What You Really Need to Know</li> <li>• 10</li> </ul> <p>If you do not want the <i>Caving What You Really Need to Know</i> title broken up into two fields, you can specify the encapsulation character to be a double quotation mark and surround the book title with double quotation marks as shown in the following record:</p> <pre>135:"Caving: What You Really Need to Know":10</pre> <p>When this Flat File record is now parsed with the encapsulation character set to double quotation marks, the colon after Caving does not break this field into two sections even though the parent record uses the colon as a delimiter. The Integration Appliance reads all the characters between two encapsulation delimiters as characters rather than delimiters.</p>
Dynamic Position	<p>Specifies the character position, starting from 1, where the delimiter is defined in the first record. The encapsulation delimiter is determined at run time using the character found at the specified character position</p> <p>For example, how is the following record parsed when no encapsulation character is defined and the delimiter of the record is a colon?</p> <pre>135:Caving: What You Really Need to Know:10</pre> <p>The preceding record would be parsed into the following 4 fields:</p> <ul style="list-style-type: none"> <li>• 135</li> <li>• Caving</li> <li>• What You Really Need to Know</li> <li>• 10</li> </ul> <p>If you do not want the <i>Caving What You Really Need to Know</i> title broken up into two fields, you can specify the Dynamic Position of 5 and surround the book title with double quotation marks and as shown in the following record:</p> <pre>135:"Caving: What You Really Need to Know":10</pre> <p>The encapsulation character is equal to the 5th character in the record: the double quotation mark character. When this Flat File record is now parsed with the encapsulation character is equal to the double quotation mark character, the colon after Caving does not break this field into two sections even though the record uses the colon as a delimiter. The Integration Appliance reads all the characters between two encapsulation delimiters as characters and not delimiters.</p>

Property	Description
Write Default	<p>Specifies the encapsulation character to use when writing this field as Flat File data. Write Default is only used in the Write Flat File activity when converting XML data to Flat File data. The Write Default is not used when converting Flat File data to XML data in the Read Flat File activity.</p> <p>In the Write Default text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type in the Unicode value of the character. For example, enter <code>/u0020</code> for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a>.</li> </ul>
	<p>For example, you wanted to encapsulate the data found in the <code>&lt;title&gt;Caving: What You Really Need to Know&lt;/title&gt;</code> XML element with quotation marks when converting it to Flat File data, specify the double quotation marks in the Write Default field. The runtime result for this field is the following string:</p> <pre>"Caving: What You Need to Know"</pre> <p>The character position specified in the Dynamic Position field is not used when an XML element is converted to Flat File data.</p>

## Positional Properties

The Positional Properties of a field are defined in the following table. These properties are only active if the parent record has the Positional option selected for Structure property.

Field	Description
Field Offset	Specifies the number of characters to skip, starting from the end of the previous field, to reach the beginning of this field.
Field Length	Specifies the length of the data for this field.

## Adding Records or a Record Type

---

### About this task

---

Why add records?

You use records to define the structure of your Flat File data. Records can contain fields, groups, or other records. Records that are children of another record are used to model fields with a complex structure. Records can also be used define additional layers of hierarchy of the data.

The fields and subrecords of a record are parsed using one of the following methods:

- **Delimited:** The fields and child records within the record use delimiters to define their beginning and end points. Some delimited formats use record IDs as identifiers and beginning delimiters. For examples of defining records that parse delimited data, see the following examples:
  - [Mixed positional and delimited example](#)
  - "Developing the BookOrder Project" section of the *Getting Started Guide*
- **Positional:** the fields within the record use no delimiters but are defined instead by their position and length. Positional fields are also known as fixed-length fields. For an example of defining a record that parses positional data, see [Mixed positional and delimited example](#).

You create records in the Schema Layout tab. Records that contain child records and fields and are not based on a record type are displayed in the Schema Layout tab using the following icon:

Records that are based on a record type are displayed in the Schema Layout tab using the following icon:

Why Add Record Types?

Record types define a set of record properties, fields, and child records that can be reused by multiple records. For example, you could define an address record type that contains a street field, a city field, a state field, and a zip code field. You could then use the address record type as the basis of all the addresses in the Flat File Schema, for example to define the shipping address record and the billing address record.

You create record types in the Type Library tab. Record types that contain child records and fields and are not based on a record type are displayed in the Type Library tab using the following icon:

Record types that are based on a record type are displayed in the Type Library tab using the following icon:

Note:

- Record types are only reusable to the current Flat File Schema and are not global to the project.
- Records based on a record type can only inherit child nodes from the record type. Child nodes cannot be added to a record that is based on a record type.

- The child nodes inherited from the record type are only visible in the Type Library tab and are not visible in the Schema Layout tab.
- Record types can also be based on other record types, inheriting both properties and children from parent record types.

To add a record or a record type:

## Procedure

---

1. Open a Flat File Schema from the Project tab.
2. Select the appropriate tab:
  - To add a record, select the Schema Layout tab.
  - To add a record type, select the Type Library tab.
3. Right-click a node in the tab and select one of the options in the list:
  - New Child > Record: To add a record as a child of the current node. Records can only be children of the root node, another record, or a group.
  - New Sibling > Record: To add a record as a sibling after the current node.
  - New Children: to add child fields and records in bulk.
4. Enter a [valid node name](#) for the new record in the New Record pane.
5. If this record should be based on a record type, select the record type from the Based on Record list.
6. Click OK. The record node is shown in the appropriate tab (Schema Layout or Type Library) and record properties display in the Properties pane.
7. Specify the properties for the record or record type.
8. If you are creating a new record not based on a record type, add fields, groups, or records to define the content of the record. If you based the record on a record type, the record is complete and because the content of the record is defined by the record type.

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/mde\\_Adding\\_Records\\_or\\_a\\_Record\\_Type.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/mde_Adding_Records_or_a_Record_Type.html)

## Record properties

---

When a record is selected in the Schema Layout tab or a record type is selected in the Type Library tab, the following sections of properties are available in the pane:

- Basic Properties
- Delimiters

### Basic Properties

---

The Basic Properties of a record are defined in the following table:

<b>Property</b>	<b>Description</b>
Name	Specifies the name of this record. Attention: The field name must be a <a href="#">valid node name</a> .
Type	Optional: Specifies the record type used as a basis for the record. The Type list is only active if the selected record node does not contain any children and a record type has been created. A record cannot inherit fields or subrecords from a record type if the record contains children. Attention: Selecting a new type might reset some of the existing properties of the record with the new settings.
Reset	Resets properties that have been set locally for this record to the values for the selected type. Reset is only active if a record type has been selected from the Type list.
Structure	<ul style="list-style-type: none"> <li>Specify Delimited if the structure of the record is determined by delimiters.</li> <li>Specify Positional if the structure of the record is determined positions in the record.</li> </ul>
Record Identifier	Specifies the unique string that identifies this record. Record identifiers are called segment IDs in X.12 message standards such as EDI or HL7, and typically begin each record.
Record ID Starting Position	Specifies the character position where the record ID begins after the end of the previous record. The default is 0, which places the record ID at the beginning of the record.
Minimum Occurrences	Specifies the minimum number of repetitions for this record. The default is 1, which means the record is required. Specify 0 if this record is optional. <b>WARNING:</b> When specifying the optional property for a record, be careful not to create an ambiguous grammar for the Flat File Schema. For more information, see <a href="#">Specifying Optional Fields and Records</a> .
Maximum Occurrences	Controls repetitions of the single record. Select one of the following options: Unbounded - Specifies this record can repeat any number of times. Range - Specify the maximum number of repetitions for this record. The actual occurrences in a specific message can be less than or equal to this limit. <b>NOTE:</b> Multiple occurrences are only allowed when the parent node has specified

## Delimiters

If the Delimited option is selected for the Structure property for the record, the following record delimiter properties are active:

- Child Delimiter
- Include Trailing Delimiters for Empty Data
- Child Delimiter Position
- Repeat Delimiter

Child delimiters

### Child Delimiters

The Child property defines the character that delimits children of the record. This character is commonly called the record delimiter, segment delimiter, or line delimiter.

Specify the type of child delimiter by selecting one type from the three options listed in the following table:

Option	Definition
Character	<p>Specifies the character for the child delimiter. If the Character option is selected for the Child Delimiter, you must enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type in the Unicode value of the character. For example, enter /u0020 for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed.</li> </ul> <p>Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character.</p> <p>For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a>.</p>
Line End	<p>Specifies that the child delimiter is the end of the line, either a LF (line feed) or CRLF (carriage return, line feed). If the children are delimited with just a CR (carriage return), select the Character option and specify a CR (carriage return) character as the delimiter. The Integration Appliance accepts both line end characters (LF and CRLF) when parsing data. When writing data, the character used for line ends is determined by the Write Line Ends As CRLF property.</p>
Dynamic	<p>Specifies that the character used as the child delimiter is defined dynamically within the data. Dynamic delimiters must show at a specific position within the first record of the data, such as in EDI or HL7 data. How the character is used by the Integration Appliance depends if the Flat File data is incoming or outgoing:</p> <ul style="list-style-type: none"> <li>• While parsing incoming Flat File data in the Read Flat File activity, the Integration Appliance reads the character at the specified position and uses it as a child delimiter to parse the rest of the data. The Write Default text field is not used when incoming Flat File data is read.</li> <li>• While writing outgoing Flat File data in the Write Flat File activity, the Integration Appliance uses the character specified in the Write Default text field to delimit the children of the record. In addition, the specified character is written at the specified position of the first record in the outgoing data.</li> </ul>

<b>O p t i o n</b>	<b>Definition</b>
W r i t e  D e f a u l t	<p>Specifies the character that should be used as the child delimiter when the Integration Appliance writes outgoing data in the Write Flat File activity. In addition, the specified character is written at the specified position of the first record in the outgoing data. The character specified in this field is not used when incoming Flat File data is read in the Read Flat File activity.</p> <p>In the Write Default text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type if the Unicode value of the character. For example, enter <code>/u0020</code> for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might display for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a></li> </ul>

**Include Trailing Delimiters for Empty Data**

Select the Include Trailing Delimiters for Empty Data check box to specify that delimiters for empty optional children must be present at the end of the record or field when the Integration Appliance writes outgoing Flat File data in the Write Flat File activity.

Clear this checkbox, if delimiters for empty optional children might be omitted.

This check box does not affect how the Integration Appliance reads incoming data because when reading data the Integration Appliance accepts either the absence or presence of delimiters with empty data.

**Child Delimiter Position**

This property defines the position of record delimiters for data. Select one option from the following table:

<b>Positio n</b>	<b>Definition</b>
After	<p>Specifies that the child delimiter marks the end of a child, including the last child in the data.</p> <p>After is the most common position for record delimiters.</p>
Before	<p>Specifies that the child delimiter indicates the beginning of a child. The end of the last child is marked by the delimiter of the parent.</p>
In betwee n	<p>Specifies that delimiters are placed between children but do not show at either the beginning of the first child nor the end of the last child.</p>

For an example with all three types of child delimiter positions, see [Mixed positional and delimited example](#).

**Repeat Delimiter**

This property determines the delimiter used between repeated occurrences of one record in the Flat File data. Select one option from the following table:

<b>P o s i t i o n</b>	<b>Definition</b>
<b>C h a r a c t e r</b>	<p>Specifies the character for the repeat delimiter. If the Character option is selected for the Repeat Delimiter, you must enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type in the Unicode value of the character. For example, enter /u0020 for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed.</li> </ul> <p>Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character.</p> <p>For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a>.</p>
<b>L i n e E n d</b>	<p>Specifies that the repeat delimiter is the end of the line, either a LF (line feed) or CRLF (carriage return, line feed). If the children are delimited with just a CR (carriage return), select the Character option and specify a CR (carriage return) character as the delimiter. The Integration Appliance accepts both line end characters (LF and CRLF) when parsing data. When writing data, the character used for line ends is determined by the Write Line Ends As CRLFproperty.</p>
<b>D y n a m i c P o s i t i o n</b>	<p>Specifies that the character used as the repeat delimiter is defined dynamically within the data. Dynamic delimiters must show at a specific position within the first record of the data, such as in EDI or HL7 data. How the character is used by the Integration Appliance depends if the Flat File data is incoming or outgoing:</p> <ul style="list-style-type: none"> <li>• While parsing incoming Flat File data in the Read Flat File activity, the Integration Appliance reads the character at the specified position and uses it as a repeat delimiter to parse the rest of the data. The Write Default text field is not used when incoming Flat File data is read.</li> <li>• While writing outgoing Flat File data in the Write Flat File activity, the Integration Appliance uses the character specified in the Write Default text field to delimit the repeating children of the root node. In addition, the specified character is written at the specified position of the first record in the outgoing data.</li> </ul>

<b>P o s i t i o n</b>	<b>Definition</b>
<b>W r i t e D e f a u l t</b>	<p>Specifies the character that should be used as the repeat delimiter when the Integration Appliance writes outgoing data in the Write Flat File activity. In addition, the specified character is written at the specified position of the first record in the outgoing data. The character specified in this field is not used when incoming Flat File data is read in the Read Flat File activity.</p> <p>In the Write Default text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> <li>• Type in the character.</li> <li>• Type if the Unicode value of the character. For example, enter /u0020 for the space character.</li> <li>• Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might display for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: <a href="http://www.unicode.org/charts/">http://www.unicode.org/charts/</a></li> </ul>

[Feedback](#) | [Notices](#)

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref\\_record\\_properties.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_record_properties.html)

## Adding Groups or Group Types

---

### About this task

---

Why add groups?

Groups allow you to define repeated occurrences of sets of records, for example the groups that are used with EDI messages to define loops. Groups are only required when the data does not provide any additional delimiters or structure to clearly mark the beginning and end of repetitions that contain more than one record. The following example data shows a repeating set of records that can be defined using groups:

## Using Groups to Define Repeating Sets of Data

Groups can contain any number of records or other groups. Groups cannot contain fields. For an example of using a group to model the preceding input Flat File data, see [Group Example](#).

You create groups in the Schema Layout tab. Groups that are not based on a group type are displayed in the Schema Layout tab using the following icon:

Groups that are based on a group type are displayed in the Schema Layout tab using the following icon:

Note: Groups are not global to the project and can only be reused in the current Flat File Schema.

### Why Add Group Types?

Group types allow you to define a set of repeating records or groups once and then use it many times within a Flat File Schema. Both the occurrence properties and the content you define in a group type are inherited by any group based on that type.

Note:

- Groups based on a group type cannot contain any other content besides the nodes inherited from the group type
- The content inherited from the group type is not visible in the Schema Layout tab.
- Group types can also be based on other group types.
- Group types are not global to the project and can only be reused in the current Flat File Schema.

Create group types in the Type Library tab. Group types that are not based on a group type are displayed in the Type Library tab using the following icon:

Group types that are based on a group type are displayed in the Type Library tab using the following icon:

## Adding Groups or Group Types

The procedure for adding groups and group types is identical except for the tab you initially select as described in the following procedure. To add a group or group type:

### Procedure

---

1. Open a Flat File Schema from the Project tab.
2. Select the appropriate tab:
  - o To add a group, select the Schema Layout tab.
  - o To add a group type, select the Type Library tab.
3. Select the appropriate tab:
  - o To add a group, select the Schema Layout tab.
  - o To add a group type, select the Type Library tab.
4. Select one of the following options from the list:
  - o New Child > Group: To add a group as a child of the current node.
  - o New Sibling > Group: To add a group as a sibling of the current node.
  - o **New Children**: to bulk add groups as a child of the current group or record.
5. In the New Group dialog box, enter a [valid node name](#) in the Group Name field.
6. If this group should be based on a group type, select the group type from the Based on Group list.
7. Click OK. The group node is shown in the appropriate tab (Schema Layout or Type Library) and group properties display in the Basic Properties pane.
8. Specify the properties for the group.

If this group is based on a group type that defines the content for the group, the group is complete. If not, define the content of the group.

**Parent topic:** [Flat File Schemas](#)

---

### Feedback | Notices

 Last updated: Wednesday, 15 June 2016  
file:///dcs/markdown/workspace/Transform/out.html

[http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/mde\\_Adding\\_Groups\\_or\\_Group\\_Types.html](http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/mde_Adding_Groups_or_Group_Types.html)

## Group Properties

---

When a group is selected in the Schema Layout tab, the Basic Properties of a group are displayed. When a group type is selected in the Type Library tab, the Basic Properties of the group type are displayed. The Basic Properties of a group or group type are listed in the following table:

Field	Description
Name	Specifies the name of this field. Attention: The field name must be a <a href="#">valid node name</a> .

Field	Description
Type	Optional: Specifies the group type used as a basis for the group. The Type list is only active if the selected group node does not contain any children and a group type has been created. A group cannot inherit groups or records from a group type if the group contains children. Attention: Selecting a new type may reset some of the existing properties of the field with the new settings.
Reset	Resets properties that were set locally for this group to the values for the selected type. Reset is only active if a group type has been selected from the Type list.
Minimum Occurrences	Specifies the minimum occurrences for the group. Defaults to 1, making the group required. Select 0 if this group is optional.
Maximum Occurrences	Specifies the maximum occurrences for the group: <ul style="list-style-type: none"> <li>• Unbounded - Specifies this group can repeat any number of times. Unbounded, optional groups must contain at least one required record.</li> <li>• Range - Specifies the maximum number of repetitions for this group. The actual occurrences of the group can be less than or equal to this number.</li> </ul>

## Group Example

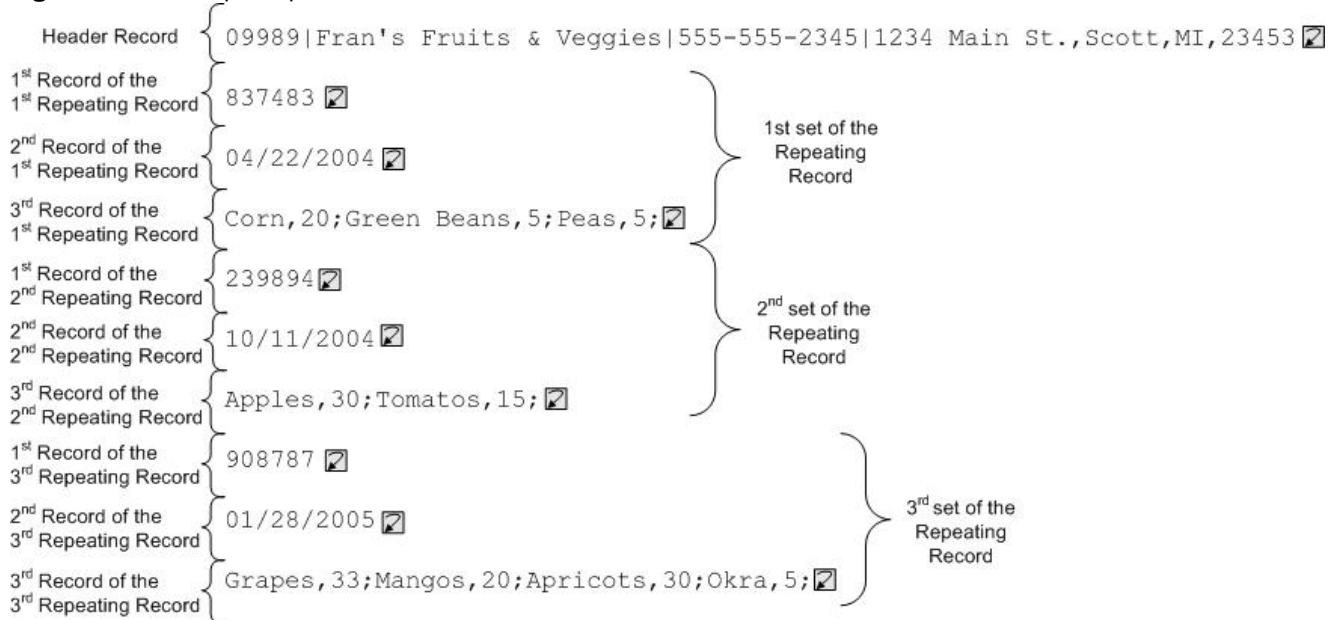

---

### About this task

---

This example shows a Flat File Schema that parses a repeating set of records using groups. Each set of the repeating record contains records of different types as shown in the following example input Flat File data:

Figure 1. An example input Flat File

In this example data, the first, second, and third records of the repeating set are each a different type of record. In addition, this example shows how types stored in the Type Library tab are used in a Flat Files Schema. In this example, you view and test an existing Flat File Schema rather than creating the Flat File Schema from scratch.

To open, view, and test the Flat File Schema used to parse the input data displayed in [Figure 1](#):

## Procedure

1. In this example, the Flat File Schema is already built in the FlatFileSchemasExample project. To view the Flat File Schema, you must first extract the FlatFileSchemasExample project:
  - a. Find the Default Create Path defined in Studio - the directory that new projects are created in. To view the current Default Create Path, select File > Preferences... from the Studio toolbar menu. The Preferences dialog opens. The current Default Create Path shows at the end of the pane. By default, the Default Create Path is located in the following directory:
 

```
C:\Documents and Settings\myLogin\My Documents
```

 Where *myLogin* represents your Windows login name.
  - b. Find the FlatFileSchemasExample.zip file that contains the files that make up the FlatFileSchemasExample project. If you accepted the defaults during the installation of Studio, this file is located in the following directory:
 

```
C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\FlatFileSchema
```
  - c. Copy the FlatFileSchemasExample.zip file from the FlatFileSchema directory to the Default Create Path directory.
  - d. Extract the contents of FlatFileSchemasExample.zip file into the Default Create Path directory.
2. Open the FlatFileSchemasExample project:
  - a. Select File > Open Project... from the Studio toolbar menu. The Open dialog box shows.
  - b. Browse for and open the FlatFileSchemasExample directory.
  - c. Click the FlatFileSchemasExample.sp3 file and click Open. The project is displayed.
3. Open the prebuilt vegPO Flat File Schema. In the Flat File Schemas folder of the Project tab, double-click the vegPO Flat File Schema. The nodes of the vegPO Flat File Schema are displayed in the Schema Layout tab and the properties of the vegPO root node show in the right pane.

4. Test the vegPO Flat File Schema:
  - a. In the test pane, click Browse. The Open Sample Test Data File dialog box opens.
  - b. Browse for the vegPO.txt file that contains the input data. If you accepted the defaults during the installation of Studio, this file is located in the following directory:  
  
C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\FlatFileSchema
  - c. Click Open. The input data from the vegPO.txt file shows in the left pane of the Test tab.
  - d. Click the Test () icon. In the results pane, the result of the conversion is displayed as XML data.
5. In the Schema Layout tab, click the vegPO root node. The vegPO root node is displayed with the following properties:
  - a. Structure property is equal to Delimited - The structure of the root node is delimited.
  - b. Child delimiter is equal to Line End- The child records are delimited by an end-of-line.
  - c. Child Delimiter Position is equal to After - Expect the delimiters after each record
  - d. Repeat delimiter is equal to Line End- Repeating records are also delimited by end-of-line.
6. In the Schema Layout tab, click the orderingStore node. The first line of the input data is highlighted within the test pane as shown in the following figure:

The first record of the vegPO Flat File Schema is a header record called orderingStore that occurs only once. In the Schema Layout tab, the fields and record that make up the orderingStore record display as children. This first line is parsed into the fields and records that make up the orderingStore record.

After the first header record, the sets of repeating elements start. Each set of repeating elements contains three child records of different types as shown in the following figure:

A repeating record that contains child records of different types can be modeled in the Flat File Schema Editor using groups. Groups are only required when the data does not provide any additional delimiters or structure to clearly mark the beginning and end of repetitions that contain more than one record. The delimiters for the repetitions are inherited from the parent record or root node. In this example for the vegPO root node, the repeat delimiter is set to end-of-line. The orders group node uses end-of-line delimiter to parse its repeating records

7. In the Schema Layout tab, click the orders group node. Note the following graphical changes in the panes:
  - o In the left subpane of the test pane, all the lines after the header line are highlighted. This highlighting indicates that after parsing, all the data after the first record are all assigned to the orders group node.
  - o In the Basic Properties pane, the Occurrences of the orders group is Unbounded. This setting means that there can be one or more instances of this group.
  - o In the Basic Properties pane, for the orders group the Type is equal to order. This setting means that the orders group is based on the order group type. The contents and the properties of the order group type are defined in the Type Library tab.
8. Select the Type Library tab. The record types and group types used in the vegPO Flat File Schema display. The order group type contains three records as shown in the following figure:

The following icon represents a record that is based on a record type:

The orders group with the order group type define a set of repeating records of different records because of the following characteristics:

- o There can be one to many instances of the orders group.
- o The order group type contains three records of different types.
- o The orders group is based on or inherits from the order group type.

The repeating relationship between the orders group and the order group type is shown in the following figure:

9. In the Type Library tab, click the id record node of the order group type. Note the following graphical changes in the panes:

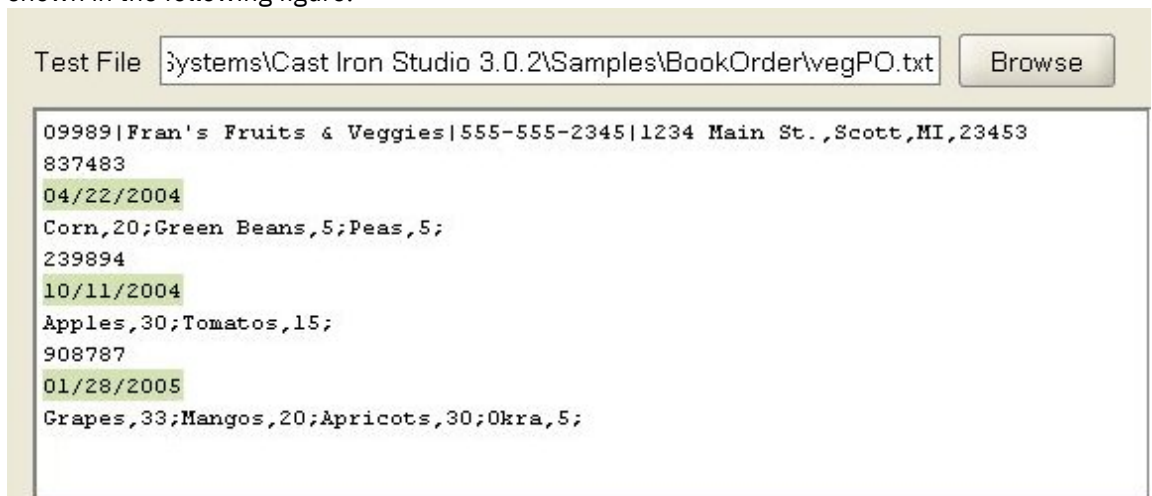

- o In the Basic Properties pane, the Type of the id record is equal to the record type named orderID. This setting means that the id record is based on the orderID record type.
- o In the left subpane of the test pane, the first line of each repeating record is highlighted as shown in the following figure:

This highlighting indicates that the first line of each repeating record is assigned to the id record.

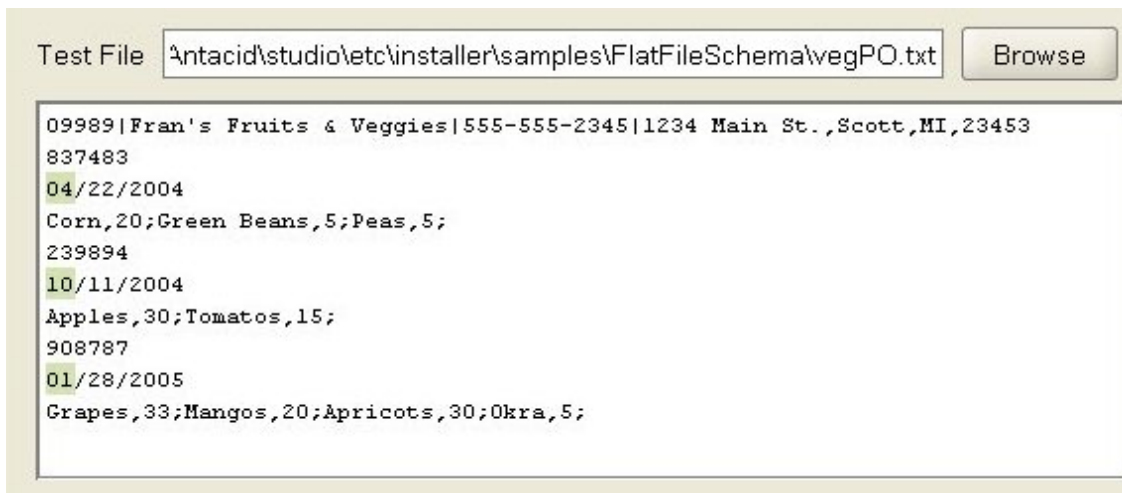

10. In the Type Library tab, click the shipdate record node of the order group type. Note the following graphical changes in the panes:

- o In the Basic Properties pane, the Type of the shipdate record is equal to the record type named shippingDate. This setting means that the shipdate record is based on the shippingDate record type.
- o In the Basic Properties pane, the Structure of the shipdate record is Positional. This setting means that the child fields of the shipDate record are determined by their position and length in the record and not by delimiters.
- o In the left subpane of the test pane, the second line of each repeating record is highlighted as shown in the following figure:

This highlighting indicates that the second line of each repeating record is assigned to the shipDate record. The shipDate record contains three positional child fields (month, day, and year) that are inherited from the shippingDate record type.

11. In the Type Library, click the month field node of the shippingDate record type. In the left subpane of the test pane, the values assigned to the month field are highlighted as shown in the following figure:

12. In the Type Library, click the contents record node of the order group type. Note the following graphical changes in the panes:
- o In the Basic Properties pane, the Type of the contents record is equal to the record type named orderContent. This setting means that the contents record is based on the orderContent record type.
  - o In the left subpane of the test pane, the third line of each repeating record is highlighted as shown in the following figure:

The orderContent record type contains the vegetables record. The vegetables record its contains a set of repeating vegetable records. The vegetable record contains a name field and a pounds field.

13. In the Type Library, click the name record node of the orderContent record type. In the left subpane of the test pane, the values assigned to the name field are highlighted as shown in the following figure:

## Working with Nodes in the Schema Tabs

---

### About this task

---

In the Schema tab or the Type Library tab, you can do the following actions:

- [Copy nodes](#)
- [Delete nodes](#)
- [Rename nodes](#)
- [Move nodes](#)

You can also bulk-add many children. For more information, see [Adding Several Children](#).

- [Copy nodes](#)
- [Delete nodes](#)
- [Rename nodes](#)
- [Move nodes](#)

## Copy nodes

---

### About this task

---

You can copy nodes in the Schema Layout tab or in the Type Library tab using the following procedures:

- Copy and paste a Child node
- Copy and paste a Sibling node

You can also use keyboard shortcuts (CTRL+C, CTRL+V, CTRL+X) or the Edit toolbar menu options (Edit > Cut, Edit > Copy, Edit > Paste) to copy nodes.

### To copy and paste a Child node:

Pasting a node as a child places the node inside the record or group you have selected at the end of any existing children.

1. Right-click the node you want to copy.
2. Select Copy.
3. Right-click the record or group that should be the parent of the node you are pasting.
4. Select Paste As Child.

If you paste a node within the same record or group that you copied it from, the Flat File Schema Editor changes the name of the new node to copy\_node-name.

### To copy and paste a Sibling node:

Pasting a node as a sibling places it directly above the node you have selected. This option is not available for the root node.

1. Right-click the node you want to copy.
2. Select Copy.
3. Right-click the node that should come directly after the node you are pasting.
4. Select Paste As Sibling.

If you paste a node within the same record or group that you copied it from, the Flat File Schema Editor changes the name of the new node to copy\_node-name.

## Delete nodes

---

### About this task

---

You can delete nodes in the Schema Layout tab or the Type Library tab, using any of the following procedures:

- To delete a tree node by right-clicking the node
- To delete a tree node using the Delete key

You can also use keyboard shortcut cut (CTRL+X) or the Edit > Cut toolbar menu option to delete nodes.

#### To delete a tree node by right-clicking the node:

1. Right-click the node to be deleted.
2. Select Delete from the list.

### To delete a tree node using the Delete key:

1. Click the node to be deleted.
2. Press Delete.

Attention: If you delete a type node in the Type Library tab that is used as the basis for records, groups, or fields within the Schema Layout tab, the nodes that are based on that type are affected in the following ways:

- The Type is changed to None.
- Node properties are left unchanged, but inherited content from the type node is removed.

## Rename nodes

---

### About this task

---

You can rename nodes in the Schema Layout tab or the Type Library tab, using any of the following procedures:

- Change a node name from the Basic Properties pane
- To change a node name using a shortcut menu
- To change a node name using F2

You can also use the Edit > Rename toolbar menu option to rename nodes.

#### To change a node name from the Basic Properties pane:

1. Double-click the node to open its properties.
2. Enter the new name into Name text field in the Basic Properties pane.

Note: Press Esc to cancel the editing of the name of a node.

#### To change a node name using a shortcut menu:

1. Right-click the node.
2. Select Rename from the list.
3. Enter a new [valid node name](#).

Note: Press Esc to cancel the editing of the name of a node.

#### To change a node name using F2:

1. Click the node to be renamed.
2. Press F2.
3. Enter a new [valid node name](#).

# Move nodes

---

## About this task

---

You can move nodes in the Schema Layout tab or the Type Library tab, using any of the following procedures:

- To copy and paste a Child node (as described in [Copy nodes](#)).
- To copy and paste a Sibling node (as described in [Copy nodes](#)).
- To move nodes using drag and drop

### To move nodes using drag and drop:

1. Select the node you want to move in the Schema Layout or Type Library tab.
2. Drag it over another node:
  - To make it the last child, drop it over the root, record, or group that should be the new parent.

# Adding Several Children

---

## About this task

---

Add several child records and fields to a root node or a record by right-clicking the node and selecting the New Children option from the list.

To add multiple child nodes to a Flat File Schema:

## Procedure

---

1. [Create a new Flat File Schema](#) or open an existing Flat File Schema by selecting it in the Project tab.
2. Select either the Schema Layout or Type Library tab.

3. Right-click the root node or a record node in the tree and select New Children. The Bulk Add dialog box opens.
4. Click Add.
5. Click the Name field and enter a [valid node name](#) for the field, record, or group to be added.
6. Click the Node Type field and select a node type (Field, Group, or Record) for the child from the list.
7. If this node is based on a record type, group type, or field type, click the Based On Type field and select an existing type from the list.
8. Repeat steps 4-7 for each node you want to add.
9. To reorganize or delete the nodes in the list:
  - o Click Up to move a child up the list.
  - o Click Down to move a child down the list.
  - o Click Delete to delete a child.
10. When finished, click OK.
11. In the Schema Layout or Type Library tab, select the node and edit the properties:
  - o [Edit the field properties](#)
  - o [Edit the record properties](#)
  - o [Edit group properties](#)

## Valid Node Names

When a Flat File Schema is created, an internal XML Schema-based representation of the metadata is also generated, so the node names you specify for the records, fields, and groups *must* be valid XML names. Follow the naming restrictions listed in the following tables when creating node nodes in Flat File Schema.
