1. How to interpret messages and codes

The information in this topic can be used to understand a message or code produced by the WebSphere MQ for z/OS product. The topic is divided into the following parts:

Messages

Describes all WebSphere MQ messages in alphanumeric order.

All WebSphere MQ message identifiers are eight characters long. The first three characters are always CSQ. If you get a message with a different prefix, see [Messages from other products](#) to find out which product issued the message.

The fourth character is the component identifier; this identifies the component of WebSphere MQ that issued the message. These are shown in [WebSphere MQ component identifiers](#). The fifth through seventh characters represent the numeric identifier, which is unique within the component. The last character is the message type code; this indicates the type of response that the message requires. [Table 1](#) shows the four type codes used by WebSphere MQ for z/OS.

Table 1. Message type codes

A	Immediate action	System operator action is required immediately. The associated task does not continue until the requested action has been taken.
D	Immediate decision	System operator decision or action is required immediately. The operator is requested to select from specific options, such as retry or cancel . The associated task does not continue until the requested decision has been made or action has been taken.
E	Eventual action	System operator action <i>will</i> be required; however, the associated task continues independently of system operator action.
I	Information only	No operator action is required.

In messages issued by the queue manager itself and the mover, the message identifier is normally followed

by the *command prefix* (CPF); this indicates which WebSphere MQ queue manager issued the message. These messages have prefixes starting CSQE, CSQH, CSQI, CSQM, CSQN, CSQP, CSQR, CSQV, CSQX, CSQY, CSQ2, CSQ3, CSQ5, and CSQ9; some messages with prefixes CSQJ and CSQW also have the CPF. In certain exceptional cases, the CPF might show as blank.

Messages from CICS-related components (CSQC) show the CICS® application ID or transaction ID if applicable.

Messages from other components, that is messages with prefixes CSQO, CSQQ, CSQU, and CSQ1 (and some with prefixes CSQJ and CSQW) have no indicator.

Codes

Describes all WebSphere MQ abend reason codes, and subsystem termination reason codes, in alphanumeric order.

The codes are four bytes long. The first byte is always 00; this is the high-order byte. The second byte is the hexadecimal identifier (Hex ID) of the WebSphere MQ component. These are shown in [WebSphere MQ component identifiers](#). The last two bytes are the numeric identifier, which is unique within the component.

WebSphere MQ CICS abend codes

Describes the CICS abend codes issued by the WebSphere MQ CICS adapter, and the WebSphere MQ CICS bridge.

Accompanying each message and code is the following information, when applicable:

Explanation:

This section tells what the message or code means, why it occurred, and what caused it.

Severity:

Severity values have the following meanings:

0

An information message. No error has occurred.

4

A warning message. A condition has been detected of which the user should be aware. The user might need to take further action.

8

An error message. An error has been detected and processing could not continue.

12

A severe error message. A severe error has been detected and processing could not continue.

System action:

This part tells what is happening as a result of the condition causing the message or code. If this information is not shown, no system action is taken.

User response:

If a response by the user is necessary, this section tells what the appropriate responses are, and what their effect is. If this information is not shown, no user response is required.

Operator response:

If an operator response is necessary, this section tells what the appropriate responses are, and what their effect is. If this information is not shown, no operator response is required.

System programmer response:

If a response by the system programmer is required, this part tells what the appropriate responses are, and what their effect is. If this information is not shown, no system programmer response is required.

Programmer response:

If a programmer response is necessary, this part tells what the appropriate responses are, and what their effect is. If this information is not shown, no programmer response is required.

Problem determination:

This section lists the actions that can be performed to obtain adequate data for support personnel to diagnose the cause of the error. If this information is not shown, no problem determination is required.

2.1.1. CSQB001E: Language environment programs running in z/OS batch or USS must use the DLL interface to WebSphere MQ

Explanation

Application programs using WebSphere MQ and Language Environment services from z/OS Batch or Unix System Services must use the DLL interface to WebSphere MQ. This message is issued once per connection. The program which caused this message to be issued is using the stub interface to WebSphere MQ.

Severity

4

System action

Processing continues. The Application CCSID Detection and Async Consume features of WebSphere MQ are not supported when using the stub interface to WebSphere MQ.

Programmer response

2.2. CICS® adapter and Bridge messages (CSQC...)

Note:

When using the CICS provided code for the adapter and bridge for CICS TS 3.2 and later, the messages have a DFHMQ0 prefix instead of a CSQC prefix. The DFHMQ0 prefixed messages are documented in *CICS Messages and Codes*.

2.2.1. CSQC100D: *cics-applid csect-name* Cannot retrieve data from a START command. EIBFN=*eibfn* EIBRESP=*eibresp* EIBRESP2=*eibresp2*

Explanation

CKTI has attempted to retrieve data from a CICS® START command, but the retrieve was unsuccessful.

Severity

8

System action

CKTI ends.

System programmer response

The EIB fields contain information about the cause of the problem. See the *CICS Application Programming Reference* manual for an explanation of these values. Use the data contained in these fields to resolve the problem, and retry.

Parent topic: [CICS adapter and Bridge messages \(CSQC...\)](#)

2.2.2. CSQC101D: *cics-applid csect-name* Cannot open the initiation queue. MQCC=*mqcc* MQRC=*mqrc*

Explanation

CKTI has attempted to open an initiation queue, but the attempt was unsuccessful (for example, because the queue was not defined). *mqcc* and *mqrc* give the reason for the problem.

Severity

8

System action

CKTI ends.

Operator response

Refer to [API completion and reason codes](#) for information about *mqcc* and *mqrc*, determine the cause of the problem, and use CKQC to restart CKTI.

Parent topic: [CICS adapter and Bridge messages \(CSQC...\)](#)

2.2.3. CSQC102D: *cics-applid csect-name* Cannot start the CICS transaction tran-id. EIBFN=*eibfn* EIBRESP=*eibresp* EIBRESP2=*eibresp2*

Explanation

A trigger message has been retrieved from the initiation queue which defines a CICS® transaction to be started. However the transaction cannot be started (for example, it cannot be found).

Severity

8

System action

The trigger message is sent to the dead-letter queue. CKTI processes the next message.

System programmer response

The EIB fields contain information about the cause of the problem. See the *CICS Application Programming Reference* manual for an explanation of these values. Determine the reason for the problem, and restart the transaction.

Parent topic: [CICS adapter and Bridge messages \(CSQC...\)](#)

2.2.4. CSQC103E: *cics-applid csect-name* CKTI has read a trigger message with an incorrect MQTM-Strucld of *struc-id*

Explanation

A trigger message has been retrieved, but the structure identifier of the message is not MQTM_STRUC_ID and so is not compatible with this version of CSQCTASK.

Severity

4

System action

The trigger message is sent to the dead-letter queue. CKTI processes the next message.

System programmer response

Check the header of the message on the dead-letter queue. This will tell you where the trigger message came from. Correct the process that created the trigger message.

Parent topic: [CICS adapter and Bridge messages \(CSQC...\)](#)

2.2.28. CSQC214E: *cics-applid csect-name* Initiation queue name not found. CKTI not started

Explanation

A connection has been made to MQ, but CKTI cannot be started as no initiation queue name has been specified.

Severity

0

System action

The queue manager is connected, but CKTI is not started.

Operator response

Use the MQ CICS® adapter control panels (the CKQC transaction) to start CKTI.

System programmer response

Add the initiation queue name to **INITPARM** statement if you want to start CKTI automatically next time you connect CICS to MQ.

Parent topic: [CICS adapter and Bridge messages \(CSQC...\)](#)

2.2.29. CSQC216D: *cics-applid csect-name* Queue manager name invalid. Connection rejected

Explanation

An attempt has been made to connect to MQ, but it was unsuccessful because the queue manager name given was more than 4 characters long.

Severity

8

System action

The connection process terminates, and control returns to CICS®.

System programmer response

Use the MQ CICS adapter control panels to specify the correct queue manager name, or correct the **CSQCPARM** keyword in the **INITPARM** statement, and retry the connection process. See the [WebSphere MQ for z/OS System Setup Guide](#) for information about **INITPARM** and **CSQCPARM**.

2.2.30. CSQC217E: *cics-applid csect-name* Initiation queue name invalid. CKTI not started

Explanation

An attempt has been made to connect to MQ, but it was unsuccessful because the initiation queue name given was more than 48 characters long.

Severity

8

System action

The connection process terminates, and control returns to CICS®.

System programmer response

Use the MQ CICS adapter control panels (the CKQC transaction) to specify the correct initiation queue name, and retry the connection process.

2.2.31. CSQC218I: *cics-applid csect-name* No trace number specified in CSQCPARM. The default of 0 will be used

Explanation

A connection has been made to MQ but no trace number was specified in the **CSQCPARM** keyword of the **INITPARM** statement. The default of 0 will be used.

Severity

0

System action

The queue manager is connected with a trace number of 0.

System programmer response

Use the MQ CICS® adapter control panels (the CKQC transaction) to specify the required trace number. Add the trace number to the **CSQCPARM** keyword of the **INITPARM** statement to set it automatically next time you connect CICS to MQ.

Parent topic: [CICS adapter and Bridge messages \(CSQC...\)](#)

2.2.32. CSQC219E: *cics-applid csect-name* Trace number specified in CSQCPARM is not valid. The default of 0 will be used

Explanation

A connection has been made to MQ but the trace number specified in the **CSQCPARM** keyword of the **INITPARM** statement was not valid. The default of 0 will be used.

Severity

4

System action

The queue manager is connected with a trace number of 0.

System programmer response

Use the CICS® adapter control panels (the CKQC transaction) to specify the required trace number. Correct the trace number in the **CSQCPARM** keyword of the **INITPARM** statement to set it automatically next time you connect CICS to MQ.

2.2.57. CSQC311D: *cics-applid csect-name* Unable to start alert monitor CKAM. EIBFN=*eibfn* EIBRESP=*eibresp* EIBRESP2=*eibresp2* EIBRCODE=*eibrcode*

Explanation

During the connection process, the MQ CICS® adapter was unable to start the alert monitor CKAM.

Severity

8

System action

The queue manager is connected, but CKAM is not started so the function of the MQ CICS adapter is restricted.

Operator response

Without the alert monitor, the MQ CICS adapter is unable to perform the following functions:

- It cannot handle a deferred connection
- It cannot respond to a queue manager failure
- It cannot perform a warm or immediate shutdown if it needs to wait (that is, the last task carries out shutdown)

It is recommended that you use CKQC to terminate the connection using a forced shutdown of the CICS adapter, and refer to the System Programmer Response.

System programmer response

The EIB fields contain information about the cause of the problem. See the *CICS Application Programming Reference* manual for an explanation of these values. When the error has been corrected, use the CKQC transaction to reinitiate the connection.

Parent topic: [CICS adapter and Bridge messages \(CSQC...\)](#)

2.2.59. CSQC313I: *cics-applid csect-name* *UOWID=*conn-name.uow-id* is in doubt

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Explanation

This message is issued at connection time. The unit of work shown is in doubt. An asterisk character preceding the unit-of-work identifier indicates that the unit of work will not be resolved automatically.

System action

The units of work will be resolved by the distributed queuing component when remote queuing starts.

Severity

0

System programmer response

See the [WebSphere MQ for z/OS System Administration Guide](#) for information about resolving the MQ unit of recovery associated with the in-doubt CICS® unit of work.

2.2.61. CSQC315E: *cics-applid csect-name* Unable to LOAD API exit CSQCAPX. EIBFN=*eibfn* EIBRESP=*eibresp* EIBRESP2=*eibresp2* EIBRCODE=*eibrancode*

Explanation

The MQ CICS® adapter is unable to use the API-crossing exit program CSQCAPX. This can be a normal situation if you do not intend to use the API-crossing exit, and have disabled the program CSQCAPX.

Severity

8

System action

The API-crossing exit is not used.

System programmer response

The EIB fields contain information about the cause of the problem. See the *CICS Application Programming Reference* manual for an explanation of these values. If you are trying to use the API-crossing exit, use the data contained in these fields to resolve the problem.

2.2.66. CSQC321D: *cics-applid csect-name* There is no active connection. Stop connection rejected

Explanation

An attempt was made to shut down a connection, but there was no connection active. This could be caused by one of the following:

- A connection had not been made
- The connection had already been shut down
- The connection is still being made (that is, it is pending)

Severity

8

System action

The request is ignored, and control returns to CICS®.

2.2.67. CSQC322D: *cics-applid csect-name* Invalid input. Stop connection rejected

Explanation

A request to shut down the MQ CICS® adapter was made, but it was rejected because the syntax of the shutdown request was not valid.

Severity

8

System action

The request is ignored.

Operator response

Issue the request again. See the [WebSphere MQ for z/OS System Administration Guide](#) for details of the correct syntax.

2.2.78. CSQC350I: *cics-applid csect-name* Unable to LOAD API exit CSQCAPX. Program not found

Explanation

The MQ CICS® adapter is unable to use the API-crossing exit program CSQCAPX because it cannot be found. This is a normal situation if you do not intend to use the API-crossing exit.

Severity

0

System action

The API-crossing exit is not used.

System programmer response

If you wish to use the API-crossing exit:

- Ensure that CSQCAPX is in the DFHRPL concatenation.
- Issue the CICS command CEMT SET PROGRAM(CSQCAPX) NEWCOPY ENABLE.
- Activate the exit using the Modify Connection option of the CKQC transaction.

Parent topic: [CICS adapter and Bridge messages \(CSQC...\)](#)

An attempt was made to start CKTI specifying the name of an initiation queue that is used by another CKTI being started.

Severity

8

System action

The request is ignored.

Operator response

Review the console for messages in the range CSQC100D through CSQC109D for further information, or use CICS® operator commands (for example CEMT INQ TASK) to determine why the CKTI started earlier is not running.

2.2.92. CSQC383D: *cics-applid csect-name* Another CKTI with the same initiation queue name is still running. command rejected

Explanation

An attempt was made to start CKTI specifying the name of an initiation queue that is already used by a CKTI which is still running.

Severity

8

System action

The request is ignored.

Operator response

If required, use the MQ CICS® adapter control panels (the CKQC transaction) to stop the existing CKTI, and restart.

Parent topic: [CICS adapter and Bridge messages \(CSQC...\)](#)

 This build: January 26, 2011 11:42:52

This topic's URL:

zm11160_

2.2.93. CSQC384D: *cics-applid csect-name* Another CKTI with the same initiation queue name is being stopped. command rejected

Explanation

Either:

- An attempt was made to start CKTI with an initiation queue name the same as the one that is currently being stopped.
- An attempt was made to stop an initiation queue that was already in the process of stopping.

Severity

8

System action

The request is ignored.

Operator response

Wait until the initiation queue has stopped, and then reissue the start request if required.

Parent topic: [CICS adapter and Bridge messages \(CSQC...\)](#)

This topic's URL:

zm11170_

2.2.94. CSQC385D: *cics-applid csect-name* CKTI not found. command rejected

Explanation

An attempt to stop CKTI was unsuccessful because the queue name specified was not found. This is because either:

- The name of the initiation queue was specified incorrectly
- The CKTI has already stopped

Severity

8

System action

The request is ignored.

Operator response

Verify the name of the initiation queue, and reissue the request if necessary.

2.2.146. CSQC471A: *cics-applid csect-name* Server subtask (TCB address=address) unable to establish ESTAE, RC=rc

Explanation

The server subtask was trying to establish a z/OS® ESTAE but failed with return code *rc*. This error occurred while the server subtask was undergoing its initialization phase, so no CICS® tasks will have been affected.

Severity

8

System action

The server subtask terminates. The MQ CICS adapter continues without that particular server.

System programmer response

See the *MVS™ Programming: Assembler Services Reference* to determine the reason why the ESTAE call failed and take appropriate action if possible. Restart the connection using the CKQC transaction.

If you are unable to resolve the problem, contact your IBM® support center.

2.2.164. CSQC715E: *transid taskid* Invalid COMMAREA length length in message

Explanation

The COMMAREA length calculated by the bridge is not valid. It probably exceeds the maximum of 32767. This error can also occur if a negative length was calculated.

System programmer response

If OutputDataLength is set within the MQCIH, check it does not exceed 32759 (allowing 8 bytes for the program name). If it is not set, check the total request message length (also allowing 8 bytes for the program name). The length of any MQCIH must not exceed 32767. Note that the length of the MQCIH is taken from the MQCIH length field.

2.2.166. CSQC717E: *transid taskid* UOW first or only received when UOW middle or last expected

Explanation

A bridge task has received a message for a second or subsequent MQGET call within a multipart unit of work. The correlation identifier matches the message identifier of the first message within the unit of work, but the UOWControl field within the MQCIH is invalid. It is set to MQCUOWC_FIRST or MQCUOWC_ONLY when MQCUOWC_MIDDLE, MQCUOWC_LAST, MQCUOWC_COMMIT, or MQCUOWC_BACKOUT is required. The unit of work is backed out.

System programmer response

Correct the UOWControl field and rerun the unit of work.

Parent topic: [CICS adapter and Bridge messages \(CSQC...\)](#)

2.2.200. CSQC758E: *transid taskid* Unable to START bridge task, *userid user-id* not authorized. EIBRESP=*eibresp* EIBRESP2=*eibresp2*

Explanation

The bridge monitor is being run with the IDENTIFY or VERIFY authorization option. An EXEC CICS® START command for the bridge task failed with NOTAUTH or USERIDERR because the user ID is not authorized to start bridge transactions or has been revoked.

System programmer response

See the *CICS Application Programming* manual for an explanation of *eibresp* and *eibresp2*. Correct the security definitions if this userid should be authorized to run requests using the bridge.

2.2.207. CSQC766I: *transid taskid* Bridge queue not defined with INDXTYPE(CORRELID)

Explanation

The bridge queue should be defined with an index type of CORRELID. This is required if the queue is a shared queue and strongly recommended for private queues.

System action

If the bridge queue is shared, the bridge monitor does not start. Otherwise, processing continues.

System programmer response

Alter the queue definition to specify the required index type and restart the bridge monitor.

Parent topic: [CICS adapter and Bridge messages \(CSQC...\)](#)

2.2.213. CSQC772E: *transid taskid* Invalid FacilityLike value (xxx) in message

Explanation

The CICS® Link3270 program DFHL3270 returned code BRIHRC_FACILITYLIKE_INVALID, because the FacilityLike field of the MQCIH header in the input message was invalid. It must correspond to an installed terminal that is to be used as a model for the bridge facility.

System action

The input messages are backed out to the backout-requeue queue or dead-letter queue.

System programmer response

Correct the FacilityLike field to specify the name of a terminal installed on the CICS system or install a terminal with the required name.

Parent topic: [CICS adapter and Bridge messages \(CSQC...\)](#)

 This build: January 26, 2011 11:42:59

This topic's URL:

zm12370_

2.2.214. CSQC773E: *transid taskid* Invalid or expired Facility token in message

Explanation

The CICS® Link3270 program DFHL3270 returned code BRIHRC_INVALID_FACILITYTOKEN or BRIHRC_FACILITYTOKEN_IN_USE, because the Facility field of the MQCIH header in the input message was invalid. The value must be zero on the first request of a sequence of 3270 bridge messages, and the value that is returned in the reply message must then be used in subsequent messages. The token expires after the time specified in the FacilityKeepTime field of the first message. The token cannot be used by more than one sequence of bridge messages.

System action

The input messages are backed out to the backout-requeue queue or dead-letter queue.

System programmer response

Check the application to ensure that the correct Facility token is being used and that it has not expired. If necessary, increase the FacilityKeepTime so that the token does not expire before the sequence of messages has been processed.

Parent topic: [CICS adapter and Bridge messages \(CSQC...\)](#)

This topic's URL:

zm12380_

2.2.215. CSQC774E: *transid taskid* Unable to start transaction on CICS system *sys-name*

Explanation

The RemoteSysId field of the MQCIH message header is non-blank, but the specified name *sys-name* is not known to CICS® or there is no active CICS connection to that remote system.

System action

The input messages are backed out to the backout-requeue queue or dead-letter queue.

System programmer response

Ensure that the specified CICS system is running and that there is an active CICS Intersystem communication connection to it from the system running the bridge monitor.

Parent topic: [CICS adapter and Bridge messages \(CSQC...\)](#)

 This build: January 26, 2011 11:42:59

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

This topic's URL:

zm12390_

2.2.216. CSQC775I: *transid taskid* Unable to start transaction on this CICS system

Explanation

The RemoteSysId field of the MQCIH message header is blank, but the specified Facility token is not known to CICS®. The bridge monitor does not know which CICS system allocated the token and so leaves the message on the queue for another bridge monitor to process. If the token is invalid or expired this may result in the message never being processed.

System programmer response

Ensure that the RemoteSysId field of all messages except the first of a sequence contains the RemoteSysId returned in the previous reply message. This will ensure messages are routed directly to the correct CICS region, improve performance, and prevent the possibility of unprocessed messages.

Parent topic: [CICS adapter and Bridge messages \(CSQC...\)](#)

 This build: January 26, 2011 11:42:59

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

This topic's URL:

zm12400_

2.2.217. CSQC776E: *transid taskid* Invalid FacilityKeepTime value (*nnn*) in message

Explanation

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

The CICS® Link3270 program DFHL3270 returned code BRIHRC_INVALID_KEEPTIME, because the FacilityKeepTime field of the MQCIH message header was zero or greater than the maximum allowed keep time (as controlled by the BRMAXKEEPTIME CICS system initialization parameter).

System action

The input messages are backed out to the backout-requeue queue or dead-letter queue.

System programmer response

Ensure that the FacilityKeepTime field of the first message in a 3270 transaction sequence contains a value within the valid range.

Parent topic: [CICS adapter and Bridge messages \(CSQC...\)](#)

2.2.218. CSQC777E: *transid taskid* Link3270 error, RC=>code<

Explanation

The CICS® Link3270 program DFHL3270 returned an unexpected return code.

System action

The input messages are backed out to the backout-requeue queue or dead-letter queue.

System programmer response

Use the CICS COBOL copy book DFHBRIHO to find the symbolic name of the return code from the numeric value *code* reported in the message. Then refer to 'BRIH-RETURNCODE values' in the *CICS External Interfaces Guide* to determine the meaning of the return code from DFHL3270. Correct the input message accordingly.

This topic's URL:

zm12450_

2.2.222. CSQC781E: *transid taskid* Invalid bridge vector

Explanation

The bridge input vector was invalid. Possible errors are:

- The vector length is greater than the message length
- The vector type is not recognized
- A field length is greater than its defined length
- A field input data length is greater than the defined length of the field

The ErrorOffset field of the MQCIH header indicates the position within the message where the error was detected (although the actual error may have caused by a problem earlier in the message).

System action

The input messages are backed out to the backout-requeue queue or dead-letter queue.

System programmer response

Ensure the map name in the input message matches the name expected by the CICS® transaction and returned in the preceding receive map request vector.

2.2.231. CSQC790E: *transid taskid* Transaction not running

Explanation

The CICS® Link3270 program DFHL3270 returned code BRIHRC_TRANSACTION_NOT_RUNNING, because there was no transaction currently running on the bridge facility so the data from the MQ message could not be passed to the transaction.

System programmer response

Check the state of the CICS system.

For information about Link3270 see 'Bridging to 3270 transactions' in the *CICS External Interfaces Guide*.

2.2.232. CSQC791E: *transid taskid* Invalid header format found in message

Explanation

The length field in the header is less than the minimum header length or greater than the actual message message length.

System programmer response

Ensure that the input message contains only valid MQ headers. Only MQH-type headers with standard header-chaining fields may appear in a bridge message before the MQCIH header and/or application data.

2.3. Coupling Facility manager messages (CSQE...)

The value shown for *struc-name* in the coupling facility manager messages that follow is the 12-character name as used by WebSphere® MQ. The external name of such CF structures for use by z/OS® is formed by prefixing the MQ name with the name of the queue-sharing group to which the queue manager is connected.

[**CSQE005I: Structure struc-name connected as conn-name, version=version**](#)

2.3.13. CSQE020E: Structure *struc-name* connection as *conn-name* failed, RC=*return-code* reason=>*reason*< codes=*s1 s2 s3*

Explanation

The queue manager failed to connect to CF structure *struc-name*.

System action

This depends on the component that caused the connection request (queue manager or channel initiator) and the reason for connecting to the CF structure. The component may terminate, or may continue processing but with functions that require the structure inhibited.

System programmer response

Examine the return and reason codes to determine why the connect failed. Codes *s1 s2 s3* are the XES IXLCONN diagnosis codes, which are described in the *z/OS® MVS™ Programming: Sysplex Services Reference* manual.

Parent topic: [Coupling Facility manager messages \(CSQE...\)](#)

zm12710_

2.3.15. CSQE022E: Structure *struc-name* unusable, size is too small

Explanation

The queue manager cannot use the named CF structure because its size is less than the minimum that MQ requires.

System action

The queue manager disconnects from the CF structure, which becomes unusable. If it is an application structure, the queues that use the structure are not usable. If it is the administration structure, the queue manager terminates with completion code X'6C6' and reason code X'00C53000'.

System programmer response

Increase the size of the CF structure to at least the minimum size required. See the [WebSphere MQ for z/OS System Setup Guide](#) for guidance on required structure sizes.

If the structure is allocated and the Coupling Facility Resource Manager policy allows the size of it to be increased, use the z/OS® command SETXCF START,ALTER,STRNAME=*ext-struc-name*,SIZE=*newsize*. If the policy does not so allow, or there is insufficient space in the Coupling Facility that hosts the structure, the policy must be altered; then the structure can be rebuilt using the z/OS command SETXCF START,REBUILD,STRNAME=*ext-struc-name*. (In these commands, *ext-struc-name* is formed by prefixing *struc-name* with the queue-sharing group name.)

If the structure is not allocated, alter the policy to specify a larger INITSIZE for the structure.

Parent topic: [Coupling Facility manager messages \(CSQE...\)](#)

 This build: January 26, 2011 11:43:01

This topic's URL:

zm12730_

2.3.17. CSQE025E: Invalid UOW for *qmgr-name* in list *list-id* cannot be recovered, key=>*uow-key*<

Explanation

A unit-of-work descriptor was read during recovery processing that contained unexpected data. The descriptor was for the indicated queue manager; it was in the coupling facility list *list-id* and had key *uow-key* (shown in hexadecimal).

System action

The unit-of-work in error cannot be processed and the descriptor is marked as being in error. Processing continues.

System programmer response

Take a dump of the indicated list in your coupling facility administration structure for queue manager *qmgr-name* and contact your IBM® support center.

Parent topic: [Coupling Facility manager messages \(CSQE...\)](#)

 This build: January 26, 2011 11:43:01

This topic's URL:

zm12740_

2.3.18. CSQE026E: Structure *struc-name* unusable, incorrect coupling facility level >*level1*<, required *level2*

Explanation

The queue manager cannot use the named CF structure because it has been allocated in a CF which supports level *level1*, but MQ requires at least level *level2*.

System action

The queues that use the CF structure are not usable.

System programmer response

Either upgrade the coupling facility, or use a CF structure which is in a CF running level *level2* or above.

Parent topic: [Coupling Facility manager messages \(CSQE...\)](#)

 This build: January 26, 2011 11:43:02

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

zm12750_

2.3.19. CSQE027E: Structure *struc-name* unusable, vector size $\mathbf{\rangle n1\langle}$ incorrect, required $\mathbf{\rangle n2\langle}$

Explanation

The queue manager cannot use the named CF structure because it has been allocated a list notification vector of size $n1$, but MQ requires at least size $n2$. This is probably because there is not enough available hardware storage area (HSA) for the vector.

System action

The queues that use the CF structure are not usable.

System programmer response

You cannot adjust the amount of HSA defined for your processor. Instead, retry the application (or other process) which was attempting to open the shared queue. If the problem persists, contact your IBM® support center for assistance.

Parent topic: [Coupling Facility manager messages \(CSQE...\)](#)

This topic's URL:

zm12770_

2.3.21. CSQE029E: Structure *struc-name* unusable, version $\mathbf{v1}$ differs from group version $\mathbf{v2}$

Explanation

The queue manager cannot use the named CF structure because the version number of the structure differs from that of the queue-sharing group.

System action

The queue manager disconnects from the CF structure, which becomes unusable. If it is an application structure, the queues that use the structure are not usable. If it is the administration structure, the queue manager terminates with completion code X'6C6' and reason code X'00C51057'.

System programmer response

Check that the configuration of your queue manager, queue-sharing group, and data-sharing group is correct. If so, deallocate the CF structure using the z/OS® commands SETXCF FORCE,CON and SETXCF FORCE,STRUCTURE. (In these commands, the structure name is formed by prefixing *struc-name* with the queue-sharing group name.)

2.3.22. CSQE030I: Serialized application cannot start, admin structure data incomplete

Explanation

A serialized application attempted to start, but it could not do so because one or more queue managers in the queue-sharing group has not completed building its data for the administration structure. Messages CSQE031I and CSQE032I precede this message to identify such queue managers.

System action

The application is not started. The MQCONN call that it issued to connect to the queue manager fails with a completion code of MQCC_FAILED and a reason code of MQRC_CONN_TAG_NOT_USABLE. (See [API completion and reason codes](#) for more information about these codes.)

System programmer response

➤ The administration structure is automatically rebuilt. The rebuild can occur on any member of the QSG. Restart the application after the administration structure is successfully rebuilt, which is shown by message CSQE037I on the system performing the rebuild. ◀

2.3.26. CSQE034E: Recovery phase 2 failed for structure *struc-name* connection name *>conn-name<*, RC=*return-code* reason=*reason*

Explanation

An error occurred during phase two of peer level recovery processing. The recovery attempt is terminated. *return-code* and *reason* are the diagnosis codes (in hexadecimal) from an XES IXL call.

System action

Processing continues. The connection will be recovered by the failed queue manager when it restarts.

System programmer response

See the z/OS® MVS™ *Programming: Sysplex Services Reference* manual for information about the XES IXL diagnosis codes. Restart the queue manager that failed; if it is unable to recover, contact your IBM® support center.

2.3.27. CSQE035E: *csect-name* Structure *struc-name* in failed state, recovery needed

Explanation

The queue manager attempted to use CF structure *struc-name*, but it is in a failed state. The failure occurred previously; it was not caused by the current use of the structure.

System action

Processing continues, but queues that use this CF structure will not be accessible.

System programmer response

Check the console for messages from XES relating to the earlier failure, and investigate the cause. See the z/OS® MVS™ *Programming: Sysplex Services Reference* manual for information about diagnosing problems in XES.

When the problem is resolved, issue a RECOVER CFSTRUCT command specifying TYPE(NORMAL) for this and any other failed CF structure.

zm12837_

2.3.30. CSQE040I: Structure *struc-name* should be backed up

Explanation

The latest backup for the named CF structure is not very recent. Unless backups are taken frequently, the time to recover persistent messages on shared queues may become excessive.

The message is issued at checkpoint time if the queue manager was the one that took the last backup, or if it has used the structure since the last backup was taken.

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

System action

Processing continues.

System programmer response

Use the BACKUP CFSTRUCT command (on any queue manager in the queue-sharing group) to make a new CF structure backup. You are recommended to set up a procedure to take frequent backups automatically.

Parent topic: [Coupling Facility manager messages \(CSQE...\)](#)

 This build: January 26, 2011 11:43:02

2.3.50. CSQE136I: Error returned by DB2 when clearing queue *queue-name*, list header number=*list header number*, structure number=*strucnum*

Explanation

Shared queue messages greater than 63 KB in size have their message data held as one or more binary large objects (BLOBs) in a DB2 table. An error was returned by DB2 when clearing these messages from the table.

Severity

4

System action

Processing continues.

System programmer response

The messages have been deleted from the coupling facility but message data might remain in DB2 as orphaned BLOBs. This message is normally preceded by message CSQ5023E. Examine the DB2 job log to determine why the error occurred. The orphaned messages can be deleted by issuing the '**DISPLAY GROUP OBSMSGS(YES)**' command after 24 hours.

Parent topic: [Coupling Facility manager messages \(CSQE...\)](#)

 This build: January 26, 2011 11:43:05

 Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

zm13035_

2.3.51. CSQE137E: +cpf *csect-name* DB2 and CF structure out of sync for queue *queue-name*, list header number =*list header number*, structure number=*strucnum*

Explanation

The queue manager has identified a discrepancy between the information stored about a queue in the coupling facility and the corresponding information in DB2.

Severity

4

System action

Processing continues, but applications are unable to open the affected queue until the discrepancy is resolved by the System Programmer.

System programmer response

If the queue manager has recently been recovered from a backup then the recovery process should be reviewed to ensure that everything was correctly restored, including any DB2 tables associated with the queue manager.

If the cause of the problem cannot be determined then contact your IBM support center for assistance.

2.4.4. CSQH004I: *csect-name* STAT call failed for class **>class-name** **<, SAF return code=>saf-rc<, ESM return code=>esm-rc<**

Explanation

This message is issued as a result of a SAF RACROUTE REQUEST=STAT call to your external security manager (ESM) returning a non-zero return code at one of the following times:

- During initialization, or in response to a REFRESH SECURITY command
If the return codes from SAF and your ESM are not zero, and are unexpected, this will cause abnormal termination with one of the following reason codes:
 - X'00C8000D'
 - X'00C80032'
 - X'00C80038'
- In response to a REFRESH SECURITY command.
If the return codes from SAF and your ESM are not zero (for example, because a class is not active because you are not going to use it) this message is returned to the issuer of the command to advise that the STAT call failed.

Possible causes of this problem are:

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

- The class is not installed
- The class is not active
- The external security manager (ESM) is not active
- The RACF® z/OS® router table is incorrect

Severity

8

System programmer response

To determine if you need to take any action, see the *Security Server External Security Interface (RACROUTE) Macro Reference* for more information about the return codes.

2.4.5. CSQH005I: *csect-name* >*resource-type*< In-storage profiles successfully listed

Explanation

This message is issued in response to a REFRESH SECURITY command that caused the in-storage profiles to be RACLISTED (that is, rebuilt); for example, when the security switch for a resource is set on, or a refresh for a specific class is requested that requires the in-storage tables to be rebuilt.

Severity

0

System programmer response

This message is issued so that you can check the security configuration of your queue manager.

Parent topic: [Security manager messages \(CSQH...\)](#)

2.4.7. CSQH007I: Reverify flag not set for user-id >userid<, no entry found

Explanation

A user identifier (*user-id*) specified in the RVERIFY SECURITY command was not valid because there was no entry found for it in the internal control table. This could be because the identifier was entered incorrectly in the command, or because it was not in the table (for example, because it had timed-out).

Severity

0

System action

The user identifier (*user-id*) is not flagged for reverify.

System programmer response

Check that the identifier was entered correctly.

2.4.10. CSQH010I: *csect-name* Security timeout timer not restarted

Explanation

This message is issued to inform you that the security timeout timer is not operational. The reason for this depends on which of the following messages precedes this one:

CSQH009I

An error occurred during timeout processing

CSQH011I

The timeout interval has been set to zero

Severity

8

System action

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

If this message follows message CSQH009I, the queue manager ends abnormally with one of the following reason codes:

csect-name**Reason code****CSQHTPOP**

X'00C80040'

CSQHPATC

X'00C80041'

System programmer response

Refer to [Security manager codes \(X'C8'\)](#) for information about the reason code.

2.5.1. CSQI002I: *csect-name* Page set *psid* value out of range

Explanation

One of the following commands has been issued:

- DEFINE STGCLASS
- DISPLAY STGCLASS
- DISPLAY USAGE

The value given for the page-set identifier was not in the range 0 through 99.

Severity

8

System action

The command is ignored.

System programmer response

Reissue the command using the correct syntax. (See the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual for information about the command.)

Parent topic: [Data manager messages \(CSQI...\)](#)

 This build: January 26, 2011 11:43:06

This topic's URL:

zm13350_

2.5.3. CSQI005I: *csect-name* PAGE SET *nn* OFFLINE. RECOVERY RBA = *rba*

Explanation

This message indicates that the page set *nn* is currently not accessible by the queue manager. This might be because the page set has not been defined to the queue manager with the DEFINE PSID command.

rba is the restart RBA for page set *nn*.

This situation can cause problems, so you should take action to correct it as soon as possible.

Severity

0

System action

Processing continues.

System programmer response

If the page set is required, bring it online; this can be done without stopping the queue manager. Use the FORMAT function of the utility program CSQUTIL, specifying TYPE(REPLACE). Then issue a DEFINE PSID command to bring the page set back into use. Note that all units of recovery (except those that are indoubt) that involved the offline page set will have been backed out by the queue manager when the page set was last used. These indoubt units of recovery may be resolved once the page set is back in use by the queue manager.

2.5.6. CSQI010I: Page set usage ...

Explanation

This message is the response to the DISPLAY USAGE command. It provides information about the page set usage, as follows:

```

Page ...
set
_ n   page-set-information
:
End of page set report

```

where *n* is the page set identifier. The columns of *page-set-information* are:

Buffer pool

The buffer pool used by the page set.

Total pages

The total number of 4 KB pages in the page set (this relates to the records parameter on the VSAM definition of the page set).

Unused pages

The number of pages that are not used (that is, available page sets).

Persistent data pages

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

The number of pages holding persistent data (these pages are being used to store object definitions and persistent message data).

Nonpersistent data pages

The number of pages holding nonpersistent data (these pages are being used to store nonpersistent message data).

Expansion count

➤The type of expansion used for the page set (SYSTEM, USER, or NONE), and the number of times the page set has been dynamically expanded since restart. (The maximum number of times the page set can be expanded is constrained by the maximum number of extents allowable for the type of VSAM data set allocation and your operating system version.) If the count is large, your page set allocation might be wrong, or you might have some message processing problem.◀

Note: The page numbers are approximate because other threads might be altering the status of pages in this page set while the command is being processed.

If a page set is unavailable, *page-set-information* is one of:

has never been online

if the page set has been defined, but has never been used.

OFFLINE, recovery RBA=*rba*

if the page set is currently not accessible by the queue manager, for example because the page set has not been defined to the queue manager with the DEFINE PSID command; *rba* is the restart RBA for the page set.

is not defined

if the command was issued for a specific page set that is not defined to the queue manager.

Exceptionally, the last line of the report might be:

Page set report terminated

if there was an error in obtaining the information. The error is described in the following messages.

2.5.7. CSQI012E: *csect-name* COULD NOT COMPLETE COMMAND. STORAGE EXHAUSTED

Explanation

A display of page set usage could not complete because all the available storage was exhausted.

Severity

8

System action

The output terminates at this point. There might be more information that has not been displayed. If this is in response to a DISPLAY USAGE command without the PSID keyword, try it again, specifying a page set

identifier. This could decrease the amount of information produced, enabling it all to be displayed.

2.5.12. CSQI024I: *csect-name* Restart RBA for system as configured = **>restart-rba<**

Explanation

This message gives the restart RBA (relative byte address) for the queue manager, but does not include any offline page sets in the calculation of this restart point.

This value can be used to determine where to truncate logs, if you have no offline page sets.

If you have offline page sets that you wish to add to your system at some time in the future, you must use the restart RBA given in message CSQI025I. If you truncate your logs at *rba* you might make it impossible to add the offline page sets back to the system.

2.5.29. CSQI048I: *csect-name* WLM reached maximum enclave limit

Explanation

Workload Management Services (WLM) reported that no more enclaves could be created, so a message could not be notified to WLM. (An IWMECREA call gave a return code of 8 with a reason code of X'xxxx0836'.)

Note: This message might be issued repeatedly during the scan of the indexes for WLM-managed queues.

Severity

4

System action

The queue manager will attempt to notify the message to WLM again on the next scan of the indexes for WLM-managed queues. This will be after the interval specified by the WLMTIME system parameter; see the CSQ6SYSP macro in the [WebSphere MQ for z/OS System Setup Guide](#) for information about the system parameters.

System programmer response

See the *MVS™ Programming: Workload Management Services* manual for information about the return and reason codes from the WLM call.

2.5.30. CSQI049I: Page set *psid* has media recovery RBA=>*rcvry-rba* <, checkpoint RBA=>*chkpt-rba*<

Explanation

During restart, the queue manager opened the indicated page set. The media recovery RBA from the page set itself and the checkpointed RBA from the logs are as shown.

If the RBAs differ, it indicates that an old copy of the page set is being used. If the checkpoint RBA and the prior checkpoint RBA shown in message CSQR003I differ, it indicates that the page set has been offline.

Severity

0

System action

Processing continues. Media recovery is performed if necessary to bring the page set up to date.

>2.5.31. CSQI059E<: Unable to increase cluster cache

Explanation

The dynamic cluster cache cannot be increased because the queue manager cluster cache task encountered an error.

Severity

8

System action

The cluster cache task terminates. The channel initiator will probably terminate.

System programmer response

Investigate the problem reported in any preceding messages.

Parent topic: [Data manager messages \(CSQI...\)](#)

2.5.32. CSQI060E: QSG names differ, log=*log-name* queue

manager=*qmgr-name*

Explanation

The queue-sharing group name recorded in the log does not match the name being used by the queue manager.

Possible causes are:

- The queue manager was restarted using the log from another queue manager.
- The queue manager was restarted with the wrong QSGDATA system parameter.
- The queue manager was not removed correctly from its previous queue-sharing group.

Severity

8

System action

Restart is terminated abnormally with completion code X'5C6' and reason code X'00C94505'.

System programmer response

Restart the queue manager using the correct logs and BSDS, or change the QSGDATA system parameter. Note that you cannot change the name of the queue-sharing group that a queue manager uses, or remove it from a queue-sharing group, unless it has been shut down normally and the further procedures for removal described in [WebSphere MQ for z/OS System Administration Guide](#) have been followed.

2.5.33. CSQI061E: Queue manager QSG numbers differ, log=*log-num* queue manager=*qmgr-num*

Explanation

The queue manager was restarted using the log from another queue manager. The queue-sharing group queue manager number recorded in the log does not match that being used by the queue manager.

Severity

8

System action

Restart is terminated abnormally with completion code X'5C6' and reason code X'00C94506'.

System programmer response

Restart the queue manager using the correct logs and BSDS. If the correct logs are being used, correct the entry for the queue manager in the DB2® CSQ.ADMIN_B_QMGR table. If you cannot resolve the problem, contact your IBM® Support Center for assistance.

2.5.34. CSQI062I: Queue *q-name* deleted by another queue manager during restart

Explanation

During restart processing the queue manager detected that the named queue has been deleted by another queue manager in the queue-sharing group.

Severity

0

System action

Processing continues.

Parent topic: [Data manager messages \(CSQI...\)](#)

 This build: January 26, 2011 11:43:08

This topic's URL:

zm13660_

2.5.35. CSQI063E: Queue *q-name* is both PRIVATE and SHARED

Explanation

During restart processing the queue manager detected that the named queue exists both as a locally-defined queue on this queue manager and as a shared queue in the queue-sharing group. Opening a queue with this name will therefore not be allowed.

Severity

0

System action

Processing continues.

System programmer response

Plan to delete one of the instances of the queue. There are several things to consider in doing this, as described in the [WebSphere MQ for z/OS Concepts and Planning Guide](#).

Parent topic: [Data manager messages \(CSQI...\)](#)

16/03/2011

2.5.36. CSQI064E: Cannot get information from DB2. *obj-type* COPY objects not refreshed

Explanation

During queue manager or channel initiator startup, objects of type *obj-type* with a disposition of COPY were being refreshed from those with a disposition of GROUP. However, the necessary information could not be obtained from DB2®; this may be because DB2 is not available or no longer available, or because the connection to DB2 is suspended, or because there was an error in accessing DB2, or because a DB2 table was temporarily locked.

Severity

8

System action

The COPY objects of type *obj-type* are not refreshed. Startup continues.

System programmer response

Refer to the console log for messages giving more information about the error.

When the error condition has cleared, refresh the objects manually, or restart the queue manager or channel initiator.

Parent topic: [Data manager messages \(CSQI...\)](#)

2.5.37. CSQI070I: Data set usage ...

Explanation

This message is the response to the DISPLAY USAGE command. It provides information about the data sets relating to various circumstances, as follows:

```

Data set  RBA/LRSN  DSName
data-set-type:
           rrr      dsname
:
End of data set report

```

where:

data-set-type

The type of data set and circumstance, which can be:

Log, oldest with active unit of work

The log data set containing the beginning RBA of the oldest active unit of work for the queue manager.

Log, oldest for page set recovery

The log data set containing the oldest restart RBA of any page set for the queue manager.

Log, oldest for CF structure recovery

The log data set containing the LRSN which matches the time of the oldest current backup of any CF structure in the queue-sharing group.

rrr

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

The RBA or LRSN corresponding to the circumstance.

dsname

The name of the copy 1 data set. If no data set relates to a circumstance, this is shown as **None**; if the data set name cannot be determined, this is shown as **Not found**.

Severity

0

System programmer response

This information can be used to help manage data sets; see the [WebSphere MQ for z/OS System Administration Guide](#) for details.

2.5.38. CSQI965I: *modulename* Backward migration required for msgs on pageset *ps-name*

Explanation

During queue manager restart it has been detected that one or more of the page sets that have been connected has been used at a higher version of queue manager code.

System action

The queue manager will automatically perform special processing during restart to alter any messages stored on the indicated page set so they can be read by the current version of the queue manager.

Parent topic: [Data manager messages \(CSQI...\)](#)

 This build: January 26, 2011 11:46:00

This topic's URL:

zm48000_

2.5.39. CSQI966I: *modulename* Backward migration failed for msgs on Queue *qname*, pageset *ps-name*. Reason *reason-code*

Explanation

During backward migration of messages on the indicated queue and page set a problem was encountered which prevents further backward migration of messages.

The type of problem, for example page set full, is indicated by the reason code.

System action

The indicated page set is taken offline. Queues and messages on that page set will not be available while the queue manager is running at Version 6.

User action

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

To process the affected queues and messages it will be necessary to migrate the queue manager forward to WebSphere MQ V7.

Parent topic: [Data manager messages \(CSQI...\)](#)

 This build: January 26, 2011 11:46:00

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

zm48010_

2.5.40. CSQI967I: *modulename* Backward migration completed for msgs on *ps-name*

Explanation

The indicated page set has had all messages successfully migrated to a format where they can be processed by applications running on an WebSphere MQ V6 queue manager.

The following limitations still applies:

- If `SYSTEM.RETAINED.PUB.QUEUE` is defined on this pageset, all messages on that queue will have been deleted.
- If the queue manager is subsequently restarted at V7, then all retained publications are lost.

Parent topic: [Data manager messages \(CSQI...\)](#)

2.5.41. CSQI968I: *modulename* Alias queue *aq-name* to TARGQ *tq-name* has TARGTYEP *ttype* which is not supported. *aq-name* has been deleted

Explanation

During object migration, an alias queue was found which had an invalid **TARGETYPE**, for example an alias queue to a topic object.

System action

The alias queue indicated is deleted.

System programmer action

If the queue manager is migrated forward to WebSphere MQ V7, the indicated alias queue must be recreated before it can be used.

Parent topic: [Data manager messages \(CSQI...\)](#)

2.5.42. CSQI969I: Data set *ds-name* for page set *ps-name* was used for a higher version of WMQ and cannot be added dynamically

Explanation

During dynamic connection to a pageset which was offline at queue manager restart, it has been detected that it requires backward migration processing.

The pageset is not dynamically added.

System programmer action

The pageset must be connected at queue manager restart time so that the special restart time backward migration of messages processing can be performed.

Add a **DEFINE PAGESET** command to the queue manager's `CSQINP2` parameters to ensure the pageset is connected during restart processing.

2.6.1. CSQJ001I: CURRENT COPY *n* ACTIVE LOG DATA SET IS DSNAME=*dsname*, STARTRBA=>*sss*< ENDRBA=*ttt*

Explanation

This message is generated for one of two reasons:

1. When the queue manager starts, this information message is sent to identify the current active log data sets (copy 1 and, if dual logging is used, copy 2).
2. When the current active log data set is full (or when an ARCHIVE LOG command is issued), MQ will switch to the next available active log data set. This message identifies the next available active log data set that will be used for logging.

The value specified by STARTRBA is the RBA of the first byte of log data in the named data set. The value specified by ENDRBA is the RBA of the last possible byte in the data set.

System programmer response

None required. However, if recovery is required, information from this message might be required as input to the change log inventory utility (CSQJU003).

2.6.2. CSQJ002I: END OF ACTIVE LOG DATA SET DSNAME= >*dsname*<, STARTRBA=*sss* ENDRBA=*ttt*

Explanation

This message is sent when logging switches to a new empty data set. The message shows the name and log RBA range of the full data set.

System programmer response

None required. However, if recovery is required, information from this message might be required as input to the change log inventory utility (CSQJU003).

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

2.6.3. CSQJ003I: FULL ARCHIVE LOG VOLUME DSNAME=>*dsname*<, http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

**STARTRBA=sss ENDRBA=ttt, STARTTIME=ppp ENDTIME=qqq,
UNIT=unitname, COPYnVOL=vvv VOLSPAN=xxx CATLG=yyy**

Explanation

Offloading for the specified archive log data set was successfully completed for the given volume. If the data set spans multiple tape volumes, this message is generated for each tape volume.

System action

An archive log data set has been created, and the archive log data set inventory in the BSDS has been updated with the information in the message:

DSNAME

The name of the archive log data set

STARTRBA

The starting RBA contained in the volume

ENDRBA

The ending RBA contained in the volume

STARTTIME

The starting store-clock value of the log records in the volume

ENDTIME

The ending store-clock value of the log records in the volume

UNIT

The device unit to which the data set was allocated

COPYnVOL

The name of the volume; this is displayed as COPY1VOL if this is the copy-1 archive log data set, and as COPY2VOL if this is the copy-2 archive log data set

VOLSPAN

An indicator to denote one of four conditions:

NO

The data set is entirely contained on the volume specified by COPYnVOL

FIRST

This is the first entry of a multivolume data set

MIDDLE

This is the middle entry of a multivolume data set

LAST

This is the last entry of a multivolume data set

CATLG

An indicator to denote one of two conditions:

NO

The archive log data set is uncataloged

YES

The archive log data set is cataloged

The BSDS is automatically updated with the information contained in this message; however, if recovery is required, information from this message might be required as input to the change log inventory utility (CSQJU003).

zm13730_

2.6.4. CSQJ004I: ACTIVE LOG COPY >*n*< INACTIVE, LOG IN SINGLE MODE, ENDRBA=*ttt*

Explanation

This message is sent when the dual active logging option is selected and copy *n* becomes inactive. A log copy becomes inactive when the next active log data set is not ready when required. ENDRBA is the last byte of log data written on copy *n*. This is usually caused by a delay in offload.

System action

The log is switched to single mode until the next data set for copy *n* is ready for logging.

If the queue manager is shut down or terminates abnormally while in single mode with the system parameter option still set for dual active data sets, the previous state of the active log data sets determines what happens when the queue manager is started, as follows:

- If fewer than two data sets are available (not flagged as STOPPED) for each set of active logs, queue manager startup terminates and message CSQJ112E is issued.
- If an active log data set is in NOTREUSABLE state, the queue manager can be started in single logging mode, but dual mode takes effect when the other active log data set becomes available after offloading.

System programmer response

Perform a display request to ensure that there are no outstanding requests that are related to the log offload process. Take the necessary action to satisfy any requests, and permit offload to continue.

If the switch to single mode was caused by the lack of a resource required for offload, the necessary resource should be made available to allow offload to complete and thus permit dual logging to proceed. If recovery is required, information from this message might be required as input to the change log inventory utility (CSQJU003).

2.6.6. CSQJ006I: ALLOCATION FOR NEW ARCHIVE LOG DATA SET HAS BEEN CANCELED BY OPERATOR

Explanation

This message is sent if the operator answers 'N' to message CSQJ008E.

System action

If the allocation is for the first copy of the archive log data set, offload terminates processing until the next time it is activated. If the first copy has already been allocated and this request is for the second copy, offload switches to single offload mode for this data set only.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

This topic's URL:

zm13760_

2.6.7. CSQJ007I: ALLOCATION FOR ARCHIVE VOL SER=*volser* HAS BEEN CANCELED BY OPERATOR

Explanation

If the operator answers 'N' to message CSQJ009E, this message is issued. *volser* is the volume serial of an archive log volume required to satisfy the read request. The name of the archive data set is given by message CSQJ022I which follows.

System action

The read request that needed the archive volume is unsuccessful. If the request was issued with the *COND=YES* parameter, the log manager returns to its invoker with return code 12 and reason code X'00D1032B'. Otherwise, the log manager's invoker ends abnormally with the same reason code.

zm13770_

2.6.8. CSQJ008E: *nn* OF *mm* ACTIVE LOGS ARE FULL, *qmgr-name* NEEDS ARCHIVE SCRATCH

Explanation

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

MQ needs a scratch volume for offloading an active log data set. *qmgr-name* is the name of the queue manager. *nn* is the number of full active log data sets. *mm* is the total number of active log data sets.

System action

The offload task issues message CSQJ021D and waits for the operator's reply.

Operator response

There are three options:

- Get a scratch volume ready, make sure there is an available unit for the volume, and reply 'Y'. MQ then continues with the offload.
- Determine from the number of active log data sets available whether the offload can be delayed until the next time an active log data set becomes full. If the process can be delayed, reply 'N'.

This response has two possible effects:

- If dual archive logging is in effect and this allocation is for a copy 1 archive data set, the 'N' response delays the offload process until the next active log data set becomes full.
- However, if the copy 1 archive data set has already been allocated and this request is for copy 2, the 'N' response causes the offload to switch to single archive mode (the switch is for this data set only).
- Defer giving a response. This causes offload to wait before processing. However, because offload is a separate service task, the wait does not affect MQ performance.

If offloading to DASD, an error has occurred attempting to allocate an archive log data set. Reply 'Y' to receive the error messages.

This topic's URL:

zm13780_

2.6.9. CSQJ009E: *qmgr-name* NEEDS VOL SER=>*nnnnnn*<

Explanation

MQ needs the specified archive volume for a read operation. *qmgr-name* is the name of the queue manager.

System action

The archive log read service task issues message CSQJ021D and waits for the operator's reply. This wait affects the agent for which the log read was issued and any other agents that might be waiting on the log read service task queue.

Operator response

Locate the requested volume, ensure that a device is available, and reply 'Y'. MQ continues with dynamic allocation and begins reading the log.

If dual archiving is in effect, a response of 'N' causes archive read to reissue the message for the copy 2 archive VOLSER with the same RBA range. A response of 'N' to this second message, or to the initial message for single archiving, causes the archive read service task to be unsuccessful, with unpredictable results.

zm13800_

2.6.11. CSQJ011D: RESTART CONTROL *rrr* CREATED AT *>date time* ◀ FOUND. REPLY Y TO USE, N TO CANCEL

Explanation

During queue manager initialization, a conditional restart control record was found in the BSDS data set. Both the record identifier (a 4-byte hexadecimal number) and the creation time stamp are displayed to help identify the conditional restart record which will be used. If you want a conditional restart using that record, reply 'Y' to the message. Otherwise, reply 'N'.

System action

If 'Y' is the response, the queue manager is started conditionally, using the record found. If 'N' is the response, startup is terminated.

System programmer response

Respond as indicated.

If a normal restart has failed and you have created a conditional restart record with the change log inventory utility, check whether the time and date in the message agree with when you created that record. If they do, reply 'Y'. If they do not, reply 'N' and investigate the discrepancy.

zm13810_

2.6.12. CSQJ012E: ERROR *ccc* READING RBA *rrr* IN DATA SET **>*dsname*<**, CONNECTION-ID=*xxxx* THREAD-XREF=*yyyyyy*

Explanation

While scanning log records read into a buffer, MQ detected a logical error with reason code *ccc*. *rrr* is the log RBA of the segment in the buffer at which the error was detected. *dsname* is the name of the active or archive log data set from which the record was read. If *dsname* is blank, the data was read from an active log output buffer.

The connection ID and thread-xref identify the user or application that encountered the problem. Messages that have the same connection ID and thread-xref relate to the same user.

System action

The application program is terminated with reason code *ccc*. However, information in this message might be useful in diagnosing the abnormal termination that will follow.

System programmer response

See the [WebSphere MQ for z/OS System Administration Guide](#) for information about dealing with problems on the log.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

zm13820_

2.6.13. CSQJ013E: TERMINAL ERROR *ccc* IN BUFFER *rrr* BEFORE ACTIVE LOG WRITE

Explanation

A scan of the log output buffer, just prior to writing the buffer, detected an inconsistency in the log data. *ccc* is the reason code associated with the SDUMP that is produced. *rrr* is the log RBA at which the error was detected.

System action

The queue manager will terminate with a dump, and will not write the damaged buffer to either COPY 1 or COPY 2 active log data set.

System programmer response

Restart the queue manager after it terminates.

Because the damaged buffer has not been written to a log data set, the queue manager can be restarted. No corrective action is required.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

 This build: January 26, 2011 11:43:09

This topic's URL:

zm13830_

2.6.14. CSQJ014E: TERMINAL ERROR *ccc* IN BUFFER *rrr* AFTER ACTIVE LOG WRITE

Explanation

A scan of the log output buffer, after writing to the first copy of the active log data set and before writing to the second copy, detected an inconsistency in the log data. *ccc* is the reason code associated with the SDUMP that is produced. *rrr* is the log RBA at which the error was detected.

System action

The queue manager terminates with a dump, and does not write the damaged buffer to the COPY 2 data set.

System programmer response

The block containing the indicated log RBA might be damaged. The buffer was found to be in error at the completion of the write to the COPY 1 data set of the active log.

If dual active logs are being used, use the print log map utility (CSQJU004) to list the active log data sets for both copies of the active log. Find the COPY 2 data set with the corresponding RBA, and copy that data set (using Access Method Services REPRO) to the COPY 1 data set. Start the queue manager.

If only a single active log is used, contact the IBM® support center for assistance. An attempt to start the queue manager might succeed if the damage to the buffer occurred after completion of the write to DASD.

zm13870_

2.6.18. CSQJ030E: RBA RANGE *>startrba<* TO *endrba* NOT AVAILABLE IN ACTIVE LOG DATA SETS

Explanation

Previous errors have made the active log data sets (that contain the RBA range reported in the message) unavailable. The status of these logs is STOPPED in the BSDS.

System action

The queue manager terminates with a dump.

System programmer response

The log RBA range must be available for the queue manager to be recoverable. Correct the previous errors and restore the active log data sets that contain the RBA range reported in the message.

- If the log data sets are recoverable, the active log data set inventory in the BSDS must be modified to reset the STOPPED status. Use the print log map utility (CSQJU004) to obtain a copy of the BSDS log
- http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm 16/03/2011

inventory. Next, use the change log inventory utility (CSQJU003) to delete the active log data sets marked STOPPED (use the DELETE statement), then add them again (use the NEWLOG statement). The starting and ending RBA for each active log data set must be specified on the NEWLOG statement when the logs are added back to the BSDS using the change log inventory utility.

- If the log data sets are not recoverable, see the [WebSphere MQ for z/OS System Administration Guide](#) for information about dealing with problems on the log.

Problem determination

Examine previous messages to determine the reason the active log data sets are unavailable.

2.6.22. CSQJ070E: *csect-name* ARCHIVE LOG DSN PREFIX NOT IN PROPER FORMAT TO RECEIVE TIME STAMP DATA. TIME STAMPING OF *dsname* BYPASSED

Explanation

The system parameters (set by CSQ6ARVP) specify that the date and time of creation of an archive log data set be included as part of the archive log data set name (DSN). To accomplish this, MQ requires that the length of the archive log data set name prefix is limited. If the prefix requirement is not met, this message is issued just prior to the allocation of the archive log data set specified in the message.

System action

The archive log data set will be allocated using the archive log prefix. However, the archive log DSN will not contain the date and time as the user requested.

System programmer response

The system parameters for the log archive function must be changed. Specifically, the TSTAMP and ARCPFXn fields are not consistent with one another. For information about the actions required to eliminate this

problem, see the [WebSphere MQ for z/OS System Setup Guide](#), under the CSQ6ARVP macro subtopic.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

2.6.23. CSQJ071E: *csect-name* TIMER FAILURE CAUSED TIME STAMPING OF ARCHIVE *dsname* TO BE BYPASSED

Explanation

The system parameters (set by CSQ6ARVP) specify that the date and time of creation of an archive log data set be included as part of the archive log data set name (DSN). However an attempt to get the current date and time from the system was unsuccessful. This message is issued just prior to the allocation of the archive log data set specified in the message.

System action

The archive log data set will be allocated using the archive log prefix. However, the archive log DSN will not contain the date and time as the user requested.

2.6.24. CSQJ072E: ARCHIVE LOG DATA SET *dsname* HAS BEEN ALLOCATED TO NON-TAPE DEVICE AND CATALOGED, OVERRIDING CATALOG PARAMETER

Explanation

The system parameters (set by CSQ6ARVP) specify that all archive log data sets should be uncataloged (CATALOG=NO). However, MQ requires that all archive log data sets allocated to non-tape devices must be cataloged. The archive log data set specified by *dsname* has been allocated to a non-tape device, and has thus been cataloged. The user's system parameter CATALOG setting of NO has been overridden.

System action

The archive log data set has been allocated to a nontape device, and has been cataloged. The system parameter CATALOG=NO setting has been overridden. The BSDS reflects that the data set has been cataloged.

System programmer response

The archive system parameters must be changed. Specifically, the CATALOG and UNIT parameters are not consistent with one another. For information about the actions required to eliminate this problem, see the [WebSphere MQ for z/OS System Setup Guide](#), under the CSQ6ARVP macro subtopic.

2.6.25. CSQJ073E: LOG ARCHIVE UNIT ALLOCATION FAILED, REASON CODE=>ccc<. ALLOCATION OR OFFLOAD OF ARCHIVE LOG DATA SET MAY FAIL

Explanation

While building the SVC99 text entries to allocate a new archive log data set dynamically, a unit allocation error was detected. The reason code, indicated by ccc in the message, further clarifies the problem as follows:

4-28 (X'4'-X'1C')

Return code from z/OS® IEFGB4UV macro. Common values are:

4 (X'04')

Invalid unit name

8 (X'08')

Unit name has incorrect units assigned

16 (X'10')

No storage available

20 (X'14')

Device numbers not valid

32 (X'20')

MQ was able to obtain a list of devices corresponding to the device type (unit name) specified in the system parameters. However, it was determined that this list contained a mixture of tape and nontape devices.

36 (X'24')

Nonfetch-protected storage could not be obtained to build a parameter list for a z/OS service.

40 (X'28')

The device type (unit name) specified by the user in the system parameters is valid. However, no devices are currently associated with the given device type (unit name).

44 (X'2C')

The device type (unit name) specified by the user in the system parameters is valid. However, no DASD volumes are available with a volume use attribute of *storage*.

System action

This message is issued after the SVC99 text entries are built, but prior to the allocation of the new archive log data set. As a result of the error, the dynamic allocation of the archive log data set will be attempted using standard default values. The standard default values are generally acceptable; however, the allocation might be unsuccessful or the subsequent offload might produce undesirable processing results. For example:

- A reason code of 4 or 44 (X'2C') indicates an allocation error (CSQJ103E) when the SVC99 is issued for the archive data set.
- Offload processing to tape might be unsuccessful. MQ uses a volume count of 20 when allocating to tape, and uses the standard z/OS volume count default of 5 volumes when writing to non-tape devices. In the case of most of the above errors, it would be impossible for MQ to determine the device type on which the data set is to be allocated. Therefore, the standard z/OS default is assumed for the volume count. If the data set is successfully allocated to a tape device, and the volume of data is such that more than five volumes will be used for the archive data set, the offload processing will receive a z/OS completion code X'837-08' with message IEC028I when attempting to write to the sixth tape volume.
- Offload processing to a direct access device might be unsuccessful. When allocating a new archive log

data set on a direct access device, MQ will use a unit count to facilitate multivolume archive data sets. With most of the above errors, it might be impossible for MQ to correctly determine the type of device on which the data set is to be allocated. Therefore, the standard default (1) is assumed for the unit count. If the data set is successfully allocated to a direct access device, and during the offload processing it becomes necessary to extend the data set to another device, the offload processing will receive a z/OS X'B37' (out of space) completion code, and the archive log data set will be deallocated.

System programmer response

The required action is based on the reason code indicated in the message:

4-28 (X'4'-X'1C')

See the *MVS™ Authorized Assembler Services Guide* for more info about the return code from the z/OS IEFGB4UV macro. The most likely causes for the common values are:

4 (X'04')

Incorrect specification in the archive system parameters. Correct the UNIT parameter. If the UNIT parameter from the archive system parameters appears to be correct, check the EDT to ensure that the esoteric or generic unit name specified in the parameters is actually in the EDT. Subsequent offload processing will archive the log data which could not be previously archived due to the allocation error (CSQJ103E).

8 (X'08')

Incorrect specification in archive system parameters, incorrect operational setup.

16 (X'10')

This is usually a temporary problem. If the allocation of the archive log data set is successful, no action is required to correct this situation. If this is a recurring problem, sufficient page space is not available, and the region size for the queue manager address space might have to be increased, or standard z/OS diagnostic procedures might have to be used to correct the problem.

20 (X'14')

Incorrect specification in archive system parameters, incorrect operational

32 (X'20') or 40 (X'28')

To correct this situation, change the archive system parameter UNIT to use a device type (unit name) that contains homogenous devices, or modify the device list associated with the device type (unit name) using a system generation to supply a list of homogenous devices.

44 (X'2C')

To correct this situation, issue the z/OS command MOUNT to change the volume use attribute of a mounted private volume to storage. If this is a recurring problem, you might have to do one of the following:

- Perform a system generation to add permanently resident volumes with a volume use attribute of storage to the esoteric or generic unit
- Change the archive system parameters to use a different esoteric or generic unit name for the UNIT

2.6.26. CSQJ077E: LOG OR BSDS READ ERROR FOR QMGR **>qmgr-name<**, REASON CODE=*ccc*

Explanation

This message identifies a queue manager whose log data cannot be accessed. The logs or BSDSs of other queue managers in a queue-sharing group may be accessed during a RECOVER CFSTRUCT operation **>**or

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

during the rebuild of peer administration structures that might occur on a queue manager in a queue-sharing group. ◀

System action

The execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

System programmer response

Look for earlier messages which may identify more specifically the data set being accessed and the problem.

If you are unable to solve the problem, note the reason code, collect the following items, and contact your IBM® support center:

- System dump
- Console output for the issuing queue manager
- Console output for the other queue manager
- Printout of SYS1.LOGREC

2.6.27. CSQJ098E: *csect-name* RESTART CONTROL ENDLRSN *rrr* IS NOT IN KNOWN LRSN RANGE. QUEUE MANAGER STARTUP IS TERMINATED

Explanation

A conditional restart control record requests truncation, but it cannot take place because the end LRSN was not in the range of LRSN values known to either the active or archive logs. *rrr* is the end LRSN specified in the active record. The end LRSN is either higher than the end LRSN of the most recent active log data set, or lower than the starting LRSN of the oldest archive log data set.

System action

Queue manager startup is terminated.

System programmer response

Check the ENDLRSN value specified in the conditional restart control record. If it is not correct, run the change log inventory utility (CSQJU003) using CRESTART CANCEL cancel the conditional restart, and a new CRESTART specifying the correct ENDLRSN.

zm13980_

2.6.29. CSQJ100E: *csect-name* ERROR OPENING BSDSn DSNAME=>dsname<, ERROR STATUS=eeii**Explanation**

During startup, or while processing a RECOVER BSDS command, MQ could not open the specified BSDS. BSDSn matches the DDname in the queue manager started task JCL procedure (xxxxMSTR) of the data set that cannot be opened. The value of *n* is 1 or 2. The error status contains the VSAM open return code in *ee*, and the VSAM open reason code in *ii*.

System action

When this error occurs at initialization time, startup must be terminated, because the log data sets cannot be determined and allocated without the BSDS. When this error occurs during RECOVER BSDS processing, the command is terminated, and the queue manager continues in single BSDS mode.

System programmer response

Recover the BSDS that cannot be opened. See the [WebSphere MQ for z/OS System Administration Guide](#) for information about dealing with problems on the BSDS or the log.

Problem determination

The error status contains the VSAM open return code in *ee*, and the VSAM open reason code in *ii*. See the *DFSMS/MVS Macro Instructions for Data Sets* manual for a list of the VSAM OPEN return codes and reason codes, and the steps required to take corrective action.

2.6.30. CSQJ101E: *csect-name* RESTART CONTROL ENDRBA *rrr* IS

NOT IN KNOWN RBA RANGE. QUEUE MANAGER STARTUP IS TERMINATED

Explanation

A conditional restart control record requests truncation, but it cannot take place because the end RBA was not in the range of RBA values known to either the active or archive logs. *rrr* is the end RBA specified in the active record. The end RBA is either higher than the end RBA of the most recent active log data set, or lower than the starting RBA of the oldest archive log data set.

System action

Queue manager startup is terminated.

System programmer response

Check the ENDRBA value specified in the conditional restart control record. If it is not correct, run the change log inventory utility (CSQJU003) using CRESTART CANCEL cancel the conditional restart, and a new CRESTART specifying the correct ENDRBA.

Otherwise, then most likely, the archive log data set that contained the requested RBA has been deleted from the BSDS data set by the change log inventory utility. Locate the output from an old print log map utility and identify the data set that contains the missing RBA. If the data set has not been reused, run the change log inventory utility to add this data set back into the inventory of log data sets. Restart the queue manager.

2.6.31. CSQJ102E: LOG RBA CONTENT OF LOG DATA SET DSNAME=>*dsname*<, STARTRBA= *sss* ENDRBA=*ttt*, DOES NOT AGREE WITH BSDS INFORMATION

Explanation

The log RBA range shown in the BSDS for the specified data set does not agree with the content of the data set.

System action

Startup processing is terminated.

System programmer response

Use the print log map and change log inventory utilities to make the BSDS consistent with the log data sets.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

This topic's URL:

zm14010_

2.6.32. CSQJ103E: *csect-name* LOG ALLOCATION ERROR DSNAME=*dsname*, ERROR STATUS=*eeeeiiii*, SMS REASON CODE= >*SSSSSSSS*<

Explanation

An error occurred while attempting to allocate the active or archive log data set indicated by DSNAME. STATUS indicates the error reason code returned by z/OS® dynamic allocation (SVC99).

This message might be preceded by message CSQJ073E.

System action

Subsequent actions depend on the type of data set involved.

For active log data sets, if the error is encountered during queue manager initialization, startup is terminated. If two copies of the active log data sets are defined, this message appears only once.

For archive log data sets, if two copies of the archive log data sets are defined, processing continues on the remaining archive log data set.

System programmer response

The error status portion of this message contains a 2-byte error code (*eeee*, S99ERROR) followed by the 2-byte information code (*iiii*, S99INFO) from the SVC99 request block. If the S99ERROR code indicates an SMS allocation error ('97xx'), then *ssssssss* contains additional SMS reason code information obtained from S99ERSN. See the *MVS™ Authorized Assembler Services Guide* manual for a description of these codes.

For active log data sets, if the problem occurred during queue manager initialization, you can resolve the problem by doing one of the following:

- Resolve the error associated with the active log data set as indicated by STATUS
- Provide another copy of the active log data set, using Access Method Services
- Update the BSDS with the change log inventory utility (CSQJU003)
- Restart the queue manager

For archive log data sets:

- If the problem occurred during allocation with the intent to write the data set, no immediate action is required. However, if you do not resolve the SVC99 error (indicated by the STATUS value in the message), the available space in the active log could eventually be exhausted (CSQJ111A) because all future offloads might be unsuccessful because of the same error.
- If the problem occurred during allocation with the intent to read the data set, determine the problem, and use the change log inventory utility (CSQJU003) DELETE function to delete the archive log data set from the BSDS archive log inventory. Then use the NEWLOG function to add the data set back into the archive log inventory, pointing to the correct volume and device.

See the [WebSphere MQ for z/OS System Administration Guide](#) for information about dealing with problems on the log.

This message might also be issued as the result of a user error. If STATUS displays a value of '17080000', you might have one or more active log data sets defined in the BSDS, but not allocated on DASD. To correct the situation, print the contents of the current active log data set inventory using the print log map utility (CSQJU004), then either:

- Use Access Method Services to allocate the active log data set for each active log data set listed in the BSDS, but not actually allocated on DASD. You can find the Access Method Services command syntax for active log data sets in the CSQ4BSDS sample JCL.
- Use the change log inventory utility (CSQJU003) DELETE statement to delete the errant active log data set name, and the NEWLOG statement to add the correct name to the active log data set inventory. The name specified on the NEWLOG statement must be the same as the name of the actual active log data set allocated on DASD.

This topic's URL:

zm14020_

2.6.33. CSQJ104E: *csect-name* RECEIVED ERROR STATUS *nnn* FROM *>macro-name<* FOR DSNAME *dsname*

Explanation

An error occurred while issuing macro *macro-name*. Error status is the return code from the specified macro:

- For an OPEN of a VSAM data set, the return code in the error field of the Access Method Services control block is included in this message as the error status value. See the *DFSMS/MVS Macro Instructions for Data Sets* manual for a description of these values.
- If the OPEN was for a non-VSAM data set, the error status is zero.
- For MMSRV errors, error status contains the error information returned by media manager services. If an MMSRV CATUPDT error occurs attempting to truncate an active log data set, the log data set will be unavailable and the status of the log data set will be flagged as STOPPED in the BSDS.
- For VSAM OPEN and MMSRV errors, this message is preceded by an IEC161I message that defines the error that occurred.
- For a PROTECT of an archive log data set, the return code is from DADSM PROTECT. See the *MVS/ESA System - Data Administration* manual for details of the return code.

See the [WebSphere MQ for z/OS System Administration Guide](#) for information about dealing with problems on the log.

System action

Subsequent actions depend on when the error occurred.

During queue manager initialization, startup is terminated.

When using the data set either for offload or for input operations, processing continues. If a second copy of the data is available, MQ attempts to allocate and open the second data set.

When using the data set as an active log data set, MQ attempts to retry the request. If the retry is unsuccessful, the queue manager is terminated.

During checkpoint processing, where MQ attempts to locate the oldest active or archive log data sets that are required for restart recovery of page sets and restart and media recovery of CF structures, processing continues. The message is a warning that either restart recovery would fail or media recovery of CF structures would fail. It is most likely to occur when all CF application structures are not being regularly backed up, thereby requiring excessively old log data sets for recovery.

System programmer response

If the error occurred during initialization, either correct the problem so that the data set is available or provide another copy of the data set and change the BSDSs to point to the new data set.

If the error occurred after startup, the return code should be reviewed and the appropriate action taken to correct the problem, so that the data set can be used at a later time, or the data set entry can be removed from the BSDS using the change log inventory utility.

If the error was received from PROTECT, there might be a problem with the PASSWORD data set. See the appropriate DADSM publication to determine the cause of the problem. When the problem has been corrected, ensure the archive log data sets receiving the error are added to the PASSWORD data set. If these archive log

data sets are not added to the PASSWORD data set, archive read will not be able to OPEN these data sets. If you do not have information about the named macro, note the macro name and the return code and contact your IBM® support center for help.

If the error occurred during checkpoint processing, issue the DISPLAY USAGE TYPE(DATASET) command to show which log data sets are currently required for page set and media recovery, and ensure that they are available. If applicable, use the BACKUP CFSTRUCT command for your CF structures, and institute a procedure to back up your CF structures frequently.

This topic's URL:

zm14030_

2.6.34. CSQJ105E: *csect-name* LOG WRITE ERROR DSNAME=**>dsname<**, LOGRBA=*rrr*, ERROR STATUS=*ccccffss*

Explanation

An error occurred while writing a log data set. If *csect-name* is CSQJW107, the error occurred writing the log buffers to an active log data set. If *csect-name* is CSQJW207, the error occurred while preformatting the next control area before writing log data into it.

Error status contains the error information returned by media manager in the form *ccccffss*, where *cccc* is a 2-byte return code that describes the error, *ff* is a 1-byte code that defines the functional routine that detected the error, and *ss* is the 1-byte status code that defines a general category of error.

System action

If the dual active logging option is selected, the MQ switches to the next data set for this copy. If the next data set is not ready, MQ temporarily enters single logging mode and allocates a replacement data set for the one that encountered the error. Dual logging is resumed as soon as possible.

If single active logging option is selected and the next data set is not ready, MQ waits for that data set to be available. In this case, log writing is inhibited until the replacement is ready for output.

System programmer response

See the *MVS/DFP Diagnosis Reference* manual for information about return codes from the media manager. If you are unable to resolve the problem, note the return code, and contact your IBM® support center.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

 This build: January 26, 2011 11:43:11

This topic's URL:

zm14040_

2.6.35. CSQJ106E: LOG READ ERROR DSNAME=**>dsname<**, LOGRBA=*rrr*, ERROR STATUS=*ccccffss*

Explanation

An error occurred while reading an active log data set. The error status contains the error information returned

by the media manager in the form *ccccffss*, where *cccc* is a 2-byte return code that describes the error, *ff* is a 1-byte code that defines the functional routine that detected the error, and *ss* is the 1-byte status code that defines a general category of error. (See the *MVS/DFP Diagnosis Reference* manual for information about return codes from the media manager.)

System action

If another log data set contains the data, MQ attempts to read the data from the alternate source. If an alternate source is not available, a read error return code is sent to the program requesting the log data. Depending on the circumstances under which the failure occurred, the queue manager might continue with the alternate log data set if dual logging is used, or end abnormally.

System programmer response

If you are using dual logging, the requested RBA was probably retrieved from the corresponding dual active log data set, and no immediate response is necessary. However, if this error occurs frequently, or if you are using single logging, immediate attention might be required. If so, note the contents of the error status field, and contact your IBM® support center for help.

It might be necessary to replace the data set in error with a new data set containing the log data, and to update the BSDSs to reflect the new data set using the change log inventory (CSQJU003) NEWLOG operation.

See the [WebSphere MQ for z/OS System Administration Guide](#) for information about dealing with problems on the log.

This message might also be issued as the result of a user error. If the data set name specified by DSNAME is missing, and STATUS displays a value of '00180408' or '00100408', you are using dual logging, but only one set of active log data sets is defined in the BSDS. To resolve this condition, do either of the following:

- Define a second set of active log data sets using Access Method Services (if they are not defined already), and update the BSDS log inventory using the change log inventory (CSQJU003) NEWLOG operation. See the [WebSphere MQ for z/OS System Administration Guide](#) for information about using the change log inventory utility.
- Reset the log system parameters to indicate single logging. You can do this by setting TWOACTV to 'NO' in the CSQ6LOGP system parameters.

zm14050_

2.6.36. CSQJ107E: READ ERROR ON BSDS DSNAME=*dsname* ERROR STATUS=>*eee*<

Explanation

An error occurred while reading the specified BSDS. Error Status contains the VSAM return and feedback codes. It is a 2-byte field with the first byte containing the hexadecimal return code and the second containing the hexadecimal feedback code. See the *DFSMS/MVS Macro Instructions for Data Sets* manual for a description of VSAM return and reason codes.

See the [WebSphere MQ for z/OS System Administration Guide](#) for information about dealing with problems on the BSDS or the log.

System action

If dual BSDSs are available, MQ attempts to read from the other BSDSs. If the read from the second BSDS fails or if there is only one BSDS, an error code is returned to the log request that caused access to the BSDS.

If the read error is detected during startup, the queue manager terminates.

System programmer response

It might be necessary to replace or repair the BSDS, depending on what conditions resulted from the read error. To replace a BSDS, first delete the BSDS in error, then define the new BSDS with the same name and attributes. If a new name is used for the new BSDS, change the queue manager started task JCL procedure (xxxxMSTR) to specify the new BSDS name.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

This topic's URL:

zm14060_

2.6.37. CSQJ108E: WRITE ERROR ON BSDS DSNAME=*dsname* ERROR STATUS=>*eee*<

Explanation

An error occurred while writing to the specified BSDS. Error Status contains the VSAM return and feedback codes. It is a 2-byte field with the first containing the hexadecimal return code and the second containing the hexadecimal feedback code. See the *DFSMS/MVS Macro Instructions for Data Sets* manual for a description of VSAM return and reason codes.

System action

If dual BSDSs are available, MQ enters single BSDS mode using the remaining good BSDS. Otherwise, an error code is returned to the log request that caused access to the BSDS.

System programmer response

If dual BSDS mode is being used, run an offline Access Method Services job to rename the error BSDS and define a new BSDS with the same name. Then enter the RECOVER BSDS command to reestablish dual BSDS mode.

If dual BSDS mode is not being used, the queue manager must be shut down, and the BSDS must be recovered from a backup copy. To recover the BSDS, use the change log inventory utility.

2.6.38. CSQJ109E: OUT OF SPACE IN BSDS DSNAME=*dsname*

Explanation

There is no more space in the specified BSDS. The operation that encountered the out-of-space condition did not complete properly.

System action

If dual BSDSs are available, MQ enters single BSDS mode using the remaining good BSDS. Otherwise, an error code is returned to the log request that caused access to the BSDS.

System programmer response

If dual BSDS mode is being used, run an offline Access Method Services job to rename the full BSDS and define a new, larger BSDS with the same name. Enter the RECOVER BSDS command to reestablish dual BSDS mode.

If dual BSDS mode is not being used, the queue manager must be shut down and the BSDS recovered offline. In this case, run the same Access Method Services job mentioned above to rename the full data set and define a larger data set. Next, run an Access Method Services REPRO job to copy the full BSDS into the new BSDS.

2.6.39. CSQJ110E: LAST COPY *n* ACTIVE LOG DATA SET IS *nnn* PERCENT FULL

Explanation

This message is issued when the last available active log data set is 5% full, and is reissued after each additional 5% of the data set space is filled.

System action

Each time the message is issued, the offload processing will be re-attempted. If the situation is not corrected, the active log data set will fill to capacity, message CSQJ111A will be issued, and MQ processing will stop.

System programmer response

To clear this condition, you must take steps to complete other waiting offload tasks. Once an active log data set is made available (reusable) by completing the offload process for it, the MQ logging activity can continue.

Perform a display request to determine the outstanding requests related to the log offload process. Take the necessary action to satisfy any requests, and permit offload to continue.

Consider whether there are sufficient active log data sets. If necessary, additional log data sets can be added dynamically using the DEFINE LOG command.

If offload does not complete normally or cannot be initiated, either correct the problem that is causing the offload process error, increase the size of the allocated data sets, or add more active log data sets. Note that the latter action requires the queue manager to be inactive and the change log inventory utility to be run.

Possible causes for the shortage of active log data space are:

- Excessive logging. For example, there is a lot of persistent message activity.
- Delayed or slow offloading. For example, failure to mount archive volumes, incorrect replies to offload messages, or slow device speeds.
- Excessive use of the ARCHIVE LOG command. Each invocation of this command causes MQ to switch to a new active log data set and to initiate an offload of the active log. Although the command will not be processed when only one active log data set remains in a copy of the active log (see CSQJ319I), excessive use of the command could have consumed all space in the active log except the current active log data sets.
- Offloads were unsuccessful.

- Insufficient active log space.

zm14090_

2.6.40. CSQJ111A: OUT OF SPACE IN ACTIVE LOG DATA SETS

Explanation

Due to delays in offload processing, all available space in all active log data sets has been exhausted. Recovery logging cannot continue.

System action

MQ waits for an available data set. Any tasks performing MQ API calls that require logging will wait.

System programmer response

Perform a display request to ensure that there are no outstanding requests that are related to the log offload process. Take the necessary action to satisfy any requests, and permit offload to continue.

Consider whether there are sufficient active log data sets. If necessary, additional log data sets can be added dynamically using the DEFINE LOG command.

If the delay was caused by the lack of a resource required for offload, the necessary resource must be made available to allow offload to complete and thus permit logging to proceed. For information about recovery from this condition, see the [WebSphere MQ for z/OS System Administration Guide](#).

If the problem occurred because archiving was set off, or because archive data sets could not be allocated, or for any other reason that requires the system parameters to be changed, the queue manager must be canceled as neither STOP MODE(QUIESCE) nor STOP MODE(FORCE) commands will work.

To free any tasks that are waiting because they were performing MQ API calls that require logging, you must solve the underlying problem, or cancel the queue manager.

If the offload process has stalled because some resource is not available or for some other reason, it may be possible to resolve the problem by canceling the currently executing offload task using the ARCHIVE LOG CANCEL OFFLOAD command, and then starting another. If there are hardware problems, it may be necessary to use z/OS® commands to cancel the devices with problems.

This topic's URL:

zm14100_

2.6.41. CSQJ112E: *csect-name* INSUFFICIENT ACTIVE LOG DATA SETS DEFINED IN BSDS

Explanation

There are not enough active log data sets defined in the BSDS to start the queue manager. This condition
http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm 16/03/2011

usually exists for one of the following reasons:

- Fewer than two data sets are defined for one of the active log copy sets.
- The CSQ6LOGP system parameters specified TWOACTV=YES but data sets for two copies of active log are not defined in BSDS.
- Fewer than two data sets are available (not flagged as STOPPED) for one of the active log copy sets.

System action

Startup is terminated.

System programmer response

Use the change log inventory utility to make the number of active log data sets defined in the BSDS consistent with the system parameters specified in CSQ6LOGP, or to add further active log data sets so that there are two or more active log data sets available for use in each active log copy. Restart the queue manager.

Note: Log data sets that are flagged as STOPPED will not be reused by MQ. Once the queue manager has been restarted you might need to recover STOPPED log data sets. To clear the STOPPED status:

1. Stop the queue manager
2. Recover the log data set (either redefined or recovered from the other copy of the log)
3. Delete and re-add to the BSDS (using the change log inventory utility) with the appropriate RBAs

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

zm14110_

2.6.42. CSQJ113E: RBA *>log-rba<* NOT IN ANY ACTIVE OR ARCHIVE LOG DATA SET, CONNECTION-ID=xxxx THREAD-XREF=yyyyyy

Explanation

There was a request to read the log record starting at this RBA. However, this log record cannot be found in any active or archive log data set. The connection ID and thread-xref identify the user or application that encountered the problem (this could be an internal MQ task). See the [WebSphere MQ for z/OS System Administration Guide](#) for information about dealing with problems on the log.

System action

Depending upon what log record is being read and why, the requestor might end abnormally with a reason code of X'00D1032A'.

System programmer response

Probable user error. Most likely, the archive log data set that contained the requested RBA has been deleted from the BSDS by the change log inventory utility. Locate the output from an old print log map run, and identify the data set that contains the missing RBA. If the data set has not been reused, run the change log inventory utility to add this data set back into the inventory of log data sets. Restart the queue manager.

2.6.43. CSQJ114I: ERROR ON ARCHIVE DATA SET, OFFLOAD CONTINUING WITH ONLY ONE ARCHIVE DATA SET BEING GENERATED

Explanation

An error occurred while accessing one of the archive data sets being created by offload. Because the dual archive option is specified, offload is continuing with the other archive data set. For the RBA range being offloaded, there is only one copy of archive instead of the usual two copies.

System action

Offload produces a single archive data set.

System programmer response

A second copy of this archive log data set can be made, and the BSDSs can be updated with the change log inventory utility.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

zm14130_

2.6.44. CSQJ115E: OFFLOAD FAILED, COULD NOT ALLOCATE AN ARCHIVE DATA SET

Explanation

Offload could not allocate an archive log data set. The offload was not performed. This message is preceded by message CSQJ103E or CSQJ073E.

Note: If you are using the dual archiving option, neither copy is made.

System action

Offload will be tried at a later time.

System programmer response

Review the error status information of message CSQJ103E or CSQJ073E. Correct the condition that caused the data set allocation error so that, on retry, the offload can take place.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

2.6.49. CSQJ120E: DUAL BSDS DATA SETS HAVE UNEQUAL TIME STAMPS, SYSTEM BSDS1=>sys-bsds1<, BSDS2=sys-bsds2, UTILITY BSDS1=uty-bsds1, BSDS2=uty-bsds2

Explanation

When the queue manager was initialized, the time stamps of the dual BSDS did not agree. The time stamps from the system and from the change log inventory utility are shown for each BSDS. The time stamps have the format `date hh:mm:ss.th`.

System action

The queue manager attempts to re-synchronize the BSDS data sets to restore dual BSDS mode. If re-synchronization is successful, message CSQJ130I is issued and startup continues. Otherwise, startup is terminated.

System programmer response

If startup fails, run the print log map utility against each BSDS. From the output, determine which data set is obsolete, delete it, define a replacement for it, and copy the remaining BSDS to the replacement.

If output from the print log map utility for both data sets is similar, delete the data set with the oldest time stamp, and copy the data set with the most recent time stamp.

2.6.53. CSQJ124E: OFFLOAD OF ACTIVE LOG SUSPENDED FROM RBA xxxxxx TO RBA xxxxxx DUE TO I/O ERROR

Explanation

During offload, an unrecoverable input/output error was encountered on an active log data set. The data set experiencing the error is marked unusable, and no further logging is done to that data set.

System action

Active log data sets continue to be offloaded as they become full.

System programmer response

Recover the data manually from the data set, copy it to an archive data set, run the change log inventory utility to make the new archive data set available to the queue manager, and remove the error-prone active log data set.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

This topic's URL:

zm14230_

2.6.54. CSQJ125E: ERROR COPYING BSDS, OFFLOAD CONTINUING WITHOUT THE BSDS COPY

Explanation

An error occurred while copying the BSDS data set during the offload process. The data set is not produced, and the volume containing the offloaded data set does not contain a BSDS for recovery use.

System action

The queue manager continues the offload process without producing a copy of the BSDS.

System programmer response

When archiving occurs, both a copy of the active log data set, and the BSDS at that time, are dumped. The BSDS is not critical because it will be copied again with the next archive log (the missing one simply means an extended restart time). However, the underlying data management problem (for example, not enough space allocated) should be resolved for subsequent BSDS offloads to occur.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

 This build: January 26, 2011 11:43:12

This topic's URL:

zm14250_

2.6.56. CSQJ127I: SYSTEM TIME STAMP FOR BSDS=>date time<

Explanation

When the queue manager is initialized, the system time stamp for the BSDS is displayed. The time stamp is of
http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm 16/03/2011

the format `date hh:mm:ss.th`. This time stamp should be close to the last time at which this queue manager was stopped. If not, it might indicate a restart is being attempted with the wrong BSDS.

The time stamp will show as `'*****'` if the BSDS has not been used before.

System action

Startup continues.

System programmer response

If the time displayed is not close to the time this queue manager was last stopped, and you cannot explain any time discrepancy, cancel the queue manager. From the queue manager started task JCL procedure `xxxxMSTR`, determine the data set names of the BSDSs and run the print log map utility. Check whether the active and archive log data sets all belong to this queue manager. If not, then change the started task JCL procedure `xxxxMSTR` for the queue manager to use the correct BSDSs.

This topic's URL:

zm14260_

2.6.57. CSQJ128E: LOG OFFLOAD TASK FAILED FOR ACTIVE LOG *dsname*

Explanation

The offload task ended abnormally while attempting to offload the RBA range in active log data set *dsname*.

System action

The offload task terminates and the archive data sets allocated to the offload task are deallocated and deleted. The status of the active log data sets involved in the unsuccessful offload processing remains set to `'not reusable'`.

The log offload task will be reinitiated by one of several events. The most common are:

- All the available space in the current active log data set has been used (normal case)
- A CSQJ110E message is issued
- The queue manager address space is started, but data in the active log has not been archived
- An I/O error occurs on the active log, which will force the queue manager to truncate and offload the active log data set, and switch to a new active log data set

System programmer response

This message is the result of an offload error, and will be preceded by one or more MQ messages (for example, CSQJ073E) and z/OS® messages (for example, IEC030I, IEC031I, IEC032I). If the queue manager is operating with restricted active log resources (see message CSQJ110E), quiesce the system to restrict logging activity until the abnormal termination or the CSQJ110E condition can be resolved.

Investigate and correct the cause of the abnormal termination before the offload is attempted again by the queue manager.

Problem determination

This message is the result of an offload error and will be preceded by one or more MQ messages and z/OS messages. See the appropriate manual for the associated MQ and z/OS messages to formulate a course of

corrective action. Use the print log map utility (CSQJU004) to print the BSDS (both copies if running in dual mode), then use the CSQJU004 output to determine the current status of the active and archive log data sets.

This message can be generated for a variety of reasons. However, the most likely are:

- Archive log data set allocation errors. See the text for message CSQJ103E for corrective action.
- The size of the archive log data set is too small to contain the active log data sets during offload processing. All secondary space allocations have been used. This condition is normally accompanied by z/OS message IEC030I.
- All available space on the DASD volumes to which the archive data set is being written has been exhausted. This condition is normally accompanied by z/OS message IEC032I.
- The primary space allocation for the archive log data set (as specified in the system parameters) is too large to allocate to any available online DASD device. This condition is normally accompanied by z/OS message IEC032I.

2.6.58. CSQJ129E: END OF LOG RBA *eol-rba* COULD NOT BE FOUND IN ANY ACTIVE LOG DATA SET, HIGHEST RBA FOUND WAS *hi-rba*

Explanation

There was a request to find *eol-rba*, the log record that has been recorded in the BSDS as the highest RBA written. This RBA cannot be found in any active log data set. The highest RBA which could be found in any active data set was *hi-rba*.

System action

Startup processing is terminated.

System programmer response

Most likely, the active log data set containing the requested RBA has been deleted from the BSDS by the change log inventory utility. If the data set has not been reused, run the change log inventory utility to add this data set back into the BSDS. Restart the queue manager.

If the data set is not available, contact your IBM® support center.

2.6.62. CSQJ133E: LRSN *rrr* NOT IN ANY ACTIVE OR ARCHIVE LOG DATA SET, CONNECTION-ID=*xxxx* THREAD-XREF=*>yyyyyy<*, QMGR=*qmgr-name*

Explanation

There was a request to read the log record starting at this LRSN *>for<* the indicated queue manager (which might not be the issuer of the message). However, this log record cannot be found in any active or archive log data set. The connection ID and thread-xref identify the user or application that encountered the problem (this could be an internal MQ task). See the [WebSphere MQ for z/OS System Administration Guide](#) for information about dealing with problems on the log.

System action

Depending upon what log record is being read and why, the requestor might end abnormally with a reason code of X'00D1032A'.

System programmer response

This is probably a user error. Most likely, the archive log data set that contained the requested RBA has been deleted from the BSDS by the change log inventory utility. Locate the output from an old print log map run, and identify the data set that contains the missing LRSN. If the data set has not been reused, run the change log inventory utility to add this data set back into the inventory of log data sets. Restart the queue manager.

2.6.63. CSQJ134E: RBA *log-rba* NOT IN ANY ACTIVE OR ARCHIVE LOG DATA SET, CONNECTION-ID=*xxxx* THREAD-XREF=*yyyyyy*, QMGR=*qmgr-name*

Explanation

There was a request to read the log record starting at this RBA for the indicated queue manager. However, this log record cannot be found in any active or archive log data set. The connection ID and thread-xref identify the user or application that encountered the problem (this could be an internal MQ task). See the for information about dealing with problems on the log.

System action

Depending upon what log record is being read and why, the requestor might end abnormally with a reason code of X'00D1032A'.

System programmer response

This is probably a user error. Most likely, the archive log data set that contained the requested RBA has been deleted from the indicated queue manager's BSDS by the change log inventory utility. Locate the output from an old print log map run, and identify the data set that contains the missing RBA. If the data set has not been reused, run the change log inventory utility to add this data set back into the inventory of log data sets.

2.6.64. CSQJ136I: UNABLE TO ALLOCATE TAPE UNIT FOR CONNECTION-ID=xxxx CORRELATION-ID=>yyyyyy<, *m* ALLOCATED *n* ALLOWED

Explanation

An attempt to allocate a tape unit for the indicated connection ID failed. The current maximum tape unit specified is *n*, but only *m* are physically available.

System action

The process for the connection ID and correlation ID is held until either an allocated tape unit becomes free or more tape units are varied online and made available to the archive read task. This situation rectifies itself over time as currently allocated tape units become available.

Operator response

To improve throughput, vary additional tape units online and make them available to MQ. Note that an archive process rescan is not attempted until the SET LOG command is issued or an allocated tape dismounts.

2.6.66. CSQJ140I: Data set *dsname* successfully added to active log copy *n*

Explanation

A DEFINE LOG command has dynamically added a new log data set, *dsn*, and added it to either the LOGCOPY1 or LOGCOPY2 ring of active log data sets, as indicated by *n*.

The new active log data set is eligible to be used when the current active log data set fills and logging switches to the next active log data set in the ring.

Information about the data set is stored in the BSDS and will persist over a restart of the queue manager.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

2.6.68. CSQJ142I: Data set *dsname* has been used previously

Explanation

MQ checks that a data set being added by a DEFINE LOG command has not been previously used as a log data set, as this might be an indication of operator error. The requested data set *dsname* was found to have been previously so used.

System action

The data set is closed and deallocated. Dynamic addition of a new active log data set fails.

System programmer response

Ensure that the data set being added as an active log data set is newly allocated, or has been formatted with

the active log preformat utility, CSQJUFMT.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

2.6.71. CSQJ150E: LOG CAPTURE EXIT ABEND, EXIT DEACTIVATED

Explanation

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

An abnormal program interrupt was detected while executing in the installation-supplied log capture exit code (that is entry point CSQJW117 in load module CSQJL004). As a result of this, the log capture exit will no longer be active; log data will no longer be available for exit capture/processing.

This message can only occur when an *installation-supplied* log capture exit (entry CSQJW117) is active for this queue manager.

System action

The log capture exit (entry point CSQJW117) is terminated. No further calls will be attempted for this queue manager. A full dump is provided for diagnostic purposes.

System programmer response

Determine the cause of the CSQJL004 load module (CSQJW117 entry point) abend and take corrective action.

Note: A correctly-functioning copy of load module CSQJL004/entry CSQJW117 *must* be available in order to start the queue manager. If the problem that caused this error cannot be corrected, ensure that the default CSQJW117 entry (load module CSQJL004 - supplied with MQ) is available during the next queue manager start.

2.6.72. CSQJ151I: *csect-name* ERROR READING RBA *>rrr<*, CONNECTION-ID=*xxxx* CORRELATION-ID=*yyyyyy* REASON CODE=*ccc*

Explanation

The queue manager could not successfully complete the read of the indicated RBA due to reason code *ccc*. The user or application that encountered the error is identified by the connection and correlation IDs. Messages that have the same connection ID and correlation ID relate to the same application. Correlation IDs beginning with '0nn', where nn is a number from 01 to 28, identify system agents.

System action

The queue manager attempts to recover from the error.

System programmer response

If the queue manager was able to recover from the error and successfully complete the application, no further action is required. If the application abnormally terminated or the queue manager could not recover successfully, this message is followed by one or more messages. Refer to the information in this message and the subsequent messages to determine the appropriate corrective action. For information about recovery from log failures, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

16/03/2011

2.6.73. CSQJ152I: *csect-name* ERROR BUILDING ARCHIVE LOG VOLUME REPORT, CONNECTION-ID=*xxxx* CORRELATION-ID=*yyyyyy* REASON CODE=*ccc*

Explanation

An error occurred while attempting to create the archive log volume report. An RBA range could not be successfully mapped into one or more archive data sets due to reason code *ccc*. The user or application that encountered the error is identified by the connection and correlation IDs. This message might be preceded by one or more related error messages. Messages that have the same connection ID and correlation ID relate to the same application. Correlation IDs beginning with '0nn', where nn is a number from 01 to 28, identify system agents.

This failure could be caused by one or more missing archive log data sets, or a system error (for example, an I/O error reading the BSDS).

System action

The archive log volume report (see message CSQJ330I) is not produced. In addition, no premounting of tapes is possible.

The user or application continues processing. The physical read process for the user or application continues until the job completes normally or terminates abnormally. The job can terminate abnormally if the error is encountered again when the data set is physically required for the read process.

System programmer response

If the user or application completes successfully, no further action is necessary. If the user or application does not complete successfully, refer to the messages related to the actual failure to determine the appropriate corrective action. For information about recovery from log failures, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

2.6.93. CSQJ218E: SPECIFIED VOLUME DOES NOT EXIST IN BSDS, DDNAME=*ddd*

Explanation

The DELETE operation specifies a COPY1VOL or COPY2VOL argument that cannot be found in the BSDS. *ddd* contains the DDname of the subject BSDS.

System action

The current utility is terminated.

System programmer response

Correct the control statement, and rerun the utility.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

 This build: January 26, 2011 11:43:14

This topic's URL:

zm14600_

2.6.94. CSQJ219E: OPEN ERROR, DDNAME=*ddd*

Explanation

An error occurred when *csect-name* tried to open a data set named *ddd*.

This error can be caused by a number of different conditions. The most probable conditions are:

1. The DDname of the SYSPRINT, SYSIN, or SYSUT1 data set was not specified in the user's job control language (JCL)
2. The queue manager is currently active
3. The BSDS has been allocated by another job with a disposition (DISP) that conflicts with the DISP specified in the user's JCL
4. The data set associated with *ddd* is already open, possibly due to an earlier error
5. The user is not authorized to access the data set associated with *ddd*
6. Insufficient storage is available to perform the OPEN operation
7. The catalog indicates that the data set associated with *ddd* has an invalid physical record size

System action

The current utility is terminated.

System programmer response

The user's action depends on the condition that caused the OPEN error. The following is a list of appropriate actions corresponding to the conditions listed in the explanation:

1. Provide the missing data definition (DD) statements, and then rerun the utility. See the [WebSphere MQ for z/OS System Administration Guide](#) for details concerning the required DD statements.
2. Wait until the queue manager is inactive before running the utility again because the log utility cannot run while it is active.
3. Correct the disposition conflict and then rerun the utility.
4. Submit an Access Method Services (IDCAMS) VERIFY job against the data set associated with *ddd*. Rerun the log utility job.
5. In the case of an authorization problem, a separate message is usually generated from the authorization facility (RACF®, for example). Investigate the authorization messages and obtain the proper authorization before running the utility again.
6. Insufficient storage is usually accompanied by a separate error from z/OS®. Increase the storage available and rerun the utility.
7. Reallocate the data set with a suitable physical record size.

2.6.95. CSQJ220E: BSDS IN CREATE MODE. NO DATA TO MAP, DDNAME=*ddd*

Explanation

The print log map utility found the BSDS to be in create mode, so it cannot contain data to map. *ddd* contains the DDname of the data set.

System action

The current utility is terminated.

System programmer response

Correct the JCL so that a non-null data set can be processed.

2.6.96. CSQJ221I: PREVIOUS ERROR CAUSED *oper* OPERATION TO BE BYPASSED

Explanation

Errors were encountered during utility processing. These errors subsequently caused *oper* to be bypassed.

This message is a warning only and is displayed after messages that specify the error or errors that occurred. Note that the error or errors might not be associated with the current *oper* operation; rather, under log utility processing, a significant error in any operation causes the control statements for this and any subsequent operations to be checked for syntax only. BSDS updates do not occur for any operation specified in this message.

System action

The log utility continues to process. However, for this and all subsequent operations, the BSDS is not updated and the utility only checks the syntax of the control statements.

System programmer response

Consult the previous messages and correct any errors that caused this message to be generated. Resubmit the log utility job for all operations that have been bypassed.

2.6.103. CSQJ228E: *csect-name* LOG DEALLOCATION ERROR DSNAME=>*dsname*<, ERROR STATUS=*eeeeiiii*, SMS REASON CODE=*ssssssss*

Explanation

An error occurred when trying to dynamically deallocate the data set. Error status is the error reason code returned by z/OS® dynamic allocation.

System action

Processing continues.

System programmer response

The error status portion of this message contains a 2-byte error code (*eeee*, S99ERROR) followed by the 2-byte information code (*iiii*, S99INFO) from the SVC99 request block. If the S99ERROR code indicates an SMS allocation error ('97xx'), then *ssssssss* contains additional SMS reason code information obtained from S99ERSN. See the *MVS™ Authorized Assembler Services Guide* manual for a description of these codes.

2.6.121. CSQJ250I: *csect-name* DATA SET *dsname* HAS SHAREOPTIONS LESS THAN (2 3) – CF STRUCTURE RECOVERY NOT POSSIBLE

Explanation

An active log data set was detected with share options that do not permit CF structure recovery in a queue-sharing group environment. All active log data sets must have SHAREOPTIONS(2 3) at least to allow CF structure recovery.

This can occur when the queue manager's own log data sets are checked during startup, or when a RECOVER CFSTRUCT command is issued that requires to access another queue manager's log data sets.

System action

If this is a result of a RECOVER CFSTRUCT command, the command is terminated. Otherwise, startup continues, but CF structure recovery will not be possible.

System programmer response

If you want CF structure recovery, use the Access Method Services ALTER function to correct the SHAREOPTIONS for the data set; for example

```
ALTER dsname.DATA SHAREOPTIONS(2 3)
```

Then restart the queue manager that owns the data set.

This topic's URL:

zm14890_

2.6.123. CSQJ301E: *csect-name* ERROR USING ONLINE BOOTSTRAP DATA SET (ACTION CODE *>a<*)

Explanation

During command processing for the RECOVER BSDS command or the ARCHIVE LOG command, an error occurred while performing an operation on the BSDS. The type of operation is specified by the code *a*:

1

Unable to OPEN the BSDS

2

Unable to read a required record from the BSDS

3

Unable to write a required record to the BSDS

4

The contents of the stable BSDS was successfully copied to the replacement BSDS; however, the queue manager was unable to successfully restore dual BSDS operation

System action

If this message was received during processing of the RECOVER BSDS command, then the queue manager will continue in single BSDS mode. If this message was received during processing of the ARCHIVE LOG command, the archive log history record in the BSDS will not be updated to reflect the occurrence of an ARCHIVE LOG command; logging and the offload processing will continue.

System programmer response

If this message was received during processing of the RECOVER BSDS command, recovery action must be performed on the BSDS before re-entering the command. If this message was received during processing of the ARCHIVE LOG command, no action is necessary.

2.6.124. CSQJ302E: ALLOCATION ERROR ON REPLACEMENT BSDS DSNAME=*dsname* ERROR STATUS=>*eee*<

Explanation

The RECOVER BSDS command encountered an error while trying to allocate the specified data set dynamically. DSNAME is the data set name. Error Status is the error code and information code returned by z/OS® dynamic allocation.

System action

Processing of the command is terminated. The queue manager continues in single BSDS mode.

System programmer response

Determine the cause of the error from the error status contained in the message, and correct the condition. Then re-enter the RECOVER BSDS command.

The error status portion of this message contains the 2-byte error code (S99ERROR) followed by the 2-byte information code (S99INFO) from the SVC request block. See the *MVS™ Authorized Assembler Services Guide* manual for a description of these codes.

2.6.125. CSQJ303E: WRITE ERROR ON REPLACEMENT BSDS DSNAME=*dsname* ERROR STATUS=>*eee*<

Explanation

The RECOVER BSDS command encountered an error while attempting to write to the specified BSDS. Error status contains the VSAM return and feedback codes. It is a 2-byte field with the first containing the hexadecimal return code and the second containing the hexadecimal feedback code.

System action

Processing of the command is terminated. The queue manager continues in single BSDS mode.

System programmer response

Run an offline Access Method Services job to delete or rename the replacement BSDS and define a new BSDS with the same name. Re-enter the RECOVER BSDS command to reestablish dual BSDS mode.

2.6.131. CSQJ309I: QUIESCING FOR ARCHIVE LOG COMMAND WITH WAIT(YES) STARTED FOR MAXIMUM OF xxx SECONDS

Explanation

An ARCHIVE LOG command with the MODE(QUIESCE) and WAIT(YES) options has been accepted by the queue manager. The quiesce processing has commenced.

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

WAIT(YES) means that quiesce processing will be synchronous to the user; that is, the user can enter additional commands, but they will not be processed until the quiesce processing has ended.

System action

The queue manager attempts to stop all updates to MQ resources within the time period specified in the message. Users and jobs using the queue manager are allowed to reach a point of consistency (commit point) before being blocked from further update activity. Users and jobs are suspended until they are released by the queue manager following the initiation of the offload processing. If the queue manager can effectively block all users from performing updates before the maximum specified time, the offload is initiated immediately, and normal processing is resumed.

This message will be followed by message CSQJ311I or CSQJ317I.

Operator response

No response is necessary. However, it can be expected that users and jobs using MQ resources will be suspended through the duration of the specified time interval, or until the queue manager can be certain that all update activity has been effectively blocked. At some point, this message will be followed by the CSQJ311I message or CSQJ317I message.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

2.6.132. CSQJ310I: QUIESCING FOR ARCHIVE LOG COMMAND WITH WAIT(NO) STARTED FOR MAXIMUM OF xxx SECONDS

Explanation

An ARCHIVE LOG command with the MODE(QUIESCE) and WAIT(NO) by the queue manager. The quiesce processing has commenced.

WAIT(NO) means that quiesce processing will be asynchronous to the user; that is, control will be returned to the invoker as soon as the quiesce task has been started. Thus, the queue manager will accept, and process, any new commands while the quiesce task is running.

System action

The queue manager attempts to stop all updates to MQ resources within the time period specified in the message. Users and jobs using the queue manager are allowed to reach a point of consistency (commit point) before being blocked from further update activity. Users and jobs are suspended until they are released by the queue manager following the initiation of the offload processing. If the queue manager can effectively block all users from performing updates before the maximum specified time, the offload is initiated immediately, and normal processing is resumed.

This message will be followed by message CSQJ311I or CSQJ317I.

Operator response

No response is necessary. However, it can be expected that users and jobs using MQ resources will be suspended through the duration of the specified time interval, or until the queue manager can be certain that all update activity has been effectively blocked. At some point, this message will be followed by the CSQJ311I message or CSQJ317I message.

2.6.133. CSQJ311I: *csect-name* LOG ARCHIVE (OFFLOAD) TASK INITIATED

Explanation

A user-initiated ARCHIVE LOG command has been accepted by the queue manager. A task to archive (offload) the active log data set has been started.

System action

The current active log data sets will be truncated and switched to the next available active log data sets. The task has been started will archive the active log data sets asynchronously, allowing the queue manager to continue processing.

This message will be followed by the CSQJ312I message if the MODE(QUIESCE) option was used with the ARCHIVE LOG command.

Operator response

Respond as for normal operational procedures when the offload task begins.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

2.6.134. CSQJ312I: ARCHIVE LOG QUIESCE ENDED. UPDATE ACTIVITY IS NOW RESUMED

Explanation

An ARCHIVE LOG command with the MODE(QUIESCE) option was processed by the queue manager. As part of the MODE(QUIESCE) processing, an attempt was made to stop all new update activity against MQ resources. This message signals the end of the quiesce processing, and the resumption of normal activity for all users and jobs which were blocked during the quiesce period.

This message will follow the CSQJ311I message or CSQJ317I message.

System action

The queue manager has now resumed all normal activity for all users and jobs which were blocked during the quiesce period.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

This topic's URL:

zm15040_

2.6.138. CSQJ317I: QUIESCE PERIOD EXPIRED WITH *nn* OUTSTANDING URS AT *>time<*. ARCHIVE LOG PROCESSING TERMINATED

Explanation

An ARCHIVE LOG MODE(QUIESCE) command was processed by the queue manager. However, the queue manager was not able to quiesce all update activity in the user-specified quiesce time interval.

System action

This message is for information only. The queue manager determined that *nn* units of recovery did not reach a point of consistency during the quiesce period, and therefore could not be stopped from continuing their associated update processing.

Consequently, the ARCHIVE LOG processing will be terminated. The current active log data sets will not be truncated, and will not be switched to the next available active log data sets. The log archive (offload) task will not be created. All jobs and users suspended during the quiesce will be resumed, and normal update activity against MQ resources will be commenced.

This message will be followed by the CSQJ312I message.

System programmer response

You must decide whether the outstanding (non-quiesced) units of recovery represent significant work.

Each user on the system has a unit of recovery if they are modifying MQ resources. Units of recovery are also created by the queue manager itself for internal processing. Because the purpose of the MODE(QUIESCE) option is to have all units of recovery reach a point of consistency (commit point) before the active log data set is truncated and offloaded, determine all outstanding non-queued jobs and users by using DISPLAY THREAD and the z/OS® command DISPLAY ACTIVE,LIST.

Note that units of recovery might be outstanding due to lock contention between a user or job that holds a resource (and has reached a point of consistency), and a user or job that wants a lock (and therefore cannot reach a point of consistency).

Before resubmitting the ARCHIVE LOG command with the MODE(QUIESCE) option, either:

- Wait until the threads have been deallocated
- Wait until the queue manager is less busy
- Force the offending threads to terminate
- Use the TIME option to override and extend the maximum quiesce time period specified in the system parameters
- If having all units of recovery reach a point of consistency in the active log is no longer critical, issue the ARCHIVE LOG command without the MODE(QUIESCE) option

Note: If you decide to use the ARCHIVE LOG command without the MODE(QUIESCE) option, the active log data sets will be truncated without regard to quiescing activity on the queue manager. If the resulting archive log data set is used for recovery, it is possible that some units of recovery might be found to be in-flight, in-backout, in-commit, or in-doubt during queue manager initialization.

If expiration of the quiesce period before all units of recovery reach a consistent point is a problem, you might
http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm 16/03/2011

have to adjust the QUIESCE value in the CSQ6ARVP system parameters. See the [WebSphere MQ for z/OS System Setup Guide](#) for more information.

This topic's URL:

zm15060_

2.6.140. CSQJ319I: *csect-name* CURRENT ACTIVE LOG DATA SET IS THE LAST AVAILABLE ACTIVE LOG DATA SET. ARCHIVE LOG PROCESSING WILL BE TERMINATED

Explanation

The ARCHIVE LOG command was rejected because the current active log is the last available active log data set. To process the command when these conditions exist would cause the queue manager to exhaust its available active log resources and immediately halt processing.

System action

Processing for the command is terminated.

If the situation is not corrected, the queue manager will issue the CSQJ110E message (if it has not already done so) when the available active log data space reaches critically low levels. Ultimately, message CSQJ111A will be issued when the available active log data space is exhausted, and processing will stop until active log space is made available.

System programmer response

To clear this condition, steps must be taken to complete other waiting offload tasks. Once another active log is made available (re-usable) by completing the offload process for it, the command processing for the current active log can proceed.

Perform a display request to determine the outstanding requests related to the log offload process. Take the necessary action to satisfy any requests, and permit offload to continue.

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsa.doc/zm10120_.htm

16/03/2011

➤ If offload does not complete normally, or cannot be initiated, either correct the problem that is causing the offload problem, or consider whether there are sufficient active log data sets. If necessary, additional log data sets can be added dynamically using the DEFINE LOG command. ⚡

Possible causes for the shortage of active log data space are:

- Excessive logging. For example, there is a lot of persistent message activity.
- Delayed or slow offloading. For example, failure to mount archive volumes, incorrect replies to offload messages, or slow device speeds.
- Excessive use of the ARCHIVE LOG command. Each invocation of the command causes the queue manager to switch to a new active log data set. Excessive use could consume the available active log data space if the resulting offloads were not processed in a timely manner.
- Offloads unsuccessful.
- Insufficient active log space.

2.6.141. CSQJ320E: *csect-name* UNABLE TO PROCESS LOG TRUNCATION REQUEST DUE TO INTERNAL ERROR. (ERROR DATA=>ddd<)

Explanation

While processing an ARCHIVE LOG command, an internal request was made of the log buffer output routine to force-write the log buffers and to truncate and switch the active log to the next available active log data sets.

System action

Processing for the command is terminated.

System programmer response

This is an internal error detected by the queue manager. The error might be caused by an unrelated error in the log buffer writer component (CSQJWxxx), by a STOP QMGR MODE(FORCE) command, or by abnormal termination. See any messages that precede this message.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

2.6.142. CSQJ321E: UNABLE TO CONTINUE ARCHIVE LOG QUIESCE DUE TO INTERNAL ERROR. ARCHIVE LOG PROCESSING TERMINATED

Explanation

An ARCHIVE LOG command with the MODE(QUIESCE) option was processed by the queue manager. As part of the MODE(QUIESCE) processing, an attempt was made to stop all new update activity against MQ resources. During the processing, an internal error occurred.

System action

The ARCHIVE LOG MODE(QUIESCE) processing is terminated. This message will be followed by message CSQJ312I after all users and jobs quiesced by the MODE(QUIESCE) processing are resumed.

System programmer response

This error is an internal error detected by the queue manager. Retry the ARCHIVE LOG MODE(QUIESCE) command. If the error persists, the active log data sets can be switched using the ARCHIVE LOG command without the MODE(QUIESCE) option.

Parent topic: [Recovery log manager messages \(CSQJ...\)](#)

2.6.143. CSQJ322I: DISPLAY parm-type report ...

Explanation

This message comprises part of the response to the DISPLAY and SET *parm-type* commands (where *parm-type* is SYSTEM, LOG, or ARCHIVE). It provides information about the corresponding system parameters as follows:

```

Parameter  Initial value  SET value
parm-name  vvv                sss
:
End of parm-type report

```

where:

parm-name

is the name of the system parameter or subparameter.

vvv

is the value for the indicated parameter (specified in CSQ6SYSP, CSQ6LOGP, or CSQ6ARVP) used when the queue manager was started.

sss

is the value for the indicated parameter in use currently, as specified by a SET *parm-type* command. If *sss* is blank, the initial value is in use currently.

System action

Processing continues.

2.6.144. CSQJ325I: ARCHIVE tape unit report ...

Explanation

This message comprises part of the response to the DISPLAY and SET ARCHIVE commands. It provides information about tape units used for archive logging, as follows:

```

Addr St CorrelID VolSer DSName
  addr st correlid volser dsname
:
End of tape unit report

```

where:

addr

The physical address of a tape unit allocated to read the archive log.

st

The status of the tape unit:

B

Busy, actively processing an archive log data set.

P

Premount, active and allocated for premounting.

A

Available, inactive and waiting for work.

Unknown.

correlid

The correlation ID associated with the user of the tape being processed; '*****' if there is no current user.

volser

The volume serial number of the tape that is mounted.

dsname

The data set name on the tape volume that is being processed or was last processed.

If no tape units are allocated, the list is replaced by:

```
No tape archive reading activity
```

System action

Processing continues.

2.6.145. CSQJ330I: ARCHIVE LOG VOLUMES required for connection-ID >xxxx<, correlation-ID yyyyyy:

Explanation

This message lists the names of the archive log volumes needed by the indicated correlation ID for the given connection ID. The archive log volumes are listed with a maximum of six on each line. It is generated

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

automatically by the archive read process at the first archive log tape mount for that correlation ID. The connection ID is an identifier representing the connection name used to establish the thread; the correlation ID is an identifier associated with a specified thread, such as a job name.

A volume name prefixed with an '*' signifies that the data on the archive log volume is also mapped by an active log data set. As such, the volume might not be required for the read process, because the data is read from the active log if possible.

The following is an example of the output produced by message CSJ330I::

```
CSQJ330I: ARCHIVE LOG VOLUMES required for connection-ID xxxx, correlation-ID yyyyyy:
volume1, volume2, volume3, volume4, volume5, volume6
End of ARCHIVE LOG VOLUMES report
```

System action

Processing continues.

2.6.149. CSQJ364I: IMS Bridge facility suspended for XCFGNAME=*gname* XCFMNAME=*mname*

Explanation

This is issued as part of the response to a DISPLAY SYSTEM command if the MQ-IMS Bridge facility to the partner IMS™ system identified by *gname* and *mname* is suspended.

System programmer response

Use the RESUME QMGR FACILITY(IMSBRIDGE) command when ready to resume the MQ-IMS Bridge.

2.6.154. CSQJ369E: *csect-name* Failure while suspending logging

Explanation

A SUSPEND QMGR LOG command was issued, but it terminated abnormally.

System action

The command is ignored, and logging is not suspended.

System programmer response

Verify the command entry, and reissue the command. If it fails again, collect the items listed in the Problem Determination section, and contact your IBM® support center.

Problem determination

Collect the following diagnostic items:

- A description of the action(s) that led to the error, or if applicable, a listing of the application program, or the input string to a utility program, being run at the time of the error
- Queue manager job log
- System dump resulting from the error
- The WebSphere® MQ, z/OS®, DB2®, CICS®, and IMS™ service levels

2.6.155. CSQJ370I: LOG status report ...

Explanation

This message comprises part of the response to the DISPLAY and SET LOG commands. It provides information about the status of the log data sets, as follows:

```
Copy %Full DSName
  1   k   dsname
  2   k   dsname
Restarted at date time using RBA=sss
Latest RBA=rrr
Offload task is xxx
Full logs to offload - m of n
```

where:

1, 2

Information for the current active log copy 1 and copy 2 data sets respectively.

k

The percentage of the active log data set that has been used.

dsname

The data set name of the active log data set. If the copy is not currently active, this is shown as **Inactive**.

date time

The time that the queue manager was started.

sss

The RBA from which logging began when the queue manager was started.

rrr

The RBA of the most recently written log record. If logging is suspended, this line is replaced by

Logging suspended at RBA=rrr

xxx

The status of the offload task, which can be:

BUSY, allocating archive data set

This could indicate that a tape mount request is pending.

BUSY, copying BSDS

Copying the BSDS data set.

BUSY, copying active log

Copying the active log data set.

BUSY

Other processing.

AVAILABLE

Waiting for work.

m, n

The number of full active log data sets that have not yet been archived, and the total number of active log data sets.

System action

Processing continues.

2.6.156. CSQJ372I: Logging suspended for *qmgr-name* at RBA=*rrr*

Explanation

This is issued in response to a SUSPEND QMGR LOG command if it completed successfully.

It is also issued in response to other commands if logging is suspended, indicating that the command cannot be processed while logging is suspended.

System action

All log update activity is suspended for the queue manager named. *rrr* is the RBA of the last log record written.

For commands other than SUSPEND QMGR LOG, the command is ignored.

System programmer response

Use the RESUME QMGR LOG command when ready to resume logging.

2.6.158. CSQJ401E: RECORD NOT FOUND – *rrr*

Explanation

An attempt was made to read the *rrrr* record from the BSDS. In doing so, the read routine (CSQJU01B) could not find the record.

This is not necessarily an error; for example, if you have never used CSQJU003 CRESTART, there won't be any CRCR records, so you will get this message from CSQJU004 for the RESTART CONTROL records.

System action

Utility processing continues.

2.6.162. CSQJ407E: NO VALID CHECKPOINT RBA FOUND

Explanation

After completing its search through the resource manager status table and the checkpoint queue, no valid checkpoint RBA was found within the specified range.

System action

The current utility processing is terminated.

System programmer response

The last 100 checkpoints are recorded in the BSDS, including the log STARTRBA and log ENDRBA of the checkpoint range. The utility attempts to locate a valid checkpoint in the range. In this case the utility was unsuccessful in finding a valid checkpoint.

Use the Print Log Map Utility (CSQJU004) to determine the valid RBA ranges, and rerun the job with a suitable RBA specification.

2.7.1. CSQM050I: *csect-name* Intra-group queuing agent starting, TCB=*tcb-name*

Explanation

The intra-group queuing (IGQ) agent was started during the initialization of a queue manager that is in a queue-sharing group. The agent uses TCB *tcb-name*.

The IGQ agent handles SYSTEM.QSG.TRANSMIT.QUEUE.

Severity

0

System action

Processing continues. The IGQ agent starts asynchronously.

Parent topic: [Message manager messages \(CSQM...\)](#)

 This build: January 26, 2011 11:43:18

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

This topic's URL:

zm15620_

2.7.2. CSQM051I: *csect-name* Intra-group queuing agent stopping

Explanation

The intra-group queuing (IGQ) agent is stopping because:

- the queue manager is stopping
- it has retried a failing request repeatedly without success
- it was unable to recover from an abnormal ending

Severity

0

System action

The IGQ agent stops.

System programmer response

If the queue manager is not stopping, investigate the cause of the error as reported in the preceding messages. To restart the IGQ agent, issue an ALTER QMGR command specifying IGQ(ENABLED).

Parent topic: [Message manager messages \(CSQM...\)](#)

zm15630_

2.7.3. CSQM052I: *csect-name* Shared channel recovery completed for *>qmgr-name<*, *n* channels found, *p* FIXSHARED, *r* recovered

Explanation

The queue manager successfully recovered some shared channels that were owned by queue manager *qmgr-name* in the queue-sharing group when it or its channel initiator terminated abnormally. This recovery process may occur when:

- another queue manager or its channel initiator terminates abnormally
- the channel initiator is started, for channels that were owned by other queue managers
- the channel initiator is started, for channels that were owned by itself

n channels were found that needed recovery, of which *p* were originally started as FIXSHARED. The number recovered, *r*, may be less than *n* (or even 0) because other active queue managers are also recovering the channels and because FIXSHARED channels cannot be recovered by another queue manager.

See the [WebSphere MQ Intercommunication](#) manual for more information about shared channel recovery.

Severity

0

System action

Processing continues.

Parent topic: [Message manager messages \(CSQM...\)](#)

 This build: January 26, 2011 11:43:18

zm15640_

2.7.4. CSQM053E: *csect-name* Shared channel recovery terminated, DB2 not available

Explanation

Because DB2® is not available or no longer available, the queue manager was unable to recover some shared channels that were owned by a queue manager in the queue-sharing group when it or its channel initiator terminated abnormally. This recovery process may occur when:

- another queue manager or its channel initiator terminates abnormally
- the channel initiator is started, for channels that were owned by other queue managers
- the channel initiator is started, for channels that were owned by itself

Severity

8

System action

The recovery process is terminated; some channels may have been recovered, while others have not.

System programmer response

Use the preceding messages on the z/OS® console to investigate why DB2 is not available, and resume the connection or restart DB2 if necessary. Any channels that were not recovered will be recovered when the recovery process next runs; alternatively, they can be restarted manually.

Parent topic: [Message manager messages \(CSQM...\)](#)

 This build: January 26, 2011 11:43:18

zm15650_

2.7.5. CSQM054E: *csect-name* Shared channel recovery terminated, error accessing DB2

Explanation

Because there was an error in accessing DB2®, the queue manager was unable to recover some shared channels that were owned by a queue manager in the queue-sharing group when it or its channel initiator terminated abnormally. This recovery process may occur when:

- another queue manager or its channel initiator terminates abnormally
- the channel initiator is started, for channels that were owned by other queue managers
- the channel initiator is started, for channels that were owned by itself

Severity

8

System action

The recovery process is terminated; some channels may have been recovered, while others have not.

System programmer response

Resolve the error reported in the preceding messages. Any channels that were not recovered will be recovered when the recovery process next runs; alternatively, they can be restarted manually.

Parent topic: [Message manager messages \(CSQM...\)](#)

This topic's URL:

zm15660_

2.7.6. CSQM055E: *csect-name* Shared channel recovery terminated, error putting command, reason=*mqr*

Explanation

Because there was an error putting a message on the system-command input queue, the queue manager was unable to recover some shared channels that were owned by a queue manager in the queue-sharing group when it or its channel initiator terminated abnormally. This recovery process may occur when:

- another queue manager or its channel initiator terminates abnormally
- the channel initiator is started, for channels that were owned by other queue managers
- the channel initiator is started, for channels that were owned by itself

Severity

8

System action

The recovery process is terminated; some channels may have been recovered, while others have not.

System programmer response

Refer to [API completion and reason codes](#) for information about *mqr*, and resolve the error. Any channels that were not recovered will be recovered when the recovery process next runs; alternatively, they can be restarted manually.

Parent topic: [Message manager messages \(CSQM...\)](#)

This topic's URL:

zm15670_

2.7.7. CSQM056E: *csect-name mqapi-call* failed for queue **>*q-name*<**, reason=*reason*

Explanation

The indicated MQ API call for the named queue, failed for the specified reason, which may be an MQ reason code (MQRC_) or a signal completion code (MQEC_).

Severity

8

System action

If the queue is SYSTEM.ADMIN.CONFIG.EVENT or SYSTEM.ADMIN.COMMAND.EVENT, processing continues but events are not generated; message CSQM071E follows to show how many event messages have not been generated since the problem first occurred. These messages are generated on the first occurrence of the problem, and at intervals thereafter while the problem persists.

For other queues, it is the intra-group queuing (IGQ) agent that issued the call. Depending on the queue involved and the type of error, it may continue processing, retry the request at regular intervals until the error is corrected, or terminate.

System programmer response

Refer to [API completion and reason codes](#) for information about MQ reason codes or the [WebSphere MQ Application Programming Reference](#) for information about signal completion codes. Correct the problem with the queue, or use the ALTER QMGR command to disable the events or the IGQ agent if the function is not required.

2.7.8. CSQM059E: *csect-name* Queue *q-name* has incorrect attributes

Explanation

The named queue, used by the intra-group queuing (IGQ) agent, has incorrect attributes. For example, SYSTEM.QSG.TRANSMIT.QUEUE must have attributes USAGE(XMITQ), INDXTYPE(CORRELID), QSGDISP (SHARED).

Severity

8

System action

The IGQ agent retries at regular intervals until the error is corrected.

System programmer response

Redefine the queue with the correct attributes.

This topic's URL:

zm15690_

2.7.9. CSQM060E: *csect-name* Cluster cache is full

Explanation

No more space is available in the cluster cache area.

Severity

8

System action

The application call that resulted in the need for more space will fail with MQRC_CLUSTER_RESOURCE_ERROR. Processing continues, and existing users of clustering will be unaffected unless their actions are such as to need more cluster cache space.

System programmer response

The problem may be temporary. If it persists, the queue manager must be restarted; this will cause more space to be allocated for the cluster cache area.

Consider changing the cluster cache type system parameter CLCACHE to dynamic, so that more space for the cache will be obtained automatically as required. (If you are using a cluster workload exit, ensure that it supports a dynamic cluster cache.) See the CSQ6SYSP macro in the [WebSphere MQ for z/OS System Setup Guide](#) for information about the system parameters.

This topic's URL:

zm15700_

2.7.10. CSQM061E: *csect-name* Cluster workload exit *>exit-name<* does not support dynamic cache

Explanation

In response to the initialization call (using ExitReason MQXR_INIT), the cluster workload exit returned the value MQCLCT_STATIC in the ExitResponse2 field, indicating that it does not support a dynamic cluster cache.

Severity

8

System action

The cluster workload exit is suppressed.

System programmer response

Either change the cluster cache type system parameter CLCACHE to static, or rewrite the exit to be compatible with a dynamic cache. See the CSQ6SYSP macro in the [WebSphere MQ for z/OS System Setup Guide](#) for information about the system parameters.

Parent topic: [Message manager messages \(CSQM...\)](#)

This topic's URL:

zm15710_

2.7.11. CSQM063E: *csect-name* Specified dead-letter queue name is unacceptable

Explanation

The intra-group queuing (IGQ) agent has attempted to put a persistent message on the dead-letter queue that is defined to the queue manager. The dead-letter queue specified is either SYSTEM.QSG.TRANSMIT.QUEUE or there is no dead-letter queue name specified.

Severity

4

System action

The put of the message to the dead-letter queue does not take place, the get of the message from the SYSTEM.QSG.TRANSMIT.QUEUE is backed out and the intra-group queuing (IGQ) agent goes into retry.

System programmer response

Ensure the queue manager has a dead-letter queue defined which is neither blank nor SYSTEM.QSG.TRANSMIT.QUEUE. Examine the message to determine the reason for its placement on the dead-letter queue.

Parent topic: [Message manager messages \(CSQM...\)](#)

 This build: January 26, 2011 11:45:53

2.7.12. CSQM064I: *csect-name* Intra-group queuing agent put messages to dead-letter queue

Explanation

The intra-group queuing (IGQ) agent was unable to deliver some messages to the required destination queue, so has put them on the dead-letter queue.

Severity

4

System action

Processing continues.

System programmer response

Examine the contents of the dead-letter queue. Each message is contained in a structure that describes why the message was put to the queue, and to where it was originally addressed.

Parent topic: [Message manager messages \(CSQM...\)](#)

This topic's URL:

zm15720_

2.7.13. CSQM065E: *csect-name mqapi-call* failed for queue **>q-name** **<, reason=reason**

Explanation

The indicated MQ API call failed for the specified reason, which is an MQ reason code (MQRC_).

Severity

8

System action

It is the intra-group queuing (IGQ) agent that issued the call; it was unable to commit or backout a batch of messages for the specified reason. Depending on the type of error, it may retry the request at regular intervals until the error is corrected, or terminate.

System programmer response

Refer to [API completion and reason codes](#) for information about MQ reason codes. Correct the problem if required.

Parent topic: [Message manager messages \(CSQM...\)](#)

 This build: January 26, 2011 11:43:20

2.7.14. CSQM067E: *csect-name* Intra-group queuing agent ended abnormally. Restarting

Explanation

The intra-group queuing (IGQ) agent has ended abnormally because a severe error occurred, as reported in the preceding messages.

Severity

8

System action

The IGQ agent attempts to restart a number of times. If it fails persistently, it terminates.

System programmer response

Investigate the reason for the abnormal termination, as reported in the preceding messages.

Parent topic: [Message manager messages \(CSQM...\)](#)

This topic's URL:

zm15740_

2.7.15. CSQM070E: *csect-name* Queue *q-name* available again, >*n*< events not generated

Explanation

An earlier problem with putting messages on the configuration or command event queue has been corrected. *n* is the number of event messages that have not been generated since the problem first occurred.

Severity

4

System action

Processing continues and event messages for that queue will be generated again.

System programmer response

If the queue is SYSTEM.ADMIN.CONFIG.EVENT, and complete configuration information is required, use the REFRESH QMGR TYPE(CONFIGEV) command to generate events to replace those that were not generated; specify the INCLINT parameter to cover the period when the problem was occurring.

If the queue is SYSTEM.ADMIN.COMMAND.EVENT, a limited number of the missed event messages may be recovered automatically, as reported by message CSQM072I.

Parent topic: [Message manager messages \(CSQM...\)](#)

2.7.16. CSQM071E: *csect-name* Queue *q-name* unavailable, >*n*< events not generated

Explanation

There was an error putting a message on the configuration or command event queue, as reported in the preceding CSQM056E message; *n* is the number of event messages that have not been generated since the problem first occurred.

Severity

8

System action

Processing continues but event messages for that queue are not generated. This message is issued on the first occurrence of the problem, and at intervals thereafter while the problem persists.

System programmer response

Correct the problem with the event queue, or use the ALTER QMGR command to set the CONFIGEV or CMDEV attribute to DISABLED if events are not required.

Parent topic: [Message manager messages \(CSQM...\)](#)

2.7.23. CSQM084I: *csect-name* COMMAND INHIBITED DURING RESTART/TERMINATION

Explanation

A command that will affect a recoverable object was requested either too early in queue manager startup, or too late in termination.

The usual reason for receiving this message is that some prohibited command was issued in the initialization input data set CSQINP1.

Severity

8

System action

Message CSQM085I is also issued and the command is ignored.

System programmer response

Wait until the queue manager is in a state where it is possible to reissue the prohibited commands. If appropriate, remove the command from CSQINP1, and place it in CSQINP2, to ensure that this problem does not reoccur.

2.7.30. CSQM094I: *csect-name* >*keyword(value)*< WAS NOT FOUND

Explanation

A command was issued that refers to an object that does not exist. That is, no object could be found with the specified name and type (and subtype, for queues and channels) and with any disposition in the queue-sharing group.

Severity

8

System action

The command is ignored.

System programmer response

Check that you specified the correct name for the object, and the correct subtype (for queues and channels). If a queue-sharing group is in use, check that DB2® is available and not suspended. Define the object if necessary.

Note:

1. If you are dealing with a queue or channel object, an object of the same name, but of a different subtype, might already exist.
2. Remember that the object might have recently been deleted by someone else, or from another queue manager in the queue-sharing group.

This topic's URL:

zm15910_

2.7.37. CSQM101I: *csect-name* >*keyword(value)*< IS CURRENTLY IN USE

Explanation

The object specified is in use. This could be because:

- It is open through the API.
- A trigger message is presently being written to it.
- It is in the process of being deleted.
- When it is a storage class, there is a queue defined as using the storage class, and there are messages currently on the queue.
- When it is a CF structure, there is a queue defined as using the CF structure, and there are messages currently on the queue or the queue is open.
- When altering the index type of a queue, the necessary conditions regarding messages and uncommitted activity are not satisfied.
- When altering the default transmission queue, the old queue is currently being used as a transmission queue by default.
- Although the FORCE option was specified to overcome the object being open through the API, the object was created with a previous version of MQ.

Severity

8

System action

The command is ignored.

System programmer response

Either:

- Wait until the object has been closed or deleted.
Note: MCAs for receiver channels, or the intra-group queuing (IGQ) agent, can keep the destination queues open for a while even when messages are not being transmitted, and so such queues might appear to be in use.
- Wait until all the queues that use a storage class are empty
- Wait until the queue is empty
- Wait until use of the queue as a default transmission queue has ended

It is not possible to use the FORCE option of the ALTER command to overcome the situations that cause this message.

For more information about the command, see the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual.

Parent topic: [Message manager messages \(CSQM...\)](#)

2.7.40. CSQM105I: *csect-name* '➤*keyword*◀' VALUE IS SAME AS QALIAS NAME

Explanation

An attempt was made to DEFINE or ALTER an alias queue so that the queue itself was named on the TARGQ keyword. Unless the queue is a cluster queue, this is not allowed because an alias queue can only resolve to a local or remote queue.

Severity

8

System action

The command is ignored.

System programmer response

Reissue the command with a different name for the TARGQ keyword.

Parent topic: [Message manager messages \(CSQM...\)](#)

 This build: January 26, 2011 11:43:22

2.7.41. CSQM106I: *csect-name* DEFXMITQ(➤*q-name*◀) IS NOT ALLOWED

Explanation

The specified queue is not allowed to be used as the default transmission queue because it is reserved for use exclusively by clustering.

Severity

8

System action

The command is ignored.

System programmer response

Reissue the command with a different DEFXMITQ name.

Parent topic: [Message manager messages \(CSQM...\)](#)

 This build: January 26, 2011 11:43:22

2.7.42. CSQM107I: *csect-name* STGCLASS ACTIVE OR QUEUE IN USE

Explanation

A request to ALTER or DEFINE REPLACE a local queue involving a change to the STGCLASS field is not allowed because there are messages on the queue, or other threads have the queue open.

Severity

8

System action

The command is ignored.

System programmer response

If there are messages on the queue, you must remove them before changing the storage class.

Note: If you remove all the messages from the queue, there might be a short delay before the command can be processed successfully.

If other threads have the queue open, wait until they have closed the queue before reissuing the command.

Parent topic: [Message manager messages \(CSQM...\)](#)

2.7.43. CSQM108I: *csect-name* >*keyword(value)*< NOT ALLOWED, INCOMPATIBLE NAME AND TYPE

Explanation

An attempt was made to issue a DEFINE command on a reserved object name, using an incorrect object type or subtype. The object is only allowed to be of the predetermined type listed below:

Type	Object
Any Queue	SYSTEM.ADMIN.ACTIVITY.QUEUE SYSTEM.ADMIN.CHANNEL.EVENT SYSTEM.ADMIN.COMMAND.EVENT SYSTEM.ADMIN.CONFIG.EVENT SYSTEM.ADMIN.PERFM.EVENT SYSTEM.ADMIN.QMGR.EVENT SYSTEM.ADMIN.TRACE.ROUTE.QUEUE
Alias queue	SYSTEM.DEFAULT.ALIAS.QUEUE
Alias or local queue	SYSTEM.ADMIN.COMMAND.QUEUE SYSTEM.COMMAND.INPUT
Local queue	SYSTEM.CHANNEL.INITQ SYSTEM.CHANNEL.SYNCQ SYSTEM.CLUSTER.COMMAND.QUEUE SYSTEM.CLUSTER.REPOSITORY.QUEUE SYSTEM.CLUSTER.TRANSMIT.QUEUE SYSTEM.DEFAULT.LOCAL.QUEUE SYSTEM.QSG.CHANNEL.SYNCQ SYSTEM.QSG.TRANSMIT.QUEUE
Model queue	SYSTEM.COMMAND.REPLY.MODEL SYSTEM.DEFAULT.MODEL.QUEUE SYSTEM.MQEXPLORER.REPLY.MODEL

Remote queue	SYSTEM.DEFAULT.REMOTE.QUEUE
Cluster-sender channel	SYSTEM.DEF.CLUSSDR
Cluster-receiver channel	SYSTEM.DEF.CLUSRCVR
Sender channel	SYSTEM.DEF.SENDER
Server channel	SYSTEM.DEF.SERVER
Receiver channel	SYSTEM.DEF.RECEIVER
Requester channel	SYSTEM.DEF.REQUESTER
Client-connection channel	SYSTEM.DEF.CLNTCONN
Server-connection channel	SYSTEM.ADMIN.SVRCONN SYSTEM.DEF.SVRCONN
Authentication information	SYSTEM.DEFAULT.AUTHINFO.CRLLDAP
Namelist	SYSTEM.DEFAULT.NAMELIST
Process	SYSTEM.DEFAULT.PROCESS
Storage class	SYSTEMST

Severity

8

System action

The command is ignored.

System programmer response

Ensure that reserved objects are defined with the correct object type or subtype.

Parent topic: [Message manager messages \(CSQM...\)](#)

2.7.44. CSQM109E: *csect-name* DYNAMIC QUEUE *>value<* NOT DELETED, REASON=*mqrc*

Explanation

A dynamic queue could not be deleted during normal close processing, thread termination, or the end of queue manager restart, because an error occurred whilst attempting to delete it. *mqrc* gives the reason code for the error.

Severity

8

System action

The named dynamic queue is not deleted.

System programmer response

Refer to [API completion and reason codes](#) for information about the reason code to determine why the queue could not be deleted, and take the appropriate action as necessary. The most likely reason codes are:

- MQRC_OBJECT_IN_USE

- MQRC_PAGESET_ERROR
- MQRC_Q_NOT_EMPTY

2.7.47. CSQM112E: *csect-name* ERROR ACCESSING **>***keyword* **<***(value)***<**

Explanation

While processing a command for an object, object information could not be accessed. This may be because of an error on page set zero, or in the coupling facility information, or because a coupling facility structure has failed, or because DB2® is not available or is suspended. This message is issued with message CSQM090E or CSQM091E, which include a reason code that gives more information about the error.

Severity

4

System action

The command is ignored.

System programmer response

Check for error messages on the console log that might relate to the problem. Verify that page set zero is set up correctly; refer to the [WebSphere MQ for z/OS System Administration Guide](#) for information about this. If a queue-sharing group is in use, check whether the coupling facility structure has failed and check that DB2 is available and not suspended. If the accompanying message is CSQM091E, refer to [API completion and reason codes](#) for an explanation of the *mqrc* in that message, and what action to take.

Parent topic: [Message manager messages \(CSQM...\)](#)

2.7.48. CSQM113E: *csect-name* NO SPACE FOR **>***keyword**(value)***<** QSGDISP(*disposition*)

Explanation

A command failed because page set zero is full, or because the application structure is full, or because no more application structures are available in the coupling facility (the limit is 63).

Severity

8

System action

The command is not actioned.

System programmer response

Do one of the following, depending on the cause of the error:

- Increase the size of page set zero or the application structure. Refer to the [WebSphere MQ for z/OS System Administration Guide](#) for information about how to do this.
- Reduce the number of application structures you are using.

Parent topic: [Message manager messages \(CSQM...\)](#)

2.7.49. CSQM114E: *csect-name* >*keyword(value)*< EXCEEDED LOCAL QUEUE LIMIT

Explanation

A command failed because no more local queues could be defined. There is an implementation limit of 524 287 for the total number of local queues that can exist. For shared queues, there is a limit of 512 queues in a single coupling facility structure.

Severity

8

System action

The command is not actioned.

System programmer response

Delete any existing queues that are no longer required.

Parent topic: [Message manager messages \(CSQM...\)](#)

 This build: January 26, 2011 11:43:23

This topic's URL:

zm16040_

2.7.50. CSQM115I: *csect-name* >*keyword(value)*< IS CURRENTLY IN USE, ALTER WITH FORCE NEEDED

Explanation

The object specified is in use. This could be because:

- It is open through the API.
- When altering the USAGE attribute of a local queue, there are messages currently on the queue.
- When altering the default transmission queue, the old queue is currently being used as a transmission queue by default.

Severity

8

System action

The command is ignored.

System programmer response

Either:

- Wait until the object has been closed or deleted.
Note: MCAs for receiver channels, or the intra-group queuing (IGQ) agent, can keep the destination queues open for a while even when messages are not being transmitted, and so such queues might appear to be in use.
- Wait until the queue is emptied.
- Wait until use of the queue as a default transmission queue has ended.
- Use the ALTER command with the FORCE option.
Note: Any subsequent API calls referencing the object will fail with a reason code of MQRC_OBJECT_CHANGED.

For more information about the command, see the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual.

Parent topic: [Message manager messages \(CSQM...\)](#)

2.7.59. CSQM125I: *csect-name* >*keyword(value)*< QSGDISP (*disposition*) WAS NOT FOUND

Explanation

A command was issued that refers to an object that does not exist. That is, no object could be found with the specified name and type (and subtype, for queues and channels) and disposition in the queue-sharing group.

Severity

8

System action

The command is ignored.

System programmer response

Check that you specified the correct name for the object, and the correct subtype (for queues and channels) or channel definition table (for deleting channels). If *disposition* is GROUP or SHARED, check that DB2® is available and is not suspended. Define the object if necessary.

Note:

1. An object of the same name and type, but of a different disposition, might already exist.
2. If you are dealing with a queue or channel object, an object of the same name, but of a different subtype, might already exist.
3. Remember that the object might have recently been deleted by someone else, or from another queue manager in the queue-sharing group.

zm16210_

2.7.67. CSQM133I: *csect-name* UNABLE TO START CHANNEL INITIATOR

Explanation

A START CHINIT command was issued but the channel initiator could not be started.

This could be for one of the following reasons:

- The system did not allow the channel initiator address space to be created at this time due to a heavy system workload
- There was not enough storage to start the channel initiator address space
- The system tried to obtain more address spaces than the maximum number supported
- The queue manager was quiescing or shutting down.

Severity

8

System action

The command is not actioned.

System programmer response

Reissue the command when the system workload is reduced and when the queue manager is not shutting down.

2.7.69. CSQM135I: *csect-name* NO CHANNEL INITIATOR AVAILABLE

Explanation

A command was issued for a shared channel, but there was no suitable channel initiator available for any active queue manager in the queue-sharing group. This could be because:

- no channel initiators are running
- the channel initiators that are running are too busy to allow any channel, or a channel of the particular type, to be started

Severity

8

System action

The command is not actioned.

System programmer response

Start a new channel initiator (on an active queue manager where there is no channel initiator running), or try again when there are fewer channels running.

2.7.70. CSQM136I: COMMAND NOT ALLOWED, COMMAND SERVER UNAVAILABLE

Explanation

A command for the channel initiator was entered, but the command server is not running and not enabled so the command cannot be processed.

System action

The command is not actioned.

System programmer response

Use the START CMDSERV command to start the command server, and reissue the command.

Parent topic: [Message manager messages \(CSQM...\)](#)

2.7.71. CSQM137I: *csect-name* >*command keyword*< COMMAND ACCEPTED

Explanation

Initial processing for a command has completed successfully. The command requires further action by the channel initiator, for which a request has been queued. Messages reporting the success or otherwise of the action will be sent to the command issuer subsequently.

Severity

0

System action

A request was queued for the channel initiator. Further messages will be produced when the command has been completed.

2.7.103. CSQM170I: *csect-name* REFRESHING CONFIGURATION EVENTS SINCE >*date time*<

Explanation

A REFRESH QMGR command was issued for configuration events specifying a refresh interval with the INCLINT keyword. Event messages will be generated for all objects with an alteration date and time later than *date time* (provided they match any other specified selection criteria, such as name or type). However, event messages will not be generated for objects deleted after that time.

Severity

0

2.7.104. CSQM171I: *csect-name* CONFIGURATION EVENTS REFRESH NEEDED

Explanation

An ALTER QMGR command was issued that enables configuration events. Event messages need to be generated to ensure that the configuration information is complete and up-to-date.

Severity

0

System action

Processing continues.

System programmer response

If complete configuration information is required, do one of the following, as appropriate:

- If this is the first time that configuration events have been enabled, use the REFRESH QMGR TYPE (CONFIGEV) command to generate configuration events for **all** objects. If you have many objects, it may be preferable to use several such commands each with a different selection of objects, but such that all are included.
- Otherwise, use the REFRESH QMGR TYPE(CONFIGEV) command to generate events to replace those that were not generated while configuration events were disabled; specify the INCLINT parameter to cover this period.

2.7.107. CSQM181I: *csect-name* INSUFFICIENT STORAGE TO COMPLETE COMMAND

Explanation

There was insufficient storage available to complete processing for the command.

Severity

8

System action

The command terminates. Any processing already completed may be retained or backed out.

System programmer response

Refer to the accompanying messages to determine what processing has been done. Retry the command, if appropriate, when your queue manager is less busy. If the problem persists, you might need to increase the region size used by your queue manager, or you might need to reduce the number of jobs running in your system.

2.7.108. CSQM182E: **>csect-name<** DURABLE SUBSCRIPTIONS NOT ALLOWED

Explanation

A DEFINE SUB command was issued, but it was not possible to make a durable subscription.

This could be for one of the following reasons:

- The topic subscribed to is defined as DURSUB(NO)
- The queue named SYSTEM.DURABLE.SUBSCRIBER.QUEUE is not available
- **>**The CSQINP2 data sets are in the wrong order, the order is:**>**

```
//CSQINP2 DD DSN=hlq.SCSQPROC(CSQ4INYS),DISP=SHR
// DD DSN=hlq.SCSQPROC(CSQ4INSX),DISP=SHR
// DD DSN=hlq.SCSQPROC(CSQ4INSG),DISP=SHR
```

<<

Severity

8

System action

The command is not executed.

System programmer response

Durable subscriptions are stored on the SYSTEM.DURABLE.SUBSCRIBER.QUEUE. Ensure that this queue is available for use. Possible reasons for failure include the queue being full, the queue being put inhibited, or the queue not existing.

If the topic subscribed to is defined as DURSUB(NO) then it is not possible to administratively define a subscription. The topic can be altered to DURSUB(YES) to enable the subscription to be defined.

This topic's URL:

zm_M189E_

2.7.116. CSQM190E: *csect-name* TOPIC STRING IS INVALID

Explanation

A DEFINE SUB command was issued, but it was not possible to make a subscription because the topic string was invalid.

This could be because the WSCHEMA attribute was set to CHAR and either:

- The TOPICSTR attribute contains an invalid escape character, or
- The TOPICOBJ attribute refers to a TOPIC object whose TOPICSTR attribute contains an invalid escape character.

Severity

8

System action

The command is not executed.

System programmer response

Correct the TOPICSTR attribute on the **DEFINE SUB** command to correctly use escape characters. If the problem is with the TOPICSTR in a TOPIC object, correct that TOPIC object or refer to a different TOPIC object. If the TOPICSTR needs to use the characters in that way, set the WSCHEMA attribute to *TOPIC* to avoid errors with escape characters.

Parent topic: [Message manager messages \(CSQM...\)](#)

2.7.118. CSQM201I: *csect-name* verb-name *obj-type* DETAILS

Explanation

This message is the response to a command that displays attributes or other information about objects, when that command was entered from either the console, or the command server initialization server. It shows the attributes requested for *obj-type*, as follows:

```
obj-type (name)
attribute-value
attribute-value
```

```
:
```

```
END obj-type DETAILS
```

csect-name might include the command prefix (CPF), depending on how the command was entered.

Exceptionally, the last line might be:

```
obj-type TERMINATED WITH MAX LINES
```

if the number of lines allowed in a multiple line WTO to be issued on the console (255) was exceeded. This figure includes the first and last lines of the display. The only object that might cause this message is namelist because displaying a complete namelist would require 263 lines in total. (This only occurs when the command http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

was issued from the console.)

2.7.124. CSQM298I: *csect-name* TOTAL MESSAGE LENGTH ALLOWED ON CONSOLE EXCEEDED

Explanation

The total message length for the command allowed on the console (32 K) was exceeded.

Severity

8

System action

The command is actioned, but the display of the command is terminated.

System programmer response

This error occurs if a command that displays attributes or other information about objects is entered using a generic name (for example, DIS Q(*) ALL), and the total amount of data to be displayed exceeds 32 K. To avoid this problem, try to be more selective about the information requested (for example, DIS Q(PAY*) ALL).

Parent topic: [Message manager messages \(CSQM...\)](#)

2.7.126. CSQM4nnI: object details

Explanation

This message consists of the entire object or object status details formatted for use by applications. It is issued in response to commands entered from the command server. Message CSQ9022I follows this message.

The message number depends on the object or object status type, as follows:

Number	Object or status type
CSQM400I	Storage class object
CSQM401I	Local queue object
CSQM402I	Model queue object
CSQM403I	Alias queue object
CSQM406I	Remote queue object
CSQM407I	Namelist object
CSQM408I	Process object
CSQM409I	Queue manager object

CSQM410I	Sender channel object
CSQM411I	Server channel object
CSQM412I	Receiver channel object
CSQM413I	Requester channel object
CSQM415I	Server-connection channel object
CSQM416I	Client-connection channel object
CSQM417I	Cluster-receiver channel object
CSQM418I	Cluster-sender channel object
CSQM420I	Sender channel status
CSQM421I	Server channel status
CSQM422I	Receiver channel status
CSQM423I	Requester channel status
CSQM425I	Server-connection channel status
CSQM427I	Cluster-receiver channel status
CSQM428I	Cluster-sender channel status
CSQM430I	CF structure object
CSQM431I	Cluster queue object
CSQM437I	Authentication information object
CSQM439I	Cluster queue manager object
CSQM440I	CF structure status
CSQM441I	Local queue status
CSQM442I	Connection information
CSQM451I	Local queue statistics

2.7.132. CSQM505I: *csect-name* GROUPUR support disabled

Explanation

This message is generated during queue manager startup or in response to an ALTER QMGR command if the GROUPUR queue manager attribute is disabled.

Severity

0

System action

The queue manager inhibits XA client applications from establishing transactions with a GROUP unit of recovery disposition.

Parent topic: [Message manager messages \(CSQM...\)](#)

 This build: January 26, 2011 11:46:01

2.7.133. CSQM506I: *csect-name* GROUPUR qmgr attribute has been disabled **CODE=code**

Explanation

This message is generated at queue manager startup if the GROUPUR queue manager attribute is enabled but one of the configuration checks performed by the GROUPUR agent failed. **CODE=code** contains an identifier indicating which configuration check failed.

Severity

4

System action

The GROUPUR queue manager attribute is disabled.

System programmer response

The system programmer should use the code specified to identify what configuration check failed. If support for group units of recovery is required, they should take corrective action and then re-enable the GROUPUR queue manager attribute.

When you enable group units of recovery (GROUPUR support) a number of configuration checks are performed to ensure the configuration steps have been completed. You cannot enable this support if any of these checks fail.

These checks are also performed at queue manager start up if GROUPUR queue manager attribute is enabled. If one of these checks fails during start up then group units of recovery will be disabled until you correct the error and re-enable the GROUPUR queue manager attribute.

If a check fails it will be identified with a return code (number). You can use this code to identify the failing check using the list below:

1. This queue manager is not a member of a queue-sharing group.
2. The SYSTEM.QSG.UR.RESOLUTION.QUEUE does not exist.
3. The SYSTEM.QSG.UR.RESOLUTION.QUEUE does not support persistent messages.
4. The SYSTEM.QSG.UR.RESOLUTION.QUEUE is not indexed by correlation id.
5. The SYSTEM.QSG.UR.RESOLUTION.QUEUE does not reside on the system application coupling facility structure, CSQSYSAPPL.
6. The queue manager name is the same as the name of the queue-sharing group.
7. Group units of recovery are restricted by the queue manager's mode of operation (OPMODE).

For details on how to enable the GROUPUR queue manager attribute refer to [▶Enabling GROUP units of recovery◀](#).

2.7.134. CSQM507E: *csect-name* GROUPUR qmgr attribute was not enabled CODE=*code*

Explanation

This message is generated in response to an ALTER QMGR command if an attempt to enable the GROUPUR queue manager attribute fails because one of the configuration checks performed by the GROUPUR agent are not satisfied. CODE=*code* contains an identifier indicating which configuration check failed.

Severity

8

System action

The GROUPUR queue manager attribute remains disabled and the ALTER QMGR command fails.

System programmer response

The system programmer should use the code specified to identify what configuration check failed. They should then take corrective action and then re-issue the ALTER QMGR command.

When you enable group units of recovery (GROUPUR support) a number of configuration checks are performed to ensure the configuration steps have been completed. You cannot enable this support if any of these checks fail.

These checks are also performed at queue manager start up if GROUPUR queue manager attribute is enabled. If one of these checks fails during start up then group units of recovery will be disabled until you correct the error and re-enable the GROUPUR queue manager attribute.

If a check fails it will be identified with a return code (number). You can use this code to identify the failing check using the list below:

1. This queue manager is not a member of a queue-sharing group.
2. The SYSTEM.QSG.UR.RESOLUTION.QUEUE does not exist.
3. The SYSTEM.QSG.UR.RESOLUTION.QUEUE does not support persistent messages.
4. The SYSTEM.QSG.UR.RESOLUTION.QUEUE is not indexed by correlation id.
5. The SYSTEM.QSG.UR.RESOLUTION.QUEUE does not reside on the system application coupling facility structure, CSQSYSAPPL.
6. The queue manager name is the same as the name of the queue-sharing group.

For details on how to enable the GROUPUR queue manager attribute refer to [▶Enabling GROUP units of recovery◀](#).

2.7.135. CSQM508E: *csect-name* GROUPUR agent ended abnormally. Restarting

Explanation

The group unit of recovery (GROUPUR) agent has ended abnormally because a severe error occurred, as reported in the preceding messages.

Severity

8

System action

The group unit of recovery (GROUPUR) agent attempts to restart a number of times. If it fails persistently, it terminates.

System programmer response

Investigate the reason for the abnormal termination, as reported in the preceding messages.

2.8.17. CSQN018E: *csect-name* INTERNAL ERROR FOR *>identifier<*, RETURN CODE=*rc*

Explanation

This message could be caused by the following:

Identifier

Description

INSSRV01

During the early part of initialization, the queue manager was unable to start the task that processes commands in CSQINP1.

INSSRV02

During the later part of initialization, the queue manager was unable to start the task that processes commands in CSQINP2.

RTSSRV01

After initialization has completed with the command server enabled, or in response to a START CMDSERV command, the queue manager was unable to start the command server task that processes commands in the system-command input queue.

GRSSRV01

After initialization has completed with the command server enabled, or in response to a START CMDSERV command, the queue manager was unable to start the command server task that processes commands using CMDSCOPE.

Severity

8

System action

The task is not started.

System programmer response

Stop and restart the queue manager. Check the console for other messages regarding this error, and note the message number, *identifier*, and *rc*. Also collect the system dump (if one was produced). Contact your IBM® support center to report the problem.

Parent topic: [Command server messages \(CSQN...\)](#)

2.8.18. CSQN019E: *csect-name* INTERNAL ERROR FOR *>identifier<*, RETURN CODE=*rc*

Explanation

This message could be caused by the following:

Identifier

Description

INSSRV01

During the early part of initialization an error occurred when trying to delete the task that processes commands in CSQINP1.

INSSRV02

During the later part of initialization an error occurred when trying to delete the task that processes commands in CSQINP2.

RTSSRV01

During termination with the command server running, or in response to a START CMDSERV command, an error occurred when trying to delete the command server task that processes commands in the system-command input queue.

GRSSRV01

During termination with the command server running, or in response to a START CMDSERV command, an error occurred when trying to delete the command server task that processes commands using CMDSCOPE.

Severity

8

System action

If the value of *identifier* was INSSRV01 or INSSRV02, the error is ignored, and startup continues.

If the value of *identifier* was RTSSRV01 or GRSSRV01 and *csect-name* was CSQNESTP, the command server could have terminated while processing a command.

System programmer response

Check the console for other messages regarding this error. If you are unable to resolve the problem, note the message number, *identifier*, and *rc*, collect the system dump (if one was produced), and contact your IBM® support center.

2.8.23. CSQN102I: COMMAND BUFFER INVALID, ERROR UNKNOWN, COMMAND IGNORED

Explanation

An internal error has occurred.

Severity

4

System action

This command is ignored, and the next command is processed.

System programmer response

The command in question precedes this message in the CSQOUT1 or CSQOUT2 data set. If you are unable to solve the problem, contact your IBM® support center.

Parent topic: [Command server messages \(CSQN...\)](#)

2.8.24. CSQN103I: COMMAND PROCESSOR RETURN CODE=>*rc*<, REASON CODE=*reason*

Explanation

An error occurred while processing the command preceding this message in the CSQOUT1 or CSQOUT2 data set. The possible values of *rc* are as follows:

Return code

Description

00000004

Internal error

00000008

Syntax or command preprocessor error, see the following lines in the CSQOUTx data set

0000000C

Command processor error, see the following lines in the CSQOUTx data set

00000010

Command processor abnormal termination

00000014

Command completed, but there is insufficient storage for the messages

00000018

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Command preprocessor has insufficient storage (there could be further messages about this error)

0000001C

The command processor has insufficient storage (the command could be partially completed)

00000020

Security check

00D50102

Refer to [Command server codes \(X'D5'\)](#)

Note: If the return code is '00000010', the reason code has no meaning.

If *reason* is 00000004 and *return code* is 00000000, the command has been accepted and will be completed later. Further messages will be produced when the command has been completed.

Otherwise the reason code indicates the command result as follows:

Reason**Description****00000000**

Command completed

00000004

Partial completion

00000008

Command not actioned

0000000C

Command processorabend

FFFFFFFF

Command not actioned

Severity

4

System action

The next command is processed, if possible.

System programmer response

If *reason* indicates that the command did not complete, examine the command and all associated messages. See the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual for further information about the commands.

If you are unable to solve the problem, collect the input and output data sets and contact your IBM® support center.

2.8.44. CSQN205I: COUNT=>*count*<, RETURN=*rc*, REASON=*reason*

Explanation

This message reports the results from the command processor (refer to the [WebSphere MQ for z/OS System Administration Guide](#) for further information). *count* is the number of messages (including this one) to be written to the reply-to queue in response to the command. Possible values of *rc* are as follows:

Return code

Description

00000000

Normal completion

00000004

Internal error

00000008

Syntax or command preprocessor error, see the following messages

0000000C

Command processor error, see the following messages

00000010

Command processor abnormal termination

00000014

Command completed, but there is insufficient storage for the messages

00000018

Command preprocessor has insufficient storage, (there could be further messages about this error)

0000001C

The command processor has insufficient storage (the command could be partially completed)

00000020

Security check, check userid authority

00000024

Command too long, see the following messages

00000028

Queue-sharing group error, see the following messages

00D5xxxx

Refer to [Command server codes \(X'D5'\)](#)

Note: If the return code is '00000010', the reason code has no meaning.

If *reason* is 00000004 and *return code* is 00000000, the set of reply messages is incomplete. Further sets of messages, each including another CSQN205I message, will be produced later. The results of the command will be shown by the codes in the CSQN205I message included with the final set of messages.

Otherwise the reason code indicates the command result as follows:

Reason**Description****00000000**

Command completed

00000004

Partial completion

00000008

Command not actioned

0000000C

Command processorabend

FFFFFFFF

Command not actioned

Severity

0

System action

The next command is processed, if possible.

System programmer response

If *reason* indicates that the command did not complete, examine the command and all associated messages. See the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual for further information about the commands.

If you are unable to solve the problem, collect the input and output data sets and contact your IBM® support center.

Message CSQN203I is sent to the console containing the return and reason codes from the request function. The command server terminates.

System programmer response

Change the system-command input queue to be enabled, and issue the START CMDSERV command.

If the problem persists, collect the following items, and contact your IBM® support center:

- Return and reason codes
- Any trace data collected
- Printout of SYS1.LOGREC

2.8.53. CSQN219E: Unable to find command reply information

Explanation

While processing responses from a command that specified CMDSCOPE or a command for the channel initiator, the command server could not find the information to determine where to send the responses.

Severity

8

System action

The command may not be processed; any command responses are discarded. The command server continues.

System programmer response

If the problem persists, contact your IBM® support center with details of this message, any previous messages pertaining to this error, and the dump (if applicable).

2.8.54. CSQN220E: Error monitoring CMDSCOPE command data

Explanation

The command server experienced an error while monitoring command data in the coupling facility.

System action

Message CSQN202I is sent to the z/OS® console, reporting the return and reason codes from the request.

The command server terminates.

System programmer response

Refer to [Coupling Facility codes \(X'C5'\)](#) for information about the reason code. Use this information to solve the problem, and restart the command server. If this does not help you to solve the problem, collect the following items, and contact your IBM® support center:

- Return and reason codes from the console message
- Any trace information collected

2.9.3. CSQO003I: Use the ISPF command PFSHOW to display F-key settings

Explanation

On entry to Operations and Control, F-key settings are not being displayed. This tells you how to display the settings; you need to use F-keys to use the Operations and Control panels.

Severity

0

System action

None.

Operator response

Type PFSHOW in the command area of the panel to see the F-key settings. (Note that this will cause the F-key settings to be displayed on any other logical ISPF screens that you have, and to remain displayed when you leave Operations and Control. Use the ISPF command PFSHOW OFF to turn the display off.)

This topic's URL:

zm17430_

2.9.14. CSQO014E: MQOPEN of *q-name* unsuccessful. Reason code=>*mqrc*<.

Explanation

An attempt to open *q-name* was unsuccessful. *mqrc* is the reason code returned by **MQOPEN**; see [API completion and reason codes](#) for more information. *q-name* is one of the following:

- SYSTEM.COMMAND.INPUT
- SYSTEM.COMMAND.REPLY.MODEL; the requested dynamic queue name is appended in parentheses.
- The name of a transmission queue (if you are attempting to send commands to a remote system)

Likely causes of this problem are:

- One or both of the required queues is not defined on the queue manager that you have connected to.
- An attempt was made to send commands to a remote system, but no transport queue is defined.
- You are not authorized to open one of the required queues. If the message indicates that it is the SYSTEM.COMMAND.REPLY.MODEL queue that you are not authorized to open, it could be that you are not authorized to open the SYSTEM.CSQOREXX.* dynamic queue.
- There is insufficient storage available.

Severity

8

System action

The main menu is redisplayed.

Operator response

Take the corrective action suggested for *mqrc*. Also:

- Check that *q-name* is defined correctly.
- If your target queue manager is not the same as the connect to queue manager, ensure that you have defined a transmission queue with the same name. See the [WebSphere MQ Intercommunication](#) manual for information about remote queues.
- If *mqrc* is 2035 (MQRC_NOT_AUTHORIZED) contact your MQ data security administrator.

Parent topic: [Operations and control messages \(CSQO...\)](#)

16/03/2011

zm17440_

2.9.15. CSQO015E: Command issued but no reply received.

Explanation

The reply to a command could not be retrieved from the reply-to queue using **MQGET** because the response wait time was exceeded.

Severity

8

System action

The panel is redisplayed. The command was sent to the queue manager, but it might not have been executed successfully.

Operator response

Increase the response wait time and try again.

If the problem persists, issue commands from the z/OS® console for the target queue manager to do the following:

- Check whether the command was actioned (for example, if you were trying to define a queue ABCD, use the command `DISPLAY QUEUE(ABCD)` to see if it has been actioned).
- Check the GET attribute of the `SYSTEM.COMMAND.INPUT` queue; it should be set to `ENABLED`.
- Check the PUT and `MAXMSGL` attributes of the reply-to model queue `SYSTEM.COMMAND.REPLY.MODEL`. PUT should be set to `ENABLED`; `MAXMSGL` should be at least 15000.
- If all the settings are correct, stop and restart the command server using the `STOP CMDSERV` and `START CMDSERV` commands.

Additionally, if the target queue manager was remote:

- Check that the links to the remote queue manager are still available.
- Check the transmission queue definitions for both the local and remote queue managers. The commands are put onto a locally defined transmission queue, and after transmission, they are put onto the system-command input queue of the remote queue manager. After the command has been actioned, the replies are put onto a transmission queue on the remote queue manager, and after transmission, they are put onto the local reply-to queue. You should check all four queues.
- If you think you have a network performance problem, contact the system programmer.

Parent topic: [Operations and control messages \(CSQO...\)](#)

 This build: January 26, 2011 11:43:31

This topic's URL:

zm17450_

2.9.16. CSQO016E: MQPUT to *q-name* unsuccessful. Reason code= >*mqrc*<.

Explanation

An attempt to put a command on a queue (*q-name*) using **MQPUT** was unsuccessful. *q-name* is the name of either the system-command input queue, or a transmission queue if you are sending commands to a remote queue manager. *mqrc* is the reason code returned from **MQPUT**; see [API completion and reason codes](#) for more information.

The most likely causes of this problem are:

1. Put requests are inhibited for the system-command input queue or the transmission queue.
2. The system-command input queue or transmission queue is full, because the command server is not running.
3. There is insufficient storage available.

Severity

8

System action

The command is not sent to the queue manager and the panel is redisplayed.

Operator response

Wait a bit and try again.

If the problem persists, take the corrective action suggested for *mqrc*. Issue commands from the z/OS® console for the target queue manager to do the following:

- Check the PUT, MAXDEPTH, and MAXMSGL attributes of the queue. Set PUT to ENABLED. MAXDEPTH must not be zero. MAXMSGL must be at least 32762.
- If all the settings are correct, stop and restart the command server using the STOP CMDSERV and START CMDSERV commands.

If you are unable to resolve the problem, contact the system programmer.

This topic's URL:

zm17460_

2.9.17. CSQO017E: MQGET from **>reply-q<** unsuccessful. Reason code=*mqrc*.

Explanation

The reply to a command could not be retrieved from the reply-to queue using **MQGET**. (The reply-to queue is a local queue generated from the model queue SYSTEM.COMMAND.REPLY.MODEL.) *mqrc* is the reason code returned from **MQGET**; see [API completion and reason codes](#) for more information.

A possible cause of this problem is that get requests are inhibited on the reply-to queue.

Severity

8

System action

The panel is redisplayed. The command was sent to the queue manager, but it might not have been executed successfully.

Operator response

Take the corrective action suggested for *mqrc*. Issue commands from the z/OS® console for the target queue

manager to do the following:

- Check whether the command was actioned (for example, if you were trying to define a queue ABCD, use the command DISPLAY QUEUE(ABCD) to see if it has been actioned).
- Check the GET and MAXMSGL attributes of the reply-to model queue SYSTEM.COMMAND.REPLY.MODEL. GET should be set to ENABLED; MAXMSGL should be at least 13000.
- If all the settings are correct, stop and restart the command server using the STOP CMDSERV and START CMDSERV commands.

If you are unable to resolve the problem, contact the system programmer.

2.9.18. CSQO018E: Queue manager is invalid or unknown or unavailable.

Explanation

An attempt to send a command was unsuccessful because the target or action queue manager was not known or not valid or not running.

Severity

8

System action

The command is not sent the queue manager and the panel is redisplayed.

Operator response

Check the name and, if a remote queue manager is being used, check the remote queue definition, and correct as necessary. If required, start the queue manager.

This topic's URL:

zm17490_

2.9.20. CSQO020I: '>field<' truncated due to quotes. Press Enter to continue.

Explanation

The value in field *field* contains one or more quote marks. In order that these are treated as quote marks instead of indicators of the beginning or end of a string, each quote mark is converted into two quote marks (doubling up) in the command for the queue manager. However, this conversion has made the string too long, and it has been truncated.

Severity

0

System action

The value is truncated. The panel may be redisplayed with *field-name* set to the truncated value.

Operator response

Press Enter to submit the altered definition. If the panel is redisplayed, reduce the number of quote marks used in the field if appropriate.

2.9.29. CSQO031E: ALLOCATE of data set *dsname* unsuccessful. Return code = **>rc<**.

Explanation

An ALLOCATE error occurred when processing the data set allocated during an attempt to edit the names in a namelist. *dsname* is the name of the data set, and is of the form *userid.NAMELIST.NAMESn* (where *userid* is the TSO userid involved, and *n* is a number). *rc* is the return code from the TSO command ALLOCATE.

The most likely cause of this problem is that another data set with the same name already exists, or that DDname CSQONLn is in use.

Severity

8

System action

The panel is redisplayed.

Operator response

Check to see if data set *userid.NAMELIST.NAMESn* already exists. If it does not, contact your system programmer.

System programmer response

This message will be accompanied by one or more messages from TSO, giving more information about the cause of the problem. The return code is documented in the *TSO/E Command Reference* manual.

If you are unable to resolve the problem, contact your IBM® support center.

Parent topic: [Operations and control messages \(CSQO...\)](#)

2.9.49. CSQO051I: Like object name with disposition *disptype* not found. Name assumed to be for defining new object with default attributes.

Explanation

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

You asked to define an object of type *objtype*, using as a basis an object with disposition *disptype* and name *name*, but no such object was found.

(In earlier releases, you could specify the name of a new object to define on the 'Main Menu' panel, and a 'like' name to use as a basis for your definition. Now, only the 'like' name can be specified for 'Define' on the 'Main Menu' panel; you specify the new object name on the 'Define' panel.)

Severity

0

System action

The 'Define' panel is displayed, initialized with the name you specified and the default attributes for that type of object, on the assumption that you intended to define a new object with default attributes.

Operator response

Check the disposition and attributes and then press Enter to define a new object with the name you specified, or press F12 to return to the 'Main Menu' panel.

To define a new object with default attributes, you should leave the name blank on the 'Main Menu' panel, and enter it on the 'Define' panel.

2.9.79. CSQO086E: Error in **>pgm-name<**. TBDISPL *panel-name* failed, return code = *rc*.

Explanation

An attempt by *pgm-name* to call the ISPF TBDISPL service was unsuccessful. *panel-name* is the name of the panel that *pgm-name* was attempting to display.

Severity

12

System action

The system is unable to display the panel, and the last panel is redisplayed (if applicable). An ISPF message giving more details about the error might be shown first.

System programmer response

If *rc*=12, the system is unable to find the panel. If you receive this message when you are trying to display the 'Main Menu' panel it could be that you do not have the data set containing the panels in your library concatenation. Find the name of the data set containing the panels, then check your ISPLIB library definitions. This will probably be in your TSO logon procedure unless you are calling CSQOREXX from a higher level exec or CLIST that has the ISPF LIBDEF calls in it.

If you are already using the panels when you get this message, either a panel is missing from your ISPLIB library, or an internal error has occurred. If you are unable to solve the problem, contact your IBM® support center for assistance.

If *rc*=20, the most likely cause of the problem is that the system was unable to find the key-list which goes with the panel that it is trying to display. All the key lists are in an ISPF table (CSQOKEYS) that should be in a library in your ISPTLIB concatenation.

2.10.2. CSQP002I: BUFFPOOL VALUE OUT OF RANGE

Explanation

One of the following commands has been issued incorrectly:

- DEFINE BUFFPOOL(n)
- ALTER BUFFPOOL(n)
- DELETE BUFFPOOL(n)
- DEFINE PSID(x) BUFFPOOL(n)

The value of n must be in the range 0 through 15.

Severity

8

System action

The command is ignored.

System programmer response

See the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual for information about the command, and reissue the command correctly.

Parent topic: [Buffer manager messages \(CSQP...\)](#)

This topic's URL:

zm18230_

2.10.4. CSQP004E: *csect-name* I/O ERROR STATUS *ret-code* PSID *psid* RBA *rba*

Explanation

An I/O error has occurred. *ret-code* is the return code from the Media Manager. *psid* is the identifier of the page set for which the error occurred and *rba* is the RBA (in hexadecimal) of the record on which the error occurred.

Severity

8

System action

▶The queue manager can be abended. For example, in the case of a failing MQGET or MQPUT, the queue-manager is not terminated if the CSQP004E I/O error occurs during a WebSphere® MQ API call. However, if the I/O error occurs during checkpoint processing, the queue-manager is terminated.◀

System programmer response

See the *MVS/DFP Diagnosis Reference* manual for information about return codes from the Media Manager. If you do not have access to the required manual, contact your IBM® support center, quoting the return code from the Media Manager.

Parent topic: [Buffer manager messages \(CSQP...\)](#)

 This build: January 26, 2011 11:43:37

2.10.5. CSQP005I: BUFFERS VALUE OUT OF RANGE

Explanation

One of the following commands has been issued incorrectly:

- DEFINE BUFFPOOL(n) BUFFERS(x)
- ALTER BUFFPOOL(n) BUFFERS(x)

The value of x must be in the range 100 through 500_{SP}000.

Severity

8

System action

The command is ignored.

System programmer response

Reissue the command correctly. The total number of buffers that it is possible to define in all the buffer pools is determined by the amount of storage available in the queue manager address space, and may be less than 500_{SP}000.

Parent topic: [Buffer manager messages \(CSQP...\)](#)

2.10.6. CSQP006I: LOG CHECKPOINT NAME *log-name* DOES NOT MATCH QUEUE MANAGER NAME *qmgr-name*

Explanation

An attempt to restart with a log from another queue manager was detected. The name recorded in the log during checkpoint does not match the name of the queue manager using that log for restart.

Severity

8

System action

Restart is abnormally terminated with completion code X'5C6' and reason code X'00D70102'.

System programmer response

Change the started task JCL procedure xxxxMSTR for the queue manager to name the appropriate bootstrap and log data sets.

This topic's URL:

zm18290_

2.10.10. CSQP011E: CONNECT ERROR STATUS *ret-code* FOR PAGE SET *psid*

Explanation

An attempt to open a page set was unsuccessful. *psid* is the page set identifier and *ret-code* is the return code from the Data Facilities Product (DFP) CONNECT function.

This can occur during queue manager startup, where the most likely cause is that there is no DD statement for the page set included in the queue manager started task JCL, or in response to a DEFINE PSID command used to add a page set dynamically.

Severity

8

System action

If this occurs during queue manager startup, MQ attempts to dynamically allocate the page set and retry the open, on the assumption that the DD statement for the page set is missing. Messages following message CSQI010I at the end of restart indicate whether the dynamic page set allocation was successful, or whether such page sets still remain offline.

If the page set cannot be opened, the queue manager continues running, but you will be unable to access the data in that page set. You could encounter problems during restart, or when attempting to open a queue.

System programmer response

If applicable, ensure that there is a DD statement for the page set included in the queue manager started task JCL.

If the page set cannot be opened, see the *MVS/DFP Diagnosis Reference* manual for information about return codes from the Media Manager. If you do not have access to the required manual, contact your IBM® support center, quoting the return code from the Media Manager.

Parent topic: [Buffer manager messages \(CSQP...\)](#)

2.10.11. CSQP012I: DISCONNECT ERROR STATUS *ret-code* FOR

PAGE SET *psid*

Explanation

An attempt to close a page set was unsuccessful. *psid* is the page set identifier and *ret-code* is the return code from the Media Manager.

Severity

8

System action

Queue manager shutdown continues, but some information might be missing from the page set. This will be corrected from the log during restart.

System programmer response

See the *MVS/DFP Diagnosis Reference* manual for information about return codes from the Media Manager. If you do not have access to the required manual, contact your IBM® support center, quoting the return code from the Media Manager.

Parent topic: [Buffer manager messages \(CSQP...\)](#)

zm18310_

2.10.12. CSQP013I: *csect-name* NEW EXTENT CREATED FOR PAGE SET *psid*. NEW EXTENT WILL NOW BE FORMATTED

Explanation

Page set *psid* has been successfully dynamically expanded by creating a new extent.

Severity

0

System action

The new extent is formatted; message CSQI031I will be issued when formatting completes successfully.

System programmer response

The page set can only be expanded 123 times. After this you will have to reallocate the page set using larger primary and secondary extents. For information about how to do this, see the [WebSphere MQ for z/OS System Setup Guide](#).

Parent topic: [Buffer manager messages \(CSQP...\)](#)

 This build: January 26, 2011 11:43:37

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

zm18320_

2.10.13. CSQP014E: *csect-name* EXPANSION FAILED FOR PAGE SET *psid*. FUTURE REQUESTS TO EXTEND IT WILL BE REJECTED

Explanation

An attempt to expand a page set dynamically was unsuccessful.

Severity

8

System action

Processing continues

System programmer response

Look for messages from VSAM or DFP that explain why the request was unsuccessful, and do the required actions.

If you have received message IEC070I, and the *return code* (the first value in that message) is 203, an extend was attempted, but no secondary space allocation quantity was specified. If the value of *return code* was 204, an extend was attempted, but the maximum number of extents was reached. The maximum number of extents for a VSAM data set cataloged in an ICF catalog is between 119 and 123, depending upon the number of extents (1-5) allocated by DADSM per allocate/extend request.

If you believe that there is sufficient free space that could be used by another secondary extent, contact your IBM® support center for assistance.

Note: DFP uses up to five non-contiguous areas of disk to satisfy the total space requirements of a primary or secondary extent. This means, in the worst case of badly fragmented disk space, that you might only get around 22 times the secondary space allocated before you reach the maximum space limit.

2.10.14. CSQP016E: *csect-name* PAGE SET *psid* HAS REACHED THE MAXIMUM NUMBER OF EXTENTS. IT CANNOT BE EXTENDED AGAIN

Explanation

An attempt to expand page set *psid* dynamically was unsuccessful because the maximum number of extents had been used.

Severity

8

System action

The page set cannot be extended again. When the messages on the full page set are retrieved, the existing space will be reused.

System programmer response

Copy the page set to a new page set with larger primary and secondary extents. By defining the page set as a multivolume data set, you can take advantage of the free space on as many disk volumes as possible. See the [WebSphere MQ for z/OS Concepts and Planning Guide](#) and the [WebSphere MQ for z/OS System Setup Guide](#) for more information about page set organization and management.

This topic's URL:

zm18370_

2.10.18. CSQP020E: *csect-name* Buffer pool *>n<* is too small

Explanation

Contention is taking place for buffers in a buffer pool. Messages will have to be read from and written to the page sets, which increases the time to process an application request and increases the amount of CPU time used.

Severity

8

System action

Processing continues.

System programmer response

If required, use the ALTER BUFFPOOL command to add more buffers to the buffer pool. Consider first altering other buffer pools to reduce the total number of buffers in use. Refer to the latest CSQY220I message on the z/OS® console to see how much virtual storage is free, and hence how many extra buffers may be safely added to a buffer pool. (If you do change the number of buffers in the buffer pool, you should also change the DEFINE BUFFPOOL commands in the CSQINP1 initialization input data set used by the queue manager, so that the changes remain in force when the queue manager is restarted.)

Alternatively, stop the queue manager as soon as possible and increase the number of buffers on the DEFINE BUFFPOOL commands in the CSQINP1 initialization input data set used by the queue manager, and restart the queue manager.

2.10.20. CSQP022I: Buffer pool >*n*< is not defined

Explanation

A command has been issued specifying a buffer pool that is not defined.

Severity

8

System action

The command is ignored.

System programmer response

See the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual for information about the command, and reissue the command correctly.

Parent topic: [Buffer manager messages \(CSQP...\)](#)

2.10.27. CSQP030E: Deallocation failed for data set >dsname<, error status=eeeeiii, SMS reason code=ssssssss

Explanation

An error occurred when trying to dynamically deallocate the page set data set. Error status is the error reason code returned by z/OS® dynamic allocation.

Severity

8

System action

The page set is deleted and is no longer available for use.

System programmer response

The error status portion of this message contains a 2-byte error code (eeee, S99ERROR) followed by the 2-byte information code (iii, S99INFO) from the SVC99 request block. If the S99ERROR code indicates an SMS allocation error ('97xx'), then ssssssss contains additional SMS reason code information obtained from S99ERSN. See the *MVS™ Authorized Assembler Services Guide* manual for a description of these codes.

zm18520_

2.10.33. CSQP036I: Data set *dsname* for page set *>n<* is not formatted with RECOVER or REPLACE

Explanation

The named page set data set was not formatted correctly. A data set that is to be used for adding a page set dynamically must be one that is newly formatted (using TYPE(RECOVER)), or one that has previously been used to hold messages and has been formatted using TYPE(REPLACE).

Severity

8

System action

The page set is not defined.

System programmer response

Format the data set as required. If you are adding a previously unused page set to the queue manager, use the FORMAT function of the utility program CSQUTIL, specifying TYPE(RECOVER). If the page set was previously used to hold messages, use the FORMAT function specifying TYPE(REPLACE).

In the latter case, if the queue manager terminated abnormally, the formatting may fail, and message CSQU160E will be issued. It is not possible to add such a page set data set dynamically, but the page set can be brought into use again by including it in the started task JCL procedure xxxXMSTR for the queue manager, and then restarting the queue manager.

2.10.42. CSQP047E: Unavailable page sets can cause problems – take action to correct this situation

Explanation

One or more page sets are unavailable, as reported in the preceding messages; they are either offline having been used previously, not defined, or otherwise inaccessible. For example, MQ may have attempted to open a page set at restart, but failed perhaps because it was in use by another application.

This situation can cause problems, so you should take action to correct it as soon as possible.

Severity

4

System action

Processing continues.

System programmer response

Use the DISPLAY USAGE command to get a list of the unavailable page sets.

If a previously-used page set is required, bring it online; this can be done without stopping the queue manager. Use the FORMAT function of the utility program CSQUTIL, specifying TYPE(REPLACE). Then issue a DEFINE PSID command to bring the page set back into use. Note that all units of recovery (except those that are indoubt) that involved the offline page set will have been backed out by the queue manager when the page set was last used. These indoubt units of recovery may be resolved once the page set is back in use by the queue manager.

If a page set is not required, issue a DELETE PSID command to remove it. Also remove any DEFINE PSID command for it from the CSQINP1 initialization input data set.

Parent topic: [Buffer manager messages \(CSQP...\)](#)

2.10.44. CSQP049I: Data set *dsname* is formatted for a different page set **>n<**

Explanation

The page set data set was formatted using TYPE(REPLACE), and as such may contain messages for a specific page set *n*. It cannot be added dynamically with a different page set identifier.

Severity

8

System action

The page set is not defined.

System programmer response

Reissue the command specifying the correct data set and page set. If you intended adding a previously unused page set, reformat the data set with use the FORMAT function of the utility program CSQUTIL, specifying TYPE (RECOVER).

Parent topic: [Buffer manager messages \(CSQP...\)](#)

2.10.45. CSQP051I: Insufficient storage for buffer pool **>n<** request

Explanation

The size of the specified buffer pool has not been changed as requested because insufficient storage is available.

Severity

4

System programmer response

The DISPLAY USAGE command can be used to determine the current sizes of all buffer pools defined to the system. It may be possible to reduce the size of other buffer pools, so freeing storage, which can then be assigned to this buffer pool by reissuing the command.

Parent topic: [Buffer manager messages \(CSQP...\)](#)

2.11.2. CSQQ001I: IMS/TM **>iiii<** not connected to queue manager *qqqq*. Notify message accepted

Explanation

This message is produced at the IMS™ master terminal when the IMS control region for IMS system *iiii* has tried to connect to queue manager *qqqq* but the queue manager is not yet ready to make connections.

Severity

0

System action

The queue manager has accepted the notify message from IMS and when it is ready to make connections it will issue the z/OS® command MODIFY IMS to cause IMS to attempt to make the connection again. IMS applications can not access MQ resources until the connection is made.

Operator response

Look for other errors in MQ that might prevent it becoming ready, and notify the system programmer.

System programmer response

Resolve any other MQ problems.

Problem determination

You might find the following items useful in resolving the problem:

- Symptom string
- Printout of SYS1.LOGREC
- Queue manager job log
- PSW and registers at point of failure
- Copy of the IMS log

Parent topic: [IMS adapter messages \(CSQQ...\)](#)

 This build: January 26, 2011 11:43:40

2.11.3. CSQQ002E: IMS/TM >iiii< failed to connect to queue manager qqqq, MQRC=mqrc

Explanation

This message is produced at the IMS™ master terminal when the IMS control region for IMS system *iiii* has failed to connect to queue manager *qqqq*. *mqrc* is the MQ reason code for the failure.

Severity

12

System action

The IMS control region, and dependent regions are not connected to the queue manager. Any request from IMS applications for MQ resources will fail.

Operator response

Notify the system programmer.

System programmer response

Refer to [API completion and reason codes](#) for information about *mqrc* to determine the nature of the error.

Problem determination

You might find the following items useful in resolving the problem:

- Symptom string
- Printout of SYS1.LOGREC
- Queue manager job log
- Copy of the IMS log

Parent topic: [IMS adapter messages \(CSQQ...\)](#)

2.11.4. CSQQ003E: IMS/TM >iiii< create thread failed while connecting to queue manager qqqq, MQRC=mqrc

Explanation

This message is produced at the IMS™ master terminal when the IMS control region for IMS system *iiii* has failed to connect to queue manager *qqqq*. *mqrc* is the MQ reason code for the failure from the MQ create thread function.

Severity

12

System action

The IMS control region, and dependent regions are not connected to the queue manager. Any request from IMS applications for MQ resources will fail.

Operator response

Notify the system programmer.

System programmer response

Refer to [API completion and reason codes](#) for information about *mqrc* to determine the cause of the problem.

Problem determination

You might find the following items useful in resolving the problem:

- Printout of SYS1.LOGREC
- Queue manager job log

2.11.28. CSQQ114E: **>psb-name< region-id MQINQ error, MQCC=mqcc MQRC=mqrc**

Explanation

An attempt to use the **MQINQ** call to inquire about the attributes of a queue was unsuccessful. *region-id* is the last four digits of the region identifier, or blank. This message is followed by message CSQQ110I indicating the name of the queue.

Severity

8

System action

CSQQTRMN ends.

System programmer response

Refer to [API completion and reason codes](#) for information about *mqcc* and *mqrc* to determine why an **MQINQ** call could not be made on the queue.

Parent topic: [IMS adapter messages \(CSQQ...\)](#)

2.12.1. CSQR001I: RESTART INITIATED

Explanation

This message delimits the beginning of the restart process within startup. The phases of restart are about to begin. These phases are necessary to restore the operational environment to that which existed at the time of the previous termination and to perform any recovery actions that might be necessary to return MQ-managed resources to a consistent state.

Parent topic: [Recovery manager messages \(CSQR...\)](#)

This topic's URL:

zm19170_

2.12.4. CSQR004I: RESTART – UR COUNTS – IN COMMIT=>*nnnn*<, INDOUBT=*nnnn*, INFLIGHT=*nnnn*, IN BACKOUT=*nnnn*

Explanation

This message indicates the completion of the first phase of the restart process. The counts indicate the number of units of recovery whose execution state during a previous queue manager termination was such that (to ensure MQ resource consistency) some recovery action must be performed during this restart process. The counts might provide an indication of the time required to perform the remaining two phases of restart (forward and backward recovery).

The IN COMMIT count specifies the number that had started, but not completed, phase-2 of the commit process. These must undergo forward recovery to complete the commit process.

The INDOUBT count specifies the number that were interrupted between phase-1 and phase-2 of the commit process. These must undergo forward recovery to ensure that resources modified by them are unavailable until their INDOUBT status is resolved.

The INFLIGHT count specifies the number that neither completed phase-1 of the commit process nor began the process of backing out. These must undergo backward recovery to restore resources modified by them to their previous consistent state.

The IN BACKOUT count specifies the number that were in the process of backing out. These must undergo backward recovery to restore resources modified by them to their previous consistent state.

System action

Restart processing continues.

Parent topic: [Recovery manager messages \(CSQR...\)](#)

 This build: January 26, 2011 11:43:44

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

This topic's URL:

zm19180_

2.12.5. CSQR005I: RESTART – FORWARD RECOVERY COMPLETE – IN COMMIT=>*nnnn*<, INDOUBT=*nnnn*

Explanation

The message indicates the completion of the forward recovery restart phase. The counts indicate the number of units of recovery whose recovery actions could not be completed during the phase. Typically, those in an IN COMMIT state remain because the recovery actions of some subcomponents have not been completed. Those units of recovery in an INDOUBT state will remain until connection is made with the subsystem that acts as their commit coordinator.

System action

Restart processing continues.

Operator response

No action is required unless the conditions persist beyond some installation-defined period of time. Recovery action will be initiated when the resource is brought online. Indoubt resolution will be initiated as part of the process of reconnecting the subsystems.

Parent topic: [Recovery manager messages \(CSQR...\)](#)

 This build: January 26, 2011 11:43:44

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

This topic's URL:

zm19190_

2.12.6. CSQR006I: RESTART – BACKWARD RECOVERY COMPLETE – INFLIGHT=>nnnn<, IN BACKOUT=nnnn

Explanation

The message indicates the completion of the backward recovery restart phase. The counts indicate the number of units of recovery whose recovery actions could not be completed during the phase. Typically, those in either state remain because the recovery actions of some subcomponents have not been completed.

System action

Restart processing continues.

Operator response

No action is required unless the condition persists beyond some installation-defined period of time. Recovery action will be initiated when the resource collection is brought online.

zm19200_

2.12.7. CSQR007I: UR STATUS

Explanation

This message precedes a table showing the status of units of recovery (URs) after each restart phase. The message and the table will accompany the CSQR004I, CSQR005I, or CSQR006I message after each nested

phase. At the end of the first phase, it shows the status of any URs that require processing. At the end of the second (forward recovery) and third (backout) phases, it shows the status of only those URs which needed processing but were not processed. The table helps to identify the URs that were active when the queue manager stopped, and to determine the log scope required to restart.

The format of the table is:

T	CON-ID	THREAD-XREF	S	URID	TIME
---	--------	-------------	---	------	------

The columns contain the following information:

T

Connection type. The values can be:

B

Batch: From an application using a batch connection

R

RRS: From an RRS-coordinated application using a batch connection

C

CICS®: From CICS

I

IMS™: From IMS

S

System: From an internal function of the queue manager or from the channel initiator.

CON-ID

Connection identifier for related URs. Batch connections are not related to any other connection. Subsystem connections with the same identifier indicate URs that originated from the same subsystem.

THREAD-XREF

The recovery thread cross-reference identifier associated with the thread; see the [WebSphere MQ for z/OS System Administration Guide](#) for more information.

S

Restart status of the UR. When the queue manager stopped, the UR was in one of these situations:

B

INBACKOUT: the UR was in the 'must-complete' phase of backout, and is yet to be completed

C

INCOMMIT: the UR was in the 'must-complete' phase of commit, and is yet to be completed

D

INDOUBT: the UR had completed the first phase of commit, but MQ had not received the second phase instruction (the UR must be remembered so that it can be resolved when the owning subsystem reattaches)

F

INFLIGHT: the UR had not completed the first phase of commit, and will be backed out.

URID

UR identifier, the log RBA of the beginning of this unit of recovery. It is the earliest RBA required to process the UR during restart.

TIME

The time the UR was created, in the format *yyyy-mm-dd hh:mm:ss*. It is approximately the time of the first MQ API call of the application or the first MQ API call following a commit point.

zm19210_

2.12.8. CSQR009E: NO STORAGE FOR UR STATUS TABLE, SIZE REQUESTED=>xxxx<, REASON CODE=yyyyyyyy

Explanation

There was not enough storage available during the creation of the recoverable UR (unit of recovery) display table.

System action

Restart continues but the status table is not displayed.

System programmer response

Increase the region size of the xxxxMSTR region before restarting the queue manager.

Problem determination

The size requested is approximately 110 bytes for each unit of recovery (UR). See the message CSQR004I to determine the total number of URs to process. Use this value with the storage manager reason code from this message to determine the reason for the shortage. The reason codes are documented in [Storage manager codes \(X'E2'\)](#).

This topic's URL:

zm19240_

2.12.11. CSQR015E: CONDITIONAL RESTART CHECKPOINT RBA *rba* NOT FOUND

Explanation

The checkpoint RBA in the conditional restart control record, which is deduced from the end RBA or LRSN value that was specified, is not available. This is probably because the log data sets available for use at restart do not include that end RBA or LRSN.

System action

Restart ends abnormally with reason code X'00D99001' and the queue manager terminates.

System programmer response

Run the change log inventory utility (CSQJU003) specifying an ENDRBA or ENDLRSN value on the CRESTART control statement that is in the log data sets that are to be used for restarting the queue manager.

Parent topic: [Recovery manager messages \(CSQR...\)](#)

2.12.12. CSQR020I: OLD UOW FOUND

Explanation

During restart, a unit of work was found that predates the oldest active log. Information about the unit of work is displayed in a table in the same format as in message CSQR007I.

System action

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Message CSQR021D is issued and the operator's reply is awaited.

Operator response

The operator has two options:

- Commit the unit of work, by replying 'Y'.
- Continue, by replying 'N'. The unit of work will be handled by the normal restart recovery processing. Because the unit of work is old, this is likely to involve using the **archive** logs.

2.12.13. CSQR021D: REPLY Y TO COMMIT OR N TO CONTINUE

Explanation

An old unit of work was found, as indicated in the preceding CSQR020I message.

System action

The queue manager waits for the operator's reply.

Operator response

See message CSQR020I.

Parent topic: [Recovery manager messages \(CSQR...\)](#)

 This build: January 26, 2011 11:43:44

This topic's URL:

zm19290_

2.12.16. CSQR026I: Long-running UOW shunted to RBA=>*rba*<, URID=*urid* connection name=*name*

Explanation

During checkpoint processing, an uncommitted unit of recovery was encountered that has been active for at least 3 checkpoints. The associated log records have been rewritten ('shunted') to a later point in the log, at RBA *rba*. The unit of recovery identifier *urid* together with the connection name *name* identify the associated thread.

System action

Processing continues.

System programmer response

Uncommitted units of recovery can lead to difficulties later, so consult with the application programmer to determine if there is a problem that is preventing the unit of recovery from being committed, and to ensure that the application commits work frequently enough.

Parent topic: [Recovery manager messages \(CSQR...\)](#)

This topic's URL:

zm19300_

2.12.17. CSQR027I: Long-running UOW shunting failed, URID=*urid* connection name=>*name*<

Explanation

During checkpoint processing, an uncommitted unit of recovery was encountered that has been active for at least 3 checkpoints. However, the associated log records could not be rewritten ('shunted') to a later point in the log. The unit of recovery identifier *urid* together with the connection name *name* identify the associated thread.

System action

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

The unit of recovery is not shunted, and will not participate in any future log shunting.

System programmer response

The most likely cause is insufficient active log data sets being available, in which case you should add more log data sets for the queue manager to use. Use the DISPLAY LOG command or the print log map utility (CSQJU004) to determine how many log data sets there are and what their status is.

Uncommitted units of recovery can lead to difficulties later, so consult with the application programmer to determine if there is a problem that is preventing the unit of recovery from being committed, and to ensure that the application commits work frequently enough.

This topic's URL:

zm19360_

2.12.23. CSQR034I: Backward migration detected

Explanation

During queue manager restart it has been detected that one or more of the page sets that have been connected has been used at a higher version of queue manager code.

System action

➤ The queue manager will automatically perform special processing during restart to alter any messages stored on those page sets so they can be read by the current version of the queue manager. This special processing is dependent on there being no unresolved units of work found at the end of restart, so you might be prompted by way of further messages during restart to force commit these. ◀

Restart processing continues.

Operator response

None.

2.13.1. CSQT001I: *csect-name* Unable to allocate above the bar storage using IARV64, RC=*rc*, reason=*reason*

Explanation

A request by the queue manager to allocate above the bar storage failed. *rc* is the return code and *reason* is the reason code (both in hexadecimal) from the z/OS® IARV64 service.

Severity

8

System action

The queue manager terminates with completion code 5C6 and reason code 00A31000

System programmer response

See the *MVS™ Authorized Assembler Services Reference* manual for information about the return code from the IARV64 request. If you are unable to solve the problem, contact your IBM® support center.

2.13.5. CSQT816E: *csect-name* Unable to open Queued Pub/Sub control queue, MQCC=*mqcc* MQRC=*mqrc*

Explanation

The Queued Pub/Sub Daemon failed to open the control queue, SYSTEM.BROKER.CONTROL.QUEUE. The attempt to open the queue failed with completion code *mqcc* and reason *mqrc*. The most likely reasons for this error are that an application program has opened the control queue for exclusive access, or that the control queue has been defined incorrectly.

Severity

8

System programmer response

Refer to [API completion and reason codes](#) for information about *mqcc* and *mqrc*. Correct the problem and restart the **CHINIT**. The SYSTEM.BROKER.CONTROL.QUEUE and other queue definitions that the Queued Pub/Sub Interface require are defined in CSQINP2 sample CSQ4INSR.

Parent topic: [Topic manager messages \(CSQT..\)](#)

2.13.6. CSQT817E: *csect-name* An invalid stream queue has been detected, queue *queue-name*

Explanation

The Pub/Sub Daemon attempted to use queue *queue-name* as a stream queue. The most likely reason for this error is that the queue is:

- Not a local queue.
- A shareable queue.
- A temporary dynamic queue.

Severity

8

System programmer response

Correct the problem with the queue *queue-name* or, if you do not intend to use it as a stream queue, remove it from the namelist SYSTEM.QPUBSUB.QUEUE.NAMELIST.

Parent topic: [Topic manager messages \(CSQT..\)](#)

2.13.7. CSQT818E: *csect-name* Unable to open Queued Pub/Sub stream, queue *queue-name* MQCC=*mqcc* MQRC=*mqrc*

Explanation

The queue manager has failed to open a stream queue *queue-name*. The attempt to open the queue failed with completion code *mqcc* and reason *mqrc*. The most likely reasons for this error are:

1. A new stream name has been added to SYSTEM.QPUBSUB.QUEUE.NAMELIST but the stream queue does not exist.
2. An application has the queue open for exclusive access.

Severity

8

System programmer response

Correct the problem

Parent topic: [Topic manager messages \(CSQT..\)](#)

2.13.12. CSQT826E: *csect-name* Failed to propagate subscription, stream *stream-name*, to queue manager *qm-name*, MQCC=*mqcc* MQRC=*mqrc*

Explanation

The queue manager failed to propagate subscription to steam *stream-name* at queue manager *queue-manager-name* with reason code *mqrc*. An application has either registered or unregistered a global subscription to stream *stream-name*. The queue manager has attempted to propagate the subscription change to the queue manager, but the request has not been successful. The queue manager will immediately attempt to refresh the state of the global subscriptions for stream *stream-name* at queue manager *queue-manager-name*. Until the subscription state has been successfully refreshed, messages published on the stream through the queue manager might not reach this queue manager.

Severity

8

System programmer response

Investigate why the problem occurred and take appropriate action to correct the problem.

Parent topic: [Topic manager messages \(CSQT..\)](#)

2.13.13. CSQT827E: *csect-name* Queued Pub/Sub internal subscription failed. Stream *stream-name* to queue manager *queue-manager-name* reason=*reason* MQRC=*mqrc*

Explanation

The queue manager failed to subscribe to stream *stream-name* at queue manager *queue-manager-name* with reason code *mqrc*. Related queue managers learn about each others configuration by subscribing to information published by each other. A queue manager discovered that one of these internal subscriptions has failed. The queue manager will reissue the subscription immediately. The queue manager cannot function correctly without knowing some information about neighboring queue managers. The information that this broker has about queue manager *queue-manager-name* is not complete and this could lead to subscriptions and publications not being propagated around the network correctly.

Severity

8

System programmer response

Investigate why the problem occurred and take appropriate action to correct the problem. The most likely cause of this failure is a problem with the transmission queue at the queue manager *queue-manager-name* or

a problem with the definition of the route between this queue manager and queue manager *queue-manager-name*

Parent topic: [Topic manager messages \(CSQT..\)](#)

2.13.14. CSQT833E: *csect-name* >Queue manager *queue-manager-name*< introduced a loop into the Pub/Sub hierarchy.

Explanation

The queue manager *queue-manager-name* introduced a loop in the Pub/Sub hierarchy. This queue manager will terminate immediately.

Severity

8

System programmer response

Remove queue manager *queue-manager-name* from the hierarchy, either by deleting the queue manager, or by removing knowledge of the queue manager's parent, using the ALTER QMGR PARENT(' ') command, or in exceptional circumstances, RESET QMGR TYPE(PUBSUB) PARENT(>*queue-manager-name*<).

2.13.15. CSQT834E: *csect-name* Conflicting queue manager names in the Pub/Sub hierarchy

Explanation

The names of the queue managers (*queue-manager-name*) and (*queue-manager-name*) in the Pub/Sub hierarchy both start with the same 12 characters. The first 12 characters of a queue manager name should be unique to ensure that no confusion arises within the hierarchy, and to guarantee unique message ID allocation.

Severity

8

System programmer response

Use a queue manager naming convention that guarantees uniqueness of the first 12 characters of the queue manager name.

Parent topic: [Topic manager messages \(CSQT..\)](#)

 This build: January 26, 2011 11:46:00

zm44600_

2.13.16. CSQT835E: *csect-name* Unable to inform parent *parent-name* of new relation *queue-manager-name*, reason=*mqrc*

Explanation

The queue manager failed to notify its parent queue manager *parent-name* of the relation *queue-manager-name* in the Pub/Sub hierarchy. The notification message will be put to the parent's dead-letter queue. A failure to notify a queue manager of a new relation will mean that no loop detection can be performed for the new relation.

Severity

8

System programmer response

Diagnose and correct the problem on the parent queue manager. One possible reason for this is that the parent queue manager does not yet exist.

Parent topic: [Topic manager messages \(CSQT..\)](#)

2.13.17. CSQT836E: *csect-name* Duplicate queue manager name *queue-manager-name* located in the Pub/Sub hierarchy

Explanation

Multiple instances of the queue manager name *queue-manager-name* have been located. This could either be the result of a previously resolved loop in the Pub/Sub hierarchy, or multiple queue managers in the Pub/Sub hierarchy having the same name.

Severity

8

System programmer response

If this queue manager introduced a loop in the hierarchy (typically identified by message CSQT833E), this message can be ignored. It is strongly recommended that every queue manager in a Pub/Sub hierarchy has a unique name. It is not recommended that multiple queue managers use the same name.

Parent topic: [Topic manager messages \(CSQT..\)](#)

16/03/2011

zm44260_

2.13.18. CSQT839E: *csect-name* Unexpected topology information received from queue manager *queue-manager-name*

Explanation

A queue manager has received a distributed publish/subscribe communication that it did not expect. The message was sent by queue manager *queue-manager-name*. The message will be processed according to the report options in that message. The most likely reason for this message is that the queue manager topology has been changed while distributed publish/subscribe communication messages were in transit (for example, on a transmission queue) and that a message relating to the previous queue manager topology has arrived at a queue manager in the new topology. This message may be accompanied by an informational FFST™ including details of the unexpected communication.

Severity

8

System programmer response

If the queue manager topology has changed and the queue manager named in the message is no longer related to the queue manager issuing this message, this message can be ignored. If the **RESET QMGR TYPE (PUBSUB)** command was issued to unilaterally remove knowledge of queue manager *queue-manager-name* from this queue manager, the **RESET QMGR TYPE(PUBSUB)** command should also be used to remove knowledge of this queue manager from queue manager *queue-manager-name*.

Parent topic: [Topic manager messages \(CSQT..\)](#)

zm44280_

2.13.20. CSQT852E: *csect-name* Unable to propagate delete publication command, topic *topic-name*, stream *stream-name*, to queue manager *queue-manager-name*, reason=*mqrc*

Explanation

The queue manager failed to propagate delete publication command for stream *stream-name* to related queue manager *queue-manager-name* for reason *mqrc*. When an application issues a delete publication command to delete a global publication, the command has to be propagated to all queue managers in the sub-hierarchy supporting the stream. The queue manager reporting the error has failed to forward a delete publication command to a related queue manager *queue-manager-name* who supports stream *stream-name*. Delete publication commands are propagated without MQRO_DISCARD_MSG and the command message might have been written to a dead-letter queue. The topic for which the delete publication has failed is *topic-name*.

Severity

8

System programmer response

If the delete publication has failed because the stream has been deleted at the related queue manager, this message can be ignored. Investigate why the delete publication has failed and take the appropriate action to recover the failed command.

Parent topic: [Topic manager messages \(CSQT..\)](#)

 This build: January 26, 2011 11:45:57

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

 Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

zm44290_

2.13.21. CSQT853E: *csect-name* Unable to propagate delete publication command, topic *topic-name*, stream *stream-name*

Explanation

The queue manager failed to propagate a delete publication command for stream *stream-name* to a previously related queue manager. When an application issues a delete publication command to delete a global publication, the command is propagated to all queue managers in the sub-hierarchy supporting the stream. The queue manager topology was changed after deleting the publication, but before a queue manager removed by the topology change processed the propagated delete publication message. The topic for which the delete publication has failed is *topic-name*.

Severity

8

System programmer response

It is the user's responsibility to quiesce queue manager activity before changing the queue manager topology using the RESET QMGR TYPE(PUBSUB) command. Investigate why this delete publication activity was not quiesced. The delete publication command will have been written to the dead-letter queue at the queue manager that was removed from the topology. In this case, further action might be necessary to propagate the delete publication command that was not quiesced before the RESET QMGR TYPE(PUBSUB) command was issued.

Parent topic: [Topic manager messages \(CSQT..\)](#)

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsa.doc/zm10120_.htm

zm44300_

2.13.22. CSQT854E: *csect-name* Unable to propagate delete publication command, topic *topic-name*, stream *stream-name* to queue manager *queue-manager-name*

Explanation

When an application issues a delete publication command, the command has to be propagated to all queue managers in the sub-hierarchy supporting the stream. At the time the delete publication was propagated, queue manager *queue-manager-name* was a known relation of this message queue manager supporting stream *stream-name*. Before the delete publication command arrived at the related queue manager, the queue manager topology was changed so that queue manager *queue-manager-name* no longer supported stream *stream-name*. The topic for which the delete publication has failed is *topic-name*.

Severity

8

System programmer response

It is the user's responsibility to quiesce queue manager activity before changing the stream topology of the queue manager. Investigate why this delete publication activity was not quiesced. The delete publication command will have been written to the dead-letter queue at queue manager *queue-manager-name*.

Parent topic: [Topic manager messages \(CSQT..\)](#)

2.13.23. CSQT855E: *csect-name* Queued Pub/Sub Daemon failed, reason=*mqrc*

Explanation

An attempt has been made to run the queued publish/subscribe interface (Queued Pub/Sub Daemon) but the interface has ended for reason *mqrc*.

If *mqrc* is a number in the range of 2000 - 3000, it is an API reason code. If it is of the form *5nnn*, it is a queued publish/subscribe message code associated with the message CSQT *nnnE*, which is normally issued previously.

Severity

8

System programmer response

If *mqrc* is an API reason code, see [API completion and reason codes](#) for more information about the *mqrc*. If *mqrc* is a queued publish/subscribe message code, see the corresponding message explanation for more

information. Where no such message exists, see [Queued Publish/Subscribe message codes](#) for the corresponding message number.

Determine why the Queues Pub/Sub Daemon ended. The message logs for the Channel Initiator might contain more detailed information about why the Queued Pub/Sub Daemon cannot be started. Resolve the problem that is preventing the Daemon from completing and restart the Channel Initiator.

Parent topic: [Topic manager messages \(CSQT..\)](#)

This topic's URL:

zm44330_

2.13.26. CSQT858E: *csect-name* Unable to send publication to subscriber queue, queue *queue-name*, to queue manager *queue-manager-name*, reason=*mqrc*

Explanation

A failure has occurred sending a publication to subscriber queue *queue-name* at queue manager *queue-manager-name* for reason *mqrc*. The broker configuration options prevent it from recovering from this failure by discarding the publication or by sending it to the dead-letter queue. Instead the queue manager will back out the unit of work under which the publication is being sent and retry the failing command message a fixed number of times. If the problem still persists, the queue manager will then attempt to recover by failing the command message with a negative reply message. If the issuer of the command did not request negative replies, the queue manager will either discard or send to the dead-letter queue the failing command message. If the queue manager configuration options prevent this, the queue manager will restart the affected stream, which will reprocess the failing command message again. This behavior will be repeated until such time as the failure is resolved. During this time the stream will be unable to process further publications or subscriptions.

Severity

8

System programmer response

Usually the failure will be due to a transient resource problem, for example, the subscriber queue, or an intermediate transmission queue, becoming full. Use reason code *mqrc* to determine what remedial action is required. If the problem persists for a long time, you will notice the stream being continually restarted by the queue manager. Evidence of this occurring will be a large number of CSQT820E messages, indicating stream restart, being written to the Channel Initiator log. In such circumstances, manual intervention will be required to allow the queue manager to dispose of the failing publication. To do this, you will need to end the Queued Pub/Sub Daemon using the ALTER QMGR PSMODE(COMPAT), change the appropriate queue manager attributes; PSNPMSG, PSNPRES, PSSYNCP, and restart it using ALTER QMGR PSMODE(ENABLED). This will allow the publication to be sent to the rest of the subscribers, while allowing the Queued Pub/Sub Daemon to discard or send to the dead-letter queue the publication that could not be sent.

2.13.27. CSQT859E: *csect-name* Queued Pub/Sub stream *stream-*

name terminating, reason=*mqrc*

Explanation

The stream *stream-name* has run out of internal resources and will terminate with reason code *mqrc*. If the command in progress was being processed under syncpoint control, it will be backed out and retried when the stream is restarted by the queue manager. If the command was being processed out of syncpoint control, it will not be able to be retried when the stream is restarted.

Severity

8

System programmer response

This message should only be issued in very unusual circumstances. If this message is issued repeatedly for the same stream, and the stream is not especially large in terms of subscriptions, topics, and retained publications, save all generated diagnostic information and use either the WMQ Support site, or IBM® Support Assistant (ISA) to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

2.13.28. CSQT864E: *csect-name* Unable to put a reply message, queue *queue-name* (queue manager *qm-name*) MQCC=*mqcc* MQRC=*mqrc*

Explanation

While processing a publish/subscribe command, the queue manager could not send a reply message to the queue *queue-name* at the queue manager *qm-name* for MQRC=*mqrc*. The queue manager was also unable to write the message to the dead-letter queue. Since the command is being processed under syncpoint control, the queue manager will attempt to retry the command in the hope that the problem is only of a transient nature. If, after a set number of retries, the reply message still could not be sent, the command message will be discarded if the report options allow it. If the command message cannot be discarded, the stream will be restarted, and processing of the command message recommenced.

Severity

8

System programmer response

Use reason code *mqrc* to determine what remedial action is required. If the failure is due to a resource problem (for example, a queue being full), you might find that the problem has already cleared itself. If not, this message will be issued repeatedly each time the command is retried. In this case you are strongly advised to define a dead-letter queue to receive the reply message so that the Queued Pub/Sub Daemon can process other commands while the problem is being investigated. Check the application from which the command originated and ensure that it is specifying its reply-to queue correctly.

2.13.31. CSQT876E: *csect-name* Parent conflict detected in Pub/Sub hierarchy with queue manager *queue-manager-name*

Explanation

The queue manager *queue-manager-name* has been started, naming this queue manager as its parent. This queue manager was started naming queue manager *queue-manager-name* as its parent. The queue manager will send an exception message to the queue manager *queue-manager-name* indicating that a conflict has been detected. The most likely reason for this message is that the queue manager topology has been changed while distributed publish/subscribe communication messages were in transit (for example, on a transmission queue) and that a message relating to the previous queue manager topology has arrived at a queue manager in the new topology. This message may be accompanied by an informational FFST™ including details of the unexpected communication.

Severity

8

System programmer response

If the queue manager topology has changed and the queue manager named in the message no longer identifies this queue manager as its parent, this message can be ignored - for example, if the command ALTER QMGR PARENT(' ') was issued. If queue manager *queue-manager-name* has been defined as this queue manager's parent, and this queue manager has been defined as queue manager *queue-manager-name*'s parent, the ALTER QMGR command should be used to resolve the conflict by specifying the correct PARENT.

2.13.33. CSQT883E: *csect-name* Queued Pub/Sub state not recorded

Explanation

The Queued Pub/Sub state on stream *stream-name* not recorded while processing a publication outside of syncpoint. A nonpersistent publication has requested a change to either a retained message or a publisher registration. This publication is being processed outside of syncpoint because the queue manager has been configured with the queue manager attribute PSSYNCP set to IFPER. A failure has occurred hardening either the publisher registration or the retained publication to the queue manager's local queue. All state changes attempted as a result of this publication will be backed-out. Processing of the publication will continue and the queue manager will attempt to deliver it to all subscribers.

Severity

0

System programmer response

Investigate why the failure occurred. It is probably due to a resource problem occurring on the queue manager. The most likely cause is 'queue full' on a queue. If your publications also carry state changes, you are advised to send them either as persistent publications or set the queue manager attribute PSSYNCP to YES. In this way, they will be carried out under syncpoint and the queue manager can retry them in the event of a failure such as this.

2.13.38. CSQT961I: *csect-name* Distributed Pub/Sub publication processor stopped

Explanation

The distributed Pub/Sub publication processor stopped. This may be for one of three reasons:

- The channel initiator is stopping.
- The channel initiator is starting and the queues used by the distributed Pub/Sub command processor have not been defined because distributed Pub/Sub publication processor is not required.
- An error has occurred

Severity

0

System action

Processing continues, but distributed Pub/Sub is not available.

System programmer response

If an error has occurred, investigate the problem reported in the preceding messages.

Parent topic: [Topic manager messages \(CSQT..\)](#)

2.13.39. CSQT962I: *csect-name* Distributed Pub/Sub proxy-subscription fan out processor stopped

Explanation

The distributed Pub/Sub proxy-subscription stopped. This may be for one of three reasons:

- The channel initiator is stopping.
- The channel initiator is starting and the queues used by the distributed pub/sub proxy-subscription fan out processor have not been defined because distributed pub/sub proxy-subscription fan out processor is not required.
- An error has occurred

Severity

0

System action

Processing continues, but distributed Pub/Sub is not available.

System programmer response

If an error has occurred, investigate the problem reported in the preceding messages.

2.13.40. CSQT963E: *csect-name* Queued pub/sub daemon unavailable

Explanation

The Distributed publish/subscribe process was unable to contact the Queued Pub/Sub Daemon. The problem will be reported in preceding messages.

Severity

8

System action

Hierarchical connections cannot be processed until the problem is rectified.

System programmer response

Investigate the problem reported in the preceding messages. When the Daemon becomes available, it may be necessary to issue the REFRESH QMGR TYPE(PROXYSUB) command to resynchronize subscriptions.

2.13.43. CSQT966E: *csect-name* A previous publication is being incorrectly processed again

Explanation

A publication, previously processed by this queue manager, has been received.

This is caused by an invalid configuration of a hierarchy and a pub/sub cluster.

Severity

8

System action

This message will not be re-published and will be processed according to the message's report options. Additional messages may be written if this publication is sent to the dead-letter queue.

System programmer response

Correct the configuration to remove the loop. Check the message properties in the dead-letter queue to determine the route taken.

2.13.45. CSQT968I: *csect-name* Distributed Pub/Sub unable to persist successful clean shutdown, reason=*mqrc*

Explanation

A failure occurred while attempting to persist the successful completion of the Distributed publish/subscribe process to cleanup proxy subscriptions which have been sent on behalf of non-durable subscriptions. Associated reason code is *mqrc*.

Severity

0

System Action

When the queue manager restarts, the distributed publish/subscribe process will issue a resync of proxy

subscriptions with all other directly connected queue managers in a hierarchy or publish/subscriber cluster.

Parent topic: [Topic manager messages \(CSQT..\)](#)

2.13.46. CSQT969I *csect-name* Requests outstanding for distributed Pub/Sub on shutdown

Explanation

Proxy subscription requests are still outstanding after the Distributed publish/subscribe process has successfully completed cleanup of proxy subscriptions which have been sent on behalf of non-durable subscriptions.

These requests will not be processed.

Severity

0

System Action

When the queue manager restarts, the Distributed publish/subscribe process will issue a resync of proxy subscriptions with all other directly connected queue managers in a hierarchy or publish/subscribe cluster.

2.13.47. CSQT970I *csect-name* Distributed Pub/Sub unable to check request queue, reason=*mqrc*

Explanation

Following a successful cleanup of proxy subscriptions which have been sent on behalf of non-durable subscriptions, the Distributed publish/subscribe process is unable to check the request queue to determine if any proxy subscriptions requests are outstanding. The associated reason code is *mqrc*.

Severity

0

System Action

When the queue manager restart, the distributed publish/subscribe process will issue a resync of proxy subscriptions with all other directly connected queue managers in a hierarchy or publish/subscriber cluster.

2.13.49. CSQT972E *csect-name* Unable to put Distributed Pub/Sub fan-out request to *q-name*, reason=*mqrc*

Explanation

An attempt to put a subscription fan-out request on the distributed publish/subscribe fan-out request queue *q-name* failed with reason code *mqrc*.

Severity

8

User Response

Investigate the problem reported in *mqrc*. See [API Completion and reason codes](#) for information about *mqrc*. When the problem has been resolved it might be necessary to run the REFRESH QMGR TYPE(PROXYSUB) command to resynchronize the subscriptions.

zm19390_

2.14.3. CSQU002E: Unable to get storage of size **>n<** bytes, return code=*ret-code*

Explanation

An attempt to obtain some storage failed.

System action

The function is terminated, and any queue updates are backed out.

System programmer response

See the *MVS™ Programming: Assembler Services Reference* manual for information about the return code from the STORAGE or GETMAIN request.

Parent topic: [Utilities messages \(CSQU...\)](#)

 This build: January 26, 2011 11:43:45

This topic's URL:

zm19490_

2.14.13. CSQU013E: Initialization command handling failed, RC=*return-code*

Explanation

The initialization command handler, which processes the CSQINPX command data set, did not complete successfully. *return-code* shows the type of error:

00000008

Some or all of the commands were not processed.

0000000C

Severe error; this is most likely because the CSQINPX or CSQOUTX data sets are defined erroneously.

System action

The initialization command handler ends, but the channel initiator continues.

System programmer response

Refer to the CSQOUTX data set and to the preceding messages for more information about the error.

See the [WebSphere MQ for z/OS System Setup Guide](#) for information about the initialization command handler and the CSQINPX or CSQOUTX data sets, and the [WebSphere MQ for z/OS System Administration Guide](#) for information about the COMMAND statement.

Parent topic: [Utilities messages \(CSQU...\)](#)

2.14.17. CSQU030E: Page *nn* in data set *ddname* is invalid

Explanation

The utility program encountered a page that is invalid in the page set data set *ddname*. If the page number is 0, it might be that the data set is not the page set that is implied by *ddname*.

System action

The function is terminated.

System programmer response

Check that the page set has not been corrupted, and that the page set number corresponds to the DDname.

Parent topic: [Utilities messages \(CSQU...\)](#)

zm19540_

2.14.19. CSQU032E: Page set *psid* is invalid

Explanation

The utility program encountered a page set that is invalid. The page set is in an inconsistent state and so the standalone utility functions cannot process it.

System action

The function is terminated.

System programmer response

This may be the result of performing a fuzzy backup (as described in the [WebSphere MQ for z/OS System Administration Guide](#)) or because the queue manager terminated abnormally. Restart the queue manager and then terminate it normally.

Parent topic: [Utilities messages \(CSQU...\)](#)

 This build: January 26, 2011 11:43:46

2.14.23. CSQU044I: Commands made for *qmgr-name* only, not for other queue managers

Explanation

Some of the DISPLAY object commands for the COMMAND function with MAKEDEF, MAKEREP, MAKEALT, or MAKEDEL used the CMDSCOPE option, and so information about objects for queue managers other than the target queue manager *qmgr-name* was received. Commands are not generated for such objects.

System programmer response

Avoid using CMDSCOPE in conjunction with the MAKEDEF, MAKEREP, MAKEALT, or MAKEDEL options. Use a separate COMMAND function for each target queue manager, with separate data sets for each set of generated commands.

Parent topic: [Utilities messages \(CSQU...\)](#)

zm19620_

2.14.27. CSQU048I: >n< authentication objects included, m excluded

Explanation

This indicates, for the current function, how many sets of authentication information were included in the client channel definition file, and how many were excluded. Authentication information may be excluded because:

- the LDAPUSER and LDPAPWD attributes are not blank
- there are too many sets of information
- there was a data conversion error.

System programmer response

If some information was excluded, check that the authentication information objects were selected correctly.

2.14.39. CSQU060E: Incorrect length data record. $>n<$ bytes found, *exp-length* bytes expected

Explanation

In the LOAD function, the utility program encountered a record with the wrong length while reading from the input data set. The record was of length *length* instead of *exp-length*.

System action

The function is terminated, and any queue updates are backed out.

System programmer response

Check that the data set was created by the COPY function and is not corrupted.

Parent topic: [Utilities messages \(CSQU...\)](#)

2.14.72. CSQU117I: No queues found for page set *psid*

Explanation

The page set specified has no queues associated with it that are eligible for the requested function. For the COPY and EMPTY functions, there are no local queues; for the SCOPY function, there are no local queues with messages.

System action

The function is terminated.

System programmer response

If required, correct the page set specified, and rerun the job.

2.14.118. CSQU168E: Requested page sets are for more than one queue manager

Explanation

The page sets for which information was requested are associated with more than one queue manager. No system recovery RBA can therefore be determined.

System action

Processing continues.

System programmer response

Specify a set of page sets for a single queue manager, and resubmit the job.

Parent topic: [Utilities messages \(CSQU...\)](#)

 This build: January 26, 2011 11:43:52

2.14.119. CSQU180E: *csect-name* Unable to load module *>module-name<*, reason=*ssssrrrr*

Explanation

The utility program was unable to load the requested channel initiator parameter module. *ssss* is the completion code and *rrrr* is the reason code (both in hexadecimal) from the z/OS LOAD service.

System action

The function is terminated.

System programmer response

Check the member name specified on the XPARM function, and ensure that the module is in the library specified by the DDNAME keyword.

Parent topic: [Utilities messages \(CSQU...\)](#)

 This build: January 26, 2011 11:43:52

2.14.123. CSQU202I: Dead-letter queue handler ending. Successful

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

actions: **>n1<** retries, **n2** forwards, **n3** discards

Explanation

The dead-letter queue handler is ending because there are no more messages on the dead-letter queue, or because the queue manager is shutting down, or because the dead-letter queue handler detected an error. The message indicates how many dead-letter queue messages were successfully handled.

System action

The utility terminates.

System programmer response

If the utility ended because of an error, investigate the problem reported in the preceding messages.

Parent topic: [Utilities messages \(CSQU...\)](#)

2.14.125. CSQU210I: Message does not have a valid MQDLH

Explanation

The dead-letter queue handler retrieved a message from the dead-letter queue, but the message was not prefixed by a valid dead-letter queue header (MQDLH). This typically occurs because an application is writing directly to the dead-letter queue but is not prefixing messages with a valid MQDLH.

System action

The message is left on the dead-letter queue and the dead-letter queue handler continues to process the dead-letter queue.

This message is issued only once the first time such a message is encountered.

System programmer response

Remove all the invalid messages from the dead-letter queue. Do not write messages to the dead-letter queue unless they are prefixed by a valid MQDLH.

Parent topic: [Utilities messages \(CSQU...\)](#) This build: January 26, 2011 11:43:52[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#) Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

2.14.126. CSQU211I: Unable to put message, line *n* MQRC=*mqrc*

Explanation

The dead-letter queue handler tried to redirect a message to another queue as requested, but the MQPUT call was unsuccessful.

System action

The retry count for the message is incremented; processing continues.

System programmer response

Refer to [API completion and reason codes](#) for information about *mqrc*. The line number *n* of the rules table used to determine the action for the message will help identify the queue to which the message was being put.

Parent topic: [Utilities messages \(CSQU...\)](#) This build: January 26, 2011 11:43:52[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#) Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

zm20720_

2.14.139. CSQU230E: Unable to obtain storage

Explanation

The dead-letter queue handler was unable to obtain storage.

This problem would typically arise as a result of some wider problem. For example, if there is a persistent problem that is causing messages to be written to the dead-letter queue and the same problem (for example, queue full) is preventing the dead-letter queue handler from taking the requested action with the message, ever-increasing amounts of storage would be required.

System action

The utility is terminated.

System programmer response

Increase the storage available to the utility. Investigate whether some wider problem exists, and if the dead-letter queue contains a large number of messages.

Parent topic: [Utilities messages \(CSQU...\)](#)

2.14.154. CSQU506E: Invalid EXEC PARM function parameter

Explanation

The function requested for the utility, as the first parameter in EXEC PARM field, was invalid.

System action

The utility program is terminated.

System programmer response

Correct the parameter and rerun the job. See the [WebSphere MQ for z/OS System Administration Guide](#) for information about the parameters required by the utility.

Parent topic: [Utilities messages \(CSQU...\)](#)

 This build: January 26, 2011 11:43:53

2.14.158. CSQU512E: Utility terminated, DB2 tables in use

Explanation

The queue-sharing group utility cannot run because the DB2 tables it uses are reserved by another job. The most likely reason is that another instance of the utility is running, or that a queue manager in the queue-sharing group is in the process of starting.

System action

The utility program is terminated.

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

System programmer response

Rerun the job later.

This topic's URL:

zm21030_

2.14.170. CSQU527E: No eligible DB2 currently active

Explanation

If a DB2 ssid was specified in the EXEC PARM field this indicates that the DB2 subsystem is not currently active

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

on the z/OS system on which the utility job executed.

If a DB2 data-sharing group name was specified in the EXEC PARM field then no eligible DB2 subsystem was active on the z/OS system on which the utility job executed.

System action

The utility program is terminated.

System programmer response

If a DB2 ssid was specified in the EXEC PARM field then ensure that it is active on the z/OS system on which the utility job will execute.

If a DB2 data-sharing group name was specified in the EXEC PARM field then ensure that at least one eligible DB2 subsystem is active on the z/OS system on which the utility job will execute.

2.14.172. CSQU529E: QSG *>qsg-name<* entry cannot be removed, *n* members are still defined

Explanation

A request to remove the queue-sharing group name in *qsg-name* failed because *n* members are still defined to it.

System action

The utility program is terminated.

System programmer response

All members of the queue-sharing group must be removed from it before the queue-sharing group itself can be deleted. Use the preceding CSQU522I message to identify which queue-sharing group members are still defined to the queue-sharing group.

Note: Members in a state of ACTIVE or FAILED cannot be removed from a queue-sharing group.

Parent topic: [Utilities messages \(CSQU...\)](#)

This topic's URL:

zm21060_

2.14.173. CSQU530E: QMGR *qmgr-name* entry cannot be removed from QSG **>*qsg-name*<**, status is *sss*

Explanation

The queue manager named by *qmgr-name* cannot be removed from the queue-sharing group named by *qsg-name* because it is in an incorrect XCF member state as specified by *sss*.

System action

The utility program is terminated.

System programmer response

In order to remove a queue manager from the queue-sharing group it must have XCF member state CREATED or QUIESCED.

If the XCF member state is ACTIVE then stop the queue manager with a STOP QMGR command and resubmit the job.

If the XCF member state is FAILED then start the queue manager and stop it normally using the STOP QMGR command and resubmit the job.

Parent topic: [Utilities messages \(CSQU...\)](#)

 This build: January 26, 2011 11:43:54

2.14.183. CSQU540E: Unable to remove QMGR *qmgr-name* – not terminated normally, or needed for recovery

Explanation

The queue manager named by *qmgr-name* cannot be removed from the queue-sharing group because it is currently active, or because it terminated abnormally during its last execution, or because it is needed for backup and recovery purposes.

System action

The utility program is terminated.

System programmer response

If the queue manager is active then stop the queue manager with a STOP QMGR command and resubmit the job.

If the queue manager terminated abnormally during its last execution then start the queue manager and stop it normally using the STOP QMGR command and resubmit the job.

If neither of these cases applies, or if it still cannot be removed, it must be needed for backup and recovery purposes. See the [WebSphere MQ for z/OS System Administration Guide](#) for information about removing such a queue manager from a queue-sharing group.

2.14.189. CSQU546E: Unable to add QMGR *qmgr-name* entry, already exists in DB2 table *>table-name<*

Explanation

The attempt to add an entry for queue manager *qmgr-name* to the DB2 table *table-name* failed because a row already exists for the queue manager.

System action

The utility program is terminated.

System programmer response

Examine the DB2 table specified by *table-name* and determine whether the entry for the queue manager specified by *qmgr-name* is for the correct queue-sharing group. If it is, no further action is required.

Parent topic: [Utilities messages \(CSQU...\)](#)

 This build: January 26, 2011 11:43:55

zm21230_

2.14.190. CSQU547E: Unable to add QMGR *qmgr-name* entry, no QSG *>qsg-name<* entry exists in DB2 table *table-name*

Explanation

The attempt to add queue manager *qmgr-name* failed because there is no queue-sharing group entry for the queue-sharing group *qsg-name* in the DB2 table *table-name*.

System action

The utility program is terminated.

System programmer response

In order to add a queue manager to a queue-sharing group the DB2 CSQ.ADMIN_B_QSG table must contain a queue-sharing group record for the queue-sharing group named by *qsg-name*.

Examine the DB2 tables and if necessary run the CSQ5PQSG utility ADD QSG function prior to resubmitting this job.

Parent topic: [Utilities messages \(CSQU...\)](#)

2.14.191. CSQU548E: QMGR *qmgr-name* cannot be added to QSG **>*qsg-name*<**, no unassigned QMGR number

Explanation

The attempt to add queue manager *qmgr-name* to the queue-sharing group *qsg-name* failed because all queue manager numbers are in use.

System action

The utility program is terminated.

System programmer response

A maximum of 32 queue managers can be defined to a queue-sharing group at any one time. If the queue-sharing group named by *qsg-name* already contains 32 queue managers then the only course of action is to create a new queue-sharing group or remove an existing queue manager.

zm21290_

2.14.196. CSQU553E: QMGR *qmgr-name* exists in DB2 table *table-name* as a member of a different QSG

Explanation

An attempt to add the queue manager specified by *qmgr-name* into a queue-sharing group failed because the DB2 table specified by *table-name* indicates that the queue manager is already a member of a different queue-sharing group.

System action

The utility program is terminated.

System programmer response

➤ A queue manager can be a member of only one queue-sharing group at any one time. Examine the CSQ.ADMIN_B_QMGR table to determine which queue-sharing group the queue manager is already a member of. ◀

Either remove the queue manager from the queue-sharing group it is in and resubmit the job or take no further action.

Parent topic: [Utilities messages \(CSQU...\)](#)

2.14.197. CSQU554E: QMGR *qmgr-name* entry cannot be removed from QSG *>qsg-name<*, needed for structure *struc-name* backup

Explanation

The queue manager named by *qmgr-name* cannot be removed from the queue-sharing group named by *qsg-name* because it has information about backups for structure *struc-name*. (The value shown for *struc-name* is the 12-character name as used by WebSphere MQ, not the external name used by z/OS which includes the queue-sharing group name.)

If the queue manager is needed for more than one structure, this message will be issued for each one.

System action

The utility program is terminated.

System programmer response

Using another queue manager in the queue-sharing group, take a backup of the structure. Ensure that the EXCLINT time value used in the BACKUP CFSTRUCT command is less than the time since the queue manager that you are trying to remove was last stopped. Then resubmit the job.

Parent topic: [Utilities messages \(CSQU...\)](#)

 This build: January 26, 2011 11:43:56

zm21310_

2.14.198. CSQU555E: QMGR *qmgr-name* release level is incompatible with QSG *>qsg-name<* in DB2 table *table-name*

Explanation

An attempt to add the queue manager specified by *qmgr-name* into a queue-sharing group failed because the DB2 table specified by *table-name* indicates that another queue manager in the queue-sharing group is at an incompatible release level.

System action

The utility program is terminated.

System programmer response

Only queue managers with compatible release levels can be members of the same queue-sharing group. See the [WebSphere MQ for z/OS Concepts and Planning Guide](#) and the [WebSphere MQ for z/OS System Setup Guide](#) for information about migration and compatibility between releases.

Parent topic: [Utilities messages \(CSQU...\)](#)

2.14.199. CSQU556I: QSG *>qsg-name<* may contain unexpected

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

characters

Explanation

The queue-sharing group *qsg-name* being added specifies a queue-sharing group name that either contains the '@' character, or is shorter than four characters and therefore has '@' characters appended to the short name to make the name four characters in length.

System action

Processing to add the queue-sharing group will continue. The utility will complete with return code 4.

System programmer response

Verify that the queue-sharing group name specified by *qsg-name* is the intended name to be used for the queue-sharing group. If not, use the utility to remove the queue-sharing group, correct the queue-sharing group name, and resubmit the request to add the queue-sharing group.

2.14.205. CSQU564E: Queue managers cannot be added to QSG >*qsg-name*<, admin structure too small

Explanation

An attempt to add a queue manager to a queue-sharing group failed; the current administration structure allocation is too small for a queue-sharing group with the requested number of queue managers. The full name of the administration structure is given in the following CSQ570I message.

System action

The utility program terminates. The queue manager is not added to the queue sharing group.

System programmer response

See the [WebSphere MQ for z/OS Concepts and Planning Guide](#) for information about coupling facility structure sizes for use with queue-sharing groups.

The administration structure allocation must be increased before a new queue manager can be added to the queue-sharing group. This may involve one or more of the following steps:

- Update the administration structure definition using the IXLMIAPU utility.
- Refresh the currently active CFRM policy.
- Dynamically alter the current allocation of the administration structure using the z/OS SETXCF START,ALTER command.

Rerun the job when the administration structure allocation has been increased.

2.14.206. CSQU565E: Unable to get attributes for admin structure, CF in failed state

Explanation

An attempt to add a queue manager to a queue-sharing group failed; it was not possible to check the attributes of the administration structure because it is in a failed state. The full name of the administration structure is given in the following CSQ570I message.

System action

The utility program terminates. The queue manager is not added to the queue sharing group.

System programmer response

Use the z/OS DISPLAY XCF,STRUCTURE command to display the status of all structures in the currently active CFRM policy.

If the administration structure has failed, starting a queue manager in the queue-sharing group will cause the structure to be allocated according to the current CFRM policy.

Parent topic: [Utilities messages \(CSQU...\)](#)

2.14.207. CSQU566I: Unable to get attributes for admin structure, CF not found or not allocated

Explanation

In attempting to add a queue manager to a queue-sharing group, it was not possible to check the attributes of the administration structure because it has not yet been defined to the CFRM policy, or is not currently allocated in a coupling facility. The full name of the administration structure is given in the following CSQ570I message. If the structure is not allocated, then the structure will be allocated when the first queue manager starts.

System action

Processing continues.

System programmer response

Use the z/OS® DISPLAY XCF,STRUCTURE command to display the status of all structures in the currently active CFRM policy.

Ensure a structure definition exists in the CFRM policy. It will be needed before the queue manager can be started.

2.14.219. CSQU581E: DSG *dsg-name* has incompatible QMGR levels

Explanation

The data-sharing group *dsg-name* cannot be migrated to use new DB2® tables because the levels of the queue managers using the data-sharing group are incompatible.

System action

The utility program is terminated.

System programmer response

In order to perform the migration, all the queue managers in all the queue-sharing groups that use the data-sharing group must have installed a PTF and been started, to bring them to the necessary level. Examine the CSQ.ADMIN_B_QMGR DB2 table to determine the levels of the queue managers and those which need to be upgraded.

See the [WebSphere MQ for z/OS Concepts and Planning Guide](#) and the [WebSphere MQ for z/OS System Setup Guide](#) for full information about migration between releases and the PTF.

2.14.220. CSQU582E: DSG *dsg-name* has already been migrated

Explanation

The data-sharing group *dsg-name* cannot be migrated to use new DB2® tables because it has already been migrated.

System action

The utility program is terminated.

System programmer response

As part of the migration, the CSQ.OBJ_B_CHANNEL DB2 table will have its row size increased above 4 KB. The utility found that such a row size already exists. Examine the CSQ.OBJ_B_CHANNEL DB2 table to verify that the migration has already occurred.

See the [WebSphere MQ for z/OS Concepts and Planning Guide](#) and the [WebSphere MQ for z/OS System Setup Guide](#) for full information about migration between releases.

2.14.221. CSQU583I: QSG *qsg-name* in DSG *dsg-name* is ready for migration

Explanation

The request to migrate the queue-sharing group *qsg-name* in data-sharing group *dsg-name* to use new DB2® tables successfully verified that the queue-sharing group is ready to be migrated.

System programmer response

Perform the migration. You should do this as a conditional step in the same job as the utility migration request, as shown in the sample job CSQ45ATB in the SCSQPROC library.

This topic's URL:

CSQU601I

2.14.225. CSQU602I: Migrating Publish/Subscribe ACLs. No Broker ACLs.

Explanation

There are no ACLs set up in the broker. This means that anyone can use Publish/Subscribe.

System programmer response

The easiest way to migrate to WebSphere MQ is to:

1. Choose or create a user group whose members are all the user IDs that intend to use Publish/Subscribe services. This group can then be granted authority to the profiles that protect SYSTEM.BASE.TOPIC. This allows all users in that group access to everything in the topic tree. Decide if you want open up access to the topic tree in this way or if you want to grant more specific authorities.
2. Turn off the appropriate levels of security on your WebSphere MQ system until migration is complete. Then grant the authorities required for your Publish/Subscribe applications to continue working.

Parent topic: [Utilities messages \(CSQU...\)](#)

This topic's URL:

CSQU602I

2.14.226. CSQU603I: Migrating Publish/Subscribe ACLs. No Negative ACLs.

Explanation

The root of the topic tree has been changed to the same setting that is used by WebSphere MQ. Furthermore, the topic tree contains only positive ACLs. Therefore it is possible to migrate the ACLs directly.

System programmer response

Look at the information provided in the data set named in the REPORT DD statement of your CSQUMGMB JCL regarding profiles, and user IDs, and the access those profiles, and user IDs require. See [CSQUMGMB example](#) for more details. Set up the appropriate profiles and accesses in your external security manager for WebSphere MQ for z/OS.

This topic's URL:

CSQU603I

2.14.227. CSQU605E: The broker sent a reply message, but the message was damaged or incomplete, and the migration tool was not able to process it.

Explanation

The migration tool sent a request to the broker asking for the Publish/Subscribe state. The broker sent a response message but the message is incomplete or damaged, and the migration tool cannot use it.

System programmer response

If the broker has many subscriptions then this problem can occur when the broker suffers a timeout while writing the response message. In this case it can be helpful to use the **mqsichangebroker** command to increase the value of *ConfigurationChangeTimeout* and *InternalConfigurationTimeout*. If not, then it can be a temporary the problem with the broker, and you can run the migration command again to see if the problem is resolved. If the command still fails, contact your IBM support center.

This topic's URL:

CSQU640E

2.14.254. CSQU641E: Unable to allocate a unique name for a subscription point.

Explanation

The queue manager allocates a unique topic object name for each subscription point up to a maximum of 256, and that limit has been reached. No further subscription points can be migrated to this queue manager. In addition, any artifact that depends on this subscription point, for example, retained publications, cannot be migrated.

System programmer response

If possible reduce the number of subscription points used by the WebSphere Message Broker broker that is the source of the migration.

2.14.256. CSQU648I: Some properties of RFH1 format retained messages cannot be retrieved from the Broker.

Explanation

Some properties of RFH1 format retained messages cannot be retrieved from the broker. If there are RFH1 format retained messages in the broker then check that the retained publication that has been migrated to the queue manager is correct. See the WebSphere MQ documentation for more details.

System programmer response

Check if the WebSphere Message Broker broker does have retained publications that were published in RFH1 format. If so, manually migrate those messages to the queue manager.

This topic's URL:

CSQU649E

2.14.258. CSQU650E: Unable to resume an interrupted migration run.

Explanation

The migration tool found that a previous run had been interrupted. It normally attempts to resume that migration run from the point where it was interrupted, but on this occasion was unable to do so because the interruption occurred while processing multiple subIdentities for a subscription.

System programmer response

Run the migration again with the **-s** switch turned on to prevent resumption of the previous run, and also with the **-o** switch to force existing definitions in the queue manager to be over written by the definitions brought from the broker.

System programmer response

If you want to run the Migration tool on WebSphere MQ for z/OS ensure that you have the appropriate PTFs installed. Contact your IBM service center for more details.

Parent topic: [Utilities messages \(CSQU...\)](#) This build: January 26, 2011 11:46:11[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#) Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

CSQU657I

2.14.266. CSQU658I: Topic Object tree successfully migrated on previous *-t* switch run.

Explanation

Migration of the topic object tree for this broker (using the *-t* switch) has been completed successfully in the past. As the *-z* switch was not specified this run will not be executed.

System programmer response

If the previous run produced satisfactory results then there is no more topic migration work to do. If you really do need to execute this stage of the migration again then specify the *-z* switch. You can also use the *-o* switch to overwrite existing artifacts in the queue manage with those artifacts found during migration.

Parent topic: [Utilities messages \(CSQU...\)](#) This build: January 26, 2011 11:46:11http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

This topic's URL:

CSQU658I

2.14.267. CSQU659I: Unable to perform a -c switch run as the Topic Object tree migration run has not been executed.

Explanation

An attempt to run the final stage of the migration tool has been made. This can only be done once the topic object tree has been migrated successfully. The security of the queue manager (topic and ACL settings) must be set correctly before the tool can move the Publish/Subscribe artifacts from the broker.

System programmer response

Run the migration tool again using the `-t` switch to migrate topic objects, and then complete the manual process to migrate the ACLs. Finally run the command again using the `-c` switch to migrate the rest of the Publish/Subscribe state.

2.15.1. CSQV086E: QUEUE MANAGER ABNORMAL TERMINATION REASON=>*reason-code*<

Explanation

The queue manager is ending abnormally, because an error that cannot be corrected has occurred. This message, which is not automatically deleted from the operator console, is issued during abnormal termination. *reason-code* is the termination reason code. If this abnormal termination is invoked multiple times, the termination reason code that accompanies this message is the reason associated with the first invocation.

System action

Abnormal termination processing continues.

Operator response

Notify the system programmer, and restart the queue manager.

System programmer response

For additional information, look up the reason code in [Codes](#).

This message is accompanied by one or more dumps. Obtain a copy of SYS1.LOGREC after the queue manager completely terminates, and the dumps. If you suspect an error in WebSphere® MQ, see the [WebSphere MQ for z/OS Problem Determination Guide](#) for information about identifying and reporting the problem.

Problem determination

You might find the following items useful in resolving the problem:

- Console output
- Printout of SYS1.LOGREC
- Any system dumps produced

2.15.2. CSQV400I: ARCHIVE LOG QUIESCE CURRENTLY ACTIVE

Explanation

An ARCHIVE LOG MODE(QUIESCE) command is currently active. This message is part of the DISPLAY LOG or DISPLAY THREAD command report.

System action

This message is issued as information only. It indicates that the ARCHIVE LOG MODE(QUIESCE) command has not completed and, consequently, updates against MQ resources have been temporarily suspended. This might result in active threads being suspended awaiting termination of the quiesce period. Processing otherwise continues normally.

Parent topic: [Agent services messages \(CSQV...\)](#)

2.15.3. CSQV401I: DISPLAY THREAD REPORT FOLLOWS –

Explanation

This message is issued as the title for the DISPLAY THREAD command report output. It precedes the other messages generated by this command:

- Message CSQV402I provides the formatted report when the detailed status of active threads is requested using TYPE(ACTIVE).
- Message CSQV432I provides the formatted report when the summary status of active threads is requested using TYPE(REGIONS).
- Message CSQV406I provides the formatted report when the status of in-doubt threads is requested using TYPE(INDOUBT).
- Message CSQV436I provides the formatted report when the status of in-doubt threads on another queue manager is requested using TYPE(INDOUBT) with QMNAME.

System action

Processing continues normally.

2.15.4. CSQV402I: ACTIVE THREADS –

Explanation

This message comprises the response to the DISPLAY THREAD TYPE(ACTIVE) command. It provides the status information for each active thread, as follows:

```

NAME S T REQ THREAD-XREF USERID ASID URID
  name s t req thread-xref userid asid urid
:
DISPLAY ACTIVE REPORT COMPLETE

```

where:

name

The connection name, which is one of the following:

- z/OS® batch job name
- TSO user ID
- CICS® APPLID
- IMS™ region name
- Channel initiator job name

S

Connection status code:

N

The thread is in IDENTIFY status.

T

The thread has issued CREATE THREAD.

Q

The CREATE THREAD request has been queued. The associated allied task is placed in a wait state.

C

The thread is queued for termination as a result of the termination of the associated allied task. If this thread is also the last (or only) MQ thread for the address space, the associated allied task is placed in a wait state.

D

The thread is in the process of termination as a result of the termination of the associated allied task. If this thread is also the last (or only) MQ thread for the address space, the associated allied task is placed in a wait state.

An asterisk is appended if the thread is active within MQ.

t

Connection type code:

B

Batch: From an application using a batch connection

R

RRS: From an RRS-coordinated application using a batch connection

C

CICS: From CICS

I

IMS: From IMS

S

System: From an internal function of the queue manager or from the channel initiator.

req

A wraparound counter to show the number of MQ requests.

thread-xref

The recovery thread cross-reference identifier associated with the thread. See the [WebSphere MQ for z/OS System Administration Guide](#) for more information.

userid

The user ID associated with a connection. If not signed-on, this field is blank.

asid

A hexadecimal number representing the ASID of the home address space.

urid

Unit of recovery identifier. This is the log RBA of the current unit of recovery associated with the thread. If there is no current unit of recovery, it is shown as 000000000000.

Exceptionally, the last line might be:

```
DISPLAY ACTIVE TERMINATED WITH MAX LINES
```

if the report was generated in response to a command from a z/OS console and more than 252 response messages were generated. Only 252 response messages are returned.

System action

Processing continues normally.

Operator response

If the report was truncated, reissue the DISPLAY THREAD request specifying a specific connection name.

Problem determination

If you have active threads with C or D status codes, the information in message CSQ3201E can be used to diagnose a possible MQ problem.

2.15.5. CSQV406I: INDOUBT THREADS –

Explanation

This message comprises the response to the DISPLAY THREAD TYPE(INDOUBT) command. It provides the status information for each in-doubt thread, as follows:

```
NAME THREAD-XREF URID NID
name thread-xref urid origin-id
:
DISPLAY INDOUBT REPORT COMPLETE
```

where:

name

The connection name, which is one of the following:

- z/OS® batch job name
- TSO user ID
- CICS® APPLID
- IMS™ region name

- Channel initiator job name

thread-xref

The recovery thread cross-reference identifier associated with the thread. See the [WebSphere MQ for z/OS System Administration Guide](#) for more information.

urid

Unit of recovery identifier. This is the log RBA of the current unit of recovery associated with the thread. (This is omitted if the command was issued from a z/OS console with a non-specific connection name.)

origin-id

The origin identifier, a unique token identifying the unit of recovery within the queue manager. This has the form *origin-node.origin-urid*, where:

origin-node

A name that identifies the originator of the thread. (This is omitted for batch RRS connections.)

origin-urid

The hexadecimal number assigned to the unit of recovery for this thread by the originating system.

Exceptionally, the last line might be:

```
DISPLAY INDOUBT TERMINATED WITH MAX LINES
```

if the report was generated in response to a command from a z/OS console and more than 252 in-doubt threads were eligible for display.

System action

Processing continues normally.

Operator response

If the report was truncated, reissue the DISPLAY THREAD request specifying a specific connection name.

2.15.21. CSQV432I: ACTIVE THREADS –

Explanation

This message comprises the response to the DISPLAY THREAD TYPE(REGIONS) command. It provides the status information for each active connection, as follows:

```

NAME TYPE USERID ASID THREADS
  name type userid asid threads
:
DISPLAY ACTIVE REPORT COMPLETE

```

where:

name

The connection name, which is one of the following:

- z/OS® batch job name
- TSO user ID
- CICS® APPLID
- IMS™ region name
- Channel initiator job name

type

The connection type:

CICS

From CICS.

IMS

From IMS.

BATCH

From an application using a batch connection.

RRSBATCH

From an RRS-coordinated application using a batch connection.

CHINIT

From the channel initiator.

userid

The user ID associated with a connection. If not signed-on, this field is blank.

asid

A hexadecimal number representing the ASID of the home address space.

threads

The number of active threads associated with the connection. This excludes fixed internal threads, such as those for the CICS adapter tasks, or the channel initiator listeners.

Exceptionally, the last line might be:

```
DISPLAY ACTIVE TERMINATED WITH MAX LINES
```

If the report was generated in response to a command from a z/OS console and more than 252 response messages were generated. Only 252 response messages are returned.

System action

Processing continues normally.

Operator response

If the report was truncated, reissue the DISPLAY THREAD request specifying a specific connection name.

2.15.26. CSQV437I: CANNOT RESOLVE THREAD NID=>*origin-id*◀, SOME RESOURCES UNAVAILABLE

Explanation

The RESOLVE INDOUBT command was unable to schedule the thread specified by the recovery origin identifier *origin-id* for recovery, because not all the resources necessary for recovery were available.

System action

The identified thread will remain in-doubt.

Operator response

The most likely cause of this is unavailable page sets. Check for the CSQP047E message at the previous checkpoint. Follow the guidance for this message to bring the required page sets online. Once all the page sets are available the RESOLVE INDOUBT command can be re-issued to resolve the thread.

This topic's URL:

zm21980_

2.15.29. CSQV452I: *csect-name* Cluster workload exits not available

Explanation

Cluster workload user exit functions will not be available, because:

- There is no CSQXLIB DD statement in the started task JCL procedure for the queue manager, xxxxMSTR
- The EXITTCB system parameter is zero.

System action

Processing continues, but cluster workload user exits will not be available.

System programmer response

If you wish to use cluster workload exits, add the required statement to the queue manager started task JCL procedure and specify a non-zero value for the EXITTCB system parameter. See the [WebSphere MQ for z/OS System Setup Guide](#) for more information.

Parent topic: [Agent services messages \(CSQV...\)](#)

This topic's URL:

zm21990_

2.15.30. CSQV453I: *csect-name* Unable to load **>module-name<**, reason=**SSSSrrrr**

Explanation

The queue manager was unable to load a module required for exits. *ssss* is the completion code and *rrrr* is the reason code (both in hexadecimal) from the z/OS® LOAD service.

System action

Processing continues, but cluster workload user exits will not be available.

System programmer response

Check the console for messages indicating why the module was not loaded. See the *MVS™ Programming: Assembler Services Reference* manual for information about the codes from the LOAD request.

Ensure that the module is in the required library, and that it is referenced correctly. The queue manager attempts to load this module from the library data sets under the STEPLIB DD statement of its started task JCL procedure xxxxMSTR.

2.15.31. CSQV455E: *csect-name* Cluster workload exit **exit-name** timed out

Explanation

A cluster workload user exit did not return to the queue manager within the allowed time, as specified by the EXITLIM system parameter.

System action

The exit is disabled until its load module in the CSQXLIB data set is refreshed.

System programmer response

Investigate why your exit is not returning in time.

Parent topic: [Agent services messages \(CSQV...\)](#)

 This build: January 26, 2011 11:44:00

2.15.32. CSQV456E: *csect-name* Cluster workload exit error, TCB=*tcb-name* reason=*sssuuu-reason*

Explanation

The exit subtask using TCB *tcb-name* is ending abnormally because an error that cannot be corrected has occurred in a cluster workload user exit. *sss* is the system completion code, *uuu* is the user completion code, and *reason* is the associated reason code (all in hexadecimal).

System action

The subtask ends abnormally, and a dump is normally issued. The exit is disabled until its load module in the CSQXLIB data set is refreshed.

System programmer response

User completion codes are generally the result of errors detected by the exit itself. If a system completion code is shown, see the *MVS™ System Codes* manual for information about the problem in your exit.

2.15.33. CSQV457E: *csect-name* Unable to establish ESTAE, RC=*return-code*

Explanation

During startup processing, the recovery environment for a cluster workload user exit task could not be set up. *return-code* is the return code (in hexadecimal) from the z/OS® ESTAE service.

Severity

8

System action

The task does not start. Cluster workload user exits will be available providing at least one task starts.

System programmer response

See the *MVS™ Programming: Assembler Services Reference* manual for information about the return code from the ESTAE request. If you are unable to solve the problem, contact your IBM® support center for assistance.

Parent topic: [Agent services messages \(CSQV...\)](#)

 This build: January 26, 2011 11:44:00

2.15.34. CSQV459I: *csect-name* Unable to free storage for exits, RC=*return-code*

Explanation

An attempt to release some storage that was used by exits failed. *return-code* is the return code (in hexadecimal) from the z/OS® STORAGE service.

System action

Processing continues.

System programmer response

See the *MVS™ Programming: Assembler Services Reference* manual for information about the return code from the STORAGE request.

2.16.1. CSQW001I: ASYNCHRONOUSLY GATHERED DATA IS BEING FORMATTED

Explanation

The dump formatting exit is not using summary dump records for formatting. The formatted control blocks might not contain the same values as they did at the time of the error.

System action

Dump formatting continues.

System programmer response

If you want summary dump records to be used, do not specify the 'SUMDUMP=NO' operand on the MQ DUMP DISPLAY MAIN MENU (if you are using the dump display panels), or in the CSQWDMP verbexit (if you are using line mode IPCS).

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

 This build: January 26, 2011 11:44:00

2.16.2. CSQW002I: SUMMARY DUMP RECORDS ARE BEING FORMATTED

Explanation

The dump formatting exit is using MQ summary dump record information to format its control blocks.

System action

Dump formatting continues.

System programmer response

If you do not want MQ summary dump records to be used in formatting, specify the 'SUMDUMP=NO' and 'SUBSYS=subsystem name' on the MQ DUMP DISPLAY MAIN MENU (if you are using the dump display panels), or in the CSQWDMP verbexit (if you are using line mode IPCS). Both operands are required.

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

2.16.3. CSQW004E: ONE OR MORE OPERANDS ARE NOT VALID. FORMATTING TERMINATED

Explanation

An invalid operand was specified on the MQ DUMP DISPLAY MAIN MENU (if you are using the dump display panels), or in the CSQWDMP verbexit (if you are using line mode IPCS).

System action

The dump formatting exit terminates.

System programmer response

Correct the operand specified by message CSQW007E.

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

zm22080_

2.16.4. CSQW006E: THE ERLY BLOCK CANNOT BE ACCESSED OR IT IS INVALID

Explanation

The dump formatting exit could not locate its anchor block.

System action

The dump formatting exit terminates.

System programmer response

Specify 'SUBSYS=subsystem name', and 'SUMDUMP=NO' on the MQ DUMP DISPLAY MAIN MENU (if you are using the dump display panels), or in the CSQWDMP verbexit if you are using line mode IPCS.

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

2.16.6. CSQW008E: THE SCOM CANNOT BE ACCESSED OR IT IS INVALID

Explanation

An error was encountered while trying to retrieve the SCOM.

System action

The dump formatting exit terminates.

System programmer response

If 'SUMDUMP=NO' was specified on the MQ DUMP DISPLAY MAIN MENU (if you are using the dump display panels), or in the CSQWDMP verbexit (if you are using line mode IPCS) omit it and resubmit the request. Otherwise, specify this operand, and resubmit the request.

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

This topic's URL:

zm22120_

2.16.8. CSQW010E: THE TRACE RMFT CANNOT BE ACCESSED OR IT IS INVALID

Explanation

The MQ trace table could not be located.

System action

Formatting of the MQ trace table is bypassed, and formatting continues of any other requested dump segment.

System programmer response

If 'SUMDUMP=NO' was specified try formatting the dump again using the summary dump because it could contain the information required to access this data.

If 'SUMDUMP=NO' was not specified, and the summary dump was used, try formatting the dump again specifying this option because the summary dump data could have been corrupted.

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

 This build: January 26, 2011 11:44:00

This topic's URL:

zm22130_

2.16.9. CSQW011I: A LARGER REGION SIZE IS REQUIRED FOR THIS JOB

Explanation

The dump formatting exit could not obtain a large enough work buffer to process the summary dump records.

System action

The dump formatting exit terminates.

System programmer response

Rerun the job, specifying a larger TSO region size (or a larger region size if running in batch).

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

 This build: January 26, 2011 11:44:00

2.16.10. CSQW013I: DMPW NOT FOUND IN SUMMARY DUMP

Explanation

The dump formatting exit was unable to locate the DMPW control block in the summary record portion of the dump data set. Because the DMPW provides the main anchor block for the dump formatter, processing is terminated.

System action

The dump formatting exit terminates.

System programmer response

Specify 'SUBSYS=xxxx' to identify which address space to format information for.

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

2.16.13. CSQW016I: THE RMVT CANNOT BE ACCESSED OR IT IS INVALID

Explanation

The dump formatting exit could not locate the RMVT. The RMVT is required for formatting the MQ trace table and a number of other MQ control blocks.

System action

Formatting of the MQ trace table is bypassed, and formatting of other requested dump segments continues.

System programmer response

If 'SUMDUMP=NO' was specified try formatting the dump again using the summary dump because it could

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

contain the information required to access this data.

If 'SUMDUMP=NO' was not specified, and the summary dump was used, try formatting the dump again specifying this option because the summary dump data could have been corrupted.

2.16.34. CSQW041E: THE TAB CANNOT BE ACCESSED OR IT IS INVALID

Explanation

The MQ trace table anchor block could not be located.

System action

Formatting of the MQ trace table is bypassed, and formatting of any other requested dump segment continues.

System programmer response

If 'SUMDUMP=NO' was specified try formatting the dump again using the summary dump because it could contain the information required to access this data.

If 'SUMDUMP=NO' was not specified, and the summary dump was used, try formatting the dump again specifying this option because the summary dump data could have been corrupted.

Check the z/OS® console to see if any messages were produced to indicate that there was a problem when the dump was taken. If you suspect an error in MQ, see the [WebSphere MQ for z/OS Problem Determination Guide](#) for information about reporting the problem.

Problem determination

You might find the following items useful in resolving the problem:

- Console output
- Dynamic dump
- Printout of SYS1.LOGREC

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

 This build: January 26, 2011 11:44:01

This topic's URL:

zm22400_

2.16.36. CSQW049I: OLDEST SLOT ADDRESS INVALID, FORMATTING TRACE TABLE FROM FIRST ENTRY

Explanation

There are several pointers in the control block that defines the trace. One points to the start of the storage that contains the trace data, one to the end, and one to the next free record. The formatter has detected that the pointer to the next free record is outside the range indicated by the pointers to the start and end of the storage.

System action

Dump formatting continues, but from the physical start of the trace table, not the oldest record.

System programmer response

If the time of day values are meaningful, and in sequence, scan down the formatted trace to find the latest trace record written.

Problem determination

This error occurs when the trace control block has been overwritten, and could be a symptom of a larger problem.

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

2.16.37. CSQW050I: ssnm NO SDWA/LOGREC, ABN=>comp-reason<, U=userid, M=module, C=compid.vrm.comp-function

Explanation

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

This message provides the default SVC dump title (SDUMP) associated with the SYS1.DUMP data set, when an SDWA was unavailable during recovery processing. The individual variable fields contain:

Field**Contents*****ssnm***

MQ subsystem name

ABN

The abend completion code, followed by the abend reason code

U

The user ID for the individual subsystem user

M

The function recovery routine responsible for the dump

C

The component-ID

vrm

The MQ version, release number, and modification level

comp-function

The component-ID function

System action

Dump processing continues.

System programmer response

Since the SDWA provides important diagnostic information to assist in problem determination, the recovery environment at time of error should be examined to determine why an SDWA was not provided for this ABEND.

In a non-recovery environment, there might be valid reasons for the lack of an SDWA (for example, the operator could have initiated the dump).

Problem determination

In a recovery environment, functional recovery routines (FRRs) are guaranteed an SDWA by Recovery Termination Manager (RTM). Therefore, the recovery routine is most likely an ESTAE recovery routine. The primary reason for an SDWA not being provided to an ESTAE routine is due to insufficient storage available during recovery processing. The region sizes allocated to the function in error should be examined to ensure sufficient storage is available.

In a non-recovery environment, where there is no RTM, no SDWA is produced.

2.16.38. CSQW051E: ERROR DURING DUMP PROCESSING

Explanation

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

This message is generated by the recovery routine of the SDUMP dump data gathering service when an error is encountered during dump processing.

System action

Processing of the SUMLSTA user storage areas is terminated, an SVC dump is requested, and control is returned to RTM.

System programmer response

This error is documented in a SYS1.LOGREC record. This message can be issued because of an error in the invocation of SDUMP, or because of an error in SDUMP itself, or during control block examination and access.

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

 This build: January 26, 2011 11:44:01

2.16.44. CSQW060I: BEGIN SAVE AREA TRACE

Explanation

This message identifies the start of the MQ register save area trace report which appears in the formatted section of an MQ SVC dump. This report is useful for problem determination because it contains the save areas for the agent execution block (EB) in error, and all associated agent EBs, traced from the point of error and displayed in order of invocation.

System action

Save area trace format processing continues for the agent EB in error, and all associated agent EBs.

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

 This build: January 26, 2011 11:44:02

2.16.46. CSQW062I: R6 (➤*R6-contents*◀) DOES NOT CONTAIN A VALID EB ADDRESS

Explanation

During dump format processing of the MQ formatted save area trace report (CSQW060I), register 6 (R6) did not contain the address of a valid agent execution block (EB).

System action

Save area trace format processing is terminated for the current agent EB, and all prior EBs.

Problem determination

Register 6 does not contain the current EB address or a prior EB address.

Refer to the abend reason and completion codes associated with the original error to determine the use of register 6 prior to the error.

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

 This build: January 26, 2011 11:44:02

This topic's URL:

zm22510_

2.16.47. CSQW063E: **>name< (address) ASID (asid) NOT FOUND IN DUMP**

Explanation

During processing of the save area trace report (CSQW060I), a control block or save area was not found in the dump data set.

Because the dump formatter utilizes the MQ and z/OS® control blocks defined under the *name* field of this message to locate individual register save areas, subsequent save areas located using the *named* control block or save area will not be displayed in the report.

name

Identifies the name of the control block or save area that was not found in the dump data set:

SA

Indicates a save area

ASCE

MQ address space control element

EB

MQ execution block

TCB

z/OS task control block

RB

z/OS request block

XSB

z/OS extended status block

PSA

z/OS prefix save area

SDWA

z/OS system diagnostic work area

STSV

z/OS SRB status save area

STKE

z/OS cross memory stack element

address

The address of the named control block or save area.

asid

The address space identifier associated with the control block or save area.

Due to the execution structures and environmental restrictions of selected MQ and z/OS control structures, some control blocks and save areas associated with these execution environments will not be included in the dump data set.

System action

Register save area trace format processing for the current save area chains is terminated. Subsequent save area processing will vary depending on the specific control block or save area that was available, and the MQ agent execution environments at the time of the error.

Problem determination

During z/OS RTM recovery processing, MQ attempts to include all control blocks (both MQ and z/OS), and the pertinent MQ save areas in the dump data set, regardless of the type of error. Control blocks and save areas associated with the MQ address space at time of error will be included in the dump data set.

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

2.16.48. CSQW064I: *ERROR* BLOCK NOT FOUND IN DUMP

Explanation

The dump formatter was unable to format a control block because the storage could not be found.

System action

Dump formatting continues.

Problem determination

This problem can occur for the following reasons:

- The dump is incomplete, this could be because:
 - The SYS1.DUMPxx data set was not large enough when the dump was taken
 - Errors occurred when the SYS1.DUMPxx data set was copied
- A pointer within a control block contains invalid data
- The length of a control block is invalid

This could be a symptom of a more significant problem. Identifying which control block contains the incorrect value could help you to solve other problems.

2.16.60. CSQW105E: ERROR DURING LOAD OR VALIDATION OF A CONTROL BLOCK STRUCTURE TABLE MODULE

Explanation

The MQ dump formatting facility cannot be used to format control blocks. An error occurred during the startup process while attempting to LOAD one of the Control Block Structures Table modules (CSQWDST1, CSQWDST2, CSQWDST3, and CSQWDST4) from the MQ program library.

System action

Queue manager startup processing continues.

System programmer response

If you expect to experience problems, stop your queue manager, resolve the problem, and restart. If however you do not anticipate that this error will cause problems, you can stop and restart the queue manager at a convenient time.

Problem determination

The modules must reside in an MQ program library named in the started task JCL procedure (xxxxMSTR) used to start the queue manager.

The named modules prohibit the use of the MQ dump formatting facility to format SVC dumps that occur during the current execution of the queue manager. The named modules are not required for execution of the queue manager itself.

2.16.61. CSQW108E: UNABLE TO AUTOMATICALLY START '>type<' TRACE

Explanation

System parameters indicated that an MQ trace should be started automatically during queue manager initialization, but the queue manager was unable to start the trace.

System action

Queue manager initialization continues.

System programmer response

Start the trace with the START TRACE command after queue manager initialization is complete.

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

 This build: January 26, 2011 11:44:02

2.16.62. CSQW109E: TRACE INITIALIZATION PARAMETERS UNAVAILABLE, DEFAULTS USED FOR '>type<' TRACE

Explanation

The trace function was unable to access the trace initialization parameters defined by the CSQ6SYSP macro. Default values as defined by that macro are assumed for trace parameters.

System action

Queue manager initialization continues.

System programmer response

Determine if the system parameter load module (the default version is called CSQZPARM) is missing or inaccessible. Trace can be started with the START TRACE command.

2.16.63. CSQW120E: DEST VALUE IS INVALID FOR '>type<' TRACE

Explanation

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

A trace command has been entered, but the specified destination value is not valid for the trace type requested.

System action

Processing for the TRACE command is terminated.

System programmer response

If a START TRACE command was entered, specify a valid destination for the trace. Otherwise, a DISPLAY TRACE command can be issued to determine what traces are currently active. See the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual for information about valid destinations.

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

This topic's URL:

zm22710_

2.16.67. CSQW124E: *csect-name* '*>type<*' TRACE TERMINATED RC=*code* RMID=*nn*

Explanation

During processing *type* trace, processing ended due to an error. A trace type of blank indicates all tracing has stopped. RMID, displayed in decimal, identifies the resource manager (for a list of MQ RMIDs, see the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual). *code*, displayed in hexadecimal, specifies the return, reason, or abend code associated with the action. Refer to [Codes](#) for information about these codes.

Further collection of the named trace is stopped. If it is necessary to resume collection of the trace, a START TRACE command can be issued. However if another error is experienced, the problem should be resolved before starting the trace collection again.

System action

Processing for the named trace type is stopped. The message is not externalized by the functional recovery routine, but is output whenever an IFC event is driven at a later time. A trace type of blank indicates all tracing has stopped.

System programmer response

Investigate the reasons for the error. If necessary to collect the named trace, issue a START TRACE command to resume processing.

Problem determination

If you are unable to resolve the problem, save the SYS1.LOGREC, and contact your IBM® support center.

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

zm22740_

2.16.70. CSQW127I: CURRENT TRACE ACTIVITY IS –

Explanation

This message is issued in response to the DISPLAY TRACE command. For each trace that is active, the message indicates the trace number, the type of trace, the class(es) within type, the destination(s) for the trace entries, the user ID, and the RMID(s), as follows:

```
TNO TYPE CLASS DEST USERID RMID
tno type class dest userid rmid
:
END OF TRACE REPORT
```

The trace number *tno* can be:

01-03

A trace started automatically when the queue manager started, or a trace started by a START TRACE command.

04-32

A trace started by a START TRACE command.

00

The global trace started automatically when the channel initiator started.

Parent topic: [Instrumentation facilities messages \(CSQW...\)](#)

This topic's URL:

zm22780_

2.16.74. CSQW133E: *csect-name* TRACE DATA LOST, *dest* NOT ACCESSIBLE RC=*>code<*

Explanation

The destination specified stopped accepting trace data during a trace. Some external condition caused the data rejection. The reason for the error is defined by the return code (RC). The value of *code* can be:

- The hexadecimal return code from SMF. See the *MVS™ System Management Facilities (SMF)* manual for the specific value.
- The hexadecimal return code from the GTF request

04

GTF trace and/or USR tracing is not active

- The hexadecimal return code from the SRV request

10

The serviceability routine is absent

xx

The serviceability routine return code

System action

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Trace processing continues, although data is lost.

System programmer response

Investigate the GTF or SMF facility to determine why data is not being accepted. You can issue a START TRACE command to record the data at another destination. The DISPLAY TRACE command shows what types of data were recorded at the specified destination.

See the *MVS System Management Facilities (SMF)* manual for an explanation of the return code value.

2.16.84. CSQW202E: Incomplete trace record detected

Explanation

A long trace record has been segmented, and the start record for the record currently being processed has not been processed.

This usually occurs when records within a time range have been selected for processing. The record with the start of segment flag is probably before the start of the selected time interval. This can also occur if the Generalized Trace Facility (GTF) is unable to write all records to the GTF data set.

System action

A hexadecimal dump of the record is produced, and formatting continues with the next record. (You will receive this message for each subsequent part of this logical record.)

System programmer response

Select a slightly earlier start time for your time interval (one tenth of a second for example) and retry the operation. If this is not successful, it is possible that your trace table has wrapped, and the start record has been overwritten.

2.17.2. CSQX001I: *csect-name* Channel initiator starting

Explanation

The channel initiator address space is starting, in response to a START CHINIT command.

Severity

0

System action

Channel initiator startup processing begins. Message CSQX022I is sent when the startup process has completed.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:44:06

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

 Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

2.17.3. CSQX002I: *csect-name* Queue-sharing group is >qsg-name<

Explanation

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

This is issued during channel initiator startup processing or in response to the DISPLAY CHINIT command if the queue manager that the channel initiator uses is in a queue-sharing group.

Severity

0

System action

Processing continues.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:44:06

2.17.4. CSQX003I: *csect-name* Obsolete parameter module ignored

Explanation

The START CHINIT command specified a parameter module name using the PARM keyword. The use of a channel initiator parameter module is obsolete, so the name is ignored.

Severity

0

System action

Processing continues.

System programmer response

Channel initiator parameters are specified by queue manager attributes. Use the ALTER QMGR command to set the values you want.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.8. CSQX007E: *csect-name* Unable to connect to queue manager *>qmgr-name<*, MQCC=*mqcc* MQRC=*mqrc*

Explanation

An attempt by the channel initiator to connect to the queue manager was unsuccessful.

Severity

8

System action

If the error occurred during the channel initiator startup procedure, the channel initiator does not start. In other cases, the component where the error occurred (message channel agent, dispatcher, adapter subtask, SSL server subtask, repository manager, or listener) does not start and the function it provides is unavailable; in most cases, the end result is that the channel initiator terminates.

System programmer response

Refer to [API completion and reason codes](#) for information about *mqcc* and *mqrc* to determine the cause of the problem. If you are unable to solve the problem, contact your IBM® support center.

2.17.13. CSQX012E: *csect-name* Unable to open *ddname* data set

Explanation

The *ddname* data set could not be opened, as reported in the preceding messages.

Severity

4

System action

Processing continues, but functions that require the data set will be inhibited. For example, if the exit library data set CSQXLIB cannot be opened, user channel and channel auto-definition exits will not be available, and channels that use them will not start. If the error information data set CSQSNAP cannot be opened, the error information will be lost.

System programmer response

Investigate the problem reported in the preceding messages.

2.17.14. CSQX013I: *csect-name* Address conflict for listener, port

>port< address *ip-address*, TRPTYPE=TCP INDISP=*disposition***Explanation**

A STOP LISTENER or START LISTENER command was issued specifying TRPTYPE(*trptype*) and INDISP (*disposition*), but that listener was already active for a port and IP address combination that conflicted with the requested port and IP address. If *ip-address* is '*', all IP addresses were requested.

The port and IP address combination specified must match a combination for which the listener is active. It cannot be a superset or a subset of that combination.

Severity

4

System action

None.

System programmer response

Reissue the command correctly if necessary.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

This topic's URL:

zm23110_

2.17.15. CSQX014E: *csect-name* Listener exceeded channel limit, TRPTYPE=*trptype* INDISP=*disposition***Explanation**

The number of current channels using the indicated communications system *trptype* is the maximum allowed. The listener cannot accept an incoming request to start another channel; if the maximum is 0, the listener itself cannot start. (The name of the channel requested cannot be determined because the listener could not accept the request.) Current channels include stopped and retrying channels as well as active channels.

disposition shows which type of incoming requests the listener was handling:

QMGR

those directed to the target queue manager

GROUP

those directed to the queue-sharing group.

The maximum allowed is specified in the TCPCHL or LU62CHL queue manager attribute respectively, but may be reduced if a dispatcher fails, or if TCP/IP resources are restricted (as reported by message CSQX118I).

Severity

8

System action

The channel or listener does not start.

System programmer response

If the maximum allowed is zero, communications using the indicated system *trptype* are not allowed, and no such channels can be started. The listener also cannot be started. If the maximum allowed is non-zero, wait for some of the operating channels to terminate before restarting the remote channel, or use the ALTER QMGR command to increase TCPCHL or LU62CHL.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.16. CSQX015I: *csect-name* started dispatchers started, **>failed<** **failed**

Explanation

The channel initiator startup procedure has started the requested number of dispatchers; *started* dispatchers started successfully and *failed* dispatchers did not start.

Severity

0

System action

The channel initiator startup processing continues. The number of current TCP/IP and LU 6.2 channels allowed will be reduced proportionately if some dispatchers did not start.

System programmer response

If the message indicates that some dispatchers failed, investigate the problem reported in the preceding messages.

2.17.31. CSQX031E: *csect-name* Initialization command handler ended abnormally, reason=>00sssuuu<

Explanation

The initialization command handler, which processes the CSQINPX command data set, is ending abnormally. *sss* is the system completion code, and *uuu* is the user completion code (both in hexadecimal).

Severity

8

System action

The initialization command handler ends abnormally, but the channel initiator continues.

System programmer response

If a system completion code is shown, see the *MVS™ System Codes* manual for information about the problem; the message will normally be preceded by other messages giving additional information.

The most likely cause is erroneous definition of the CSQINPX and CSQOUTX data sets. See the [WebSphere MQ for z/OS System Setup Guide](#) for information about the initialization command handler and these data sets. If you are unable to solve the problem, contact your IBM® support center.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.32. CSQX032I: *csect-name* Initialization command handler terminated

Explanation

The initialization command handler, which processes the CSQINPX command data set, was terminated before completing all the commands because the channel initiator is stopping, and so cannot process any more commands.

Severity

4

System action

The initialization command handler ends.

System programmer response

Refer to the CSQOUTX data set for information about the commands that were processed. If the channel initiator is not stopping because of a STOP command, refer to the preceding messages for information about the problem causing it to stop.

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

See the [WebSphere MQ for z/OS System Setup Guide](#) for information about the initialization command handler.

2.17.33. CSQX033E: *csect-name* Channel initiator stopping because of errors

Explanation

A severe error, as reported in the preceding messages, occurred during channel initiator processing; the channel initiator is unable to continue.

Severity

8

System action

The channel initiator terminates.

System programmer response

Investigate the problem reported in the preceding messages.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.36. CSQX036E: *csect-name* Unable to open **>name<**, MQCC=*mqcc* MQRC=*mqrc*

Explanation

>An MQOPEN call for *name* was unsuccessful; *name* may be a queue name, queue manager name, namelist name, channel name, topic name, or authentication information name. (The channel initiator can access channel definitions and authentication information as objects using the MQ API.) **<**

Severity

8

System action

The component where the error occurred (message channel agent, dispatcher, adapter subtask, SSL server subtask, repository manager, listener, or supervisor) terminates. In the case of a message channel agent, the associated channel will be stopped.

System programmer response

Refer to [API completion and reason codes](#) for information about *mqcc* and *mqrc*. The most common cause of the problem will be that the channel and queue definitions are incorrect.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.45. CSQX045E: *csect-name* Unable to load *>module-name<*, reason=*ssssrrrr*

Explanation

The channel initiator was unable to load a required module. *ssss* is the completion code and *rrrr* is the reason code (both in hexadecimal) from the z/OS® LOAD service.

System action

The component where the error occurred (message channel agent, dispatcher, adapter subtask, SSL server subtask, repository manager, or listener) does not start and the function it provides is unavailable; in many cases, the end result is that the channel initiator terminates.

System programmer response

Check the console for messages indicating why the module was not loaded. See the *MVS™ Programming: Assembler Services Reference* manual for information about the codes from the LOAD request.

Ensure that the module is in the required library, and that it is referenced correctly. The channel initiator attempts to load this module from the library data sets under the STEPLIB DD statement of its started task JCL procedure xxxxCHIN.

2.17.64. CSQX064I: *csect-name* Distributed Pub/Sub Offloader stopped

Explanation

The Distributed Pub/Sub command Offloader task has stopped. This may be for one of three reasons:

- The channel initiator is stopping.
- The channel initiator is starting and the queues used by the distributed pub/sub offloader have not been defined because distributed pub/sub command processing is not required.
- An error has occurred

Severity

0

System action

Processing continues, but distributed pub/sub is not available.

System programmer response

If an error has occurred, investigate the problem reported in the preceding messages.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:45:55

zm43900_

2.17.66. CSQX066E: *csect-name* Refresh proxy subscriptions failed

Explanation

A REFRESH QMGR TYPE(PROXYSUB) was issued, but could not complete. This could be because the Channel Initiator is shutting down, or as a result of an error.

Severity

8

System action

Processing continues, but remote subscriptions are not resynchronized.

System programmer response

If an error has occurred, investigate the problem reported in the preceding messages.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:45:55

This topic's URL:

zm43910_

2.17.67. CSQX067E: *csect-name* Error removing non durable remote subscriptions

Explanation

The Pub/Sub Offloader task is ending but was unable to remove one or more remote proxy subscriptions. If no previous error has occurred, this is likely to have been triggered by Queue Manager shut down.

Severity

8

System action

Processing continues, but remote subscriptions may continue to exist which are no longer valid. This could cause a build up of publications for this Queue Manager on remote transmission queues.

System programmer response

If the Queue Manager is to be restarted immediately, these subscriptions will be cleaned up when initial resynchronization with the cluster occurs. If this is not the case, proxy subscriptions may need to be manually removed using DELETE SUB on other Queue Managers in the cluster. Investigate the problem reported in the preceding messages to see why resynchronization failed.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

zm43920_

2.17.68. CSQX070I: *csect-name* CHINIT parameters ...

Explanation

The channel initiator is being started with the parameter values shown in the following messages: CSQX071I, CSQX072I, CSQX073I, CSQX074I, CSQX075I, CSQX078I, CSQX079I, CSQX080I, CSQX081I, CSQX082I, CSQX085I, CSQX090I, CSQX091I, CSQX092I, CSQX093I, CSQX094I, CSQX099I.

Severity

0

System action

The channel initiator startup processing continues.

System programmer response

Channel initiator parameters are specified by queue manager attributes. Use the ALTER QMGR command to set the values you want.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:44:10

2.17.69. CSQX100E: *csect-name* Dispatcher failed to start, TCB=*tcb-name*

Explanation

A severe error, as reported in the preceding messages, occurred during dispatcher startup processing.

Severity

8

System action

The channel initiator will attempt to restart the dispatcher. The number of current TCP/IP and LU 6.2 channels allowed will be reduced proportionately.

System programmer response

Investigate the problem reported in the preceding messages.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:44:10

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

This topic's URL:

zm23580_

2.17.70. CSQX101E: *csect-name* Dispatcher unable to schedule essential process *>process<*

Explanation

During dispatcher startup processing, one of the essential dispatcher processes (named *process*) could not be scheduled.

Severity

8

System action

The dispatcher does not start.

System programmer response

The most likely cause is insufficient storage. If increasing the available storage does not solve the problem, contact your IBM® support center.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:44:11

This topic's URL:

zm23590_

2.17.71. CSQX102E: *csect-name* Dispatcher linkage stack error, TCB=*tcb-name*

Explanation

The dispatcher using TCB *tcb-name* found an inconsistency in the linkage stack.

Severity

8

System action

The dispatcher ends abnormally with completion code X'5C6' and reason code X'00E7010E', and a dump is issued. The channel initiator will attempt to restart it.

System programmer response

The most likely cause is incorrect use of the linkage stack by a user channel exit; exits must issue any MQ API calls and return to the caller at the same linkage stack level as they were entered. If exits are not being used, or if they do not use the linkage stack, contact your IBM® support center to report the problem.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

This topic's URL:

zm23620_

2.17.74. CSQX106E: *csect-name* Unable to connect to TCP/IP using USS, service '*>serv<*' RC=*return-code* reason=*reason*

Explanation

Use of TCP/IP with the UNIX System Services (USS) sockets interface was requested, but an error occurred. *return-code* and *reason* are the return and reason codes (both in hexadecimal) from the USS service *serv* that gave the error.

The most likely causes are:

- The user ID that the channel initiator uses is not set up correctly for use with USS. For example, it may not have a valid OMVS segment defined or its security profile may be incomplete.
- The TCPNAME queue manager attribute does not specify a valid TCP/IP stack name. These stack names are defined in the SUBFILESYSTYPE NAME parameter in member BPXPRMxx for SYS1.PARMLIB.
- The MAXFILEPROC or MAXPROCUSER parameter in member BPXPRMxx for SYS1.PARMLIB is too small.

Severity

4

System action

Processing continues, but communications using TCP/IP with the USS sockets interface will not be available.

System programmer response

See the z/OS® *UNIX System Services Messages and Codes* manual for information about the codes from the service request.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:44:11

2.17.76. CSQX110E: *csect-name* User data conversion exit error, TCB=*tcb-name* reason=*sssuuu-reason*

Explanation

A process for the dispatcher using TCB *tcb-name* is ending abnormally because an error that cannot be corrected has occurred in a user data conversion exit. *sss* is the system completion code, *uuu* is the user completion code, and *reason* is the associated reason code (all in hexadecimal).

Severity

8

System action

The process ends abnormally, and a dump is normally issued. The channel is stopped, and must be restarted manually.

System programmer response

User completion codes are generally the result of errors detected by the Language Environment®; see the *Language Environment for z/OS® Debugging Guide and Runtime Messages* for information about these codes. If a system completion code is shown, see the *MVS™ System Codes* manual for information about the problem in your exit.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:44:11

2.17.83. CSQX118I: *csect-name* TCP/IP channel limit reduced to *nn*

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Explanation

This is issued during channel initiator startup processing and in response to the DISPLAY CHINIT command if the maximum number of current TCP/IP channels allowed is less than is specified in the TCPCHL queue manager attribute. This can occur because:

- TCP/IP resources are restricted. The UNIX System Services MAXFILEPROC parameter (specified in the BPXPRMxx member of SYS1.PARMLIB) controls how many sockets each task is allowed: in other words, how many channels each dispatcher is allowed
- Some dispatchers have failed and not been restarted; the number of current TCP/IP channels allowed will be reduced proportionately

Severity

0

System programmer response

If TCP/IP resources are restricted, consider increasing either the UNIX System Services MAXFILEPROC parameter or the number of dispatchers if you need more current TCP/IP channels.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.89. CSQX144E: *csect-name* Adapter subtask attach failed, RC=*return-code*

Explanation

An adapter subtask could not be attached. *return-code* is the return code (in hexadecimal) from the z/OS® ATTACH service.

Severity

8

System action

The adapter subtask is not restarted.

System programmer response

See the *MVS™ Programming: Assembler Services Reference* manual for information about the return code from the ATTACH request. If you are unable to solve the problem, contact your IBM® support center.

2.17.90. CSQX145E: *csect-name* Adapter subtask not restarted – too many failures

Explanation

A adapter subtask failed; because it had already failed too many times, the channel initiator did not attempt to restart it.

Severity

8

System action

The adapter subtask is not restarted; processing capacity may therefore be reduced.

System programmer response

Investigate the problems causing the adapter subtask failures.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.93. CSQX151I: *csect-name* **>started<** SSL server subtasks started, *failed* failed

Explanation

The channel initiator startup procedure has started the requested number of SSL server subtasks; *started* SSL server subtasks started successfully and *failed* SSL server subtasks did not start.

Severity

0

System action

The channel initiator startup processing continues.

System programmer response

If the message indicates that some SSL server subtasks failed, investigate the problem reported in the preceding messages.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.95. CSQX153E: *csect-name* SSL server subtask ended abnormally, TCB=*tcb-name* reason=*sssuuu-reason*

Explanation

The SSL server subtask using TCB *tcb-name* is ending abnormally because an error that cannot be corrected has occurred. *sss* is the system completion code, *uuu* is the user completion code, and *reason* is the associated reason code (all in hexadecimal).

Severity

8

System action

The SSL server subtask ends abnormally, and a dump is normally issued. The channel initiator will attempt to restart it.

System programmer response

If you are using user channel exits, check that your exit is setting its parameter lists correctly. User completion codes are generally the result of errors detected by the Language Environment®; see the *Language Environment for z/OS® Debugging Guide and Runtime Messages* for information about these codes. Otherwise, contact your IBM® support center.

2.17.103. CSQX164E: *csect-name* Unable to access SSL key repository

Explanation

The SSL key repository, whose name is specified by the SSLKEYR queue manager attribute, could not be accessed.

The most likely causes are:

- The specified key repository does not exist.
- The channel initiator does not have permission to read the specified key repository.
- The channel initiator was unable to connect to the LDAP server specified in an authentication information object listed in the SSL CRL namelist.
- When using shared key rings, the name is not prefixed with `userid/'.

Severity

4

System action

Processing continues, but communications using SSL will not be available. Channels using SSL communications will not start.

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

System programmer response

Check that:

- the SSL key repository name is specified correctly; if using a shared key ring, it is prefixed with 'userid/'
- the key ring specified as the SSL key repository exists, and the channel initiator has permission to read it
- the LDAP name is specified correctly and that it is available.

2.17.112. CSQX190E: *csect-name* Channel *>channel-name<* stopping because of error in exit *exit-name*, *Id=ExitId* reason=*ExitReason*

Explanation

The user exit *exit-name* invoked for channel *channel-name* returned invalid values, as reported in the preceding messages. *ExitId* shows the type of exit:

11

MQXT_CHANNEL_SEC_EXIT, security exit

12

MQXT_CHANNEL_MSG_EXIT, message exit

13

MQXT_CHANNEL_SEND_EXIT, send exit

14

MQXT_CHANNEL_RCV_EXIT, receive exit

16

MQXT_CHANNEL_AUTO_DEF_EXIT, auto-definition exit

and *ExitReason* shows the reason for invoking it:

11

MQXR_INIT, initialization

12

MQXR_TERM, termination

13

MQXR_MSG, process a message

14

MQXR_XMIT, process a transmission

15

MQXR_SEC_MSG, security message received

16

MQXR_INIT_SEC, initiate security exchange

18

MQXR_AUTO_CLUSSDR, auto-definition of cluster-sender channel

28

MQXR_AUTO_CLUSRCVR, auto-definition of cluster-receiver channel

Severity

8

System action

The channel stops. The associated transmission queue may be set to GET(DISABLED) and triggering turned off. For auto-defined channels, the channel does not start.

System programmer response

Investigate why the user exit program set invalid values.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

zm24000_

2.17.113. CSQX191I: *csect-name* Channel *channel-name* beginning message reallocation

Explanation

The channel *channel-name* is entering message reallocation because it cannot currently deliver messages to the destination queue manager.

Severity

0

System action

Messages that are not bound to a particular queue manager will be workload balanced. This may take some time if there are a large number of messages assigned to this channel. Check how many using the **DISPLAY CHSTATUS(*channel-name*) XQMSGSA** command.

System programmer response

If reallocation is not desired, for instance because the destination queue manager is now available, reallocation can be interrupted using **STOP CHANNEL MODE(FORCE)**.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:45:55

2.17.118. CSQX201E: *csect-name* Unable to allocate conversation, channel *channel-name*, connection *conn-id* TRPTYPE=*trptype* RC=*return-code* (*return-text*) reason=*reason*

Explanation

An attempt to allocate a conversation on connection *conn-id* was not successful. The associated channel is *channel-name*; in some cases its name cannot be determined and so is shown as '????'. *trptype* shows the communications system used:

TCP

TCP/IP

LU62

APPC/MVS

The return code from it was: (in hexadecimal) *return-code*, (in text) *return-text*. For some errors, there may also be an associated reason code *reason* (in hexadecimal) giving more information.

Severity

8

System action

The channel is not started.

System programmer response

The error may be due to an incorrect entry in the channel definition or some problems in the APPC setup. Correct the error and try again.

It could also be that the listening program at the remote end is not running. If so, perform the necessary operations to start the listener for *trptype*, and try again.

See [Communications protocol return codes](#) for information about the cause of the return code from the communications system. If using TCP/IP, see the *z/OS® UNIX System Services Messages and Codes* manual for information about the reason code.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.119. CSQX202E: *csect-name* Connection or remote listener unavailable, channel *channel-name*, connection *conn-id* TRPTYPE=*trptype* RC=*return-code* (*return-text*) reason=*reason*

Explanation

An attempt to allocate a conversation was not successful because the connection *conn-id* was unavailable. The associated channel is *channel-name*; in some cases its name cannot be determined and so is shown as '????'. *trptype* shows the communications system used:

TCP

TCP/IP

LU62

APPC/MVS

The return code from it was: (in hexadecimal) *return-code*, (in text) *return-text*. For some errors, there might also be an associated reason code *reason* (in hexadecimal) giving more information.

Severity

8

System action

The attempt to start the channel is retried.

System programmer response

Try again later.

A likely cause is that the listener at the remote end was not running or has been started using the wrong port or LU name. If this is the case, perform the necessary operations to start the appropriate listener, and try again.

See [Communications protocol return codes](#) for information about the cause of the return code from the communications system. If using TCP/IP, see the *z/OS® UNIX System Services Messages and Codes* manual for information about the reason code.

2.17.120. CSQX203E: *csect-name* Error in communications configuration, channel *channel-name*, connection *conn-id* TRPTYPE=*trptype* RC=*return-code* (*return-text*) reason=*reason*

Explanation

An attempt to allocate a conversation on connection *conn-id* was not successful because of a communications configuration error. The associated channel is *channel-name*; in some cases its name cannot be determined and so is shown as '????'. *trptype* shows the communications system used:

TCP

TCP/IP

LU62

APPC/MVS

The return code from it was: (in hexadecimal) *return-code*, (in text) *return-text*. For some errors, there might also be an associated reason code *reason* (in hexadecimal) giving more information.

Severity

8

System action

The channel is not started.

System programmer response

See [Communications protocol return codes](#) for information about the cause of the return code from the communications system.

Probable causes are:

- If the communications protocol is LU 6.2:
 - One of the transmission parameters (MODENAME or TPNAME or PARTNER_LU) in the side information is incorrect, or that there is no side information for the symbolic destination name specified as the connection name. Correct the error and try again.
 - An LU 6.2 session has not been established, perhaps because the LU has not been enabled. Issue the z/OS® command VARY ACTIVE if this is the case.
- If the communications protocol is TCP/IP:
 - The connection name specified is incorrect, or that it cannot be resolved to a network address, or the name may not be in the name server. Correct the error and try again.
 - If the return code is zero, there is a name server problem. The OMVS command OPING usually fails in the same way. Resolve this failure and restart the channel. Check the `/etc/resolv.conf` file and check that the correct name server address is specified in the NSINTERADDR statement.

See the *z/OS UNIX System Services Messages and Codes* manual for information about the reason code.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.121. CSQX204E: *csect-name* Connection attempt rejected, channel *channel-name*, connection *conn-id* TRPTYPE=*trptype* RC=*return-code* (*return-text*) reason=*reason*

Explanation

An attempt to connect on connection *conn-id* was rejected. The associated channel is *channel-name*; in some cases its name cannot be determined and so is shown as '????'. *trptype* shows the communications system used:

TCP

TCP/IP

LU62

APPC/MVS

The return code from it was: (in hexadecimal) *return-code*, (in text) *return-text*. For some errors, there might also be an associated reason code *reason* (in hexadecimal) giving more information.

Severity

8

System action

The channel is not started.

System programmer response

Check the appropriate listener has been started on the remote end.

See [Communications protocol return codes](#) for information about the cause of the return code from the communications system.

If the communications protocol is LU 6.2, it is possible that either the user ID or password supplied at the remote LU is incorrect. The remote host or LU may not be configured to allow connections from the local host or LU.

If the communications protocol is TCP/IP, it is possible that the remote host does not recognize the local host. See the *z/OS® UNIX System Services Messages and Codes* manual for information about the reason code.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.123. CSQX206E: *csect-name* Error sending data, channel *channel-name*, connection *conn-id* (queue manager *qmgr-name*) TRPTYPE=*trptype* RC=*return-code* (*return-text*) reason=*reason*

Explanation

An error occurred sending data to *conn-id*, which may be due to a communications failure. The associated channel is *channel-name* and the associated remote queue manager is *qmgr-name*; in some cases the names cannot be determined and so are shown as '????'. *trptype* shows the communications system used:

TCP

TCP/IP

LU62

APPC/MVS

The return code from it was: (in hexadecimal) *return-code*, (in text) *return-text*. For some errors, there might also be an associated reason code *reason* (in hexadecimal) giving more information.

Severity

8

System action

The channel is stopped. The associated transmission queue may be set to GET(DISABLED) and triggering turned off.

System programmer response

See [Communications protocol return codes](#) for information about the cause of the return code from the communications system. If using TCP/IP, see the *z/OS® UNIX System Services Messages and Codes* manual for information about the reason code.

Note that the error may have occurred because the channel at the other end has stopped for some reason, for example an error in a receive user exit.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.129. CSQX213E: *csect-name* Communications error, channel *channel-name*, TRPTYPE=*trptype* function '*func*' RC=*return-code* (*return-text*) reason=*reason*

Explanation

An unexpected communications error occurred for a listener or a channel. If it was for a listener, the *csect-name* is CSQXCLMA, and the channel name is shown as '????'. If it was for a channel, the channel is *channel-name*; in some cases its name cannot be determined and so is shown as '????'.

trptype shows the communications system used:

TCP

TCP/IP

LU62

APPC/MVS

func is the name of the TCP/IP or APPC/MVS function that gave the error. In some cases the function name is not known and so is shown as '????'.

return-code is

- normally, the return code (in hexadecimal) from the communications system function
- for an LU 6.2 listener, it may be the reason code (in hexadecimal) from APPC/MVS allocate services
- if it is of the form 10009*nnn* or 20009*nnn*, it is a distributed queuing message code.

return-text is the text form of the return code.

For some errors, there may also be an associated reason code *reason* (in hexadecimal) giving more information.

Severity

8

System action

If the error occurred for a channel, the channel is stopped. For a listener, the channel is not started or, in some cases, the listener terminates.

System programmer response

See [Communications protocol return codes](#) for information about the cause of the return code from the communications system.

A distributed queuing message code *nnn* is generally associated with message CSQX*nnn*E, which will normally be issued previously. See that message explanation for more information. Where no such message is described, see [Distributed queuing message codes](#) for the corresponding message number.

Check for error messages on the partner system that may indicate the cause of the problem.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.131. CSQX218E: *csect-name* Listener not started – unable to bind, port *port* address *ip-address*, TRPTYPE=TCP INDISP=*disposition*, RC=*return-code*

Explanation

An attempt to bind the TCP/IP socket to the indicated listener port was not successful. *ip-address* is the IP address used, or '*' if the listener is using all IP addresses. The return code (in hexadecimal) from TCP/IP was *return-code*.

disposition shows which type of incoming requests the listener was handling:

QMGR

those directed to the target queue manager

GROUP

those directed to the queue-sharing group.

Severity

8

System action

The listener is not started.

System programmer response

The failure could be due to another program using the same port number.

See [Communications protocol return codes](#) for information about the return code from TCP/IP.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.135. CSQX234I: *csect-name* Listener stopped, TRPTYPE=*trptype* INDISP=*disposition*

Explanation

➤ The specified listener terminated. This could be for a number of reasons including, but not limited to, those in the following list:

- a STOP command was issued
- the listener was retrying
- an error occurred in the communications system

trptype is the transport type.

disposition shows which type of incoming requests the listener was handling:

QMGR

those directed to the target queue manager

GROUP

those directed to the queue-sharing group.

Severity

0

System action

Processing continues. If the listener was not deliberately stopped, the channel initiator will attempt to restart the listener, at the intervals specified by the LSTRTMR queue manager attribute.

System programmer response

If the listener was not deliberately stopped, look at any preceding messages relating to the channel initiator or to the TCP/IP, OMVS, or APPC address spaces to determine the cause.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.138. CSQX250E: *csect-name* Listener ended abnormally, TRPTYPE=*trptype* INDISP=*disposition*, reason=*sssuuu-reason*

Explanation

The specified listener is ending abnormally because an error that cannot be corrected has occurred. *sss* is the system completion code, *uuu* is the user completion code, and *reason* is the associated reason code (all in hexadecimal).

disposition shows which type of incoming requests the listener was handling:

QMGR

those directed to the target queue manager

GROUP

those directed to the queue-sharing group.

Severity

8

System action

The listener ends abnormally, and a dump is normally issued. The channel initiator will attempt to restart the listener, at the intervals specified by the LSTRTMR queue manager attribute.

System programmer response

User completion codes are generally the result of errors detected by the Language Environment®; see the *Language Environment for z/OS® Debugging Guide and Runtime Messages* for information about these codes. Otherwise, contact your IBM® support center.

2.17.139. CSQX251I: *csect-name* Listener started, TRPTYPE=*trptype*

INDISP=*disposition*

Explanation

The specified listener started successfully. This may be as a result of a START LISTENER command, or because the listener restarted automatically following an error.

disposition shows which type of incoming requests the listener was handling:

QMGR

those directed to the target queue manager

GROUP

those directed to the queue-sharing group.

Severity

0

System action

Processing continues.

2.17.140. CSQX256E: *csect-name* Listener stopped – error selecting new connection, TRPTYPE=TCP INDISP=*disposition*

Explanation

An error occurred in the listener select processing. The listener was notified by TCP/IP, but no attach request was received.

disposition shows which type of incoming requests the listener was handling:

QMGR

those directed to the target queue manager

GROUP

those directed to the queue-sharing group.

Severity

8

System action

The listener stops. The channel initiator will attempt to restart it, at the intervals specified by the LSTRTMR queue manager attribute.

System programmer response

The failure may be transitory, try again later. If the problem persists, it may be necessary to stop some other jobs that use TCP/IP, or to restart TCP/IP.

This topic's URL:

zm24280_

2.17.143. CSQX259E: *csect-name* Connection timed out, channel *channel-name*, connection *conn-id* (queue manager *qmgr-name*) TRPTYPE=*trptype*

Explanation

The connection *conn-id* timed out. The associated channel is *channel-name* and the associated remote queue manager is *qmgr-name*; in some cases the names cannot be determined and so are shown as '????'. *trptype* shows the communications system used:

TCP

TCP/IP

LU62

APPC/MVS

Probable causes are:

- A communications failure.
- For a message channel, if the Receive Timeout function is being used (as set by the RCVTIME, RCVTTYPE, and RCVTMIN queue manager attributes) and no response was received from the partner within this time.
- For an MQI channel, if the Client Idle function is being used (as set by the DISCINT server-connection channel attribute) and the client application did not issue an MQI call within this time.

Severity

8

System action

The channel stops.

System programmer response

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

For a message channel, check the remote end to see why the time out occurred. Note that, if retry values are set, the remote end will restart automatically. If necessary, set the receive wait time for the queue manager to be higher.

For an MQI channel, check that the client application behaviour is correct. If so, set the disconnect interval for the channel to be higher.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.145. CSQX261E: *csect-name* No suitable IP stack available, channel *channel-name*, connection *conn-id*

Explanation

An attempt to allocate a conversation on connection *conn-id* for channel *channel-name* using TCP/IP communications was not successful because the IP stack used did not support the IP address family required for the connection.

Severity

8

System action

The channel is not started.

System programmer response

If the channel's CONNAME attribute resolves to an IPv6 address, then ensure the stack being used by the combination of the TCPNAME queue manager attribute and the channel's LOCLADDR attribute supports IPv6. If the channel's CONNAME attribute resolves to an IPv4 address, then ensure the stack being used by the combination of the TCPNAME queue manager attribute and the channel's LOCLADDR attribute supports IPv4.

zm24360_

2.17.152. CSQX407I: *csect-name* Cluster queue *q-name* definitions inconsistent

Explanation

The definition of a cluster queue has different values for the DEFPRTY, DEFPSIST, and DEFBIND attributes on the various queue managers in the cluster.

All definitions of the same cluster queue should be identical; otherwise, problems may arise if your applications rely on one of these attributes to determine messaging behavior. For example, if an application opens a cluster queue with the option MQOO_BIND_AS_Q_DEF, and the different instances of the queue have different DEFBIND values, the behavior of the message transfer depends on which instance of the queue happens to be selected when it is opened.

Severity

4

System action

None.

System programmer response

Alter the definitions of the queue on the various queue managers so that they have identical values for these attributes.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.167. CSQX428E: *csect-name* Unexpected publication of a cluster queue object received, cluster *cluster-name*, cluster queue *q-name*, sender *sender-id*

Explanation

The repository manager received a publication for cluster queue *q-name* from another queue manager, whose identifier is *sender-id*, relating to cluster *cluster-name*. The local queue manager cannot accept the command because it is not a full repository for the cluster and thus it does not have an interest in the cluster queue.

This can also occur because a command destined for the local repository manager is delayed in the network and is out of date when it arrives, for example because a REFRESH CLUSTER command has been issued on the local repository manager and caused its view of the cluster to change.

Severity

8

System action

The command is ignored.

System programmer response

If the local partial repository queue manager is supposed to be a full repository for the cluster, use the ALTER QMGR command to specify a repository or repository namelist which contains the cluster. If the local queue manager is correctly a partial repository for the cluster, ensure that the remote queue manager does not have a manually defined cluster sender directed at the local partial repository.

If the message occurs because a command is out of date, the message can be ignored.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

This topic's URL:

zm_X429E_

2.17.169. CSQX430E: *csect-name* Unexpected queue manager repository command, cluster *cluster-name*, channel *channel-name*, sender *sender-id*

Explanation

The repository manager received a command from another queue manager, whose identifier is *sender-id*, relating to cluster *cluster-name*. The local queue manager cannot accept the command because it is not a full repository for the cluster, it does not have an interest in the cluster channel, and it does not have any matching cluster-sender channels. The cluster-sender channel used by the other queue manager was *channel-*

name.

This message may appear on a queue manager that has defined a cluster-sender channel to another queue manager that does not host a full repository, if the other queue manager is later modified to host a full repository.

Severity

8

System action

The command is ignored.

System programmer response

Check the definition of the channel on the sending queue manager to ensure that it is connected to a full repository for the cluster.

2.17.174. CSQX435E: *csect-name* Unable to put repository manager message, target *target-id* MQCC=*mqcc* MQRC=*mqrc*

Explanation

The repository manager tried to send a message to SYSTEM.CLUSTER.COMMAND.QUEUE on another queue manager whose identifier is *target-id*, but the MQPUT call was unsuccessful.

Severity

4

System action

Processing continues, but repository information may be out of date.

System programmer response

Refer to [API completion and reason codes](#) for information about *mqcc* and *mqrc*. Check the channel and cluster definitions on the local and target queue managers, and ensure that the channels between them are running.

When the problem is corrected, the repository information will normally be updated automatically. The REFRESH CLUSTER command can be used to be sure that the repository information is up to date.

This error may occur if the REFRESH CLUSTER REPOS(YES) command is issued against a full repository, as the full repository will then be temporarily unable to fulfil requests from other repositories until it has rebuilt the

cluster. If there is more than one full repository for the cluster, the problem will resolve itself. If there is only a single full repository for the cluster, the REFRESH CLUSTER command will need to be run against all the other queue managers in the cluster to make them contact the full repository again.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:44:17

zm24710_

2.17.189. CSQX456I: *csect-name* Full repository update not received, cluster *cluster-name*, queue *q-name* (queue manager *qmgr-name*)

Explanation

The repository manager found a cluster queue that had been used **▶**sometime**◀** in the last 30 days, and for which updated information should have been received. However, no such information has been received. The queue is *q-name* in *cluster-name*, and its queue manager is *qmgr-name*.

If the queue manager is a partial repository for the queue, the updated information should have been sent from a full repository. If the queue manager is a full repository, the updated information should have been sent from the queue manager on which the queue is defined.

Severity

0

System action

The repository manager will keep information about this queue for a further 60 days **▶**from when the error first occurred**◀**. If information has not been sent to a full repository then this queue will not be used to satisfy any new requests for cluster resources made to this full repository.

System programmer response

If the queue is still required, check that:

- The cluster channels to and from the queue manager that is the full repository for the cluster, and between there and the queue manager where the queue is located, are able to run.
- The repository managers on those queue managers have not ended abnormally.

zm24730_

2.17.191. CSQX460E: *csect-name* Cluster cache is full

Explanation

No more space is available in the cluster cache area.

Severity

8

System action

The repository manager terminates. The channel initiator will try to restart it after the specified interval.

System programmer response

The problem may be temporary. If it persists, the queue manager must be restarted; this will cause more space to be allocated for the cluster cache area.

Consider changing the cluster cache type system parameter CLCACHE to dynamic, so that more space for the cache will be obtained automatically as required. (If you are using a cluster workload exit, ensure that it supports a dynamic cluster cache.) See the CSQ6SYSP macro in the [WebSphere MQ for z/OS System Setup Guide](#) for information about the system parameters.

2.17.195. CSQX465I: *csect-name* New cluster topic definition inconsistent, topic *topic-name*, queue manager identifier *qmid*, attribute *attr*

Explanation

The definition of the cluster topic *topic-name*, defined on queue manager identifier *qmid* has different *attr* attribute values than one or more cluster topics that already exist in the cluster cache. The existing topic objects are reported by message CSQX466I.

All definitions of the same cluster topic should be identical; otherwise, problems may arise if your applications rely on one of these attributes to determine messaging behavior. For example, if an application opens a cluster topic and the different instances of the topic have different TOPICSTR values, the behavior of the message transfer depends on which instance of the topic happens to be selected when it is opened.

Severity

4

System action

None.

System programmer response

Alter the definitions of the topic on the various queue managers so that they have identical values for all attributes.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.196. CSQX466I: *csect-name* Cluster topic definitions inconsistent, topic *topic-name*, queue manager identifier *qmid* attribute *attr*

Explanation

The definition of the cluster topic *topic-name*, defined on queue manager identifier *qmid* has different *attr* attribute value than a cluster topic being added to the cluster cache. The topic object being added is reported by message CSQX465I.

All definitions of the same cluster topic should be identical; otherwise, problems may arise if your applications rely on one of these attributes to determine messaging behavior. For example, if an application opens a cluster topic and the different instances of the topic have different TOPICSTR values, the behavior of the message transfer depends on which instance of the topic happens to be selected when it is opened.

Severity

4

System action

None.

System programmer response

Alter the definitions of the topic on the various queue managers so that they have identical values for all attributes.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.197. CSQX470E: *csect-name* Channel *channel-name* has the wrong disposition *disposition*

Explanation

The action you requested cannot be performed on channel *channel-name* because it has the wrong disposition. For example, the action asked for a shared channel, but its disposition is private.

Severity

8

System action

The requested action is not performed.

System programmer response

Check whether the channel name is specified correctly. If it is, check that:

- The channel has been defined correctly
- The transmission queue name identifies the correct queue, and that queue has the required disposition.

The disposition of an instance of a channel is **not** related to that specified by QSGDISP in the channel

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

definition:

- A sending channel is *shared* if its transmission queue is shared, and *private* if it is not.
- A receiving channel is *shared* if it was started in response to an inbound transmission directed to the queue-sharing group, and *private* if it was started in response to an inbound transmission directed to the queue manager.

zm24780_

2.17.198. CSQX471I: *csect-name nn* shared channels to restart, *nn* requests issued

Explanation

The channel initiator is shutting down; it owns some active shared sending channels, and they have not been requested to stop. Requests to restart these channels on another queue manager have been issued as shown.

Severity

0

System action

The channel initiator shutdown processing continues.

System programmer response

If the numbers in the message differ, the channel initiator was not able to issue restart requests for all the channels. In this case, use the DISPLAY CHSTATUS command to determine which channels are still owned by the queue manager for the channel initiator that is shutting down, and which therefore have not been restarted, and restart them manually as required.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

This topic's URL:

zm24820_

2.17.202. CSQX476E: *csect-name* Channel *channel-name* is active on *qmgr-name*, shared status entry found

Explanation

An operation was requested on a channel that is active. Because the channel is shared, it may be active on another queue manager. If the channel is a receiver, a previous instance of it may have been orphaned and therefore still be active.

Severity

8

System action

The request fails.

System programmer response

For operations other than starting the channel, either stop the channel manually, or wait for it to terminate, and retry the operation. It may be necessary to use MODE(FORCE) to stop the channel manually if the Adopt MCA function is not being used. Using the Adopt MCA function will avoid the need for manual intervention to handle orphaned receiver channels.

If the channel is not running on the named queue manager, then there is an orphaned shared status entry, which may be because a loss of connectivity to DB2® occurred. If the problem persists, contact your IBM® support center.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:44:20

zm24830_

2.17.203. CSQX477E: *csect-name* Channel *channel-name* is active, transmission queue *queue-name* in use on *qmgr-name*

Explanation

An operation was requested on a channel that is active. The queue *queue-name* named as a transmission queue in the channel definition for *channel-name* is in use on another member of the queue sharing group, *qmgr-name*.

Severity

8

System action

The request fails.

System programmer response

Do the following, as appropriate:

- Check if the channel is already running
- Check if another channel is using the queue by using the DISPLAY QSTATUS command
- Ensure the queue name is specified correctly in the channel definition
- Alter the queue usage attribute of the queue to that of a transmission queue.

If the channel is already running, for operations other than starting the channel, either stop the channel manually, or wait for it to terminate, and retry the operation. It may be necessary to use MODE(FORCE) to stop the channel manually if the Adopt MCA function is not being used. Using the Adopt MCA function will avoid the need for manual intervention to handle orphaned receiver channels.

2.17.204. CSQX478E: *csect-name* Channel *channel-name* is active on *qmgr-name*, connection tag in use

Explanation

An operation was requested on a channel that is active. The connection tag used to serialize the channel within the queue-sharing group is currently in use. Because the channel is shared, it may be active on another queue manager. If the channel is a receiver, a previous instance of it may have been orphaned and therefore still be active.

Severity

8

System action

The request fails.

System programmer response

For operations other than starting the channel, either stop the channel manually, or wait for it to terminate, and retry the operation. It may be necessary to use MODE(FORCE) to stop the channel manually if the Adopt MCA function is not being used. Using the Adopt MCA function will avoid the need for manual intervention to handle orphaned receiver channels.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.205. CSQX479E: *csect-name* Channel *channel-name* is active on *qmgr-name*, shared channel adoption failed

Explanation

An attempt was made to adopt channel *channel-name*, which was orphaned because of a communications error. It failed, either because the channel could not be stopped or because a response was not received from the queue manager *qmgr-name*.

Severity

8

System action

The request fails, and the orphaned channel may remain active.

System programmer response

Investigate any preceding error messages to discover why the adopt failed. Either stop the channel manually, or wait for it to terminate, and retry the operation. It may be necessary to use MODE(FORCE) to stop the channel manually.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.219. CSQX504E: *csect-name* Local protocol error, channel *channel-name*, type=*type* data=*xxx*

Explanation

During communications with the remote end, the local message channel agent for channel *channel-name* detected a protocol error. *type* shows the type of error that occurred:

0000000A

Incorrect segment type

00000012

Incorrect message length

00000013

Incorrect segment number

The incorrect value is shown by *xxx*.

Severity

8

System action

The channel stops. The associated transmission queue may be set to GET(DISABLED) and triggering turned off.

System programmer response

Examine the console log to determine the cause of the failure. This may occur after the channel initiator or queue manager is stopped forcibly or ends abnormally. If it occurs in other cases, contact your IBM® support center to report the problem.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.224. CSQX514E: *csect-name* Channel *channel-name* is active on *qmgr-name*

Explanation

An operation was requested on a channel that is active. If the channel is shared, it may be active on another queue manager. If the channel is a receiver, a previous instance of it may have been orphaned and therefore still be active.

Severity

8

System action

The request fails.

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

System programmer response

For operations other than starting the channel, either stop the channel manually, or wait for it to terminate, and retry the operation. It may be necessary to use MODE(FORCE) to stop the channel manually if the Adopt MCA function is not being used. Using the Adopt MCA function will avoid the need for manual intervention to handle orphaned receiver channels.

2.17.225. CSQX515I: *csect-name* Channel *channel-name* changed

Explanation

The channel for which information has been requested is a new instance of the channel. The previous channel instance has ended.

Severity

0

System action

The information shown is for the new channel instance.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:44:22

This topic's URL:

zm25040_

2.17.226. CSQX516E: *csect-name* Error accessing synchronization data, RC=*return-code*

Explanation

There was an error when accessing the channel synchronization data.

If the return code is of the form 10009*nnn* or 20009*nnn*, it is a distributed queuing message code. This is generally associated with message CSQX*nnn*E, which will normally be issued previously.

Otherwise the most likely cause is a shortage of storage.

Severity

8

System action

The channel stops. The associated transmission queue may be set to GET(DISABLED) and triggering turned off.

In some cases, the channel initiator will stop as well.

System programmer response

If the return code is a distributed queuing message code, see the corresponding message explanation for more information. Where no such message is described, see [Distributed queuing message codes](#) for the corresponding message number.

Restart the channel or the channel initiator. If the problem persists, contact your IBM® support center.

zm25050_

2.17.227. CSQX517E: *csect-name* Error in *q-name* – channel *channel-name* repeated

Explanation

There was more than one set of synchronization information in *q-name* for an instance of channel *channel-name*. This is probably because the channel is a receiver channel, and there are two sender channels with the same name on different queue managers within the same network address that have communicated with it.

Severity

8

System action

The first set of synchronization information for the channel instance is used, and any others are ignored. Errors may occur if the channel is used.

System programmer response

Avoid using the channel. Remove the extra sets of information from the channel synchronization queue, and rename channels so that they have unique names.

If this does not resolve the problem, contact your IBM® support center.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.228. CSQX519E: *csect-name* Channel *channel-name* not defined, connection *remote-conn-id*

Explanation

The associated remote connection name is *remote-conn-id*. If the request to use the channel is not an inbound
http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm 16/03/2011

channel start, or the remote connection name cannot be determined this will be shown as '????'.

Severity

8

System action

The requested operation fails.

System programmer response

➤ Ensure that the name is specified correctly and the channel definition is available. The message can also be issued if an automatically defined cluster sender channel (CLUSSDRA) has been deleted as a result of issuing a REFRESH CLUSTER command but a putting application still has a queue object open which is using the channel.◀

2.17.230. CSQX523E: *csect-name* Remote protocol error, channel *channel-name*, type=*type* data=*xxx*

Explanation

During communications with the remote end, the remote message channel agent for channel *channel-name* detected a protocol error. *type* shows the type of error that occurred:

0000000A

Incorrect segment type

0000000B

Incorrect length

0000000C

Invalid data

0000000D

Invalid segment

0000000E

Invalid ID

0000000F

Invalid MSH

00000010

General error

00000011

Batch failure

00000012

Incorrect message length

00000013

Incorrect segment number

The data associated with the error (for example, the incorrect value) is shown by xxx.

Severity

8

System action

The channel stops. The associated transmission queue may be set to GET(DISABLED) and triggering turned off.

System programmer response

Examine the console log for the remote end to determine the cause of the failure. This may occur after the channel initiator or queue manager is stopped forcibly or ends abnormally. If it occurs in other cases, contact your IBM® support center.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

This topic's URL:

zm25110_

2.17.233. CSQX526E: *csect-name* Message sequence error for channel *channel-name*, sent=*msg-seqno* expected=*exp-seqno*

Explanation

The local queue manager does not agree with the remote end on the next message sequence number for channel *channel-name*. The message is normally issued at both the sending and receiving end: at the sending http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm 16/03/2011

end, *msg-seqno* and *exp-seqno* are unpredictable; at the receiving end, a message had sequence number *msg-seqno* but sequence number *exp-seqno* was expected.

Severity

8

System action

The channel stops. The associated transmission queue may be set to GET(DISABLED) and triggering turned off.

System programmer response

Determine the cause of the inconsistency. It could be that the synchronization information has become damaged, or has been backed out to a previous version. If the problem cannot be resolved, the sequence number can be reset manually at the sending end of the channel using the RESET CHANNEL command. (For some queue managers, it may be necessary to issue the RESET CHANNEL command at the receiving end as well.)

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.236. CSQX531E: *csect-name* Queue *q-name* for channel *channel-name* is in use or wrong type

Explanation

The queue *q-name* named as a transmission queue in the channel definition for *channel-name* is either in use (by this channel or another channel), or it is not a transmission queue.

Severity

8

System action

The channel does not start.

System programmer response

Do the following, as appropriate:

- Check if the channel is already running
- Check if another channel is using the queue; use the DISPLAY QSTATUS command
- Ensure the queue name is specified correctly in the channel definition
- Alter the queue usage attribute of the queue to that of a transmission queue.

This topic's URL:

zm25240_

2.17.246. CSQX547E: *csect-name* Remote channel *channel-name* has the wrong type

Explanation

The operation requested cannot be performed because channel *channel-name* on the remote end is not of a suitable type. For example, if the local channel is defined as a sender the remote queue manager must define its corresponding channel as either a receiver or requester.

Severity

8

System action

The requested operation is not performed.

System programmer response

Check that the channel name is specified correctly. If it is, check that:

- The channel definition on the remote end has an appropriate channel type
- The connection name of the local channel identifies the remote end correctly
- For cluster channels, the connection names do not specify a generic address
- For TCP/IP connections, the port number specified by the local channel matches that used by the listener at the remote queue manager.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.253. CSQX567E: *csect-name* Listener unable to register to APPC/MVS, TRPTYPE=LU62 INDISP=*disposition* RC=*return-code* reason=*reason*

Explanation

While starting, the specified LU 6.2 listener could not register as an APPC/MVS server. The return code from APPC/MVS allocate services was *return-code* and the associated reason code was *reason* (both in hexadecimal).

Severity

8

System action

The listener is not started.

System programmer response

See [Communications protocol return codes](#) for the cause of the return code from APPC/MVS allocate services, and the *Writing Servers for APPC/MVS* manual for more information. Check that the LUNAME queue manager attribute is the same as the PARTNER_LU value for the APPC/MVS symbolic destination used by the listener.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.254. CSQX568E: *csect-name* Listener unable to unregister from APPC/MVS, TRPTYPE=LU62 INDISP=*disposition* RC=*return-code* reason=*reason*

Explanation

While stopping, the specified LU 6.2 listener could not unregister as an APPC/MVS server. The return code from APPC/MVS allocate services was *return-code* and the associated reason code was *reason* (both in hexadecimal).

Severity

8

System action

The listener stops. It may not be possible to restart it.

System programmer response

See [Communications protocol return codes](#) for the cause of the return code from APPC/MVS allocate services and the *Writing Servers for APPC/MVS* manual for more information.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.255. CSQX569E: *csect-name* Channel *channel-name* exceeded TCP/IP channel limit

Explanation

The number of current TCP/IP channels is the maximum allowed; another channel cannot be started. Current channels include stopped and retrying channels as well as active channels. The maximum allowed is specified in the TCPCHL queue manager attribute, but may be reduced if a dispatcher fails, or if TCP/IP resources are restricted (as reported by message CSQX118I).

Severity

8

System action

The channel does not start.

System programmer response

If the maximum allowed is zero, TCP/IP communications are not allowed, and no TCP/IP channels can be started. If the maximum allowed is non-zero, wait for some of the operating channels to terminate before restarting the channel, or use the ALTER QMGR command to increase TCPCHL.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:44:23

2.17.257. CSQX572E: *csect-name* Channel *channel-name* stopping because message header is not valid

Explanation

During the processing of channel *channel-name*, a message was found that had an invalid header. The dead-letter queue was defined as a transmission queue, so a loop would have been created if the message had been put there.

Severity

8

System action

The channel stops. The associated transmission queue may be set to GET(DISABLED) and triggering turned off.

System programmer response

Correct the problem that caused the invalid message header.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:44:23

2.17.258. CSQX573E: *csect-name* Channel *channel-name* exceeded active channel limit

Explanation

There are too many channels active (transmitting messages) to be able to start another. The maximum number allowed is specified in the ACTCHL queue manager attribute.

Severity

8

System action

The channel does not start.

System programmer response

Either wait for some of the operating channels to terminate, or stop some channels manually, before restarting the channel, or use the ALTER QMGR command to increase ACTCHL. A change that increases ACTCHL will not be effective until the channel initiator has been stopped and restarted.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:44:23

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

2.17.260. CSQX575E: *csect-name* Negotiation failed for channel

Explanation

A channel between the local queue manager and the remote end could not be established due to a negotiation failure. The failure was such that the channel name could not be determined: for example, data conversion between the coded character set identifiers (CCSIDs) used by the local and remote ends may not have been possible.

Severity

8

System action

The channel is not started.

System programmer response

Examine the console log for the remote end for messages explaining the cause of the negotiation failure.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:44:23

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

2.17.261. CSQX578E: *csect-name* Unable to save status for channel *channel-name*

Explanation

An internal error has occurred.

Severity

8

System action

The channel stops. The associated transmission queue may be set to GET(DISABLED) and triggering turned off.

Information about the error is written to the data set identified by the CSQSNAP DD statement of the channel initiator started task JCL procedure, xxxxCHIN.

System programmer response

Collect the items listed in the Problem Determination section and contact your IBM® support center.

Problem determination

Collect the following diagnostic items:

- Queue manager job log
- Channel initiator job log
- The CSQSNAP data set

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:44:23

2.17.272. CSQX631E: *csect-name* Cipher specifications differ, channel *channel-name*, *local=local-ciph* *remote=remote-ciph*

Explanation

The SSL cipher specification value for channel *channel-name* is *local-ciph*, but the value specified at the remote end is *remote-ciph*. The two values must be the same before the channel can be started. They are shown in the message as two-character codes; common values are as shown in message CSQX635E.

Severity

8

System action

The channel does not start.

System programmer response

Change either the local or remote channel definition so that the values specified for the SSL cipher specification are the same.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

This topic's URL:

zm25510_

2.17.273. CSQX632I: *csect-name* SSL certificate has no associated user ID, remote channel *channel-name* – channel initiator user ID used

Explanation

The certificate sent from the remote end during SSL handshaking was accepted, but no user ID could be found associated with it. The channel is *channel-name*; in some cases its name cannot be determined and so is shown as '????'.

Likely causes are that neither the certificate nor a matching certificate name are defined to the external security manager (ESM), or that the certificate contains fields that are not understood by the ESM.

Severity

0

System action

The user ID of the channel initiator address space is used as the channel user ID for the channel.

System programmer response

If certificate name filtering is being used, you can create a filter that will match this certificate. Alternatively, change the SSLPEER channel attribute to prevent this certificate being accepted from the remote channel.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

 This build: January 26, 2011 11:44:24

2.17.276. CSQX635E: *csect-name* Invalid cipher specification *ciph* for channel *channel-name*

Explanation

The SSL cipher specification value for channel *channel-name* is not valid. The value is shown in the message as a two-character code; common values are:

01

NULL_MD5

02

NULL_SHA

03

RC4_MD5_EXPORT

04

RC4_MD5_US

05

RC4_SHA_US

06

RC2_MD5_EXPORT

09

DES_SHA_EXPORT

0A

TRIPLE_DES_SHA_US

2F

TLS_RSA_WITH_AES_128_CBC_SHA

35

TLS_RSA_WITH_AES_256_CBC_SHA

In some cases the channel name cannot be determined and so is shown as '????'.

Severity

8

System action

The channel will not start.

System programmer response

Correct the SSL cipher specification for the channel.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.277. CSQX636E: *csect-name* Distinguished name does not match peer name, channel *channel-name*, name='dist-name'

Explanation

The distinguished name, *dist-name*, specified in the SSL certificate at the remote end does not match the SSL peer name for channel *channel-name*. The distinguished name at the remote end must match the peer name specified (which can be generic) before the channel can be started. In some cases the channel name cannot be determined and so is shown as '????'.

Severity

8

System action

The channel will not start.

System programmer response

If you wish to allow this remote end to connect, change the SSL peer name specification for the channel so that it matches the distinguished name in the SSL certificate at the remote end, or obtain the correct certificate for the remote end, as appropriate.

Parent topic: [Distributed queuing messages \(CSQX...\)](#)

2.17.283. CSQX642E: *csect-name* No SSL certificate for channel *channel-name*

Explanation

The channel *channel-name*. did not supply a certificate to use during SSL handshaking, but a certificate is required by the remote end. In some cases the channel name cannot be determined and so is shown as '????'.

Severity

8

System action

The channel will not start.

System programmer response

Ensure that the key ring of the local queue manager *qmgr-name* has an SSL certificate connected to it called 'ibmWebSphereMQ*qmgr-name*'; alternatively, if appropriate, change the remote channel definition so that its SSLCAUTH attribute is set to OPTIONAL.

For full details about SSL certificates and key repositories see [WebSphere MQ Security](#).

2.17.284. CSQX643E: *csect-name* Peer name error for remote channel *channel-name*

Explanation

An error occurred with the SSL peer name for remote channel *channel-name*. In some cases the channel name cannot be determined and so is shown as '????'.

Severity

8

System action

The channel will not start.

System programmer response

Review the remote console log to determine the peer name error.

2.17.285. CSQX644E: *csect-name* Unable to determine peer name for remote channel *channel-name*

Explanation

The peer name associated with the certificate sent from the remote end during SSL handshaking could not be determined. The channel is *channel-name*; in some cases its name cannot be determined and so is shown as '????'.

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Severity

4

System action

If the local channel has a peer name specified it does not start.

System programmer response

Ensure that the SSL certificate `'ibmWebSphereMQqmgr-name'` in the key ring at the local queue manager `qmgr-name` is valid, and that the signing certificate has been connected to the key repository on the remote end so that the certificate sent can be authenticated. Check that the local and remote channel definitions are correct.

For full details about SSL certificates and key repositories see [WebSphere MQ Security](#).

2.17.316. CSQX847I: *csect-name* LU 6.2 listener INDISP=*disposition* started, for LU name *name*

Explanation

This is issued in response to the DISPLAY CHINIT command for each LU 6.2 listener that is active.

disposition shows which type of incoming requests the listener handles:

QMGR

those directed to the target queue manager

GROUP

those directed to the queue-sharing group.

Severity

0

2.17.317. CSQX848I: *csect-name* TCP/IP listener INDISP=*disposition* not started

Explanation

This is issued in response to the DISPLAY CHINIT command for each TCP/IP listener that is not active.

disposition shows which type of incoming requests the listener handles:

QMGR

those directed to the target queue manager

GROUP

those directed to the queue-sharing group.

Severity

0

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

System programmer response

If the listener had been started, and was not deliberately stopped, this may be because there was an error in the communications system. The channel initiator will attempt to restart the listener, at the intervals specified by the LSTRTMR queue manager attribute.

zm25990_

2.18.2. CSQY001I: QUEUE MANAGER STARTING, USING PARAMETER MODULE *parm-name*

Explanation

The START QMGR command is accepted. System parameter values will be taken from the module *parm-name*. This message is issued to the z/OS® console at which the START command was issued. Message CSQY022I is sent when the queue manager startup process has completed.

System action

Queue manager startup processing begins.

Parent topic: [Initialization procedure and general services messages \(CSQY...\)](#)

 This build: January 26, 2011 11:44:26

This topic's URL:

zm26000_

2.18.3. CSQY002I: QUEUE MANAGER STOPPING

Explanation

The STOP QMGR command is accepted. Message CSQ9022I is issued when the queue manager shutdown process has completed. The message is issued either to the originator of the STOP QMGR command, or to the z/OS® console from which the START QMGR command was received.

System action

Queue manager shutdown is initiated.

Parent topic: [Initialization procedure and general services messages \(CSQY...\)](#)

 This build: January 26, 2011 11:44:26

2.18.5. CSQY004I: QUEUE MANAGER IS ALREADY STOPPING

Explanation

The STOP QMGR command has not been accepted either because the queue manager shutdown is in progress for the specified option (QUIESCE or FORCE), or because the QUIESCE option was specified after a FORCE option had been accepted previously. Message CSQ9023E is issued after this message.

System action

Queue manager shutdown continues.

Parent topic: [Initialization procedure and general services messages \(CSQY...\)](#)

 This build: January 26, 2011 11:44:26

zm26030_

2.18.6. CSQY005E: QUEUE MANAGER STARTUP TERMINATED, INVALID START COMMAND

Explanation

The queue manager can be started only by a START QMGR command.

System action

Queue manager startup is terminated.

Operator response

Start the queue manager using the START QMGR command, and reenter the rejected command.

Parent topic: [Initialization procedure and general services messages \(CSQY...\)](#)

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

2.18.7. CSQY006E: *csect-name* INVALID AMODE OR RMODE ATTRIBUTE FOUND FOR LOAD MODULE *module-name*

Explanation

The queue manager initialization procedures found that a module had an invalid AMODE or RMODE attribute when it was loaded. *module-name* is the name of the load module with an invalid addressing or residency mode.

System action

Queue manager startup terminates abnormally.

Operator response

Notify the system programmer of the problem.

System programmer response

Verify that all installation and maintenance activities against WebSphere® MQ have been done correctly. If you are unable to correct the problem, contact your IBM® support center.

Parent topic: [Initialization procedure and general services messages \(CSQY...\)](#)

 This build: January 26, 2011 11:44:26

2.18.8. CSQY007E: *csect-name* QUEUE MANAGER STARTUP TERMINATED, INVALID OPERATING SYSTEM LEVEL

Explanation

The queue manager initialization procedures found that the level of the operating system did not have the function required for correct queue manager operation.

System action

Queue manager startup terminates abnormally.

Operator response

Notify the system programmer of the problem.

System programmer response

Verify that the prerequisite, or later, level of the operating system is installed. If you are unable to correct the problem, contact your IBM® support center.

Parent topic: [Initialization procedure and general services messages \(CSQY...\)](#)

2.18.9. CSQY008I: QUEUE MANAGER SHUTDOWN REQUEST NOT ACCEPTED

Explanation

The STOP QMGR command has not been accepted because startup has not completed to the point where shutdown can occur. Message CSQ9023E is issued after this message.

System action

Queue manager startup continues, and the STOP QMGR command is ignored.

Operator response

Reissue the STOP QMGR command after startup has completed.

Parent topic: [Initialization procedure and general services messages \(CSQY...\)](#)

This topic's URL:

zm26070_

2.18.11. CSQY010E: *csect-name* LOAD MODULE *module-name* IS NOT AT THE CORRECT RELEASE LEVEL

Explanation

The named load module is not at the correct level for the version of the queue manager that was being used.

System action

If detected by the queue manager, startup terminates abnormally with reason code X'00E80161'. If detected by the channel initiator (*module-name* is CSQXJST), it does not start.

Operator response

Notify the system programmer.

System programmer response

Verify that the correct WebSphere® MQ program libraries are being used (for the queue manager or channel initiator as appropriate) and that all installation and maintenance activities against WebSphere MQ have been done correctly. If the early processing program is incorrect (*module-name* is CSQ3EPX), refresh it by issuing the REFRESH QMGR TYPE(EARLY) command.

If you are unable to correct the problem, contact your IBM® support center.

2.18.13. CSQY012E: *csect-name* COMMAND PREFIX REGISTRATION FAILED. INVALID CHARACTER(S) IN QUEUE MANAGER NAME

Explanation

Command prefix registration failed because the queue manager name used as the owner of the command prefix (CPF) contains invalid characters.

System action

The queue manager does not start.

System programmer response

Reissue the z/OS® command SETSSI ADD with the correct CPF parameter. Correct the CPF parameter in the record of SYS1.PARMLIB member IEFSSNxx. See the [WebSphere MQ for z/OS System Setup Guide](#) for information about the parameters.

Parent topic: [Initialization procedure and general services messages \(CSQY...\)](#)

2.18.18. CSQY017E: *csect-name* INCORRECT STORAGE PROTECT KEY

Explanation

The queue manager initialization procedures found that the storage protect key was not 7. The most likely causes are that the program properties table (PPT) entry for CSQYASCP has not been specified correctly, or that the WebSphere® MQ program libraries or other libraries in the WebSphere MQ STEPLIB are not APF authorized.

System action

Queue manager startup terminates abnormally with reason code X'00E80162'.

Operator response

Notify the system programmer.

System programmer response

See the [WebSphere MQ for z/OS System Setup Guide](#) for information about specifying the PPT entry for CSQYASCP and about APF authorization for the WebSphere MQ program libraries.

Parent topic: [Initialization procedure and general services messages \(CSQY...\)](#)

2.18.20. CSQY019E: csect-name QUEUE MANAGER STARTUP TERMINATED, INVALID PARAMETER MODULE LEVEL, REBUILD *macro-name*

Explanation

The queue manager initialization procedures found that the level of the parameter module (named in the preceding CSQY001I message) is not at the correct level for this version of the queue manager.

System action

Queue manager startup terminates abnormally with reason code 00E80051.

Operator response

Notify the system programmer.

System programmer response

Rebuild the parameter module ensuring that *macro-name* is recompiled with the same level of code that the queue manager is running with.

See the *z/OS System Setup Guide* for information about the macros used to build the parameter module.

2.18.28. CSQY200E: *csect-name* ARM *request-type* for element *arm-element* type *arm-element-type* failed, rc=*rc* reason=*reason*

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Explanation

An ARM request (IXCARM REQUEST=*request-type*) for the specified element failed. *rc* is the return code and *reason* is the reason code (both in hexadecimal) from the call.

System action

None.

System programmer response

See the z/OS® MVS™ *Programming Sysplex Services Reference* manual for information about the return and reason codes from the IXCARM call. If you are unable to solve the problem, contact your IBM® support center.

2.18.34. CSQY210E: *csect-name call-name* call for name name-token failed, rc=rc

Explanation

During processing for a group connect, a name token services call failed. *rc* is the return code (in hexadecimal) from the call.

System action

If the failure occurs in the batch adapter (*csect-name* CSQBCON or CSQBDSC), the application call will fail with a reason code of MQRC_UNEXPECTED_ERROR. Otherwise (*csect-name* CSQYGRA1), processing continues, but the group connect facility will not be available.

System programmer response

See the *MVS™ Authorized Assembler Services Reference* manual for information about the return codes from the name token services call. If you are unable to solve the problem, take a stand-alone system dump and contact your IBM® support center.

Parent topic: [Initialization procedure and general services messages \(CSQY...\)](#)

2.18.35. CSQY211I: *csect-name* Unable to add entry to group connect name table (at *table-addr*)

Explanation

During initialization for the group connect facility, a new entry could not be added to the name table for this queue manager. The most likely cause is that there is already the maximum of 32 queue managers active in the group.

System action

Processing continues, but this queue manager will not be available for group connection.

System programmer response

Reduce the number of active queue managers and restart this queue manager. If this does not solve the problem, contact your IBM® support center.

Parent topic: [Initialization procedure and general services messages \(CSQY...\)](#)

2.18.36. CSQY212E: *csect-name* Unable to find the group attach table

Explanation

During initialization for the group connect facility, the group attach table could not be found. The most likely causes are that an error occurred during subsystem initialization, or that the subsystem was not initialized with the latest version of the WebSphere MQ early code.

System action

Processing continues, but the group connect facility will not be available to CICS.

System programmer response

Ensure that the libraries with the latest version, release, or maintenance level of the WebSphere MQ early code are in the libraries used for the z/OS LPA, and refresh the early code for the queue manager using the WebSphere MQ command REFRESH QMGR TYPE(EARLY). See the [z/OS System Setup Guide, Early code](#)

2.18.37. CSQY220I: Queue manager is using *mm* MB of local storage, *nn* MB are free

Explanation

Displays the amount of virtual storage currently used and available in the extended private region. Both values are displayed in megabytes (1048576 bytes), and are approximations.

➤ This message is logged at queue manager start and then either every hour if the usage does not change or when the memory usage changes (up or down) by more than 2%. ◀

System action

Processing continues. Any special actions taken by MQ or that are required will be indicated by the CSQY221I and CSQY222E messages.

System programmer response

No action is required at this time. However, a frequent occurrence of this message may be an indication that the system is operating beyond the optimum region for the current configuration.

Parent topic: [Initialization procedure and general services messages \(CSQY...\)](#)

2.18.38. CSQY221I: Queue manager is short of local storage

Explanation

The queue manager is running short of virtual storage in the extended private region.

System action

Processing continues. Storage contraction processing is performed, which attempts to remove unused storage from internal subpools so that it can be reused in other subpools. This might be necessary after a temporary need for lots of storage; for example, more than the usual number of messages held on an indexed queue, or an unusually large unit of work being performed.

System programmer response

No action is required at this time. However, a frequent occurrence of this message may be an indication that the system is operating beyond the optimum region for the current configuration.

Parent topic: [Initialization procedure and general services messages \(CSQY...\)](#)

 This build: January 26, 2011 11:44:28

2.18.39. CSQY222E: Queue manager is critically short of local storage – take action

Explanation

The queue manager is running critically short of virtual storage in the extended private region. Action should be taken to relieve the situation, and to avoid the possible abnormal termination of the queue manager.

System action

Processing continues. Storage contraction processing has been performed, but the remaining unallocated virtual storage is less than a predetermined safe amount. If storage use continues to increase, the queue manager may terminate abnormally in an unpredictable way.

System programmer response

Virtual storage is over-allocated for the current configuration. The following actions can reduce the virtual storage requirement:

- Reduce buffer pool sizes with the ALTER BUFFPOOL command. Buffer pool statistics may be used to

determine buffer pools which are over-allocated.

- Reduce the number of messages held on private queues which are indexed.
- Remove units of work which hold large numbers of locks. These are units of work which have put or got lots of messages, or large messages.
- Reduce the number of concurrent connections to the queue manager. The DISPLAY CONN command can be used to determine connections which are consuming queue manager resources.

If the problem persists after taking actions described above, it may be an indication of an internal error whereby storage is not freed (a 'storage leak'). If you suspect this, then collect at least two system dumps of the queue manager, separated by an interval of time, and contact your IBM® support center.

2.18.41. CSQY270E: *csect-name* UNRECOGNIZED MESSAGE NUMBER *message-id*

Explanation

An unsuccessful attempt has been made to issue the message *message-id*. This message is issued only if the requested message could not be found in the MQ message directory.

Severity

8

System action

Processing continues as though the requested message had been issued.

Operator response

Notify the system programmer.

System programmer response

Use the message number (*message-id*) and look up the message in this book. If you are using a language other than US English, ensure that you have installed the language feature correctly and that you have the appropriate load library data set concatenations in your job. Apart from that possibility, this is an MQ system problem; see the [WebSphere MQ for z/OS Problem Determination Guide](#).

Note: Messages are also used to provide text for constructing panels and reports. If such a message cannot be found, message CSQY270E will appear on the panel or report, generally in truncated form.

Parent topic: [Initialization procedure and general services messages \(CSQY...\)](#)

2.18.42. CSQY271I: MESSAGE GENERATOR INITIALIZATION PARAMETERS NOT FOUND. DEFAULTS ASSUMED

Explanation

The message generator was unable to access the routing code initialization parameter defined by the CSQ6SYSP macro. Default values defined by that macro are assumed.

Severity

4

System action

Queue manager initialization continues.

Operator response

Notify the system programmer.

System programmer response

It might be necessary to change the CSQ6SYSP macro. See the [WebSphere MQ for z/OS System Setup Guide](#) for information about this macro.

Parent topic: [Initialization procedure and general services messages \(CSQY...\)](#)

2.18.43. CSQY290E: *csect-name* NO STORAGE AVAILABLE

Explanation

There was insufficient storage available for a system routine. *csect-name* shows the system routine function:

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

CSQAXDPS, CSQVXDPS

User exits (other than channel)

CSQXARMY

Channel initiator automatic restart

CSQXDCTS, CSQXTRPG

Channel initiator trace

CSQXDMPS

Channel initiator system dump

CSQXLDXS

User channel exits

CSQ2GFRR, CSQ2MFRR

IMS™ bridge system dump

Severity

4

System action

Processing continues, but the function provided by the system routine will be inhibited. For example, if the routine is CSQXLDXS, then user channel exits will not be available, and channels that use them will not start.

System programmer response

If the problem occurs in the queue manager, increase the size of the its address space, or reduce the number of queues, messages, and threads being used.

If the problem occurs in the channel initiator, increase the size of the its address space, or reduce the number of dispatchers, adapter subtasks, SSL server subtasks, and active channels being used.

2.18.51. CSQY340E: Queue manager has restricted functionality, but previously had full functionality. Unsupported objects will be deleted (losing messages), invalid attributes will be changed

Explanation

The installation and customization options chosen for WebSphere® MQ do not allow all functions to be used. However, the queue manager has run previously without any functional restriction, and so may have objects and attribute settings that are not allowed with the restricted functionality.

In order to continue, these objects must be deleted (which may mean messages are lost) and the attributes must be changed. The queue manager will do this automatically.

System action

Message CSQY341D is issued and the operator's reply is awaited.

System programmer response

The operator has two options:

- Allow the queue manager to delete the objects and change the attributes, by replying 'Y'.
- Cancel the queue manager, by replying 'N'.

2.19.27. CSQ1151I: UR CONNID=*cc* THREAD-XREF=*bb* USERID=*aa* TIME=*date time* START=*s-rba* END=*e-rba* DISP=*xx* INFO=*ii*

Explanation

This message describes a unit of recovery that terminated.

cc

Connection id (for example, BATCH)

bb

Thread cross-reference id (for example, JOB xxx)

aa

User id executing the UR

date time

Starting time of the UR

s-rba

Log RBA of the first log record associated with the UR (that is, the URID)

e-rba

Log RBA of the last log record associated with the UR. If the UR is not complete, *e-rba* is shown as '***'

xx

Disposition of the UR, values include:

- INFLIGHT
- IN BACKOUT
- IN COMMIT
- INDOUBT
- COMMITTED
- BACKED OUT

ii

Status of the data, one of the following:

- COMPLETE, indicating that all page sets modified by this UR have been identified
- PARTIAL, indicating that the list of page sets modified by this UR is incomplete (this is shown if all records associated with a UR are not available, and no checkpoint is found prior to the UR's completion)

If the UR identifying information is not available, it will be shown as '***'.

2.19.34. CSQ1161E: INVALID URE FOUND AT *x-rba*

Explanation

While processing the SUMMARY option, an invalid URE checkpoint record was encountered in the log.

Severity

4

System action

Processing continues.

System programmer response

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

If the checkpoint record identified in the message is used to restart the queue manager, the restart will be unsuccessful because it will not be able to process the unit of recovery presented by the invalid URE.

Look for other messages that indicate the cause of the problem. If you are unable to resolve the problem, contact your IBM® support center.

zm26900_

2.19.41. CSQ1211E: BAD LOG RBA RETURNED

Explanation

One of the three problems listed below exists:

- The recovery log data set is damaged
- You identified a data set that is not a recovery log data set
- There is a problem with the log print utility

Severity

8

System action

Processing terminates, and a dump is produced.

System programmer response

A common error is to specify the first data set on an archive tape (the Bxxxxxxx data set) as a log data set; it is actually a bootstrap data set (BSDS).

Determine if the problem is your error by dumping the data set and determining if it is a log data set.

This topic's URL:

zm26940_

2.19.45. CSQ1215I: NO LOG RECORDS READ

Explanation

CSQ1LOGP read no log records.

Possible explanations are:

- An error has prevented CSQ1LOGP from continuing, therefore no log records have yet been processed (if this is so, an error message should precede this message)
- You specified the active log data sets or archive log data sets out of RBA sequence
- You specified an RBASTART or LRSNSTART value that is greater than any RBA or LRSN in the active and archive data sets available
- You specified a log range using LRSNs, but the queue manager is not in a queue-sharing group.

Severity

0

System action

Processing continues.

2.19.46. CSQ1216E: LOG READ ERROR, RETCODE=*rc*, REASON CODE=*reason*, RBA=*x-rba*

Explanation

An error was encountered while attempting to read the log, indicating that either the log has an error in one of the control intervals (CI), or a data set containing the requested RBA cannot be located. The RBA specification in the message indicates where the error was detected and gives the requested RBA. It will point to:

- The start of the CI if there is a problem with the log control interval definition (LCID), or with any of the general control information within a CI
- The log record in the CI if there is a problem with a log record header (LRH)

If this is the first log record read during this execution of the Log Extractor, and if there is a problem with the LCID, the RBA specification will be all zeros.

Before returning any records, the utility checks the control information (LCID) at the end of a CI, and analyzes the LRH to ensure that all records are properly chained together within the CI. If an error is detected while performing this process, CSQ1LOGP will issue this message, before dumping the entire CI. It will not format individual records within the CI, but will, if possible, continue processing by reading the next CI.

Severity

4

System action

Processing continues.

Problem determination

The reason code identifies the nature of the error. The return code included in the message is explained in [Log services return codes](#), and the reason code is explained in [Codes](#).

Parent topic: [Service facilities messages \(CSQ1...\)](#)

 This build: January 26, 2011 11:44:31

2.19.48. CSQ1218I: *nn* LOG ERROR MESSAGES

Explanation

CSQ1LOGP distinguishes three classes of errors:

- Code problems existing in the MQ or system code used for CSQ1LOGP. In such cases, abnormal termination with a user completion code of U0153 will occur.
- Incorrect invocation of CSQ1LOGP caused, perhaps, by your having used an incorrect keyword or missed a DD statement. Under these circumstances, CSQ1LOGP will issue appropriate error messages, and the program will be terminated.
- An error in a given log CI under the scrutiny of CSQ1LOGP. Such scrutiny is performed before any of the records within the CI are processed. This is an indication of logical damage, and error messages are issued by the utility. The CI or log record in error is printed, and CSQ1LOGP continues to the next CI or log record.

The count *nn* provided summarizes the number (in decimal) of errors CSQ1LOGP detected while accessing the log.

Severity

0

System action

Processing continues.

zm26980_

2.19.49. CSQ1220E: ARCHIVE LOG TRUNCATED AT *xxxx* – INVALID LOG RECORDS READ

Explanation

At a restart of the queue manager, an archive log was truncated. This archive log data set could not be physically altered to reflect this truncation, and invalid log records therefore still exist. CSQ1LOGP has already reported this information in the summary report, and cannot retract it. Nor can it disregard the invalid log information already read in order adequately to summarize what has occurred. Therefore, all information up to this point in the log will be summarized, and a new summary report initiated. Consequently, the same UR might be reported twice with different dispositions and different page sets modified.

Severity

4

System action

Processing continues.

System programmer response

To avoid this condition, use the BSDS DD statement instead of the ARCHIVE DD statement.

2.20.1. CSQ2001I: csect-name OTMA REJECTED MESSAGE – APPLICATION ERROR, SENSE CODE=code, XCFGNAME=gname XCFMNAME=mname TPIPE=tpipename

Explanation

Because of an application error, the MQ-IMS bridge received a negative acknowledgement (NAK) from OTMA when sending a message. The information provided in the message is:

gname

The XCF group to which the partner belongs.

mname

The member name of the partner.

tpipename

The name of the Tpipe used by the partner.

code

The IMS™ sense code returned by the partner (the first four characters are the sense code).

System action

The message is put to the dead-letter queue, and processing continues.

System programmer response

Refer to the *IMS/ESA® Open Transaction Manager Access Guide* for information about the sense code from IMS.

Parent topic: [WebSphere MQ-IMS bridge Messages \(CSQ2...\)](#)

2.20.2. CSQ2002E: *csect-name* OTMA CLIENT BID REJECTED, XCFGNAME=*gname* XCFMNAME=*mname*, SENSE CODE=*code*

Explanation

An OTMA client bid command from the MQ-IMS bridge was rejected. *code* is the associated IMS™ sense code. *gname* and *mname* identify the partner IMS system to which the command was directed.

System action

No connection is made to the IMS system. Connections to other OTMA partners are unaffected.

System programmer response

Refer to the *IMS/ESA® Open Transaction Manager Access Guide* for information about the sense code from IMS.

Parent topic: [WebSphere MQ-IMS bridge Messages \(CSQ2...\)](#)

2.20.3. CSQ2003E: *csect-name* OTMA REJECTED MESSAGE – SYSTEM ERROR, SENSE CODE=*code*, XCFGNAME=*gname* XCFMNAME=*mname* TPIPE=*tpipename*

Explanation

Because of a system-related error, the MQ-IMS bridge received a negative acknowledgement (NAK) from OTMA when sending a message. The information provided in the message is:

gname

The XCF group to which the partner belongs.

mname

The member name of the partner.

tpipename

The name of the Tpipe used by the partner.

code

The IMS™ sense code returned by the partner (the first four characters are the sense code).

System action

If the problem was caused by an environmental error, the IMS bridge returns the message to the queue. Depending on the error described by the sense code, the message send is retried or the queue is closed.

If a severe error occurred, the message is returned to the queue, and the IMS bridge ends abnormally with completion code X'5C6' and reason code X'00F20059'.

System programmer response

Refer to the *IMS/ESA® Open Transaction Manager Access Guide* for information about the sense code from IMS.

Parent topic: [WebSphere MQ-IMS bridge Messages \(CSQ2...\)](#)

2.20.4. CSQ2004E: *csect-name* ERROR USING QUEUE *q-name*, MQRC=*mqrc*

Explanation

The MQ-IMS bridge was unable to open, close, get from, put to, or inquire about a queue.

If *csect-name* is CSQ2QCP0, the problem was with the message queue associated with IMS™ or the reply-to queue. If *csect-name* is CSQ2QCP1, the problem was with the reply-to queue. If *csect-name* is CSQ2PUTD, the problem was with the dead-letter queue.

System action

If the problem was caused by an environmental error, processing continues.

If a severe error occurred, the IMS bridge ends abnormally with completion code X'5C6' and a reason code which shows the particular error.

System programmer response

Refer to [API completion and reason codes](#) for information about *mqrc*.

Parent topic: [WebSphere MQ-IMS bridge Messages \(CSQ2...\)](#)

2.20.5. CSQ2005I: *csect-name* ERROR PROCESSING MESSAGE, FEEDBACK=*code*, XCFGNAME=*gname* XCFMNAME=*mname* TPIPE=*tpipename*

Explanation

The MQ-IMS bridge encountered an error while processing a message. *code* is the associated feedback code that will be set in the messagedescriptor. The information provided in the message is:

gname

The XCF group to which the partner belongs.

mname

The member name of the partner.

tpipename

The name of the Tpipe used by the partner.

code

The IMS™ sense code returned by the partner.

System action

The message is not processed.

System programmer response

code is one of the following:

291 (MQFB_DATA_LENGTH_ZERO)

A segment length field was zero in the application data of the message.

292 (MQFB_DATA_LENGTH_NEGATIVE)

A segment length field was negative in the application data of the message.

293 (MQFB_DATA_LENGTH_TOO_BIG)

A segment length field was too big in the application data of the message.

294 (MQFB_BUFFER_OVERFLOW)

The value of one of the length fields would overflow the MQ message buffer.

295 (MQFB_LENGTH_OFF_BY_ONE)

The length field was one byte too short.

296 (MQFB_IIH_ERROR)

The MQMD specified MQFMT_IMS, but the message does not begin with a valid MQIIH structure.

298 (MQFB_NOT_AUTHORIZED_FOR_IMS)

The user ID specified in the MQMD was denied access.

3xx

IMS sense code xx (where xx is the decimal representation of the IMS sense code). Refer to the *IMS/ESA® Open Transaction Manager Access Guide* for information about the sense code from IMS.

2.20.6. CSQ2006I: *csect-name* DEAD-LETTER QUEUE UNAVAILABLE, MQRC=*mqrc*

Explanation

The MQ-IMS bridge was unable to put a message to the dead-letter queue.

System action

If the message was being sent to IMS™, it will be retained on the local IMS queue, and the queue will be disabled. If the message was coming from IMS, a NAK will be sent to IMS so that IMS will retain it and stop sending messages on the Tpipe.

System programmer response

If *mqrc* is 0, there is no dead-letter queue defined; you are strongly recommended not to use the MQ-IMS bridge unless you have a dead-letter queue defined. Otherwise, there is a problem obtaining the name of the queue from the queue manager; refer to [API completion and reason codes](#) for information about *mqrc*.

2.20.7. CSQ2009I: *csect-name* PREREQUISITE PRODUCTS FOR IMS BRIDGE NOT AVAILABLE

Explanation

The MQ-IMS bridge cannot operate because:

- The version of z/OS® being used is not correct
- The version of IMS™ being used is not correct
- OTMA support has not been enabled on IMS.
- An incorrect version of the system parameter module (CSQZPARM) is being used.

System action

The MQ-IMS bridge does not start.

System programmer response

Refer to the [WebSphere MQ for z/OS Concepts and Planning Guide](#) for information about what product levels are required.

If required, recompile CSQZPARM with the correct libraries.

Parent topic: [WebSphere MQ-IMS bridge Messages \(CSQ2...\)](#)

2.20.14. CSQ2020E: *csect-name* RESYNCHRONIZATION ERROR

Explanation

A resynchronization error has occurred. The information provided by this message is:

```
IN TPIPE tpipename
FOR QUEUE q-name,
BY PARTNER, XCFGNAME=gname XCFMNAME=mname,
QMGR SEND=sendseq PARTNER RECEIVE=otmarecvseq,
QMGR RECEIVE=rcvseq PARTNER SEND=otmasendseq,
INDOUBT UNIT OF RECOVERY urid
```

where:

tpipename

The name of the Tpipe which cannot be resynchronized

q-name

The name of the queue for this Tpipe

gname

The name of the XCF group to which the Tpipe belongs

mname

The name of the XCF member to which the Tpipe belongs

sendseq

The recoverable sequence number of the message last sent by MQ to the partner, in hexadecimal

otmasendseq

The recoverable sequence number of the message last sent by the partner to MQ, in hexadecimal

rcvseq

The recoverable sequence number of the message last received by MQ from the partner, in hexadecimal

otmarecvseq

The recoverable sequence number of the message last received by the partner from MQ, in hexadecimal

urid

The identifier of an in-doubt unit of recovery; a value of 0 means that there is no in-doubt unit of recovery.

System action

No messages are sent on the Tpipe.

System programmer response

Use the RESET TPIPE command to reset recoverable sequence numbers, to restart the Tpipe, and, if required, to resolve the unit of recovery.

2.20.22. CSQ2030I: *csect-name* TPIPE *tpipename* IS STILL OPEN FOR PARTNER, XCFGNAME=*gname* XCFMNAME=*mname*

Explanation

The Tpipe is still open. The information provided by this message is:

tpipename

The name of the Tpipe which is still open.

gname

The XCF group name.

mname

The member name of the partner for the Tpipe.

System action

The command is rejected.

System programmer response

➤ The most likely cause of this message is that the RESET TPIPE command was issued with an incorrect Tpipe name or that the command was issued on the wrong queue manager in a queue-sharing group. ◀ Resubmit the RESET TPIPE command with the correct Tpipe name.

2.21.1. CSQ3001E: *csect-name* – ABNORMAL DISCONNECT FROM SUBSYSTEM INTERFACE

Explanation

An online routine was still supporting SSI calls (IEFSSREQ) even though the queue manager had nearly completed termination or was no longer executing. This occurs with *csect-name* CSQ3RS00 or CSQ3RS0X when the queue manager address space has reached end-of-memory and neither normal termination nor online error recovery routines have successfully completed termination of the queue manager. This occurs with

csect-name CSQ3SSTM when this condition is discovered during online termination.

System action

The connection is terminated. All IEFSSREQ requests are handled by the MQ early processing program until the queue manager is restarted. An SVC dump is requested.

Problem determination

Collect the following items, and contact your IBM® support center:

- System dump
- Printout of SYS1.LOGREC

Parent topic: [Subsystem support messages \(CSQ3...\)](#)

 This build: January 26, 2011 11:44:35

2.21.2. CSQ3002I: INDOUBT RECOVERY BY *connection-name* STILL IN PROGRESS

Explanation

There might be MQ units of recovery (URs), related to an identified subsystem (*connection-name*), still in doubt after restart synchronization has taken place. (Indoubt URs are those for which commit has been voted by MQ but which have not yet been acknowledged by *connection-name*.)

This message might appear if the *connection-name* subsystem has begun to do new work before having resolved all in-doubt URs. The *connection-name* subsystem is still in the process of resolving the in-doubt URs.

System action

Resources held (locked) by these in-doubt URs are unavailable to any other work units until their status is resolved.

System programmer response

The system programmer or system administrator must determine the correct recovery action to resolve the in-doubt situations. This involves either ensure-commit or backout decisions for all in-doubt URs.

The DISPLAY THREAD command should be used to see the URs still in doubt. It will normally show that all in-doubt URs have now been resolved. If not, the RESOLVE INDOUBT command should be used to resolve the in-doubt URs and to release the resources they hold.

Problem determination

This error is probably caused by a cold start after an abnormal termination or by offline alterations of the logs of either MQ or the subsystem.

Parent topic: [Subsystem support messages \(CSQ3...\)](#)

2.21.3. CSQ3004E: SSI DESCRIPTOR GET FAILURE, RC=*rc* REASON=*reason*

Explanation

An internal error has occurred during initialization or termination.

System action

The queue manager terminates.

System programmer response

Ensure that all maintenance has been applied to the WebSphere® MQ program libraries, and then restart the queue manager.

Problem determination

If the problem persists, collect the following items, and contact your IBM® support center:

- Console log
- System dump

Parent topic: [Subsystem support messages \(CSQ3...\)](#)

2.21.6. CSQ3008E: *csect-name* – ABNORMAL DISCONNECT FOR PROGRAM REQUEST HANDLER(S)

Explanation

One or more resource managers are still supporting application program calls through their program request handler, even though the queue manager had almost completed termination, or was no longer executing. This occurs when the queue manager address space has gone to end of memory and neither normal termination nor online error recovery routines have successfully completed termination.

System action

The connection is terminated. All application program support requests are rejected with an indication that the queue manager is not active. An SVC dump is requested.

System programmer response

If the problem persists, collect the following items, and contact your IBM® support center:

- System dump
- Printout of SYS1.LOGREC

Parent topic: [Subsystem support messages \(CSQ3...\)](#)

2.21.7. CSQ3009E: error-info

Explanation

An internal error has occurred in RRS exit processing. The message contains error information that will be needed to resolve the problem.

System action

Processing continues, but RRS coordination is no longer available to the queue manager. It will probably be necessary to restart the queue manager or RRS.

Problem determination

Collect the following diagnostic items and contact your IBM® support center:

- A description of the actions that led to the message, or if applicable, a listing of the application program, or the input string to a utility program, being run at the time
- The error information in the message
- The queue manager job log
- The queue manager active log data set
- Any system dump output associated with the message

Parent topic: [Subsystem support messages \(CSQ3...\)](#)

2.21.8. CSQ3011I: *csect-name* Coordinator RRS is cold-starting and has lost its log. In-doubt MQ threads need manual resolution

Explanation

MQ has participant responsibility for in-doubt threads. RRS, the commit coordinator, has informed the queue manager that it lost all knowledge of MQ in-doubt threads. The in-doubt threads at this queue manager must be manually resolved with the RESOLVE INDOUBT command.

System action

Processing continues.

System programmer response

A list of in-doubt threads where RRS is the coordinator can be displayed using the DISPLAY THREAD command for in-doubt type threads by specifying RRSBATCH as the connection name.

The decision to commit or back out the logical unit of work should be coordinated with any other participant RRS Recoverable Resource Managers. The existence of other participants might not be easy to determine. The information might be available in the RRS recovery log even though information has been lost.

At this queue manager, all in-doubt threads coordinated by RRS must be resolved with the RESOLVE INDOUBT command. Locked data remains unavailable until resolution. Threads that were already resolved with this

command are discarded. Threads not yet resolved are discarded after resolution with the command.

The commit or back out decision provided using the RESOLVE INDOUBT command for a logical unit of work is propagated to all downstream participants, if any.

Parent topic: [Subsystem support messages \(CSQ3...\)](#)

 This build: January 26, 2011 11:44:36

This topic's URL:

zm27430_

2.21.10. CSQ3014I: *csect-name* In-doubt RRS URID=*rrs-urid* is unknown to MQ. URID recorded for MQ by RRS=*mq-urid*

Explanation

The queue manager is restarting with RRS where MQ is a participant and RRS is the coordinator. RRS has a unit of recovery (UR) that the queue manager should be a participant in, but it has no knowledge of the RRS unit of recovery, whose ID is *rrs-urid*. RRS has recorded the MQ URID as *mq-urid*.

System action

Restart with RRS continues.

System programmer response

This message might indicate a problem in MQ or RRS, or it might be produced because of one of the following prior actions:

- A conditional restart was performed that resulted in the loss of part or all of the MQ log. This conditional restart might have happened at any time in the past.

- The RESOLVE INDOUBT command was used to resolve the MQ UR with ID *mq-urid*.

If one of these occurred, the message can be ignored. If neither occurred, there might be a problem in MQ or RRS.

If the *mq-urid* appears to be a valid log RBA, use the log print utility (CSQ1LOGP) with the SUMMARY option and URID options using the *mq-urid* value. If this finds the UR, the disposition will indicate whether it was committed or backed out. If possible, use the RRS ISPF interface to commit or back out the RRS URID so that they match.

If you suspect an error in MQ, collect the items listed in the Problem Determination section and contact your IBM® support center.

Problem determination

Collect the following diagnostic items:

- The queue manager job log
- The queue manager active log data set

Parent topic: [Subsystem support messages \(CSQ3...\)](#)

 This build: January 26, 2011 11:44:36

2.21.11. CSQ3016I: *csect-name* RRS has lost data from its log

Explanation

The queue manager is restarting with RRS and RRS has lost some portion of its log.

System action

Restart with RRS continues.

System programmer response

MQ might not be able to resolve in-doubt units of recovery successfully with RRS because of the loss of RRS log data.

Parent topic: [Subsystem support messages \(CSQ3...\)](#)

 This build: January 26, 2011 11:44:36

This topic's URL:

zm27450_

2.21.12. CSQ3017I: *csect-name* RRS function *call-name* failed, RC=*rc*

Explanation

During queue manager restart, the RRS function specified by *call-name* issued a return code *rc* indicating a failure.

System action

Processing continues, but RRS functions will not be available. For example, connections using the RRS adapter http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm 16/03/2011

will not be allowed, and queue-sharing group facilities will not work.

System programmer response

Investigate the RRS return code from the function specified and resolve the problem. Then restart the queue manager.

2.21.14. CSQ3101E: *csect-name* – INVALID EARLY PROCESSING PARAMETER

Explanation

The z/OS® command SETSSI ADD or the subsystem definition record in the IEFSSNxx member of SYS1.PARMLIB for the MQ subsystem specified the early processing initialization parameter incorrectly. The name must be CSQ3EPX.

The failing subsystem name is provided in message IEF759I, which follows this message.

System action

The MQ subsystem with the indicated name is not available.

Operator response

If you are trying to add an MQ subsystem, reissue the z/OS command SETSSI ADD with the correct parameters. Otherwise, notify the system programmer.

System programmer response

Correct the parameter fields in the record of SYS1.PARMLIB member IEFSSNxx. See the [WebSphere MQ for z/OS System Setup Guide](#) for information about the parameters.

Parent topic: [Subsystem support messages \(CSQ3...\)](#)

2.21.17. CSQ3105E: *csect-name* – UNABLE TO LOAD EARLY PROCESSING PROGRAM 'CSQ3EPX'. *ssnm* IS NOT AVAILABLE

Explanation

Subsystem initialization or early processing refreshing for the MQ subsystem failed because the initialization program (CSQ3INI) could not locate the early processing program (CSQ3EPX).

For subsystem initialization, the program must be either in the linkpack area (LPA) or in a library which is in the link list. For early processing refreshing, the program must be in the LPA.

System action

Subsystem initialization or early processing refreshing ends abnormally. MQ subsystem *ssnm* is not available.

Operator response

Use the z/OS® command SETPROG LPA,ADD,... to load the CSQ3EPX program into the LPA. For subsystem initialization, reissue the z/OS command SETSSI ADD. For early processing refreshing, reissue the REFRESH QMGR TYPE(EARLY) command.

Parent topic: [Subsystem support messages \(CSQ3...\)](#)

2.21.19. CSQ3107E: *csect-name* – COMMAND REJECTED. REQUESTER NOT AUTHORIZED

Explanation

A command was received from a console that does not have the correct authority.

System action

The command is not processed. This message is sent to the console that entered the command.

Operator response

Enter the command from another console that has the correct authority.

System programmer response

Verify that this console should be used for entering MQ commands. If so, authorize it for MQ commands by using z/OS® services.

Note: If MQ security is not activated, this check is still performed. This authorization is the z/OS console authority, and is not related to the external security manager. The console that entered the MQ command must have the SYS, ALL, or MASTER console authority attribute.

2.21.21. CSQ3109E: *csect-name* – UNABLE TO OBTAIN SUBSYSTEM AFFINITY TABLE INDEX FOR SUBSYSTEM *ssnm*. IEFSSREQ RC=*nn*

Explanation

MQ was unable to obtain a subsystem affinity table index for the named subsystem. z/OS® did not recognize the named subsystem name as a known subsystem. If this message is issued, a serious error has occurred in z/OS or MQ.

In the message, *nn* is the return code from the IEFSSREQ z/OS service. *ssnm* is the name of the MQ subsystem undergoing IPL-time initialization.

System action

MQ ends abnormally with completion code X'5C6' and reason code X'00F30104'. The MQ subsystem with the indicated name is not available for this IPL of z/OS.

Operator response

Notify the system programmer.

System programmer response

Try to re-IPL. If the problem persists, see the [WebSphere MQ for z/OS Problem Determination Guide](#) for information about reporting the problem.

Problem determination

A record is written to SYS1.LOGREC. No SVC dump is taken. Return codes from IEFSSREQ are documented in the *MVS™ Authorized Assembler Services Guide* manual.

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

The MQ subsystem with the indicated name is not available.

Operator response

If you are trying to add an MQ subsystem, reissue the z/OS command SETSSI ADD with a correct CPF parameter. Otherwise, notify the system programmer.

System programmer response

Correct the CPF parameter in the record of SYS1.PARMLIB member IEFSSNxx. See the [WebSphere MQ for z/OS System Setup Guide](#) for information about the parameters.

2.21.28. CSQ3116E: *csect-name* – COMMAND PREFIX REGISTRATION FAILED. CPF IS A SUBSET OF A CPF ALREADY DEFINED

Explanation

Command prefix registration failed because the command prefix (CPF) is a subset of a CPF already defined to z/OS®.

System action

The MQ subsystem with the indicated name is not available.

Operator response

If you are trying to add an MQ subsystem, reissue the z/OS command SETSSI ADD with a correct CPF parameter. Otherwise, notify the system programmer.

System programmer response

Correct the CPF parameter in the record of SYS1.PARMLIB member IEFSSNxx. See the [WebSphere MQ for z/OS System Setup Guide](#) for information about the parameters.

Parent topic: [Subsystem support messages \(CSQ3...\)](#)

2.21.29. CSQ3117E: *csect-name* – COMMAND PREFIX REGISTRATION FAILED. CPF IS A SUPERSET OF A CPF ALREADY DEFINED

Explanation

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Command prefix registration failed because the command prefix (CPF) is a superset of a CPF already defined to z/OS®.

System action

The MQ subsystem with the indicated name is not available.

Operator response

If you are trying to add an MQ subsystem, reissue the z/OS command SETSSI ADD with a correct CPF parameter. Otherwise, notify the system programmer.

System programmer response

Correct the CPF parameter in the record of SYS1.PARMLIB member IEFSSNxx. See the [WebSphere MQ for z/OS System Setup Guide](#) for information about the parameters.

2.21.31. CSQ3119E: *csect-name call-name* call for group attach table failed, rc=*rc*

Explanation

During initialization for the group connect facility, a name token services call failed. *rc* is the return code (in hexadecimal) from the call.

System action

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Processing continues, but the group connect facility will not be available to CICS.

System programmer response

See the *MVS™ Authorized Assembler Services Reference* manual for information about the return codes from the name token services call. If you are unable to solve the problem, take a stand-alone system dump and contact your IBM support center.

Parent topic: [Subsystem support messages \(CSQ3...\)](#)

zm27645_

2.21.32. CSQ3201E: ABNORMAL EOT IN PROGRESS FOR USER=*user* CONNECTION-ID=*conn-id* THREAD-XREF=*thread-xref* »JOBNAME=*jobname* ASID=*asid* TCB=*tcb*«

Explanation

»Abnormal termination processing has been started for the agent with the values for the USER, CONNECTION-ID, THREAD-XREF, JOBNAME, ASID, and TCB shown. These values are the last known set of identifiers for the terminating agent.«

»The abnormal termination might be the result of an error in the allied agent address space or the result of the z/OS® command CANCEL issued by the operator.«

»The value for the USER, the THREAD-XREF or both might be blank. The values for the USER, CONNECTION-ID, THREAD-XREF, JOBNAME and ASID are the last values established to WebSphere® MQ for this connection and might represent the current activity of the agent. The TCB value is the address of the TCB that is terminating. Previous WebSphere MQ work by this agent might have completed successfully. «

This message, CSQ3201E, is written to the z/OS console after the agent has been removed from the service task work queue at the time that termination processing begins.

System action

The agent was previously queued to a service task for termination processing. This message indicates that the agent has been taken from the queue for processing. Any uncommitted changes are backed out.

Operator response

Notify your system programmer.

System programmer response

See the Problem Determination section of this message. The z/OS commands CANCEL and FORCE have no effect. Do not cancel WebSphere MQ. If an extensive backout is in progress, the subsequent queue manager restart might take a long time due to additional log activity.

Problem determination

You can detect a deferred termination condition for a task by examining several indicators. Some or all of the following might be present:

- The allied address space might be swapped out and appear to be in a never-ending WAIT condition.
- The z/OS commands CANCEL and FORCE appear to have no effect.

- The allied task holds a z/OS-shared ENQ on resource SYSZCSQ3.ERLYOLRH.*erly-block-address*.
- During abnormal termination of the agent associated with the task in error, the task connection appears on the WebSphere MQ DISPLAY THREAD output with a QD status, prior to this message being written, or with a D status after this message is written and until the thread is resolved. See message CSQV402I for the definitions of these status codes.
- IMS™ transactions running in regions connected to WebSphere MQ might receive this message for non-MQ transactions.

2.21.33. CSQ3580E: CONNECTION FOR '*ssi-call*' GAVE RC=*rc*, REASON=*reason*

Explanation

A nonzero return code has been returned to CSQ3AMI2 from the connect to subsystem interface (SSI) call. The variables in the message indicate which SSI call is involved and the actual return and reason codes associated with it.

System action

The current task is ended abnormally with a system completion code of X'5C6' and a reason code of X'00F30580'. The queue manager terminates.

Operator response

Notify the system programmer.

System programmer response

Restart the queue manager. Note the values contained in the message, and contact your IBM® support center.

This topic's URL:

zm27680_

2.22.2. CSQ5002E: *csect-name* Connection to DB2 using *connect-name* failed, RC=*return-code* reason=*reason*

Explanation

The queue manager's attempt to establish a connection to the named DB2® subsystem failed.

System action

Queue manager startup is terminated.

System programmer response

This is normally an authorization error.

Consult the *DB2 for z/OS® Messages and Codes* manual for an explanation of the codes and attempt to resolve the problem.

Parent topic: [DB2 manager messages \(CSQ5...\)](#)

This topic's URL:

zm27690_

2.22.3. CSQ5003A: *csect-name* Connection to DB2 using *connect-name* pending, no active DB2

Explanation

The queue manager is waiting for an eligible DB2® subsystem to become active so that a connection can be established. Alternatively, RRS is inactive or was started after the DB2 subsystems.

System action

The queue manager waits for an eligible DB2 subsystem to become active.

System programmer response

Check whether the DB2 subsystem(s) are active. If not then start them. If they are active, ensure RRS is active and check that it was started prior to the DB2 subsystems.

Parent topic: [DB2 manager messages \(CSQ5...\)](#)

 This build: January 26, 2011 11:44:38

zm27700_

2.22.4. CSQ5004E: *csect-name* DB2 table entry for queue manager in queue-sharing group *qsg-name* is missing or incorrect

Explanation

During startup the queue manager was unable to find its entry in the DB2® administration tables, or the entry was incorrect.

System action

The queue manager terminates with completion code X'6C6' and reason code X'00F50013'.

System programmer response

Check that a queue manager record exists in the DB2 tables for the DB2 data-sharing group specified. Check the QSGDATA system parameter specifies the correct DB2 data-sharing group. If so, check that a queue manager entry exists in the CSQ.ADMIN_B_QMGR table.

If you are migrating from a previous release of WebSphere® MQ, check also that you have updated the DB2 tables to the format for the current release. See the [WebSphere MQ for z/OS Concepts and Planning Guide](#) and the [WebSphere MQ for z/OS System Setup Guide](#) for information about migration and compatibility between releases.

2.22.5. CSQ5005E: *csect-name* Queue manager release level is incompatible with queue-sharing group

Explanation

The release level of the queue manager that is being started is incompatible with that of other members of the queue-sharing group.

System action

The queue manager terminates with completion code X'6C6' and reason code X'00F50029'.

System programmer response

Verify that the correct load libraries are being used and that the queue-sharing group information in the system parameters has been specified correctly. Also use the queue-sharing group utility (CSQ5PQSG) to verify that the queue manager has been defined correctly in the DB2® administration tables; be sure to use the same version of WebSphere® MQ for the utility as was used for running the queue manager. See the [WebSphere MQ for z/OS Concepts and Planning Guide](#) and the [WebSphere MQ for z/OS System Setup Guide](#) for information about migration and compatibility between releases.

2.22.6. CSQ5006E: *csect-name* Data-sharing groups differ

Explanation

A mismatch has been detected between the DB2® data-sharing group specified on the QSGDATA system parameter and the queue manager entry in the CSQ.ADMIN_B_QMGR table.

System action

The queue manager terminates with completion code X'6C6' and reason code X'00F50006'.

System programmer response

The queue-sharing group name specified on the QSGDATA system parameter must match that in which the queue manager is defined in the DB2 CSQ.ADMIN_B_QMGR table.

Parent topic: [DB2 manager messages \(CSQ5...\)](#)

 This build: January 26, 2011 11:44:39

2.22.7. CSQ5007E: *csect-name* RRSAF function *function* failed for plan *plan-name*, RC=*return-code* reason=*reason* syncpoint code=*sync-code*

Explanation

A non-zero or unexpected return code was returned from an RRSAF request. The DB2® plan involved was *plan-name*.

System action

If the error occurs during queue manager startup or reconnect processing, the queue manager terminates with completion code X'6C6' and reason code X'00F50016'. Otherwise, an error message is issued and processing continues.

System programmer response

Determine the cause of the error using the RRS return and reason code from the message.

Consult the *DB2 for z/OS® Messages and Codes* manual for an explanation of the codes and attempt to resolve the problem.

Parent topic: [DB2 manager messages \(CSQ5...\)](#)

zm27740_

2.22.8. CSQ5008E: *csect-name* DB2 *db2-name* is not a member of data-sharing group *dsg-name*

Explanation

The DB2® subsystem to which the queue manager has connected is not a member of the DB2 data-sharing group specified on the QSGDATA system parameter.

System action

The queue manager terminates with completion code X'6C6' and reason code X'00F50007'.

System programmer response

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Ensure that the DB2 subsystem to which the queue manager has connected is a member of the data-sharing group specified on the QSGDATA system parameter.

Issue the DB2 command DIS GROUP to the DB2 subsystem and check the data-sharing group name matches the data-sharing group name on the QSGDATA system parameter.

2.22.9. CSQ5009E: *csect-name* SQL error for table *table-name*, code=*SQL-code* state=*SQL-state*, data=*d1 d2 d3 d4 d5*

Explanation

A non-zero or unexpected SQL return code was returned from a DB2® SQL request.

System action

The requested operation fails. Processing continues, but the failed request may result in further errors occurring. In some circumstances, the queue manager terminates with completion code X'6C6' and reason code X'00F50014'.

System programmer response

Determine the reason for the SQL error and correct the problem.

Consult the *DB2 for z/OS® Messages and Codes* manual to determine the reason for the SQL error.

Parent topic: [DB2 manager messages \(CSQ5...\)](#)

2.22.16. CSQ5016I: *csect-name* Connection to *db2-name* quiescing, DB2 terminating

Explanation

The queue manager received a STOP QUIESCE termination notification from the DB2® subsystem to which it is connected.

System action

The queue manager will quiesce all DB2 server tasks and disconnect from the DB2 subsystem so that it can shut down. It will then attempt to reconnect. If a DB2 group attach name was specified on the QSGDATA system parameter a connection to a different DB2 may occur.

System programmer response

Restart the DB2 subsystem so that shared queue operations can resume.

Parent topic: [DB2 manager messages \(CSQ5...\)](#)

2.22.17. CSQ5019I: *csect-name* Disconnected from DB2 *db2-name*

Explanation

The queue manager has successfully disconnected from the DB2® subsystem.

System action

If the disconnect is due to a DB2 STOP MODE(QUIESCE) the queue manager will attempt to reconnect to the DB2 subsystem.

System programmer response

None.

Parent topic: [DB2 manager messages \(CSQ5...\)](#)

 This build: January 26, 2011 11:44:40

2.22.18. CSQ5020E: *csect-name* SQL error, table *table-name* not defined in DB2

Explanation

The queue manager attempted to access one of its DB2® tables. DB2 has returned an SQL code indicating the table does not exist.

System action

The request fails and processing continues.

System programmer response

Check that all MQ tasks to set up the DB2 environment completed successfully and that the correct DB2 data-sharing group name was specified on the QSGDATA system parameter.

Parent topic: [DB2 manager messages \(CSQ5...\)](#)

2.22.19. CSQ5021E: *csect-name* SQL error, table *table-name* index not built in DB2

Explanation

The queue manager has attempted to access one of its DB2® tables. DB2 has returned an SQL code indicating that the index for the specified table has not been built.

System action

The request fails and processing continues.

System programmer response

Check that all MQ tasks to set up the DB2 environment completed successfully and that the correct DB2 data-sharing group name was specified on the QSGDATA system parameter.

2.22.21. CSQ5023E: *csect-name* SQL error, > failed to access <table *table-name*

Explanation

An attempt by the queue manager to access one of its tables was returned an SQL code indicating that >access to <the named resource >failed.<

System action

The request fails and processing continues.

System programmer response

➤ This message will be followed by message CSQ5009E which contains full details of the information returned from DB2® which should be used in conjunction with messages on the DB2 log to diagnose the problem. ◀

The most likely cause of this problem is contention for a DB2 resource, especially on a heavily-used system. If so, the problem is temporary; retry the action that gave the error.

If not, and the problem persists, determine from the message and the DB2 log the resource concerned and perform the recovery actions necessary to unlock the resource. Such a problem could be caused by a DB2 failure while updating one of the DB2 tables, which will be indicated in the DB2 log.

2.22.24. CSQ5026E: *csect-name* Unable to access DB2, RRS is not available

Explanation

The queue manager tried to access DB2®, but RRS is not available.

System action

If this occurs during queue manager initialization, the queue manager waits for RRS to become available.

If this occurs at other times, the queue manager terminates its connection to DB2, and then tries to reconnect. Some queue-sharing group functions will not be available until RRS is restarted and the connection to DB2 is reestablished.

System programmer response

Start (or restart) RRS.

2.22.26. CSQ5028E: *csect-name* Unable to access DB2, RRS connection limit exceeded

Explanation

The queue manager tried to access DB2®, but RRS has reached the limit of allowed concurrent connections (IDENTIFYs).

System action

If this occurs during queue manager initialization, the queue manager waits for an RRS connection to become available.

If this occurs at other times, the queue manager terminates its connection to DB2, and then tries to reconnect. Some queue-sharing group functions will not be available until RRS is restarted and the connection to DB2 is reestablished.

System programmer response

Adjust the RRS connection limit if required, then start (or restart) RRS.

zm27930_

2.22.27. CSQ5029E: *csect-name* Operation on DB2 table *table-name* failed

Explanation

An operation requested for the named DB2® table failed. For example, the table may be full, or there may be insufficient storage available to perform the request.

This is most likely to occur when writing data to one of the tables that MQ uses to store large shared messages.

System action

Message CSQ5009E is issued giving details of the associated SQL error codes. The requested operation fails and processing continues. The message or other data is not written to the table.

System programmer response

Investigate the cause of the problem as indicated by the SQL codes in message CSQ5009E.

If the table is one of those used for storing large shared messages, and the problem is due to insufficient storage, retry the operation later, as the condition may be temporary. If the problem is because the table is full, take action to remove some of the messages; for example, start an application that retrieves and processes the messages. Use the MQ DISPLAY GROUP command to check if there are any obsolete messages

in the tablespace, and delete them. If necessary, increase the size of the table.

2.22.34. CSQ5102I: Queue managers in group *group-name*

Explanation

This message is part of the responses to the DISPLAY GROUP command. It provides information about each queue manager in the group, as follows:

```

Name Num Prefix Status Ver DB2 Connection
  name num cpf      qmgr-stat vrm db2-id conn-stat
:
End of queue managers report

```

where:

name

The name of the queue manager.

num

The internally generated number of the queue manager in the group.

cpf

The command prefix of the queue manager.

qmgr-stat

The current status of the queue manager:

ACTIVE

The queue manager is running.

INACTIVE

The queue manager is not running, having terminated normally.

FAILED

The queue manager is not running, having terminated abnormally.

CREATED

The queue manager has been defined to the group, but has not yet been started.

UNKNOWN

The status cannot be determined.

vrn

The function level of the queue manager. The value is a 3-digit number, where:

v

is the version number

r

is the release number

m

is the modification number.

db2-id

The name of the DB2® subsystem or group attachment to which the queue manager connects.

conn-stat

The current status of the connection to DB2:

ACTIVE

The queue manager is running and connected to DB2.

PENDING

The queue manager is running but not connected because DB2 has terminated normally.

FAILED

The queue manager is running but not connected because DB2 has terminated abnormally.

INACTIVE

The queue manager is not running and not connected to DB2.

UNKNOWN

The status cannot be determined.

Exceptionally, the last line might be either:

Report terminated, too many lines

if the report was generated in response to a command from a z/OS® console and more than 253 response lines were generated. Only 253 response lines are returned.

Report terminated

if there was an error in obtaining the information. The error is described in the following messages.

System action

Processing continues normally.

Parent topic: [DB2 manager messages \(CSQ5...\)](#)

2.22.35. CSQ5103I: Obsolete messages in DB2 for group *group-name*

Explanation

Messages are normally deleted automatically from DB2®, but in exceptional circumstances obsolete messages can remain. This identifies such messages, as follows:

```
LEID msg-id
```

```
:
```

End of messages report

where:

msg-id

is the identifier of the message.

Exceptionally, the last line might be either:

Report terminated, too many lines

if the report was generated in response to a command from a z/OS® console and more than 253 response lines were generated. Only 253 response lines are returned.

Report terminated

if there was an error in obtaining the information.

System action

Processing continues normally.

System programmer response

Delete the obsolete messages from DB2. For example, use SPUFI to issue the SQL command

```
DELETE FROM CSQ.ADMIN_B_MESSAGES
WHERE QSGNAME = 'group-name' AND
LEID = 'msg-id';
```

2.23.5. CSQ9004E: 'keyword' parameter specifies range (:) incorrectly

Explanation

A parameter of keyword *keyword* specifies a range of values incorrectly. The character used to denote a range is a colon (:); the format is *lower-limit:upper-limit*.

System action

Processing for the command is terminated.

System programmer response

See the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual to verify that the command you are using allows a range for the given keyword. Correct the error, and reissue the command.

Parent topic: [Generalized command preprocessor messages \(CSQ9...\)](#)

2.23.6. CSQ9005E: 'keyword' parameter does not satisfy generic rules

Explanation

For the keyword *keyword*, parameter values may be generic, but the value specified does not conform to the rules for a generic value. Either:

- The value contains an asterisk (*) which is not the last character.
- The value contains a question mark (?) or colon (:).
- The keyword is WHERE and the value is a single asterisk.

System action

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Processing for the command is terminated.

System programmer response

Verify the command entry, correct the keyword parameter, and reenter the command. See the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual for a description of the keyword and how to enter the command.

Parent topic: [Generalized command preprocessor messages \(CSQ9...\)](#)

This topic's URL:

zm28120_

2.23.7. CSQ9006E: 'keyword' parameter uses asterisk (*) incorrectly

Explanation

For the keyword *keyword*, an asterisk (*) was used in a parameter value. Either:

- The asterisk was not the last or only character in the value. Incorrect examples are NAME(BL*CK) and NAME(*LUE); a correct specification is NAME(BL*) or NAME(*).
- There is a list of parameter values, for example DETAIL(1,*).

System action

Processing for the command is terminated.

System programmer response

See the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual to verify that the command you are using allows specification of '*' for the given keyword. Correct the error, and reissue the command.

Parent topic: [Generalized command preprocessor messages \(CSQ9...\)](#)

2.23.8. CSQ9007E: Either 'keyword1' or 'keyword2' must be specified

Explanation

The command requires that either keyword *keyword1* or keyword *keyword2* is specified, but neither keyword was entered on the command. One of the two keywords must be present in order for the command to be processed.

System action

Processing for the command is terminated.

System programmer response

Reissue the command and include whichever keyword is appropriate. See the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual for descriptions of the two keywords. and for information about the rules for http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsa.doc/zm10120_.htm

building commands.

2.23.11. CSQ9010E: Required parameter for 'keyword' not specified

Explanation

For the keyword *keyword*, either:

- One or more parameters must be specified, but no parameter was entered.
- A fixed number of parameters must be specified, but fewer parameters were entered.

For example, the keyword USERDATA must have a parameter that is a character string. Entering USERDATA() is meaningless; you must either enter a string (for example, USERDATA(MY_DATA)), or if you want to remove this attribute, you must enter USERDATA(' ').

System action

Processing for the command is terminated.

System programmer response

Verify the command entry, supply appropriate parameters for the specified keyword, and reissue the command. See the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual for further information about this command.

This topic's URL:

zm28180_

2.23.13. CSQ9012E: 'keyword' parameter is not hexadecimal

Explanation

Parameter values for the keyword *keyword* must be hexadecimal values. Hexadecimal characters are the numeric digits 0 through 9 and the letters A through F, in either uppercase or lowercase. The value may optionally be specified using the hexadecimal string notation X'hex characters'; for example, *keyword*(123ABC) and *keyword*(X'123ABC') are synonymous.

System action

Processing for the command is terminated.

System programmer response

Verify the command entry, and reissue the command, ensuring that the parameters for the named keyword are hexadecimal values.

2.23.16. CSQ9015E: Parameter '*parameter-value*' is unacceptable for '*keyword*'

Explanation

The parameter value *parameter-value* is not an acceptable value for keyword *keyword*. Either:

- The keyword parameter can be one of a set of character values, but the value specified is not one of them.
- The keyword parameter can be a bounded numeric value, but the value specified is outside the bounds.
- The keyword parameter can be either numeric or one of a set of character values, but the value specified is neither numeric nor one of the set.
- The keyword is WHERE and the first parameter (the filter keyword) is not one of the acceptable keywords for the command.

System action

Processing for the command is terminated.

System programmer response

Verify the command entry, and reissue the command correctly. See the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual for a list of acceptable values, and for information about the rules for building commands.

2.23.17. CSQ9016E: '*cmd*' command request not authorized

Explanation

The command requires a level of authorization that you do not have, either for the command itself, or for the resource that it is operating on.

System action

The command is not executed. Processing is terminated.

Operator response

If the command must be executed on behalf of the user and your installation operating procedures permit it, enter the command on request.

System programmer response

Contact the system programmer responsible for system security, and request that this person grant you authorization to use the command. Otherwise, you must have someone who is authorized issue the command for you.

2.23.18. CSQ9017E: Failure while processing 'cmd' command

Explanation

The command preprocessor ended abnormally while processing the command shown in the message. The error is recorded in SYS1.LOGREC, and an SVC dump is requested. The command might have partially completed. Look at any previous response messages to determine what has been done.

System action

Processing for the command is terminated.

System programmer response

Verify the command entry, and reissue the command. If it fails again, collect the items listed in the Problem Determination section, and contact your IBM® support center.

Problem determination

Collect the following diagnostic items:

- A description of the action(s) that led to the error, or if applicable, a listing of the application program, or the input string to a utility program, being run at the time of the error
- Queue manager job log
- System dump resulting from the error
- The WebSphere® MQ, z/OS®, DB2®, CICS®, and IMS™ service levels

2.23.19. CSQ9018E: *csect-name* Insufficient storage to process 'cmd' command

Explanation

The command preprocessor was unable to obtain sufficient storage to complete processing of any response messages generated by the command.

System action

Processing for the command is terminated abnormally.

Operator response

Notify the system programmer before attempting to reissue the command.

System programmer response

If the problem persists, you might need to increase the region size used by your queue manager or channel initiator, or you might need to reduce the number of jobs running in your system.

Problem determination

The invoked command had completed processing and returned to the command preprocessor when an attempt was made to obtain storage from the address space from which the command was entered. Because sufficient storage was unavailable, no response messages from the invoked command are available.

This topic's URL:

zm28290_

2.23.24. CSQ9025E: '*parameter-value*' is unacceptable with 'WHERE' parameter '*filter-keyword*'

Explanation

The parameter values for the WHERE keyword are incompatible. The WHERE keyword must have three parameters, *filter-keyword*, *operator*, and *filter-value*. The error is one of the following:

- The operator parameter is not appropriate for the type of parameter values that the filter keyword requires. For example, the filter keyword requires one of a set of parameter values, but the operator is not EQ or NE.
- The filter value parameter exceeds the length limit for parameter values of the filter keyword.
- The filter value parameter is not a value that is valid as a value of the filter keyword. For example:
 - The filter keyword requires a numeric parameter value but the filter value parameter is not numeric.
 - The filter keyword requires one of a set of parameter values but the filter value parameter is not one of them.
 - The filter keyword requires a bounded numeric parameter value but the filter value parameter is outside the bounds.
 - The filter keyword requires an object or system name, but the filter value parameter does not consist only of characters that are valid for such a name.

Depending on the error, *parameter-value* may be the operator parameter or the filter value parameter.

System action

Processing for the command is terminated.

System programmer response

Verify the command entry, and reissue the command correctly. See the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual for information about the parameters for the WHERE keyword.

This topic's URL:

zm28300_

2.23.25. CSQ9026E: '*keyword*' parameter does not satisfy name rules

Explanation

Parameter values for the keyword *keyword* are names, and therefore must consist only of characters that are

valid for the particular type of name, object name or system name. The valid object name characters are uppercase A-Z, lowercase a-z, numerics 0-9, period (.), forward slash (/), underscore (_), and percent sign (%). The valid system name characters are uppercase A-Z, and numerics 0-9; the first character must not be numeric.

This message is issued if the name specified contains invalid characters, or if the name is all blank in cases where an all-blank name is not allowed.

System action

Processing for the command is terminated.

System programmer response

Verify the command entry, and reissue the command ensuring that the parameters for the named keyword are of the required type. See the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual for a description of the keyword and how to enter the command.

2.23.31. CSQ9033E: Command exceeds allowable length

Explanation

The command is so large that its internal form has exceeded the maximum length allowed. The size of the internal form of the command is affected by both the length, and the complexity of the command. (For example, an attempt has been made to use the operations and control panels to create a namelist containing too many names.)

This message could also be caused by commands entered through one of the following:

- the initialization input data sets
- the COMMAND function of the utility program CSQUTIL
- a user-written program that puts commands onto the system-command input queue, SYSTEM.COMMAND.INPUT

Severity

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

8

System action

Processing of the command is terminated.

System programmer response

If you are using the operations and control panels to define a namelist, use the edit facility to reduce the number of names in the list. If you are entering a command from elsewhere, determine which command caused the error, and verify the syntax of that command from the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual. Correct the command.

2.23.34. CSQ9036E: Command with 'keyword(parameter-value)' not allowed when queue manager is active

Explanation

The command has the specified parameter value for keyword *keyword*. The command with this keyword and value can be issued only when the queue manager is not active.

Severity

8

System action

The command is ignored.

System programmer response

See the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual for information about how to use the command.

Parent topic: [Generalized command preprocessor messages \(CSQ9...\)](#)

2.23.36. CSQ9038E: Command must be issued from console

Explanation

An attempt was made to issue a command from other than the z/OS® console or its equivalent. The command can only be issued in that way.

Severity

8

System action

The command is ignored.

System programmer response

Issue the command from the z/OS console; it cannot be issued from elsewhere.

See the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual for information about how to use the command.

2.23.41. CSQ9045E: '*keyword*' has parameter(s) and is a 'WHERE' parameter

Explanation

The command specifies the WHERE keyword with a filter keyword parameter *keyword*. That keyword is also specified explicitly with with parameters, which is not allowed.

System action

Processing for the command is terminated.

System programmer response

Verify the command entry, and reissue the command correctly. See the [WebSphere MQ Script \(MQSC\) Command Reference](#) manual for information about the parameters for the WHERE keyword.

This topic's URL:

zm28560_

3.3.1. 00C20001

Explanation

The CSQBSRV program has detected a request for a nonexistent function. CSQBSRV is invoked from batch and RRS-batch applications via a stub such as CSQBSTUB, CSQBRSI, or CSQBRSTB.

System action

The application program ends abnormally, but MQ continues processing.

System programmer response

The most likely cause of this problem is incompatible versions of CSQBSRV and the stub. If this is not the cause of the problem, obtain the diagnostic items listed below, and contact your IBM® support center.

- Application program listing
- Queue manager job log
- PSW and registers at point of failure

Parent topic: [Batch adapter codes \(X'C2'\)](#)

This topic's URL:

zm28570_

3.3.2. 00C20009

Explanation

The task which started an asynchronous MQ thread (for asynchronous message consumption or asynchronous event listening) has ended before the asynchronous thread which it started had ended. This abend is raised on the asynchronous MQ thread, because processing cannot continue after the resources allocated by the original thread have been released.

System action

The application program ends abnormally, but MQ continues processing.

System programmer response

Ensure that an MQDISC is called for all connections which are used to start asynchronous threads before termination of the task which created the connection.

3.4.1. 00C5004F

Explanation

This reason code is issued in message CSQM090E when a command has failed. It indicates that a request has been issued for a CF structure, but the request cannot be performed, as explained in the accompanying more specific message.

Severity

4

System action

The command is ignored.

System programmer response

Refer to the description of the accompanying message.

Parent topic: [Coupling Facility codes \(X'C5'\)](#)

Explanation

An internal error has occurred.

System action

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager may terminate with completion code X'6C6'.

System programmer response

Collect the items listed in [Coupling facility problem determination](#) and contact your IBM® support center.

Restart the queue manager if necessary.

3.4.10. 00C510AB

Explanation

The CF structure has failed or connection to it has been lost.

System action

This may be issued in response to a command, in which case processing of the command is terminated. Otherwise, the current execution unit terminates with completion code X'5C6'. In some cases, the queue manager may terminate with completion code X'6C6'.

System programmer response

Restart the queue manager if necessary. Recover the structure; if the error occurred in response to a command, reissue it.

Explanation

An internal error has occurred.

System action

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager may terminate with completion code X'6C6'.

System programmer response

Collect the items listed in [Coupling facility problem determination](#) and contact your IBM® support center.

Restart the queue manager if necessary.

This topic's URL:

zm28850_

3.4.29. 00C53001

Explanation

The queue manager has detected a mismatch between the queue-sharing group creation timestamp in the DB2® tables and the creation timestamp associated with the structure name in message CSQE029E.

System action

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

System programmer response

Verify the queue manager, queue-sharing group and data-sharing group configuration and determine whether a queue manager has configured to connect to a different DB2 data-sharing group.

If the queue manager and queue-sharing group configuration is correct then the structure should be deallocated. Having verified that there are only failed-persistent connections remaining to the structure, deallocate it with the z/OS® command

```
SETXCF FORCE, STRUCTURE, STRNAME=ext-struct-name
```

(In thi command, *ext-struct-name* is formed by prefixing the MQ structure name from message CSQE029E with the queue-sharing group name.)

3.4.30. Coupling facility problem determination

Collect the following diagnostic items:

- A description of the action(s) that led to the error (including any command that was being issued), or if applicable, a listing of the application program, or the input string to a utility program, being run at the time of the error
- Console output for the period leading up to the error
- Queue manager job log
- System dump resulting from the error
- CICS® transaction dump output, if using CICS
- The WebSphere® MQ, z/OS®, DB2®, CICS, and IMS™ service levels
- ISPF panel name, if using the MQ Operations and Control panels
- A dump of the coupling facility structure

3.5.1. 00C60001

Explanation

MQ received return code X'20' when issuing a WTO request to display a console message. This means that there are no message buffers for either Multiple Console Support (MCS) or JES3, or there is a JES3 WTO staging area excess. The WTO request is terminated. The current console message and all subsequent informational console messages are ignored until the problem is corrected.

System action

A record is written to SYS1.LOGREC. A retry is requested and execution continues. MQ resumes issuing console messages when the condition is corrected.

3.7.1. 00C80001

Explanation

An attempt to obtain storage for the security manager was unsuccessful.

Note: This could indicate a system-wide storage problem.

System action

The queue manager is terminated, and a dump is produced. Register 2 contains the return code from the storage failure.

System programmer response

Check that you are running with the recommended region size, and if not, reset your system and restart the queue manager. If this is not the cause of the problem, use these items to diagnose the cause of the problem:

- Queue manager job log
- Information about any other storage-related problems
- System dump resulting from the error

3.7.5. 00C8000A

Explanation

A severe error has occurred during a SAF RACROUTE REQUEST=STAT call to the external security manager (ESM) during security switch processing at queue manager initialization time.

System action

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

System programmer response

See your ESM documentation for information about any return codes that appear in the job log. Check your security configuration (for example, that the required classes are installed and active). If you are unable to resolve the problem, collect the items listed in [Security manager problem determination](#) and contact your IBM® support center.

3.7.8. 00C8000D

Explanation

An unexpected return code has been received from one of the following SAF calls to the external security manager (ESM) during security switch processing at queue manager initialization time:

- RACROUTE REQUEST=EXTRACT

- RACROUTE REQUEST=LIST
- RACROUTE REQUEST=STAT

System action

Message CSQH004I is produced containing the return codes from SAF and the ESM. The queue manager is terminated, and a dump is produced. Register 2 contains the address of the return codes.

System programmer response

See your ESM documentation for information about the return codes that appear in message CSQH004I (in the job log) or the dump. See the [WebSphere MQ for z/OS System Setup Guide](#) for information about setting MQ security switches. If you are unable to resolve the problem, collect the items listed in [Security manager problem determination](#) and contact your IBM® support center.

3.7.27. 00C80036

Explanation

A severe error has occurred during a SAF RACROUTE REQUEST=EXTRACT call to the external security manager (ESM) during security switch processing for a REFRESH SECURITY command.

System action

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the address of the entity being checked at the time of the error.

System programmer response

See your ESM documentation for information about any return codes that appear in the job log. See the [WebSphere MQ for z/OS System Setup Guide](#) for information about setting MQ security switches. If you are unable to resolve the problem, collect the items listed in [Security manager problem determination](#) and contact your IBM® support center.

3.7.29. 00C80038

Explanation

An unexpected return code has been received from one of the following SAF calls to the external security manager (ESM) during the processing of a REFRESH SECURITY command.

- RACROUTE REQUEST=LIST (create)
- RACROUTE REQUEST=LIST (delete)
- RACROUTE REQUEST=EXTRACT
- RACROUTE REQUEST=STAT

System action

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the address of the return codes from SAF, and the ESM.

Note: If the error occurred on a STAT call, the error is preceded by a CSQH004I message containing the return codes from SAF, and the ESM.

System programmer response

See your ESM documentation for information about the return codes from SAF and the ESM. See the [WebSphere MQ for z/OS System Setup Guide](#) for information about setting MQ security switches. If you are unable to resolve the problem, collect the items listed in [Security manager problem determination](#) and contact your IBM® support center.

3.7.30. 00C80039

Explanation

An attempt to obtain a storage subpool for a security manager user entry block was unsuccessful. This could have occurred during either security timeout processing, or REFRESH SECURITY command processing.

Note: This could indicate a system-wide storage problem.

System action

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the return code from the storage failure.

System programmer response

Use the items listed in [Security manager problem determination](#), together with information about any other storage-related problems, to diagnose the cause of the problem. If you are unable to resolve the problem, contact your IBM® support center.

3.7.31. 00C80040

Explanation

A severe error has occurred during security timeout processing. An unexpected return code has been received from the MQ timer component.

Note: This could indicate a system-wide problem with the timer component, or the system timer.

System action

Messages CSQH009I and CSQH010I are issued. The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the return code from the timer component that caused the problem.

System programmer response

Use the items listed in [Security manager problem determination](#), together with information about any other timer-related problems, to diagnose the cause of the problem. If you are unable to resolve the problem, contact your IBM® support center.

3.7.56. 00C80075

Explanation

An internal loop count was exceeded during security switch processing at queue manager initialization time.

System action

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

System programmer response

Collect the items listed in [Security manager problem determination](#) and contact your IBM® support center.

Restart the queue manager.

3.7.57. 00C80080

Explanation

A severe error has occurred during a SAF RACROUTE REQUEST=STAT call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

System action

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

System programmer response

See your ESM documentation for information about any return codes that appear in the job log. Check your security configuration (for example, that the required classes are installed and active). If you are unable to resolve the problem, collect the items listed in [Security manager problem determination](#) and contact your IBM® support center.

Explanation

An unexpected return code has been received from one of the following SAF calls to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

- RACROUTE REQUEST=EXTRACT
- RACROUTE REQUEST=LIST
- RACROUTE REQUEST=STAT

System action

Message CSQH004I is produced containing the return codes from SAF and the ESM. The queue manager is terminated, and a dump is produced. Register 2 contains the address of the return codes.

System programmer response

See your ESM documentation for information about the return codes that appear in message CSQH004I (in the job log) or the dump. See the [WebSphere MQ for z/OS System Setup Guide](#) for information about setting MQ security switches. If you are unable to resolve the problem, collect the items listed in [Security manager problem determination](#) and contact your IBM® support center.

3.7.83. Security manager problem determination

Collect the following diagnostic items:

- A description of the action(s) that led to the error, or if applicable, a listing of the application program, or the input string to a utility program, being run at the time of the error

- Console output for the period leading up to the error
- Queue manager job log
- The MQ active log data set
- System dump resulting from the error
- CICS® transaction dump output, if using CICS
- The WebSphere® MQ, z/OS®, DB2®, CICS, and IMS™ service levels
- The SECURITY command issued ►before◀ the error

This topic's URL:

zm30030_

3.8.17. 00C90D00

Explanation

A page set that was originally page set n is being presented as being a different page set, probably because the started task JCL procedure for the queue manager has been changed. Register 0 contains the identifier of the page set in error, and register 2 contains the identifier it was previously associated with.

System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

System programmer response

Check the started task JCL procedure for the queue manager, and undo any changes to the CSQPnnnn DD statements that specify the page sets. Restart the queue manager. If the problem persists, or no changes have been made to these statements, collect the items listed in [Data manager problem determination](#) and contact your IBM® support center.

Parent topic: [Data manager codes \(X'C9'\)](#)

 This build: January 26, 2011 11:44:57

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

 Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

zm30040_

3.8.18. 00C90D01

Explanation

Your data set is not recognized as an MQ page set. This may be for one of the following reasons.▶

- The data set has not been formatted
- You are attempting to start the queue manager with an older version of MQ and the backward migration PTF for that release is not installed
- You are attempting to start the queue manager with an older version of MQ, but the queue manager had been running with OPMODE=NEWFUNC at the higher release, and fallback to an earlier release is not possible

Register 0 contains the identifier of the page set in error.

System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

System programmer response

► Investigate the reason code and take one of the following actions:

- format the page set
- install appropriate backward migration PTFs
- start the queue manager with the correct level of code

Parent topic: [Data manager codes \(X'C9'\)](#)

This build: January 26, 2011 11:44:57

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

zm30050_

3.8.19. 00C90D02

Explanation

This reason code is caused by one of the following:

- An attempt to use a page set that is a valid MQ page set, but does not belong to this queue manager
- An attempt to change the subsystem name

Neither of these actions is allowed.

Register 0 contains the identifier of the page set in error.

System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

System programmer response

If you were attempting to use a page set from another queue manager, correct the error. Do not attempt to change the name of your queue manager.

Parent topic: [Data manager codes \(X'C9'\)](#)

This build: January 26, 2011 11:44:57

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

3.8.20. 00C90D03

Explanation

An internal error has occurred during processing of an MQGET call with the Mark Skip Backout option.

System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

System programmer response

Collect the items listed in [Data manager problem determination](#) and contact your IBM® support center.

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Parent topic: [Data manager codes \(X'C9'\)](#) This build: January 26, 2011 11:44:57[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#) Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

zm30070_

3.8.21. 00C90D04

Explanation

During restart, the queue manager detected that a page set has been truncated. This is probably because the data set allocated during restoration of a backup was smaller than required to hold the backed up data, and so the data has been truncated. It may also occur if page set 0 is larger than the maximum supported page set size.

System action

The identifier of the page set in error is put in register 0. Restart is terminated.

System programmer response

Reallocate the data set correctly, restore the backed up data if necessary, and restart the queue manager.

Parent topic: [Data manager codes \(X'C9'\)](#) This build: January 26, 2011 11:44:57[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#) Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

zm30160_

3.8.31. 00C91400

Explanation

The data manager was unable to access the header page (page 0) of one of the page sets.

System action

The current execution unit terminates with completion code X'5C6', and a dump is produced. The number of the page set whose header page was unreadable is held in register 2.

System programmer response

1. Check for a preceding IEC161I or CSQP011E message relating to page set mentioned in register 2.
2. Check the following:
 - For the page set mentioned in register 2, is the appropriate CSQPnnnn DD statement present in the started task JCL procedure for the queue manager, xxxxMSTR?
 - Does this DD statement reference a genuine data set? DD DUMMY statements are not allowed for page sets.
 - Is DEFINE PSID(nn) present in the CSQINP1 initialization input data set?
3. If you are still unable to resolve the problem, collect the items listed in [Data manager problem determination](#) and contact your IBM® support center.

3.8.32. 00C91500

Explanation

During queue manager startup, the data manager was following a chain of objects on disk, and requested the next data page in the chain from the buffer manager. However, the buffer manager could not supply this page.

System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

System programmer response

Collect the items listed in [Data manager problem determination](#) and contact your IBM® support center.

zm30340_

3.8.49. 00C93500

Explanation

MQ was extending a page set at startup, based on log records from earlier dynamic page set extend operations. (MQ does this so that any media recovery operation will have the required number of pages available in the page set.)

The page set could not be extended to the required RBA value.

The contents of the relevant registers are as follows:

R0

The number of the page set that could no longer be extended

R2

The logged page number that MQ was trying to extend to

R3

The high page number at restart. This is the base from which MQ was extending.

System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

System programmer response

Create a larger page set, using multiple disk volumes if required, with a larger secondary extent value. The high page number of the page set should at least match that shown in register 2 in the dump.

Parent topic: [Data manager codes \(X'C9'\)](#)

 This build: January 26, 2011 11:44:59

zm30460_

3.8.61. 00C94503

Explanation

A page set that has been the subject of the RESETPAGE function had not previously been through a clean shutdown of the queue manager. Using this page set for subsequent MQ processing would lead to data integrity problems.

System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

System programmer response

Check the page sets that are defined to the queue manager. One or more of the page sets has been the subject of a RESETPAGE operation. Do not run the RESETPAGE operation against page sets that are either of the following:

- Fuzzy page set backups
- From a queue manager that has terminated abnormally

If you are unable to solve the problem, collect the items listed in [Data manager problem determination](#) and contact your IBM® support center.

Parent topic: [Data manager codes \(X'C9'\)](#)

 This build: January 26, 2011 11:45:00

This topic's URL:

zm30470_

3.8.62. 00C94505

Explanation

An internal error has occurred.

An attempt to restart with a log from another queue manager was detected. The queue-sharing group name recorded in the log during checkpoint does not match the name of the queue-sharing group in the queue manager using that log. If the correct log is being used, you can perform the change only after a clean

shutdown of the queue manager, that is, after a quiesce.

Message CSQI060E is issued before this error occurs.

System action

Restart is terminated abnormally with completion code X'5C6' and a dump is produced.

System programmer response

Restart the queue manager using the correct logs and BSDS, or change the QSGDATA system parameter. Note that you cannot change the name of the queue-sharing group that a queue manager uses unless it has been shut down normally.

The following registers in the dump contain helpful values:

- R0 = the queue-sharing group name recorded in the log
- R2 = the queue-sharing group name in the running queue manager

Parent topic: [Data manager codes \(X'C9'\)](#)

This topic's URL:

zm30480_

3.8.63. 00C94506

Explanation

An internal error has occurred.

An attempt to restart with a log from another queue manager was detected. The shared queue manager identifier recorded in the log during checkpoint does not match the shared queue manager identifier in the queue manager using that log. If the correct log is being used, the entry in the DB2® CSQ.ADMIN_B_QMGR table for this queue manager has been corrupted.

Message CSQI061E is issued before this error occurs.

System action

Restart is terminated abnormally with completion code X'5C6' and a dump is produced.

System programmer response

Restart the queue manager using the correct logs and BSDS. If the correct logs are being used, correct the entry for the queue manager in the DB2 CSQ.ADMIN_B_QMGR table. If you cannot resolve the problem, contact your IBM® support center for assistance.

The following registers in the dump contain helpful values:

- R0 = the queue manager identifier recorded in the log
- R2 = the queue manager identifier in the running queue manager

3.8.64. 00C94507

Explanation

An internal error has occurred during processing of Mark Skip Backout.

System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

System programmer response

Collect the items listed in [Data manager problem determination](#) and contact your IBM® support center.

Parent topic: [Data manager codes \(X'C9'\)](#)

 This build: January 26, 2011 11:45:00

This topic's URL:

zm30500_

3.8.65. 00C94510

Explanation

A request was made to a Coupling Facility resource manager service within MQ. The Coupling Facility resource manager service returned an unexpected return code.

System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

System programmer response

Collect the items listed in [Data manager problem determination](#) and contact your IBM® support center.

Parent topic: [Data manager codes \(X'C9'\)](#)

 This build: January 26, 2011 11:45:00

This topic's URL:

zm30510_

3.8.66. 00C94511

Explanation

An attempt to obtain storage for the data manager's use was unsuccessful. This indicates there could be a wider-ranging problem relating to storage availability.

System action

The queue manager is terminated and a dump is produced.

System programmer response

Check that you are running with the recommended region size, and if not, reset your system and restart the queue manager. If this is not the cause, use these items to diagnose the cause of the problem:

- Queue manager job log
- Information about any other storage-related problems
- System dump resulting from the error

Parent topic: [Data manager codes \(X'C9'\)](#)

This topic's URL:

zm30540_

3.8.69. 00C9451A

Explanation

A request was made to a DB2® resource manager service within MQ during restart. The DB2 resource manager service returned an unexpected return code related to a locked table condition.

System action

The queue manager terminates with completion code X'5C6', and a dump is produced.

System programmer response

Restart the queue manager. If you started several queue managers at the same time, try restarting them one at a time to alleviate this condition.

If the problem persists, collect the items listed in [Data manager problem determination](#) and contact your IBM® support center.

Parent topic: [Data manager codes \(X'C9'\)](#)

3.9.1. 00D10010

Explanation

The end log range value specified on an invocation of the log print utility (CSQ1LOGP) is less than or equal to the start range value.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

Correct the log range input control parameters specified in the invocation of the log print utility.

For more information about log services, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

Parent topic: [Recovery log manager codes \(X'D1'\)](#)

 This build: January 26, 2011 11:45:01

 Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

zm30590_

3.9.2. 00D10011

Explanation

An invocation of the log print utility (CSQ1LOGP) was unable to obtain the storage required to perform the request.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

It is probable that the REGION parameter on the EXEC statement of the job control language (JCL) for this invocation is too small. Increase the REGION size, and resubmit the log print request.

For more information about log services, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

Parent topic: [Recovery log manager codes \(X'D1'\)](#)

This topic's URL:

zm30600_

3.9.3. 00D10012

Explanation

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because the job control language (JCL) for this invocation did not specify either the use of the bootstrap data set (BSDS) or, in the absence of the BSDS, the active or archive log data sets.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

Correct the JCL and resubmit the log print request.

For more information about log services, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

Parent topic: [Recovery log manager codes \(X'D1'\)](#)

 This build: January 26, 2011 11:45:01

16/03/2011

zm30610_

3.9.4. 00D10013

Explanation

An invocation of the log print utility (CSQ1LOGP) resulted in a VSAM error while attempting to open the bootstrap data set (BSDS).

This reason code, and the VSAM return code are issued with message CSQ1221E.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

Refer to the *DFSMS/MVS Macro Instructions for Data Sets* to determine the meaning of the VSAM OPEN error. Take appropriate action, and resubmit the log print request.

For more information about log services, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

Parent topic: [Recovery log manager codes \(X'D1'\)](#)

 This build: January 26, 2011 11:45:01

This topic's URL:

zm30620_

3.9.5. 00D10014

Explanation

The job control language (JCL) for an invocation of the log print utility (CSQ1LOGP) specified the use of the bootstrap data set (BSDS), but the utility control statements did not specify values for RBASTART and RBAEND.

The RBASTART and RBAEND values must be specified when using the BSDS, although they are not required when using the active or archive logs.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

Either:

- Continue to use the BSDS, but change the utility control statements to specify values for RBASTART and RBAEND
- Change the JCL to use the active and archive data sets instead

For more information about log services, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

Parent topic: [Recovery log manager codes \(X'D1'\)](#)

16/03/2011

This topic's URL:

zm30630_

3.9.6. 00D10015

Explanation

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because the record format of the bootstrap data set is incompatible with this release of the log print services.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

Ensure that the correct release of the log print services are used with the appropriate BSDS record format.

For more information about log services, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

Parent topic: [Recovery log manager codes \(X'D1'\)](#)

 This build: January 26, 2011 11:45:01

This topic's URL:

zm30640_

3.9.7. 00D10019

Explanation

An invocation of the log print utility (CSQ1LOGP) resulted in a VSAM error while attempting to open the bootstrap data set (BSDS). The error was determined to be one which could be corrected by use of a VSAM access method services (AMS) VERIFY call, but the VERIFY call was also unsuccessful.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

Collect the following items, and contact your IBM® support center:

- A copy of the user's job control language (JCL) that was used to invoke the log print utility (CSQ1LOGP)
- The log data sets that the user was attempting to print

For more information about log services, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

This topic's URL:

zm30650_

3.9.8. 00D10020

Explanation

The log print utility (CSQ1LOGP) issued this message because the end of data has been reached (that is, the end of the log, or the end of the user-specified data sets, or the user-specified RBAEND value has been reached).

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

This is not an error. This reason code denotes a normal end of data condition. No action is necessary.

For more information about log services, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

Parent topic: [Recovery log manager codes \(X'D1'\)](#)

 Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

zm30660_

3.9.9. 00D10021

Explanation

An invocation of the log print utility (CSQ1LOGP) encountered a gap in the log RBA range when switching log data sets. This indicates that log records might be missing.

Normally, a continuous set of log records is supplied as input by the ACTIVE and ARCHIVE DDnames (or the BSDS DDname if you are using the bootstrap data set (BSDS) to access the log data sets) in the job control language (JCL) used to invoke the utility. If a log data set was removed from the JCL, this condition will arise.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

If the log data set was not removed intentionally, check the JCL to ensure that the log data sets are specified in ascending RBA value order. If you are using the BSDS to access the log data sets, use the print log map utility (CSQJU004) to examine the RBA ranges as recorded in the BSDS, and note any RBA gaps that might have resulted from the deletion of an active or archive log data set.

If it appears that a log error might have occurred, see the [WebSphere MQ for z/OS System Administration Guide](#) for information about dealing with problems on the log.

Parent topic: [Recovery log manager codes \(X'D1'\)](#)

 This build: January 26, 2011 11:45:01

This topic's URL:

zm30670_

3.9.10. 00D10022

Explanation

An invocation of the log print utility (CSQ1LOGP) encountered a gap in the log RBA range when switching log data sets. This indicates that log records might be missing. The log RBA of the next record following the gap is greater than the RBAEND value specified in the utility control statements.

Normally, a continuous set of log records is supplied as input by the ACTIVE and ARCHIVE DDnames (or the BSDS DDname if using the bootstrap data set (BSDS) to access the log data sets) in the job control language (JCL) used to invoke the utility. If a log data set was removed from the JCL, this condition will arise.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

Check the JCL and the RBAEND value specified in the utility control statements.

If a log data set was not removed intentionally, check that the log data sets are specified in ascending RBA value order. If using the BSDS to access log data sets, use the print log map utility (CSQJU004) to examine the RBA ranges as recorded in the BSDS, and note any RBA gaps that might have resulted from the deletion of an active or archive log data set.

If it appears that a log error might have occurred, see the [WebSphere MQ for z/OS System Administration Guide](#) for information about dealing with problems on the log.

This topic's URL:

zm30680_

3.9.11. 00D10024

Explanation

An invocation of the log print utility (CSQ1LOGP) encountered a log RBA sequence error. The RBA of the previous log record is greater than the RBA of the current log record.

Normally, a continuous set of log records is supplied as input by the ACTIVE and ARCHIVE DDnames (or the BSDS DDname if using the bootstrap data set (BSDS) to access the log data sets) in the job control language (JCL) used to invoke the utility. If a log data set appears out of sequence, this condition will arise.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

Check the JCL to ensure that the log data sets are specified in ascending RBA value order. If using the BSDS to access the log data sets, use the print log map utility (CSQJU004) to examine the RBA ranges associated with each archive and active log data set. If both archive and active log data sets are used, the first archive log data set must contain the lowest log RBA value. If necessary, adjust the concatenation of the archive and active log data sets in the JCL to ensure that log records are read in ascending RBA sequence, and resubmit the log print request.

If it appears that a log error might have occurred, see the [WebSphere MQ for z/OS System Administration Guide](#) for information about dealing with problems on the log.

Parent topic: [Recovery log manager codes \(X'D1'\)](#)

3.9.12. 00D10025

Explanation

An invocation of the log print utility (CSQ1LOGP) resulted in a VSAM GET error while attempting to read the active log data set.

This reason code, and the VSAM return and reason codes are issued in message CSQ1221E.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

Refer to the *DFSMS/MVS Macro Instructions for Data Sets* to determine the meaning of the VSAM GET error and the RPL error code. Take appropriate action to correct the error, and resubmit the log print request.

For more information about log services, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

Parent topic: [Recovery log manager codes \(X'D1'\)](#)

This topic's URL:

zm30700_

3.9.13. 00D10026

Explanation

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because an RBA value within the range specified by RBASTART and RBAEND could not be located on a log data set.

This reason code, and the RBA value that could not be located are issued with message CSQ1216E

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

Check the utility control statements to ensure that the RBASTART and RBAEND values have not exceeded the lower or upper bounds of the RBAs available on all the active or archive log data sets defined by DDnames in the JCL.

If you are using the BSDS to access the log data sets, use the print log map utility (CSQJU004) to examine the RBA ranges associated with each archive and active log data set.

Correct the JCL and utility control statements as necessary, and resubmit the log print request.

For more information about log services, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because an RBA value has been requested in an active log data set that has previously not been opened. A VSAM OPEN error occurred while attempting to open the active log data set. The VSAM OPEN error was determined to be one that could be corrected, however, a system error occurred while executing a z/OS® TESTCB macro to determine whether the active log data set in question was a VSAM ESDS (entry-sequenced data set) or a VSAM LDS (linear data set).

This reason code, and the VSAM return and reason codes are issued in message CSQ1221E.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

Refer to the *DFSMS/MVS Macro Instructions for Data Sets* manual to determine the meaning of the VSAM OPEN error and the ACB error code. Take appropriate action to correct the error, and resubmit the log print request.

If the problem persists, collect the following items, and contact your IBM® support center:

- A copy of the job control language (JCL) used to invoke the log print utility (CSQ1LOGP)
- The log data sets that the user was attempting to print

For more information about log services, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

This topic's URL:

zm30740_

3.9.17. 00D1002C

Explanation

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because an RBA value has been requested in a active log data set that has previously not been opened. A VSAM OPEN error occurred while attempting to open the active log data set. The VSAM OPEN error was determined to be one which could be corrected by use of a VSAM access method services (AMS) VERIFY call, but the VERIFY call was unsuccessful.

This reason code, and the VSAM return and reason codes are issued with message CSQ1221E.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

Refer to the *DFSMS/MVS Macro Instructions for Data Sets* manual to determine the meaning of the VSAM OPEN error and the ACB error code. Take appropriate action to correct the error, and resubmit the log print request.

For more information about log services, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

3.9.18. 00D1002D

Explanation

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because an RBA value has been requested in an active log data set that has previously not been opened. A VSAM OPEN error occurred while attempting to open the active log data set. The VSAM OPEN error was corrected by use of a VSAM access method services (AMS) VERIFY call, but a subsequent attempt to reposition the VSAM pointer back to the beginning of the active log data set (using the VSAM AMS POINT call) was unsuccessful.

This reason code and the VSAM return and reason codes are issued with message CSQ1221E.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

Refer to the *DFSMS/MVS Macro Instructions for Data Sets* manual to determine the meaning of the VSAM OPEN error and the ACB error code. Take the appropriate action to correct the error, and resubmit the print log request.

For more information about log services, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

This topic's URL:

zm30770_

3.9.20. 00D10031

Explanation

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because an RBA value has been requested in a log data set that has previously not been opened. The job control language (JCL) has specified that the bootstrap data set (BSDS) be used as the guide to determine which data sets are required. An attempt to allocate the appropriate data set dynamically (using z/OS® SVC 99) was unsuccessful.

This reason code, and the dynamic allocation information and error codes (S99INFO and S99ERROR) are issued with message CSQ1222E.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

Refer to the *MVS™ Authorized Assembler Services Guide* manual to determine the meaning of the SVC 99 information and error codes. Take the appropriate action to correct the error, and resubmit the log print request.

For more information about log services, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

Parent topic: [Recovery log manager codes \(X'D1'\)](#)

 This build: January 26, 2011 11:45:02

This topic's URL:

zm30780_

3.9.21. 00D10040

Explanation

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because an RBA value has been requested in an archive log data set (on tape) that has previously not been opened. An attempt was made to open the second file on the archive log tape (the first file normally contains the bootstrap data set) but this was unsuccessful because the archive log data set was not the second file on the archive log tape. The read job file control block (RDJFCB) macro was then invoked to attempt to change the data set sequence number from the default value of 2 to a value of 1, before attempting to open the second file again, but the macro invocation resulted in an error.

This reason code, and the RDJFCB return code are issued in message CSQ1223E.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

System programmer response

Refer to the *MVS/ESA DFP System Programming Reference* manual to determine the meaning of the RDJFCB error code. Take the appropriate action to correct the error, and resubmit the log print request.

For more information about log services, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

Parent topic: [Recovery log manager codes \(X'D1'\)](#)

This topic's URL:

zm30820_

3.9.25. 00D10061

Explanation

An invocation of the log print utility (CSQ1LOGP) succeeded, but an unexpected physical record length was encountered for the log record control interval (CI) for an active or archive log data set.

The data on the log data set might have been corrupted after it was written by MQ. The data in the log data set might still be usable, but with caution.

The length of a log CI in an active log data set is expected to be 4089 bytes. The length of a log CI in an archive log data set is expected to be 4096 bytes.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set. The log print request has completed. This reason code is issued as a warning.

System programmer response

Ensure that the ACTIVE and ARCHIVE DDnames in the job control language (JCL) refer to active and archive logs correctly.

If the problem persists, collect the following items, and contact your IBM® support center:

- A copy of the job control language (JCL) used to invoke the log print utility (CSQ1LOGP)
- The log data set that the user was trying to print

For more information about log services, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

This topic's URL:

zm30830_

3.9.26. 00D10062

Explanation

An invocation of the log print utility (CSQ1LOGP) succeeded, but the first log record segment could not be found for a middle spanned log record segment.

System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set. The log print request has completed. This reason code is issued as a warning.

System programmer response

Several possibilities exist for the cause of this condition:

- The recovery log manager component of MQ did not originally construct the log record header (LRH) properly
- The LRH for the log record segment was damaged after it was written by MQ
- The application program continued to process after being informed about a gap in the log RBA values (reason code X'00D10021')

Determine if the LRH of the log record segment is truly in error by looking at the record segments directly preceding and after the record segment in question.

Take the appropriate action to correct the error, and resubmit the log print request. If the problem persists, collect the following items, and contact your IBM® support center:

- A copy of the job control language (JCL) used to invoke the log print utility (CSQ1LOGP)
- The log data set that the user was attempting to print

For more information about log services, refer to the [WebSphere MQ for z/OS System Administration Guide](#).

This topic's URL:

zm44480_

3.9.29. 00D10250

Explanation

An unrecoverable error occurred while updating either the BSDS or the z/OS® catalog to reflect changes in active log data sets.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The queue manager then terminates abnormally.

System programmer response

Obtain the SYS1.LOGREC and SVC dump. Correct the error, and restart the queue manager.

You might find the items listed in [Recovery log manager problem determination](#) useful in resolving the problem. In addition, see the description of reason code X'00D10252' for details of the information recorded in the variable recording area (VRA) of the system diagnostic work area (SDWA).

Examine the console log for a CSQJxxxx message preceding this error to determine whether the error was a BSDS error or a z/OS catalog update error. If you cannot resolve the problem, contact your support center.

Parent topic: [Recovery log manager codes \(X'D1'\)](#)

This topic's URL:

zm30860_

3.9.30. 00D10251

Explanation

An unrecoverable error occurred in the log buffer writer.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The queue manager then terminates abnormally.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. This error is usually caused by a previous error that was recorded on SYS1.LOGREC and produced an SVC dump. The SYS1.LOGREC entries and SVC dump should be examined to determine the primary error that occurred.

You might find the items listed in [Recovery log manager problem determination](#) useful in resolving the problem. In addition, see the description of reason code X'00D10252' for details of the information recorded in the variable recording area (VRA) of the system diagnostic work area (SDWA).

If you cannot resolve the problem, contact your support center.

This topic's URL:

zm30900_

3.9.34. 00D10261

Explanation

While scanning the records and record segments in a log control interval (CI), it was discovered that the forward record chain was broken. This condition is the result of an incorrect record length in the log record header of some record in the log CI.

System action

This reason code can be issued by an active queue manager as the log buffers are scanned before they are written to the active log, or by the MQ log services GET processor as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active queue manager, a diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by CSQJOFF1, the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'
- If the error was detected by CSQJR005, message CSQJ012E is issued and the calling agent is terminated
- If the error was detected by CSQJW009, message CSQJ012E is issued and the queue manager is terminated
- If the error was detected by CSQJW107, the queue manager is terminated

If this reason code is issued as the result of MQ log services GET processing, no error is issued and no information is written to the SYS1.LOGREC data set.

System programmer response

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

zm30940_

3.9.38. 00D10265

Explanation

While scanning the records and record segments in a log control interval (CI), it was discovered that the backward record chain was broken. This condition is the result of an incorrect record length in the log record header of some record in the log CI.

System action

This reason code can be issued by an active queue manager as the log buffers are scanned before they are written to the active log, or by the MQ log services GET processor as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active queue manager, a diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by CSQJOFF1, the archiving of the active log data set is terminated
- If the error was detected by CSQJR005, message CSQJ012E is issued and the calling agent is terminated
- If the error was detected by CSQJW009, message CSQJ012E is issued and the queue manager is terminated
- If the error was detected by CSQJW107, the queue manager is terminated

If this reason code is issued as the result of MQ log services GET processing, no error is issued, and no information is written to SYS1.LOGREC data set.

System programmer response

For information about dealing with problems on the log, see the [WebSphere MQ for z/OS System Administration Guide](#).

You might find the items listed in [Recovery log manager problem determination](#) useful in resolving the problem. If you are unable to solve the problem, contact your IBM® support center.

zm30950_

3.9.39. 00D10266

Explanation

While scanning a log control interval (CI), a unit of recovery ID or LINK RBA in some record was found to be inconsistent with the beginning log RBA of the CI.

System action

This reason code can be issued by an active queue manager as the log buffers are scanned before they are written to the active log, or by the MQ log services GET processor as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active queue manager, a diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by CSQJOFF1, the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'
- If the error was detected by CSQJR005, message CSQJ012E is issued and the calling agent is terminated
- If the error was detected by CSQJW009, message CSQJ012E is issued and the queue manager is terminated
- If the error was detected by CSQJW107, the queue manager is terminated

If this reason code is issued as the result of MQ log services GET processing, no error is issued, and no information is written to SYS1.LOGREC data set.

System programmer response

For information about dealing with problems on the log, see the [WebSphere MQ for z/OS System Administration Guide](#).

You might find the items listed in [Recovery log manager problem determination](#) useful in resolving the problem. If you are unable to solve the problem, contact your IBM® support center.

This topic's URL:

zm30960_

3.9.40. 00D10267

Explanation

While scanning a log control interval (CI), a middle or last spanned record segment was not the first segment contained in the log CI.

System action

This reason code can be issued by an active queue manager because the log buffers are scanned before they are written to the active log, or by the MQ log services GET processor because a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active queue manager, a diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by CSQJOFF1, the archiving of the active log data set is terminated and the

faulty active log data set is marked 'stopped'

- If the error was detected by CSQJR005, message CSQJ012E is issued and the calling agent is terminated
- If the error was detected by CSQJW009, message CSQJ012E is issued and the queue manager is terminated
- If the error was detected by CSQJW107, the queue manager is terminated

If this reason code is issued as the result of MQ log services GET processing, no error is issued, and no information is written to the SYS1.LOGREC data set.

System programmer response

For information about dealing with problems on the log, see the [WebSphere MQ for z/OS System Administration Guide](#).

3.9.42. 00D10269

Explanation

An unrecoverable error was found in one of the buffers, while moving the current log buffer to the static write buffer in preparation for the physical write to the active log.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The queue manager then terminates.

System programmer response

For information about dealing with problems on the log, see the [WebSphere MQ for z/OS System Administration Guide](#).

You might find the items listed in [Recovery log manager problem determination](#) useful in resolving the problem. If you are unable to solve the problem, contact your IBM® support center.

This topic's URL:

zm30990_

3.9.43. 00D10327

Explanation

A LOG READ completed unsuccessfully because of an invalid log LOGRBA. A log read, MODE(DIRECT) with a requested RBA does not match the start of a log record.

System action

An SVC dump is requested and the execution unit ends abnormally. If the log read error occurs during queue manager startup then the queue manager ends abnormally.

System programmer response

Log read with MODE(DIRECT) is most commonly used in the queue manager for verifying that the start RBA of a unit of work can be found on the log, before a sequential (maybe backward) read of the log data to recover locks on an in-doubt unit of work, or to back out a unit of work. It indicates that the queue manager is being started with incomplete log data available.

If you suspect an error in WebSphere MQ, collect the following data and contact IBM support:

- The BSDS
- All active and archive logs
- The SVC dump created by this error

3.9.61. Recovery log manager problem determination

Collect the following diagnostic items:

- Console output

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

- System dump resulting from the error, if any
- The WebSphere® MQ, z/OS®, DB2®, CICS®, and IMS™ service levels
- Printout of SYS1.LOGREC, if the reason code is issued by an active queue manager
- A CSQ1LOGP detail report containing the log records associated with the problem, if the reason code is issued by an active queue manager
- Contents of the BSDS; obtain a listing by running the Print Log Map utility (CSQJU004)
- The recovery log manager standard diagnostic information, provided in the SYS1.LOGREC variable recording area (VRA) of the system diagnostic work area (SDWA) for many of the reason codes:

MODID

Name of module issuing the error

LEVEL

Change level

COMPONENT

Subcomponent identifier of recovery log manager

REGISTERS

General purpose registers (GPRs) 0 through 15 at time of abend.

3.10.2. 00D301F2

Explanation

An attempt to obtain storage was unsuccessful. This is probably because there is insufficient storage in your region.

System action

The current execution unit terminates with completion code X'5C6'.

System programmer response

Check that you are running in a region that is large enough. If not, reset your system and restart the queue manager. If this is not the cause of the problem, collect the items listed in [Lock manager problem determination](#) and contact your IBM® support center.

Parent topic: [Lock manager codes \(X'D3'\)](#)

3.11.22. 00D4003B

Explanation

An internal error has occurred.

System action

The current execution unit terminates with completion code X'5C6'.

System programmer response

Collect the items listed in [Message manager problem determination](#). Also collect details of the queue-sharing group (QSG) and of the queue managers active, as well as the queue managers defined to the QSG at the time of the error. This information can be obtained by entering the following z/OS® commands:

```
D XCF,GRP
```

to display a list of all QSGs in the Coupling Facility.

```
D XCF,GRP,qsg-name,ALL
```

to display status about the queue managers defined to QSG qsg-name. Contact your IBM® support center.

3.11.49. 00D40090

Explanation

An error has occurred during an MQPUT1 to the SYSTEM.DURABLE.SUBSCRIBER.QUEUE during start up and initialisation. This can occur for example:

- If you do not have a SYSTEM.DURABLE.SUBSCRIBER.QUEUE defined.

- The datasets used at startup that contain the definitions for your storage classes and objects are concatenated in the incorrect order. The dataset containing the storage class definitions must come before the object definitions that use them.

System action

The queue manager will terminate with completion code X'6C6'. The failing reason code from the MQPUT1 will be in register 2 of the dump.

System programmer response

Identify the error, correct the problem and Restart the queue manager.

Parent topic: [Message manager codes \(X'D4'\)](#)

This topic's URL:

zm31680_

3.11.52. 00D44001

Explanation

This reason code is issued in message CSQM090E when a command has failed. This code indicates that an object of the specified name exists, but is of a different subtype; it might not necessarily have the same disposition in the queue-sharing group. This can only occur with subtypes of queues or channels. Message CSQM099I is also issued, indicating the object in error.

Severity

8

System action

The command is ignored.

System programmer response

Reissue the command, ensuring that all object subtypes are correct.

Parent topic: [Message manager codes \(X'D4'\)](#)

This topic's URL:

zm31690_

3.11.53. 00D44002

Explanation

This reason code is issued in message CSQM090E when a command has failed. This code indicates that the object specified on the request could not be located. Message CSQM094I or message CSQM125I is also issued, indicating the object in error.

It is also issued in message CSQM086E, indicating that the queue manager object could not be located.

Severity

8

System action

For CSQM090E, the command is ignored. For CSQM086E, the queue manager fails to restart.

System programmer response

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

If you are using a queue-sharing group, check that DB2® is available and not suspended. Define the object in question. For the queue manager, reissue the START QMGR command to restart the queue manager.

Note: An object of the same name and type, but of a different disposition, might already exist. If you are dealing with a queue or channel object, an object of the same name, but of a different subtype, might already exist.

3.11.54. 00D44003

Explanation

This reason code is issued in message CSQM090E when a command has failed. This code indicates that the object specified on the request already exists. This will only arise when trying to define a new object. Message CSQM095I is also issued.

Severity

8

System action

The command is ignored.

System programmer response

Use the object in question.

Parent topic: [Message manager codes \(X'D4'\)](#)

3.11.55. 00D44004

Explanation

This reason code is issued in message CSQM090E when a command has failed. This code indicates that one or more of the keywords on the command failed the parameter validation rules that apply to them. One or more other more specific messages are also issued, indicating the reason for the validation failure.

Severity

8

System action

The command is ignored.

System programmer response

Refer to the more specific associated message to determine what the error is.

Parent topic: [Message manager codes \(X'D4'\)](#)

3.11.56. 00D44005

Explanation

This reason code is issued in message CSQM090E when a command has failed. This code indicates that either:

- The object specified on the request is currently open. This usually happens when an object is in use through the API or a trigger message is being written to it, but it could also arise because the object specified is in the process of being deleted. For a local queue, it can occur because there are messages currently on the queue. Message CSQM101I or CSQM115I is also issued.
- A request has been issued for a local queue, but this queue has incomplete units of recovery outstanding for it. Message CSQM110I is also issued.
- A alter, delete, or define request was made against a storage class that is in use (that is, there is a queue defined as using the storage class, and there are messages currently on the queue. Message CSQM101I is also issued.

Severity

8

System action

The command is ignored.

System programmer response

Refer to the description of message CSQM101I, CSQM110I, or CSQM115I as appropriate.

3.11.57. 00D44006

Explanation

This reason code is issued in message CSQM090E when a command has failed. This code indicates that a request has been issued to delete a local queue. The PURGE option has not been specified, but there are messages on the queue. Message CSQM103I is also issued.

Severity

8

System action

The command is ignored.

System programmer response

If the local queue must be deleted, even though there are messages on it, reissue the command with the PURGE option.

3.11.60. 00D44009

Explanation

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM112E or message CSQM117E indicating the object in error. It is also issued in message CSQM086E during queue manager restart.

This code indicates that a request has been issued for an object, but the object information could not be accessed because of an error on page set zero.

Severity

8

System action

The command is ignored or the queue manager fails to restart.

System programmer response

Check for error messages on the console log that might relate to the problem. Verify that page set zero is set up correctly; refer to the [WebSphere MQ for z/OS System Administration Guide](#) for information about this.

3.11.62. 00D4400B

Explanation

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM114E. This code indicates that a request has been issued for a local queue, but no more local queues could be defined. There is an implementation limit of 524,287 for the total number of local queues that can exist. For shared queues, there is a limit of 512 queues in a single coupling facility structure, and 512 structures altogether.

Severity

4

System action

The command is ignored.

System programmer response

Delete any existing queues that are no longer required.

Parent topic: [Message manager codes \(X'D4'\)](#)

3.12.1. 00D50101

Explanation

During initialization, the command server was unable to obtain storage. This is probably because there is insufficient storage in your region.

System action

Message CSQN104I is sent to the console containing this reason code and the return code from the internal storage macro. None of the commands in the initialization data set currently being processed are performed. Queue manager startup continues.

Note: If there is a storage problem, startup might not be successful.

System programmer response

Check that you are running in a region that is large enough, and if not, reset your system and restart the queue manager. If this is not the cause of the problem, collect the following items and contact your IBM® support center:

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

- Return and reason codes from CSQN104I message
- Trace of startup (if available)

3.12.2. 00D50102

Explanation

The command preprocessor ended abnormally while processing a command in the initialization input data set.

System action

Message CSQ9029E is produced, followed by message CSQN103I with this code as the return code, and a reason code of -1 indicating that the command was not processed, and a dump is produced. The next command is processed.

System programmer response

Look in the output data set to determine the command in error. Check that the command is correctly formed, that it applies to a valid object.

If the command is correct, collect the items listed in [Command server problem determination](#) and contact your IBM® support center.

3.12.3. 00D50103

Explanation

During initialization, an internal error occurred.

System action

Message CSQN104I is sent to the z/OS® console, indicating the return and reason codes from the internal macro. The command server stops, without processing any commands.

System programmer response

Review the job log for messages about other errors that might be related. If you are unable to solve the problem, collect the items listed in [Command server problem determination](#), and contact your IBM® support center.

This topic's URL:

zm32160_

3.13.2. 00D70102

Explanation

The name of the queue manager being restarted does not match the name recorded in a prior checkpoint log record.

System action

The queue manager is terminated, an entry is written to SYS1.LOGREC, and a dump is produced. This is preceded by message CSQP006I. Register 0 contains the name found in the log record. Register 2 contains the name of the queue manager being restarted.

System programmer response

Change the started task JCL procedure xxxxMSTR for the queue manager to name the appropriate bootstrap and log data sets.

The print log utility, CSQ1LOGP, can be used to view checkpoint records. You might also find the MQ active log data set useful for problem determination.

Restart the queue manager.

Collect the items listed in [Buffer manager problem determination](#) and contact your IBM® support center.

Parent topic: [Buffer manager codes \(X'D7'\)](#) This build: January 26, 2011 11:45:13[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#) Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

zm32280_

3.13.14. 00D70118

Explanation

A page was about to be written to a page set, but was found to have improper format. The executing thread is terminated. (If this is the deferred write processor, the queue manager is terminated)

System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

System programmer response

Restart the queue manager. If the problem persists collect the items listed in [Buffer manager problem determination](#) and contact your IBM® support center.

Parent topic: [Buffer manager codes \(X'D7'\)](#) This build: January 26, 2011 11:45:13[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#) Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

zm32290_

3.13.15. 00D70120

Explanation

No buffers are available to steal. An executing thread needed a buffer in a buffer pool to bring a page in from the page set. The buffer pool is overcommitted, and despite attempts to make more buffers available, including writing pages to the page set, no buffers could be released.

System action

The current execution unit terminates with completion code X'5C6'. The API request is terminated with reason code MQRC_UNEXPECTED_ERROR, with the aim of reducing demand for the buffer pool.

System programmer response

Determine the problem buffer pool from preceding CSQP019I and CSQP020E messages. Review the size of the buffer pool with the DISPLAY USAGE command. Consider increasing the size of the buffer pool using the ALTER BUFFPOOL command.

Parent topic: [Buffer manager codes \(X'D7'\)](#) This build: January 26, 2011 11:45:13[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#) Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

zm32300_

3.13.16. 00D70122

Explanation

An unrecoverable error has occurred during check point.

System action

The queue manager is terminated, an entry is written to SYS1.LOGREC, and a dump is produced. Register 0 contains the reason code for the error.

System programmer response

Restart the queue manager.

Note the completion code and the reason code, collect the MQ active log data set, and contact your IBM® support center.

3.13.20. Buffer manager problem determination

Collect the following diagnostic items:

- A description of the action(s) that led to the error, or if applicable, a listing of the application program, or the input string to a utility program, being run at the time of the error
- Console output for the period leading up to the error
- Queue manager job log
- The MQ active log data set
- System dump resulting from the error
- CICS® transaction dump output, if using CICS
- The WebSphere® MQ, z/OS®, DB2®, CICS, and IMS™ service levels

This topic's URL:

zm32360_

3.14.1. 00D90000

Explanation

A recovery manager module received control from its FRR for retry and found an invalid retry point identifier. The name of the module in which the error occurred appears in the SYS1.LOGREC entry showing this reason code in register 15.

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

System action

Standard diagnostic information is provided. The error is recorded in SYS1.LOGREC, an SVC dump is scheduled, and queue manager termination is requested. The termination reason code reflects the function for which retry was unsuccessfully attempted.

System programmer response

This is a secondary error. Obtain a copy of SYS1.LOGREC and the SVC dump for this error and for the original problem that resulted in the retry attempt. Examine the SYS1.LOGREC information and the dumps from both the original and the secondary error to determine if the recovery parameter area was damaged or if retry incorrectly restored registers for the mainline module.

Restart the queue manager.

Parent topic: [Recovery manager codes \(X'D9'\)](#)

This topic's URL:

zm32370_

3.14.2. 00D90002

Explanation

The recovery manager startup notification routine received an error return code from the recovery log manager when attempting to read a recovery manager status table (RMST) record from the bootstrap data set (BSDS) in one of the following cases:

- When reading the record containing the RMST header. The first copy was successfully read, but the second copy could not be found.
- When reading records containing the RMST entries. A *no record found* condition was encountered before all entries were read.
- When reading either a header record or an entry record. The record exceeded its expected length.

This is an MQ error.

System action

The recovery manager has no functional recovery routine (FRR) in place when this error occurs. It relies on its invoker, the facility startup function, to perform SYS1.LOGREC recording and to request a dump. The queue manager terminates with a X'00E80100' reason code.

System programmer response

The queue manager determined that the BSDS that it was reading has been corrupted. If you are running in a dual BSDS environment, determine which BSDS is corrupt, and follow the procedures described in the [WebSphere MQ for z/OS System Administration Guide](#) to recover it from the valid BSDS.

If you are running in a single BSDS environment, refer to the [WebSphere MQ for z/OS System Administration Guide](#), which describes the procedures needed to recover your BSDS from an archived BSDS.

This topic's URL:

zm32430_

3.14.8. 00D92021

Explanation

System action

The restart processing will end abnormally, which will terminate the queue manager. This is to prevent the loss or incorrect processing of an MQ unit of recovery.

System programmer response

Do not attempt to restart the queue manager until the error is resolved.

The log has become corrupted. If you are running with dual logging, try to start the queue manager from the undamaged log.

If you are unable to do achieve this, use the following procedure (you will lose all updates since your last backup):

1. Clear the logs
2. Run the RESETPAGE function of the CSQUTIL utility against your last good set of backups
3. Restart the queue manager

See the [WebSphere MQ for z/OS System Administration Guide](#) for information about restarting the queue manager from one log when using dual logging, and using the CSQUTIL utility. If you are unable to resolve the problem, contact your IBM® support center.

This topic's URL:

zm32460_

3.14.11. 00D93011

Explanation

A subcomponent of MQ invoked commit when the agent state was invalid for commit-UR invocation. Commit-UR was requested for an agent that was modifying data. Either commit-UR or backout-UR was already in process, or the recovery structure (URE) was damaged.

System action

Abnormal termination of the agent results, including backing out (backout-UR) of its activity to the previous point of consistency. This releases all locks held by the agent for its resources.

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled. Additional information, identified in the SDWA variable recording area (VRA) by reason code X'00D9CCCC', is added to the VRA.

If the agent was in a 'must-complete' state (in-commit2 or in-backout), the queue manager is also terminated with reason code X'00D93001'. When the queue manager is next restarted, recoverable activity for this agent (such as an ensure-backout or ensure-commit UR) is handled to complete the commit or backout process.

System programmer response

This is an MQ error. Examine the SYS1.LOGREC data and the dump to establish whether either commit-UR was invoked incorrectly or the control structure that reflects the state was damaged.

Parent topic: [Recovery manager codes \(X'D9'\)](#)

 Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

zm32510_

3.14.16. 00D94012

Explanation

During backout, the end of the log was read before all the expected log ranges had been processed. The error is accompanied by an abnormal termination with reason code X'00D94001'.

This could be because the queue manager has been started with a system parameter load module that specifies OFFLOAD=NO rather than OFFLOAD=YES.

System action

The agent is abnormally terminated with completion code X'5C6'. Because the agent is in a must-complete state, the queue manager is terminated with reason code X'00D94001' and message CSQV086E.

Standard diagnostic information is recorded in SYS1.LOGREC. and an SVC dump is requested.

System programmer response

See the information about recovering and restarting the queue manager in the [WebSphere MQ for z/OS System Administration Guide](#) before restarting.

Run the print log map utility to print the content of both BSDSs. Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. At the time of the error, registers 3 and 4 contain the 6-byte relative byte address (RBA) of the beginning of this unit of recovery. MQ must read the log back to this point to complete the backout of this unit of recovery.

To restart the queue manager, you must add the missing archive log data sets back to the BSDS with the change log inventory utility, and increase the MAXARCH parameter in the CSQ6LOGP macro (the system parameter module log initialization macro) to complete the backout.

If the missing archive log is not available, or if archiving was not active, the queue manager can not be restarted unless the log data sets and page sets are all reinitialized or restored from backup copies. Data will be lost as a result of this recovery action.

3.14.18. 00D95011

Explanation

The recovery manager checkpoint FRR invoked queue manager termination, because an unrecoverable error was detected while performing its checkpoint functions.

This is a queue manager termination reason code.

System action

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

System programmer response

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error and follow the instructions associated with it.

Restart the queue manager.

Parent topic: [Recovery manager codes \(X'D9'\)](#)

This topic's URL:

zm32560_

3.14.21. 00D96021

Explanation

The queue manager was terminated during restart because an error occurred while attempting to read the log forward MODE(DIRECT). It is accompanied by a recovery log manager error X'5C6' with a reason code describing the specific error.

Each time a portion of the log is skipped, a 'read direct' is used to validate the beginning RBA of the portion that is read.

This is a queue manager termination reason code.

System action

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

System programmer response

Run the print log map utility to print the contents of both BSDSs. Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. Follow instructions for the accompanying recovery log manager error. If possible, remove the cause of original error and restart the queue manager. If you cannot correct the error, contact your IBM® support center.

3.14.22. 00D96022

Explanation

The restart FRR invoked abnormal termination, because, while reading the log forward during restart, the end-

of-log was read before all recovery log scopes had been processed. It is followed by an abnormal termination with the same reason code (X'00D96022').

This is a queue manager termination reason code.

System action

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the error before queue manager termination is initiated.

System programmer response

Run the print log map utility to print the contents of both BSDSs. Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. At the time of the error, registers 2 and 3 (as shown in the dump or in SYS1.LOGREC) contain the 6-byte relative byte address (RBA) of the last log record that was read before end-of-log was encountered. Follow instructions for the accompanying recovery log manager error. If you cannot correct the error, contact your IBM® support center.

This topic's URL:

zm32740_

3.14.39. 00D99104

Explanation

Queue manager restart detected that backward migration of messages was required. For backward migration to be possible, there must be no uncommitted units of recovery present at the end of restart. During restart, however, a decision was made not to force commit a detected indoubt unit of work. The decision is based on the response to message CSQR021D, or by the presence of a service parm which prevents the CSQR021D WTOR from being issued.

System action

Queue manager restart is terminated.

System programmer response

Either restart the queue manager with a higher level of code so that backward migration is not required, or, allow indoubt units of work to be force committed during restart.

3.15.1. 00E20001, 00E20002

Explanation

An internal error has occurred.

System action

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

System programmer response

Collect the items listed in [Storage manager problem determination](#) and contact your IBM® support center.

Parent topic: [Storage manager codes \(X'E2'\)](#)

 This build: January 26, 2011 11:45:15

3.15.2. 00E20003

Explanation

A request for storage indicated that sufficient storage in the private area was not available.

System action

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

System programmer response

Increase region size.

If you are unable to solve the problem by increasing the region size, collect the items listed in [Storage manager problem determination](#) and contact your IBM® support center.

Parent topic: [Storage manager codes \(X'E2'\)](#)

3.15.8. 00E2000D, 00E2000E

Explanation

An internal error has occurred.

System action

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

System programmer response

The most likely cause of the problem is a storage overlay or an invalid storage request from a queue manager component. A product other than MQ could cause the storage overlay problem.

Collect the items listed in [Storage manager problem determination](#) and contact your IBM® support center.

Parent topic: [Storage manager codes \(X'E2'\)](#)

This topic's URL:

zm33100_

3.16.2. 00E30002

Explanation

This reason code was issued because an attempt to call the z/OS® macro STIMERM was unsuccessful. The return code from STIMERM is in register 9.

System programmer response

Analyze the system dump, correct the problem from the information contained in the dump, and restart the queue manager.

For information about the STIMERM macro, see the *MVS™ Programming: Assembler Services Reference* manual.

This topic's URL:

zm33280_

3.17.17. 00E50054

Explanation

The queue manager is ended abnormally by the synchronization services recovery routine when an unrecoverable error is encountered during recovery processing for the SUSPEND, CANCEL, RESUME, or SRB REDISPATCH functions. This is a queue manager termination reason code.

One of the following conditions was encountered during recovery processing for the requested function:

- Unable to complete resume processing for an SRB mode execution unit that was suspended at time of error
- Errors were encountered during primary recovery processing causing entry to the secondary recovery routine
- Recovery initiated retry to mainline suspend/resume code caused retry recursion entry into the functional recovery routine
- Unable to obtain or release the cross-memory lock (CML) of the queue manager address space either during mainline processing or during functional recovery processing (for example, reason code X'00E50052')

System action

The queue manager is terminated. This reason code is associated with a X'6C6' completion code indicating that synchronization services was responsible for termination.

System programmer response

Restart the queue manager.

Scan the system log and the contents of SYS1.LOGREC for MQ errors occurring immediately before the system termination message CSQV086E. Follow the problem determination procedures for the specific errors. If you are unable to resolve the problem, collect the items listed in [Agent services problem determination](#) and contact your IBM® support center.

This topic's URL:

zm33290_

3.17.18. 00E50055

Explanation

The synchronization services functional recovery routine was unable to successfully complete resume processing for a suspended TCB mode execution unit. The resume processing was requested by the CANCEL or RESUME functions.

System action

Because the suspended TCB mode execution unit must not be permitted to remain in a suspended state, the recovery routine invokes the z/OS® CALLRTM (TYPE=ABTERM) service to end the execution unit abnormally with a X'6C6' completion code. Depending upon which execution unit was terminated, the queue manager

might be ended abnormally.

System programmer response

Restart the queue manager if necessary.

Scan the system log and the contents of SYS1.LOGREC for MQ errors occurring immediately before the end of the execution unit. Follow the problem determination procedures for the specific errors. If you are unable to resolve the problem, collect the items listed in [Agent services problem determination](#) and contact your IBM® support center.

This topic's URL:

zm33340_

3.17.23. 00E50069

Explanation

This reason code is issued during recovery processing for the suspend function when executing in SRB mode

under the recovery routine established by the z/OS® SRBSTAT(SAVE) service. Because the recovery routine established by this service is the only routine in the FRR stack at the time of error, normal RTM percolation to the invoking resource manager recovery routine is not possible.

After recovery processing for the initial error has successfully completed, the RTM environment is exited through retry to a routine that restores the original FRR stack. This routine terminates abnormally with completion code X'5C6' and this reason code. This causes entry into the original recovery routine established during suspend initialization.

System action

After this is intercepted by the original suspend recovery routine, a SYS1.LOGREC entry and SVC dump are requested to document the original error. The original recovery reason code is placed in the SDWACOMU field of the SDWA indicating the actions performed during recovery processing of the initial error. Control is then returned to the invoking resource manager's recovery routine through RTM percolation.

System programmer response

Because this is used only to permit the transfer of the initial recovery reason code to the invoking resource manager's recovery routine, no further recovery actions are required for this reason code. Diagnostic information for the initial error encountered can be obtained through the SYS1.LOGREC and SVC dump materials provided.

3.17.24. 00E50070

Explanation

To enable an internal task to terminate itself, the task has ended abnormally. This is not necessarily an error.

System action

The task is ended abnormally.

If the service task is ended abnormally with a completion code of X'6C6', no SVC dump is taken.

System programmer response

The error should be ignored if it happens in isolation, however, if it occurs in conjunction with other problems, these problems should be resolved.

If you are unable to resolve the problem, collect the items listed in [Agent services problem determination](#) and contact your IBM® support center.

zm33390_

3.17.28. 00E50074

Explanation

This reason code is issued in response to a nonzero return code from ATTACH during an attempt to create an internal task.

System action

The ATTACH is retried. A record is written to SYS1.LOGREC, and an SVC dump is requested. If a problem occurs again, the queue manager is terminated.

System programmer response

Restart the queue manager if necessary.

Register 2, in the SDWA, contains the return code from the ATTACH request. If you are unable to resolve the problem, collect the items listed in [Agent services problem determination](#) and contact your IBM® support center.

This topic's URL:

zm33440_

3.17.33. 00E50101

Explanation

MQ was unable to establish an ESTAE.

System action

The error is passed on to a subsystem support subcomponent (SSS) ESTAE. Probably, the queue manager is ended abnormally. A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

The inability to establish an ESTAE is normally due to insufficient free space in the local system queue area (LSQA) for an ESTAE control block (SCB). If necessary, increase the size of the queue manager address space.

Restart the queue manager.

Review the associated SVC dump for usage and free areas in the LSQA subpools belonging to the system services address space. If you are unable to solve the problem, collect the items listed in [Agent services problem determination](#) and contact your IBM® support center.

This topic's URL:

zm33530_

3.17.42. 00E50702

Explanation

An error occurred while processing in SRB mode which could not be recovered.

SRB mode processing is often used internally by the queue manager to ensure data integrity and consistency of internal state. Where recovery is not possible, the queue manager is terminated with this reason code.

Most occurrences are due to internal errors which should be reported to IBM service for further investigation.

The error is also known to occur where log data sets have been reformatted, without reformatting the pagesets (so they still contain active data). This situation can be resolved by user action.

System action

The queue manager is ended abnormally with this reason code. An SVC dump of the original error was requested by the recovery routine for CSQVEUS2 and a record written to SYS1.LOGREC.

System programmer response

Restart the queue manager.

Scan the SYS1.LOGREC entries looking for one or more MQ errors immediately prior to the queue manager termination. If you are unable to resolve the problem, collect the items listed in [Agent services problem determination](#) and contact your IBM support center.

Parent topic: [Agent services codes \(X'E5'\)](#)

The queue manager is ended abnormally.

System programmer response

Restart the queue manager.

You might find the items listed in [Agent services problem determination](#) useful in resolving the problem. Scan the SYS1.LOGREC entries for one or more MQ errors occurring immediately prior to the queue manager termination.

3.17.59. Agent services problem determination

Collect the following diagnostic items:

- A description of the action(s) that led to the error, or if applicable, a listing of the application program, or the input string to a utility program, being run at the time of the error
- Console output for the period leading up to the error
- Queue manager job log
- System dump, if any
- Printout of SYS1.LOGREC
- The WebSphere® MQ, z/OS®, DB2®, CICS®, and IMS™ service levels

3.18.4. 00E60100 through 00E60199

Explanation

The reason codes X'00E60100' through X'00E60199' are used by the instrumentation facility component (IFC) when a trace event occurs for which IBM® service personnel have requested a dump using the IFC selective dump service aid.

System action

The agent might be retried or terminated, depending upon the serviceability dump request.

System programmer response

The reason code is issued on the occurrence of a specified trace event. An SVC dump is taken to the SYS1.DUMPxx data set. Problem determination methods depend on the condition that IBM service personnel are attempting to trap.

3.19.26. Distributed queuing problem determination

Collect the following diagnostic items:

- A description of the action(s) that led to the error and details of any command being issued at the time of the failure
- The channel definitions being used
- If the error affected a message channel agent, a listing of any user channel exit programs used by the message channel agent
- Console output for the period leading up to the error
- Queue manager job log
- Channel initiator job log
- System dump resulting from the error, if any
- The WebSphere® MQ, z/OS®, DB2®, CICS®, and IMS™ service levels

3.20.2. 00E80002

Explanation

The queue manager address space was not started correctly or an error occurred during z/OS® IEFSSREQ processing.

System action

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested. Register 9 contains the address of an 8-byte field that contains the following diagnostic information:

- Bytes 1 through 4 – subsystem name
- Bytes 5 through 8 – contents of register 15 that contains the return code set by the z/OS IEFSSREQ macro

System programmer response

zm34310_

3.20.28. 00E800D2

Explanation

An error was encountered while attempting to obtain the z/OS® LOCAL lock.

System action

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Restart the queue manager.

You might find the items listed in [Initialization procedures problem determination](#) useful in resolving the problem.

Parent topic: [Initialization procedure and general services codes \(X'E8'\)](#)

This topic's URL:

zm34340_

3.20.31. 00E80100

Explanation

The queue manager was ended abnormally because the queue manager address space control task ESTAE was entered. This reason code is issued for all completion codes, except for the X'5C6' completion code.

The queue manager is unable to determine the cause of the error.

System action

Termination of the queue manager is initiated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

Restart the queue manager after resolving the problem.

The subcomponent that caused the error is unknown. This reason code might be returned if the queue manager is unable to find the system parameter load module you specified on the START QMGR command (the default name is CSQZPARM). Check that the module you specified is available.

This reason code is also issued if the queue manager is canceled by the z/OS® command CANCEL. If this is the case, determine why the queue manager was canceled.

You might find the items listed in [Initialization procedures problem determination](#), together with the contents of the BSDS and a GTF trace, useful in resolving the problem.

zm35000_

3.24.8. 00F30052

Explanation

The recovery coordinator for the caller has already terminated, so the connection from the caller to MQ has been terminated.

System action

The request is not processed. The connection from the caller to MQ is terminated.

The caller may reconnect to MQ when the recovery coordinator has been restarted.

System programmer response

Identify and restart the recovery coordinator.

This abnormal termination is most commonly associated with a termination of RRS. There may be additional CSQ3009E messages on the console log associated with the termination of RRS.

3.24.11. 00F30070

Explanation

Functional recovery for the connection processing could not be established. The executing module could not establish its ESTAE. This can occur if the current address space has insufficient storage. This might lead to an abnormal termination of the queue manager.

System action

The connection request is not processed. The caller is ended abnormally with completion code X'5C6' and this reason code.

System programmer response

Restart the queue manager if necessary. A dump should be taken for problem analysis.

Examine the usage and free areas in the LSQA portion of the current address space private area. If necessary, have the size of the private areas expanded.

The caller should produce a SYS1.LOGREC entry and an SVC dump, so that you can examine the LSQA area. You might find the items listed in [Subsystem support problem determination](#) useful in resolving the problem.

16/03/2011

Explanation

An internal error was detected in either MQ or RRS.

System action

The application is ended abnormally. The error is recorded in the SYS1.LOGREC data set and an SVC dump is requested.

This error might, in many cases, eventually cause the queue manager to terminate abnormally.

System programmer response

This is probably either an error in MQ or in RRS.

Collect the items listed in [Subsystem support problem determination](#) and contact your IBM® support center.

The calling task is ended abnormally. The calling task might have requested an SVC dump or created associated SYS1.LOGREC entries.

System programmer response

Cancel the queue manager. (End-of-task processing might still work, and it does a more complete clean-up than end-of-memory processing does.) If this does not work, issue the z/OS® command FORCE for the queue manager. If the problem is still unresolved, re-IPL z/OS.

Collect the items listed in [Subsystem support problem determination](#) and contact your IBM® support center.

3.24.32. 00F3021A

Explanation

An internal error has occurred.

System action

The calling task is ended abnormally. An SVC dump and associated SYS1.LOGREC entries are produced.

System programmer response

Stop the queue manager and reissue the START QMGR command.

Collect the items listed in [Subsystem support problem determination](#) and contact your IBM® support center.

Parent topic: [Subsystem support codes \(X'F3'\)](#)

 This build: January 26, 2011 11:45:35

This topic's URL:

zm35250_

3.24.33. 00F3021C

Explanation

An ESTAE could not be established. This can occur if the z/OS® system address space that is broadcasting the command has insufficient storage.

System action

The caller is ended abnormally (without a dump). The current START command processing is terminated.

System programmer response

Retry the command. If the error persists, re-IPL z/OS.

Examine the LOGREC entries, and the console log for indications of a z/OS error, and try increasing the storage.

If you are unable to resolve the problem, collect the items listed in [Subsystem support problem determination](#) and contact your IBM® support center.

Parent topic: [Subsystem support codes \(X'F3'\)](#)

This topic's URL:

zm35260_

3.24.34. 00F3021D

Explanation

An ESTAE could not be established during either the initialization or termination of the queue manager.

This can occur during initialization if the z/OS® system address space that is broadcasting the first command

(assumed to be the START command) has insufficient storage. e

This can occur during termination if the current address space (usually the queue manager, or in the case of EOM broadcast, a z/OS system address space) has insufficient storage.

System action

The caller is ended abnormally (without a dump). The initialization stops, but termination proceeds.

System programmer response

Retry the command after the queue manager has terminated. If the problem persists, a re-IPL of z/OS might be necessary.

Examine the LOGREC entries, and the console log for indications of a z/OS error, and try increasing the storage.

If you are unable to resolve the problem, collect the items listed in [Subsystem support problem determination](#) and contact your IBM® support center.

This topic's URL:

zm35270_

3.24.35. 00F3021E

Explanation

An ESTAE could not be established while in the process of routing control to the actual ESTAE routine. The caller (RTM) is ended abnormally. This causes the original error to percolate to a higher-level recovery routine and causes this reason code to be shown in an RTM recovery environment.

This can occur if the current address space (usually an allied address space) has insufficient storage.

System action

The caller is ended abnormally and a dump is produced.

System programmer response

Examine the usage and free areas in the LSQA portion of the current address space private area. If necessary, have the size of the private area expanded.

You might find the items listed in [Subsystem support problem determination](#) useful in resolving the problem.

This topic's URL:

zm35430_

3.24.51. 00F30415

Explanation

An ESTAE could not be established during the processing of an EOM SSI broadcast. This is probably a z/OS® problem, because these modules are executing in the z/OS master scheduler address space.

System action

The queue manager is terminated.

System programmer response

The queue manager can be started again after it terminates. If the problem persists, re-IPL z/OS.

This can occur if the z/OS master scheduler address space has insufficient free storage. If such is the case, MQ is unable to write a SYS1.LOGREC record or request a dump. The z/OS master scheduler should have produced these diagnostic aids. Examine the dump to determine whether the problem is in z/OS or MQ. Other unrelated errors in the z/OS Master Scheduler address space would indicate a z/OS problem.

If the problem appears to be an MQ problem, collect the items listed in [Subsystem support problem determination](#) and contact your IBM® support center.

This topic's URL:
zm35590_

3.24.67. 00F30461

Explanation

The queue manager was unable to successfully restart with RRS because of an internal error in either MQ or RRS.

System action

The queue manager is not connected to RRS and all services dependent on that connection are unavailable. This means that applications might not connect to the queue manager using RRSAF and that WLM-established address spaces might not be used for MQ stored procedures until the queue manager successfully restarts with RRS.

System programmer response

Stop and then start RRS. Stop and then start the queue manager. If the problem persists, perform an RRS cold start.

Collect the items listed in [Subsystem support problem determination](#) and contact your IBM® support center.

System programmer response

Restart the queue manager.

Refer to *z/OS® MVS™ Programming: Sysplex Services Reference* for an explanation of the error and the diagnostic information, if any, that you must collect. In addition, collect the items listed in [DB2 manager problem determination](#) and contact your IBM® support center.

Parent topic: [DB2 manager codes \(X'F5'\)](#) This build: January 26, 2011 11:45:39[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#) Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

3.25.11. 00F50013

Explanation

No queue manager entry was found in the CSQ.ADMIN_B_QMGR table for this combination of queue manager and queue-sharing group, or the entry was incorrect.

System action

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

System programmer response

Check the CSQ.ADMIN_B_QMGR table in the DB2® data-sharing group and ensure that an entry has been defined for the queue manager and it relates to the correct queue-sharing group.

If you are migrating from a previous release of MQ, check also that you have updated the DB2 tables to the format for the current release. See the [WebSphere MQ for z/OS Concepts and Planning Guide](#) and the [WebSphere MQ for z/OS System Setup Guide](#) for information about migration and compatibility between releases.

Restart the queue manager. If the problem persists, collect the items listed in [DB2 manager problem determination](#) and contact your IBM® support center.

Explanation

An internal error has occurred.

System action

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

System programmer response

Check that the DB2® related installation and customization tasks have all completed successfully. Restart the queue manager.

If the problem persists, refer to *DB2 for z/OS® Messages and Codes* for information about the completion and reason code in the accompanying message and collect the diagnostic data requested in the manual. In addition, collect the items listed in [DB2 manager problem determination](#) and contact your IBM® support center.

3.26.10. 00F90009

Explanation

This reason code is used to document that module CSQ9SCN9 has added information to the SDWA variable recording area (VRA) following the data provided by the CSQWRCRD service. If CSQ9SCN9 records an error in SYS1.LOGREC and the reason code in the VRA is not of the form X'00F9xxxx', the reason code is changed to X'00F90009'. This is done so that anyone examining a SYS1.LOGREC entry can determine, from the reason code, what additional data has been placed in the VRA. The reason code is the first data item in the VRA, as mapped by macro IHAVRA.

System programmer response

Collect the items listed in [Command preprocessor problem determination](#) and contact your IBM® support center.

16/03/2011

Explanation

An internal error occurred while attempting to obtain CSA storage. The storage request could not be satisfied, either because no CSA storage was available or because an unreasonably large amount of storage was requested. The amount of storage requested is determined by the length of the command being parsed. Normally, it is several hundred bytes.

System action

Command execution is ended abnormally.

System programmer response

It might be necessary to restart the CICS® or IMS™ adapter, or the queue manager.

If the problem persists, collect the items listed in [Command preprocessor problem determination](#) and contact your IBM® support center.

Parent topic: [Generalized command preprocessor codes \(X'F9'\)](#)

Explanation

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

An internal error has occurred.

System action

The queue manager start-up is terminated.

System programmer response

Restart the queue manager.

Collect the items listed in [Command preprocessor problem determination](#) and contact your IBM® support center.

Parent topic: [Generalized command preprocessor codes \(X'F9'\)](#)

This topic's URL:

zm36240_

3.26.16. 00F9000F

Explanation

MQ was unable to locate the default userid to be used on a command check. This indicates that CSQ6SYSP is not in the system parameter load module.

System action

The current execution unit terminates with completion code X'5C6'.

System programmer response

Ensure that CSQ6SYSP is in the system parameter load module. Restart the queue manager if necessary.

3.26.18. Command preprocessor problem determination

Collect the following diagnostic items:

- A description of the action(s) that led to the error, or if applicable, a listing of the application program, or the input string to a utility program, being run at the time of the error
- Console output for the period leading up to the error
- Queue manager job log
- System dump resulting from the error, if any
- The WebSphere® MQ, z/OS®, DB2®, CICS®, and IMS™ service levels
- ISPF panel name, if using the MQ Operations and Control panels
- The command issued **>**before**<** the error

4.1.1. CKB0

Explanation

This abend code is issued because the WebSphere® MQ CICS® adapter error handler is unable to load the message text module CSQFCTAB or CSQCMTXT. This module must be defined as a program entry in CICS, and exists in the WebSphere MQ library under the DFHRPL DD statement in the CICS JCL.

System action

The task invoking the message handler is ended abnormally.

System programmer response

Check that the installation process was followed correctly.

This topic's URL:

zm36320_

4.1.4. CKB3

Explanation

The CICS® DPL bridge program has detected an error in a request message for this unit of work.

System action

All request messages for this unit of work are copied to the dead-letter queue with an MQFB_CICS_* reason code. Corresponding error messages are written to the CICS CSMT transient data queue. An MQCRC_BRIDGE_ERROR reply is sent to the reply-to queue if requested. The CICS bridge task is ended abnormally.

Programmer response

See the description of the accompanying messages for more information.

Parent topic: [WebSphere MQ CICS bridge abend codes](#)

This topic's URL:

zm36380_

4.1.10. MBRA

Explanation

The type of EXEC CICS® RECEIVE request does not match the next BRMQ vector.

System action

The transaction is abnormally terminated.

Programmer response

This indicates a programming error in creating the input vectors. Use CEDX, or another programming tool to understand the transaction's input requests. Check whether the RECEIVE requests are TC or BMS.

Parent topic: [WebSphere MQ CICS bridge abend codes](#)

 This build: January 26, 2011 11:45:43

4.2.1. QAPI

Explanation

Unrecognizable API call. All supported API calls are documented in the [WebSphere MQ Application Programming Reference](#).

System action

The task is ended abnormally.

Programmer response

See the [WebSphere MQ Application Programming Reference](#) manual for details of the API calls.

Parent topic: [WebSphere MQ CICS adapter abend codes](#)

4.2.2. QCAL

Explanation

The WebSphere® MQ CICS® adapter has been invoked by CICS for an unknown reason.

System action

The invoking task is ended abnormally.

System programmer response

Contact your IBM® support center.

Parent topic: [WebSphere MQ CICS adapter abend codes](#)

4.2.3. QCMG

Explanation

This abend code is issued because the WebSphere® MQ CICS® adapter error handler is unable to load the message text module CSQFCTAB or CSQCMTXT. This module must be defined as a program entry in CICS, and exists in the WebSphere MQ library under the DFHRPL DD statement in the CICS JCL.

System action

The task invoking the message handler is ended abnormally.

System programmer response

Check that the installation process was followed correctly.

4.2.4. QDCL

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

Explanation

An attempt to EXEC CICS® LOAD the data conversion service modules was unsuccessful.

System action

The task is ended abnormally.

Programmer response

Ensure that the correct library concatenation has been specified in the CICS DFHRPL. Ensure that you have updated your CICS CSD to include CSQAVICM.

4.2.5. QGAL

Explanation

CSQCCON had enabled CSQCTRUE with a global area smaller than that needed by CSQCTRUE. This could be due to a mismatch of version level between CSQCCON and CSQCTRUE.

System action

The task is ended abnormally.

Programmer response

Check that the versions of CSQCCON and CSQCTRUE are compatible. If you are unable to solve the problem, contact your IBM® support center.

This topic's URL:

zm36650_

4.2.6. QNST

Explanation

A task has issued an API call that requires task switching, but there are no server subtasks available. This is because the subtasks have not yet started, or were not started successfully. (Message CSQC472I is issued for each subtask started; there should be eight of these.)

System action

The task is ended abnormally.

This abend can also cause CICS® to **stop**. This happens if either:

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

- In-doubt units of work are being resolved at connect time. The connection process requires a server subtask to execute the resolutions, so if there are no subtasks available, the process **stops** with this reason code. This abend during the resynchronization process causes CICS to **stop**.
- The abend occurs in a program list table (PLT) program.

System programmer response

► Investigate why your system is running so slowly that the subtasks have not yet started. ◀

5. API completion and reason codes

For each call, a completion code and a reason code are returned by the queue manager or by an exit routine, to indicate the success or failure of the call.

For more information about the WebSphere® MQ API, see the [WebSphere MQ Application Programming Guide](#) and the [WebSphere MQ Application Programming Reference](#) manual.

5.1. Completion codes

The following is a list of the completion codes (MQCC) returned by WebSphere® MQ

0: Successful completion (MQCC_OK)

The call completed fully; all output parameters have been set.

The *Reason* parameter always has the value MQRC_NONE in this case.

1: Warning (partial completion) (MQCC_WARNING)

The call completed partially. Some output parameters might have been set in addition to the *CompCode* and *Reason* output parameters.

The *Reason* parameter gives additional information.

2: Call failed (MQCC_FAILED)

The processing of the call did not complete, and the state of the queue manager is normally unchanged; exceptions are specifically noted. Only the *CompCode* and *Reason* output parameters have been set; all other parameters are unchanged.

The reason might be a fault in the application program, or it might be a result of some situation external to the program, for example the application's authority might have been revoked. The *Reason* parameter gives additional information.

Parent topic: [API completion and reason codes](#)

This topic's URL:

fm12020_

5.2. Reason codes

The reason code parameter (*Reason*) is a qualification to the completion code parameter (*CompCode*).

If there is no special reason to report, MQRC_NONE is returned. A successful call returns MQCC_OK and MQRC_NONE.

If the completion code is either MQCC_WARNING or MQCC_FAILED, the queue manager always reports a qualifying reason; details are given under each call description.

Where user exit routines set completion codes and reasons, they should adhere to these rules. In addition, any special reason values defined by user exits should be less than zero, to ensure that they do not conflict with values defined by the queue manager. Exits can set reasons already defined by the queue manager, where these are appropriate.

Reason codes also occur in:

- The *Reason* field of the MQDLH structure
- The *Feedback* field of the MQMD structure

5.2.1.2. 900 (0384) (RC900): MQRC_APPL_FIRST

Explanation

This is the lowest value for an application-defined reason code returned by a data-conversion exit. Data-conversion exits can return reason codes in the range MQRC_APPL_FIRST through MQRC_APPL_LAST to indicate particular conditions that the exit has detected.

Completion Code

MQCC_WARNING or MQCC_FAILED

Programmer response

As defined by the writer of the data-conversion exit.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:41

This topic's URL:

fm12060_

5.2.1.3. 999 (03E7) (RC999): MQRC_APPL_LAST

Explanation

This is the highest value for an application-defined reason code returned by a data-conversion exit. Data-conversion exits can return reason codes in the range MQRC_APPL_FIRST through MQRC_APPL_LAST to indicate particular conditions that the exit has detected.

Completion Code

MQCC_WARNING or MQCC_FAILED

Programmer response

As defined by the writer of the data-conversion exit.

5.2.1.4. 2001 (07D1) (RC2001): MQRC_ALIAS_BASE_Q_TYPE_ERROR

Explanation

An MQOPEN or MQPUT1 call was issued specifying an alias queue as the destination, but the *BaseQName* in the alias queue definition resolves to a queue that is not a local queue, a local definition of a remote queue, or a cluster queue.

Completion Code

MQCC_FAILED

Programmer response

Correct the queue definitions.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:41

This topic's URL:

fm12080_

5.2.1.5. 2002 (07D2) (RC2002): MQRC_ALREADY_CONNECTED

Explanation

An MQCONN or MQCONNX call was issued, but the application is already connected to the queue manager.

- On z/OS®, this reason code occurs for batch and IMS™ applications only; it does not occur for CICS® applications.
- On AIX®, HP-UX, i5/OS®, Solaris, Windows, this reason code occurs if the application attempts to create a nonshared handle when a nonshared handle already exists for the thread. A thread can have no more than one nonshared handle.
- On Windows, MTS objects do not receive this reason code, as additional connections to the queue manager are allowed.

Completion Code

MQCC_WARNING

Programmer response

None. The *Hconn* parameter returned has the same value as was returned for the previous MQCONN or MQCONNX call.

An MQCONN or MQCONNX call that returns this reason code does *not* mean that an additional MQDISC call must be issued in order to disconnect from the queue manager. If this reason code is returned because the application has been called in a situation where the connect has already been done, a corresponding MQDISC http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

should *not* be issued, because this will cause the application that issued the original MQCONN or MQCONNX call to be disconnected as well.

5.2.1.6. 2003 (07D3) (RC2003): MQRC_BACKED_OUT

Explanation

The current unit of work encountered a fatal error or was backed out. This occurs in the following cases:

- On an MQCMIT or MQDISC call, when the commit operation has failed and the unit of work has been backed out. All resources that participated in the unit of work have been returned to their state at the start of the unit of work. The MQCMIT or MQDISC call completes with MQCC_WARNING in this case.
 - On z/OS®, this reason code occurs only for batch applications.
- On an MQGET, MQPUT, or MQPUT1 call that is operating within a unit of work, when the unit of work has already encountered an error that prevents the unit of work being committed (for example, when the log space is exhausted). The application must issue the appropriate call to back out the unit of work. (For a unit of work coordinated by the queue manager, this call is the MQBACK call, although the MQCMIT call has the same effect in these circumstances.) The MQGET, MQPUT, or MQPUT1 call completes with MQCC_FAILED in this case.
 - On z/OS, this case does not occur.

Completion Code

MQCC_WARNING or MQCC_FAILED

Programmer response

Check the returns from previous calls to the queue manager. For example, a previous MQPUT call may have failed.

Parent topic: [Reason code list](#)

fm12100_

5.2.1.7. 2004 (07D4) (RC2004): MQRC_BUFFER_ERROR

Explanation

The *Buffer* parameter is not valid for one of the following reasons:

- The parameter pointer is not valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)
- The parameter pointer points to storage that cannot be accessed for the entire length specified by *BufferLength*.
- For calls where *Buffer* is an output parameter: the parameter pointer points to read-only storage.

Completion Code

MQCC_FAILED

Programmer response

Correct the parameter.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:41

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

This topic's URL:

fm12110_

5.2.1.8. 2005 (07D5) (RC2005): MQRC_BUFFER_LENGTH_ERROR

Explanation

The *BufferLength* parameter is not valid, or the parameter pointer is not valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)

This reason can also be returned to an MQ client program on the MQCONN or MQCONNX call if the negotiated maximum message size for the channel is smaller than the fixed part of any call structure.

This reason should also be returned by the MQZ_ENUMERATE_AUTHORITY_DATA installable service component when the *AuthorityBuffer* parameter is too small to accommodate the data to be returned to the invoker of the service component.

Completion Code

MQCC_FAILED

Programmer response

Specify a value that is zero or greater. For the mqAddString and mqSetString calls, the special value MQBL_NULL_TERMINATED is also valid.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:42

This topic's URL:

fm12120_

5.2.1.9. 2006 (07D6) (RC2006): MQRC_CHAR_ATTR_LENGTH_ERROR

Explanation

CharAttrLength is negative (for MQINQ or MQSET calls), or is not large enough to hold all selected attributes (MQSET calls only). This reason also occurs if the parameter pointer is not valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)

Completion Code

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

MQCC_FAILED

Programmer response

Specify a value large enough to hold the concatenated strings for all selected attributes.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:42

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

This topic's URL:

fm12140_

5.2.1.11. 2008 (07D8) (RC2008): MQRC_CHAR_ATTRS_TOO_SHORT

Explanation

For MQINQ calls, *CharAttrLength* is not large enough to contain all of the character attributes for which MQCA_* selectors are specified in the *Selectors* parameter.

The call still completes, with the *CharAttrs* parameter string filled in with as many character attributes as there is room for. Only complete attribute strings are returned: if there is insufficient space remaining to accommodate an attribute in its entirety, that attribute and subsequent character attributes are omitted. Any space at the end of the string not used to hold an attribute is unchanged.

An attribute that represents a set of values (for example, the namelist *Names* attribute) is treated as a single entity—either all of its values are returned, or none.

Completion Code

MQCC_WARNING

Programmer response

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Specify a large enough value, unless only a subset of the values is needed.

Parent topic: [Reason code list](#)

This topic's URL:

fm12150_

5.2.1.12. 2009 (07D9) (RC2009): MQRC_CONNECTION_BROKEN

Explanation

Connection to the queue manager has been lost. This can occur because the queue manager has ended. If the call is an MQGET call with the MQGMO_WAIT option, the wait has been canceled. All connection and object handles are now invalid.

For MQ client applications, it is possible that the call did complete successfully, even though this reason code is returned with a *CompCode* of MQCC_FAILED.

Completion Code

MQCC_FAILED

Programmer response

Applications can attempt to reconnect to the queue manager by issuing the MQCONN or MQCONNX call. It may be necessary to poll until a successful response is received.

- On z/OS® for CICS® applications, it is not necessary to issue the MQCONN or MQCONNX call, because CICS applications are connected automatically.

Any uncommitted changes in a unit of work should be backed out. A unit of work that is coordinated by the queue manager is backed out automatically.

This topic's URL:

fm12160_

5.2.1.13. 2010 (07DA) (RC2010): MQRC_DATA_LENGTH_ERROR

Explanation

The *DataLength* parameter is not valid. Either the parameter pointer is not valid, or it points to read-only storage. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)

This reason can also be returned to an MQ client program on the MQGET, MQPUT, or MQPUT1 call, if the *BufferLength* parameter exceeds the maximum message size that was negotiated for the client channel.

Completion Code

MQCC_FAILED

Programmer response

Correct the parameter.

If the error occurs for an MQ client program, also check that the maximum message size for the channel is big enough to accommodate the message being sent; if it is not big enough, increase the maximum message size for the channel.

Parent topic: [Reason code list](#)

This topic's URL:

fm12170_

5.2.1.14. 2011 (07DB) (RC2011): MQRC_DYNAMIC_Q_NAME_ERROR

Explanation

On the MQOPEN call, a model queue is specified in the *ObjectName* field of the *ObjDesc* parameter, but the *DynamicQName* field is not valid, for one of the following reasons:

- *DynamicQName* is completely blank (or blank up to the first null character in the field).
- Characters are present that are not valid for a queue name.
- An asterisk is present beyond the 33rd position (and before any null character).
- An asterisk is present followed by characters that are not null and not blank.

This reason code can also sometimes occur when a server application opens the reply queue specified by the *ReplyToQ* and *ReplyToQMgr* fields in the MQMD of a message that the server has just received. In this case the reason code indicates that the application that sent the original message placed incorrect values into the *ReplyToQ* and *ReplyToQMgr* fields in the MQMD of the original message.

Completion Code

MQCC_FAILED

Programmer response

Specify a valid name.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:42

This topic's URL:

fm12180_

5.2.1.15. 2012 (07DC) (RC2012): MQRC_ENVIRONMENT_ERROR

Explanation

The call is not valid for the current environment.

- On z/OS®, one of the following applies:
 - An MQCONN or MQCONNX call was issued, but the application has been linked with an adapter that is not supported in the environment in which the application is running. For example, this can arise

when the application is linked with the MQ RRS adapter, but the application is running in a DB2® Stored Procedure address space. RRS is not supported in this environment. Stored Procedures wishing to use the MQ RRS adapter must run in a DB2 WLM-managed Stored Procedure address space.

- An MQCMIT or MQBACK call was issued, but the application has been linked with the RRS batch adapter CSQBRSTB. This adapter does not support the MQCMIT and MQBACK calls.
- An MQCMIT or MQBACK call was issued in the CICS® or IMS™ environment.
- The RRS subsystem is not up and running on the z/OS system that ran the application.
- ➤An MQCTL call with MQOP_START or an MQCB call registering an Event Listener, was issued but the application is not allowed to create a POSIX thread.◀
- ➤A WebSphere MQ Java or JMS application has instantiated an MQQueueManager object using client connection options. The z/OS environment only supports bindings connection options.◀
- On HP OpenVMS, i5/OS®, Compaq NonStop Kernel, UNIX systems, and Windows, one of the following applies:
 - The application is linked to the wrong libraries (threaded or nonthreaded).
 - An MQBEGIN, MQCMIT, or MQBACK call was issued, but an external unit-of-work manager is in use. For example, this reason code occurs on Windows when an MTS object is running as a DTC transaction. This reason code also occurs if the queue manager does not support units of work.
 - The MQBEGIN call was issued in an MQ client environment.
 - An MQXCLWLN call was issued, but the call did not originate from a cluster workload exit.
- On Windows, when using the managed .NET client, an attempt was made to use one of the unsupported features:
 - Unmanaged channel exits
 - Secure Sockets Layer (SSL)
 - XA Transactions
 - Communications other than TCP/IP
 - Channel compression

Completion Code

MQCC_FAILED

Programmer response

Do one of the following (as appropriate):

- On z/OS:
 - Link the application with the correct adapter.
 - Modify the application to use the SRRCMIT and SRRBACK calls in place of the MQCMIT and MQBACK calls. Alternatively, link the application with the RRS batch adapter CSQBRSI. This adapter supports MQCMIT and MQBACK in addition to SRRCMIT and SRRBACK.
 - For a CICS or IMS application, issue the appropriate CICS or IMS call to commit or backout the unit of work.
 - Start the RRS subsystem on the z/OS system that is running the application.
 - ➤If your application uses Language Environment (LE) ensure that it uses the DLL interface and it runs with POSIX(ON).◀
 - ➤Ensure that your application is allowed to use Unix System Services (USS).◀
 - ➤Ensure that your Connection Factory definitions for local z/OS applications and WebSphere Application Server applications use Transport Type with bindings mode connections.◀
- In the other environments:
 - Link the application with the correct libraries (threaded or nonthreaded).
 - Remove from the application the call that is not supported.

This topic's URL:

fm12220_

5.2.1.19. 2017 (07E1) (RC2017): MQRC_HANDLE_NOT_AVAILABLE

Explanation

An MQOPEN, MQPUT1 or MQSUB call was issued, but the maximum number of open handles allowed for the current task has already been reached. Be aware that when a distribution list is specified on the MQOPEN or MQPUT1 call, each queue in the distribution list uses one handle.

- On z/OS®, "task" means a CICS® task, a z/OS task, or an IMS-dependent region.

Completion Code

MQCC_FAILED

Programmer response

Check whether the application is issuing MQOPEN calls without corresponding MQCLOSE calls. If it is, modify the application to issue the MQCLOSE call for each open object as soon as that object is no longer needed.

Also check whether the application is specifying a distribution list containing a large number of queues that are consuming all of the available handles. If it is, increase the maximum number of handles that the task can use, or reduce the size of the distribution list. The maximum number of open handles that a task can use is given by the *MaxHandles* queue manager attribute.

Parent topic: [Reason code list](#)

This topic's URL:

fm12230_

5.2.1.20. 2018 (07E2) (RC2018): MQRC_HCONN_ERROR

Explanation

The connection handle *HConn* is not valid, for one of the following reasons:

- The parameter pointer is not valid, or (for the MQCONN or MQCONN call) points to read-only storage. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable

results occur.)

- The value specified was not returned by a preceding MQCONN or MQCONNX call.
- The value specified has been made invalid by a preceding MQDISC call.
- The handle is a shared handle that has been made invalid by another thread issuing the MQDISC call.
- The handle is a shared handle that is being used on the MQBEGIN call (only nonshared handles are valid on MQBEGIN).
- The handle is a nonshared handle that is being used a thread that did not create the handle.
- The call was issued in the MTS environment in a situation where the handle is not valid (for example, passing the handle between processes or packages; note that passing the handle between library packages *is* supported).

Completion Code

MQCC_FAILED

Programmer response

Ensure that a successful MQCONN or MQCONNX call is performed for the queue manager, and that an MQDISC call has not already been performed for it. Ensure that the handle is being used within its valid scope (see the description of MQCONN in the [WebSphere MQ Application Programming Reference](#)).

- On z/OS®, also check that the application has been linked with the correct stub; this is CSQCSTUB for CICS® applications, CSQBSTUB for batch applications, and CSQQSTUB for IMS™ applications. Also, the stub used must not belong to a release of the queue manager that is more recent than the release on which the application will run.

5.2.1.21. 2019 (07E3) (RC2019): MQRC_HOBJ_ERROR

Explanation

The object handle *Hobj* is not valid, for one of the following reasons:

- The parameter pointer is not valid, or (for the MQOPEN call) points to read-only storage. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)
- The value specified was not returned by a preceding MQOPEN call.
- The value specified has been made invalid by a preceding MQCLOSE call.
- The handle is a shared handle that has been made invalid by another thread issuing the MQCLOSE call.
- The handle is a nonshared handle that is being used by a thread that did not create the handle.
- The call is MQGET or MQPUT, but the object represented by the handle is not a queue.

Completion Code

MQCC_FAILED

Programmer response

Ensure that a successful MQOPEN call is performed for this object, and that an MQCLOSE call has not already been performed for it. Ensure that the handle is being used within its valid scope (see the description of MQOPEN in the [WebSphere MQ Application Programming Reference](#)).

16/03/2011

MQRC_INT_ATTR_COUNT_TOO_SMALL

Explanation

On an MQINQ call, the *IntAttrCount* parameter is smaller than the number of integer attribute selectors (MQIA_*) specified in the *Selectors* parameter.

The call completes with MQCC_WARNING, with the *IntAttrs* array filled in with as many integer attributes as there is room for.

Completion Code

MQCC_WARNING

Programmer response

Specify a large enough value, unless only a subset of the values is needed.

5.2.1.25. 2023 (07E7) (RC2023): MQRC_INT_ATTRS_ARRAY_ERROR

Explanation

On an MQINQ or MQSET call, the *IntAttrs* parameter is not valid. The parameter pointer is not valid (MQINQ and MQSET), or points to read-only storage or to storage that is not as long as indicated by the *IntAttrCount* parameter (MQINQ only). (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)

Completion Code

MQCC_FAILED

Programmer response

Correct the parameter.

Parent topic: [Reason code list](#)

5.2.1.26. 2024 (07E8) (RC2024): MQRC_SYNCPOINT_LIMIT_REACHED

Explanation

An MQGET, MQPUT, or MQPUT1 call failed because it would have caused the number of uncommitted messages in the current unit of work to exceed the limit defined for the queue manager (see the

MaxUncommittedMsgs queue-manager attribute). The number of uncommitted messages is the sum of the following since the start of the current unit of work:

- Messages put by the application with the MQPMO_SYNCPOINT option
- Messages retrieved by the application with the MQGMO_SYNCPOINT option
- Trigger messages and COA report messages generated by the queue manager for messages put with the MQPMO_SYNCPOINT option
- COD report messages generated by the queue manager for messages retrieved with the MQGMO_SYNCPOINT option
- On Compaq NonStop Kernel, this reason code occurs when the maximum number of I/O operations in a single TM/MP transaction has been exceeded.

Completion Code

MQCC_FAILED

Programmer response

Check whether the application is looping. If it is not, consider reducing the complexity of the application. Alternatively, increase the queue-manager limit for the maximum number of uncommitted messages within a unit of work.

- On z/OS®, the limit for the maximum number of uncommitted messages can be changed by using the ALTER QMGR command.
- On i5/OS®, the limit for the maximum number of uncommitted messages can be changed by using the CHGMQM command.
- On Compaq NonStop Kernel, the application should cancel the transaction and retry with a smaller number of operations in the unit of work. See the *MQSeries® for Tandem NonStop Kernel System Management Guide* for more details.

5.2.1.27. 2025 (07E9) (RC2025): MQRC_MAX_CONNS_LIMIT_REACHED

Explanation

The MQCONN or MQCONNX call was rejected because the maximum number of concurrent connections has been exceeded.

- On z/OS®, connection limits are applicable only to TSO and batch requests. The limits are determined by the customer using the following parameters of the CSQ6SYSP macro:
 - For TSO: IDFORE
 - For batch: IDBACK

For more information, see the [Task 17: Tailor your system parameter module](#).

- On HP OpenVMS, i5/OS®, Compaq NonStop Kernel, UNIX systems, and Windows, this reason code can also occur on the MQOPEN call.
- When using Java applications, a limit to the number of concurrent connections may be defined by the connection manager.

Completion Code

MQCC_FAILED

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Programmer response

Either increase the size of the appropriate parameter value, or reduce the number of concurrent connections.

5.2.1.28. 2026 (07EA) (RC2026): MQRC_MD_ERROR

Explanation

The MQMD structure is not valid, for one of the following reasons:

- The *StrucId* field is not MQMD_STRUC_ID.
- The *Version* field specifies a value that is not valid or not supported.
- The parameter pointer is not valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)
- The queue manager cannot copy the changed structure to application storage, even though the call is successful. This can occur, for example, if the pointer points to read-only storage.

Completion Code

MQCC_FAILED

Programmer response

Ensure that input fields in the MQMD structure are set correctly.

Parent topic: [Reason code list](#)

5.2.1.29. 2027 (07EB) (RC2027): MQRC_MISSING_REPLY_TO_Q

Explanation

On an MQPUT or MQPUT1 call, the *ReplyToQ* field in the message descriptor MQMD is blank, but one or both of the following is true:

- A reply was requested (that is, MQMT_REQUEST was specified in the *MsgType* field of the message descriptor).
- A report message was requested in the *Report* field of the message descriptor.

Completion Code

MQCC_FAILED

Programmer response

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Specify the name of the queue to which the reply message or report message is to be sent.

Parent topic: [Reason code list](#)

5.2.1.30. 2029 (07ED) (RC2029): MQRC_MSG_TYPE_ERROR

Explanation

Either:

- On an MQPUT or MQPUT1 call, the value specified for the *MsgType* field in the message descriptor (MQMD) is not valid.
- A message processing program received a message that does not have the expected message type. For example, if the WebSphere® MQ command server receives a message which is not a request message (MQMT_REQUEST) then it rejects the request with this reason code.

Completion Code

MQCC_FAILED

Programmer response

Specify a valid value for the *MsgType* field. In the case where a request is rejected by a message processing program, refer to the documentation for that program for details of the message types that it supports.

Parent topic: [Reason code list](#)

fm12340_

5.2.1.31. 2030 (07EE) (RC2030): MQRC_MSG_TOO_BIG_FOR_Q

Explanation

An MQPUT or MQPUT1 call was issued to put a message on a queue, but the message was too long for the queue and MQMF_SEGMENTATION_ALLOWED was not specified in the *MsgFlags* field in MQMD. If segmentation is not allowed, the length of the message cannot exceed the lesser of the queue *MaxMsgLength* attribute and queue-manager *MaxMsgLength* attribute.

- On z/OS®, the queue manager does not support the segmentation of messages; if MQMF_SEGMENTATION_ALLOWED is specified, it is accepted but ignored.

This reason code can also occur when MQMF_SEGMENTATION_ALLOWED *is* specified, but the nature of the data present in the message prevents the queue manager splitting it into segments that are small enough to place on the queue:

- For a user-defined format, the smallest segment that the queue manager can create is 16 bytes.
- For a built-in format, the smallest segment that the queue manager can create depends on the particular format, but is greater than 16 bytes in all cases other than MQFMT_STRING (for MQFMT_STRING the minimum segment size is 16 bytes).

MQRC_MSG_TOO_BIG_FOR_Q can also occur in the *Feedback* field in the message descriptor of a report message; in this case it indicates that the error was encountered by a message channel agent when it attempted to put the message on a remote queue.

Completion Code

MQCC_FAILED

Programmer response

Check whether the *BufferLength* parameter is specified correctly; if it is, do one of the following:

- Increase the value of the queue's *MaxMsgLength* attribute; the queue-manager's *MaxMsgLength* attribute may also need increasing.
- Break the message into several smaller messages.
- Specify MQMF_SEGMENTATION_ALLOWED in the *MsgFlags* field in MQMD; this will allow the queue manager to break the message into segments.

Parent topic: [Reason code list](#)

5.2.1.32. 2031 (07EF) (RC2031): MQRC_MSG_TOO_BIG_FOR_Q_MGR

Explanation

An MQPUT or MQPUT1 call was issued to put a message on a queue, but the message was too long for the queue manager and MQMF_SEGMENTATION_ALLOWED was not specified in the *MsgFlags* field in MQMD. If segmentation is not allowed, the length of the message cannot exceed the lesser of the queue-manager *MaxMsgLength* attribute and queue *MaxMsgLength* attribute.

This reason code can also occur when MQMF_SEGMENTATION_ALLOWED *is* specified, but the nature of the data present in the message prevents the queue manager splitting it into segments that are small enough for the queue-manager limit:

- For a user-defined format, the smallest segment that the queue manager can create is 16 bytes.
- For a built-in format, the smallest segment that the queue manager can create depends on the particular format, but is greater than 16 bytes in all cases other than MQFMT_STRING (for MQFMT_STRING the minimum segment size is 16 bytes).

MQRC_MSG_TOO_BIG_FOR_Q_MGR can also occur in the *Feedback* field in the message descriptor of a report message; in this case it indicates that the error was encountered by a message channel agent when it attempted to put the message on a remote queue.

This reason also occurs if a channel, through which the message is to pass, has restricted the maximum message length to a value that is actually less than that supported by the queue manager, and the message length is greater than this value.

- On z/OS®, this return code is issued only if you are using CICS® for distributed queuing. Otherwise, MQRC_MSG_TOO_BIG_FOR_CHANNEL is issued.

Completion Code

MQCC_FAILED

Programmer response

Check whether the *BufferLength* parameter is specified correctly; if it is, do one of the following:

- Increase the value of the queue-manager's *MaxMsgLength* attribute; the queue's *MaxMsgLength* attribute may also need increasing.
- Break the message into several smaller messages.
- Specify MQMF_SEGMENTATION_ALLOWED in the *MsgFlags* field in MQMD; this will allow the queue manager to break the message into segments.
- Check the channel definitions.

fm12360_

5.2.1.33. 2033 (07F1) (RC2033): MQRC_NO_MSG_AVAILABLE

Explanation

An MQGET call was issued, but there is no message on the queue satisfying the selection criteria specified in MQMD (the *MsgId* and *CorrelId* fields), and in MQGMO (the *Options* and *MatchOptions* fields). Either the MQGMO_WAIT option was not specified, or the time interval specified by the *WaitInterval* field in MQGMO has expired. This reason is also returned for an MQGET call for browse, when the end of the queue has been reached.

This reason code can also be returned by the mqGetBag and mqExecute calls. mqGetBag is similar to MQGET. For the mqExecute call, the completion code can be either MQCC_WARNING or MQCC_FAILED:

- If the completion code is MQCC_WARNING, some response messages were received during the specified wait interval, but not all. The response bag contains system-generated nested bags for the messages that were received.
- If the completion code is MQCC_FAILED, no response messages were received during the specified wait interval.

Completion Code

MQCC_WARNING or MQCC_FAILED

Programmer response

If this is an expected condition, no corrective action is required.

If this is an unexpected condition, check that:

- The message was put on the queue successfully.
- The unit of work (if any) used for the MQPUT or MQPUT1 call was committed successfully.
- The options controlling the selection criteria are specified correctly. All of the following can affect the eligibility of a message for return on the MQGET call:
 - MQGMO_LOGICAL_ORDER
 - MQGMO_ALL_MSGS_AVAILABLE
 - MQGMO_ALL_SEGMENTS_AVAILABLE
 - MQGMO_COMPLETE_MSG
 - MQMO_MATCH_MSG_ID
 - MQMO_MATCH_CORREL_ID
 - MQMO_MATCH_GROUP_ID

- MQMO_MATCH_MSG_SEQ_NUMBER
- MQMO_MATCH_OFFSET
- Value of *MsgId* field in MQMD
- Value of *CorrelId* field in MQMD

Consider waiting longer for the message.

Parent topic: [Reason code list](#)

This topic's URL:

fm12370_

5.2.1.34. 2034 (07F2) (RC2034): MQRC_NO_MSG_UNDER_CURSOR

Explanation

An MQGET call was issued with either the MQGMO_MSG_UNDER_CURSOR or the MQGMO_BROWSE_MSG_UNDER_CURSOR option. However, the browse cursor is not positioned at a retrievable message. This is caused by one of the following:

- The cursor is positioned logically before the first message (as it is before the first MQGET call with a browse option has been successfully performed).
- The message the browse cursor was positioned on has been locked or removed from the queue (probably by some other application) since the browse operation was performed.
- The message the browse cursor was positioned on has expired.

Completion Code

MQCC_FAILED

Programmer response

Check the application logic. This may be an expected reason if the application design allows multiple servers to compete for messages after browsing. Consider also using the MQGMO_LOCK option with the preceding browse MQGET call.

fm12380_

5.2.1.35. 2035 (07F3) (RC2035): MQRC_NOT_AUTHORIZED

Explanation

The user is not authorized to perform the operation attempted:

- On an MQCONN or MQCONNX call, the user is not authorized to connect to the queue manager.
 - On z/OS®, for CICS® applications, MQRC_CONNECTION_NOT_AUTHORIZED is issued instead.
- On an MQOPEN or MQPUT1 call, the user is not authorized to open the object for the option(s) specified.
 - On z/OS, if the object being opened is a model queue, this reason also arises if the user is not

authorized to create a dynamic queue with the required name.

- On an MQCLOSE call, the user is not authorized to delete the object, which is a permanent dynamic queue, and the *Hobj* parameter specified on the MQCLOSE call is not the handle returned by the MQOPEN call that created the queue.
- On a command, the user is not authorized to issue the command, or to access the object it specifies.

This reason code can also occur in the *Feedback* field in the message descriptor of a report message; in this case it indicates that the error was encountered by a message channel agent when it attempted to put the message on a remote queue.

Completion Code

MQCC_FAILED

Programmer response

Ensure that the correct queue manager or object was specified, and that appropriate authority exists.

Parent topic: [Reason code list](#)

This topic's URL:

fm12440_

5.2.1.41. 2041 (07F9) (RC2041): MQRC_OBJECT_CHANGED

Explanation

Object definitions that affect this object have been changed since the *Hobj* handle used on this call was returned by the MQOPEN call. See the description of MQOPEN in the [WebSphere MQ Application Programming Reference](#) for more information.

This reason does not occur if the object handle is specified in the *Context* field of the *PutMsgOpts* parameter on the MQPUT or MQPUT1 call.

Completion Code

MQCC_FAILED

Programmer response

Issue an MQCLOSE call to return the handle to the system. It is then usually sufficient to reopen the object and retry the operation. However, if the object definitions are critical to the application logic, an MQINQ call can be used after reopening the object, to obtain the new values of the object attributes.

Parent topic: [Reason code list](#)

This topic's URL:

fm12450_

5.2.1.42. 2042 (07FA) (RC2042): MQRC_OBJECT_IN_USE

Explanation

An MQOPEN call was issued, but the object in question has already been opened by this or another application with options that conflict with those specified in the *Options* parameter. This arises if the request is for shared input, but the object is already open for exclusive input; it also arises if the request is for exclusive input, but the object is already open for input (of any sort).

MCAs for receiver channels, or the intra-group queuing agent (IGQ agent), may keep the destination queues open even when messages are not being transmitted; this results in the queues appearing to be "in use". Use the MQSC command DISPLAY QSTATUS to find out who is keeping the queue open.

- On z/OS®, this reason can also occur for an MQOPEN or MQPUT1 call, if the object to be opened (which can be a queue, or for MQOPEN a namelist or process object) is in the process of being deleted.

Completion Code

MQCC_FAILED

Programmer response

System design should specify whether an application is to wait and retry, or take other action.

Parent topic: [Reason code list](#)

fm12480_

5.2.1.45. 2045 (07FD) (RC2045): MQRC_OPTION_NOT_VALID_FOR_TYPE

Explanation

On an MQOPEN or MQCLOSE call, an option is specified that is not valid for the type of object or queue being opened or closed.

For the MQOPEN call, this includes the following cases:

- An option that is inappropriate for the object type (for example, MQOO_OUTPUT for an MQOT_PROCESS object).
- An option that is unsupported for the queue type (for example, MQOO_INQUIRE for a remote queue that has no local definition).
- One or more of the following options:
 - MQOO_INPUT_AS_Q_DEF
 - MQOO_INPUT_SHARED
 - MQOO_INPUT_EXCLUSIVE
 - MQOO_BROWSE
 - MQOO_INQUIRE
 - MQOO_SET

when either:

- the queue name is resolved through a cell directory, or
- *ObjectQMgrName* in the object descriptor specifies the name of a local definition of a remote queue (in order to specify a queue-manager alias), and the queue named in the *RemoteQMgrName* attribute of the definition is the name of the local queue manager.

For the MQCLOSE call, this includes the following case:

- The MQCO_DELETE or MQCO_DELETE_PURGE option when the queue is not a dynamic queue.

This reason code can also occur on the MQOPEN call when the object being opened is of type
http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsa.doc/zm10120_.htm

MQOT_NAMELIST, MQOT_PROCESS, or MQOT_Q_MGR, but the *ObjectQMgrName* field in MQOD is neither blank nor the name of the local queue manager.

Completion Code

MQCC_FAILED

Programmer response

Specify the correct option. For the MQOPEN call, ensure that the *ObjectQMgrName* field is set correctly. For the MQCLOSE call, either correct the option or change the definition type of the model queue that is used to create the new queue.

Parent topic: [Reason code list](#)

5.2.1.46. 2046 (07FE) (RC2046): MQRC_OPTIONS_ERROR

Explanation

The *Options* parameter or field contains options that are not valid, or a combination of options that is not valid.

- For the MQOPEN, MQCLOSE, MQXCNVC, mqBagToBuffer, mqBufferToBag, mqCreateBag, and mqExecute calls, *Options* is a separate parameter on the call.
This reason also occurs if the parameter pointer is not valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)
- For the MQBEGIN, MQCONN, MQGET, MQPUT, and MQPUT1 calls, *Options* is a field in the relevant options structure (MQBO, MQCNO, MQGMO, or MQPMO).

Completion Code

MQCC_FAILED

Programmer response

Specify valid options. Check the description of the *Options* parameter or field to determine which options and combinations of options are valid. If multiple options are being set by adding the individual options together, ensure that the same option is not added twice. ➤ For more information, see [Rules for validating MQI options](#). ◀

5.2.1.47. 2047 (07FF) (RC2047): MQRC_PERSISTENCE_ERROR

Explanation

On an MQPUT or MQPUT1 call, the value specified for the *Persistence* field in the message descriptor MQMD is not valid.

Completion Code

MQCC_FAILED

Programmer response

Specify one of the following values:

- MQPER_PERSISTENT
- MQPER_NOT_PERSISTENT
- MQPER_PERSISTENCE_AS_Q_DEF

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:44

This topic's URL:

fm12510_

5.2.1.48. 2048 (0800) (RC2048): MQRC_PERSISTENT_NOT_ALLOWED

Explanation

On an MQPUT or MQPUT1 call, the value specified for the *Persistence* field in MQMD (or obtained from the *DefPersistence* queue attribute) specifies MQPER_PERSISTENT, but the queue on which the message is being placed does not support persistent messages. Persistent messages cannot be placed on temporary dynamic queues.

This reason code can also occur in the *Feedback* field in the message descriptor of a report message; in this case it indicates that the error was encountered by a message channel agent when it attempted to put the message on a remote queue.

Completion Code

MQCC_FAILED

Programmer response

Specify MQPER_NOT_PERSISTENT if the message is to be placed on a temporary dynamic queue. If persistence is required, use a permanent dynamic queue or predefined queue in place of a temporary dynamic queue.

Be aware that server applications are recommended to send reply messages (message type MQMT_REPLY) with the same persistence as the original request message (message type MQMT_REQUEST). If the request message is persistent, the reply queue specified in the *ReplyToQ* field in the message descriptor MQMD cannot be a temporary dynamic queue. Use a permanent dynamic queue or predefined queue as the reply queue in this situation.

On z/OS®, you cannot put persistent messages to a shared queue if the CFSTRUCT that the queue uses is defined with RECOVER(NO). Either put only non-persistent messages to this queue or change the queue definition to RECOVER(YES). If you put a persistent message to a queue that uses a CFSTRUCT with RECOVER(NO) the put will fail with MQRC_PERSISTENT_NOT_ALLOWED.

5.2.1.49. 2049 (0801) (RC2049): MQRC_PRIORITY_EXCEEDS_MAXIMUM

Explanation

An MQPUT or MQPUT1 call was issued, but the value of the *Priority* field in the message descriptor MQMD exceeds the maximum priority supported by the local queue manager, as shown by the *MaxPriority* queue-manager attribute. The message is accepted by the queue manager, but is placed on the queue at the queue manager's maximum priority. The *Priority* field in the message descriptor retains the value specified by the application that put the message.

Completion Code

MQCC_WARNING

Programmer response

None required, unless this reason code was not expected by the application that put the message.

Parent topic: [Reason code list](#)

5.2.1.50. 2050 (0802) (RC2050): MQRC_PRIORITY_ERROR

Explanation

An MQPUT or MQPUT1 call was issued, but the value of the *Priority* field in the message descriptor MQMD is not valid. The maximum priority supported by the queue manager is given by the *MaxPriority* queue-manager attribute.

Completion Code

MQCC_FAILED

Programmer response

Specify a value in the range zero through *MaxPriority*, or the special value MQPRI_PRIORITY_AS_Q_DEF.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:45

5.2.1.51. 2051 (0803) (RC2051): MQRC_PUT_INHIBITED

Explanation

MQPUT and MQPUT1 calls are currently inhibited for the queue, or for the queue to which this queue resolves.

This reason code can also occur in the *Feedback* field in the message descriptor of a report message; in this case it indicates that the error was encountered by a message channel agent when it attempted to put the message on a remote queue.

Completion Code

MQCC_FAILED

Programmer response

If the system design allows put requests to be inhibited for short periods, retry the operation later.

Parent topic: [Reason code list](#)

This topic's URL:

fm12550_

5.2.1.52. 2052 (0804) (RC2052): MQRC_Q_DELETED

Explanation

An *Hobj* queue handle specified on a call refers to a dynamic queue that has been deleted since the queue was opened. (See the description of MQCLOSE in the [WebSphere MQ Application Programming Reference](#) for information about the deletion of dynamic queues.)

- On z/OS®, this can also occur with the MQOPEN and MQPUT1 calls if a dynamic queue is being opened, but the queue is in a logically-deleted state. See MQCLOSE for more information about this.

Completion Code

MQCC_FAILED

Programmer response

Issue an MQCLOSE call to return the handle and associated resources to the system (the MQCLOSE call will succeed in this case). Check the design of the application that caused the error.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:45

This topic's URL:

fm12560_

5.2.1.53. 2053 (0805) (RC2053): MQRC_Q_FULL

Explanation

An MQPUT or MQPUT1 call, or a command, failed because the queue is full, that is, it already contains the maximum number of messages possible, as specified by the *MaxQDepth* queue attribute.

This reason code can also occur in the *Feedback* field in the message descriptor of a report message; in this case it indicates that the error was encountered by a message channel agent when it attempted to put the message on a remote queue.

Completion Code

MQCC_FAILED

Programmer response

Retry the operation later. Consider increasing the maximum depth for this queue, or arranging for more instances of the application to service the queue.

Parent topic: [Reason code list](#)

This topic's URL:

fm12570_

5.2.1.54. 2055 (0807) (RC2055): MQRC_Q_NOT_EMPTY

Explanation

An MQCLOSE call was issued for a permanent dynamic queue, but the call failed because the queue is not empty or still in use. One of the following applies:

- The MQCO_DELETE option was specified, but there are messages on the queue.
- The MQCO_DELETE or MQCO_DELETE_PURGE option was specified, but there are uncommitted get or put calls outstanding against the queue.

See the usage notes pertaining to dynamic queues for the MQCLOSE call for more information.

This reason code is also returned from a command to clear or delete or move a queue, if the queue contains uncommitted messages (or committed messages in the case of delete queue without the purge option).

Completion Code

MQCC_FAILED

Programmer response

Check why there might be messages on the queue. Be aware that the *CurrentQDepth* queue attribute might be zero even though there are one or more messages on the queue; this can happen if the messages have been retrieved as part of a unit of work that has not yet been committed. If the messages can be discarded, try using the MQCLOSE call with the MQCO_DELETE_PURGE option. Consider retrying the call later.

fm12580_

5.2.1.55. 2056 (0808) (RC2056): MQRC_Q_SPACE_NOT_AVAILABLE

Explanation

An MQPUT or MQPUT1 call was issued, but there is no space available for the queue on disk or other storage device.

This reason code can also occur in the *Feedback* field in the message descriptor of a report message; in this case it indicates that the error was encountered by a message channel agent when it attempted to put the message on a remote queue.

- On z/OS®, this reason code does not occur.

Completion Code

MQCC_FAILED

Programmer response

Check whether an application is putting messages in an infinite loop. If not, make more disk space available for the queue.

Parent topic: [Reason code list](#)

This topic's URL:

fm12590_

5.2.1.56. 2057 (0809) (RC2057): MQRC_Q_TYPE_ERROR

Explanation

One of the following occurred:

- On an MQOPEN call, the *ObjectQMgrName* field in the object descriptor MQOD or object record MQOR specifies the name of a local definition of a remote queue (in order to specify a queue-manager alias), and in that local definition the *RemoteQMgrName* attribute is the name of the local queue manager. However, the *ObjectName* field in MQOD or MQOR specifies the name of a model queue on the local queue manager; this is not allowed. See the [WebSphere MQ Application Programming Guide](#) for more information.
- On an MQPUT1 call, the object descriptor MQOD or object record MQOR specifies the name of a model queue.
- On a previous MQPUT or MQPUT1 call, the *ReplyToQ* field in the message descriptor specified the name of a model queue, but a model queue cannot be specified as the destination for reply or report messages. Only the name of a predefined queue, or the name of the *dynamic* queue created from the model queue, can be specified as the destination. In this situation the reason code MQRC_Q_TYPE_ERROR is returned in the *Reason* field of the MQDLH structure when the reply message or report message is placed on the dead-letter queue.

Completion Code

MQCC_FAILED

Programmer response

Specify a valid queue.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:45

5.2.1.57. 2058 (080A) (RC2058): MQRC_Q_MGR_NAME_ERROR

Explanation

On an MQCONN or MQCONNX call, the value specified for the *QMgrName* parameter is not valid or not known. This reason also occurs if the parameter pointer is not valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)

- On z/OS® for CICS® applications, this reason can occur on *any* call if the original connect specified an incorrect or unrecognized name.

This reason code can also occur if an MQ client application attempts to connect to a queue manager within an MQ-client queue-manager group (see the *QMgrName* parameter of MQCONN), and either:

- Queue-manager groups are not supported.
- There is no queue-manager group with the specified name.

Completion Code

MQCC_FAILED

Programmer response

Use an all-blank name if possible, or verify that the name used is valid.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:45

This topic's URL:

fm12610_

5.2.1.58. 2059 (080B) (RC2059): MQRC_Q_MGR_NOT_AVAILABLE

Explanation

This occurs:

1. On an MQCONN or MQCONNX call, the queue manager identified by the *QMgrName* parameter is not available for connection.
 - On z/OS®:
 - For batch applications, this reason can be returned to applications running in LPARs that do not have a queue manager installed.
 - For CICS® applications, this reason can occur on *any* call if the original connect specified a queue manager whose name was recognized, but which is not available.
 - On i5/OS®, this reason can also be returned by the MQOPEN and MQPUT1 calls, when MQHC_DEF_HCONN is specified for the *Hconn* parameter by an application running in compatibility mode.
2. On an MQCONN or MQCONNX call from an MQ client application:
 - Attempting to connect to a queue manager within an MQ-client queue-manager group when none of the queue managers in the group is available for connection (see the *QMgrName* parameter of the MQCONN call).
 - If the client channel fails to connect, perhaps because of an error with the client-connection or the corresponding server-connection channel definitions.

- The z/OS Client Attachment feature has not been installed.
3. If a command uses the *CommandScope* parameter specifying a queue manager that is not active in the queue-sharing group.

Completion Code

MQCC_FAILED

Programmer response

Ensure that the queue manager has been started. If the connection is from a client application, check the channel definitions, channel status, and error logs.

Parent topic: [Reason code list](#)

This topic's URL:

fm12620_

5.2.1.59. 2061 (080D) (RC2061): MQRC_REPORT_OPTIONS_ERROR

Explanation

An MQPUT or MQPUT1 call was issued, but the *Report* field in the message descriptor MQMD contains one or more options that are not recognized by the local queue manager. The options that cause this reason code to be returned depend on the destination of the message; see the description of REPORT in the [WebSphere MQ Application Programming Reference](#) for more details.

This reason code can also occur in the *Feedback* field in the MQMD of a report message, or in the *Reason* field in the MQDLH structure of a message on the dead-letter queue; in both cases it indicates that the destination queue manager does not support one or more of the report options specified by the sender of the message.

Completion Code

MQCC_FAILED

Programmer response

Do the following:

- Ensure that the *Report* field in the message descriptor is initialized with a value when the message descriptor is declared, or is assigned a value prior to the MQPUT or MQPUT1 call. Specify MQRO_NONE if no report options are required.
- Ensure that the report options specified are valid; see the *Report* field described in the description of MQMD in the [WebSphere MQ Application Programming Reference](#) for valid report options.
- If multiple report options are being set by adding the individual report options together, ensure that the same report option is not added twice.
- Check that conflicting report options are not specified. For example, do not add both MQRO_EXCEPTION and MQRO_EXCEPTION_WITH_DATA to the *Report* field; only one of these can be specified.

5.2.1.62. 2065 (0811) (RC2065): MQRC_SELECTOR_COUNT_ERROR

Explanation

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

On an MQINQ or MQSET call, the *SelectorCount* parameter specifies a value that is not valid. This reason also occurs if the parameter pointer is not valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)

Completion Code

MQCC_FAILED

Programmer response

Specify a value in the range 0 through 256.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:46

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

 Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

fm12660_

5.2.1.63. 2066 (0812) (RC2066): MQRC_SELECTOR_LIMIT_EXCEEDED

Explanation

On an MQINQ or MQSET call, the *SelectorCount* parameter specifies a value that is larger than the maximum supported (256).

Completion Code

MQCC_FAILED

Programmer response

Reduce the number of selectors specified on the call; the valid range is 0 through 256.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:46

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

This topic's URL:

fm12670_

5.2.1.64. 2067 (0813) (RC2067): MQRC_SELECTOR_ERROR

Explanation

An MQINQ or MQSET call was issued, but the *Selectors* array contains a selector that is not valid for one of the following reasons:

- The selector is not supported or out of range.
- The selector is not applicable to the type of object whose attributes are being inquired or set.
- The selector is for an attribute that cannot be set.

This reason also occurs if the parameter pointer is not valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)

Completion Code

MQCC_FAILED

Programmer response

Ensure that the value specified for the selector is valid for the object type represented by *Hobj*. For the MQSET call, also ensure that the selector represents an integer attribute that can be set.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:46

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

 Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

fm12680_

5.2.1.65. 2068 (0814) (RC2068): MQRC_SELECTOR_NOT_FOR_TYPE

Explanation

On the MQINQ call, one or more selectors in the *Selectors* array is not applicable to the type of the queue whose attributes are being inquired.

This reason also occurs when the queue is a cluster queue that resolved to a remote instance of the queue. In this case only a subset of the attributes that are valid for local queues can be inquired. See the usage notes in the description of MQINQ in the [WebSphere MQ Application Programming Reference](#) for further details.

The call completes with MQCC_WARNING, with the attribute values for the inapplicable selectors set as follows:

- For integer attributes, the corresponding elements of *IntAttrs* are set to MQIAV_NOT_APPLICABLE.
- For character attributes, the appropriate parts of the *CharAttrs* string are set to a character string consisting entirely of asterisks (*).

Completion Code

MQCC_WARNING

Programmer response

Verify that the selector specified is the one that was intended.

If the queue is a cluster queue, specifying one of the MQOO_BROWSE, MQOO_INPUT_*, or MQOO_SET options in addition to MQOO_INQUIRE forces the queue to resolve to the local instance of the queue. However, if there is no local instance of the queue the MQOPEN call fails.

Parent topic: [Reason code list](#)

5.2.1.66. 2069 (0815) (RC2069): MQRC_SIGNAL_OUTSTANDING

Explanation

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

An MQGET call was issued with either the MQGMO_SET_SIGNAL or MQGMO_WAIT option, but there is already a signal outstanding for the queue handle *Hobj*.

This reason code occurs only in the following environments: z/OS®, Windows 95, Windows 98.

Completion Code

MQCC_FAILED

Programmer response

Check the application logic. If it is necessary to set a signal or wait when there is a signal outstanding for the same queue, a different object handle must be used.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:46

This topic's URL:

fm12700_

5.2.1.67. 2070 (0816) (RC2070): MQRC_SIGNAL_REQUEST_ACCEPTED

Explanation

An MQGET call was issued specifying MQGMO_SET_SIGNAL in the *GetMsgOpts* parameter, but no suitable message was available; the call returns immediately. The application can now wait for the signal to be delivered.

- On z/OS®, the application should wait on the Event Control Block pointed to by the *Signal1* field.
- On Windows 95, Windows 98, the application should wait for the signal Windows message to be delivered.

This reason code occurs only in the following environments: z/OS, Windows 95, Windows 98.

Completion Code

MQCC_WARNING

Programmer response

Wait for the signal; when it is delivered, check the signal to ensure that a message is now available. If it is, reissue the MQGET call.

- On z/OS, wait on the ECB pointed to by the *Signal1* field and, when it is posted, check it to ensure that a message is now available.
- On Windows 95, Windows 98, the application (thread) should continue executing its message loop.

This topic's URL:

fm12720_

5.2.1.69. 2072 (0818) (RC2072): MQRC_SYNCPOINT_NOT_AVAILABLE

Explanation

Either MQGMO_SYNCPOINT was specified on an MQGET call or MQPMO_SYNCPOINT was specified on an MQPUT or MQPUT1 call, but the local queue manager was unable to honor the request. If the queue manager does not support units of work, the *SyncPoint* queue-manager attribute will have the value MQSP_NOT_AVAILABLE.

This reason code can also occur on the MQGET, MQPUT, and MQPUT1 calls when an external unit-of-work coordinator is being used. If that coordinator requires an explicit call to start the unit of work, but the application has not issued that call prior to the MQGET, MQPUT, or MQPUT1 call, reason code MQRC_SYNCPOINT_NOT_AVAILABLE is returned.

- On i5/OS®, this reason codes means that i5/OS Commitment Control is not started, or is unavailable for use by the queue manager.
- On z/OS®, this reason code does not occur.

Completion Code

MQCC_FAILED

Programmer response

Remove the specification of MQGMO_SYNCPOINT or MQPMO_SYNCPOINT, as appropriate.

- On i5/OS, ensure that Commitment Control has been started. If this reason code occurs after Commitment Control has been started, contact your system programmer.

fm12770_

5.2.1.74. 2079 (081F) (RC2079): MQRC_TRUNCATED_MSG_ACCEPTED

Explanation

On an MQGET call, the message length was too large to fit into the supplied buffer. The MQGMO_ACCEPT_TRUNCATED_MSG option was specified, so the call completes. The message is removed from the queue (subject to unit-of-work considerations), or, if this was a browse operation, the browse cursor is advanced to this message.

The *DataLength* parameter is set to the length of the message before truncation, the *Buffer* parameter contains as much of the message as fits, and the MQMD structure is filled in.

Completion Code

MQCC_WARNING

Programmer response

None, because the application expected this situation.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:46

This topic's URL:

fm12780_

5.2.1.75. 2080 (0820) (RC2080): MQRC_TRUNCATED_MSG_FAILED

Explanation

On an MQGET call, the message length was too large to fit into the supplied buffer. The MQGMO_ACCEPT_TRUNCATED_MSG option was *not* specified, so the message has not been removed from the queue. If this was a browse operation, the browse cursor remains where it was before this call, but if MQGMO_BROWSE_FIRST was specified, the browse cursor is positioned logically before the highest-priority message on the queue.

The *DataLength* field is set to the length of the message before truncation, the *Buffer* parameter contains as much of the message as fits, and the MQMD structure is filled in.

Completion Code

MQCC_WARNING

Programmer response

Supply a buffer that is at least as large as *DataLength*, or specify MQGMO_ACCEPT_TRUNCATED_MSG if not all of the message data is required.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:46

5.2.1.76. 2082 (0822) (RC2082): MQRC_UNKNOWN_ALIAS_BASE_Q

Explanation

An MQOPEN or MQPUT1 call was issued specifying an alias queue as the target, but the *BaseQName* in the alias queue attributes is not recognized as a queue name.

This reason code can also occur when *BaseQName* is the name of a cluster queue that cannot be resolved successfully.

MQRC_UNKNOWN_ALIAS_BASE_Q might indicate that the application is specifying the **ObjectQmgrName** of the queue manager that it is connecting to, and the queue manager that is hosting the alias queue. This means that the queue manager looks for the alias target queue on the specified queue manager and fails because the alias target queue is not on the local queue manager. The **ObjectQmgrName** parameter is typically left blank so that the clustering decides which queue manager to route to.

Completion Code

MQCC_FAILED

Programmer response

Correct the queue definitions.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:46

fm12800_

5.2.1.77. 2085 (0825) (RC2085): MQRC_UNKNOWN_OBJECT_NAME

Explanation

An MQOPEN or MQPUT1 call was issued, but the object identified by the *ObjectName* and *ObjectQMgrName* fields in the object descriptor MQOD cannot be found. One of the following applies:

- The *ObjectQMgrName* field is one of the following:
 - Blank
 - The name of the local queue manager
 - The name of a local definition of a remote queue (a queue-manager alias) in which the *RemoteQMgrName* attribute is the name of the local queue manager

but no object with the specified *ObjectName* and *ObjectType* exists on the local queue manager.

- The object being opened is a cluster queue that is hosted on a remote queue manager, but the local queue manager does not have a defined route to the remote queue manager.
- The object being opened is a queue definition that has QSGDISP(GROUP). Such definitions cannot be used with the MQOPEN and MQPUT1 calls.

This can also occur in response to a command that specifies the name of an object or other item that does not exist.

Completion Code

MQCC_FAILED

Programmer response

Specify a valid object name. Ensure that the name is padded to the right with blanks if necessary. If this is correct, check the object definitions.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:47

This topic's URL:

fm12810_

5.2.1.78. 2086 (0826) (RC2086): MQRC_UNKNOWN_OBJECT_Q_MGR

Explanation

On an MQOPEN or MQPUT1 call, the *ObjectQMgrName* field in the object descriptor MQOD does not satisfy the naming rules for objects. For more information, see the [WebSphere MQ Application Programming Guide](#).

This reason also occurs if the *ObjectType* field in the object descriptor has the value MQOT_Q_MGR, and the *ObjectQMgrName* field is not blank, but the name specified is not the name of the local queue manager.

Completion Code

MQCC_FAILED

Programmer response

Specify a valid queue manager name. To refer to the local queue manager, a name consisting entirely of blanks or beginning with a null character can be used. Ensure that the name is padded to the right with blanks or terminated with a null character if necessary.

Parent topic: [Reason code list](#)

fm12820_

5.2.1.79. 2087 (0827) (RC2087): MQRC_UNKNOWN_REMOTE_Q_MGR

Explanation

On an MQOPEN or MQPUT1 call, an error occurred with the queue-name resolution, for one of the following reasons:

- *ObjectQMgrName* is blank or the name of the local queue manager, *ObjectName* is the name of a local definition of a remote queue (or an alias to one), and one of the following is true:
 - *RemoteQMgrName* is blank or the name of the local queue manager. Note that this error occurs even if *XmitQName* is not blank.
 - *XmitQName* is blank, but there is no transmission queue defined with the name of *RemoteQMgrName*, and the *DefXmitQName* queue-manager attribute is blank.
 - *RemoteQMgrName* and *RemoteQName* specify a cluster queue that cannot be resolved successfully, and the *DefXmitQName* queue-manager attribute is blank.
 - On z/OS only, the *RemoteQMgrName* is the name of a queue manager in the Queue Sharing group but intra-group queuing is disabled.
- *ObjectQMgrName* is the name of a local definition of a remote queue (containing a queue-manager alias definition), and one of the following is true:
 - *RemoteQName* is not blank.
 - *XmitQName* is blank, but there is no transmission queue defined with the name of *RemoteQMgrName*, and the *DefXmitQName* queue-manager attribute is blank.
- *ObjectQMgrName* is not:
 - Blank
 - The name of the local queue manager
 - The name of a transmission queue
 - The name of a queue-manager alias definition (that is, a local definition of a remote queue with a blank *RemoteQName*)

but the *DefXmitQName* queue-manager attribute is blank and the queue manager is not part of a queue-sharing group with intra-group queuing enabled.

- *ObjectQMgrName* is the name of a model queue.
- The queue name is resolved through a cell directory. However, there is no queue defined with the same name as the remote queue manager name obtained from the cell directory, and the *DefXmitQName* queue-manager attribute is blank.

Completion Code

MQCC_FAILED

Programmer response

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Check the values specified for *ObjectQMgrName* and *ObjectName*. If these are correct, check the queue definitions.

5.2.1.81. 2091 (082B) (RC2091): MQRC_XMIT_Q_TYPE_ERROR

Explanation

On an MQOPEN or MQPUT1 call, a message is to be sent to a remote queue manager. The *ObjectName* or *ObjectQMgrName* field in the object descriptor specifies the name of a local definition of a remote queue but one of the following applies to the *XmitQName* attribute of the definition:

- *XmitQName* is not blank, but specifies a queue that is not a local queue
- *XmitQName* is blank, but *RemoteQMgrName* specifies a queue that is not a local queue

This reason also occurs if the queue name is resolved through a cell directory, and the remote queue manager name obtained from the cell directory is the name of a queue, but this is not a local queue.

Completion Code

MQCC_FAILED

Programmer response

Check the values specified for *ObjectName* and *ObjectQMgrName*. If these are correct, check the queue definitions. For more information on transmission queues, see the [WebSphere MQ Application Programming Guide](#).

5.2.1.82. 2092 (082C) (RC2092): MQRC_XMIT_Q_USAGE_ERROR

Explanation

On an MQOPEN or MQPUT1 call, a message is to be sent to a remote queue manager, but one of the following occurred:

- *ObjectQMGrName* specifies the name of a local queue, but it does not have a *Usage* attribute of MQUS_TRANSMISSION.
- The *ObjectName* or *ObjectQMGrName* field in the object descriptor specifies the name of a local definition of a remote queue but one of the following applies to the *XmitQName* attribute of the definition:
 - *XmitQName* is not blank, but specifies a queue that does not have a *Usage* attribute of MQUS_TRANSMISSION
 - *XmitQName* is blank, but *RemoteQMGrName* specifies a queue that does not have a *Usage* attribute of MQUS_TRANSMISSION
 - *XmitQName* specifies the queue SYSTEM.QSG.TRANSMIT.QUEUE the IGQ queue manager attribute indicates that IGQ is DISABLED.
- The queue name is resolved through a cell directory, and the remote queue manager name obtained from the cell directory is the name of a local queue, but it does not have a *Usage* attribute of MQUS_TRANSMISSION.

Completion Code

MQCC_FAILED

Programmer response

Check the values specified for *ObjectName* and *ObjectQMGrName*. If these are correct, check the queue definitions. For more information on transmission queues, see the [WebSphere MQ Application Programming Guide](#).

fm12910_

5.2.1.88. 2098 (0832) (RC2098): MQRC_CONTEXT_NOT_AVAILABLE

Explanation

On an MQPUT or MQPUT1 call, MQPMO_PASS_IDENTITY_CONTEXT or MQPMO_PASS_ALL_CONTEXT was specified, but the queue handle specified in the *Context* field of the *PutMsgOpts* parameter has no context associated with it. This arises if no message has yet been successfully retrieved with the queue handle referred to, or if the last successful MQGET call was a browse.

This condition does not arise if the message that was last retrieved had no context associated with it.

- On z/OS®, if a message is received by a message channel agent that is putting messages with the authority of the user identifier in the message, this code is returned in the *Feedback* field of an exception report if the message has no context associated with it.

Completion Code

MQCC_FAILED

Programmer response

Ensure that a successful nonbrowse get call has been issued with the queue handle referred to.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:47

5.2.1.89. 2099 (0833) (RC2099): MQRC_SIGNAL1_ERROR

Explanation

An MQGET call was issued, specifying MQGMO_SET_SIGNAL in the *GetMsgOpts* parameter, but the *Signal1* field is not valid.

- On z/OS®, the address contained in the *Signal1* field is not valid, or points to read-only storage. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)
- On Windows 95, Windows 98, the window handle in the *Signal1* field is not valid.

This reason code occurs only in the following environments: z/OS, Windows 95, Windows 98.

Completion Code

MQCC_FAILED

Programmer response

Correct the setting of the *Signal1* field.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:47

This topic's URL:

fm12930_

5.2.1.90. 2100 (0834) (RC2100): MQRC_OBJECT_ALREADY_EXISTS

Explanation

An MQOPEN call was issued to create a dynamic queue, but a queue with the same name as the dynamic queue already exists.

- On z/OS®, a rare "race condition" can also give rise to this reason code; see the description of reason

code MQRC_NAME_IN_USE for more details.

Completion Code

MQCC_FAILED

Programmer response

If supplying a dynamic queue name in full, ensure that it obeys the naming conventions for dynamic queues; if it does, either supply a different name, or delete the existing queue if it is no longer required. Alternatively, allow the queue manager to generate the name.

If the queue manager is generating the name (either in part or in full), reissue the MQOPEN call.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:47

This topic's URL:

fm12940_

5.2.1.91. 2101 (0835) (RC2101): MQRC_OBJECT_DAMAGED

Explanation

The object accessed by the call is damaged and cannot be used. For example, this may be because the definition of the object in main storage is not consistent, or because it differs from the definition of the object on disk, or because the definition on disk cannot be read. The object can be deleted, although it may not be possible to delete the associated user space.

- On z/OS®, this reason occurs when the DB2® list header or structure number associated with a shared queue is zero. This situation arises as a result of using the MQSC command DELETE CFSTRUCT to delete the DB2 structure definition. The command resets the list header and structure number to zero for each of the shared queues that references the deleted CF structure.

Completion Code

MQCC_FAILED

Programmer response

It may be necessary to stop and restart the queue manager, or to restore the queue-manager data from back-up storage.

- On HP OpenVMS, i5/OS®, Compaq NonStop Kernel, and UNIX systems, consult the FFST™ record to obtain more detail about the problem.
- On z/OS, delete the shared queue and redefine it using the MQSC command DEFINE QLOCAL. This will automatically define a CF structure and allocate list headers for it.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:48

fm12950_

5.2.1.92. 2102 (0836) (RC2102): MQRC_RESOURCE_PROBLEM

Explanation

There are insufficient system resources to complete the call successfully. On z/OS this can indicate DB2 errors occurred when using shared queues.

Completion Code

MQCC_FAILED

Programmer response

Run the application when the machine is less heavily loaded.

- On z/OS®, check the operator console for messages that may provide additional information.
- On HP OpenVMS, i5/OS®, Compaq NonStop Kernel, and UNIX systems, consult the FFST™ record to obtain more detail about the problem.

Parent topic: [Reason code list](#)

This topic's URL:

fm12960_

5.2.1.93. 2103 (0837) (RC2103): MQRC_ANOTHER_Q_MGR_CONNECTED

Explanation

An MQCONN or MQCONNX call was issued, but the thread or process is already connected to a different queue manager. The thread or process can connect to only one queue manager at a time.

- On z/OS®, this reason code does not occur.
- On Windows, MTS objects do not receive this reason code, as connections to other queue managers are allowed.

Completion Code

MQCC_FAILED

Programmer response

Use the MQDISC call to disconnect from the queue manager that is already connected, and then issue the MQCONN or MQCONNX call to connect to the new queue manager.

Disconnecting from the existing queue manager will close any queues that are currently open; it is recommended that any uncommitted units of work should be committed or backed out before the MQDISC call is issued.

16/03/2011

MQRC_UNKNOWN_REPORT_OPTION

Explanation

An MQPUT or MQPUT1 call was issued, but the *Report* field in the message descriptor MQMD contains one or more options that are not recognized by the local queue manager. The options are accepted.

The options that cause this reason code to be returned depend on the destination of the message; see the description of REPORT in the [WebSphere MQ Application Programming Reference](#) for more details.

Completion Code

MQCC_WARNING

Programmer response

If this reason code is expected, no corrective action is required. If this reason code is not expected, do the following:

- Ensure that the *Report* field in the message descriptor is initialized with a value when the message descriptor is declared, or is assigned a value prior to the MQPUT or MQPUT1 call.
- Ensure that the report options specified are valid; see the *Report* field described in the description of MQMD in the [WebSphere MQ Application Programming Reference](#) for valid report options.
- If multiple report options are being set by adding the individual report options together, ensure that the same report option is not added twice.
- Check that conflicting report options are not specified. For example, do not add both MQRO_EXCEPTION and MQRO_EXCEPTION_WITH_DATA to the *Report* field; only one of these can be specified.

5.2.1.95. 2105 (0839) (RC2105): MQRC_STORAGE_CLASS_ERROR

Explanation

The MQPUT or MQPUT1 call was issued, but the storage-class object defined for the queue does not exist.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Create the storage-class object required by the queue, or modify the queue definition to use an existing storage class. The name of the storage-class object used by the queue is given by the *StorageClass* queue attribute.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:52

5.2.1.96. 2106 (083A) (RC2106): MQRC_COD_NOT_VALID_FOR_XCF_Q

Explanation

An MQPUT or MQPUT1 call was issued, but the *Report* field in the message descriptor MQMD specifies one of the MQRO_COD_* options and the target queue is an XCF queue. MQRO_COD_* options cannot be specified for XCF queues.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Remove the relevant MQRO_COD_* option.

Parent topic: [Reason code list](#)

5.2.1.97. 2107 (083B) (RC2107): MQRC_XWAIT_CANCELED

Explanation

An MQXWAIT call was issued, but the call has been canceled because a STOP CHINIT command has been issued (or the queue manager has been stopped, which causes the same effect). Refer to the [WebSphere MQ Intercommunication](#) book for details of the MQXWAIT call.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Tidy up and terminate.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:53

5.2.1.98. 2108 (083C) (RC2108): MQRC_XWAIT_ERROR

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Explanation

An MQXWAIT call was issued, but the invocation was not valid for one of the following reasons:

- The wait descriptor MQXWD contains data that is not valid.
- The linkage stack level is not valid.
- The addressing mode is not valid.
- There are too many wait events outstanding.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Obey the rules for using the MQXWAIT call. Refer to the [WebSphere MQ Intercommunication](#) book for details of this call.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:53

fm13030_

5.2.1.100. 2110 (083E) (RC2110): MQRC_FORMAT_ERROR

Explanation

An MQGET call was issued with the MQGMO_CONVERT option specified in the *GetMsgOpts* parameter, but the message cannot be converted successfully due to an error associated with the message format. Possible errors

include:

- The format name in the message is MQFMT_NONE.
- A user-written exit with the name specified by the *Format* field in the message cannot be found.
- The message contains data that is not consistent with the format definition.

The message is returned unconverted to the application issuing the MQGET call, the values of the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter are set to those of the message returned, and the call completes with MQCC_WARNING.

If the message consists of several parts, each of which is described by its own *CodedCharSetId* and *Encoding* fields (for example, a message with format name MQFMT_DEAD_LETTER_HEADER), some parts may be converted and other parts not converted. However, the values returned in the various *CodedCharSetId* and *Encoding* fields always correctly describe the relevant message data.

Completion Code

MQCC_WARNING

Programmer response

Check the format name that was specified when the message was put. If this is not one of the built-in formats, check that a suitable exit with the same name as the format is available for the queue manager to load. Verify that the data in the message corresponds to the format expected by the exit.

This topic's URL:

fm13040_

5.2.1.101. 2111 (083F) (RC2111): MQRC_SOURCE_CCSID_ERROR

Explanation

The coded character-set identifier from which character data is to be converted is not valid or not supported.

This can occur on the MQGET call when the MQGMO_CONVERT option is included in the *GetMsgOpts* parameter; the coded character-set identifier in error is the *CodedCharSetId* field in the message being retrieved. In this case, the message data is returned unconverted, the values of the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter are set to those of the message returned, and the call completes with MQCC_WARNING.

This reason can also occur on the MQGET call when the message contains one or more MQ header structures (MQCIH, MQDLH, MQIIH, MQRMH), and the *CodedCharSetId* field in the message specifies a character set that does not have SBCS characters for the characters that are valid in queue names. MQ header structures containing such characters are not valid, and so the message is returned unconverted. The Unicode character set UCS-2 is an example of such a character set.

If the message consists of several parts, each of which is described by its own *CodedCharSetId* and *Encoding* fields (for example, a message with format name MQFMT_DEAD_LETTER_HEADER), some parts may be converted and other parts not converted. However, the values returned in the various *CodedCharSetId* and *Encoding* fields always correctly describe the relevant message data.

This reason can also occur on the MQXCNVC call; the coded character-set identifier in error is the *SourceCCSID* parameter. Either the *SourceCCSID* parameter specifies a value that is not valid or not supported, or the *SourceCCSID* parameter pointer is not valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)

Completion Code

MQCC_WARNING or MQCC_FAILED

Programmer response

Check the character-set identifier that was specified when the message was put, or that was specified for the *SourceCCSID* parameter on the MQXCNVC call. If this is correct, check that it is one for which queue-manager conversion is supported. If queue-manager conversion is not supported for the specified character set, conversion must be carried out by the application.

Parent topic: [Reason code list](#)

fm13050_

5.2.1.102. 2112 (0840) (RC2112): MQRC_SOURCE_INTEGER_ENC_ERROR

Explanation

On an MQGET call, with the MQGMO_CONVERT option included in the *GetMsgOpts* parameter, the *Encoding* value in the message being retrieved specifies an integer encoding that is not recognized. The message data is returned unconverted, the values of the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter are set to those of the message returned, and the call completes with MQCC_WARNING.

If the message consists of several parts, each of which is described by its own *CodedCharSetId* and *Encoding* fields (for example, a message with format name MQFMT_DEAD_LETTER_HEADER), some parts may be converted and other parts not converted. However, the values returned in the various *CodedCharSetId* and *Encoding* fields always correctly describe the relevant message data.

This reason code can also occur on the MQXCNVC call, when the *Options* parameter contains an unsupported MQDCC_SOURCE_* value, or when MQDCC_SOURCE_ENC_UNDEFINED is specified for a UCS-2 code page.

Completion Code

MQCC_WARNING or MQCC_FAILED

Programmer response

Check the integer encoding that was specified when the message was put. If this is correct, check that it is one for which queue-manager conversion is supported. If queue-manager conversion is not supported for the required integer encoding, conversion must be carried out by the application.

Parent topic: [Reason code list](#)

fm13060_

5.2.1.103. 2113 (0841) (RC2113): MQRC_SOURCE_DECIMAL_ENC_ERROR

Explanation

On an MQGET call with the MQGMO_CONVERT option included in the *GetMsgOpts* parameter, the *Encoding* value in the message being retrieved specifies a decimal encoding that is not recognized. The message data is returned unconverted, the values of the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter are set to those of the message returned, and the call completes with MQCC_WARNING.

If the message consists of several parts, each of which is described by its own *CodedCharSetId* and *Encoding* fields (for example, a message with format name MQFMT_DEAD_LETTER_HEADER), some parts may be converted and other parts not converted. However, the values returned in the various *CodedCharSetId* and *Encoding* fields always correctly describe the relevant message data.

Completion Code

MQCC_WARNING

Programmer response

Check the decimal encoding that was specified when the message was put. If this is correct, check that it is one for which queue-manager conversion is supported. If queue-manager conversion is not supported for the required decimal encoding, conversion must be carried out by the application.

Parent topic: [Reason code list](#)

5.2.1.104. 2114 (0842) (RC2114): MQRC_SOURCE_FLOAT_ENC_ERROR

Explanation

On an MQGET call, with the MQGMO_CONVERT option included in the *GetMsgOpts* parameter, the *Encoding* value in the message being retrieved specifies a floating-point encoding that is not recognized. The message data is returned unconverted, the values of the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter are set to those of the message returned, and the call completes with MQCC_WARNING.

If the message consists of several parts, each of which is described by its own *CodedCharSetId* and *Encoding* fields (for example, a message with format name MQFMT_DEAD_LETTER_HEADER), some parts may be converted and other parts not converted. However, the values returned in the various *CodedCharSetId* and *Encoding* fields always correctly describe the relevant message data.

Completion Code

MQCC_WARNING

Programmer response

Check the floating-point encoding that was specified when the message was put. If this is correct, check that it is one for which queue-manager conversion is supported. If queue-manager conversion is not supported for the required floating-point encoding, conversion must be carried out by the application.

5.2.1.105. 2115 (0843) (RC2115): MQRC_TARGET_CCSID_ERROR

Explanation

The coded character-set identifier to which character data is to be converted is not valid or not supported.

This can occur on the MQGET call when the MQGMO_CONVERT option is included in the *GetMsgOpts* parameter; the coded character-set identifier in error is the *CodedCharSetId* field in the *MsgDesc* parameter. In this case, the message data is returned unconverted, the values of the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter are set to those of the message returned, and the call completes with MQCC_WARNING.

This reason can also occur on the MQGET call when the message contains one or more MQ header structures (MQCIH, MQDLH, MQIIH, MQRMH), and the *CodedCharSetId* field in the *MsgDesc* parameter specifies a character set that does not have SBCS characters for the characters that are valid in queue names. The Unicode character set UCS-2 is an example of such a character set.

This reason can also occur on the MQXCNVC call; the coded character-set identifier in error is the *TargetCCSID* parameter. Either the *TargetCCSID* parameter specifies a value that is not valid or not supported, or the *TargetCCSID* parameter pointer is not valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)

Completion Code

MQCC_WARNING or MQCC_FAILED

Programmer response

Check the character-set identifier that was specified for the *CodedCharSetId* field in the *MsgDesc* parameter on the MQGET call, or that was specified for the *SourceCCSID* parameter on the MQXCNVC call. If this is correct, check that it is one for which queue-manager conversion is supported. If queue-manager conversion is not supported for the specified character set, conversion must be carried out by the application.

This topic's URL:

fm13120_

5.2.1.109. 2119 (0847) (RC2119): MQRC_NOT_CONVERTED

Explanation

An MQGET call was issued with the MQGMO_CONVERT option specified in the *GetMsgOpts* parameter, but an error occurred during conversion of the data in the message. The message data is returned unconverted, the values of the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter are set to those of the message returned, and the call completes with MQCC_WARNING.

If the message consists of several parts, each of which is described by its own *CodedCharSetId* and *Encoding* fields (for example, a message with format name MQFMT_DEAD_LETTER_HEADER), some parts may be converted and other parts not converted. However, the values returned in the various *CodedCharSetId* and *Encoding* fields always correctly describe the relevant message data.

This error may also indicate that a parameter to the data-conversion service is not supported.

Completion Code

MQCC_WARNING

Programmer response

Check that the message data is correctly described by the *Format*, *CodedCharSetId* and *Encoding* parameters that were specified when the message was put. Also check that these values, and the *CodedCharSetId* and *Encoding* specified in the *MsgDesc* parameter on the MQGET call, are supported for queue-manager conversion. If the required conversion is not supported, conversion must be carried out by the application.

Parent topic: [Reason code list](#)

This topic's URL:

fm13130_

5.2.1.110. 2120 (0848) (RC2120): MQRC_CONVERTED_MSG_TOO_BIG

Explanation

On an MQGET call with the MQGMO_CONVERT option included in the *GetMsgOpts* parameter, the message data expanded during data conversion and exceeded the size of the buffer provided by the application.

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsa.doc/zm10120_.htm

16/03/2011

However, the message had already been removed from the queue because prior to conversion the message data could be accommodated in the application buffer without truncation.

The message is returned unconverted, with the *CompCode* parameter of the MQGET call set to MQCC_WARNING. If the message consists of several parts, each of which is described by its own character-set and encoding fields (for example, a message with format name MQFMT_DEAD_LETTER_HEADER), some parts may be converted and other parts not converted. However, the values returned in the various character-set and encoding fields always correctly describe the relevant message data.

This reason can also occur on the MQXCNVC call, when the *TargetBuffer* parameter is too small to accommodate the converted string, and the string has been truncated to fit in the buffer. The length of valid data returned is given by the *DataLength* parameter; in the case of a DBCS string or mixed SBCS/DBCS string, this length may be *less than* the length of *TargetBuffer*.

Completion Code

MQCC_WARNING

Programmer response

For the MQGET call, check that the exit is converting the message data correctly and setting the output length *DataLength* to the appropriate value. If it is, the application issuing the MQGET call must provide a larger buffer for the *Buffer* parameter.

For the MQXCNVC call, if the string must be converted without truncation, provide a larger output buffer.

5.2.1.111. 2121 (0849) (RC2121): MQRC_NO_EXTERNAL_PARTICIPANTS

Explanation

An MQBEGIN call was issued to start a unit of work coordinated by the queue manager, but no participating resource managers have been registered with the queue manager. As a result, only changes to MQ resources can be coordinated by the queue manager in the unit of work.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows.

Completion Code

MQCC_WARNING

Programmer response

If the application does not require non-MQ resources to participate in the unit of work, this reason code can be ignored or the MQBEGIN call removed. Otherwise consult your system programmer to determine why the required resource managers have not been registered with the queue manager; the queue manager's configuration file may be in error.

Parent topic: [Reason code list](#)

This topic's URL:

fm13160_

5.2.1.113. 2123 (084B) (RC2123): MQRC_OUTCOME_MIXED

Explanation

The queue manager is acting as the unit-of-work coordinator for a unit of work that involves other resource managers, but one of the following occurred:

- An MQCMIT or MQDISC call was issued to commit the unit of work, but one or more of the participating resource managers backed-out the unit of work instead of committing it. As a result, the outcome of the unit of work is mixed.
- An MQBACK call was issued to back out a unit of work, but one or more of the participating resource managers had already committed the unit of work.

This reason code occurs in the following environments: AIX®, HP-UX, Solaris, Windows.

Completion Code

MQCC_FAILED

Programmer response

Examine the queue-manager error logs for messages relating to the mixed outcome; these messages identify the resource managers that are affected. Use procedures local to the affected resource managers to resynchronize the resources.

This reason code does not prevent the application initiating further units of work.

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

5.2.1.116. 2126 (084E) (RC2126): MQRC_BRIDGE_STOPPED

Explanation

The IMS™ bridge has been stopped.

Completion Code

MQCC_WARNING

Programmer response

None. This reason code is only used to identify the corresponding event message.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:54

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

5.2.1.117. 2127 (084F) (RC2127): MQRC_ADAPTER_STORAGE_SHORTAGE

Explanation

On an MQCONN call, the adapter was unable to acquire storage.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Notify the system programmer. The system programmer should determine why the system is short on storage, and take appropriate action, for example, increase the region size on the step or job card.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:54

This topic's URL:

fm13210_

5.2.1.118. 2128 (0850) (RC2128): MQRC_UOW_IN_PROGRESS

Explanation

An MQBEGIN call was issued to start a unit of work coordinated by the queue manager, but a unit of work is already in existence for the connection handle specified. This may be a global unit of work started by a

previous MQBEGIN call, or a unit of work that is local to the queue manager or one of the cooperating resource managers. No more than one unit of work can exist concurrently for a connection handle.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows.

Completion Code

MQCC_FAILED

Programmer response

Review the application logic to determine why there is a unit of work already in existence. Move the MQBEGIN call to the appropriate place in the application.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:54

5.2.1.119. 2129 (0851) (RC2129): MQRC_ADAPTER_CONN_LOAD_ERROR

Explanation

On an MQCONN call, the connection handling module could not be loaded, so the adapter could not link to it.

▶ The connection handling module name is: 

- CSQBICON for batch applications
- CSQQCONN or CSQQCON2 for IMS™ applications

◀

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Ensure that the correct library concatenation has been specified in the batch application program execution JCL, and in the queue-manager startup JCL.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:54

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

fm13270_

5.2.1.124. 2134 (0856) (RC2134): MQRC_BO_ERROR

Explanation

On an MQBEGIN call, the begin-options structure MQBO is not valid, for one of the following reasons:

- The *StrucId* field is not MQBO_STRUC_ID.
- The *Version* field is not MQBO_VERSION_1.
- The parameter pointer is not valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)
- The queue manager cannot copy the changed structure to application storage, even though the call is successful. This can occur, for example, if the pointer points to read-only storage.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Ensure that input fields in the MQBO structure are set correctly.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:55

fm13280_

5.2.1.125. 2135 (0857) (RC2135): MQRC_DH_ERROR

Explanation

An MQPUT or MQPUT1 call was issued, but the message data contains an MQDH structure that is not valid. Possible errors include the following:

- The *StrucId* field is not MQDH_STRUC_ID.
- The *Version* field is not MQDH_VERSION_1.
- The *StrucLength* field specifies a value that is too small to include the structure plus the arrays of MQOR and MQPMR records.
- The *CodedCharSetId* field is zero, or a negative value that is not valid.
- The *BufferLength* parameter of the call has a value that is too small to accommodate the structure (the structure extends beyond the end of the message).

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Check that the fields in the structure are set correctly. Ensure that the application sets the *CodedCharSetId* field to a valid value (note: MQCCSI_DEFAULT, MQCCSI_EMBEDDED, MQCCSI_Q_MGR, and MQCCSI_UNDEFINED are *not* valid in this field).

Parent topic: [Reason code list](#)

This topic's URL:

fm13290_

5.2.1.126. 2136 (0858) (RC2136): MQRC_MULTIPLE_REASONS

Explanation

An MQOPEN, MQPUT or MQPUT1 call was issued to open a distribution list or put a message to a distribution list, but the result of the call was not the same for all of the destinations in the list. One of the following applies:

- The call succeeded for some of the destinations but not others. The completion code is MQCC_WARNING in this case.
- The call failed for all of the destinations, but for differing reasons. The completion code is MQCC_FAILED in this case.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_WARNING or MQCC_FAILED

Programmer response

Examine the MQRR response records to identify the destinations for which the call failed, and the reason for the failure. Ensure that sufficient response records are provided by the application on the call to enable the error(s) to be determined. For the MQPUT1 call, the response records must be specified using the MQOD structure, and not the MQPMO structure.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:55

This topic's URL:

fm13300_

5.2.1.127. 2137 (0859) (RC2137): MQRC_OPEN_FAILED

Explanation

A queue or other MQ object could not be opened successfully, for one of the following reasons:

- An MQCONN or MQCONNX call was issued, but the queue manager was unable to open an object that is used internally by the queue manager. As a result, processing cannot continue. The error log will contain the name of the object that could not be opened.
- An MQPUT call was issued to put a message to a distribution list, but the message could not be sent to the destination to which this reason code applies because that destination was not opened successfully by the MQOPEN call. This reason occurs only in the *Reason* field of the MQRR response record.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Do one of the following:

- If the error occurred on the MQCONN or MQCONNX call, ensure that the required objects exist by running the following command and then retrying the application:

```
STRMQM -c qmgr
```

where `qmgr` should be replaced by the name of the queue manager.

- If the error occurred on the MQPUT call, examine the MQRR response records specified on the MQOPEN call to determine the reason that the queue failed to open. Ensure that sufficient response records are provided by the application on the call to enable the error(s) to be determined.

fm13310_

5.2.1.128. 2138 (085A) (RC2138): MQRC_ADAPTER_DISC_LOAD_ERROR

Explanation

On an MQDISC call, the disconnect handling module (CSQBDSC for batch and CSQQDISC for IMS™) could not be loaded, so the adapter could not link to it.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Ensure that the correct library concatenation has been specified in the application program execution JCL, and in the queue-manager startup JCL. Any uncommitted changes in a unit of work should be backed out. A unit of work that is coordinated by the queue manager is backed out automatically.

Parent topic: [Reason code list](#)

5.2.1.129. 2139 (085B) (RC2139): MQRC_CNO_ERROR

Explanation

On an MQCONN call, the connect-options structure MQCNO is not valid, for one of the following reasons:

- The *StrucId* field is not MQCNO_STRUC_ID.
- The *Version* field specifies a value that is not valid or not supported.
- The parameter pointer is not valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)
- The queue manager cannot copy the changed structure to application storage, even though the call is successful. This can occur, for example, if the parameter pointer points to read-only storage.

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Ensure that input fields in the MQCNO structure are set correctly.

Parent topic: [Reason code list](#)

5.2.1.130. 2140 (085C) (RC2140): MQRC_CICS_WAIT_FAILED

Explanation

On any MQI call, the CICS® adapter issued an EXEC CICS WAIT request, but the request was rejected by CICS.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Examine the CICS trace data for actual response codes. The most likely cause is that the task has been canceled by the operator or by the system.

Parent topic: [Reason code list](#)

5.2.1.131. 2141 (085D) (RC2141): MQRC_DLH_ERROR

Explanation

An MQPUT or MQPUT1 call was issued, but the message data contains an MQDLH structure that is not valid. Possible errors include the following:

- The *StrucId* field is not MQDLH_STRUC_ID.
- The *Version* field is not MQDLH_VERSION_1.
- The *CodedCharSetId* field is zero, or a negative value that is not valid.
- The *BufferLength* parameter of the call has a value that is too small to accommodate the structure (the structure extends beyond the end of the message).

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Check that the fields in the structure are set correctly. Ensure that the application sets the *CodedCharSetId* field to a valid value (note: MQCCSI_DEFAULT, MQCCSI_EMBEDDED, MQCCSI_Q_MGR, and MQCCSI_UNDEFINED are *not* valid in this field).

5.2.1.132. 2142 (085E) (RC2142): MQRC_HEADER_ERROR

Explanation

An MQPUT or MQPUT1 call was issued, but the message data contains an MQ header structure that is not valid. Possible errors include the following:

- The *StrucId* field is not valid.
- The *Version* field is not valid.
- The *StrucLength* field specifies a value that is too small.
- The *CodedCharSetId* field is zero, or a negative value that is not valid.
- The *BufferLength* parameter of the call has a value that is too small to accommodate the structure (the structure extends beyond the end of the message).

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Check that the fields in the structure are set correctly. Ensure that the application sets the *CodedCharSetId* field to a valid value (note: MQCCSI_DEFAULT, MQCCSI_EMBEDDED, MQCCSI_Q_MGR, and MQCCSI_UNDEFINED are *not* valid in this field).

This topic's URL:

fm13360_

5.2.1.133. 2143 (085F) (RC2143): MQRC_SOURCE_LENGTH_ERROR

Explanation

On the MQXCNCV call, the *SourceLength* parameter specifies a length that is less than zero or not consistent with the string's character set or content (for example, the character set is a double-byte character set, but the length is not a multiple of two). This reason also occurs if the *SourceLength* parameter pointer is not

valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)

This reason code can also occur on the MQGET call when the MQGMO_CONVERT option is specified. In this case it indicates that the MQRC_SOURCE_LENGTH_ERROR reason was returned by an MQXCNVC call issued by the data conversion exit.

Completion Code

MQCC_WARNING or MQCC_FAILED

Programmer response

Specify a length that is zero or greater. If the reason code occurs on the MQGET call, check that the logic in the data-conversion exit is correct.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:56

fm13370_

5.2.1.134. 2144 (0860) (RC2144): MQRC_TARGET_LENGTH_ERROR

Explanation

On the MQXCNVC call, the *TargetLength* parameter is not valid for one of the following reasons:

- *TargetLength* is less than zero.
- The *TargetLength* parameter pointer is not valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)
- The MQDCC_FILL_TARGET_BUFFER option is specified, but the value of *TargetLength* is such that the target buffer cannot be filled completely with valid characters. This can occur when *TargetCCSID* is a pure DBCS character set (such as UCS-2), but *TargetLength* specifies a length that is an odd number of bytes.

This reason code can also occur on the MQGET call when the MQGMO_CONVERT option is specified. In this case it indicates that the MQRC_TARGET_LENGTH_ERROR reason was returned by an MQXCNVC call issued by the data conversion exit.

Completion Code

MQCC_WARNING or MQCC_FAILED

Programmer response

Specify a length that is zero or greater. If the MQDCC_FILL_TARGET_BUFFER option is specified, and *TargetCCSID* is a pure DBCS character set, ensure that *TargetLength* specifies a length that is a multiple of two.

If the reason code occurs on the MQGET call, check that the logic in the data-conversion exit is correct.

5.2.1.137. 2148 (0864) (RC2148): MQRC_IIH_ERROR

Explanation

An MQPUT or MQPUT1 call was issued, but the message data contains an MQIIH structure that is not valid. Possible errors include the following:

- The *StrucId* field is not MQIIH_STRUC_ID.
- The *Version* field is not MQIIH_VERSION_1.
- The *StrucLength* field is not MQIIH_LENGTH_1.
- The *BufferLength* parameter of the call has a value that is too small to accommodate the structure (the structure extends beyond the end of the message).

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Check that the fields in the structure are set correctly.

Parent topic: [Reason code list](#)

fm13410_

5.2.1.138. 2149 (0865) (RC2149): MQRC_PCF_ERROR

Explanation

An MQPUT or MQPUT1 call was issued to put a message containing PCF data, but the length of the message does not equal the sum of the lengths of the PCF structures present in the message. This can occur for messages with the following format names:

- MQFMT_ADMIN
- MQFMT_EVENT
- MQFMT_PCF

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Ensure that the length of the message specified on the MQPUT or MQPUT1 call equals the sum of the lengths of the PCF structures contained within the message data.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:56

5.2.1.139. 2150 (0866) (RC2150): MQRC_DBCS_ERROR

Explanation

An error was encountered attempting to convert a double-byte character set (DBCS) string. This can occur in the following cases:

- On the MQXCNVC call, when the *SourceCCSID* parameter specifies the coded character-set identifier of a double-byte character set, but the *SourceBuffer* parameter does not contain a valid DBCS string. This may be because the string contains characters that are not valid DBCS characters, or because the string is a mixed SBCS/DBCS string and the shift-out/shift-in characters are not correctly paired. The completion code is MQCC_FAILED in this case.
- On the MQGET call, when the MQGMO_CONVERT option is specified. In this case it indicates that the MQRC_DBCS_ERROR reason code was returned by an MQXCNVC call issued by the data conversion exit. The completion code is MQCC_WARNING in this case.

Completion Code

MQCC_WARNING or MQCC_FAILED

Programmer response

Specify a valid string.

If the reason code occurs on the MQGET call, check that the data in the message is valid, and that the logic in the data-conversion exit is correct.

Parent topic: [Reason code list](#)

5.2.1.140. 2152 (0868) (RC2152): MQRC_OBJECT_NAME_ERROR

Explanation

An MQOPEN or MQPUT1 call was issued to open a distribution list (that is, the *RecsPresent* field in MQOD is greater than zero), but the *ObjectName* field is neither blank nor the null string.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

If it is intended to open a distribution list, set the *ObjectName* field to blanks or the null string. If it is not intended to open a distribution list, set the *RecsPresent* field to zero.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:56

5.2.1.141. 2153 (0869) (RC2153): MQRC_OBJECT_Q_MGR_NAME_ERROR

Explanation

An MQOPEN or MQPUT1 call was issued to open a distribution list (that is, the *RecsPresent* field in MQOD is greater than zero), but the *ObjectQMgrName* field is neither blank nor the null string.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

If it is intended to open a distribution list, set the *ObjectQMgrName* field to blanks or the null string. If it is not intended to open a distribution list, set the *RecsPresent* field to zero.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:57

5.2.1.142. 2154 (086A) (RC2154): MQRC_RECS_PRESENT_ERROR

Explanation

An MQOPEN or MQPUT1 call was issued, but the call failed for one of the following reasons:

- *RecsPresent* in MQOD is less than zero.
- *ObjectType* in MQOD is not MQOT_Q, and *RecsPresent* is not zero. *RecsPresent* must be zero if the object being opened is not a queue.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

If it is intended to open a distribution list, set the *ObjectType* field to MQOT_Q and *RecsPresent* to the number of destinations in the list. If it is not intended to open a distribution list, set the *RecsPresent* field to zero.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:57

5.2.1.143. 2155 (086B) (RC2155): MQRC_OBJECT_RECORDS_ERROR

Explanation

An MQOPEN or MQPUT1 call was issued to open a distribution list (that is, the *RecsPresent* field in MQOD is greater than zero), but the MQOR object records are not specified correctly. One of the following applies:

- *ObjectRecOffset* is zero and *ObjectRecPtr* is zero or the null pointer.
- *ObjectRecOffset* is not zero and *ObjectRecPtr* is not zero and not the null pointer.
- *ObjectRecPtr* is not a valid pointer.
- *ObjectRecPtr* or *ObjectRecOffset* points to storage that is not accessible.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Ensure that one of *ObjectRecOffset* and *ObjectRecPtr* is zero and the other nonzero. Ensure that the field used points to accessible storage.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:57

5.2.1.144. 2156 (086C) (RC2156): MQRC_RESPONSE_RECORDS_ERROR

Explanation

An MQOPEN or MQPUT1 call was issued to open a distribution list (that is, the *RecsPresent* field in MQOD is greater than zero), but the MQRR response records are not specified correctly. One of the following applies:

- *ResponseRecOffset* is not zero and *ResponseRecPtr* is not zero and not the null pointer.
- *ResponseRecPtr* is not a valid pointer.
- *ResponseRecPtr* or *ResponseRecOffset* points to storage that is not accessible.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Ensure that at least one of *ResponseRecOffset* and *ResponseRecPtr* is zero. Ensure that the field used points to accessible storage.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:57

5.2.1.145. 2157 (086D) (RC2157): MQRC_ASID_MISMATCH

Explanation

On any MQI call, the caller's primary ASID was found to be different from the home ASID.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Correct the application (MQI calls cannot be issued in cross-memory mode). Any uncommitted changes in a unit of work should be backed out. A unit of work that is coordinated by the queue manager is backed out automatically.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:57

5.2.1.146. 2158 (086E) (RC2158): MQRC_PMO_RECORD_FLAGS_ERROR

Explanation

An MQPUT or MQPUT1 call was issued to put a message, but the *PutMsgRecFields* field in the MQPMO structure is not valid, for one of the following reasons:

- The field contains flags that are not valid.
- The message is being put to a distribution list, and put message records have been provided (that is, *RecsPresent* is greater than zero, and one of *PutMsgRecOffset* or *PutMsgRecPtr* is nonzero), but *PutMsgRecFields* has the value MQPMRF_NONE.
- MQPMRF_ACCOUNTING_TOKEN is specified without either MQPMO_SET_IDENTITY_CONTEXT or MQPMO_SET_ALL_CONTEXT.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Ensure that *PutMsgRecFields* is set with the appropriate MQPMRF_* flags to indicate which fields are present in the put message records. If MQPMRF_ACCOUNTING_TOKEN is specified, ensure that either MQPMO_SET_IDENTITY_CONTEXT or MQPMO_SET_ALL_CONTEXT is also specified. Alternatively, set both *PutMsgRecOffset* and *PutMsgRecPtr* to zero.

Parent topic: [Reason code list](#)

5.2.1.147. 2159 (086F) (RC2159): MQRC_PUT_MSG_RECORDS_ERROR

Explanation

An MQPUT or MQPUT1 call was issued to put a message to a distribution list, but the MQPMR put message records are not specified correctly. One of the following applies:

- *PutMsgRecOffset* is not zero and *PutMsgRecPtr* is not zero and not the null pointer.
- *PutMsgRecPtr* is not a valid pointer.
- *PutMsgRecPtr* or *PutMsgRecOffset* points to storage that is not accessible.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Ensure that at least one of *PutMsgRecOffset* and *PutMsgRecPtr* is zero. Ensure that the field used points to accessible storage.

Parent topic: [Reason code list](#)

5.2.1.148. 2160 (0870) (RC2160): MQRC_CONN_ID_IN_USE

Explanation

On an MQCONN call, the connection identifier assigned by the queue manager to the connection between a CICS® or IMS™ allied address space and the queue manager conflicts with the connection identifier of another connected CICS or IMS system. The connection identifier assigned is as follows:

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

- For CICS, the applid
- For IMS, the IMSID parameter on the IMSCTRL (sysgen) macro, or the IMSID parameter on the execution parameter (EXEC card in IMS control region JCL)
- For batch, the job name
- For TSO, the user ID

A conflict arises only if there are two CICS systems, two IMS systems, or one each of CICS and IMS, having the same connection identifiers. Batch and TSO connections need not have unique identifiers.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Ensure that the naming conventions used in different systems that might connect to the queue manager do not conflict.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:58

This topic's URL:

fm13520_

5.2.1.149. 2161 (0871) (RC2161): MQRC_Q_MGR QUIESCING

Explanation

An MQI call was issued, but the call failed because the queue manager is quiescing (preparing to shut down).

When the queue manager is quiescing, the MQOPEN, MQPUT, MQPUT1, and MQGET calls can still complete successfully, but the application can request that they fail by specifying the appropriate option on the call:

- MQOO_FAIL_IF QUIESCING on MQOPEN
- MQPMO_FAIL_IF QUIESCING on MQPUT or MQPUT1
- MQGMO_FAIL_IF QUIESCING on MQGET

Specifying these options enables the application to become aware that the queue manager is preparing to shut down.

- On z/OS®:
 - For batch applications, this reason can be returned to applications running in LPARs that do not have a queue manager installed.
 - For CICS® applications, this reason can be returned when no connection was established.
- On i5/OS® for applications running in compatibility mode, this reason can be returned when no connection was established.

Completion Code

MQCC_FAILED

Programmer response

The application should tidy up and end. If the application specified the MQOO_FAIL_IF QUIESCING, MQPMO_FAIL_IF QUIESCING, or MQGMO_FAIL_IF QUIESCING option on the failing call, the relevant option can be removed and the call reissued. By omitting these options, the application can continue working in order

to complete and commit the current unit of work, but the application does not start a new unit of work.

Parent topic: [Reason code list](#)

5.2.1.150. 2162 (0872) (RC2162): MQRC_Q_MGR_STOPPING

Explanation

An MQI call was issued, but the call failed because the queue manager is shutting down. If the call was an MQGET call with the MQGMO_WAIT option, the wait has been canceled. No more MQI calls can be issued.

For MQ client applications, it is possible that the call did complete successfully, even though this reason code is returned with a *CompCode* of MQCC_FAILED.

- On z/OS®, the MQRC_CONNECTION_BROKEN reason may be returned instead if, as a result of system scheduling factors, the queue manager shuts down before the call completes.

Completion Code

MQCC_FAILED

Programmer response

The application should tidy up and end. If the application is in the middle of a unit of work coordinated by an external unit-of-work coordinator, the application should issue the appropriate call to back out the unit of work. Any unit of work that is coordinated by the queue manager is backed out automatically.

5.2.1.152. 2173 (087D) (RC2173): MQRC_PMO_ERROR

Explanation

On an MQPUT or MQPUT1 call, the MQPMO structure is not valid, for one of the following reasons:

- The *StrucId* field is not MQPMO_STRUC_ID.
- The *Version* field specifies a value that is not valid or not supported.
- The parameter pointer is not valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)
- The queue manager cannot copy the changed structure to application storage, even though the call is successful. This can occur, for example, if the pointer points to read-only storage.

Completion Code

MQCC_FAILED

Programmer response

Ensure that input fields in the MQPMO structure are set correctly.

Parent topic: [Reason code list](#)

5.2.1.154. 2184 (0888) (RC2184): MQRC_REMOTE_Q_NAME_ERROR

Explanation

On an MQOPEN or MQPUT1 call, one of the following occurred:

- A local definition of a remote queue (or an alias to one) was specified, but the *RemoteQName* attribute in the remote queue definition is entirely blank. Note that this error occurs even if the *XmitQName* in the definition is not blank.
- The *ObjectQMGrName* field in the object descriptor is not blank and not the name of the local queue manager, but the *ObjectName* field is blank.

Completion Code

MQCC_FAILED

Programmer response

Alter the local definition of the remote queue and supply a valid remote queue name, or supply a nonblank *ObjectName* in the object descriptor, as appropriate.

Parent topic: [Reason code list](#)

This build: January 26, 2011 11:41:58

This topic's URL:

fm13580_

5.2.1.155. 2185 (0889) (RC2185): MQRC_INCONSISTENT_PERSISTENCE

Explanation

An MQPUT call was issued to put a message in a group or a segment of a logical message, but the value specified or defaulted for the *Persistence* field in MQMD is not consistent with the current group and segment information retained by the queue manager for the queue handle. All messages in a group and all segments in a logical message must have the same value for persistence, that is, all must be persistent, or all must be nonpersistent.

If the current call specifies MQPMO_LOGICAL_ORDER, the call fails. If the current call does not specify MQPMO_LOGICAL_ORDER, but the previous MQPUT call for the queue handle did, the call succeeds with completion code MQCC_WARNING.

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_WARNING or MQCC_FAILED

Programmer response

Modify the application to ensure that the same value of persistence is used for all messages in the group, or all segments of the logical message.

Parent topic: [Reason code list](#)

5.2.1.156. 2186 (088A) (RC2186): MQRC_GMO_ERROR

Explanation

On an MQGET call, the MQGMO structure is not valid, for one of the following reasons:

- The *StrucId* field is not MQGMO_STRUC_ID.
- The *Version* field specifies a value that is not valid or not supported.
- The parameter pointer is not valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)
- The queue manager cannot copy the changed structure to application storage, even though the call is successful. This can occur, for example, if the pointer points to read-only storage.

Completion Code

MQCC_FAILED

Programmer response

Ensure that input fields in the MQGMO structure are set correctly.

Parent topic: [Reason code list](#)

This topic's URL:

fm13600_

5.2.1.157. 2187 (088B) (RC2187): MQRC_CICS_BRIDGE_RESTRICTION

Explanation

It is not permitted to issue MQI calls from user transactions that are run in an MQ/CICS-bridge environment where the bridge exit also issues MQI calls. The MQI call fails. If this occurs in the bridge exit, it will result in a transaction abend. If it occurs in the user transaction, this may result in a transaction abend.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

The transaction cannot be run using the MQ/CICS bridge. Refer to the appropriate CICS® manual for information about restrictions in the MQ/CICS bridge environment.

Parent topic: [Reason code list](#)

This topic's URL:

fm13630_

5.2.1.160. 2190 (088E) (RC2190): MQRC_CONVERTED_STRING_TOO_BIG

Explanation

On an MQGET call with the MQGMO_CONVERT option included in the *GetMsgOpts* parameter, a string in a fixed-length field in the message expanded during data conversion and exceeded the size of the field. When this happens, the queue manager tries discarding trailing blank characters and characters following the first null character in order to make the string fit, but in this case there were insufficient characters that could be discarded.

This reason code can also occur for messages with a format name of MQFMT_IMS_VAR_STRING. When this happens, it indicates that the IMS™ variable string expanded such that its length exceeded the capacity of the 2-byte binary length field contained within the structure of the IMS variable string. (The queue manager never discards trailing blanks in an IMS variable string.)

The message is returned unconverted, with the *CompCode* parameter of the MQGET call set to MQCC_WARNING. If the message consists of several parts, each of which is described by its own character-set and encoding fields (for example, a message with format name MQFMT_DEAD_LETTER_HEADER), some parts may be converted and other parts not converted. However, the values returned in the various character-set and encoding fields always correctly describe the relevant message data.

This reason code does not occur if the string could be made to fit by discarding trailing blank characters.

Completion Code

MQCC_WARNING

Programmer response

Check that the fields in the message contain the correct values, and that the character-set identifiers specified by the sender and receiver of the message are correct. If they are, the layout of the data in the message must be modified to increase the lengths of the field(s) so that there is sufficient space to allow the string(s) to expand when converted.

5.2.1.161. 2191 (088F) (RC2191): MQRC_TMC_ERROR

Explanation

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

An MQPUT or MQPUT1 call was issued, but the message data contains an MQTMC2 structure that is not valid. Possible errors include the following:

- The *StrucId* field is not MQTMC_STRUC_ID.
- The *Version* field is not MQTMC_VERSION_2.
- The *BufferLength* parameter of the call has a value that is too small to accommodate the structure (the structure extends beyond the end of the message).

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Check that the fields in the structure are set correctly.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:41:59

This topic's URL:

fm13660_

5.2.1.163. 2192 (0890) (RC2192): MQRC_STORAGE_MEDIUM_FULL

Explanation

An MQI call or command was issued to operate on an object, but the call failed because the external storage medium is full. One of the following applies:

- A page-set data set is full (nonshared queues only).
- A coupling-facility structure is full (shared queues only).

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Check which queues contain messages and look for applications that might be filling the queues unintentionally. Be aware that the queue that has caused the page set or coupling-facility structure to become full is not necessarily the queue referenced by the MQI call that returned MQRC_STORAGE_MEDIUM_FULL.

Check that all of the usual server applications are operating correctly and processing the messages on the queues.

If the applications and servers are operating correctly, increase the number of server applications to cope with the message load, or request the system programmer to increase the size of the page-set data sets.

5.2.1.164. 2193 (0891) (RC2193): MQRC_PAGESET_ERROR

Explanation

An error was encountered with the page set while attempting to access it for a locally defined queue. This could be because the queue is on a page set that does not exist. A console message is issued that tells you the number of the page set in error. For example if the error occurred in the TEST job, and your user identifier is ABCDEFG, the message is:

```
CSQI041I CSQIALLC JOB TEST USER ABCDEFG HAD ERROR ACCESSING PAGE SET 27
```

If this reason code occurs while attempting to delete a dynamic queue with MQCLOSE, the dynamic queue has not been deleted.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Check that the storage class for the queue maps to a valid page set using the DISPLAY Q(xx) STGCLASS, DISPLAY STGCLASS(xx), and DISPLAY USAGE PSID commands. If you are unable to resolve the problem, notify the system programmer who should:

- Collect the following diagnostic information:
 - A description of the actions that led to the error
 - A listing of the application program being run at the time of the error
 - Details of the page sets defined for use by the queue manager
- Attempt to re-create the problem, and take a system dump immediately after the error occurs
- Contact your IBM® Support Center

5.2.1.165. 2194 (0892) (RC2194): MQRC_NAME_NOT_VALID_FOR_TYPE

Explanation

An MQOPEN call was issued to open the queue manager definition, but the *ObjectName* field in the *ObjDesc* parameter is not blank.

Completion Code

MQCC_FAILED

Programmer response

Ensure that the *ObjectName* field is set to blanks.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:00

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

5.2.1.166. 2195 (0893) (RC2195): MQRC_UNEXPECTED_ERROR

Explanation

The call was rejected because an unexpected error occurred.

Completion Code

MQCC_FAILED

Programmer response

Check the application's parameter list to ensure, for example, that the correct number of parameters was passed, and that data pointers and storage keys are valid. If the problem cannot be resolved, contact your system programmer.

- On z/OS®, check whether any information has been displayed on the console. If this error occurs on an MQCONN or MQCONNX call, check that the subsystem named is an active MQ subsystem. In particular, check that it is not a DB2™ subsystem. If the problem cannot be resolved, rerun the application with a CSQSNAP DD card (if you have not already got a dump) and send the resulting dump to IBM®.
- On i5/OS®, consult the FFST™ record to obtain more detail about the problem.
- On HP OpenVMS, Compaq NonStop Kernel, and UNIX systems, consult the FDC file to obtain more detail about the problem.

5.2.1.167. 2196 (0894) (RC2196): MQRC_UNKNOWN_XMIT_Q

Explanation

On an MQOPEN or MQPUT1 call, a message is to be sent to a remote queue manager. The *ObjectName* or the *ObjectQMgrName* in the object descriptor specifies the name of a local definition of a remote queue (in the latter case queue-manager aliasing is being used), but the *XmitQName* attribute of the definition is not blank and not the name of a locally-defined queue.

Completion Code

MQCC_FAILED

Programmer response

Check the values specified for *ObjectName* and *ObjectQMgrName*. If these are correct, check the queue definitions. For more information on transmission queues, see the [WebSphere MQ Application Programming Guide](#).

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:00

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

This topic's URL:

fm13710_

5.2.1.168. 2197 (0895) (RC2197): MQRC_UNKNOWN_DEF_XMIT_Q

Explanation

An MQOPEN or MQPUT1 call was issued specifying a remote queue as the destination. If a local definition of the remote queue was specified, or if a queue-manager alias is being resolved, the *XmitQName* attribute in the local definition is blank.

Because there is no queue defined with the same name as the destination queue manager, the queue manager has attempted to use the default transmission queue. However, the name defined by the *DefXmitQName* queue-manager attribute is not the name of a locally-defined queue.

Completion Code

MQCC_FAILED

Programmer response

Correct the queue definitions, or the queue-manager attribute. See the [WebSphere MQ Application Programming Guide](#) for more information.

Parent topic: [Reason code list](#)

5.2.1.169. 2198 (0896) (RC2198): MQRC_DEF_XMIT_Q_TYPE_ERROR

Explanation

An MQOPEN or MQPUT1 call was issued specifying a remote queue as the destination. Either a local definition of the remote queue was specified, or a queue-manager alias was being resolved, but in either case the *XmitQName* attribute in the local definition is blank.

Because there is no transmission queue defined with the same name as the destination queue manager, the local queue manager has attempted to use the default transmission queue. However, although there is a queue defined by the *DefXmitQName* queue-manager attribute, it is not a local queue.

Completion Code

MQCC_FAILED

Programmer response

Do one of the following:

- Specify a local transmission queue as the value of the *XmitQName* attribute in the local definition of the remote queue.
- Define a local transmission queue with a name that is the same as that of the remote queue manager.
- Specify a local transmission queue as the value of the *DefXmitQName* queue-manager attribute.

See the [WebSphere MQ Application Programming Guide](#) for more information.

5.2.1.170. 2199 (0897) (RC2199): MQRC_DEF_XMIT_Q_USAGE_ERROR

Explanation

An MQOPEN or MQPUT1 call was issued specifying a remote queue as the destination. Either a local definition of the remote queue was specified, or a queue-manager alias was being resolved, but in either case the *XmitQName* attribute in the local definition is blank.

Because there is no transmission queue defined with the same name as the destination queue manager, the local queue manager has attempted to use the default transmission queue. However, the queue defined by the *DefXmitQName* queue-manager attribute does not have a *Usage* attribute of MQUS_TRANSMISSION.

Completion Code

MQCC_FAILED

Programmer response

Do one of the following:

- Specify a local transmission queue as the value of the *XmitQName* attribute in the local definition of the remote queue.
- Define a local transmission queue with a name that is the same as that of the remote queue manager.
- Specify a different local transmission queue as the value of the *DefXmitQName* queue-manager attribute.
- Change the *Usage* attribute of the *DefXmitQName* queue to MQUS_TRANSMISSION.

See the [WebSphere MQ Application Programming Guide](#) for more information.

fm13740_

5.2.1.171. 2201 (0899) (RC2201): MQRC_NAME_IN_USE

Explanation

An MQOPEN call was issued to create a dynamic queue, but a queue with the same name as the dynamic queue already exists. The existing queue is one that is logically deleted, but for which there are still one or more open handles. For more information, see the description of MQCLOSE in the [WebSphere MQ Application Programming Reference](#).

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Either ensure that all handles for the previous dynamic queue are closed, or ensure that the name of the new queue is unique; see the description for reason code MQRC_OBJECT_ALREADY_EXISTS.

Parent topic: [Reason code list](#)

5.2.1.172. 2202 (089A) (RC2202): MQRC_CONNECTION_QUIESCING

Explanation

This reason code is issued when the connection to the queue manager is in quiescing state, and an application issues one of the following calls:

- MQCONN or MQCONNX
- MQOPEN, with no connection established, or with MQOO_FAIL_IF_QUIESCING included in the *Options* parameter
- MQGET, with MQGMO_FAIL_IF_QUIESCING included in the *Options* field of the *GetMsgOpts* parameter
- MQPUT or MQPUT1, with MQPMO_FAIL_IF_QUIESCING included in the *Options* field of the *PutMsgOpts* parameter

MQRC_CONNECTION_QUIESCING is also issued by the message channel agent (MCA) when the queue manager is in quiescing state.

Completion Code

MQCC_FAILED

Programmer response

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

The application should tidy up and terminate. Any uncommitted changes in a unit of work should be backed out.

Parent topic: [Reason code list](#)

5.2.1.173. 2203 (089B) (RC2203): MQRC_CONNECTION_STOPPING

Explanation

This reason code is issued when the connection to the queue manager is shutting down, and the application issues an MQI call. No more message-queuing calls can be issued. For the MQGET call, if the MQGMO_WAIT option was specified, the wait is canceled.

Note that the MQRC_CONNECTION_BROKEN reason may be returned instead if, as a result of system scheduling factors, the queue manager shuts down before the call completes.

MQRC_CONNECTION_STOPPING is also issued by the message channel agent (MCA) when the queue manager is shutting down.

For MQ client applications, it is possible that the call did complete successfully, even though this reason code is returned with a *CompCode* of MQCC_FAILED.

Completion Code

MQCC_FAILED

Programmer response

The application should tidy up and terminate. Any uncommitted changes in a unit of work should be backed out. A unit of work that is coordinated by the queue manager is backed out automatically.

Parent topic: [Reason code list](#)

This topic's URL:

fm13780_

5.2.1.175. 2206 (089E) (RC2206): MQRC_MSG_ID_ERROR

Explanation

An MQGET call was issued to retrieve a message using the message identifier as a selection criterion, but the call failed because selection by message identifier is not supported on this queue.

- On z/OS®, the queue is a shared queue, but the *IndexType* queue attribute does not have an appropriate value:
 - If selection is by message identifier alone, *IndexType* must have the value MQIT_MSG_ID.
 - If selection is by message identifier and correlation identifier combined, *IndexType* must have the value MQIT_MSG_ID or MQIT_CORREL_ID.
- On Compaq NonStop Kernel, a key file is required but has not been defined.

Completion Code

MQCC_FAILED

Programmer response

Do one of the following:

- Modify the application so that it does not use selection by message identifier: set the *MsgId* field to MQMI_NONE and do not specify MQMO_MATCH_MSG_ID in MQGMO.
- On z/OS, change the *IndexType* queue attribute to MQIT_MSG_ID.
- On Compaq NonStop Kernel, define a key file.

Parent topic: [Reason code list](#)

5.2.1.176. 2207 (089F) (RC2207): MQRC_CORREL_ID_ERROR

Explanation

An MQGET call was issued to retrieve a message using the correlation identifier as a selection criterion, but the call failed because selection by correlation identifier is not supported on this queue.

- On z/OS®, the queue is a shared queue, but the *IndexType* queue attribute does not have an appropriate value:

- If selection is by correlation identifier alone, *IndexType* must have the value MQIT_CORREL_ID.
 - If selection is by correlation identifier and message identifier combined, *IndexType* must have the value MQIT_CORREL_ID or MQIT_MSG_ID.
- On Compaq NonStop Kernel, a key file is required but has not been defined.

Completion Code

MQCC_FAILED

Programmer response

Do one of the following:

- On z/OS, change the *IndexType* queue attribute to MQIT_CORREL_ID.
- On Compaq NonStop Kernel, define a key file.
- Modify the application so that it does not use selection by correlation identifier: set the *CorrelId* field to MQCI_NONE and do not specify MQMO_MATCH_CORREL_ID in MQGMO.

5.2.1.182. 2217 (08A9) (RC2217): MQRC_CONNECTION_NOT_AUTHORIZED

Explanation

This reason code arises only for CICS® applications. For these, connection to the queue manager is done by the adapter. If that connection fails because the CICS subsystem is not authorized to connect to the queue manager, this reason code is issued whenever an application running under that subsystem subsequently issues an MQI call.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Ensure that the subsystem is authorized to connect to the queue manager.

Parent topic: [Reason code list](#)

This topic's URL:

fm13870_

5.2.1.184. 2219 (08AB) (RC2219): MQRC_CALL_IN_PROGRESS

Explanation

The application issued an MQI call whilst another MQI call was already being processed for that connection. Only one call per application connection can be processed at a time.

Concurrent calls can arise when an application uses multiple threads, or when an exit is invoked as part of the processing of an MQI call. For example, a data-conversion exit invoked as part of the processing of the MQGET call may try to issue an MQI call.

- On z/OS®, concurrent calls can arise only with batch or IMS™ applications; an example is when a subtask ends while an MQI call is in progress (for example, an MQGET that is waiting), and there is an end-of-task exit routine that issues another MQI call.
- On Windows, concurrent calls can also arise if an MQI call is issued in response to a user message while another MQI call is in progress.
- If the application is using multiple threads with shared handles, MQRC_CALL_IN_PROGRESS occurs when the handle specified on the call is already in use by another thread and MQCNO_HANDLE_SHARE_NO_BLOCK was specified on the MQCONN call.

Completion Code

MQCC_FAILED

Programmer response

Ensure that an MQI call cannot be issued while another one is active. Do not issue MQI calls from within a data-conversion exit.

- On z/OS, if you want to provide a subtask to allow an application that is waiting for a message to arrive to be canceled, wait for the message by using MQGET with MQGMO_SET_SIGNAL, rather than MQGMO_WAIT.

fm13880_

5.2.1.185. 2220 (08AC) (RC2220): MQRC_RMH_ERROR

Explanation

An MQPUT or MQPUT1 call was issued, but the message data contains an MQRMH structure that is not valid. Possible errors include the following:

- The *StrucId* field is not MQRMH_STRUC_ID.
- The *Version* field is not MQRMH_VERSION_1.
- The *StrucLength* field specifies a value that is too small to include the structure plus the variable-length data at the end of the structure.
- The *CodedCharSetId* field is zero, or a negative value that is not valid.
- The *BufferLength* parameter of the call has a value that is too small to accommodate the structure (the structure extends beyond the end of the message).

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Check that the fields in the structure are set correctly. Ensure that the application sets the *CodedCharSetId* field to a valid value (note: MQCCSI_DEFAULT, MQCCSI_EMBEDDED, MQCCSI_Q_MGR, and MQCCSI_UNDEFINED are *not* valid in this field).

5.2.1.192. 2228 (08B4) (RC2228): MQRC_RFH_HEADER_FIELD_ERROR

Explanation

An expected RFH header field was not found or had an invalid value. If this error occurs in a WebSphere® MQ SOAP listener, the missing or erroneous field is either the *contentType* field or the *transportVersion* field or both.

Completion Code

MQCC_FAILED

Programmer response

If this error occurs in a WebSphere MQ SOAP listener, and you are using the IBM-supplied sender, contact your IBM® Support Center. If you are using a bespoke sender, check the associated error message, and that the RFH2 section of the SOAP/MQ request message contains all the mandatory fields, and that these fields have valid values.

5.2.1.193. 2229 (08B5) (RC2229): MQRC_RAS_PROPERTY_ERROR

Explanation

There is an error related to the RAS property file. The file may be missing, it may be not accessible, or the commands in the file may be incorrect.

Completion Code

MQCC_FAILED

Programmer response

Look at the associated error message, which will explain the error in detail. Correct the error and retry.

Parent topic: [Reason code list](#)

5.2.1.194. 2232 (08B8) (RC2232): MQRC_UNIT_OF_WORK_NOT_STARTED

Explanation

An MQGET, MQPUT or MQPUT1 call was issued to get or put a message within a unit of work, but no TM/MP transaction had been started. If MQGMO_NO_SYNCPOINT is not specified on MQGET, or MQPMO_NO_SYNCPOINT is not specified on MQPUT or MQPUT1 (the default), the call requires a unit of work.

Completion Code

MQCC_FAILED

Programmer response

Ensure a TM/MP transaction is available, or issue the MQGET call with the MQGMO_NO_SYNCPOINT option, or the MQPUT or MQPUT1 call with the MQPMO_NO_SYNCPOINT option, which will cause a transaction to be started automatically.

Parent topic: [Reason code list](#)

5.2.1.196. 2234 (08BA) (RC2234): MQRC_CHANNEL_AUTO_DEF_ERROR

Explanation

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

This condition is detected when the automatic definition of a channel fails; this may be because an error occurred during the definition process, or because the channel automatic-definition exit inhibited the definition. Additional information is returned in the event message indicating the reason for the failure.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_WARNING

Programmer response

Examine the additional information returned in the event message to determine the reason for the failure.

Parent topic: [Reason code list](#)

5.2.1.202. 2241 (08C1) (RC2241): MQRC_INCOMPLETE_GROUP

Explanation

An operation was attempted on a queue using a queue handle that had an incomplete message group. This reason code can arise in the following situations:

- On the MQPUT call, when the application specifies MQPMO_LOGICAL_ORDER and attempts to put a message that is not in a group. The completion code is MQCC_FAILED in this case.
- On the MQPUT call, when the application does *not* specify MQPMO_LOGICAL_ORDER, but the previous MQPUT call for the queue handle did specify MQPMO_LOGICAL_ORDER. The completion code is MQCC_WARNING in this case.
- On the MQGET call, when the application does *not* specify MQGMO_LOGICAL_ORDER, but the previous MQGET call for the queue handle did specify MQGMO_LOGICAL_ORDER. The completion code is MQCC_WARNING in this case.
- On the MQCLOSE call, when the application attempts to close the queue that has the incomplete message group. The completion code is MQCC_WARNING in this case.

If there is an incomplete logical message as well as an incomplete message group, reason code MQRC_INCOMPLETE_MSG is returned in preference to MQRC_INCOMPLETE_GROUP.

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_WARNING or MQCC_FAILED

Programmer response

If this reason code is expected, no corrective action is required. Otherwise, ensure that the MQPUT call for the last message in the group specifies MQMF_LAST_MSG_IN_GROUP.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:03

5.2.1.203. 2242 (08C2) (RC2242): MQRC_INCOMPLETE_MSG

Explanation

An operation was attempted on a queue using a queue handle that had an incomplete logical message. This reason code can arise in the following situations:

- On the MQPUT call, when the application specifies MQPMO_LOGICAL_ORDER and attempts to put a message that is not a segment, or that has a setting for the MQMF_LAST_MSG_IN_GROUP flag that is different from the previous message. The completion code is MQCC_FAILED in this case.
- On the MQPUT call, when the application does *not* specify MQPMO_LOGICAL_ORDER, but the previous MQPUT call for the queue handle did specify MQPMO_LOGICAL_ORDER. The completion code is MQCC_WARNING in this case.
- On the MQGET call, when the application does *not* specify MQGMO_LOGICAL_ORDER, but the previous MQGET call for the queue handle did specify MQGMO_LOGICAL_ORDER. The completion code is MQCC_WARNING in this case.
- On the MQCLOSE call, when the application attempts to close the queue that has the incomplete logical message. The completion code is MQCC_WARNING in this case.

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_WARNING or MQCC_FAILED

Programmer response

If this reason code is expected, no corrective action is required. Otherwise, ensure that the MQPUT call for the last segment specifies MQMF_LAST_SEGMENT.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:03

5.2.1.204. 2243 (08C3) (RC2243): MQRC_INCONSISTENT_CCIDS

Explanation

An MQGET call was issued specifying the MQGMO_COMPLETE_MSG option, but the message to be retrieved
http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm 16/03/2011

consists of two or more segments that have differing values for the *CodedCharSetId* field in MQMD. This can arise when the segments take different paths through the network, and some of those paths have MCA sender conversion enabled. The call succeeds with a completion code of MQCC_WARNING, but only the first few segments that have identical character-set identifiers are returned.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_WARNING

Programmer response

Remove the MQGMO_COMPLETE_MSG option from the MQGET call and retrieve the remaining message segments one by one.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:04

This topic's URL:

fm14080_

5.2.1.205. 2244 (08C4) (RC2244): MQRC_INCONSISTENT_ENCODINGS

Explanation

An MQGET call was issued specifying the MQGMO_COMPLETE_MSG option, but the message to be retrieved consists of two or more segments that have differing values for the *Encoding* field in MQMD. This can arise when the segments take different paths through the network, and some of those paths have MCA sender conversion enabled. The call succeeds with a completion code of MQCC_WARNING, but only the first few segments that have identical encodings are returned.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_WARNING

Programmer response

Remove the MQGMO_COMPLETE_MSG option from the MQGET call and retrieve the remaining message segments one by one.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:04

fm14090_

5.2.1.206. 2245 (08C5) (RC2245): MQRC_INCONSISTENT_UOW

Explanation

One of the following applies:

- An MQPUT call was issued to put a message in a group or a segment of a logical message, but the value specified or defaulted for the MQPMO_SYNCPOINT option is not consistent with the current group and segment information retained by the queue manager for the queue handle.
If the current call specifies MQPMO_LOGICAL_ORDER, the call fails. If the current call does not specify MQPMO_LOGICAL_ORDER, but the previous MQPUT call for the queue handle did, the call succeeds with completion code MQCC_WARNING.
- An MQGET call was issued to remove from the queue a message in a group or a segment of a logical message, but the value specified or defaulted for the MQGMO_SYNCPOINT option is not consistent with the current group and segment information retained by the queue manager for the queue handle.
If the current call specifies MQGMO_LOGICAL_ORDER, the call fails. If the current call does not specify MQGMO_LOGICAL_ORDER, but the previous MQGET call for the queue handle did, the call succeeds with completion code MQCC_WARNING.

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_WARNING or MQCC_FAILED

Programmer response

Modify the application to ensure that the same unit-of-work specification is used for all messages in the group, or all segments of the logical message.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:05

This topic's URL:

fm14100_

5.2.1.207. 2246 (08C6) (RC2246): MQRC_INVALID_MSG_UNDER_CURSOR

Explanation

An MQGET call was issued specifying the MQGMO_COMPLETE_MSG option with either MQGMO_MSG_UNDER_CURSOR or MQGMO_BROWSE_MSG_UNDER_CURSOR, but the message that is under the cursor has an MQMD with an *Offset* field that is greater than zero. Because MQGMO_COMPLETE_MSG was specified, the message is not valid for retrieval.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Reposition the browse cursor so that it is located on a message whose *Offset* field in MQMD is zero. Alternatively, remove the MQGMO_COMPLETE_MSG option.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:05

5.2.1.208. 2247 (08C7) (RC2247): MQRC_MATCH_OPTIONS_ERROR

Explanation

An MQGET call was issued, but the value of the *MatchOptions* field in the *GetMsgOpts* parameter is not valid, for one of the following reasons:

- An undefined option is specified.
- All of the following are true:
 - MQGMO_LOGICAL_ORDER is specified.
 - There is a current message group or logical message for the queue handle.
 - Neither MQGMO_BROWSE_MSG_UNDER_CURSOR nor MQGMO_MSG_UNDER_CURSOR is specified.
 - One or more of the MQMO_* options is specified.
 - The values of the fields in the *MsgDesc* parameter corresponding to the MQMO_* options specified, differ from the values of those fields in the MQMD for the message to be returned next.
- On z/OS®, one or more of the options specified is not valid for the index type of the queue.

This reason code occurs in the following environments: AIX®, HP-UX, z/OS, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Ensure that only valid options are specified for the field.

Parent topic: [Reason code list](#)

This topic's URL:

fm14120_

5.2.1.209. 2248 (08C8) (RC2248): MQRC_MDE_ERROR

Explanation

An MQPUT or MQPUT1 call was issued, but the message data contains an MQMDE structure that is not valid. Possible errors include the following:

- The *StrucId* field is not MQMDE_STRUC_ID.
- The *Version* field is not MQMDE_VERSION_2.
- The *StrucLength* field is not MQMDE_LENGTH_2.
- The *CodedCharSetId* field is zero, or a negative value that is not valid.
- The *BufferLength* parameter of the call has a value that is too small to accommodate the structure (the structure extends beyond the end of the message).

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Check that the fields in the structure are set correctly. Ensure that the application sets the *CodedCharSetId* field to a valid value (note: MQCCSI_DEFAULT, MQCCSI_EMBEDDED, MQCCSI_Q_MGR, and MQCCSI_UNDEFINED are *not* valid in this field).

Parent topic: [Reason code list](#)

This topic's URL:

fm14130_

5.2.1.210. 2249 (08C9) (RC2249): MQRC_MSG_FLAGS_ERROR

Explanation

An MQPUT or MQPUT1 call was issued, but the *MsgFlags* field in the message descriptor MQMD contains one or more message flags that are not recognized by the local queue manager. The message flags that cause this reason code to be returned depend on the destination of the message; see the description of REPORT in the [WebSphere MQ Application Programming Reference](#) for more details.

This reason code can also occur in the *Feedback* field in the MQMD of a report message, or in the *Reason* field in the MQDLH structure of a message on the dead-letter queue; in both cases it indicates that the destination queue manager does not support one or more of the message flags specified by the sender of the message.

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Do the following:

- Ensure that the *MsgFlags* field in the message descriptor is initialized with a value when the message descriptor is declared, or is assigned a value prior to the MQPUT or MQPUT1 call. Specify MQMF_NONE if no message flags are needed.
- Ensure that the message flags specified are valid; see the *MsgFlags* field described in the description of MQMD in the [WebSphere MQ Application Programming Reference](#) for valid message flags.
- If multiple message flags are being set by adding the individual message flags together, ensure that the same message flag is not added twice.
- On z/OS, ensure that the message flags specified are valid for the index type of the queue; see the description of the *MsgFlags* field in MQMD for further details.

5.2.1.211. 2250 (08CA) (RC2250): MQRC_MSG_SEQ_NUMBER_ERROR

Explanation

An MQGET, MQPUT, or MQPUT1 call was issued, but the value of the *MsgSeqNumber* field in the MQMD or MQMDE structure is less than one or greater than 999 999 999.

This error can also occur on the MQPUT call if the *MsgSeqNumber* field would have become greater than 999 999 999 as a result of the call.

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Specify a value in the range 1 through 999 999 999. Do not attempt to create a message group containing more than 999 999 999 messages.

Parent topic: [Reason code list](#)

5.2.1.212. 2251 (08CB) (RC2251): MQRC_OFFSET_ERROR

Explanation

An MQPUT or MQPUT1 call was issued, but the value of the *Offset* field in the MQMD or MQMDE structure is less than zero or greater than 999 999 999.

This error can also occur on the MQPUT call if the *Offset* field would have become greater than 999 999 999 as a result of the call.

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Specify a value in the range 0 through 999 999 999. Do not attempt to create a message segment that would extend beyond an offset of 999 999 999.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:06

5.2.1.213. 2252 (08CC) (RC2252): MQRC_ORIGINAL_LENGTH_ERROR

Explanation

An MQPUT or MQPUT1 call was issued to put a report message that is a segment, but the *OriginalLength* field in the MQMD or MQMDE structure is either:

- Less than the length of data in the message, or
- Less than one (for a segment that is not the last segment), or
- Less than zero (for a segment that is the last segment)

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Specify a value that is greater than zero. Zero is valid only for the last segment.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:06

This topic's URL:

fm14170_

5.2.1.214. 2253 (08CD) (RC2253): MQRC_SEGMENT_LENGTH_ZERO

Explanation

An MQPUT or MQPUT1 call was issued to put the first or an intermediate segment of a logical message, but the length of the application message data in the segment (excluding any MQ headers that may be present) is zero. The length must be at least one for the first or intermediate segment.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Check the application logic to ensure that segments are put with a length of one or greater. Only the last segment of a logical message is permitted to have a length of zero.

Parent topic: [Reason code list](#)

5.2.1.215. 2255 (08CF) (RC2255): MQRC_UOW_NOT_AVAILABLE

Explanation

An MQGET, MQPUT, or MQPUT1 call was issued to get or put a message outside a unit of work, but the options specified on the call required the queue manager to process the call within a unit of work. Because there is already a user-defined unit of work in existence, the queue manager was unable to create a temporary unit of work for the duration of the call.

This reason occurs in the following circumstances:

- On an MQGET call, when the MQGMO_COMPLETE_MSG option is specified in MQGMO and the logical message to be retrieved is persistent and consists of two or more segments.
- On an MQPUT or MQPUT1 call, when the MQMF_SEGMENTATION_ALLOWED flag is specified in MQMD and the message requires segmentation.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Issue the MQGET, MQPUT, or MQPUT1 call inside the user-defined unit of work. Alternatively, for the MQPUT or MQPUT1 call, reduce the size of the message so that it does not require segmentation by the queue manager.

Parent topic: [Reason code list](#)

5.2.1.216. 2256 (08D0) (RC2256): MQRC_WRONG_GMO_VERSION

Explanation

An MQGET call was issued specifying options that required an MQGMO with a version number not less than MQGMO_VERSION_2, but the MQGMO supplied did not satisfy this condition.

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Modify the application to pass a version-2 MQGMO. Check the application logic to ensure that the *Version* field in MQGMO has been set to MQGMO_VERSION_2. Alternatively, remove the option that requires the version-2 MQGMO.

5.2.1.217. 2257 (08D1) (RC2257): MQRC_WRONG_MD_VERSION

Explanation

An MQGET, MQPUT, or MQPUT1 call was issued specifying options that required an MQMD with a version number not less than MQMD_VERSION_2, but the MQMD supplied did not satisfy this condition.

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Modify the application to pass a version-2 MQMD. Check the application logic to ensure that the *Version* field in MQMD has been set to MQMD_VERSION_2. Alternatively, remove the option that requires the version-2 MQMD.

Parent topic: [Reason code list](#)

fm14210_

5.2.1.218. 2258 (08D2) (RC2258): MQRC_GROUP_ID_ERROR

Explanation

An MQPUT or MQPUT1 call was issued to put a distribution-list message that is also a message in a group, a message segment, or has segmentation allowed, but an invalid combination of options and values was specified. All of the following are true:

- MQPMO_LOGICAL_ORDER is not specified in the *Options* field in MQPMO.
- Either there are too few MQPMR records provided by MQPMO, or the *GroupId* field is not present in the MQPMR records.
- One or more of the following flags is specified in the *MsgFlags* field in MQMD or MQMDE:
 - MQMF_SEGMENTATION_ALLOWED
 - MQMF_*_MSG_IN_GROUP
 - MQMF_*_SEGMENT
- The *GroupId* field in MQMD or MQMDE is not MQGI_NONE.

This combination of options and values would result in the same group identifier being used for all of the destinations in the distribution list; this is not permitted by the queue manager.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Specify MQGI_NONE for the *GroupId* field in MQMD or MQMDE. Alternatively, if the call is MQPUT specify MQPMO_LOGICAL_ORDER in the *Options* field in MQPMO.

Parent topic: [Reason code list](#)

fm14220_

5.2.1.219. 2259 (08D3) (RC2259): MQRC_INCONSISTENT_BROWSE

Explanation

An MQGET call was issued with the MQGMO_BROWSE_NEXT option specified, but the specification of the MQGMO_LOGICAL_ORDER option for the call is different from the specification of that option for the previous call for the queue handle. Either both calls must specify MQGMO_LOGICAL_ORDER, or neither call must specify MQGMO_LOGICAL_ORDER.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Add or remove the MQGMO_LOGICAL_ORDER option as appropriate. Alternatively, to switch between logical order and physical order, specify the MQGMO_BROWSE_FIRST option to restart the scan from the beginning of the queue, omitting or specifying MQGMO_LOGICAL_ORDER as required.

Parent topic: [Reason code list](#)

5.2.1.220. 2260 (08D4) (RC2260): MQRC_XQH_ERROR

Explanation

An MQPUT or MQPUT1 call was issued, but the message data contains an MQXQH structure that is not valid. Possible errors include the following:

- The *StrucId* field is not MQXQH_STRUC_ID.
- The *Version* field is not MQXQH_VERSION_1.
- The *BufferLength* parameter of the call has a value that is too small to accommodate the structure (the structure extends beyond the end of the message).

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Check that the fields in the structure are set correctly.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:07

This topic's URL:

fm14240_

5.2.1.221. 2261 (08D5) (RC2261): MQRC_SRC_ENV_ERROR

Explanation

This reason occurs when a channel exit that processes reference messages detects an error in the source environment data of a reference message header (MQRMH). One of the following is true:

- *SrcEnvLength* is less than zero.
- *SrcEnvLength* is greater than zero, but there is no source environment data.
- *SrcEnvLength* is greater than zero, but *SrcEnvOffset* is negative, zero, or less than the length of the fixed part of MQRMH.
- *SrcEnvLength* is greater than zero, but *SrcEnvOffset* plus *SrcEnvLength* is greater than *StrucLength*.

The exit returns this reason in the *Feedback* field of the MQCXP structure. If an exception report is requested, it is copied to the *Feedback* field of the MQMD associated with the report.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Specify the source environment data correctly.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:07

This topic's URL:

fm14250_

5.2.1.222. 2262 (08D6) (RC2262): MQRC_SRC_NAME_ERROR

Explanation

This reason occurs when a channel exit that processes reference messages detects an error in the source

name data of a reference message header (MQRMH). One of the following is true:

- *SrcNameLength* is less than zero.
- *SrcNameLength* is greater than zero, but there is no source name data.
- *SrcNameLength* is greater than zero, but *SrcNameOffset* is negative, zero, or less than the length of the fixed part of MQRMH.
- *SrcNameLength* is greater than zero, but *SrcNameOffset* plus *SrcNameLength* is greater than *StrucLength*.

The exit returns this reason in the *Feedback* field of the MQCXP structure. If an exception report is requested, it is copied to the *Feedback* field of the MQMD associated with the report.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Specify the source name data correctly.

Parent topic: [Reason code list](#)

5.2.1.223. 2263 (08D7) (RC2263): MQRC_DEST_ENV_ERROR

Explanation

This reason occurs when a channel exit that processes reference messages detects an error in the destination environment data of a reference message header (MQRMH). One of the following is true:

- *DestEnvLength* is less than zero.
- *DestEnvLength* is greater than zero, but there is no destination environment data.
- *DestEnvLength* is greater than zero, but *DestEnvOffset* is negative, zero, or less than the length of the fixed part of MQRMH.
- *DestEnvLength* is greater than zero, but *DestEnvOffset* plus *DestEnvLength* is greater than *StrucLength*.

The exit returns this reason in the *Feedback* field of the MQCXP structure. If an exception report is requested, it is copied to the *Feedback* field of the MQMD associated with the report.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Specify the destination environment data correctly.

5.2.1.225. 2265 (08D9) (RC2265): MQRC_TM_ERROR

Explanation

An MQPUT or MQPUT1 call was issued, but the message data contains an MQTM structure that is not valid. Possible errors include the following:

- The *StrucId* field is not MQTM_STRUC_ID.
- The *Version* field is not MQTM_VERSION_1.
- The *BufferLength* parameter of the call has a value that is too small to accommodate the structure (the structure extends beyond the end of the message).

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Check that the fields in the structure are set correctly.

Parent topic: [Reason code list](#)

5.2.1.226. 2266 (08DA) (RC2266): MQRC_CLUSTER_EXIT_ERROR

Explanation

An MQOPEN, MQPUT, or MQPUT1 call was issued to open or put a message on a cluster queue, but the cluster workload exit defined by the queue-manager's *ClusterWorkloadExit* attribute failed unexpectedly or did not respond in time. Subsequent MQOPEN, MQPUT, and MQPUT1 calls for this queue handle are processed as though the *ClusterWorkloadExit* attribute were blank.

- On z/OS®, a message giving more information about the error is written to the system log, for example message CSQV455E or CSQV456E.

This reason code occurs in the following environments: AIX®, HP-UX, z/OS, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Check the cluster workload exit to ensure that it has been written correctly.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:08

This topic's URL:

fm14310_

5.2.1.228. 2268 (08DC) (RC2268): MQRC_CLUSTER_PUT_INHIBITED

Explanation

An MQOPEN call with the MQOO_OUTPUT and MQOO_BIND_ON_OPEN options in effect was issued for a cluster queue, but the call failed because all of the following are true:

- All instances of the cluster queue are currently put-inhibited (that is, all of the queue instances have the *InhibitPut* attribute set to MQQA_PUT_INHIBITED).
- There is no local instance of the queue. (If there is a local instance, the MQOPEN call succeeds, even if the local instance is put-inhibited.)
- There is no cluster workload exit for the queue, or there is a cluster workload exit but it did not choose a queue instance. (If the cluster workload exit does choose a queue instance, the MQOPEN call succeeds, even if that instance is put-inhibited.)

If the MQOO_BIND_NOT_FIXED option is specified on the MQOPEN call, the call can succeed even if all of the queues in the cluster are put-inhibited. However, a subsequent MQPUT call may fail if all of the queues are still put-inhibited at the time of the MQPUT call.

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

If the system design allows put requests to be inhibited for short periods, retry the operation later. If the problem persists, determine why all of the queues in the cluster are put-inhibited.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:08

fm14320_

5.2.1.229. 2269 (08DD) (RC2269): MQRC_CLUSTER_RESOURCE_ERROR

Explanation

An MQOPEN, MQPUT, or MQPUT1 call was issued for a cluster queue, but an error occurred whilst trying to use a resource required for clustering.

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Do the following:

- Check that the SYSTEM.CLUSTER.* queues are not put inhibited or full.
- Check the event queues for any events relating to the SYSTEM.CLUSTER.* queues, as these may give guidance as to the nature of the failure.
- Check that the repository queue manager is available.
- On z/OS, check the console for signs of the failure, such as full page sets.

Parent topic: [Reason code list](#)

This topic's URL:

fm14330_

5.2.1.230. 2270 (08DE) (RC2270): MQRC_NO_DESTINATIONS_AVAILABLE

Explanation

An MQPUT or MQPUT1 call was issued to put a message on a cluster queue, but at the time of the call there were no longer any instances of the queue in the cluster. The message therefore could not be sent.

This situation can occur when MQOO_BIND_NOT_FIXED is specified on the MQOPEN call that opens the queue, or MQPUT1 is used to put the message.

This reason code occurs in the following environments: AIX®, HP-UX, z/OS®, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems.

Completion Code

MQCC_FAILED

Programmer response

Check the queue definition and queue status to determine why all instances of the queue were removed from the cluster. Correct the problem and rerun the application.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:08

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

This topic's URL:

fm14350_

5.2.1.232. 2272 (08E0) (RC2272): MQRC_PARTIALLY_CONVERTED

Explanation

On an MQGET call with the MQGMO_CONVERT option included in the *GetMsgOpts* parameter, one or more MQ header structures in the message data could not be converted to the specified target character set or encoding. In this situation, the MQ header structures are converted to the queue-manager's character set and encoding, and the application data in the message is converted to the target character set and encoding. On return from the call, the values returned in the various *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter and MQ header structures indicate the character set and encoding that apply to each part of the message. The call completes with MQCC_WARNING.

This reason code usually occurs when the specified target character set is one that causes the character strings in the MQ header structures to expand beyond the lengths of their fields. Unicode character set UCS-2 is an example of a character set that causes this to happen.

Completion Code

MQCC_FAILED

Programmer response

If this is an expected situation, no corrective action is required.

If this is an unexpected situation, check that the MQ header structures contain valid data. If they do, specify as the target character set a character set that does not cause the strings to expand.

Parent topic: [Reason code list](#)

5.2.1.233. 2273 (08E1) (RC2273): MQRC_CONNECTION_ERROR

Explanation

An MQCONN or MQCONNX call failed for one of the following reasons:

- The installation and customization options chosen for WebSphere® MQ do not allow connection by the type of application being used.
- The system parameter module is not at the same release level as the queue manager.
- The channel initiator is not at the same release level as the queue manager.
- An internal error was detected by the queue manager.

Completion Code

MQCC_FAILED

Programmer response

None, if the installation and customization options chosen for WebSphere MQ do not allow all functions to be used.

Otherwise, if this occurs while starting the channel initiator, ensure that the queue manager and the channel initiator are both at the same release level and that their started task JCL procedures both specify the same level of WebSphere MQ program libraries; if this occurs while starting the queue manager, relinkedit the system parameter module (CSQZPARM) to ensure that it is at the correct level. If the problem persists, contact your IBM® support center.

This topic's URL:

fm14390_

5.2.1.236. 2278 (08E6) (RC2278): MQRC_CLIENT_CONN_ERROR

Explanation

An MQCONNX call was issued to connect to a queue manager, but the MQCD channel definition structure is not specified correctly. One of the following applies:

- *ClientConnOffset* is not zero and *ClientConnPtr* is not zero and not the null pointer.
- *ClientConnPtr* is not a valid pointer.
- *ClientConnPtr* or *ClientConnOffset* points to storage that is not accessible.

This reason code occurs in the following environments: AIX®, HP-UX, i5/OS®, Solaris, Windows, plus WebSphere® MQ clients connected to these systems. It also occurs in Java applications when a client channel definition table is specified to determine the name of the channel, but the table itself cannot be found.

Completion Code

MQCC_FAILED

Programmer response

Ensure that at least one of *ClientConnOffset* and *ClientConnPtr* is zero. Ensure that the field used points to accessible storage. Ensure that the URL of the client channel definition table is correct.

Parent topic: [Reason code list](#)

5.2.1.237. 2279 (08E7) (RC2279): MQRC_CHANNEL_STOPPED_BY_USER

Explanation

This condition is detected when the channel has been stopped by an operator. The reason qualifier identifies the reasons for stopping.

Completion Code

MQCC_WARNING

Programmer response

None. This reason code is only used to identify the corresponding event message.

Parent topic: [Reason code list](#)

This topic's URL:

fm14410_

5.2.1.238. 2280 (08E8) (RC2280): MQRC_HCONFIG_ERROR

Explanation

The configuration handle *Hconfig* specified on the MQXEP call or MQZEP call is not valid. The MQXEP call is issued by an API exit function; the MQZEP call is issued by an installable service.

- On z/OS®, this reason code does not occur.

Completion Code

MQCC_FAILED

Programmer response

Specify the configuration handle that was provided by the queue manager:

- On the MQXEP call, use the handle passed in the *Hconfig* field of the MQAXP structure.
- On the MQZEP call, use the handle passed to the installable service's configuration function on the component initialization call. See the [WebSphere MQ System Administration Guide](#) book for information about installable services.

Parent topic: [Reason code list](#)

5.2.1.239. 2281 (08E9) (RC2281): MQRC_FUNCTION_ERROR

Explanation

An MQXEP or MQZEP call was issued, but the function identifier *Function* specified on the call is not valid, or not supported by the installable service being configured.

- On z/OS®, this reason code does not occur.

Completion Code

MQCC_FAILED

Programmer response

Do the following:

- For the MQXEP call, specify one of the MQXF_* values.
- For the MQZEP call, specify an MQZID_* value that is valid for the installable service being configured. Refer to the description of the MQZEP call in the [WebSphere MQ System Administration Guide](#) book to determine which values are valid.

5.2.1.240. 2282 (08EA) (RC2282): MQRC_CHANNEL_STARTED

Explanation

One of the following has occurred:

- An operator has issued a Start Channel command.
- An instance of a channel has been successfully established. This condition is detected when Initial Data negotiation is complete and resynchronization has been performed where necessary such that message transfer can proceed.

Completion Code

MQCC_WARNING

Programmer response

None. This reason code is only used to identify the corresponding event message.

Parent topic: [Reason code list](#)

This topic's URL:

fm14560_

5.2.1.253. 2296 (08F8) (RC2296): MQRC_CHANNEL_NOT_ACTIVATED

Explanation

This condition is detected when a channel is required to become active, either because it is starting or because it is about to make another attempt to establish connection with its partner. However, it is unable to do so because the limit on the number of active channels has been reached.

- On z/OS®, the maximum number of active channels is given by the ACTCHL queue manager attribute.
- In other environments, the maximum number of active channels is given by the MaxActiveChannels parameter in the qm.ini file.

The channel waits until it is able to take over an active slot released when another channel ceases to be active. At that time a Channel Activated event is generated.

Completion Code

MQCC_WARNING

Programmer response

None. This reason code is only used to identify the corresponding event message.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:11

This topic's URL:

fm14570_

5.2.1.254. 2297 (08F9) (RC2297): MQRC_UOW_CANCELED

Explanation

An MQI call was issued, but the unit of work (TM/MP transaction) being used for the MQ operation had been canceled. This may have been done by TM/MP itself (for example, due to the transaction running for too long, or exceeding audit trail sizes), or by the application program issuing an ABORT_TRANSACTION. All updates performed to resources owned by the queue manager are backed out.

Completion Code

MQCC_FAILED

Programmer response

Refer to the operating system's *Transaction Management Operations Guide* to determine how the Transaction Manager can be tuned to avoid the problem of system limits being exceeded.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:11

This topic's URL:

fm14630_

5.2.1.260. 2303 (08FF) (RC2303): MQRC_BAG_CONVERSION_ERROR

Explanation

The mqBufferToBag or mqGetBag call was issued, but the data in the buffer or message could not be converted into a bag. This occurs when the data to be converted is not valid PCF.

Completion Code

MQCC_FAILED

Programmer response

Check the logic of the application that created the buffer or message to ensure that the buffer or message contains valid PCF.

If the message contains PCF that is not valid, the message cannot be retrieved using the mqGetBag call:

- If one of the MQGMO_BROWSE_* options was specified, the message remains on the queue and can be retrieved using the MQGET call.
- In other cases, the message has already been removed from the queue and discarded. If the message was retrieved within a unit of work, the unit of work can be backed out and the message retrieved using the MQGET call.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:11

This topic's URL:

fm14640_

5.2.1.261. 2304 (0900) (RC2304): MQRC_SELECTOR_OUT_OF_RANGE

Explanation

The *selector* parameter has a value that is outside the valid range for the call. If the bag was created with the MQCBO_CHECK_SELECTORS option:

- For the mqAddInteger call, the value must be within the range MQIA_FIRST through MQIA_LAST.
- For the mqAddString call, the value must be within the range MQCA_FIRST through MQCA_LAST.

If the bag was not created with the MQCBO_CHECK_SELECTORS option:

- The value must be zero or greater.

Completion Code

MQCC_FAILED

Programmer response

Specify a valid value.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:11

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

 Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

fm14650_

5.2.1.262. 2305 (0901) (RC2305): MQRC_SELECTOR_NOT_UNIQUE

Explanation

The *ItemIndex* parameter has the value MQIND_NONE, but the bag contains more than one data item with the selector value specified by the *Selector* parameter. MQIND_NONE requires that the bag contain only one occurrence of the specified selector.

This reason code also occurs on the mqExecute call when the administration bag contains two or more occurrences of a selector for a required parameter that permits only one occurrence.

Completion Code

MQCC_FAILED

Programmer response

Check the logic of the application that created the bag. If correct, specify for *ItemIndex* a value that is zero or greater, and add application logic to process all of the occurrences of the selector in the bag.

Review the description of the administration command being issued, and ensure that all required parameters are defined correctly in the bag.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:11

This topic's URL:

fm14660_

5.2.1.263. 2306 (0902) (RC2306): MQRC_INDEX_NOT_PRESENT

Explanation

The specified index is not present:

- For a bag, this means that the bag contains one or more data items that have the selector value specified by the *Selector* parameter, but none of them has the index value specified by the *ItemIndex* parameter. The data item identified by the *Selector* and *ItemIndex* parameters must exist in the bag.
- For a namelist, this means that the index parameter value is too large, and outside the range of valid values.

Completion Code

MQCC_FAILED

Programmer response

Specify the index of a data item that does exist in the bag or namelist. Use the mqCountItems call to determine the number of data items with the specified selector that exist in the bag, or the nameCount

method to determine the number of names in the namelist.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:11

This topic's URL:

fm14680_

5.2.1.265. 2308 (0904) (RC2308): MQRC_ENCODING_NOT_SUPPORTED

Explanation

The *Encoding* field in the message descriptor MQMD contains a value that is not supported:

- For the mqPutBag call, the field in error resides in the *MsgDesc* parameter of the call.
- For the mqGetBag call, the field in error resides in:
 - The *MsgDesc* parameter of the call if the MQGMO_CONVERT option was specified.
 - The message descriptor of the message about to be retrieved if MQGMO_CONVERT was *not* specified.

Completion Code

MQCC_FAILED

Programmer response

The value must be MQENC_NATIVE.

If the value of the *Encoding* field in the message is not valid, the message cannot be retrieved using the mqGetBag call:

- If one of the MQGMO_BROWSE_* options was specified, the message remains on the queue and can be retrieved using the MQGET call.
- In other cases, the message has already been removed from the queue and discarded. If the message was retrieved within a unit of work, the unit of work can be backed out and the message retrieved using the MQGET call.

5.2.1.269. 2312 (0908) (RC2312): MQRC_SELECTOR_WRONG_TYPE

Explanation

A data item with the specified selector exists in the bag, but has a data type that conflicts with the data type implied by the call being used. For example, the data item might have an integer data type, but the call being used might be `mqSetString`, which implies a character data type.

This reason code also occurs on the `mqBagToBuffer`, `mqExecute`, and `mqPutBag` calls when `mqAddString` or `mqSetString` was used to add the `MQIACF_INQUIRY` data item to the bag.

Completion Code

MQCC_FAILED

Programmer response

For the `mqSetInteger` and `mqSetString` calls, specify `MQIND_ALL` for the `ItemIndex` parameter to delete from the bag all existing occurrences of the specified selector before creating the new occurrence with the required data type.

For the `mqInquireBag`, `mqInquireInteger`, and `mqInquireString` calls, use the `mqInquireItemInfo` call to determine the data type of the item with the specified selector, and then use the appropriate call to determine the value of the data item.

For the `mqBagToBuffer`, `mqExecute`, and `mqPutBag` calls, ensure that the `MQIACF_INQUIRY` data item is added to the bag using the `mqAddInteger` or `mqSetInteger` calls.

5.2.1.270. 2313 (0909) (RC2313): MQRC_INCONSISTENT_ITEM_TYPE

Explanation

The mqAddInteger or mqAddString call was issued to add another occurrence of the specified selector to the bag, but the data type of this occurrence differed from the data type of the first occurrence.

This reason can also occur on the mqBufferToBag and mqGetBag calls, where it indicates that the PCF in the buffer or message contains a selector that occurs more than once but with inconsistent data types.

Completion Code

MQCC_FAILED

Programmer response

For the mqAddInteger and mqAddString calls, use the call appropriate to the data type of the first occurrence of that selector in the bag.

For the mqBufferToBag and mqGetBag calls, check the logic of the application that created the buffer or sent the message to ensure that multiple-occurrence selectors occur with only one data type. A message that contains a mixture of data types for a selector cannot be retrieved using the mqGetBag call:

- If one of the MQGMO_BROWSE_* options was specified, the message remains on the queue and can be retrieved using the MQGET call.
- In other cases, the message has already been removed from the queue and discarded. If the message was retrieved within a unit of work, the unit of work can be backed out and the message retrieved using the MQGET call.

5.2.1.271. 2314 (090A) (RC2314): MQRC_INDEX_ERROR

Explanation

An index parameter to a call or method has a value that is not valid. The value must be zero or greater. For bag calls, certain MQIND_* values can also be specified:

- For the mqDeleteItem, mqSetInteger and mqSetString calls, MQIND_ALL and MQIND_NONE are valid.
- For the mqInquireBag, mqInquireInteger, mqInquireString, and mqInquireItemInfo calls, MQIND_NONE is valid.

Completion Code

MQCC_FAILED

Programmer response

Specify a valid value.

Parent topic: [Reason code list](#)

5.2.1.272. 2315 (090B) (RC2315): MQRC_SYSTEM_BAG_NOT_ALTERABLE

Explanation

A call was issued to add a data item to a bag, modify the value of an existing data item in a bag, or retrieve a message into a bag, but the call failed because the bag is one that had been created by the system as a result of a previous mqExecute call. System bags cannot be modified by the application.

Completion Code

MQCC_FAILED

Programmer response

Specify the handle of a bag created by the application, or remove the call.

Parent topic: [Reason code list](#)

fm14760_

5.2.1.273. 2316 (090C) (RC2316): MQRC_ITEM_COUNT_ERROR

Explanation

The mqTruncateBag call was issued, but the *ItemCount* parameter specifies a value that is not valid. The value is either less than zero, or greater than the number of user-defined data items in the bag.

This reason also occurs on the mqCountItems call if the parameter pointer is not valid, or points to read-only storage. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)

Completion Code

MQCC_FAILED

Programmer response

Specify a valid value. Use the mqCountItems call to determine the number of user-defined data items in the bag.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:11

This topic's URL:

fm14770_

5.2.1.274. 2317 (090D) (RC2317): MQRC_FORMAT_NOT_SUPPORTED

Explanation

The *Format* field in the message descriptor MQMD contains a value that is not supported:

- In an administration message, the format value must be one of the following: MQFMT_ADMIN, MQFMT_EVENT, MQFMT_PCF. For the mqPutBag call, the field in error resides in the *MsgDesc* parameter of the call. For the mqGetBag call, the field in error resides in the message descriptor of the message about to be retrieved.
- On z/OS®, the message was put to the command input queue with a format value of MQFMT_ADMIN, but the version of MQ being used does not support that format for commands.

Completion Code

MQCC_FAILED

Programmer response

If the error occurred when putting a message, correct the format value.

If the error occurred when getting a message, the message cannot be retrieved using the mqGetBag call:

- If one of the MQGMO_BROWSE_* options was specified, the message remains on the queue and can be retrieved using the MQGET call.
- In other cases, the message has already been removed from the queue and discarded. If the message was retrieved within a unit of work, the unit of work can be backed out and the message retrieved using the MQGET call.

This topic's URL:

fm14920_

5.2.1.289. 2332 (091C) (RC2332): MQRC_MISSING_WIH

Explanation

An MQPUT or MQPUT1 call was issued to put a message on a queue whose *IndexType* attribute had the value MQIT_MSG_TOKEN, but the *Format* field in the MQMD was not MQFMT_WORK_INFO_HEADER. This error occurs only when the message arrives at the destination queue manager.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Modify the application to ensure that it places an MQWIH structure at the start of the message data, and sets the *Format* field in the MQMD to MQFMT_WORK_INFO_HEADER. Alternatively, change the *AppType* attribute of the process definition used by the destination queue to be MQAT_WLM, and specify the required service name and service step name in its *EnvData* attribute.

Parent topic: [Reason code list](#)

5.2.1.290. 2333 (091D) (RC2333): MQRC_WIH_ERROR

Explanation

An MQPUT or MQPUT1 call was issued, but the message data contains an MQWIH structure that is not valid. Possible errors include the following:

- The *StrucId* field is not MQWIH_STRUC_ID.
- The *Version* field is not MQWIH_VERSION_1.
- The *StrucLength* field is not MQWIH_LENGTH_1.
- The *CodedCharSetId* field is zero, or a negative value that is not valid.
- The *BufferLength* parameter of the call has a value that is too small to accommodate the structure (the structure extends beyond the end of the message).
- On z/OS®, this error also occurs when the *IndexType* attribute of the queue is MQIT_MSG_TOKEN, but the message data does not begin with an MQWIH structure.

Completion Code

MQCC_FAILED

Programmer response

Check that the fields in the structure are set correctly. Ensure that the application sets the *CodedCharSetId* field to a valid value (note: MQCCSI_DEFAULT, MQCCSI_EMBEDDED, MQCCSI_Q_MGR, and MQCCSI_UNDEFINED are *not* valid in this field).

- On z/OS, if the queue has an *IndexType* of MQIT_MSG_TOKEN, ensure that the message data begins with an MQWIH structure.

5.2.1.291. 2334 (091E) (RC2334): MQRC_RFH_ERROR

Explanation

An MQPUT or MQPUT1 call was issued, but the message data contains an MQRFH or MQRFH2 structure that is not valid. Possible errors include the following:

- The *StrucId* field is not MQRFH_STRUC_ID.
- The *Version* field is not MQRFH_VERSION_1 (MQRFH), or MQRFH_VERSION_2 (MQRFH2).
- The *StrucLength* field specifies a value that is too small to include the structure plus the variable-length data at the end of the structure.
- The *CodedCharSetId* field is zero, or a negative value that is not valid.
- The *BufferLength* parameter of the call has a value that is too small to accommodate the structure (the structure extends beyond the end of the message).

Completion Code

MQCC_FAILED

Programmer response

Check that the fields in the structure are set correctly. Ensure that the application sets the *CodedCharSetId* field to a valid value (note: MQCCSI_DEFAULT, MQCCSI_EMBEDDED, MQCCSI_Q_MGR, and MQCCSI_UNDEFINED are *not* valid in this field).

5.2.1.292. 2335 (091F) (RC2335): MQRC_RFH_STRING_ERROR

Explanation

The contents of the *NameValueString* field in the MQRFH structure are not valid. *NameValueString* must adhere to the following rules:

- The string must consist of zero or more name/value pairs separated from each other by one or more blanks; the blanks are not significant.
- If a name or value contains blanks that are significant, the name or value must be enclosed in double-quote characters.
- If a name or value itself contains one or more double-quote characters, the name or value must be enclosed in double-quote characters, and each embedded double-quote character must be doubled.
- A name or value can contain any characters other than the null, which acts as a delimiter. The null and characters following it, up to the defined length of *NameValueString*, are ignored.

The following is a valid *NameValueString*:

```
Famous_Words "The program displayed ""Hello World"""
```

Completion Code

MQCC_FAILED

Programmer response

Modify the application that generated the message to ensure that it places in the *NameValueString* field data that adheres to the rules listed above. Check that the *StrucLength* field is set to the correct value.

5.2.1.297. 2340 (0924) (RC2340): MQRC_CHAR_CONVERSION_ERROR

Explanation

This reason code is returned by the Java MQQueueManager constructor when a required character-set conversion is not available. The conversion required is between two nonUnicode character sets.

This reason code occurs in the following environment: MQ Classes for Java on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Ensure that the National Language Resources component of the z/OS Language Environment® is installed, and that conversion between the IBM-1047 and ISO8859-1 character sets is available.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:12

5.2.1.298. 2341 (0925) (RC2341): MQRC_UCS2_CONVERSION_ERROR

Explanation

➤ This reason code is returned by the Java MQQueueManager constructor when a required character set conversion is not available. The conversion required is between the UCS-2 Unicode character set and the character set of the queue manager which defaults to IBM-500 if no specific value is available. ◀

Completion Code

MQCC_FAILED

Programmer response

➤ Ensure that the relevant Unicode conversion tables are available for the JVM. For z/OS® ensure that the Unicode conversion tables are available to the z/OS Language Environment®. The conversion tables should be installed as part of the z/OS C/C++ optional feature. Refer to the *z/OS C/C++ Programming Guide* for more information about enabling UCS-2 conversions. ◀

5.2.1.299. 2342 (0926) (RC2342): MQRC_DB2_NOT_AVAILABLE

Explanation

An MQOPEN, MQPUT1, or MQSET call, or a command, was issued to access a shared queue, but it failed because the queue manager is not connected to a DB2® subsystem. As a result, the queue manager is unable to access the object definition relating to the shared queue.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Configure the DB2 subsystem so that the queue manager can connect to it.

Parent topic: [Reason code list](#)

5.2.1.300. 2343 (0927) (RC2343): MQRC_OBJECT_NOT_UNIQUE

Explanation

An MQOPEN or MQPUT1 call, or a command, was issued to access a queue, but the call failed because the queue specified cannot be resolved unambiguously. There exists a shared queue with the specified name, and a nonshared queue with the same name.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

One of the queues must be deleted. If the queue to be deleted contains messages, use the MQSC command MOVE QLOCAL to move the messages to a different queue, and then use the command DELETE QLOCAL to delete the queue.

Parent topic: [Reason code list](#)

This topic's URL:

fm15040_

5.2.1.301. 2344 (0928) (RC2344): MQRC_CONN_TAG_NOT_RELEASED

Explanation

An MQDISC call was issued when there was a unit of work outstanding for the connection handle. For CICS®, IMS™, and RRS connections, the MQDISC call does not commit or back out the unit of work. As a result, the connection tag associated with the unit of work is not yet available for reuse. The tag becomes available for reuse only when processing of the unit of work has been completed.

This reason code occurs only on z/OS®.

Completion Code

MQCC_WARNING

Programmer response

Do not try to reuse the connection tag immediately. If the MQCONN call is issued with the same connection tag, and that tag is still in use, the call fails with reason code MQRC_CONN_TAG_IN_USE.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:13

5.2.1.302. 2345 (0929) (RC2345): MQRC_CF_NOT_AVAILABLE

Explanation

An MQOPEN or MQPUT1 call was issued to access a shared queue, but the allocation of the coupling-facility

structure specified in the queue definition failed because there is no suitable coupling facility to hold the structure, based on the preference list in the active CFRM policy.

This reason code can also occur when the API call requires a capability that is not supported by the CF level defined in the coupling-facility structure object. For example, this reason code is returned by an attempt to open a shared queue that has a index type of MQIT_GROUP_ID, but the coupling-facility structure for the queue has a CF level lower than three.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Make available a coupling facility with one of the names specified in the CFRM policy, or modify the CFRM policy to specify the names of coupling facilities that are available.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:13

This topic's URL:

fm15060_

5.2.1.303. 2346 (092A) (RC2346): MQRC_CF_STRUC_IN_USE

Explanation

➤An MQI call or command was issued to operate on a shared queue, but the call failed because the coupling-facility structure specified in the queue definition is unavailable. The coupling-facility structure can be unavailable because a structure dump is in progress, or new connectors to the structure are currently inhibited, or an existing connector to the structure failed or disconnected abnormally and clean-up is not yet complete.◀

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

➤Typically, this is a temporary problem: wait for a while then retry the operation.◀

➤If the problem does not resolve itself, then connectivity problems experienced during the recovery of structures in the coupling facility could have occurred. In this case, restart the queue manager which reported the error. Resolve all the connectivity problems concerning the coupling facility before restarting the queue manager.◀

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:13

5.2.1.304. 2347 (092B) (RC2347): MQRC_CF_STRUC_LIST_HDR_IN_USE

Explanation

An MQGET, MQOPEN, MQPUT1, or MQSET call was issued to access a shared queue, but the call failed because the list header associated with the coupling-facility structure specified in the queue definition is temporarily unavailable. The list header is unavailable because it is undergoing recovery processing.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

The problem is temporary; wait a short while and then retry the operation.

Parent topic: [Reason code list](#)

fm15100_

5.2.1.307. 2350 (092E) (RC2350): MQRC_CONN_TAG_NOT_USABLE

Explanation

An MQCONN call was issued specifying one of the MQCNO_*_CONN_TAG_* options, but the call failed because the connection tag specified by *ConnTag* in MQCNO is being used by the queue manager for recovery processing, and this processing is delayed pending recovery of the coupling facility.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

The problem is likely to persist. Consult the system programmer to ascertain the cause of the problem.

Parent topic: [Reason code list](#)

5.2.1.308. 2351 (092F) (RC2351): MQRC_GLOBAL_UOW_CONFLICT

Explanation

An attempt was made to use inside a global unit of work a connection handle that is participating in another global unit of work. This can occur when an application passes connection handles between objects where the objects are involved in different DTC transactions. Because transaction completion is asynchronous, it is possible for this error to occur *after* the application has finalized the first object and committed its transaction.

This error does not occur for nontransactional MQI calls.

This reason code occurs only on Windows and z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Check that the "MTS Transaction Support" attribute defined for the object's class is set correctly. If necessary, modify the application so that the connection handle is not used by objects participating in different units of work.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:14

5.2.1.310. 2353 (0931) (RC2353): MQRC_HANDLE_IN_USE_FOR_UOW

Explanation

An attempt was made to use outside a unit of work a connection handle that is participating in a global unit of work.

This error can occur when an application passes connection handles between objects where one object is involved in a DTC transaction and the other is not. Because transaction completion is asynchronous, it is possible for this error to occur *after* the application has finalized the first object and committed its transaction.

This error can also occur when a single object that was created and associated with the transaction loses that association whilst the object is running. The association is lost when DTC terminates the transaction independently of MTS. This might be because the transaction timed out, or because DTC shut down.

This error does not occur for nontransactional MQI calls.

This reason code occurs only on Windows.

Completion Code

MQCC_FAILED

Programmer response

Check that the "MTS Transaction Support" attribute defined for the object's class is set correctly. If necessary, modify the application so that objects executing within different units of work do not try to use the same connection handle.

Parent topic: [Reason code list](#)

fm15140_

5.2.1.311. 2354 (0932) (RC2354): MQRC_UOW_ENLISTMENT_ERROR

Explanation

This reason code can occur for a variety of reasons. The most likely reason is that an object created by a DTC transaction does not issue a transactional MQI call until after the DTC transaction has timed out. (If the DTC transaction times out after a transactional MQI call has been issued, reason code MQRC_HANDLE_IN_USE_FOR_UOW is returned by the failing MQI call.)

Another cause of MQRC_UOW_ENLISTMENT_ERROR is incorrect installation; Windows NT Service pack must be installed after the Windows NT Option pack.

This reason code occurs only on Windows.

Completion Code

MQCC_FAILED

Programmer response

Check the DTC "Transaction timeout" value. If necessary, verify the NT installation order.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:14

This topic's URL:

fm15150_

5.2.1.312. 2355 (0933) (RC2355): MQRC_UOW_MIX_NOT_SUPPORTED

Explanation

The mixture of calls used by the application to perform operations within a unit of work is not supported. In particular, it is not possible to mix within the same process a local unit of work coordinated by the queue manager with a global unit of work coordinated by DTC (Distributed Transaction Coordinator).

An application may cause this mixture to arise if some objects in a package are coordinated by DTC and others are not. It can also occur if transactional MQI calls from an MTS client are mixed with transactional MQI calls from a library package transactional MTS object.

No problem arises if all transactional MQI calls originate from transactional MTS objects, or all transactional MQI calls originate from nontransactional MTS objects. But when a mixture of styles is used, the first style used fixes the style for the unit of work, and subsequent attempts to use the other style within the process fail with reason code MQRC_UOW_MIX_NOT_SUPPORTED.

When an application is run twice, scheduling factors in the operating system mean that it is possible for the queue-manager-coordinated transactional calls to fail in one run, and for the DTC-coordinated transactional calls to fail in the other run.

This reason code occurs only on Windows when running a version of the queue manager prior to version 5.2.

Completion Code

MQCC_FAILED

Programmer response

Check that the "MTS Transaction Support" attribute defined for the object's class is set correctly. If necessary, modify the application so that objects executing within different units of work do not try to use the same connection handle.

Parent topic: [Reason code list](#)

5.2.1.313. 2356 (0934) (RC2356): MQRC_WXP_ERROR

Explanation

An MQXCLWLN call was issued from a cluster workload exit to obtain the address of the next record in the chain, but the workload exit parameter structure *ExitParms* is not valid, for one of the following reasons:

- The parameter pointer is not valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)
- The *StrucId* field is not MQWXP_STRUC_ID.
- The *Version* field is not MQWXP_VERSION_2.
- The *CacheContext* field does not contain the value passed to the exit by the queue manager.

Completion Code

MQCC_FAILED

Programmer response

Ensure that the parameter specified for *ExitParms* is the MQWXP structure that was passed to the exit when the exit was invoked.

Parent topic: [Reason code list](#)

5.2.1.317. 2360 (0938) (RC2360): MQRC_OBJECT_LEVEL_INCOMPATIBLE

Explanation

An MQOPEN or MQPUT1 call, or a command, was issued, but the definition of the object to be accessed is not compatible with the queue manager to which the application has connected. The object definition was created or modified by a different version of the queue manager.

If the object to be accessed is a queue, the incompatible object definition could be the object specified, or one of the object definitions used to resolve the specified object (for example, the base queue to which an alias queue resolves, or the transmission queue to which a remote queue or queue-manager alias resolves).

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

The application must be run on a queue manager that is compatible with the object definition. Refer to the [WebSphere MQ for z/OS Concepts and Planning Guide](#) and the [WebSphere MQ for z/OS System Setup Guide](#) for information about compatibility and migration between different versions of the queue manager.

Parent topic: [Reason code list](#)

This topic's URL:

fm15220_

5.2.1.319. 2362 (093A) (RC2362): MQRC_BACKOUT_THRESHOLD_REACHED

Explanation

This reason code occurs only in the *Reason* field in an MQDLH structure, or in the *Feedback* field in the MQMD of a report message.

A JMS ConnectionConsumer found a message that exceeds the queue's backout threshold. The queue does not have a backout requeue queue defined, so the message was processed as specified by the disposition options in the *Report* field in the MQMD of the message.

On queue managers that do not support the *BackoutThreshold* and *BackoutRequeueQName* queue attributes, JMS ConnectionConsumer uses a value of 20 for the backout threshold. When the *BackoutCount* of a message reaches this threshold, the message is processed as specified by the disposition options.

If the *Report* field specifies one of the MQRO_EXCEPTION_* options, this reason code appears in the *Feedback* field of the report message. If the *Report* field specifies MQRO_DEAD_LETTER_Q, or the disposition report options are left as default, this reason code appears in the *Reason* field of the MQDLH.

Completion Code

None

Programmer response

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

Investigate the cause of the backout count being greater than the threshold. To correct this, define the backout queue for the queue concerned.

Parent topic: [Reason code list](#)

This topic's URL:

fm15230_

5.2.1.320. 2363 (093B) (RC2363): MQRC_MSG_NOT_MATCHED

Explanation

This reason code occurs only in the *Reason* field in an MQDLH structure, or in the *Feedback* field in the MQMD of a report message.

While performing Point-to-Point messaging, JMS encountered a message matching none of the selectors of ConnectionConsumers monitoring the queue. To maintain performance, the message was processed as specified by the disposition options in the *Report* field in the MQMD of the message.

If the *Report* field specifies one of the MQRO_EXCEPTION_* options, this reason code appears in the *Feedback* field of the report message. If the *Report* field specifies MQRO_DEAD_LETTER_Q, or the disposition report options are left as default, this reason code appears in the *Reason* field of the MQDLH.

Completion Code

None

Programmer response

To correct this, ensure that the ConnectionConsumers monitoring the queue provide a complete set of selectors. Alternatively, set the QueueConnectionFactory to retain messages.

Parent topic: [Reason code list](#)

5.2.1.323. 2366 (093E) (RC2366): MQRC_WRONG_CF_LEVEL

Explanation

An MQOPEN or MQPUT1 call was issued specifying a shared queue, but the queue requires a coupling-facility structure with a different level of capability.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Ensure that the coupling-facility structure used for the queue is at the level required to support the capabilities that the queue provides.

► You can use the DISPLAY CFSTRUCT command to display the level, and ALTER CFSTRUCT() CFLEVEL() command to modify the level. See ► [The MQSC commands](#) ◀◀

5.2.1.337. 2381 (094D) (RC2381): MQRC_KEY_REPOSITORY_ERROR

Explanation

On an MQCONN or MQCONN call, the location of the key repository is either not specified, not valid, or results in an error when used to access the key repository. The location of the key repository is specified by one of the following:

- The value of the MQSSLKEYR environment variable (MQCONN or MQCONN call), or
- The value of the *KeyRepository* field in the MQSCO structure (MQCONN call only).

For the MQCONN call, if both MQSSLKEYR and *KeyRepository* are specified, the latter is used.

This reason code occurs in the following environments: AIX®, HP-UX, Solaris, Windows.

Completion Code

MQCC_FAILED

Programmer response

Specify a valid location for the key repository.

Parent topic: [Reason code list](#)

5.2.1.338. 2382 (094E) (RC2382): MQRC_CRYPTO_HARDWARE_ERROR

Explanation

On an MQCONN or MQCONNX call, the configuration string for the cryptographic hardware is not valid, or results in an error when used to configure the cryptographic hardware. The configuration string is specified by one of the following:

- The value of the MQSSLCRYP environment variable (MQCONN or MQCONNX call), or
- The value of the *CryptoHardware* field in the MQSCO structure (MQCONNX call only).

For the MQCONNX call, if both MQSSLCRYP and *CryptoHardware* are specified, the latter is used.

This reason code occurs in the following environments: AIX®, HP-UX, Solaris, Windows.

Completion Code

MQCC_FAILED

Programmer response

Specify a valid configuration string for the cryptographic hardware.

Parent topic: [Reason code list](#)

5.2.1.340. 2384 (0950) (RC2384): MQRC_AUTH_INFO_REC_ERROR

Explanation

On an MQCONNX call, the MQSCO structure does not specify the address of the MQAIR records correctly. One of the following applies:

- *AuthInfoRecCount* is greater than zero, but *AuthInfoRecOffset* is zero and *AuthInfoRecPtr* is the null pointer.
- *AuthInfoRecOffset* is not zero and *AuthInfoRecPtr* is not the null pointer.
- *AuthInfoRecPtr* is not a valid pointer.
- *AuthInfoRecOffset* or *AuthInfoRecPtr* points to storage that is not accessible.

This reason code occurs in the following environments: AIX®, HP-UX, Solaris, Windows.

Completion Code

MQCC_FAILED

Programmer response

Ensure that one of *AuthInfoRecOffset* or *AuthInfoRecPtr* is zero and the other nonzero. Ensure that the field used points to accessible storage.

Parent topic: [Reason code list](#)

5.2.1.344. 2388 (0954) (RC2388): MQRC_LDAP_USER_NAME_ERROR

Explanation

On an MQCONNX call, an LDAP user name in an MQAIR record is not specified correctly. One of the following applies:

- *LDAPUserNameLength* is greater than zero, but *LDAPUserNameOffset* is zero and *LDAPUserNamePtr* is the null pointer.
- *LDAPUserNameOffset* is nonzero and *LDAPUserNamePtr* is not the null pointer.
- *LDAPUserNamePtr* is not a valid pointer.
- *LDAPUserNameOffset* or *LDAPUserNamePtr* points to storage that is not accessible.

This reason code occurs in the following environments: AIX®, HP-UX, Solaris, Windows.

Completion Code

MQCC_FAILED

Programmer response

Ensure that one of *LDAPUserNameOffset* or *LDAPUserNamePtr* is zero and the other nonzero. Ensure that the field used points to accessible storage.

Parent topic: [Reason code list](#)

5.2.1.347. 2391 (0957) (RC2391): MQRC_SSL_ALREADY_INITIALIZED

Explanation

An MQCONN or MQCONN call was issued with SSL configuration options specified, but the SSL environment had already been initialized. The connection to the queue manager completed successfully, but the SSL configuration options specified on the call were ignored; the existing SSL environment was used instead.

This reason code occurs in the following environments: AIX®, HP-UX, Solaris, Windows.

Completion Code

MQCC_WARNING

Programmer response

If the application must be run with the SSL configuration options defined on the MQCONN or MQCONN call, use the MQDISC call to sever the connection to the queue manager and then terminate the application. Alternatively run the application later when the SSL environment has not been initialized.

Parent topic: [Reason code list](#)

5.2.1.350. 2394 (095A) (RC2394): MQRC_Q_INDEX_TYPE_ERROR

Explanation

An MQGET call was issued specifying one or more of the following options:

- MQGMO_ALL_MSGS_AVAILABLE
- MQGMO_ALL_SEGMENTS_AVAILABLE
- MQGMO_COMPLETE_MSG

- MQGMO_LOGICAL_ORDER

but the call failed because the queue is not indexed by group identifier. These options require the queue to have an *IndexType* of MQIT_GROUP_ID.

This reason code occurs only on z/OS®.

Completion Code

MQCC_FAILED

Programmer response

Redefine the queue to have an *IndexType* of MQIT_GROUP_ID. Alternatively, modify the application to avoid using the options listed above.

Parent topic: [Reason code list](#)

5.2.1.356. 2400 (0960) (RC2400): MQRC_UNSUPPORTED_CIPHER_SUITE

Explanation

A connection to a queue manager was requested, specifying SSL encryption. However, JSSE reported that it does not support the CipherSuite specified by the application.

This reason code occurs only with Java applications.

Completion Code

MQCC_FAILED

Programmer response

Check the CipherSuite specified by the application. Note that the names of JSSE CipherSuites differ from their equivalent CipherSpecs used by the queue manager.

Also, check that JSSE is correctly installed.

5.2.1.357. 2401 (0961) (RC2401): MQRC_SSL_CERTIFICATE_REVOKED

Explanation

A connection to a queue manager was requested, specifying SSL encryption. However, the certificate presented by the queue manager was found to be revoked by one of the specified CertStores.

This reason code occurs only with Java applications.

Completion Code

MQCC_FAILED

Programmer response

Check the certificates used to identify the queue manager.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:18

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

This topic's URL:

fm15610_

5.2.1.358. 2402 (0962) (RC2402): MQRC_SSL_CERT_STORE_ERROR

Explanation

A connection to a queue manager was requested, specifying SSL encryption. However, none of the CertStore objects provided by the application could be searched for the certificate presented by the queue manager. The MQException object containing this reason code references the Exception encountered when searching the first CertStore; this can be obtained using the MQException.getCause() method. From JMS, the MQException is linked to the thrown JMSEException.

This reason code occurs only with Java applications.

Completion Code

MQCC_FAILED

Programmer response

Inspect the causal exception to determine the underlying error. Check the CertStore objects provided by your application. If the causal exception is a java.lang.NoSuchElementException, ensure that your application is not specifying an empty collection of CertStore objects.

5.2.1.359. 2406 (0966) (RC2406): MQRC_CLIENT_EXIT_LOAD_ERROR

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsa.doc/zm10120_.htm

16/03/2011

Explanation

The external user exit required for a client connection could not be loaded because the shared library specified for it cannot be found, or the entry point specified for it cannot be found.

This reason code occurs only with Java applications.

Completion Code

MQCC_FAILED

Programmer response

Ensure that the correct library has been specified, and that the path variable for the machine environment includes the relevant directory. Ensure also that the entry point has been named properly and that the named library does export it.

Parent topic: [Reason code list](#)

5.2.1.361. 2409 (0969) (RC2409): MQRC_SSL_KEY_RESET_ERROR

Explanation

On an MQCONN or MQCONNX call, the value of the SSL key reset count is not in the valid range of 0 through 999 999 999.

The value of the SSL key reset count is specified by either the value of the MQSSLRESET environment variable (MQCONN or MQCONNX call), or the value of the *KeyResetCount* field in the MQSCO structure (MQCONNX call only). For the MQCONNX call, if both MQSSLRESET and *KeyResetCount* are specified, the latter is used. MQCONN or MQCONNX

If you specify an SSL/TLS secret key reset count between 1 byte and 32Kb, SSL/TLS channels will use a secret key reset count of 32Kb. This is to avoid the overhead of excessive key resets which would occur for small SSL/TLS secret key reset values.

Completion Code

MQCC_FAILED

Programmer response

Check that the fields in the structure and the MQSSLRESET environment variable are set correctly.

Parent topic: [Reason code list](#)

This topic's URL:

fm15740_

5.2.1.371. 2420 (0974) (RC2420): MQRC_EPH_ERROR

Explanation

An MQPUT or MQPUT1 call was issued, but the message data contains an MQEPH structure that is not valid. Possible errors include the following:

- The *StrucId* field is not MQEPH_STRUC_ID.
- The *Version* field is not MQEPH_VERSION_1.
- The *StrucLength* field specifies a value that is too small to include the structure plus the variable-length data at the end of the structure.
- The *CodedCharSetId* field is zero, or a negative value that is not valid.
- The *Flags* field contains an invalid combination of MQEPH_* values.
- The *BufferLength* parameter of the call has a value that is too small to accommodate the structure, so the structure extends beyond the end of the message.

Completion Code

MQCC_FAILED

Programmer response

Check that the fields in the structure are set correctly. Ensure that the application sets the *CodedCharSetId* field to a valid value; note that MQCCSI_DEFAULT, MQCCSI_EMBEDDED, MQCCSI_Q_MGR, and MQCCSI_UNDEFINED are not valid in this field.

5.2.1.381. 2431 (097F) (RC2431): MQRC_SUB_USER_DATA_ERROR

Explanation

On the MQSUB call in the Subscription Descriptor MQSD the SubUserData field is not valid. One of the following applies:

- SubUserData.VSLength is greater than zero, but SubUserData.VSOffset is zero and SubUserData.VSPtr is the null pointer.

- SubUserData.VSOffset is nonzero and SubUserData.VSPtr is not the null pointer (that is, it appears both fields are being used where only one is allowed).
- SubUserData.VSPtr is not a valid pointer.
- SubUserData.VSOffset or SubUserData.VSPtr points to storage that is not accessible.
- SubUserData.VSLength exceeds the maximum length allowed for this field.

Completion Code

MQCC_FAILED

Programmer Response

Ensure that one of SubUserData.VSOffset or SubUserData.VSPtr is zero and the other nonzero. Ensure that the field used points to accessible storage. Specify a length that does not exceed the maximum length allowed for this field.

Parent topic: [Reason code list](#)

5.2.1.385. 2436 (0984) (RC2436): MQRC_DURABILITY_NOT_ALLOWED

Explanation

An MQSUB call using the MQSO_DURABLE option failed. This can be for one of the following reasons:

- The topic subscribed to is defined as DURSUB(NO).
- The queue named SYSTEM.DURABLE.SUBSCRIBER.QUEUE is not available.

Completion Code

MQCC_FAILED

Programmer Response

Durable subscriptions are stored on the SYSTEM.DURABLE.SUBSCRIBER.QUEUE. Ensure that this queue is available for use. Possible reasons for failure include the queue being full, the queue being put inhibited, or the queue not existing. If the topic subscribed to is defined as DURSUB(NO) either alter the administrative topic node to use DURSUB(YES) or use the MQSO_NON_DURABLE option instead.

5.2.1.387. 2438 (0986) (RC2438): MQRC_SRO_ERROR

Explanation

On the MQSUBRQ call, the Subscription Request Options MQSRO is not valid, for one of the following reasons:

- The StrucId field is not MQSRO_STRUC_ID.
- The Version field specifies a value that is not valid or not supported.
- The parameter pointer is not valid. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)
- The queue manager cannot copy the changed structure to application storage, even though the call is successful. This can occur, for example, if the pointer points to read-only storage.

Completion Code

MQCC_FAILED

Programmer Response

Ensure that input fields in the MQSRO structure are set correctly.

Parent topic: [Reason code list](#)

5.2.1.388. 2440 (0988) (RC2440): MQRC_SUB_NAME_ERROR

Explanation

On the MQSUB call in the Subscription Descriptor MQSD the SubName field is not valid or has been omitted. This is required if the MQSD option MQSO_DURABLE is specified, but may also be used if MQSO_DURABLE is not specified.

One of the following applies:

- SubName.VSLength is greater than zero, but SubName.VSOffset is zero and SubName.VSPtr is the null pointer.
- SubName.VSOffset is nonzero and SubName.VSPtr is not the null pointer (that is, it appears both fields are being used where only one is allowed).
- SubName.VSPtr is not a valid pointer.
- SubName.VSOffset or SubName.VSPtr points to storage that is not accessible.
- SubName.VSLength is zero but this field is required.
- SubName.VSLength exceeds the maximum length allowed for this field.

Completion Code

MQCC_FAILED

Programmer Response

Ensure that SubName is specified and SubName.VSLength is nonzero. Ensure that one of SubName.VSOffset or SubName.VSPtr is zero and the other nonzero. Ensure that the field used points to accessible storage. Specify a length that does not exceed the maximum length allowed for this field.

➤ This code can be returned if the sd.Options flags MQSO_CREATE and MQSO_RESUME are set together and sd.SubName is not initialized. You must also initialize the MQCHARV structure for sd.SubName, even if there is no subscription to resume. See [Example 2: Managed MQ subscriber](#) for more details. ◀

5.2.1.389. 2441 (0989) (RC2441): MQRC_OBJECT_STRING_ERROR

Explanation

On the MQOPEN or MQPUT1 call in the Object Descriptor MQOD, or on the MQSUB call in the Subscription Descriptor MQSD the ObjectString field is not valid.

One of the following applies:

- ObjectString.VSLength is greater than zero, but ObjectString.VSOffset is zero and ObjectString.VSPtr is the null pointer.
- ObjectString.VSOffset is nonzero and ObjectString.VSPtr is not the null pointer (that is, it appears both fields are being used where only one is allowed).
- ObjectString.VSPtr is not a valid pointer.
- ObjectString.VSOffset or ObjectString.VSPtr points to storage that is not accessible.

- ObjectString.VSLength exceeds the maximum length allowed for this field.

Completion Code

MQCC_FAILED

Programmer Response

Ensure that one of ObjectString.VSOffset or ObjectString.VSPtr is zero and the other nonzero. Ensure that the field used points to accessible storage. Specify a length that does not exceed the maximum length allowed for this field.

5.2.1.390. 2442 (098A) (RC2442): MQRC_PROPERTY_NAME_ERROR

Explanation

An attempt was made to set a property with an invalid name. This is for one of the following reasons:

- The name contained an invalid character.
- The name begins "JMS" or "usr.JMS" and the JMS property is not recognized.
- The name begins "mq" (except "mq_usr"), "jms", "mcd", "usr" or "sib" (in any mixture of lower or uppercase) and contains more than one "." character (U+002E). Multiple "." characters are not allowed in properties with those prefixes.
- The name is "NULL", "TRUE", "FALSE", "NOT", "AND", "OR", "BETWEEN", "LIKE", "IN", "IS" and "ESCAPE" or is one of these keywords prefixed by "usr."
- The name begins with "Body" or "Root" (except for names beginning "Root.MQMD.").
- A "." character must not be followed immediately by another "." character.
- The "." character cannot be the last character in a property name.

Completion Code

MQCC_FAILED

Programmer Response

Valid property names are described in the WebSphere MQ documentation. Ensure that all properties in the message have valid names before re-issuing the call.

Parent topic: [Reason code list](#)

5.2.1.391. 2443 (098B) (RC2443): MQRC_SEGMENTATION_NOT_ALLOWED

Explanation

An MQPUT or MQPUT1 call was issued to put a segmented message or a message that may be broken up into smaller segments (MQMF_SEGMENTATION_ALLOWED). The message was found to contain one or more MQ-defined properties in the message data; MQ-defined properties are not valid in the message data of a segmented message.

Completion Code

MQCC_FAILED

Programmer Response

Remove the invalid properties from the message data or prevent the message from being segmented.

5.2.1.401. 2460 (099C) (RC2460): MQRC_HMSG_ERROR

Explanation

On an MQCRTMH, MQDLTMH, MQSETMP, MQINQMP or MQDLT call, a message handle supplied is not valid, for one of the following reasons:

- The parameter pointer is not valid, or (for the MQCRTMH call) points to read-only storage. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)
- The value specified was not returned by a preceding MQCRTMH call.
- The value specified has been made invalid by a preceding MQDLTMH call.

Completion Code

MQCC_FAILED

Programmer Response

Ensure that a successful MQCRTMH call is performed for the connection, and that an MQDLTMH call has not already been performed for it. Ensure that the handle is being used within its valid scope (see the description of MQCRTMH in the WebSphere MQ documentation).

Parent topic: [Reason code list](#)

This topic's URL:

fm20300_

5.2.1.406. 2465 (09A1) (RC2465): MQRC_PROPERTY_NAME_TOO_BIG

Explanation

On an MQINQMP call, WebSphere MQ attempted to copy the name of the inquired property into the location indicated by the ReturnedName field of the InqPropOpts parameter but the buffer was too small to contain the full property name. The call failed but the VSLength field of the ReturnedName of the InqPropOpts parameter indicates how large the ReturnedName buffer needs to be.

Completion Code

MQCC_FAILED

Programmer response

The full property name can be retrieved by calling MQINQMP again with a larger buffer for the returned name, also specifying the MQIMPO_INQ_PROP_UNDER_CURSOR option. This will inquire on the same property.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:38[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#) Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

fm20310_

5.2.1.407. 2466 (09A2) (RC2466): MQRC_PROP_VALUE_NOT_CONVERTED

Explanation

An MQINQMP call was issued with the MQIMPO_CONVERT_VALUE option specified in the InqPropOpts parameter, but an error occurred during conversion of the value of the property. The property value is returned unconverted, the values of the ReturnedCCSID and ReturnedEncoding fields in the InqPropOpts parameter are set to those of the value returned.

Completion Code

MQCC_FAILED

Programmer Response

Check that the property value is correctly described by the ValueCCSID and ValueEncoding parameters that were specified when the property was set. Also check that these values, and the RequestedCCSID and RequestedEncoding specified in the InqPropOpts parameter of the MQINQMP call, are supported for MQ conversion. If the required conversion is not supported, conversion must be carried out by the application.

Parent topic: [Reason code list](#) This build: January 26, 2011 11:42:38[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#) Copyright IBM Corporation 1999, 2009. All Rights Reserved.

This topic's URL:

This topic's URL:

fm20370_

5.2.1.413. 2473 (09A9) (RC2473): MQRC_PROPERTY_TYPE_ERROR

Explanation

On an MQSETMP call, the Type parameter does not specify a valid MQTYPE_* value. For properties beginning "Root.MQMD." or "JMS" the specified Type must correspond to the data type of the matching MQMD or JMS header field:

- For MQCHARn or Java String fields use MQTYPE_STRING.
- For MQLONG or Java int fields use MQTYPE_INT32.
- For MQBYTEn fields use MQTYPE_BYTE_STRING.
- For Java long fields use MQTYPE_INT64.

On an MQINQMP call, the Type parameter is not valid. Either the parameter pointer is not valid, the value is invalid, or it points to read-only storage. (It is not always possible to detect parameter pointers that are not valid; if not detected, unpredictable results occur.)

Completion Code

MQCC_FAILED

Programmer Response

Correct the parameter.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:38

5.2.1.414. 2478 (09AE) (RC2478): MQRC_PROPERTIES_TOO_BIG

Explanation

An MQPUT or MQPUT1 call was issued to put a message on a queue, but the properties of the message were too large. The length of the properties cannot exceed the value of the MaxPropertiesLength queue manager attribute.

Completion Code

MQCC_FAILED

Programmer Response

Do one of the following:

- Reduce the number or the size of the properties associated with the message. This could include moving some of the properties into the application data.
- Increase the value of the MaxPropertiesLength queue manager attribute.

5.2.1.415. 2479 (09AF) (RC2479): MQRC_PUT_NOT_RETAINED

Explanation

An MQPUT or MQPUT1 call was issued to publish a message on a topic, using the MQPMO_RETAIN option, but the publication was unable to be retained. The publication is not published to any matching subscribers.

Completion Code

MQCC_FAILED

Programmer Response

Retained publications are stored on the SYSTEM.RETAINED.PUB.QUEUE. Ensure that this queue is available for use by the application. Possible reasons for failure include the queue being full, the queue being put inhibited, or the queue not existing.

Parent topic: [Reason code list](#)

5.2.1.416. 2480 (09B0) (RC2480): MQRC_ALIAS_TARGTYPE_CHANGED

Explanation

An MQPUT or MQPUT1 call was issued to publish a message on a topic. One of the subscriptions matching this topic was made with a destination queue that was an alias queue which originally referenced a queue, but now references a topic object, which is not allowed. In this situation the reason code MQRC_ALIAS_TARGTYPE_CHANGED is returned in the Feedback field in the MQMD of a report message, or in the Reason field in the MQDLH structure of a message on the dead-letter queue.

Completion Code

MQCC_FAILED

Programmer Response

Find the subscriber that is using an alias queue which references a topic object and change it to reference a queue again, or change the subscription to reference a different queue.

Parent topic: [Reason code list](#)

5.2.1.432. 2498 (09C2) (RC2498): MQRC_MIXED_CONTENT_NOT_ALLOWED

Explanation

An attempt was made to set a property with mixed content. For example, if an application set the property "x.y" and then attempted to set the property "x.y.z" it is unclear whether in the property name hierarchy "y" contains a value or another logical grouping. Such a hierarchy would be "mixed content" and this is not supported. Setting a property which would cause mixed content is not allowed. A hierarchy within a property name is created using the "." character (U+002E).

Completion Code

MQCC_FAILED

Programmer Response

Valid property names are described in the WebSphere MQ documentation. Change the property name hierarchy so that it no longer contains mixed content before re-issuing the call.

Parent topic: [Reason code list](#)

Explanation

An MQSUB call using option MQSO_GROUP_SUB was made creating a new grouped subscription but, although it has a unique SubName, it matches the Full topic name of an existing subscription in the group.

Completion Code

MQCC_FAILED

Programmer Response

Correct the Full topic name used so that it does not match any existing subscription in the group, or correct the grouping attributes if, either a different group was intended or the subscription was not intended to be grouped at all.

5.2.1.445. 2515 (09D3) (RC2515): MQRC_GROUPING_NOT_ALTERABLE

Explanation

An MQSUB call was made using option MQSO_ALTER on a grouped subscription, that is one made with the option MQSO_GROUP_SUB. Grouping of subscriptions is not alterable.

Completion Code

MQCC_FAILED

Programmer response

Remove the subscription using MQCLOSE and recreate it again with MQSUB with the attributes set correctly, or change the various grouping fields used on the MQSUB call so that it matches the existing subscription.

Parent topic: [Reason code list](#)

5.2.1.446. 2516 (09D4) (RC2516): MQRC_SELECTOR_INVALID_FOR_TYPE

Explanation

A SelectionString may only be specified in the MQOD for an MQOPEN/MQPUT1 if the following is true:

- ObjectType is MQOT_Q
- The queue is being opened using one of the MQOO_INPUT_* open options.

Completion Code

MQCC_FAILED

Programmer Response

Modify the value of ObjectType to be MQOT_Q and ensure that the queue is being opened using one of the MQOO_INPUT_* options.

Parent topic: [Reason code list](#)

5.2.1.447. 2517 (09D5) (RC2517): MQRC_HOBJ QUIESCED

Explanation

The HOBJ has been quiesced but there are no messages in the read ahead buffer which match the current selection criteria. This reason code indicates that the read ahead buffer is not empty.

Completion Code

MQCC_FAILED

Programmer Response

This reason code indicates that all messages with the current selection criteria have been processed. Do one of the following:

- If no further messages need to be processed issue an MQCLOSE without the MQCO_QUIESCE option. Any messages in the read ahead buffer will be discarded.
- Relax the current selection criteria by modifying the values in the MQGMO and reissue the call. Once all messages have been consumed the call will return MQRC_HOBJ_QUIESCED_NO_MSGS.

Parent topic: [Reason code list](#)

5.2.1.449. 2519 (09D7) (RC2519): MQRC_SELECTION_STRING_ERROR

Explanation

The SelectionString must be specified as per the description of how to use an MQCHARV structure. Examples of why this error was returned:

- VSPtr and VSOffset were both specified.
- Neither VSPtr or VSOffset were specified.
- The supplied VSLength was invalid.

Completion Code

MQCC_FAILED

Programmer Response

Modify the fields of the MQCHARV so that it follows the rules for a valid MQCHARV structure.

Parent topic: [Reason code list](#)

5.2.1.450. 2520 (09D8) (RC2520): MQRC_RES_OBJECT_STRING_ERROR

Explanation

On the MQOPEN or MQPUT1 call in the Object Descriptor MQOD, or on the MQSUB call in the Subscription Descriptor MQSD the ResObjectString field is not valid.

One of the following applies:

- ResObjectString.VSLength is greater than zero, but ResObjectString.VSOffset is zero and ResObjectString.VSPtr is the null pointer.
- ResObjectString.VSOffset is nonzero and ResObjectString.VSPtr is not the null pointer (that is, it appears both fields are being used where only one is allowed).
- ResObjectString.VSPtr is not a valid pointer.
- ResObjectString.VSOffset or ResObjectString.VSPtr points to storage that is not accessible.
- ResObjectString.VSBufSize is MQVS_USE_VSLENGTH and one of ResObjectString.VSOffset or ResObjectString.VSPtr have been provided.

Completion Code

MQCC_FAILED

Programmer Response

Ensure that one of ResObjectString.VSOffset or ResObjectString.VSPtr is zero and the other nonzero and that the buffer length is provided in ResObjectString.VSBufSize. Ensure that the field used points to accessible storage.

Parent topic: [Reason code list](#)

5.2.1.451. 2521 (09D9) (RC2521): MQRC_CONNECTION_SUSPENDED

Explanation

An MQCTL call with Operation MQOP_START_WAIT has returned because the asynchronous consumption of messages has been suspended. This can be for the following reasons:

- The connection was explicitly suspended using MQCTL with Operation MQOP_SUSPEND
- All consumers have been either unregistered or suspended.

Completion Code

MQCC_WARNING

Programmer Response

If this is an expected condition, no corrective action required. If this is an unexpected condition check that:

- At least one consumer is registered and not suspended
- The connection has not been suspended

Parent topic: [Reason code list](#)

This topic's URL:

fm20760_

5.2.1.452. 2522 (09DA) (RC2522): MQRC_INVALID_DESTINATION

Explanation

An MQSUB call failed because of a problem with the destination where publications messages are to be sent, so an object handle cannot be returned to the application and the subscription is not made. This can be for one of the following reasons:

- The MQSUB call used MQSO_CREATE, MQSO_MANAGED and MQSO_NON_DURABLE and the model queue referred to by MNDURMDL on the administrative topic node does not exist
- The MQSUB call used MQSO_CREATE, MQSO_MANAGED and MQSO_DURABLE and the model queue referred to by MDURMDL on the administrative topic node does not exist, or has been defined with a DEFTYPE of TEMPDYN.
- The MQSUB call used MQSO_CREATE or MQSO_ALTER on a durable subscription and the object handle provided referred to a temporary dynamic queue. This is not an appropriate destination for a durable subscription.
- The MQSUB call used MQSO_RESUME and a Hobj of MQHO_NONE, to resume an administratively created subscription, but the queue name provided in the DEST parameter of the subscription does not exist.
- The MQSUB call used MQSO_RESUME and a Hobj of MQHO_NONE, to resume a previously created API subscription, but the queue previously used no longer exists.

Completion Code

MQCC_FAILED

Programmer Response

Ensure that the model queues referred to by MNDURMDL and MDURMDL exist and have an appropriate DEFTYPE. Create the queue referred to by the DEST parameter in an administrative subscription if one is being used. Alter the subscription to use an existing queue if the previously used one does not exist.

5.2.1.453. 2523 (09DB) (RC2523): MQRC_INVALID_SUBSCRIPTION

Explanation

An MQSUB call using MQSO_RESUME or MQSO_ALTER failed because the subscription named is not valid for use by applications. This can be for one of the following reasons:

- The subscription is the SYSTEM.DEFAULT.SUB subscription which is not a valid subscription and should

only be used to fill in the default values on DEFINE SUB commands.

- The subscription is a proxy type subscription which is not a valid subscription for an application to resume and is only used to enable publications to be forwarded between queue managers.
- The subscription has expired and is no longer valid for use.

Completion Code

MQCC_FAILED

Programmer Response

Ensure the subscription named in SubName field is not one of the invalid ones listed above. If you have a handle open to the subscription already it must have expired. Use MQCLOSE to close the handle and then if necessary create a new subscription.

Parent topic: [Reason code list](#)

This topic's URL:

fm20790_

5.2.1.455. 2525 (09DD) (RC2525): MQRC_RETAINED_MSG_Q_ERROR

Explanation

An MQSUB call which did not use the MQSO_NEW_PUBLICATIONS_ONLY option, or an MQSUBRQ call, failed because the retained publications which exist for the topic string subscribed to cannot be retrieved from the SYSTEM.RETAINED.PUB.QUEUE. This can be for one of the following reasons:

- The queue has become damaged or has been deleted.

- The queue has been set to GET(DISABLED).
- Messages have been removed from this queue directly.

An error message will be written to the log giving more details about the problem with the SYSTEM.RETAINED.PUB.QUEUE.

When this return code occurs on an MQSUB call, it can only occur using the MQSO_CREATE option, and in this case the subscription is not created.

Completion Code

MQCC_FAILED

Programmer Response

If this occurs on an MQSUB call, re-issue the MQSUB call using the option MQSO_NEW_PUBLICATIONS_ONLY, which will mean no previously retained publications are sent to this subscription, or fix the SYSTEM.RETAINED.PUB.QUEUE so that messages can be retrieved from it and re-issue the MQSUB call.

If this occurs on an MQSUBRQ call, fix the SYSTEM.RETAINED.PUB.QUEUE so that messages can be retrieved from it and re-issue the MQSUBRQ call.

Parent topic: [Reason code list](#)

5.2.1.457. 2527 (09DF) (RC2527): MQRC_RFH_RESTRICTED_FORMAT_ERR

Explanation

A message was put to a queue containing an MQRFH2 header which included a folder with a restricted format. However, the folder was not in the required format. These restrictions are:

- If NameValueCCSID of the folder is 1208 then only single byte UTF-8 characters are allowed in the folder, group or element names.
- Groups are not allowed in the folder.
- The values of properties may not contain any characters that require escaping.
- Only Unicode character U+0020 will be treated as white space within the folder.
- The folder tag must not contain the content attribute.
- The folder must not contain a property with a null value.

The <mq> folder requires formatting of this restricted form.

Completion Code

MQCC_FAILED

Programmer Response

Change the message to include valid MQRFH2 folders.

Parent topic: [Reason code list](#)

5.2.1.464. 2534 (09E6) (RC2534): MQRC_OPERATION_NOT_ALLOWED

Explanation

An MQCTL call was made with an Operation that is not allowed because of the state of asynchronous consumption on the hConn is currently in.

If Operation was MQOP_RESUME, the operation is not allowed because the state of asynchronous consumption on the hConn is STOPPED. Re-issue MQCTL with the MQOP_START Operation.

If Operation was MQOP_SUSPEND, the operation is not allowed because the state of asynchronous consumption on the hConn is STOPPED. If you need to get your hConn into a SUSPENDED state, issue MQCTL with the MQOP_START Operation followed by MQCTL with MQOP_SUSPEND.

If Operation was MQOP_START, the operation is not allowed because the state of asynchronous consumption on the hConn is SUSPENDED. Re-issue MQCTL with the MQOP_RESUME Operation.

If Operation was MQOP_START_WAIT, the operation is not allowed because either:

- The state of asynchronous consumption on the hConn is SUSPENDED. Re-issue MQCTL with the MQOP_RESUME Operation.
- The state of asynchronous consumption on the hConn is already STARTED. Do not mix the use of MQOP_START and MQOP_START_WAIT within one application.

Completion Code

MQCC_FAILED

Programmer Response

Re-issue the MQCTL call with the correct Operation.

5.2.1.472. 2551 (09F7) (RC2551): MQRC_SELECTION_NOT_AVAILABLE

Explanation

An MQSUB call was issued with a SelectionString specified but WebSphere® MQ is unable to accept the call because it does not follow the rules for specifying selection strings, which are documented in [Message selector syntax](#) in the *WebSphere MQ Application Programming Guide*. It is possible that the selection string is acceptable to an extended message selection provider, however no extended message selection provider was available to validate the selection string. If a subscription is being created, the MQSUB fails; otherwise MQSUB completes with a warning.

This reason code can also be returned when an MQPUT or MQPUT1 call published a message and at least one subscriber had a content filter but WebSphere MQ could not determine whether the publication should be delivered to the subscriber (for example, because no extended message selection provider was available to validate the selection string). The MQPUT or MQPUT1 call will fail with MQRC_SELECTION_NOT_AVAILABLE and no subscribers will receive the publication.

Completion Code

MQCC_WARNING or MQCC_FAILED

Programmer response

If it was intended that the selection string should be handled by the extended message selection provider, ensure that the extended message selection provider is correctly configured and running. If extended message selection was not intended, consult [Message selector syntax](#) in *WebSphere MQ Application Programming Guide* and ensure that you have correctly followed the rules for specifying selection strings.

If a subscription is being resumed, the subscription will not be delivered any messages until a extended message selection provider is available and a message matches the SelectionString of the resumed subscription.

5.2.1.473. 2554 (09FA) (RC2554): MQRC_CONTENT_ERROR

Explanation

An MQPUT call was issued with a message where the content could not be parsed to determine whether the

message should be delivered to a subscriber with an extended message selector. No subscribers will receive the publication.

Completion Code

MQCC_FAILED

Programmer response

Check for error messages from the extended message selection provider and ensure that the message content is well formed before retrying the operation.

Parent topic: [Reason code list](#)

5.2.1.474. 2555 (09FB) (RC2555): MQRC_RECONNECT_Q_MGR_REQD

Explanation

The MQCNO_RECONNECT_Q_MGR option is required.

An option, such as MQMO_MATCH_MSG_TOKEN in an MQGET call, was specified in the client program that requires reconnection to the same queue manager.

Completion Code

MQCC_FAILED

Programmer response

Change the MQCONNX call to use MQCNO_RECONNECT_Q_MGR, or modify the client program not to use the conflicting option.

Parent topic: [Reason code list](#)

5.2.1.476. 6100 (17D4) (RC6100): MQRC_REOPEN_EXCL_INPUT_ERROR

Explanation

An open object does not have the correct ImqObject **open options** and requires one or more additional options. An implicit reopen is required but closure has been prevented.

Closure has been prevented because the queue is open for exclusive input and closure might result in the queue being accessed by another process or thread, before the queue is reopened by the process or thread that presently has access.

This reason code occurs in the WebSphere® MQ C++ environment.

Completion Code

MQCC_FAILED

Programmer response

Set the **open options** explicitly to cover all eventualities so that implicit reopening is not required.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:21

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

This topic's URL:

fm15790_

5.2.1.477. 6101 (17D5) (RC6101): MQRC_REOPEN_INQUIRE_ERROR

Explanation

An open object does not have the correct ImqObject **open options** and requires one or more additional options. An implicit reopen is required but closure has been prevented.

Closure has been prevented because one or more characteristics of the object need to be checked dynamically prior to closure, and the **open options** do not already include MQOO_INQUIRE.

This reason code occurs in the WebSphere® MQ C++ environment.

Completion Code

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

MQCC_FAILED

Programmer response

Set the **open options** explicitly to include MQOO_INQUIRE.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:21

This topic's URL:

fm15800_

5.2.1.478. 6102 (17D6) (RC6102): MQRC_REOPEN_SAVED_CONTEXT_ERR

Explanation

An open object does not have the correct ImqObject **open options** and requires one or more additional options. An implicit reopen is required but closure has been prevented.

Closure has been prevented because the queue is open with MQOO_SAVE_ALL_CONTEXT, and a destructive get has been performed previously. This has caused retained state information to be associated with the open queue and this information would be destroyed by closure.

This reason code occurs in the WebSphere® MQ C++ environment.

Completion Code

MQCC_FAILED

Programmer response

Set the **open options** explicitly to cover all eventualities so that implicit reopening is not required.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:21

[Notices](#) | [Trademarks](#) | [Downloads](#) | [Library](#) | [Support](#) | [Feedback](#)

This topic's URL:

fm15810_

5.2.1.479. 6103 (17D7) (RC6103): MQRC_REOPEN_TEMPORARY_Q_ERROR

Explanation

An open object does not have the correct ImqObject **open options** and requires one or more additional options. An implicit reopen is required but closure has been prevented.

Closure has been prevented because the queue is a local queue of the definition type MQQDT_TEMPORARY_DYNAMIC, that would be destroyed by closure.

This reason code occurs in the WebSphere® MQ C++ environment.

Completion Code

MQCC_FAILED

Programmer response

Set the **open options** explicitly to cover all eventualities so that implicit reopening is not required.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:21

This topic's URL:

fm15820_

5.2.1.480. 6104 (17D8) (RC6104): MQRC_ATTRIBUTE_LOCKED

Explanation

An attempt has been made to change the value of an attribute of an object while that object is open, or, for an ImqQueueManager object, while that object is connected. Certain attributes cannot be changed in these circumstances. Close or disconnect the object (as appropriate) before changing the attribute value.

An object may have been connected and/or opened unexpectedly and implicitly in order to perform an MQINQ call. Check the attribute cross-reference table in the [WebSphere MQ Using C++](#) book to determine whether any of your method invocations result in an MQINQ call.

This reason code occurs in the WebSphere® MQ C++ environment.

Completion Code

MQCC_FAILED

Programmer response

Include MQOO_INQUIRE in the ImqObject **open options** and set them earlier.

Parent topic: [Reason code list](#)

 This build: January 26, 2011 11:42:21

5.2.1.487. 6111 (17DF) (RC6111): MQRC_BINARY_DATA_LENGTH_ERROR

Explanation

The length of the binary data is inconsistent with the length of the target attribute. Zero is a correct length for all attributes.

- The correct length for an **accounting token** is MQ_ACCOUNTING_TOKEN_LENGTH.
- The correct length for an **alternate security id** is MQ_SECURITY_ID_LENGTH.
- The correct length for a **correlation id** is MQ_CORREL_ID_LENGTH.
- The correct length for a **facility token** is MQ_FACILITY_LENGTH.
- The correct length for a **group id** is MQ_GROUP_ID_LENGTH.
- The correct length for a **message id** is MQ_MSG_ID_LENGTH.
- The correct length for an **instance id** is MQ_OBJECT_INSTANCE_ID_LENGTH.
- The correct length for a **transaction instance id** is MQ_TRAN_INSTANCE_ID_LENGTH.
- The correct length for a **message token** is MQ_MSG_TOKEN_LENGTH.

This reason code occurs in the WebSphere® MQ C++ environment.

5.2.1.504. 6128 (17FO) (RC6128): MQRC_WRONG_VERSION

Explanation

A method failed because a version number specified or encountered is either incorrect or not supported.

For the ImqCICSBridgeHeader class, the problem is with the **version** attribute.

This reason code occurs in the WebSphere® MQ C++ environment.

Completion Code

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

MQCC_FAILED

Programmer response

If you are specifying a version number, use one that is supported by the class. If you are receiving message data from another program, ensure that both programs are using consistent and supported version numbers.

5.2.1.505. 6129 (17F1) (RC6129): MQRC_REFERENCE_ERROR

Explanation

An object reference is invalid.

There is a problem with the address of a referenced object. At the time of use, the address of the object is nonnull, but is invalid and cannot be used for its intended purpose.

This reason code occurs in the WebSphere® MQ C++ environment.

Completion Code

MQCC_FAILED

Programmer response

Check that the referenced object is neither deleted nor out of scope, or remove the reference by supplying a null address value.

6. PCF reason codes

Reason codes might be returned by a broker in response to a command message in PCF format, depending on the parameters used in that message.

For more information about PCF, see the [WebSphere MQ Publish/Subscribe User's Guide](#).

6.1. Reason codes

The following is a list of PCF reason codes, in numeric order, providing detailed information to help you understand them, including:

- An explanation of the circumstances that have caused the code to be raised
- The associated completion code
- Suggested programmer actions in response to the code

This topic's URL:

fm16600_

6.1.50. 3049 (OBE9) (RC3049): MQRCCF_CCSID_ERROR

Explanation

Coded character-set identifier error.

In a command message, one of the following occurred:

- The *CodedCharSetId* field in the message descriptor of the command does not match the coded character-set identifier of the queue manager at which the command is being processed, or
- The *CodedCharSetId* field in a string parameter structure within the message text of the command is not
 - MQCCSI_DEFAULT, or
 - the coded character-set identifier of the queue manager at which the command is being processed, as in the *CodedCharSetId* field in the message descriptor.

The error response message contains the correct value.

This reason can also occur if a ping cannot be performed because the coded character-set identifiers are not compatible. In this case the correct value is not returned.

Programmer response

Construct the command with the correct coded character-set identifier, and specify this in the message descriptor when sending the command. For ping, use a suitable coded character-set identifier.

Parent topic: [Reason codes](#)

This topic's URL:

fm16750_

6.1.65. 3072 (0C00) (RC3072): MQRCCF_TOPIC_ERROR

Explanation

Topic name is invalid.

A command has been sent to the broker containing a topic name that is not valid. Note that wildcard topic names are not allowed for *Register Publisher* and *Publish* commands.

Programmer response

Retry the command with a valid topic name parameter. Up to 256 characters of the topic name in question are returned with the error response message. If the topic name contains a null character, this is assumed to terminate the string and is not considered to be part of it. A zero length topic name is not valid, as is one that contains an escape sequence that is not valid.

Parent topic: [Reason codes](#)

fm16760_

6.1.66. 3073 (0C01) (RC3073): MQRCCF_NOT_REGISTERED

Explanation

Subscriber or publisher is not registered.

A *Deregister* command has been issued to remove registrations for a topic, or topics, for which the publisher or subscriber is not registered. If multiple topics were specified on the command, it fails with a completion code of MQCC_WARNING if the publisher or subscriber was registered for some, but not all, of the topics specified. This error code is also returned to a subscriber issuing a *Request Update* command for a topic for which he does not have a subscription.

Programmer response

Investigate why the publisher or subscriber is not registered. In the case of a subscriber, the subscriptions might have expired, or been removed automatically by the broker if the subscriber is no longer authorized.

Parent topic: [Reason codes](#)

 This build: January 26, 2011 11:42:27

fm16770_

6.1.67. 3074 (0C02) (RC3074): MQRCCF_Q_MGR_NAME_ERROR

Explanation

An invalid or unknown queue manager name has been supplied.

A queue manager name has been supplied as part of a publisher or subscriber identity. This might have been supplied as an explicit parameter or in the *ReplyToQMGr* field in the message descriptor of the command. Either the queue manager name is not valid, or in the case of a subscriber identity, the subscriber's queue could not be resolved because the remote queue manager is not known to the broker queue manager.

Programmer response

Retry the command with a valid queue manager name. If appropriate, the broker includes a further error reason code within the error response message. If one is supplied, follow the guidance for that reason code in [WebSphere MQ Application Programming Reference](#) to resolve the problem.

Parent topic: [Reason codes](#)

 This build: January 26, 2011 11:42:27

6.1.69. 3076 (0C04) (RC3076): MQRCCF_Q_NAME_ERROR

Explanation

An invalid or unknown queue name has been supplied.

A queue name has been supplied as part of a publisher or subscriber identity. This might have been supplied as an explicit parameter or in the *ReplyToQ* field in the message descriptor of the command. Either the queue name is not valid, or in the case of a subscriber identity, the broker has failed to open the queue.

Programmer response

Retry the command with a valid queue name. If appropriate, the broker includes a further error reason code within the error response message. If one is supplied, follow the guidance for that reason code in [WebSphere MQ Application Programming Reference](#) to resolve the problem.

Parent topic: [Reason codes](#)

fm16810_

6.1.71. 3078 (0C06) (RC3078): MQRCCF_DUPLICATE_IDENTITY

Explanation

Publisher or subscriber identity already assigned to another user ID.

Each publisher and subscriber has a unique identity consisting of a queue manager name, a queue name, and optionally a correlation identifier. Associated with each identity is the user ID under which that publisher or subscriber first registered. A given identity can be assigned only to one user ID at a time. While the identity is registered with the broker all commands wanting to use it must specify the correct user ID. When a publisher or a subscriber no longer has any registrations with the broker the identity can be used by another user ID.

Programmer response

Either retry the command using a different identity or remove all registrations associated with the identity so that it can be used by a different user ID. The user ID to which the identity is currently assigned is returned within the error response message. A *Deregister* command could be issued to remove these registrations. If the user ID in question cannot be used to execute such a command, you need to have the necessary authority to open the SYSTEM.BROKER.CONTROL.QUEUE using the MQOO_ALTERNATE_USER_AUTHORITY option.

6.1.73. 3080 (0C08) (RC3080): MQRCCF_CORREL_ID_ERROR

Explanation

Correlation identifier used as part of an identity is all binary zeroes.

Each publisher and subscriber is identified by a queue manager name, a queue name, and optionally a correlation identifier. The correlation identifier is typically used to allow multiple subscribers to share the same subscriber queue. In this instance a publisher or subscriber has indicated within the Registration or Publication options supplied on the command that their identity does include a correlation identifier, but a valid identifier has not been supplied.

Programmer response

Retry the command ensuring that the correlation identifier supplied in the message descriptor of the command message is not all binary zeroes.

Parent topic: [Reason codes](#)

This topic's URL:

fm16840_

6.1.74. 3081 (0C09) (RC3081): MQRCCF_NOT_AUTHORIZED

Explanation

Subscriber has insufficient authority.

To receive publications a subscriber application needs both browse authority for the stream queue that it is subscribing to, and put authority for the queue that publications are to be sent to. Subscriptions are rejected if the subscriber does not have both authorities. In addition to having browse authority for the stream queue, a subscriber would also require *altusr* authority for the stream queue to subscribe to certain topics that the broker itself publishes information on. These topics start with the MQ/SA/ prefix.

Programmer response

Ensure that the subscriber has the necessary authorities and reissue the request. The problem might occur because the subscriber's user ID is not known to the broker. This can be identified if a further error reason code of MQRC_UNKNOWN_ENTITY is returned within the error response message.

Parent topic: [Reason codes](#)

6.1.75. 3082 (0C0A) (RC3082): MQRCCF_UNKNOWN_STREAM

Explanation

Stream is not known by the broker or could not be created.

A command message has been put to the SYSTEM.BROKER.CONTROL.QUEUE for an unknown stream. This error code is also returned if dynamic stream creation is enabled and the broker failed to create a stream queue for the new stream using the SYSTEM.BROKER.MODEL.STREAM queue.

Programmer response

Retry the command for a stream that the broker supports. If the broker should support the stream, either define the stream queue manually, or correct the problem that prevented the broker from creating the stream queue itself.

6.1.78. 3085 (0C0D) (RC3085): MQRCCF_UNKNOWN_BROKER

Explanation

Command received from an unknown broker.

Within a multi-broker network, related brokers pass subscriptions and publications between each other as a series of command messages. One such command message has been received from a broker that is not, or is no longer, related to the detecting broker.

Programmer response

his situation can occur if the broker network is not quiesced while topology changes are made to the network. When removing a broker from the network ensure that the channels between the two related brokers in question are active.

6.1.81. 3088 (0C10) (RC3088): MQRCCF_CLUSTER_NAME_CONFLICT

Explanation

ClusterName and *ClusterNameList* attributes conflict.

The command was rejected because it would have resulted in the *ClusterName* attribute and the *ClusterNameList* attribute both being nonblank. At least one of these attributes must be blank.

Programmer response

If the command specified one of these attributes only, you must also specify the other one, but with a value of blanks. If the command specified both attributes, ensure that one of them has a value of blanks.

Parent topic: [Reason codes](#)

6.1.82. 3089 (0C11) (RC3089): MQRCCF_REPOS_NAME_CONFLICT

Explanation

RepositoryName and *RepositoryNamelist* attributes conflict.

Either:

- The command was rejected because it would have resulted in the *RepositoryName* and *RepositoryNamelist* attributes both being nonblank. At least one of these attributes must be blank.
- For a Reset Queue Manager Cluster command, the queue manager does not provide a full repository management service for the specified cluster. That is, the *RepositoryName* attribute of the queue manager is not the specified cluster name, or the namelist specified by the *RepositoryNamelist* attribute does not contain the cluster name.

Programmer response

Reissue the command with the correct values or on the correct queue manager.

6.1.83. 3090 (0C12) (RC3090): MQRCCF_CLUSTER_Q_USAGE_ERROR

Explanation

Queue cannot be a cluster queue.

The command was rejected because it would have resulted in a cluster queue also being a transmission queue, which is not permitted, or because the queue in question cannot be a cluster queue.

Programmer response

Ensure that the command specifies either:

- The *Usage* parameter with a value of MQUS_NORMAL, or
- The *ClusterName* and *ClusterNamelist* parameters with values of blanks.
- A *QName* parameter with a value that is not one of these reserved queues:
 - SYSTEM.CHANNEL.INITQ
 - SYSTEM.CHANNEL.SYNCQ
 - SYSTEM.CLUSTER.COMMAND.QUEUE
 - SYSTEM.CLUSTER.REPOSITORY.QUEUE
 - SYSTEM.COMMAND.INPUT
 - SYSTEM.QSG.CHANNEL.SYNCQ
 - SYSTEM.QSG.TRANSMIT.QUEUE

6.1.92. 3150 (0C4E) (RC3150): MQRCCF_FILTER_ERROR

Explanation

Filter not valid.

Either:

1. In an inquire command message, the specification of a filter is not valid.
2. In a publish/subscribe command message, the content-based filter expression supplied in the publish/subscribe command message contains invalid syntax, and cannot be used.

Programmer response

1. Correct the specification of the filter parameter structure in the inquire command message.
2. Correct the syntax of the filter expression in the publish/subscribe command message. The filter expression is the value of the *Filter* tag in the *psc* folder in the MQRFH2 structure. See the *Websphere MQ Integrator V2 Programming Guide* for details of valid syntax.

6.1.119. 3201 (0C81) (RC3201): MQRCCF_SECURITY_SWITCH_OFF

Explanation

Security refresh or reverification not processed, security switch set OFF.

Either

- a Reverify Security command was issued, but the subsystem security switch is off, so there are no internal control tables to flag for reverification; or
- a Refresh Security command was issued, but the security switch for the requested class or the subsystem security switch is off.

The switch in question may be returned in the message (with parameter identifier MQIACF_SECURITY_SWITCH).

Parent topic: [Reason codes](#)

 This build: January 26, 2011 11:42:29

This topic's URL:

fm17300_

6.1.120. 3202 (0C82) (RC3202): MQRCCF_SECURITY_REFRESH_FAILED

Explanation

Security refresh did not take place.

A SAF RACROUTE REQUEST=STAT call to your external security manager (ESM) returned a non-zero return code. In consequence, the requested security refresh could not be done. The security item affected may be returned in the message (with parameter identifier MQIACF_SECURITY_ITEM).

Possible causes of this problem are:

- The class is not installed
- The class is not active
- The external security manager (ESM) is not active
- The RACF z/OS router table is incorrect

Programmer response

For information about resolving the problem, see the explanations of messages CSQH003I and CSQH004I.

6.1.121. 3203 (0C83) (RC3203): MQRCCF_PARM_CONFLICT

Explanation

Incompatible parameters or parameter values.

The parameters or parameter values for a command are incompatible. One of the following occurred:

- A parameter was not specified that is required by another parameter or parameter value.
- A parameter or parameter value was specified that is not allowed with some other parameter or parameter value.

- The values for two specified parameters were not both blank or non-blank.
- The values for two specified parameters were incompatible.

The parameters in question may be returned in the message (with parameter identifiers MQIACF_PARAMETER_ID).

Programmer response

Reissue the command with correct parameters and values.

Parent topic: [Reason codes](#)

6.1.128. 3211 (0C8B) (RC3211): MQRCCF_DISPOSITION_CONFLICT

Explanation

Parameters are incompatible with disposition.

The parameters or parameter values for a command are incompatible with the disposition of an object. One of the following occurred:

- A value specified for the object name or other parameter is not allowed for a local queue whose disposition is shared or a model queue used to create a dynamic queue that is shared.
- A value specified for a parameter is not allowed for an object with such disposition.
- A value specified for a parameter must be non-blank for an object with such disposition.
- The *CommandScope* and *QSGDisposition* or *ChannelDisposition* parameter values are incompatible.
- The action requested for a channel cannot be performed because it has the wrong disposition.

The parameter and disposition in question may be returned in the message (with parameter identifiers MQIACF_PARAMETER_ID and MQIA_QSG_DISP).

Programmer response

Reissue the command with correct parameters and values.

Parent topic: [Reason codes](#)

6.1.133. 3218 (0C93) (RC3218): MQRCCF_CHANNEL_INITIATOR_ERROR

Explanation

Channel initiator cannot be started, or no suitable channel initiator is available.

One of the following:

- The channel initiator cannot be started because:
 - It is already active.
 - There are insufficient system resources.
 - The queue manager was shutting down.
- The shared channel cannot be started because there was no suitable channel initiator available for any active queue manager in the queue-sharing group. This could be because:
 - No channel initiators are running.
 - The channel initiators that are running are too busy to allow any channel, or a channel of the particular type, to be started.

6.1.148. 3236 (0CA4) (RC3236): MQRCCF_CF_STRUC_ERROR

Explanation

CF structure error.

A command could not be processed because of a coupling facility or CF structure error. It may be:

- A Backup CF Structure or Recover CF Structure command when the status of the CF structure is unsuitable. In this case, the CF structure status may be returned in the message together with the CF structure name (with parameter identifiers MQIACF_CF_STRUC_STATUS and MQCA_CF_STRUC_NAME).
- A command could not access an object because of an error in the coupling facility information, or because a CF structure has failed. In this case, the name of the object involved may be returned in the message (with parameter identifier MQCA_Q_NAME, for example).
- A command involving a shared channel could not access the channel status or synchronization key information.

Programmer response

In the case of a Backup CF Structure or Recover CF Structure command, take action appropriate to the CF structure status reported.

In other cases, check for error messages on the console log that might relate to the problem. Check whether the coupling facility structure has failed and check that DB2 is available.

6.1.149. 3237 (0CA5) (RC3237): MQRCCF_UNKNOWN_USER_ID

Explanation

User identifier not found.

A user identifier specified in a Reverify Security command was not valid because there was no entry found for it in the internal control table. This could be because the identifier was entered incorrectly in the command, or because it was not in the table (for example, because it had timed-out). The user identifier in question may be returned in the message (with parameter identifier MQCACF_USER_IDENTIFIER).

6.1.151. 3239 (0CA7) (RC3239): MQRCCF_NO_XCF_PARTNER

Explanation

MQ is not connected to the XCF partner.

The command involving the IMS Bridge cannot be processed because MQ is not connected to the XCF partner. The group and member names of the XCF partner in question may be returned in the message (with parameter identifiers MQCA_XCF_GROUP_NAME and MQCA_XCF_MEMBER_NAME).

6.1.192. 3318 (OCF6) (RC3318): MQRCCF_PUBSUB_INHIBITED

Explanation

MQSUB, MQOPEN, MQPUT and MQPUT1 calls are currently inhibited for all publish/subscribe topics, either by means of the queue manager attribute PSMODE or because processing of publish/subscribe state at queue manager start-up has failed, or has not yet completed.

Completion Code

MQCC_FAILED

Programmer response

If this queue manager does not intentionally inhibit publish/subscribe, investigate any error messages that describe the failure at queue manager start-up, or wait until start-up processing completes. You can use the DISPLAY PUBSUB command to check the status of the publish/subscribe engine to ensure it is ready for use, and additionally on z/OS you will receive an information message CSQM076I.

6.1.203. 4011 (0FAB) (RC4011): MQRCCF_CONFIGURATION_ERROR

Explanation

Configuration error.

There was a configuration error in the channel definition or communication subsystem, and allocation of a conversation was not possible. This might be caused by one of the following:

http://127.0.0.1:4848/help/advanced/print.jsp?topic=/com.ibm.mq.csqsao.doc/zm10120_.htm

16/03/2011

- For LU 6.2, either the *ModeName* or the *TpName* is incorrect. The *ModeName* must match that on the remote system, and the *TpName* must be specified. (On i5/OS, these are held in the communications Side Object.)
- For LU 6.2, the session might not be established.
- For TCP, the *ConnectionName* in the channel definition cannot be resolved to a network address. This might be because the name has not been correctly specified, or because the name server is not available.
- The requested communications protocol might not be supported on the platform.

Programmer response

Identify the error and take appropriate action.

Parent topic: [Reason codes](#)

6.1.226. 4037 (0FC5) (RC4037): MQRCCF_NOT_XMIT_Q

Explanation

Queue is not a transmission queue.

The queue specified in the channel definition is not a transmission queue, or is in use.

Programmer response

Ensure that the queue is specified correctly in the channel definition, and that it is correctly defined to the queue manager.

Parent topic: [Reason codes](#)

6.1.266. 4080 (0FF0) (RC4080): MQRCCF_CHAD_WRONG_TYPE

Explanation

Channel automatic definition parameter not allowed for this channel type.

The *ChannelAutoDef* parameter is allowed only for receiver and server-connection channels.

Programmer response

Remove the parameter.

Parent topic: [Reason codes](#)

6.1.271. 4085 (0FF5) (RC4085): MQRCCF_SUPPRESSED_BY_EXIT

Explanation

Action suppressed by exit program.

An attempt was made to define a channel automatically, but this was inhibited by the channel automatic definition exit. The *AuxErrorDataInt1* parameter contains the feedback code from the exit indicating why it inhibited the channel definition.

Programmer response

Examine the value of the *AuxErrorDataInt1* parameter, and take any action that is appropriate.

6.1.280. 4095 (OFFF) (RC4095): MQRCCF_RETAINED_NOT_SUPPORTED

Explanation

Retained messages used on restricted stream.

An attempt has been made to use retained messages on a publish/subscribe stream defined to be restricted to JMS usage. JMS does not support the concept of retained messages and the request is rejected.

Programmer response

Either modify the application not to use retained messages, or modify the broker `JmsStreamPrefix` configuration parameter so that this stream is not treated as a JMS stream.

8. Communications protocol return codes

The tables in this appendix document the more common return codes from TCP/IP and APPC/MVS that can be returned in messages from the distributed queuing component:

- [TCP/IP UNIX System Services Sockets return codes](#)
- [APPC/MVS return codes](#)

If the return code is not listed, or if you want more information, refer to the books mentioned in each section.

If the return code you received is X'7D0' or more, it is one of the MQRC_* return codes issued by WebSphere® MQ. These codes are listed in [API completion and reason codes](#).

[TCP/IP UNIX System Services Sockets return codes](#)

[APPC/MVS return codes](#)

8.1. TCP/IP UNIX System Services Sockets return codes

See the *TCP/IP UNIX System Services Messages and Codes* manual for more information and for further return codes.

Table 1. UNIX System Services sockets return codes

Return code (Hex)	Explanation
0001	Error in the domain
0002	Result is too large
006F	Permission is denied
0070	The resource is temporarily unavailable
0071	The file descriptor is incorrect
0072	The resource is busy
0073	No child process exists
0074	A resource deadlock is avoided
0075	The file exists
0076	The address is incorrect
0077	The file is too large
0078	A function call is interrupted
0079	The parameter is incorrect
007A	An I/O error occurred
007B	The file specified is a directory
007C	Too many files are open for this process

007D	Too many links occurred
007E	The filename is too long
007F	Too many files are open in the system
0080	No such device exists
0081	No such file, directory, or IPC member exists
0082	The exec call contained a format error (DFSMS error)
0083	No locks are available
0084	Not enough space is available
0085	No space is left on the device, or no space is available to create the IPC member ID
0086	The function is not implemented
0087	Not a directory
0088	The directory is not empty
0089	The I/O control operator is inappropriate
008A	No such device or address exists
008B	The operation is not permitted
008C	The pipe is broken
008D	The specified file system is read only
008E	The seek is incorrect
008F	No such process or thread exists
0090	A link to a file on another file system was attempted
0091	The parameter list is too long, or the message to receive was too large for the buffer
0092	A loop is encountered in symbolic links
0093	The byte sequence is illegal
0095	A value is too large to be stored in the data type
0096	OpenMVS kernel is not active
0097	Dynamic allocation error
0098	Catalog Volume Access Facility error
0099	Catalog obtain error
009C	Process Initialization error
009D	An MVS™ environmental or internal error has occurred
009E	Bad parameters were passed to the service
009F	HFS encountered a permanent file error
00A2	HFS encountered a system error
00A3	SAF/RACF extract error
00A4	SAF/RACF error
00A7	Access to the OpenMVS version of the C RTL is denied
00A8	The password for the specified resource has expired
00A9	The new password specified is not valid
00AA	A WLM service ended in error
03EA	Socket number assigned by client interface code (for socket() and accept()) is out of range
03EB	Socket number assigned by client interface code is already in use
03ED	Offload box error
03EE	Offload box restarted
03EF	Offload box down
03F0	Already a conflicting call outstanding on socket
03F1	Request cancelled via SOCKcallCANCEL request

03F3	SetIbmOpt specified a name of a PFS that either was not configured or was not a Sockets PFS
044C	Block device required
044D	Text file busy
044E	The descriptor is marked nonblocking, and the requested function cannot complete immediately
044F	Operation now in progress
0450	Operation already in progress
0451	Socket operation on a non-socket
0452	Destination address required
0453	The message is too large to be sent all at once, as required
0454	The socket type is incorrect
0455	Protocol or socket option not available
0456	Protocol not supported
0457	Socket type not supported
0458	The referenced socket is not a type that supports the requested function
0459	Protocol family not supported
045A	The address family is not supported
045B	The address is already in use
045C	Cannot assign requested address
045D	Network is down
045E	Network is unreachable
045F	Network dropped connection on reset
0460	Software caused connection abort
0461	Connection reset by peer
0462	Insufficient buffer space available
0463	The socket is already connected
0464	The socket is not connected
0465	Cannot send after socket shutdown
0466	Too many references: cannot splice
0467	Connection timed out
0468	The attempt to connect was rejected
0469	Host is down
046A	No route to host
046B	Too many processes
046C	Too many users
046D	Disc quota exceeded
046E	Stale NFS file handle
046F	Too many levels of remote in path
0470	Device is not a stream
0471	Timer expired
0472	Out of streams resources
0473	No message of the desired type
0474	Trying to read unreadable message
0475	Identifier removed
0476	Machine is not on the network
0477	Object is remote
0478	The link has been severed
0479	Advertise error

047A	srmount error
047B	Communication error on send
047C	Protocol error
047D	Protocol error
047E	Cross mount point
047F	Remote address change
0480	The asynchronous I/O request has been canceled
0481	Socket send/receive gotten out of order
0482	Unattached streams error
0483	Streams push object error
0484	Streams closed error
0485	Streams link error
0486	Tcp error
Other	See the <i>OS/390® UNIX System Services Messages and Codes</i> manual

8.2.1. APPC return codes

This table documents the return codes that can be returned from APPC/MVS in messages from the distributed queuing component if you are using APPC/MVS as your communications protocol. These return codes can be returned to the local program in response to a call.

Table 1. APPC return codes and their meanings

Return code (Hex)	Explanation
00	The call issued by the local program executed successfully. If the call specified a Notify_type of ECB, the call processing is performed asynchronously, and the ECB is posted when the processing completes.
01	The caller specified an allocate_type that was other than <i>immediate</i> . Either APPC/MVS could not establish a session with the partner LU, or VTAM® could not establish the conversation. In this case (when allocate_type is <i>immediate</i>), APPC/MVS converts this return code to <i>unsuccessful</i> .
02	The conversation cannot be allocated on a session because of a condition that might be temporary. The program can retry the allocation request. The system returns this code when the allocate_type specified on a CMALLOC verb is other than <i>immediate</i> .
03	The partner LU rejected the allocation request because the local program issued an Allocate call with the Conversation_type parameter set to either Basic_conversation or Mapped_conversation, and the partner program does not support the respective mapped or basic conversation protocol boundary. This return code is returned on a call made after the Allocate.
05	The partner LU rejected an ATBALLC or ATBALC2 (allocate) request because the partner program has one or more initialization parameter (PIP) variables defined. APPC/MVS does not support these parameters. This return code is returned on a call made after the Allocate. It is not returned for allocate requests made using CPI Communications.
06	The partner LU rejected the allocation request because the access security information is not valid. This return code is returned on a call subsequent to the Allocate.
08	The partner LU rejected the allocation request because the local program specified a synchronization level (with the Sync_level parameter) that the partner program does not support. This return code is returned on a call subsequent to the Allocate.
09	The partner LU rejected the allocation request because the local program specified a partner program that the partner LU does not recognize. This return code is returned on a call subsequent to the Allocate.
0A	The partner LU rejected the allocation request because the local program specified a partner program that the partner LU recognizes but cannot start. The condition is not temporary, and the program must not retry the allocation request. This return code is returned on a call subsequent to the Allocate.
0B	The partner LU rejected the allocation request because the local program specified a partner program that the partner LU recognizes but currently cannot start. The condition might be temporary, and the program can retry the allocation request. This return code is returned on a call subsequent to the Allocate.
11	The partner program issued a Deallocate call with a Deallocate_type of <i>Deallocate_abend</i> , or the partner LU has done so because of a partner program abnormal ending condition. If the partner program was in receive state when the call was issued, information sent by the local program and not yet received by the partner program is purged. This return code is reported to the local program on a call the program issues in Send or Receive state.
12	The partner program issued a Deallocate call on a basic or mapped conversation with a Deallocate_type of <i>Deallocate_sync_level</i> or <i>Deallocate_flush</i> . This return code is reported to the local program on a call the program issues in Receive state.
13	The local program issued a call specifying an argument that was not valid. Specific reasons for the return code apply to the following callable services: ATBALC2 or ATBALLC (LU 6.2 Allocate)

	<ul style="list-style-type: none"> • The TP name was not 1 - 64 characters long • Either the SYMDEST name or the TP name length were not specified • SNASVCMG is specified as mode name • X'06' is used as the first character of a TP name • An SNA service TP name is used with a mapped conversation verb • The partner LU name was not valid • The mode name was not valid • The local LU name specified is either undefined or not allowed <p>CMALLC (CPI-C Allocate)</p> <ul style="list-style-type: none"> • SNASVCMG is specified as mode name • X'06' is used as the first character of a TP name • An SNA service TP name is used with a mapped conversation verb • The mode name was not valid
14	A product-specific error has been detected. The system writes symptom records that describe the error to SYS1.LOGREC.
15	<p>Indicates one of the following:</p> <ul style="list-style-type: none"> • The partner program made a Send_error call on a mapped conversation and the conversation for the partner program was in Send state. No truncation occurs at the mapped conversation protocol boundary. This return code is reported to the local program on a Receive call before receiving any data records or after receiving one or more data records. • The partner program made a Send_error call specifying the Type parameter with a value of PROG, the conversation for the partner program was in Send state, and the call did not truncate a logical record. No truncation occurs at the basic conversation protocol boundary when a program performs a Send_error before sending any logical records, or after sending a complete logical record. This return code is reported to the local program on a Receive call before receiving any logical records or after receiving one or more complete logical records.
16	The partner program made a Send_error call on a mapped conversation, or made a Send_error call on a basic conversation specifying the Type parameter with a value of PROG, and the conversation for the partner program was in Receive or Confirm state. The call might have caused information to be purged. Purging occurs when a program issued Send_error in receive state before receiving all the information sent by its partner program. No purging occurs when a program issues the call in Confirm state or in Receive state after receiving all the information sent by its partner program. The return code is normally reported to the local program on a call it issues before sending any information, depending on the call and when it is made.
17	The partner program made a Send_error call specifying the Type parameter with a value of PROG, the conversation for the partner program was in Send state, and the call truncated a logical record. Truncation occurs at the basic conversation protocol boundary when a program begins sending a logical record and then makes a Send_error call before sending the complete logical record. This return code is reported to the local program on a Receive call it issues after receiving the truncated logical record.
18	<p>The local program issued a call in which a programming error has been found in one or more parameters. Specific reasons for the return code apply to the following callable services:</p> <p>ATBALC2 or ATBALLC (LU 6.2 Allocate)</p> <ul style="list-style-type: none"> • An unauthorized caller passed a nonzero TP_ID

	<ul style="list-style-type: none"> • For Sec_pgm-type security, both the userid and password were not specified • For Sec_Pgm-type security, a userid was specified with a blank password, or a password was specified with a blank userid • The SYMDEST name was not found in the side information • The specified TP_ID is not associated with the address space • An unauthorized caller specified a Notify_Type of ECB <p>ATBCFM (LU 6.2 Allocate)</p> <ul style="list-style-type: none"> • An unauthorized caller specified a Notify_type of ECB • The Sync_Level field for the conversation was equal to sync_level_none <p>ATBDEAL (LU 6.2 Allocate)</p> <ul style="list-style-type: none"> • A Deallocate_type of deallocate_confirm was specified, and the Sync_Level field for the conversation was equal to sync_level_none <p>ATBPTR (LU 6.2 Prepare to Receive)</p> <ul style="list-style-type: none"> • A Prepare_To_Receive_Type of Prep_to_receive_sync_level was specified, and the Sync_Level field for the conversation was equal to sync_level_none <p>ATBSEND (LU 6.2 Send)</p> <ul style="list-style-type: none"> • The value in the 2-byte LL field was not valid • A Send_Type of Send_and_Confirm was specified, and the Sync_Level field for the conversation was equal to sync_level_none <p>CMINIT (CPI-C Initialize Conversation)</p> <p>The SYMDEST name was not found in the side information</p>
19	<p>The local program issued a call in a state that was not valid for that call. The program does not need to examine any other returned variables associated with the call as nothing is placed in the variables. The state of the conversation remains unchanged.</p> <p>If the error occurs in one of the following callable services, the conversation was in send state and the program started, but the program did not finish sending a logical record:</p> <ul style="list-style-type: none"> • ATBCFM (LU 6.2 Allocate) • ATBDEAL (LU 6.2 Allocate) • ATBPTR (LU 6.2 Allocate) • ATBRCVW and ATBRCVI (LU 6.2 Receive and Wait and Receive Immediate) • ATBSEND (LU 6.2 Send)
1A	<p>A failure occurred that caused the conversation to be prematurely terminated. The condition is not temporary, and the program must not retry the transaction until the condition is corrected.</p>
1B	<p>A failure occurred that caused the conversation to be prematurely terminated. The condition might be temporary, and the program can retry the transaction.</p>
1C	<p>The call issued by the local program did not run successfully. This return code is returned on the unsuccessful call.</p> <p>If this code is returned by the ATBRCVI (LU 6.2 Receive_Immediate) callable service, there is no data to be returned.</p>
1E	<p>The partner program issued a Deallocate call with a Deallocate_type of Deallocate_abend_SVC. If the partner program was in Receive state when the call was issued, information sent by the local program and not yet</p>

	received by the partner program is purged. This return code is reported to the local program on a call the program issues in Send or Receive state.
1F	The partner program issued a Deallocate call with a Deallocate_type of Deallocate_abend_timer. If the partner program was in Receive state when the call was issued, information sent by the local program and not yet received by the partner program is purged. This return code is reported to the local program on a call the program issues in Send or Receive state.
20	The partner program issued a Send_error call specifying a Type parameter of SVC, the conversation for the partner program was in Send state, and the call did not truncate a logical record. This return code is returned on a Receive call. It is not returned for Send_error requests using CPI Communications.
21	The partner program issued a Send_error call specifying a Type parameter of SVC, the conversation for the partner program was in Receive, Confirm, or Sync_Point state, and the call might have caused information to be purged. This return code is normally returned to the local program on a call that the local program issues after sending some information to the partner program. However the return code can be returned on a call that the local program issues before sending any information, depending on when the call is issued. This code is not returned for Send_error requests using CPI Communications.
22	The partner program issued a Send_error call specifying a Type parameter of SVC, the conversation for the partner program was in Send state, and the call truncated a logical record. Truncation occurs when a program begins sending a logical record and then issues Send_error before sending the complete record. This return code is returned to the local program on a Receive call that the local program issues after receiving the truncated logical record. The code is not returned for Send_error requests using CPI Communications.
40	APPC/MVS is not currently active. Call the service again after APPC is available.
Other	See the <i>Writing Transaction Programs for APPC/MVS</i> and <i>Writing Servers for APPC/MVS</i> manuals.

8.2.2. APPC allocate services return codes

This table documents the return codes that can be returned from APPC/MVS allocate queue services in messages from the distributed queuing component if you are using APPC/MVS as your communications protocol.

Table 1. APPC allocate services return codes and their meanings

Return code (Hex)	Explanation
0	The service completed as requested.
4	The service completed, but possibly not as expected. See the reason code parameter for a description of the warning condition.
8	A user-supplied parameter was found to be in error. For example, a

	parameter contains characters not in the required character set. See the reason code parameter to determine which parameter is in error.
10	The service was unsuccessful. The cause is most likely a parameter error other than a syntax error, or an environmental error. For example, a syntactically valid LU name was specified, but the LU is not defined to APPC/MVS. An example of an environmental error is that the caller called the service while holding locks. See the reason code parameter for the specific cause of the error, and to determine whether the error can be corrected and the service re-issued.
20	APPC/MVS service failure. Record the return and reason code, and give them to your systems programmer, who should contact the appropriate IBM® support personnel.
40	APPC/MVS is not currently active. Call the service again after APPC is available.
Other	See the <i>Writing Transaction Programs for APPC/MVS</i> and <i>Writing Servers for APPC/MVS</i> manuals.

8.2.3. APPC reason codes

This table documents the reason codes that can be returned from APPC/MVS allocate queue services in messages from the distributed queuing component if you are using APPC/MVS as your communications protocol.

Note: Some of the APPC return codes are not accompanied by a reason code; in these cases, the value in the reason code field can be ignored. Refer to the manuals shown in [APPC/MVS return codes](#) for more information.

Table 1. APPC reason codes and their meanings

Return code (Hex)	Explanation
1	The address space issued a Register_For_Allocates call that duplicated a previous Register_For_Allocate call (that is, the values specified for TP name, local LU name, partner LU name, user ID, and profile all matched those specified on a previous call to the Register_For_Allocates service).
2	A TP name is required, but none was specified.
3	The specified TP name contains characters that are not valid
4	The specified TP name length is outside the allowable range.
5	A local LU name is required, but none was specified.
7	An asynchronous call failed because a specified parameter was found to be inaccessible.
8	The caller held one or more locks when calling the service.
0A	A transaction scheduler called the Register_For_Allocate service, which is not allowed
0B	The specified symbolic destination name could not be found in the side information data set.
0C	The specified local LU is undefined.
0D	The specified local LU is not receiving inbound allocate requests.
0E	The Register_For_Allocate service was called, but the caller is not authorized to serve the specified TP name on the specified local LU.

0F	The specified local LU is inaccessible to the caller.
10	The service failed because of an APPC failure.
11	The specified allocate queue token does not represent an allocate queue for which this address space is registered.
12	The specified notify type is not valid.
13	The specified timeout value is not valid.
14	The request was cancelled while in progress. This could have been caused by a call to the Unregister_For_Allocates service, or the termination of the caller's address space.
15	A Receive_Allocate call completed, but no allocate request was available to be received.
1A	The specified event notification type is not valid.
1B	The specified event code is not supported or is not valid for this service.
1C	The netid retrieved from the side information data set does not match the local netid.
1D	The specified event code qualifier is not valid or supported.
1E	The Get_Event call completed, but no event element was available to be received.
1F	The call to the Get_Event service was interrupted because all event notification requests were cancelled for this address space.
20	The call to the Get_Event service was rejected because a previous Get_Event call is currently outstanding.
21	The Get_Event call was rejected because no event notification is in effect for this address space.
22	The specified allocate queue keep time is outside the allowable range.
24	A call to the Unregister_For_Allocates service specified "unregister all" (that is, the allocate_queue_token was set to binary zeros), but this address space is not registered for any allocate queues.
25	The specified event get type is not valid.
26	The specified receive allocate type is not valid.
27	APPC/MVS cannot determine if the specified netid is valid.
29	The service failed because the supplied buffer was not large enough to contain the requested information.
Other	See the <i>Writing Transaction Programs for APPC/MVS</i> and <i>Writing Servers for APPC/MVS</i> manuals.

9. Secure Sockets Layer (SSL) return codes for z/OS

The table in this appendix documents the return codes, in decimal form, from the Secure Sockets Layer (SSL) that can be returned in messages from the distributed queuing component.

If the return code is not listed, or if you want more information, refer to *Cryptographic Services System SSL Programming*, SC24-5901, which you can find on the IBM® Web site.

Table 1. SSL return codes

Return code	Explanation
-------------	-------------

(decimal)	
1	Handle is not valid.
3	An internal error has occurred.
4	Insufficient storage is available
5	Handle is in the incorrect state.
6	Key label is not found.
7	No certificates available.
8	Certificate validation error.
9	Cryptographic processing error.
10	ASN processing error.
11	LDAP processing error.
12	An unexpected error has occurred.
102	Error detected while reading key database or SAF key ring.
103	Incorrect key database record format.
106	Incorrect key database password.
109	No certification authority certificates.
201	No key database password supplied.
202	Error detected while opening the key database.
203	Unable to generate temporary key pair
204	Key database password is expired.
302	Connection is active.
401	Certificate is expired or is not valid yet.
402	No SSL cipher specifications.
403	No certificate received from partner.
405	Certificate format is not supported.
406	Error while reading or writing data.
407	Key label does not exist.
408	Key database password is not correct.
410	SSL message format is incorrect.
411	Message authentication code is incorrect.
412	SSL protocol or certificate type is not supported.
413	Certificate signature is incorrect.
414	Certificate is not valid.
415	SSL protocol violation.
416	Permission denied.
417	Self-signed certificate cannot be validated.
420	Socket closed by remote partner.
421	SSL V2 cipher is not valid.
422	SSL V3 cipher is not valid.
427	LDAP is not available.
428	Key entry does not contain a private key.
429	SSL V2 header is not valid.
431	Certificate is revoked.
432	Session renegotiation is not allowed.
433	Key exceeds allowable export size.
434	Certificate key is not compatible with cipher suite.
435	Certification authority is unknown.
436	Certificate revocation list cannot be processed.

	Connection closed.
438	Internal error reported by remote partner.
439	Unknown alert received from remote partner.
501	Buffer size is not valid.
502	Socket request would block.
503	Socket read request would block.
504	Socket write request would block.
505	Record overflow.
601	Protocol is not SSL V3 or TLS V1.
602	Function identifier is not valid.
701	Attribute identifier is not valid.

10. Distributed queuing message codes

Distributed queuing message codes are in the form *s0009nnn* (in hexadecimal), and the error they identify is generally described in detail by error message *CSQXnnn*, although there are some exceptions. The following table shows the full correspondence. Distributed queuing message codes are used in some error messages, and in the event data for the *MQRC_CHANNEL_STOPPED* event. The event data also contains message inserts; the meanings of the inserts depend on the message code, and are shown in the following table, in the form in which they are given in the message explanation. Where no meaning is shown, the insert is not relevant to the message code, and the value set in the event message is unpredictable. Character insert 3 is never relevant, and so is omitted from the table.

Note: *trptype* can be shown in various forms:

Message insert

Event data

TCP

TCP/IP, and so on

LU62

LU 6.2, APPC, CPI-C, and so on

Message code (<i>nnn</i>)	Message number	Integer insert 1	Integer insert 2	Character insert 1	Character insert 2	Character insert 3

11. Queued Publish/Subscribe message codes

Queued Publish/Subscribe is a component of WebSphere® MQ for z/OS®. Use this topic to interpret the message codes issued by the queued Publish/Subscribe component.

Queued publish/subscribe message codes are in the form *5nnn* (in hexadecimal), and the error they identify is described in detail by error message *CSQTnnn*, although there are some exceptions. The following table shows the full correspondence. Queued publish/subscribe message codes are used in some error messages.

Message Code (<i>nnn</i>)	Message Number	Description
800	No equivalent message	Unexpected error
816	CSQT816E	See message description
