WebSphere MQ

Using C++

Version 7.0

SC34-6936-01

Note
Before using this information and the product it supports, be sure to read the general information under notices at the back of this book.

Second edition (January 2009)

This edition of the book applies to the following products:

- IBM WebSphere MQ, Version 7.0
- IBM WebSphere MQ for z/OS, Version 7.0

and to any subsequent releases and modifications until otherwise indicated in new editions.

Contents

Tables

Chapter 1. Features of WebSphere MQ C++

WebSphere® MQ C++ provides the following features:

- Automatic initialization of WebSphere MQ data structures
- Just-in-time queue manager connection and queue opening
- Implicit queue closure and queue manager disconnection
- Dead-letter header transmission and receipt
- IMS™ bridge header transmission and receipt
- Reference message header transmission and receipt
- Trigger message receipt
- CICS® bridge header transmission and receipt
- Work header transmission and receipt
- Client channel definition

The following Booch class diagrams show that all the classes are broadly parallel to those WebSphere MQ entities in the procedural MQI (for example using C) that have either handles or data structures. All classes inherit from the ImqError class (see "ImqError" on page 63), which allows an error condition to be associated with each object.

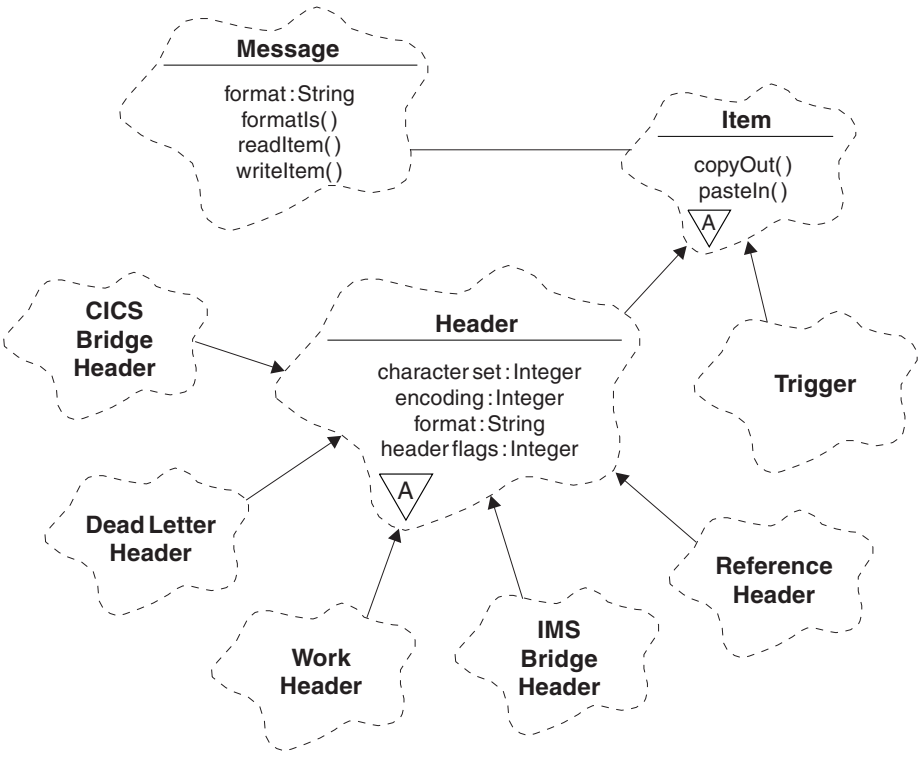

Figure 1. WebSphere MQ C++ classes (item handling)

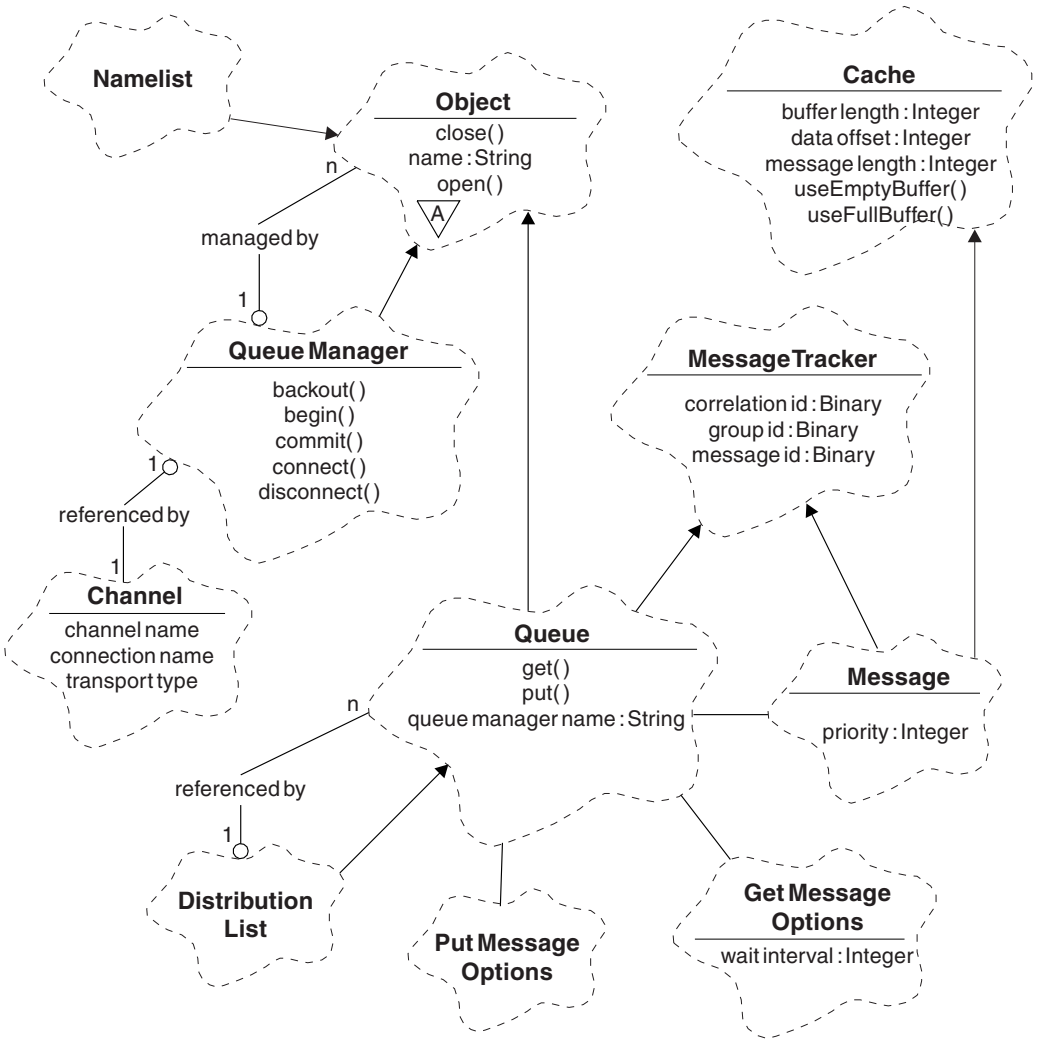

Figure 2. WebSphere MQ C++ classes (queue management)

To interpret Booch class diagrams correctly, be aware of the following:

- Methods and noteworthy attributes are listed below the *class* name.
- A small triangle within a cloud denotes an *abstract class*.
- *Inheritance* is denoted by an arrow to the parent class.
- An undecorated line between clouds denotes a *cooperative relationship* between classes.
- A line decorated with a number denotes a *referential relationship* between two classes. The number indicates the number of objects that can participate in a given relationship at any one time.

The following classes and data types are used in the C++ method signatures of the queue management classes (see Figure 2) and the item handling classes (see Figure 1 on page 1):

- The ImqBinary class (see "ImqBinary" on page 40), which encapsulates byte arrays such as MQBYTE24.
- The ImqBoolean data type, which is defined as **typedef unsigned char ImqBoolean**.

- The ImqString class (see "ImqString" on page 138), which encapsulates character arrays such as MQCHAR64.

Entities with data structures are subsumed within appropriate object classes. Individual data structure fields (see Chapter 15, "MQI cross reference," on page 161) are accessed with methods.

Entities with handles come under the ImqObject class hierarchy (see "ImqObject" on page 90) and provide encapsulated interfaces to the MQI. Objects of these classes exhibit intelligent behavior that can reduce the number of method invocations required relative to the procedural MQI. For example, you can establish and discard queue manager connections as required, or you can open a queue with appropriate options, then close it.

The ImqMessage class (see "ImqMessage" on page 76) encapsulates the MQMD data structure and also acts as a holding point for user data and *items* (see Chapter 3, "Reading messages," on page 7) by providing cached buffer facilities. You can provide fixed-length buffers for user data and use the buffer many times. The amount of data present in the buffer can vary from one use to the next. Alternatively, the system can provide and manage a buffer of flexible length. Both the size of the buffer (the amount available for receipt of messages) and the amount actually used (either the number of bytes for transmission or the number of bytes actually received) become important considerations.

Chapter 2. Preparing message data

When you send a message, message data is first prepared in a buffer managed by an ImqCache object (see "ImqCache" on page 42). A buffer is associated (by inheritance) with each ImqMessage object (see "ImqMessage" on page 76): it can be supplied by the application (using either the **useEmptyBuffer** or **useFullBuffer** method) or automatically by the system. The advantage of the application supplying the message buffer is that no data copying is necessary in many cases because the application can use prepared data areas directly. The disadvantage is that the supplied buffer is of a fixed length.

The buffer can be reused, and the number of bytes transmitted can be varied each time, by using the **setMessageLength** method before transmission.

When supplied automatically by the system, the number of bytes available is managed by the system, and data can be copied into the message buffer using, for example, the ImqCache **write** method, or the ImqMessage **writeItem** method. The message buffer grows according to need. As the buffer grows, there is no loss of previously-written data. A large or multipart message can be written in sequential pieces.

The following examples show simplified message sends.

1. Use prepared data in a user-supplied buffer

```
char szBuffer[ ] = "Hello world" ;

msg.useFullBuffer( szBuffer, sizeof( szBuffer ) );
msg.setFormat( MQFMT_STRING );
```

2. Use prepared data in a user-supplied buffer, where the buffer size exceeds the data size

```
char szBuffer[ 24 ] = "Hello world" ;

msg.useEmptyBuffer( szBuffer, sizeof( szBuffer ) );
msg.setFormat( MQFMT_STRING );
msg.setMessageLength( 12 );
```

3. Copy data to a user-supplied buffer

```
char szBuffer[ 12 ];

msg.useEmptyBuffer( szBuffer, sizeof( szBuffer ) );
msg.setFormat( MQFMT_STRING );
msg.write( 12, "Hello world" );
```

4. Copy data to a system-supplied buffer

```
msg.setFormat( MQFMT_STRING );
msg.write( 12, "Hello world" );
```

5. Copy data to a system-supplied buffer using objects (objects set the message format as well as content)

```
ImqString strText( "Hello world" );

msg.writeItem( strText );
```

Chapter 3. Reading messages

When receiving data, the application or the system can supply a suitable message buffer. The same buffer can be used for both multiple transmission and multiple receipt for a given ImqMessage object. If the message buffer is supplied automatically, it grows to accommodate whatever length of data is received. However, if the application supplies the message buffer, it might not be big enough. Then either truncation or failure might occur, depending on the options used for message receipt.

Incoming data can be accessed directly from the message buffer, in which case the data length indicates the total amount of incoming data. Alternatively, incoming data can be read sequentially from the message buffer. In this case, the data pointer addresses the next byte of incoming data, and the data pointer and data length are updated each time data is read.

Items are pieces of a message, all in the user area of the message buffer, that need to be processed sequentially and separately. Apart from regular user data, an item might be a dead-letter header or a trigger message. Items are always associated with message formats; message formats are ***not*** always associated with items.

There is a class of object for each item that corresponds to a recognizable WebSphere MQ message format. There is one for a dead-letter header and one for a trigger message. There is no class of object for user data. That is, once the recognizable formats have been exhausted, processing the remainder is left to the application program. Classes for user data can be written by specializing the ImqItem class.

The following example shows a message receipt that takes account of a number of potential items that can precede the user data, in an imaginary situation. Non-item user data is defined as anything that occurs after items that can be identified. An automatic buffer (the default) is used to hold an arbitrary amount of message data.

```
ImqQueue queue ;
ImqMessage msg ;

if ( queue.get( msg ) ) {

  /* Process all items of data in the message buffer. */
  do while ( msg.dataLength( ) ) {
    ImqBoolean bFormatKnown = FALSE ;
    /* There remains unprocessed data in the message buffer. */

    /* Determine what kind of item is next. */

    if ( msg.formatIs( MQFMT_DEAD_LETTER_HEADER ) ) {
      ImqDeadLetterHeader header ;
      /* The next item is a dead-letter header.                */
      /* For the next statement to work and return TRUE,       */
      /* the correct class of object pointer must be supplied. */
      bFormatKnown = TRUE ;

      if ( msg.readItem( header ) ) {
        /* The dead-letter header has been extricated from the */
        /* buffer and transformed into a dead-letter object.   */
        /* The encoding and character set of the dead-letter   */
        /* object itself are MQENC_NATIVE and MQCCSI_Q_MGR.    */
        /* The encoding and character set from the dead-letter */
```

```
        /* header have been copied to the message attributes   */
        /* to reflect any remaining data in the buffer.        */

        /* Process the information in the dead-letter object.  */
        /* Note that the encoding and character set have       */
        /* already been processed.                             */
        ...
      }
      /* There might be another item after this, */
      /* or just the user data.                  */
    }
    if ( msg.formatIs( MQFMT_TRIGGER ) ) {
      ImqTrigger trigger ;
      /* The next item is a trigger message.                   */
      /* For the next statement to work and return TRUE,       */
      /* the correct class of object pointer must be supplied. */
      bFormatKnown = TRUE ;
      if ( msg.readItem( trigger ) ) {

        /* The trigger message has been extricated from the */
        /* buffer and transformed into a trigger object.    */
        /* Process the information in the trigger object. */
        ...
      }

      /* There is usually nothing after a trigger message. */
    }

    if ( msg.formatIs( FMT_USERCLASS ) ) {
      UserClass object ;
      /* The next item is an item of a user-defined class.     */
      /* For the next statement to work and return TRUE,       */
      /* the correct class of object pointer must be supplied. */
      bFormatKnown = TRUE ;

      if ( msg.readItem( object ) ) {
        /* The user-defined data has been extricated from the */
        /* buffer and transformed into a user-defined object. */

        /* Process the information in the user-defined object. */
        ...
      }

      /* Continue looking for further items. */
    }
    if ( ! bFormatKnown ) {
      /* There remains data that is not associated with a specific*/
      /* item class.                                               */
      char * pszDataPointer = msg.dataPointer( );       /* Address.*/
      int iDataLength = msg.dataLength( );              /* Length. */

      /* The encoding and character set for the remaining data are */
      /* reflected in the attributes of the message object, even   */
      /* if a dead-letter header was present.                      */
      ...

    }

  }
}
```

In this example, FMT_USERCLASS is a constant representing the 8-character format name associated with an object of class UserClass, and is defined by the application.

`UserClass` is derived from the ImqItem class (see "ImqItem" on page 74), and implements the virtual **copyOut** and **pasteIn** methods from that class.

The next two examples show code from the ImqDeadLetterHeader class (see "ImqDeadLetterHeader" on page 58). The first example shows custom-encapsulated message-*writing* code.

```
// Insert a dead-letter header.
// Return TRUE if successful.
ImqBoolean ImqDeadLetterHeader :: copyOut ( ImqMessage & msg ) {
  ImqBoolean bSuccess ;
  if ( msg.moreBytes( sizeof( omqdlh ) ) ) {
    ImqCache cacheData( msg ); // Preserve original message content.
    // Note original message attributes in the dead-letter header.
    setEncoding( msg.encoding( ) );
    setCharacterSet( msg.characterSet( ) );
    setFormat( msg.format( ) );

    // Set the message attributes to reflect the dead-letter header.
    msg.setEncoding( MQENC_NATIVE );
    msg.setCharacterSet( MQCCSI_Q_MGR );
    msg.setFormat( MQFMT_DEAD_LETTER_HEADER );
    // Replace the existing data with the dead-letter header.
    msg.clearMessage( );
    if ( msg.write( sizeof( omqdlh ), (char *) & omqdlh ) ) {
      // Append the original message data.
      bSuccess = msg.write( cacheData.messageLength( ),
                            cacheData.bufferPointer( ) );
    } else {
      bSuccess = FALSE ;
    }
  } else {
    bSuccess = FALSE ;
  }
  // Reflect and cache error in this object.
  if ( ! bSuccess ) {
    setReasonCode( msg.reasonCode( ) );
    setCompletionCode( msg.completionCode( ) );
  }

  return bSuccess ;
}
```

The second example shows custom-encapsulated message-*reading* code.

```
// Read a dead-letter header.
// Return TRUE if successful.
ImqBoolean ImqDeadLetterHeader :: pasteIn ( ImqMessage & msg ) {
  ImqBoolean bSuccess = FALSE ;

  // First check that the eye-catcher is correct.
  // This is also our guarantee that the "character set" is correct.
  if ( ImqItem::structureIdIs( MQDLH_STRUC_ID, msg ) ) {
    // Next check that the "encoding" is correct, as the MQDLH
    // contains numeric data.
    if ( msg.encoding( ) == MQENC_NATIVE ) {

      // Finally check that the "format" is correct.
      if ( msg.formatIs( MQFMT_DEAD_LETTER_HEADER ) ) {
        char * pszBuffer = (char *) & omqdlh ;
        // Transfer the MQDLH from the message and move pointer on.
        if ( bSuccess = msg.read( sizeof( omdlh ), pszBuffer ) ) {
          // Update the encoding, character set and format of the
          // message to reflect the remaining data.
          msg.setEncoding( encoding( ) );
          msg.setCharacterSet( characterSet( ) );
          msg.setFormat( format( ) );
```

```
        } else {

          // Reflect the cache error in this object.
          setReasonCode( msg.reasonCode( ) );
          setCompletionCode( msg.completionCode( ) );
        }
      } else {
        setReasonCode( MQRC_INCONSISTENT_FORMAT );
        setCompletionCode( MQCC_FAILED );
      }
    } else {
      setReasonCode( MQRC_ENCODING_ERROR );
      setCompletionCode( MQCC_FAILED );
    {
  } else {
    setReasonCode( MQRC_STRUC_ID_ERROR );
    setCompletionCode( MQCC_FAILED );
  }

  return bSuccess ;
}
```

With an automatic buffer, the buffer storage is *volatile*. That is, buffer data might be held at a different physical location after each **get** method invocation. Therefore, each time buffer data is referenced, use the **bufferPointer** or **dataPointer** methods to access message data.

You might want a program to set aside a fixed area for receiving message data. In this case, invoke the **useEmptyBuffer** method before using the **get** method.

Using a fixed, nonautomatic area limits messages to a maximum size, so it is important to consider the MQGMO_ACCEPT_TRUNCATED_MSG option of the ImqGetMessageOptions object. If this option is not specified (the default), the MQRC_TRUNCATED_MSG_FAILED reason code can be expected. If this option is specified, the MQRC_TRUNCATED_MSG_ACCEPTED reason code might be expected depending on the design of the application.

The next example shows how a fixed area of storage can be used to receive messages:

```
char * pszBuffer = new char[ 100 ];

msg.useEmptyBuffer( pszBuffer, 100 );
gmo.setOptions( MQGMO_ACCEPT_TRUNCATED_MSG );
queue.get( msg, gmo );

delete [ ] pszBuffer ;
```

In this code fragment, the buffer can always be addressed directly, with *pszBuffer*, as opposed to using the **bufferPointer** method. However, it is better to use the **dataPointer** method for general-purpose access. The application (not the ImqCache class object) must discard a user-defined (nonautomatic) buffer.

Attention: Specifying a null pointer and zero length with **useEmptyBuffer** does not nominate a fixed length buffer of length zero as might be expected. This combination is actually interpreted as a request to ignore any previous user-defined buffer, and instead revert to the use of an automatic buffer.

Chapter 4. Writing a message to the dead-letter queue

A typical case of a multipart message is one containing a dead-letter header. The data from a message that cannot be processed is appended to the dead-letter header.

```
ImqQueueManager mgr ;        // The queue manager.
ImqQueue queueIn ;           // Incoming message queue.
ImqQueue queueDead ;         // Dead-letter message queue.
ImqMessage msg ;             // Incoming and outgoing message.
ImqDeadLetterHeader header ; // Dead-letter header information.

// Retrieve the message to be rerouted.
queueIn.setConnectionReference( mgr );
queueIn.setName( MY_QUEUE );
queueIn.get( msg );

// Set up the dead-letter header information.
header.setDestinationQueueManagerName( mgr.name( ) );
header.setDestinationQueueName( queueIn.name( ) );
header.setPutApplicationName( /* ? */ );
header.setPutApplicationType( /* ? */ );
header.setPutDate( /* TODAY */ );
header.setPutTime( /* NOW */ );
header.setDeadLetterReasonCode( FB_APPL_ERROR_1234 );

// Insert the dead-letter header information. This will vary
// the encoding, character set and format of the message.
// Message data is moved along, past the header.
msg.writeItem( header );

// Send the message to the dead-letter queue.
queueDead.setConnectionReference( mgr );
queueDead.setName( mgr.deadLetterQueueName( ) );
queueDead.put( msg );
```

Chapter 5. Writing a message to the IMS bridge

Messages sent to the WebSphere MQ-IMS bridge might use a special header. The IMS bridge header is prefixed to regular message data.

```
ImqQueueManager    mgr;         // The queue manager.
ImqQueue           queueBridge; // IMS bridge message queue.
ImqMessage         msg;         // Outgoing message.
ImqIMSBridgeHeader header;      // IMS bridge header.

// Set up the message.
//
// Here we are constructing a message with format
// MQFMT_IMS_VAR_STRING, and appropriate data.
//
msg.write( 2,       /* ? */ );         // Total message length.
msg.write( 2,       /* ? */ );         // IMS flags.
msg.write( 7,       /* ? */ );         // Transaction code.
msg.write( /* ? */, /* ? */ );         // String data.
msg.setFormat( MQFMT_IMS_VAR_STRING ); // The format attribute.

// Set up the IMS bridge header information.
//
// The reply-to-format is often specified.
// Other attributes can be specified, but all have default values.
//
header.setReplyToFormat( /* ? */ );

// Insert the IMS bridge header into the message.
//
// This will:
// 1) Insert the header into the message buffer, before the existing
//    data.
// 2) Copy attributes out of the message descriptor into the header,
//    for example the IMS bridge header format attribute will now
//    be set to MQFMT_IMS_VAR_STRING.
// 3) Set up the message attributes to describe the header, in
//    particular setting the message format to MQFMT_IMS.
//
msg.writeItem( header );

// Send the message to the IMS bridge queue.
//
queueBridge.setConnectionReference( mgr );
queueBridge.setName( /* ? */ );
queueBridge.put( msg );
```

Chapter 6. Writing a message to the CICS bridge

Messages sent to WebSphere MQ for z/OS® using the CICS bridge require a special header. The CICS bridge header is prefixed to regular message data.

```
ImqQueueManager mgr ;         // The queue manager.
ImqQueue queueIn ;            // Incoming message queue.
ImqQueue queueBridge ;        // CICS bridge message queue.
ImqMessage msg ;              // Incoming and outgoing message.
ImqCicsBridgeHeader header ;  // CICS bridge header information.

// Retrieve the message to be forwarded.
queueIn.setConnectionReference( mgr );
queueIn.setName( MY_QUEUE );
queueIn.get( msg );

// Set up the CICS bridge header information.
// The reply-to format is often specified.
// Other attributes can be specified, but all have default values.
header.setReplyToFormat( /* ? */ );

// Insert the CICS bridge header information.  This will vary
// the encoding, character set and format of the message.
// Message data is moved along, past the header.
msg.writeItem( header );

// Send the message to the CICS bridge queue.
queueBridge.setConnectionReference( mgr );
queueBridge.setName( /* ? */ );
queueBridge.put( msg );
```

Chapter 7. Writing a message to the work header

Messages sent to WebSphere MQ for z/OS, which are destined for a queue managed by the z/OS Workload Manager, require a special header. The work header is prefixed to regular message data.

```
ImqQueueManager mgr ;             // The queue manager.
ImqQueue queueIn ;                // Incoming message queue.
ImqQueue queueWLM ;               // WLM managed queue.
ImqMessage msg ;                  // Incoming and outgoing message.
ImqWorkHeader header ;            // Work header information

// Retrieve the message to be forwarded.
queueIn.setConnectionReference( mgr );
queueIn.setName( MY_QUEUE );
queueIn.get( msg );

// Insert the Work header information.  This will vary
// the encoding, character set and format of the message.
// Message data is moved along, past the header.
msg.writeItem( header );

// Send the message to the WLM managed queue.
queueWLM.setConnectionReference( mgr );
queueWLM.setName( /* ? */ );
queueWLM.put( msg );
```

Chapter 8. Sample programs

The sample programs are:

- HELLO WORLD (imqwrld.cpp)
- SPUT (imqsput.cpp) and SGET (imqsget.cpp)
- DPUT (imqdput.cpp)

The sample programs are located in the directories shown in Table 1.

Table 1. Location of sample programs

Environment	Directory containing source	Directory containing built programs
AIX	<**mqmtop**>/samp	<**mqmtop**>/samp/bin/ia
i5/OS	/QIBM/ProdData/mqm/samp/	(see note 1)
HP-UX	<**mqmtop**>/samp	<**mqmtop**>/samp/bin/ah (see note 2)
z/OS	**thlqual**.SCSQCPPS	None
Solaris	<**mqmtop**>/samp	<**mqmtop**>/samp/bin/as
Linux	<**mqmtop**>/samp	<**mqmtop**>/samp/bin/
Windows	<**mqmtop**>\tools\cplus\samples	<**mqmtop**>\tools\cplus\samples\bin\vn (see note 3)

Notes:

1. Programs built using the ILE C++ compiler for i5/OS® are in the library QMQM. The include files are in /QIBM/ProdData/mqm/inc.
2. Programs built using the HP ANSI C++ compiler are found in directory <**mqmtop**>/samp/bin/ah. For further information, see "HP-UX" on page 150
3. Programs built using the Microsoft® Visual Studio are found in <**mqmtop**>\tools\cplus\samples\bin\vn. For further information about these compilers, see "Windows" on page 156.

Sample program HELLO WORLD (imqwrld.cpp)

This program shows how to put and get a regular datagram (C structure) using the ImqMessage class. This sample uses few method invocations, taking advantage of implicit method invocations such as **open**, **close**, and **disconnect**.

On all platforms except z/OS

If you are using a server connection to WebSphere MQ:

1. Run **imqwrlds** to use the existing default queue SYSTEM.DEFAULT.LOCAL.QUEUE.
2. Run **imqwrlds** SYSTEM.DEFAULT.MODEL.QUEUE to use a temporary dynamically assigned queue.

For details of executing C++ programs, see Chapter 14, "Building WebSphere MQ C++ programs," on page 149.

Note:

1. If you are using a client connection to WebSphere MQ, either:
   a. Set up the MQSERVER environment variable (see WebSphere MQ Clients for more information) and run **imqwrldc**, or
   b. Run **imqwrldc** *queue-name queue-manager-name channel-definition* where a typical *channel-definition* might be SYSTEM.DEF.SVRCONN/TCP/*hostname* (1414)

On z/OS

Construct and run a batch job, using the sample JCL **imqwrldr**.

Sample code

Here is the code for the HELLO WORLD sample program.

```
extern "C" {
#include <stdio.h>
}

#include <imqi.hpp> // WebSphere MQ C++

#define EXISTING_QUEUE "SYSTEM.DEFAULT.LOCAL.QUEUE"

#define BUFFER_SIZE 12

static char gpszHello[ BUFFER_SIZE ] = "Hello world" ;
int main ( int argc, char * * argv ) {
  ImqQueueManager manager ;
  int iReturnCode = 0 ;

  // Connect to the queue manager.
  if ( argc > 2 ) {
    manager.setName( argv[ 2 ] );
  }
  if ( manager.connect( ) ) {
    ImqQueue * pqueue = new ImqQueue ;
    ImqMessage * pmsg = new ImqMessage ;

    // Identify the queue which will hold the message.
    pqueue -> setConnectionReference( manager );
    if ( argc > 1 ) {
      pqueue -> setName( argv[ 1 ] );

      // The named queue can be a model queue, which will result in
      // the creation of a temporary dynamic queue, which will be
      // destroyed as soon as it is closed. Therefore we must ensure
      // that such a queue is not automatically closed and reopened.
      // We do this by setting open options which will avoid the need
      // for closure and reopening.
      pqueue -> setOpenOptions( MQOO_OUTPUT | MQOO_INPUT_SHARED |
                                MQOO_INQUIRE );
    } else {
```

```
  pqueue -> setName( EXISTING_QUEUE );

  // The existing queue is not a model queue, and will not be
  // destroyed by automatic closure and reopening. Therefore we
  // will let the open options be selected on an as-needed basis.
  // The queue will be opened implicitly with an output option
  // during the "put", and then implicitly closed and reopened
  // with the addition of an input option during the "get".
}

// Prepare a message containing the text "Hello world".
pmsg -> useFullBuffer( gpszHello , BUFFER_SIZE );
pmsg -> setFormat( MQFMT_STRING );

// Place the message on the queue, using default put message
// Options.
// The queue will be automatically opened with an output option.
if ( pqueue -> put( * pmsg ) ) {
  ImqString strQueue( pqueue -> name( ) );

  // Discover the name of the queue manager.
  ImqString strQueueManagerName( manager.name( ) );
  printf( "The queue manager name is %s.\n",
          (char *)strQueueManagerName );

  // Show the name of the queue.
  printf( "Message sent to %s.\n", (char *)strQueue );

  // Retrieve the data message just sent ("Hello world" expected)
  // from the queue, using default get message options. The queue
  // is automatically closed and reopened with an input option
  // if it is not already open with an input option. We get the
  // message just sent, rather than any other message on the
  // queue, because the "put" will have set the ID of the message
  // so, as we are using the same message object, the message ID
  // acts as in the message object, a filter which says that we
  // are interested in a message only if it has this
  // particular ID.
  if ( pqueue -> get( * pmsg ) ) {
    int iDataLength = pmsg -> dataLength( );

    // Show the text of the received message.
    printf( "Message of length %d received, ", iDataLength );

    if ( pmsg -> formatIs( MQFMT_STRING ) ) {
      char * pszText = pmsg -> bufferPointer( );

      // If the last character of data is a null, then we can
      // assume that the data can be interpreted as a text
      // string.
      if ( ! pszText[ iDataLength - 1 ] ) {
        printf( "text is \"%s\".\n", pszText );
      } else {
        printf( "no text.\n" );
      }

    } else {
      printf( "non-text message.\n" );
    }
  } else {
    printf( "ImqQueue::get failed with reason code %ld\n",
            pqueue -> reasonCode( ) );
    iReturnCode = (int)pqueue -> reasonCode( );
  }

} else {
  printf( "ImqQueue::open/put failed with reason code %ld\n",
```

```
            pqueue -> reasonCode( ) );
      iReturnCode = (int)pqueue -> reasonCode( );
    }

    // Deletion of the queue will ensure that it is closed.
    // If the queue is dynamic then it will also be destroyed.
    delete pqueue ;
    delete pmsg ;

  } else {
    printf( "ImqQueueManager::connect failed with reason code %ld\n"
            manager.reasonCode( ) );
    iReturnCode = (int)manager.reasonCode( );
  }

  // Destruction of the queue manager ensures that it is
  // disconnected.  If the queue object were still available
  // and open (which it is not), the queue would be closed
  // prior to disconnection.

  return iReturnCode ;
}
```

Sample programs SPUT (imqsput.cpp) and SGET (imqsget.cpp)

These programs place messages to, and retrieve messages from, a named queue.

On all platforms except z/OS

1. Run **imqsputs** *queue-name*.
2. Type in lines at the console, which are placed with WebSphere MQ as messages.
3. Enter a null line to end the input.
4. Run **imqsgets** *queue-name* to retrieve all the lines and display them at the console.

On z/OS

1. Construct and run a batch job using the sample JCL **imqsputr**. The messages are read from the SYSIN data set.
2. Construct and run a batch job using the sample JCL **imqsgetr**. The messages are retrieved from the queue and sent to the SYSPRINT data set.

These samples show the use of the following classes:

- ImqError (see “ImqError” on page 63)
- ImqMessage (see “ImqMessage” on page 76)
- ImqObject (see “ImqObject” on page 90)
- ImqQueue (see “ImqQueue” on page 102)
- ImqQueueManager (see “ImqQueueManager” on page 115)

Sample program DPUT (imqdput.cpp)

This is a distribution list program that puts messages to a distribution list consisting of two queues. DPUT shows the use of the ImqDistributionList class (see “ImqDistributionList” on page 61). This sample is not supported on z/OS.

1. Run **imqdputs** *queue-name-1 queue-name-2* to place messages on the two named queues.

2. Run **imqsgets** *queue-name-1* and **imqsgets** *queue-name-2* to retrieve the messages from those queues.

Chapter 9. Implicit operations

Several operations can occur implicitly, *just in time*, to satisfy the prerequisite conditions for the successful execution of a method. These implicit operations are connect, open, reopen, close, and disconnect. You can control connect and open implicit behavior using class attributes.

Connect

An ImqQueueManager object is connected automatically for any method that results in any call to the MQI (see Chapter 15, "MQI cross reference," on page 161).

Open

An ImqObject object is opened automatically for any method that results in an MQGET, MQINQ, MQPUT, or MQSET call. Use the **openFor** method to specify one or more relevant **open option** values.

Reopen

An ImqObject is reopened automatically for any method that results in an MQGET, MQINQ, MQPUT, or MQSET call, where the object is already open, but the existing **open options** are not adequate to allow the MQI call to be successful. The object is temporarily closed using a temporary **close options** value of MQCO_NONE. Use the **openFor** method to add a relevant **open option**.

Reopen can cause problems in specific circumstances:

- A temporary dynamic queue is destroyed when it is closed and can never be reopened.
- A queue opened for exclusive input (either explicitly or by default) might be accessed by others in the window of opportunity during closure and reopening.
- A browse cursor position is lost when a queue is closed. This situation does not prevent closure and reopening, but prevents subsequent use of the cursor until MQGMO_BROWSE_FIRST is used again.
- The context of the last message retrieved is lost when a queue is closed.

If any of these circumstances occur or can be foreseen, avoid reopens by explicitly setting adequate **open options** before an object is opened (either explicitly or implicitly).

Setting the **open options** explicitly for complex queue-handling situations results in better performance and avoids the problems associated with the use of reopen.

Close

An ImqObject is closed automatically at any point where the object state would no longer be viable, for example if an ImqObject **connection reference** is severed, or if an ImqObject object is destroyed.

Disconnect

An ImqQueueManager is disconnected automatically at any point where the connection would no longer be viable, for example if an ImqObject **connection reference** is severed, or if an ImqQueueManager object is destroyed.

Chapter 10. Binary and character strings

Methods that set character (**char ***) data always take a copy of the data, but some methods might truncate the copy, because certain limits are imposed by WebSphere MQ.

The ImqString class (see "ImqString" on page 138) encapsulates the traditional **char *** and provides support for:

- Comparison
- Concatenation
- Copying
- Integer-to-text and text-to-integer conversion
- Token (word) extraction
- Uppercase translation

The ImqBinary class (see "ImqBinary" on page 40) encapsulates binary byte arrays of arbitrary size. In particular it is used to hold the following attributes:

- **accounting token** (MQBYTE32)
- **connection tag** (MQBYTE128)
- **correlation id** (MQBYTE24)
- **facility token** (MQBYTE8)
- **group id** (MQBYTE24)
- **instance id** (MQBYTE24)
- **message id** (MQBYTE24)
- **message token** (MQBYTE16)
- **transaction instance id** (MQBYTE16)

Where these attributes belong to objects of the following classes:

- ImqCICSBridgeHeader (see "ImqCICSBridgeHeader" on page 51)
- ImqGetMessageOptions (see "ImqGetMessageOptions" on page 65)
- ImqIMSBridgeHeader (see "ImqIMSBridgeHeader" on page 71)
- ImqMessageTracker (see "ImqMessageTracker" on page 84)
- ImqQueueManager (see "ImqQueueManager" on page 115)
- ImqReferenceHeader (see "ImqReferenceHeader" on page 135)
- ImqWorkHeader (see "ImqWorkHeader" on page 147)

The ImqBinary class also provides support for comparison and copying.

Chapter 11. Unsupported functions

The WebSphere MQ C++ classes and methods are independent of WebSphere MQ platform. They might therefore offer some functions that are not supported on certain platforms. If you try to use a function on a platform on which it is not supported, the function is detected by WebSphere MQ but not by the C++ language bindings. WebSphere MQ reports the error to your program, like any other MQI error.

Chapter 12. C++ language considerations

This chapter details the aspects of the C++ language usage and conventions that you must consider when writing application programs that use the Message Queue Interface (MQI).

Header files

Header files are provided as part of the definition of the MQI, to help you write WebSphere MQ application programs in the C++ language. These header files are summarized in the following table.

Table 2. C/C++ header files

Filename	Contents
IMQI.HPP	C++ MQI Classes (includes CMQC.H and IMQTYPE.H)
IMQTYPE.H	Defines the **ImqBoolean** data type
CMQC.H	MQI data structures and manifest constants

To improve the portability of applications, code the name of the header file in lowercase on the **#include** preprocessor directive:

```
#include <imqi.hpp> // C++ classes
```

Methods

Parameters that are *const* are for input only. Parameters whose signature includes a pointer (*) or a reference (&) are passed by reference. Return values that do not include a pointer or a reference are passed by value; in the case of returned objects, these are new entities that become the responsibility of the caller.

Some method signatures include items that take a default if not specified. Such items are always at the end of signatures and are denoted by an equal sign (=); the value after the equal sign indicates the default value that applies if the item is omitted.

All method names in these classes are mixed case, beginning with lowercase. Each word, except the first within a method name, begins with a capital letter. Abbreviations are not used unless their meaning is widely understood. Abbreviations used include id (for identity) and sync (for synchronization).

Attributes

Object attributes are accessed using set and get methods. A set method begins with the word *set*; a get method has no prefix. If an attribute is *read-only*, there is no set method.

Attributes are initialized to valid states during object construction, and the state of an object is always consistent.

Data types

All data types are defined by the C **typedef** statement. The type **ImqBoolean** is defined as **unsigned character** in IMQTYPE.H and can have the values TRUE and FALSE. You can use **ImqBinary** class objects in place of **MQBYTE** arrays, and **ImqString** class objects in place of **char** *. Many methods return objects instead of **char** or **MQBYTE** pointers to ease storage management. All return values become the responsibility of the caller, and, in the case of a returned object, the storage can be easily disposed of using delete.

Elementary data types

The datatype **ImqBoolean** is represented by **typedef unsigned char ImqBoolean**.

Manipulating binary strings

Strings of binary data are declared as objects of the **ImqBinary** class. Objects of this class can be copied, compared, and set using the familiar C operators. For example:

```
#include <imqi.hpp> // C++ classes

ImqMessage message ;
ImqBinary id, correlationId ;
MQBYTE24 byteId ;

correlationId.set( byteId, sizeof( byteId ) ); // Set.
id = message.id( );                            // Assign.
if ( correlationId == id ) {                   // Compare.
  ...
```

Manipulating character strings

When character data is accepted or returned using MQI C++ methods, the character data is always null-terminated and can be of any length. However, certain limits are imposed by WebSphere MQ that might result in information being truncated. To ease storage management, character data is often returned in **ImqString** class objects. These objects can be cast to **char** * using the conversion operator provided, and used for *read-only* purposes in many situations where a **char** * is required.

Note: The **char** * conversion result from an **ImqString** class object might be null.

Although C functions can be used on the **char** *, there are special methods of the **ImqString** class that are preferable; **operator length**( ) is the equivalent of **strlen** and **storage**( ) indicates the memory allocated for the character data.

Initial state of objects

All objects have a consistent initial state reflected by their attributes. The initial values are defined in the class descriptions.

Using C from C++

When using C functions from a C++ program, include headers as in the following example:

```
extern "C" {
#include <string.h>
}
```

Notational conventions

This shows how to invoke the methods and declare the parameters:

ImqBoolean ImqQueue::**get**(**ImqMessage &** *msg*)

Declare and use the parameters as follows:

```
ImqQueueManager * pmanager ;    // Queue manager
ImqQueue * pqueue ;             // Message queue
ImqMessage msg ;                // Message
char szBuffer[ 100 ];          // Buffer for message data

pmanager = new ImqQueueManager ;
pqueue = new ImqQueue ;
pqueue -> setName( "myreplyq" );
pqueue -> setConnectionReference( pmanager );

msg.useEmptyBuffer( szBuffer, sizeof( szBuffer ) );

if ( pqueue -> get( msg ) ) {
  long lDataLength = msg.dataLength( );

  ...
}
```

Chapter 13. WebSphere MQ C++ classes

The WebSphere MQ C++ classes encapsulate the WebSphere MQ Message Queue Interface (MQI). There is a single C++ header file, **imqi.hpp**, which covers all of these classes.

For each class, the following information is shown:

Class hierarchy diagram
A class diagram showing the class in its inheritance relation to its immediate parent classes, if any.

Other relevant classes
Document links to other relevant classes, such as parent classes, and the classes of objects used in method signatures.

Object attributes
Attributes of the class. These are in addition to those attributes defined for any parent classes. Many attributes reflect WebSphere MQ data-structure members (see Chapter 15, "MQI cross reference," on page 161). For detailed descriptions, see the WebSphere MQ Application Programming Guide.

Constructors
Signatures of the special methods used to create an object of the class.

Object methods (public)
Signatures of methods that require an instance of the class for their operation, and that have no usage restrictions.

Where it applies, the following information is also shown:

Class methods (public)
Signatures of methods that do not require an instance of the class for their operation, and that have no usage restrictions.

Overloaded (parent class) methods
Signatures of those virtual methods that are defined in parent classes, but exhibit different, polymorphic, behavior for this class.

Object methods (protected)
Signatures of methods that require an instance of the class for their operation, and are reserved for use by the implementations of derived classes. This section is of interest only to class writers, as opposed to class users.

Object data (protected)
Implementation details for object instance data available to the implementations of derived classes. This section is of interest only to class writers, as opposed to class users.

Reason codes
MQRC_* values (see WebSphere MQ Messages) that can be expected from those methods that fail. For an exhaustive list of reason codes that can occur for an object of a given class, consult the parent class documentation. The documented list of reason codes for a given class does not include the reason codes for parent classes.

Note:

1. Objects of these classes are not thread-safe. This ensures optimal performance, but take care not to access any given object from more than one thread.
2. It is recommended that, for a multithreaded program, a separate ImqQueueManager object is used for each thread. Each manager object must have its own independent collection of other objects, ensuring that objects in different threads are isolated from one another.

The classes are:

ImqAuthenticationRecord

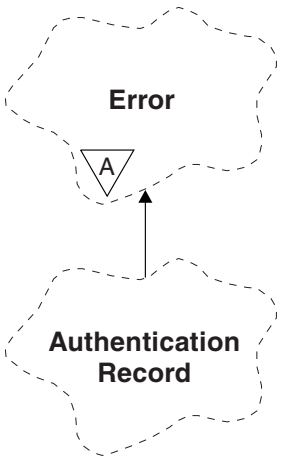

Figure 3. ImqAuthenticationRecord class

This class encapsulates an authentication information record (MQAIR) for use during execution of the ImqQueueManager::connect method, for custom SSL client connections. See the description of that method for more details. This class is not available on the z/OS platform.

Other relevant classes

- ImqBoolean (see "Elementary data types" on page 32)
- ImqError (see "ImqError" on page 63)
- ImqQueueManager (see "ImqQueueManager" on page 115)
- ImqString (see "ImqString" on page 138)

Object attributes

connection name
The name of the connection to the LDAP CRL server. This is the IP address or DNS name, followed optionally by the port number, in parentheses.

connection reference
A reference to an ImqQueueManager object that provides the required connection to a (local) queue manager. The initial value is zero. Do not confuse this with the queue manager name that identifies a queue manager (possibly remote) for a named queue.

next authentication record
Next object of this class, in no particular order, having the same **connection reference** as this object. The initial value is zero.

password
A password supplied for connection authentication to the LDAP CRL server.

previous authentication record
Previous object of this class, in no particular order, having the same **connection reference** as this object. The initial value is zero.

type The type of authentication information contained in the record.

user name
A user identifier supplied for authorization to the LDAP CRL server.

Constructors

ImqAuthenticationRecord( );
The default constructor.

Object methods (public)

void operator = (const ImqAuthenticationRecord & *air***);**
Copies instance data from *air*, replacing the existing instance data.

const ImqString & connectionName ( ) const ;
Returns the **connection name**.

void setConnectionName (const ImqString & *name* **);**
Sets the **connection name**.

void setConnectionName (const char * *name* **= 0);**
Sets the **connection name**.

ImqQueueManager * connectionReference ( ) const ;
Returns the **connection reference**.

void setConnectionReference (ImqQueueManager & *manager* **);**
Sets the **connection reference**.

void setConnectionReference (ImqQueueManager * *manager* **= 0);**
Sets the **connection reference**.

void copyOut (MQAIR * *pAir* **);**
Copies instance data to *pAir*, replacing the existing instance data. This might involve allocating dependent storage.

void clear (MQAIR * *pAir* **);**
Clears the structure and releases dependent storage referenced by *pAir*.

ImqAuthenticationRecord * nextAuthenticationRecord ( ) const ;
Returns the **next authentication record**.

const ImqString & password ( ) const ;
Returns the **password**.

void setPassword (const ImqString & *password* **);**
Sets the **password**.

void setPassword (const char * *password* **= 0);**
Sets the **password**.

ImqAuthenticationRecord * previousAuthenticationRecord ( ) const ;
Returns the **previous authentication record**.

MQLONG type ( ) const ;
Returns the **type**.

void setType (const MQLONG *type* **);**
Sets the **type**.

const ImqString & userName ( ) const ;
Returns the **user name**.

void setUserName (const ImqString & *name* **);**
Sets the **user name**.

void setUserName (const char * *name* = 0);
Sets the **user name**.

Object methods (protected)

void setNextAuthenticationRecord (ImqAuthenticationRecord * *pAir* = 0);
Sets the **next authentication record**.

Attention: Use this function only if you are sure that it will not break the authentication record list.

void setPreviousAuthenticationRecord (ImqAuthenticationRecord * *pAir* = 0);
Sets the **previous authentication record**.

Attention: Use this function only if you are sure that it will not break the authentication record list.

ImqBinary

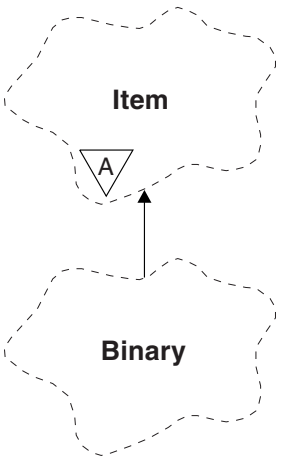

Figure 4. ImqBinary class

This class encapsulates a binary byte array that can be used for ImqMessage **accounting token**, **correlation id**, and **message id** values. It allows easy assignment, copying, and comparison.

Other relevant classes

- ImqItem (see "ImqItem" on page 74)
- ImqMessage (see "ImqMessage" on page 76)

Object attributes

data An array of bytes of binary data. The initial value is null.

data length
The number of bytes. The initial value is zero.

data pointer
The address of the first byte of the **data**. The initial value is zero.

Constructors

ImqBinary( );
The default constructor.

ImqBinary(const ImqBinary & *binary* **);**
The copy constructor.

ImqBinary(const void * *data***, const size_t** *length* **);**
Copies *length* bytes from *data*.

Overloaded ImqItem methods

virtual ImqBoolean copyOut(ImqMessage & *msg* **);**
Copies the **data** to the message buffer, replacing any existing content. Sets the *msg* **format** to MQFMT_NONE.

See the ImqItem class method description for further details.

virtual ImqBoolean pasteIn(ImqMessage & *msg*);
Sets the **data** by transferring the remaining data from the message buffer, replacing the existing **data**.

To be successful, the ImqMessage **format** must be MQFMT_NONE.

See the ImqItem class method description for further details.

Object methods (public)

void operator = (const ImqBinary & *binary*);
Copies bytes from *binary*.

ImqBoolean operator == (const ImqBinary & *binary*);
Compares this object with *binary*. It returns FALSE if not equal and TRUE otherwise. The objects are equal if they have the same **data length** and the bytes match.

ImqBoolean copyOut(void * *buffer*, const size_t *length*, const char *pad* = 0);
Copies up to *length* bytes from the **data pointer** to *buffer*. If the **data length** is insufficient, the remaining space in *buffer* is filled with *pad* bytes. *buffer* can be zero if *length* is also zero. *length* must not be negative. It returns TRUE if successful.

size_t dataLength( ) const ;
Returns the **data length**.

ImqBoolean setDataLength(const size_t *length*);
Sets the **data length**. If the **data length** is changed as a result of this method, the data in the object is uninitialized. It returns TRUE if successful.

void * dataPointer( ) const ;
Returns the **data pointer**.

ImqBoolean isNull( ) const ;
Returns TRUE if the **data length** is zero, or if all the **data** bytes are zero. Otherwise it returns FALSE.

ImqBoolean set(const void * *buffer*, const size_t *length*);
Copies *length* bytes from *buffer*. It returns TRUE if successful.

Object methods (protected)

void clear( );
Reduces the **data length** to zero.

Reason codes

- MQRC_NO_BUFFER
- MQRC_STORAGE_NOT_AVAILABLE
- MQRC_INCONSISTENT_FORMAT

ImqCache

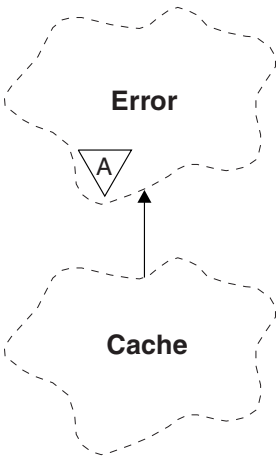

Figure 5. ImqCache class

Use this class to hold or marshal data in memory. You can nominate a buffer of memory of fixed size, or the system can provide a flexible amount of memory automatically. This class relates to the MQI calls listed in Table 7 on page 162.

Other relevant classes

- ImqError (see "ImqError" on page 63).

Object attributes

automatic buffer
Indicates whether buffer memory is managed automatically by the system (TRUE) or is supplied by the user (FALSE). It is initially set to TRUE.

This attribute is not set directly. It is set indirectly using either the **useEmptyBuffer** or the **useFullBuffer** method.

If user storage is supplied, this attribute is FALSE, buffer memory cannot grow, and buffer overflow errors can occur. The address and length of the buffer remain constant.

If user storage is not supplied, this attribute is TRUE, and buffer memory can grow incrementally to accommodate an arbitrary amount of message data. However, when the buffer grows, the address of the buffer might change, so be careful when using the **buffer pointer** and **data pointer**.

buffer length
The number of bytes of memory in the buffer. The initial value is zero.

buffer pointer
The address of the buffer memory. The initial value is null.

data length
The number of bytes succeeding the **data pointer**. This must be equal to or less than the **message length**. The initial value is zero.

data offset
The number of bytes preceding the **data pointer**. This must be equal to or less than the **message length**. The initial value is zero.

data pointer
The address of the part of the buffer that is to be written to or read from next. The initial value is null.

message length
The number of bytes of significant data in the buffer. The initial value is zero.

Constructors

ImqCache( );
The default constructor.

ImqCache(const ImqCache & *cache* **);**
The copy constructor.

Object methods (public)

void operator = (const ImqCache & *cache* **);**
Copies up to **message length** bytes of data from the *cache* object to the object. If **automatic buffer** is FALSE, the **buffer length** must already be sufficient to accommodate the copied data.

ImqBoolean automaticBuffer( ) const ;
Returns the **automatic buffer** value.

size_t bufferLength( ) const ;
Returns the **buffer length**.

char * bufferPointer( ) const ;
Returns the **buffer pointer**.

void clearMessage( );
Sets the **message length** and **data offset** to zero.

size_t dataLength( ) const ;
Returns the **data length**.

size_t dataOffset( ) const ;
Returns the **data offset**.

ImqBoolean setDataOffset(const size_t *offset* **);**
Sets the **data offset**. The **message length** is increased if necessary to ensure that it is no less than the **data offset**. This method returns TRUE if successful.

char * dataPointer( ) const ;
Returns a copy of the **data pointer**.

size_t messageLength( ) const ;
Returns the **message length**.

ImqBoolean setMessageLength(const size_t *length* **);**
Sets the **message length**. Increases the **buffer length** if necessary to ensure that the **message length** is no greater than the **buffer length**. Reduces the **data offset** if necessary to ensure that it is no greater than the **message length**. It returns TRUE if successful.

ImqBoolean moreBytes(const size_t *bytes-required* **);**
Assures that *bytes-required* more bytes are available (for writing) between the **data pointer** and the end of the buffer. It returns TRUE if successful.

If **automatic buffer** is TRUE, more memory is acquired as required; otherwise, the **buffer length** must already be adequate.

ImqBoolean read(const size_t *length***, char * &** *external-buffer* **);**
Copies *length* bytes, from the buffer starting at the **data pointer** position, into the *external-buffer*. After the data has been copied, the **data offset** is increased by *length*. This method returns TRUE if successful.

ImqBoolean resizeBuffer(const size_t *length* **);**
Varies the **buffer length**, provided that **automatic buffer** is TRUE. This is achieved by reallocating the buffer memory. Up to **message length** bytes of data from the existing buffer are copied to the new one. The maximum number copied is *length* bytes. The **buffer pointer** is changed. The **message length** and **data offset** are preserved as closely as possible within the confines of the new buffer. It returns TRUE if successful, and FALSE if **automatic buffer** is FALSE.

Note: This method can fail with MQRC_STORAGE_NOT_AVAILABLE if there is any problem with system resources.

ImqBoolean useEmptyBuffer(const char * *external-buffer*, **const size_t** *length* **);**
Identifies an empty user buffer, setting the **buffer pointer** to point to *external-buffer*, the **buffer length** to *length*, and the **message length** to zero. Performs a **clearMessage**. If the buffer is fully primed with data, use the **useFullBuffer** method instead. If the buffer is partially primed with data, use the **setMessageLength** method to indicate the correct amount. This method returns TRUE if successful.

This method can be used to identify a fixed amount of memory, as described above (*external-buffer* is not null and *length* is nonzero), in which case **automatic buffer** is set to FALSE, or it can be used to revert to system-managed flexible memory (*external-buffer* is null and *length* is zero), in which case **automatic buffer** is set to TRUE.

ImqBoolean useFullBuffer(const char * *externalBuffer*, **const size_t** *length* **);**
As for **useEmptyBuffer**, except that the **message length** is set to *length*. It returns TRUE if successful.

ImqBoolean write(const size_t *length*, **const char** * *external-buffer* **);**
Copies *length* bytes, from the *external-buffer*, into the buffer starting at the **data pointer** position. After the data has been copied, the **data offset** is increased by *length*, and the **message length** is increased if necessary to ensure that it is no less than the new **data offset** value. This method returns TRUE if successful.

If **automatic buffer** is TRUE, an adequate amount of memory is guaranteed; otherwise, the ultimate **data offset** must not exceed the **buffer length**.

Reason codes

- MQRC_BUFFER_NOT_AUTOMATIC
- MQRC_DATA_TRUNCATED
- MQRC_INSUFFICIENT_BUFFER
- MQRC_INSUFFICIENT_DATA
- MQRC_NULL_POINTER
- MQRC_STORAGE_NOT_AVAILABLE
- MQRC_ZERO_LENGTH

ImqChannel

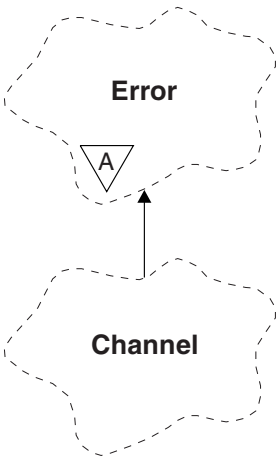

Figure 6. ImqChannel class

This class encapsulates a channel definition (MQCD) for use during execution of the Manager::connect method, for custom client connections. See the description of that method, and "Sample program HELLO WORLD (imqwrld.cpp)" on page 19, for more details. Not all the listed methods are applicable to all platforms; see the descriptions of the DEFINE CHANNEL and ALTER CHANNEL commands in WebSphere MQ Script (MQSC) Command Reference for more details. The ImqChannel class is not supported on z/OS.

Other relevant classes

- ImqBoolean (see "Elementary data types" on page 32)
- ImqError (see "ImqError" on page 63)
- ImqQueueManager (see "ImqQueueManager" on page 115)
- ImqString (see "ImqString" on page 138)

Object attributes

List of object attributes for the ImqChannel class.

batch heart-beat
The number of milliseconds between checks that a remote channel is active. The initial value is 0.

channel name
The name of the channel. The initial value is null.

connection name
The name of the connection. For example, the IP address of a host computer. The initial value is null.

header compression
The list of header data compression techniques supported by the channel. The initial values are all set to MQCOMPRESS_NOT_AVAILABLE.

heart-beat interval
The number of seconds between checks that a connection is still working. The initial value is 300.

keep alive interval
The number of seconds passed to the communications stack specifying the keep alive timing for the channel. The initial value is MQKAI_AUTO.

local address
The local communications address for the channel.

maximum message length
The maximum length of message supported by the channel in a single communication. The initial value is 4 194 304.

message compression
The list of message data compression techniques supported by the channel. The initial values are all set to MQCOMPRESS_NOT_AVAILABLE.

mode name
The name of the mode. The initial value is null.

password
A password supplied for connection authentication. The initial value is null.

receive exit count
The number of receive exits. The initial value is zero. This attribute is read-only.

receive exit names
The names of receive exits.

receive user data
Data associated with receive exits.

security exit name
The name of a security exit to be invoked on the server side of the connection. The initial value is null.

security user data
Data to be passed to the security exit. The initial value is null.

send exit count
The number of send exits. The initial value is zero. This attribute is read-only.

send exit names
The names of send exits.

send user data
Data associated with send exits.

SSL CipherSpec
CipherSpec for use with SSL.

SSL client authentication type
Client authentication type for use with SSL.

SSL peer name
Peer name for use with SSL.

transaction program name
The name of the transaction program. The initial value is null.

transport type
The transport type of the connection. The initial value is MQXPT_LU62.

user id
A user identifier supplied for authorization. The initial value is null.

Constructors

ImqChannel( ) ;
The default constructor.

ImqChannel(const ImqChannel & *channel* **);**
The copy constructor.

Object methods (public)

Public object methods for the ImqChannel class.

void operator = (const ImqChannel & *channel* **);**
Copies instance data from *channel*, replacing any existing instance data.

MQLONG batchHeartBeat( ) const ;
Returns the **batch heart-beat**.

ImqBoolean setBatchHeartBeat(const MQLONG *heartbeat* **= 0L);**
Sets the **batch heart-beat** . This method returns TRUE if successful.

ImqString channelName( ) const ;
Returns the **channel name**.

ImqBoolean setChannelName(const char * *name* **= 0);**
Sets the **channel name**. This method returns TRUE if successful.

ImqString connectionName( ) const ;
Returns the **connection name**.

ImqBoolean setConnectionName(const char * *name* **= 0);**
Sets the **connection name**. This method returns TRUE if successful.

size_t headerCompressionCount( ) const ;
Returns the supported header data compression techniques count.

ImqBoolean headerCompression(const size_t count, MQLONG compress [ ]) const ; Returns copies of the supported header data compression techniques in **compress**. This method returns TRUE if successful.

ImqBoolean setHeaderCompression(const size_t count, const MQLONG compress [ ]);

Sets the supported header data compression techniques to **compress**.

Sets the supported header data compression techniques count to **count**.

This method returns TRUE if successful.

MQLONG heartBeatInterval( ) const ;
Returns the **heart-beat interval**.

ImqBoolean setHeartBeatInterval(const MQLONG *interval* **= 300L);**
Sets the **heart-beat interval**. This method returns TRUE if successful.

MQLONG keepAliveInterval( ) const ;
Returns the **keep alive interval**.

ImqBoolean setKeepAliveInterval(const MQLONG *interval* **= MQKAI_AUTO);**
Sets the **keep alive interval**. This method returns TRUE if successful.

ImqString localAddress() const ;
Returns the **local address**.

ImqBoolean setLocalAddress (const char * *address* = 0);
Sets the **local address**. This method returns TRUE if successful.

MQLONG maximumMessageLength( ) const ;
Returns the **maximum message length**.

ImqBoolean setMaximumMessageLength(const MQLONG *length* = 4194304L);
Sets the **maximum message length**. This method returns TRUE if successful.

size_t messageCompressionCount( ) const ;
Returns the supported message data compression techniques count.

ImqBoolean messageCompression(const size_t count, MQLONG compress [ ]) const ; Returns copies of the supported message data compression techniques in **compress**. This method returns TRUE if successful.

ImqBoolean setMessageCompression(const size_t count, const MQLONG compress [ ]);

Sets the supported message data compression techniques to compress.

Sets the supported message data compression techniques count to count.

This method returns TRUE if successful.

ImqString modeName( ) const ;
Returns the **mode name**.

ImqBoolean setModeName(const char * *name* = 0);
Sets the **mode name**. This method returns TRUE if successful.

ImqString password( ) const ;
Returns the **password**.

ImqBoolean setPassword(const char * *password* = 0);
Sets the **password**. This method returns TRUE if successful.

size_t receiveExitCount( ) const ;
Returns the **receive exit count**.

ImqString receiveExitName( );
Returns the first of the **receive exit names**, if any. If the **receive exit count** is zero, it returns an empty string.

ImqBoolean receiveExitNames(const size_t *count*, ImqString * *names* [ ]);
Returns copies of the **receive exit names** in *names*. Sets any *names* in excess of **receive exit count** to null strings. This method returns TRUE if successful.

ImqBoolean setReceiveExitName(const char * *name* = 0);
Sets the **receive exit names** to the single *name*. *name* can be blank or null. Sets the **receive exit count** to either 1 or zero. Clears the **receive user data**. This method returns TRUE if successful.

ImqBoolean setReceiveExitNames(const size_t *count*, const char * *names* [ ]);
Sets the **receive exit names** to *names*. Individual *names* values must not be blank or null. Sets the **receive exit count** to *count*. Clears the **receive user data**. This method returns TRUE if successful.

ImqBoolean setReceiveExitNames(const size_t *count*, const ImqString * *names* [ ]); Sets the **receive exit names** to *names*. Individual *names* values must not be blank or null. Sets the **receive exit count** to *count*. Clears the **receive user data**. This method returns TRUE if successful.

ImqString receiveUserData( );
Returns the first of the **receive user data** items, if any. If the **receive exit count** is zero, returns an empty string.

ImqBoolean receiveUserData(const size_t *count*, **ImqString** * *data* **[ ]);**
Returns copies of the **receive user data** items in *data*. Sets any *data* in excess of **receive exit count** to null strings. This method returns TRUE if successful.

ImqBoolean setReceiveUserData(const char * *data* **= 0);**
Sets the **receive user data** to the single item *data*. If *data* is not null, **receive exit count** must be at least 1. This method returns TRUE if successful.

ImqBoolean setReceiveUserData(const size_t *count*, **const char** * *data* **[ ]);**
Sets the **receive user data** to *data*. *count* must be no greater than the **receive exit count**. This method returns TRUE if successful.

ImqBoolean setReceiveUserData(const size_t *count*, **const ImqString** * *data* **[ ]);**
Sets the **receive user data** to *data*. *count* must be no greater than the **receive exit count**. This method returns TRUE if successful.

ImqString securityExitName( ) const ;
Returns the **security exit name**.

ImqBoolean setSecurityExitName(const char * *name* **= 0);**
Sets the **security exit name**. This method returns TRUE if successful.

ImqString securityUserData( ) const ;
Returns the **security user data**.

ImqBoolean setSecurityUserData(const char * *data* **= 0);**
Sets the **security user data**. This method returns TRUE if successful.

size_t sendExitCount( ) const ;
Returns the **send exit count**.

ImqString sendExitName( );
Returns the first of the **send exit names**, if any. Returns an empty string if the **send exit count** is zero.

ImqBoolean sendExitNames(const size_t *count*, **ImqString** * *names* **[ ]);**
Returns copies of the **send exit names** in *names*. Sets any *names* in excess of **send exit count** to null strings. This method returns TRUE if successful.

ImqBoolean setSendExitName(const char * *name* **= 0);**
Sets the **send exit names** to the single *name*. *name* can be blank or null. Sets the **send exit count** to either 1 or zero. Clears the **send user data**. This method returns TRUE if successful

ImqBoolean setSendExitNames(const size_t *count*, **const char** * *names* **[ ]);**
Sets the **send exit names** to *names*. Individual *names* values must not be blank or null. Sets the **send exit count** to *count*. Clears the **send user data**. This method returns TRUE if successful.

ImqBoolean setSendExitNames(const size_t *count*, **const ImqString** * *names* **[ ]);**
Sets the **send exit names** to *names*. Individual *names* values must not be blank or null. Sets the **send exit count** to *count*. Clears the **send user data**. This method returns TRUE if successful.

ImqString sendUserData( );
Returns the first of the **send user data** items, if any. , Returns an empty string if the **send exit count** is zero.

ImqBoolean sendUserData(const size_t *count*, **ImqString *** *data* **[ ]);**
Returns copies of the **send user data** items in *data*. Sets any *data* in excess of **send exit count** to null strings. This method returns TRUE if successful.

ImqBoolean setSendUserData(const char * *data* **= 0);**
Sets the **send user data** to the single item *data*. If *data* is not null, **send exit count** must be at least 1. This method returns TRUE if successful.

ImqBoolean setSendUserData(const size_t *count*, **const char *** *data* **[ ]);**
Sets the **send user data** to *data*. *count* must be no greater than the **send exit count**. This method returns TRUE if successful.

ImqBoolean setSendUserData(const size_t *count*, **const ImqString *** *data* **[ ]);**
Sets the **send user data** to *data*. *count* must be no greater than the **send exit count**. This method returns TRUE if successful.

ImqString sslCipherSpecification( ) const ;
Returns the SSL cipher specification.

ImqBoolean setSslCipherSpecification(const char * *name* **= 0);**
Sets the SSL cipher specification. This method returns TRUE if successful.

MQLONG sslClientAuthentication( ) const ;
Returns the SSL client authentication type.

ImqBoolean setSslClientAuthentication(const MQLONG *auth* **= MQSCA_REQUIRED);**
Sets the SSL client authentication type. This method returns TRUE if successful.

ImqString sslPeerName( ) const ;
Returns the SSL peer name.

ImqBoolean setSslPeerName(const char * *name* **= 0);**
Sets the SSL peer name. This method returns TRUE if successful.

ImqString transactionProgramName( ) const ;
Returns the **transaction program name**.

ImqBoolean setTransactionProgramName(const char * *name* **= 0);**
Sets the **transaction program name**. This method returns TRUE if successful.

MQLONG transportType( ) const ;
Returns the **transport type**.

ImqBoolean setTransportType(const MQLONG *type* **= MQXPT_LU62);**
Sets the **transport type**. This method returns TRUE if successful.

ImqString userId( ) const ;
Returns the **user id**.

ImqBoolean setUserId(const char * *id* **= 0);**
Sets the **user id**. This method returns TRUE if successful.

Reason codes

- MQRC_DATA_LENGTH_ERROR
- MQRC_ITEM_COUNT_ERROR
- MQRC_NULL_POINTER
- MQRC_SOURCE_BUFFER_ERROR

ImqCICSBridgeHeader

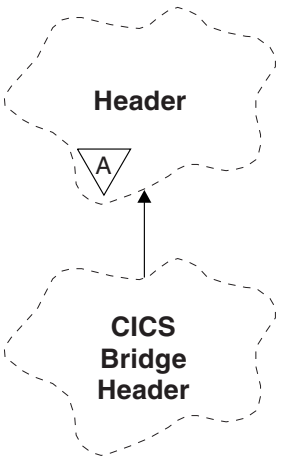

Figure 7. ImqCICSBridgeHeader class

This class encapsulates specific features of the MQCIH data structure (see Table 9 on page 163). Objects of this class are used by applications that send messages to the CICS bridge through WebSphere MQ for z/OS.

Other relevant classes

- ImqBinary (see "ImqBinary" on page 40)
- ImqHeader (see "ImqHeader" on page 69)
- ImqItem (see "ImqItem" on page 74)
- ImqMessage (see "ImqMessage" on page 76)
- ImqString (see "ImqString" on page 138)

Object attributes

ADS descriptor
Send/receive ADS descriptor. This is set using MQCADSD_NONE. The initial value is MQCADSD_NONE. The following additional values are possible:

- MQCADSD_NONE
- MQCADSD_SEND
- MQCADSD_RECV
- MQCADSD_MSGFORMAT

attention identifier
AID key. The field must be of length MQ_ATTENTION_ID_LENGTH.

authenticator
RACF® password or passticket. The initial value contains blanks, of length MQ_AUTHENTICATOR_LENGTH.

bridge abend code
Bridge abend code, of length MQ_ABEND_CODE_LENGTH. The initial value is four blank characters. The value returned in this field is dependent on the return code. See Table 3 on page 57 for more details.

bridge cancel code
Bridge abend transaction code. The field is reserved, must contain blanks, and be of length MQ_CANCEL_CODE_LENGTH.

bridge completion code
Completion code, which can contain either the WebSphere MQ completion code or the CICS EIBRESP value. The field has the initial value of MQCC_OK. The value returned in this field is dependent on the return code. See Table 3 on page 57 for more details.

bridge error offset
Bridge error offset. The initial value is zero. This attribute is read-only.

bridge reason code
Reason code. This field can contain either the WebSphere MQ reason or the CICS EIBRESP2 value. The field has the initial value of MQRC_NONE. The value returned in this field is dependent on the return code. See Table 3 on page 57 for more details.

bridge return code
Return code from the CICS bridge. The initial value is MQCRC_OK.

conversational task
Whether the task can be conversational. The initial value is MQCCT_NO. The following additional values are possible:

- MQCCT_YES
- MQCCT_NO

cursor position
Cursor position. The initial value is zero.

facility keep time
CICS bridge facility release time.

facility like
Terminal emulated attribute. The field must be of length MQ_FACILITY_LIKE_LENGTH.

facility token
BVT token value. The field must be of length MQ_FACILITY_LENGTH. The initial value is MQCFAC_NONE.

function
Function, which can contain either the WebSphere MQ call name or the CICS EIBFN function. The field has the initial value of MQCFUNC_NONE, with length MQ_FUNCTION_LENGTH. The value returned in this field is dependent on the return code. See Table 3 on page 57 for more details.

The following additional values are possible when **function** contains a WebSphere MQ call name:

- MQCFUNC_MQCONN
- MQCFUNC_MQGET
- MQCFUNC_MQINQ
- MQCFUNC_NONE
- MQCFUNC_MQOPEN
- MQCFUNC_PUT
- MQCFUNC_MQPUT1

get wait interval
Wait interval for an MQGET call issued by the CICS bridge task. The initial

value is MQCGWI_DEFAULT. The field applies only when **uow control** has the value MQCUOWC_FIRST. The following additional values are possible:

- MQCGWI_DEFAULT
- MQWI_UNLIMITED

link type
Link type. The initial value is MQCLT_PROGRAM. The following additional values are possible:

- MQCLT_PROGRAM
- MQCLT_TRANSACTION

next transaction identifier
ID of the next transaction to attach. The field must be of length MQ_TRANSACTION_ID_LENGTH.

output data length
COMMAREA data length. The initial value is MQCODL_AS_INPUT.

reply-to format
Format name of the reply message. The initial value is MQFMT_NONE with length MQ_FORMAT_LENGTH.

start code
Transaction start code. The field must be of length MQ_START_CODE_LENGTH. The initial value is MQCSC_NONE. The following additional values are possible:

- MQCSC_START
- MQCSC_STARTDATA
- MQCSC_TERMINPUT
- MQCSC_NONE

task end status
Task end status. The initial value is MQCTES_NOSYNC. The following additional values are possible:

- MQCTES_COMMIT
- MQCTES_BACKOUT
- MQCTES_ENDTASK
- MQCTES_NOSYNC

transaction identifier
ID of the transaction to attach. The initial value must contain blanks, and must be of length MQ_TRANSACTION_ID_LENGTH. The field applies only when **uow control** has the value MQCUOWC_FIRST or MQCUOWC_ONLY.

UOW control
UOW control. The initial value is MQCUOWC_ONLY. The following additional values are possible:

- MQCUOWC_FIRST
- MQCUOWC_MIDDLE
- MQCUOWC_LAST
- MQCUOWC_ONLY
- MQCUOWC_COMMIT
- MQCUOWC_BACKOUT

- MQCUOWC_CONTINUE

version
The MQCIH version number. The initial value is MQCIH_VERSION_2. The only other supported value is MQCIH_VERSION_1.

Constructors

ImqCICSBridgeHeader( );
The default constructor.

ImqCICSBridgeHeader(const ImqCICSBridgeHeader & *header* **);**
The copy constructor.

Overloaded ImqItem methods

virtual ImqBoolean copyOut(ImqMessage & *msg* **);**
Inserts an MQCIH data structure into the message buffer at the beginning, moving existing message data further along, and sets the message format to MQFMT_CICS.

See the parent class method description for more details.

virtual ImqBoolean pasteIn(ImqMessage & *msg* **);**
Reads an MQCIH data structure from the message buffer. To be successful, the encoding of the *msg* object must be MQENC_NATIVE. Retrieve messages with MQGMO_CONVERT to MQENC_NATIVE. To be successful, the ImqMessage format must be MQFMT_CICS.

See the parent class method description for more details.

Object methods (public)

void operator = (const ImqCICSBridgeHeader & *header* **);**
Copies instance data from the *header*, replacing the existing instance data.

MQLONG ADSDescriptor( ) const;
Returns a copy of the **ADS descriptor**.

void setADSDescriptor(const MQLONG *descriptor* **= MQCADSD_NONE);**
Sets the **ADS descriptor**.

ImqString attentionIdentifier( ) const;
Returns a copy of the **attention identifier**, padded with trailing blanks to length MQ_ATTENTION_ID_LENGTH.

void setAttentionIdentifier(const char * *data* **= 0);**
Sets the **attention identifier**, padded with trailing blanks to length MQ_ATTENTION_ID_LENGTH. If no *data* is supplied, resets **attention identifier** to the initial value.

ImqString authenticator( ) const;
Returns a copy of the **authenticator**, padded with trailing blanks to length MQ_AUTHENTICATOR_LENGTH.

void setAuthenticator(const char * *data* **= 0);**
Sets the **authenticator**, padded with trailing blanks to length MQ_AUTHENTICATOR_LENGTH. If no *data* is supplied, resets **authenticator** to the initial value.

ImqString bridgeAbendCode( ) const;
Returns a copy of the **bridge abend code**, padded with trailing blanks to length MQ_ABEND_CODE_LENGTH.

ImqString bridgeCancelCode( ) const;
Returns a copy of the **bridge cancel code**, padded with trailing blanks to length MQ_CANCEL_CODE_LENGTH.

void setBridgeCancelCode(const char * *data* = 0);
Sets the **bridge cancel code**, padded with trailing blanks to length MQ_CANCEL_CODE_LENGTH. If no *data* is supplied, resets the **bridge cancel code** to the initial value.

MQLONG bridgeCompletionCode( ) const;
Returns a copy of the **bridge completion code**.

MQLONG bridgeErrorOffset( ) const ;
Returns a copy of the **bridge error offset**.

MQLONG bridgeReasonCode( ) const;
Returns a copy of the **bridge reason code**.

MQLONG bridgeReturnCode( ) const;
Returns the **bridge return code**.

MQLONG conversationalTask( ) const;
Returns a copy of the **conversational task**.

void setConversationalTask(const MQLONG *task* = MQCCT_NO);
Sets the **conversational task**.

MQLONG cursorPosition( ) const ;
Returns a copy of the **cursor position**.

void setCursorPosition(const MQLONG *position* = 0);
Sets the **cursor position**.

MQLONG facilityKeepTime( ) const;
Returns a copy of the **facility keep time**.

void setFacilityKeepTime(const MQLONG *time* = 0);
Sets the **facility keep time**.

ImqString facilityLike( ) const;
Returns a copy of the **facility like**, padded with trailing blanks to length MQ_FACILITY_LIKE_LENGTH.

void setFacilityLike(const char * *name* = 0);
Sets the **facility like**, padded with trailing blanks to length MQ_FACILITY_LIKE_LENGTH. If no *name* is supplied, resets **facility like** the initial value.

ImqBinary facilityToken( ) const;
Returns a copy of the **facility token**.

ImqBoolean setFacilityToken(const ImqBinary & *token*);
Sets the **facility token**. The **data length** of *token* must be either zero or MQ_FACILITY_LENGTH. It returns TRUE if successful.

void setFacilityToken(const MQBYTE8 *token* = 0);
Sets the **facility token**. *token* can be zero, which is the same as specifying MQCFAC_NONE. If *token* is nonzero it must address MQ_FACILITY_LENGTH bytes of binary data. When using predefined

values such as MQCFAC_NONE, you might need to make a cast to ensure a signature match. For example, (MQBYTE *)MQCFAC_NONE.

ImqString function( ) const;
Returns a copy of the **function**, padded with trailing blanks to length MQ_FUNCTION_LENGTH.

MQLONG getWaitInterval( ) const;
Returns a copy of the **get wait interval**.

void setGetWaitInterval(const MQLONG *interval* **= MQCGWI_DEFA**
Sets the **get wait interval**.

MQLONG linkType( ) const;
Returns a copy of the **link type**.

void setLinkType(const MQLONG *type* **= MQCLT_PROGRAM);**
Sets the **link type**.

ImqString nextTransactionIdentifier( ) const ;
Returns a copy of the **next transaction identifier** data, padded with trailing blanks to length MQ_TRANSACTION_ID_LENGTH.

MQLONG outputDataLength( ) const;
Returns a copy of the **output data length**.

void setOutputDataLength(const MQLONG *length* **= MQCODL_AS_INPUT);**
Sets the **output data length**.

ImqString replyToFormat( ) const;
Returns a copy of the **reply-to format** name, padded with trailing blanks to length MQ_FORMAT_LENGTH.

void setReplyToFormat(const char * *name* **= 0);**
Sets the **reply-to format**, padded with trailing blanks to length MQ_FORMAT_LENGTH. If no *name* is supplied, resets **reply-to format** to the initial value.

ImqString startCode( ) const;
Returns a copy of the **start code**, padded with trailing blanks to length MQ_START_CODE_LENGTH.

void setStartCode(const char * *data* **= 0);**
Sets the **start code** data, padded with trailing blanks to length MQ_START_CODE_LENGTH. If no *data* is supplied, resets **start code** to the initial value.

MQLONG taskEndStatus( ) const;
Returns a copy of the **task end status**.

ImqString transactionIdentifier( ) const;
Returns a copy of the **transaction identifier** data, padded with trailing blanks to the length MQ_TRANSACTION_ID_LENGTH.

void setTransactionIdentifier(const char * *data* **= 0);**
Sets the **transaction identifier**, padded with trailing blanks to length MQ_TRANSACTION_ID_LENGTH. If no *data* is supplied, resets **transaction identifier** to the initial value.

MQLONG UOWControl( ) const;
Returns a copy of the **UOW control**.

void setUOWControl(const MQLONG *control* **= MQCUOWC_ONLY);**
Sets the **UOW control**.

MQLONG version( ) const;
Returns the **version** number.

ImqBoolean setVersion(const MQLONG *version* **= MQCIH_VERSION_2);**
Sets the **version** number. It returns TRUE if successful.

Object data (protected)

MQLONG *olVersion*
The maximum MQCIH version number that can be accommodated in the storage allocated for *opcih*.

PMQCIH *opcih*
The address of an MQCIH data structure. The amount of storage allocated is indicated by *olVersion*.

Reason codes

- MQRC_BINARY_DATA_LENGTH_ERROR
- MQRC_WRONG_VERSION

Return codes

Table 3. ImqCICSBridgeHeader class return codes

Return Code	Function	CompCode	Reason	Abend Code
MQCRC_OK				
MQCRC_BRIDGE_ERROR			MQFB_CICS	
MQCRC_MQ_API_ERROR	WebSphere MQ call name	WebSphere MQ CompCode	WebSphere MQ Reason	
MQCRC_BRIDGE_TIMEOUT	WebSphere MQ call name	WebSphere MQ CompCode	WebSphere MQ Reason	
MQCRC_CICS_EXEC_ERROR	CICS EIBFN	CICS EIBRESP	CICS EIBRESP2	
MQCRC_SECURITY_ERROR	CICS EIBFN	CICS EIBRESP	CICS EIBRESP2	
MQCRC_PROGRAM_NOT_AVAILABLE	CICS EIBFN	CICS EIBRESP	CICS EIBRESP2	
MQCRC_TRANSID_NOT_AVAILABLE	CICS EIBFN	CICS EIBRESP	CICS EIBRESP2	
MQCRC_BRIDGE_ABEND				CICS ABCODE
MQCRC_APPLICATION_ABEND				CICS ABCODE

ImqDeadLetterHeader

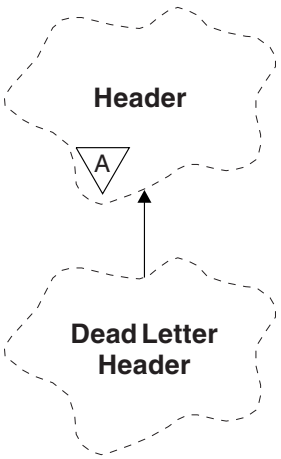

Figure 8. ImqDeadLetterHeader class

This class encapsulates features of the MQDLH data structure (see Table 10 on page 164). Objects of this class are typically used by an application that encounters an message that cannot be processed. A new message comprising a dead-letter header and the message content is placed on the dead-letter queue, and the message is discarded.

Other relevant classes

- ImqHeader (see "ImqHeader" on page 69)
- ImqItem (see "ImqItem" on page 74)
- ImqMessage (see "ImqMessage" on page 76)
- ImqString (see "ImqString" on page 138)

Object attributes

dead-letter reason code
The reason the message arrived on the dead-letter queue. The initial value is MQRC_NONE.

destination queue manager name
The name of the original destination queue manager. The name is a string of length MQ_Q_MGR_NAME_LENGTH. Its initial value is null.

destination queue name
The name of the original destination queue. The name is a string of length MQ_Q_NAME_LENGTH. Its initial value is null.

put application name
The name of the application that put the message on the dead-letter queue. The name is a string of length MQ_PUT_APPL_NAME_LENGTH. Its initial value is null.

put application type
The type of application that put the message on the dead-letter queue. The initial value is zero.

put date
The date when the message was put on the dead-letter queue. The date is a string of length MQ_PUT_DATE_LENGTH. Its initial value is a null string.

put time
The time when the message was put on the dead-letter queue. The time is a string of length MQ_PUT_TIME_LENGTH. Its initial value is a null string.

Constructors

ImqDeadLetterHeader( );
The default constructor.

ImqDeadLetterHeader(const ImqDeadLetterHeader & *header* **);**
The copy constructor.

Overloaded ImqItem methods

virtual ImqBoolean copyOut(ImqMessage & *msg* **);**
Inserts an MQDLH data structure into the message buffer at the beginning, moving existing message data further along. Sets the *msg* **format** to MQFMT_DEAD_LETTER_HEADER.

See the ImqHeader class method description on page “ImqHeader” on page 69 for further details.

virtual ImqBoolean pasteIn(ImqMessage & *msg* **);**
Reads an MQDLH data structure from the message buffer.

To be successful, the ImqMessage **format** must be MQFMT_DEAD_LETTER_HEADER.

See the ImqHeader class method description on page “ImqHeader” on page 69 for further details.

Object methods (public)

void operator = (const ImqDeadLetterHeader & *header* **);**
Copies instance data is copied from *header*, replacing the existing instance data.

MQLONG deadLetterReasonCode( ) const ;
Returns the **dead-letter reason code**.

void setDeadLetterReasonCode(const MQLONG *reason* **);**
Sets the **dead-letter reason code**.

ImqString destinationQueueManagerName( ) const ;
Returns the **destination queue manager name**, stripped of any trailing blanks.

void setDestinationQueueManagerName(const char * *name* **);**
Sets the **destination queue manager name**. Truncates data longer than MQ_Q_MGR_NAME_LENGTH (48 characters).

ImqString destinationQueueName( ) const ;
Returns a copy of the **destination queue name**, stripped of any trailing blanks.

void setDestinationQueueName(const char * *name* **);**
Sets the **destination queue name**. Truncates data longer than MQ_Q_NAME_LENGTH (48 characters).

ImqString putApplicationName( ) const ;
Returns a copy of the **put application name**, stripped of any trailing blanks.

void setPutApplicationName(const char * *name* **= 0);**
Sets the **put application name**. Truncates data longer than MQ_PUT_APPL_NAME_LENGTH (28 characters).

MQLONG putApplicationType( ) const ;
Returns the **put application type**.

void setPutApplicationType(const MQLONG *type* **= MQAT_NO_CONTEXT);**
Sets the **put application type**.

ImqString putDate( ) const ;
Returns a copy of the **put date**, stripped of any trailing blanks.

void setPutDate(const char * *date* **= 0);**
Sets the **put date**. Truncates data longer than MQ_PUT_DATE_LENGTH (8 characters).

ImqString putTime( ) const ;
Returns a copy of the **put time**, stripped of any trailing blanks.

void setPutTime(const char * *time* **= 0);**
Sets the **put time**. Truncates data longer than MQ_PUT_TIME_LENGTH (8 characters).

Object data (protected)

MQDLH *omqdlh*
The MQDLH data structure.

Reason codes

- MQRC_INCONSISTENT_FORMAT
- MQRC_STRUC_ID_ERROR
- MQRC_ENCODING_ERROR

ImqDistributionList

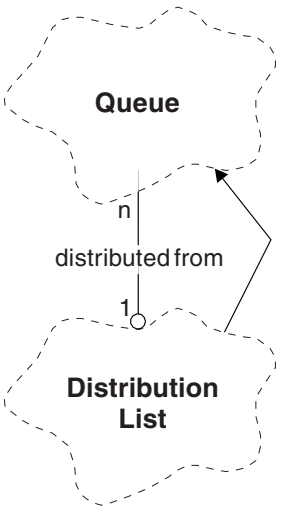

Figure 9. ImqDistributionList class

This class encapsulates a dynamic distribution list that references one or more queues for the purpose of sending a message or messages to multiple destinations.

Other relevant classes

- ImqMessage (see "ImqMessage" on page 76)
- (see "ImqQueue" on page 102)

Object attributes

first distributed queue
The first of one or more objects of class , in no particular order, in which the **distribution list reference** addresses this object.

Initially there are no such objects. To open an ImqDistributionList successfully, there must be at least one such object.

Note: When an ImqDistributionList object is opened, any open objects that reference it are automatically closed.

Constructors

ImqDistributionList( );
The default constructor.

ImqDistributionList(const ImqDistributionList & *list* **);**
The copy constructor.

Object methods (public)

void operator = (const ImqDistributionList & *list* **);**
All objects that reference **this** object are dereferenced before copying. No objects will reference **this** object after the invocation of this method.

*** firstDistributedQueue( ) const ;**
Returns the **first distributed queue**.

Object methods (protected)

void setFirstDistributedQueue(* *queue* **= 0);**
Sets the **first distributed queue**.

ImqError

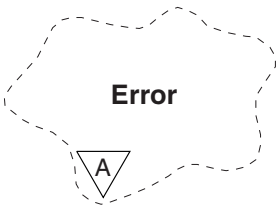

Figure 10. ImqError class

This abstract class provides information on errors associated with an object. It relates to the MQI calls listed in Table 11 on page 164.

Other relevant classes

None.

Object attributes

completion code
The most recent completion code. The initial value is zero. The following additional values are possible:

- MQCC_OK
- MQCC_WARNING
- MQCC_FAILED

reason code
The most recent reason code. The initial value is zero.

Constructors

ImqError( );
The default constructor.

ImqError(const ImqError & *error* **);**
The copy constructor.

Object methods (public)

void operator = (const ImqError & *error* **);**
Copies instance data from *error*, replacing the existing instance data.

void clearErrorCodes( );
Sets the **completion code** and **reason code** both to zero.

MQLONG completionCode( ) const ;
Returns the **completion code**.

MQLONG reasonCode( ) const ;
Returns the **reason code**.

Object methods (protected)

ImqBoolean checkReadPointer(const void * *pointer*, **const size_t** *length* **);**
Verifies that the combination of pointer and length is valid for read-only access, and returns TRUE if successful.

ImqBoolean checkWritePointer(const void * *pointer*, **const size_t** *length* **);**
Verifies that the combination of pointer and length is valid for read-write access, and returns TRUE if successful.

void setCompletionCode(const MQLONG *code* **= 0);**
Sets the **completion code**.

void setReasonCode(const MQLONG *code* **= 0);**
Sets the **reason code**.

Reason codes

- MQRC_BUFFER_ERROR

ImqGetMessageOptions

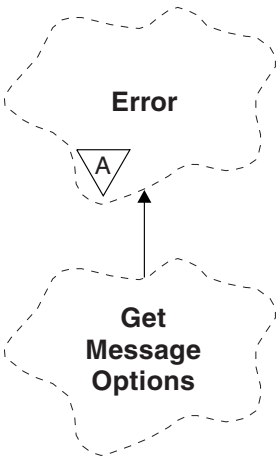

Figure 11. ImqGetMessageOptions class

This class encapsulates the MQGMO data structure (see Table 12 on page 164).

Other relevant classes

- ImqString (see "ImqString" on page 138)

Object attributes

group status
Status of a message for a group of messages. The initial value is MQGS_NOT_IN_GROUP. The following additional values are possible:

- MQGS_MSG_IN_GROUP
- MQGS_LAST_MSG_IN_GROUP

match options
Options for selecting incoming messages. The initial value is MQMO_MATCH_MSG_ID | MQMO_MATCH_CORREL_ID. The following additional values are possible:

- MQMO_GROUP_ID
- MQMO_MATCH_MSG_SEQ_NUMBER
- MQMO_MATCH_OFFSET
- MQMO_MSG_TOKEN
- MQMO_NONE

message token
Message token. A binary value (MQBYTE16) of length MQ_MSG_TOKEN_LENGTH. The initial value is MQMTOK_NONE.

options
Options applicable to a message. The initial value is MQGMO_NO_WAIT. The following additional values are possible:

- MQGMO_WAIT
- MQGMO_SYNCPOINT
- MQGMO_SYNCPOINT_IF_PERSISTENT

- MQGMO_NO_SYNCPOINT
- MQGMO_MARK_SKIP_BACKOUT
- MQGMO_BROWSE_FIRST
- MQGMO_BROWSE_NEXT
- MQGMO_BROWSE_MSG_UNDER_CURSOR
- MQGMO_MSG_UNDER_CURSOR
- MQGMO_LOCK
- MQGMO_UNLOCK
- MQGMO_ACCEPT_TRUNCATED_MSG
- MQGMO_SET_SIGNAL
- MQGMO_FAIL_IF_QUIESCING
- MQGMO_CONVERT
- MQGMO_LOGICAL_ORDER
- MQGMO_COMPLETE_MSG
- MQGMO_ALL_MSGS_AVAILABLE
- MQGMO_ALL_SEGMENTS_AVAILABLE
- MQGMO_NONE

resolved queue name
Resolved queue name. This attribute is read-only. Names are never longer than 48 characters and can be padded to that length with nulls. The initial value is a null string.

returned length
Returned length. The initial value is MQRL_UNDEFINED. This attribute is read-only.

segmentation
The ability to segment a message. The initial value is MQSEG_INHIBITED. The additional value, MQSEG_ALLOWED, is possible.

segment status
The segmentation status of a message. The initial value is MQSS_NOT_A_SEGMENT. The following additional values are possible:

- MQSS_SEGMENT
- MQSS_LAST_SEGMENT

syncpoint participation
TRUE when messages are retrieved under syncpoint control.

wait interval
The length of time that the class **get** method pauses while waiting for a suitable message to arrive, if one is not already available. The initial value is zero, which effects an indefinite wait. The additional value, MQWI_UNLIMITED, is possible. This attribute is ignored unless the **options** include MQGMO_WAIT.

Constructors

ImqGetMessageOptions( );
The default constructor.

ImqGetMessageOptions(const ImqGetMessageOptions & *gmo* **);**
The copy constructor.

Object methods (public)

void operator = (const ImqGetMessageOptions & *gmo* **);**
Copies instance data from *gmo*, replacing the existing instance data.

MQCHAR groupStatus( ) const ;
Returns the **group status**.

void setGroupStatus(const MQCHAR *status* **);**
Sets the **group status**.

MQLONG matchOptions( ) const ;
Returns the **match options**.

void setMatchOptions(const MQLONG *options* **);**
Sets the **match options**.

ImqBinary messageToken( ) const;
Returns the **message token**.

ImqBoolean setMessageToken(const ImqBinary & *token* **);**
Sets the **message token**. The **data length** of *token* must be either zero or MQ_MSG_TOKEN_LENGTH. This method returns TRUE if successful.

void setMessageToken(const MQBYTE16 *token* **= 0);**
Sets the **message token**. *token* can be zero, which is the same as specifying MQMTOK_NONE. If *token* is nonzero, then it must address MQ_MSG_TOKEN_LENGTH bytes of binary data.

When using predefined values, such as MQMTOK_NONE, you might not need to make a cast to ensure a signature match, for example (MQBYTE *)MQMTOK_NONE.

MQLONG options( ) const ;
Returns the **options**.

void setOptions(const MQLONG *options* **);**
Sets the **options**, including the **syncpoint participation** value.

ImqString resolvedQueueName( ) const ;
Returns a copy of the **resolved queue name**.

MQLONG returnedLength( ) const;
Returns the **returned length**.

MQCHAR segmentation( ) const ;
Returns the **segmentation**.

void setSegmentation(const MQCHAR *value* **);**
Sets the **segmentation**.

MQCHAR segmentStatus( ) const ;
Returns the **segment status**.

void setSegmentStatus(const MQCHAR *status* **);**
Sets the **segment status**.

ImqBoolean syncPointParticipation( ) const ;
Returns the **syncpoint participation** value, which is TRUE if the **options** include either MQGMO_SYNCPOINT or MQGMO_SYNCPOINT_IF_PERSISTENT.

void setSyncPointParticipation(const ImqBoolean *sync* **);**
Sets the **syncpoint participation** value. If *sync* is TRUE, alters the **options** to include MQGMO_SYNCPOINT, and to exclude both

MQGMO_NO_SYNCPOINT and MQGMO_SYNCPOINT_IF_PERSISTENT. If *sync* is FALSE, alters the **options** to include MQGMO_NO_SYNCPOINT, and to exclude both MQGMO_SYNCPOINT and MQGMO_SYNCPOINT_IF_PERSISTENT.

MQLONG waitInterval( ) const ;
Returns the **wait interval**.

void setWaitInterval(const MQLONG *interval* **);**
Sets the **wait interval**.

Object methods (protected)

static void setVersionSupported(const MQLONG);
Sets the **MQGMO** version. Defaults to **MQGMO_VERSION_3**.

Object data (protected)

MQGMO *omqgmo*
An MQGMO Version 2 data structure. Access MQGMO fields supported for MQGMO_VERSION_2 only.

PMQGMO *opgmo*
The address of an MQGMO data structure. The version number for this address is indicated in *olVersion*. Inspect the version number before accessing MQGMO fields, to ensure that they are present.

MQLONG *olVersion*
The version number of the MQGMO data structure addressed by *opgmo*.

Reason codes

- MQRC_BINARY_DATA_LENGTH_ERROR

ImqHeader

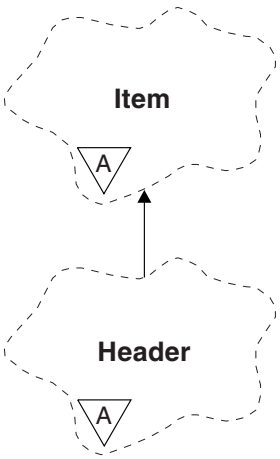

Figure 12. ImqHeader class

This abstract class encapsulates common features of the MQDLH data structure (see Table 13 on page 165).

Other relevant classes

- ImqCICSBridgeHeader (see "ImqCICSBridgeHeader" on page 51)
- ImqDeadLetterHeader (see "ImqDeadLetterHeader" on page 58)
- ImqIMSBridgeHeader (see "ImqIMSBridgeHeader" on page 71)
- ImqItem (see "ImqItem" on page 74)
- ImqMessage (see "ImqMessage" on page 76)
- ImqReferenceHeader (see "ImqReferenceHeader" on page 135)
- ImqString (see "ImqString" on page 138)
- ImqWorkHeader (see "ImqWorkHeader" on page 147)

Object attributes

character set
The original coded character set identifier. Initially MQCCSI_Q_MGR.

encoding
The original encoding. Initially MQENC_NATIVE.

format
The original format. Initially MQFMT_NONE.

header flags
The initial values are:

- Zero for objects of the ImqDeadLetterHeader class
- MQIIH_NONE for objects of the ImqIMSBridgeHeader class
- MQRMHF_LAST for objects of the ImqReferenceHeader class
- MQCIH_NONE for objects of the ImqCICSBridgeHeader class
- MQWIH_NONE for objects of the ImqWorkHeader class

Constructors

ImqHeader( );
The default constructor.

ImqHeader(const ImqHeader & *header* **);**
The copy constructor.

Object methods (public)

void operator = (const ImqHeader & *header* **);**
Copies instance data from *header*, replacing the existing instance data.

virtual MQLONG characterSet( ) const ;
Returns the **character set**.

virtual void setCharacterSet(const MQLONG *ccsid* **= MQCCSI_Q_MGR);**
Sets the **character set**.

virtual MQLONG encoding( ) const ;
Returns the **encoding**.

virtual void setEncoding(const MQLONG *encoding* **= MQENC_NATIVE);**
Sets the **encoding**.

virtual ImqString format( ) const ;
Returns a copy of the **format**, including trailing blanks.

virtual void setFormat(const char * *name* **= 0);**
Sets the **format**, padded to 8 characters with trailing blanks.

virtual MQLONG headerFlags( ) const ;
Returns the **header flags**.

virtual void setHeaderFlags(const MQLONG *flags* **= 0);**
Sets the **header flags**.

ImqIMSBridgeHeader

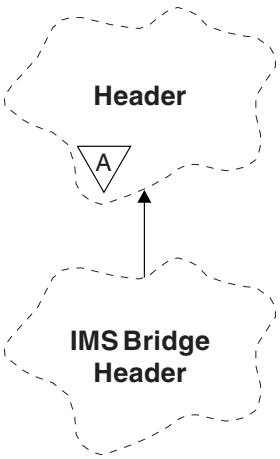

Figure 13. ImqIMSBridgeHeader class

This class encapsulates features of the MQIIH data structure (see Table 14 on page 165). Objects of this class are used by applications that send messages to the IMS bridge through WebSphere MQ for z/OS.

Note: The ImqHeader **character set** and **encoding** must have default values and must not be set to any other values.

Other relevant classes

- ImqBinary (see "ImqBinary" on page 40)
- ImqHeader (see "ImqHeader" on page 69)
- ImqItem (see "ImqItem" on page 74)
- ImqMessage (see "ImqMessage" on page 76)
- ImqString (see "ImqString" on page 138)

Object attributes

authenticator
RACF password or passticket, of length MQ_AUTHENTICATOR_LENGTH. The initial value is MQIAUT_NONE.

commit mode
Commit mode. See the *OTMA User's Guide* for more information about IMS commit modes. The initial value is MQICM_COMMIT_THEN_SEND. The additional value, MQICM_SEND_THEN_COMMIT, is possible.

logical terminal override
Logical terminal override, of length MQ_LTERM_OVERRIDE_LENGTH. The initial value is a null string.

message format services map name
MFS map name, of length MQ_MFS_MAP_NAME_LENGTH. The initial value is a null string.

reply-to format
Format of any reply, of length MQ_FORMAT_LENGTH. The initial value is MQFMT_NONE.

security scope
Desired IMS security processing. The initial value is MQISS_CHECK. The additional value, MQISS_FULL, is possible.

transaction instance id
Transaction instance identity, a binary (MQBYTE16) value of length MQ_TRAN_INSTANCE_ID_LENGTH. The initial value is MQITII_NONE.

transaction state
State of the IMS conversation. The initial value is MQITS_NOT_IN_CONVERSATION. The additional value, MQITS_IN_CONVERSATION, is possible.

Constructors

ImqIMSBridgeHeader( );
The default constructor.

ImqIMSBridgeHeader(const ImqIMSBridgeHeader & *header* **);**
The copy constructor.

Overloaded ImqItem methods

virtual ImqBoolean copyOut(ImqMessage & *msg* **);**
Inserts an MQIIH data structure into the message buffer at the beginning, moving existing message data further along. Sets the *msg* **format** to MQFMT_IMS.

See the parent class method description for further details.

virtual ImqBoolean pasteIn(ImqMessage & *msg* **);**
Reads an MQIIH data structure from the message buffer.

To be successful, the **encoding** of the *msg* object must be MQENC_NATIVE. Retrieve messages with MQGMO_CONVERT to MQENC_NATIVE.

To be successful, the ImqMessage **format** must be MQFMT_IMS.

See the parent class method description for further details.

Object methods (public)

void operator = (const ImqIMSBridgeHeader & *header* **);**
Copies instance data from *header*, replacing the existing instance data.

ImqString authenticator( ) const ;
Returns a copy of the **authenticator**, padded with trailing blanks to length MQ_AUTHENTICATOR_LENGTH.

void setAuthenticator(const char * *name* **);**
Sets the **authenticator**.

MQCHAR commitMode( ) const ;
Returns the **commit mode**.

void setCommitMode(const MQCHAR *mode* **);**
Sets the **commit mode**.

ImqString logicalTerminalOverride( ) const ;
Returns a copy of the **logical terminal override**.

void setLogicalTerminalOverride(const char * *override*);
Sets the **logical terminal override**.

ImqString messageFormatServicesMapName( ) const ;
Returns a copy of the **message format services map name**.

void setMessageFormatServicesMapName(const char * *name*);
Sets the **message format services map name**.

ImqString replyToFormat( ) const ;
Returns a copy of the **reply-to format**, padded with trailing blanks to length MQ_FORMAT_LENGTH.

void setReplyToFormat(const char * *format*);
Sets the **reply-to format**, padded with trailing blanks to length MQ_FORMAT_LENGTH.

MQCHAR securityScope( ) const ;
Returns the **security scope**.

void setSecurityScope(const MQCHAR *scope* **);**
Sets the **security scope**.

ImqBinary transactionInstanceId( ) const ;
Returns a copy of the **transaction instance id**.

ImqBoolean setTransactionInstanceId(const ImqBinary & *id*);
Sets the **transaction instance id**. The **data length** of *token* must be either zero or MQ_TRAN_INSTANCE_ID_LENGTH. This method returns TRUE if successful.

void setTransactionInstanceId(const MQBYTE16 *id* **= 0);**
Sets the **transaction instance id**. *id* can be zero, which is the same as specifying MQITII_NONE. If *id* is nonzero, it must address MQ_TRAN_INSTANCE_ID_LENGTH bytes of binary data. When using predefined values such as MQITII_NONE, you might need to make a cast to ensure a signature match, for example (MQBYTE *)MQITII_NONE.

MQCHAR transactionState( ) const ;
Returns the **transaction state**.

void setTransactionState(const MQCHAR *state* **);**
Sets the **transaction state**.

Object data (protected)

MQIIH *omqiih*
The MQIIH data structure.

Reason codes

- MQRC_BINARY_DATA_LENGTH_ERROR
- MQRC_INCONSISTENT_FORMAT
- MQRC_ENCODING_ERROR
- MQRC_STRUC_ID_ERROR

ImqItem

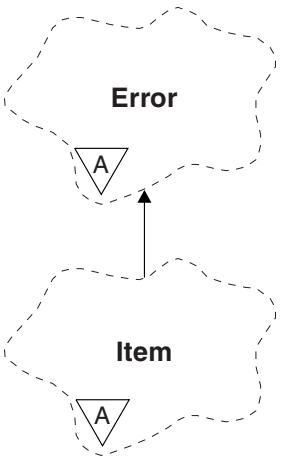

Figure 14. ImqItem class

This abstract class represents an item, perhaps one of several, within a message. Items are concatenated together in a message buffer. Each specialization is associated with a particular data structure that begins with a structure id.

Polymorphic methods in this abstract class allow items to be copied to and from messages. The ImqMessage class **readItem** and **writeItem** methods provide another style of invoking these polymorphic methods that is more natural for application programs.

This class relates to the MQI calls listed in Table 15 on page 165.

Other relevant classes

- ImqCache (see "ImqCache" on page 42)
- ImqError (see "ImqError" on page 63)
- ImqMessage (see "ImqMessage" on page 76)

Object attributes

structure id
A string of four characters at the beginning of the data structure. This attribute is read-only. This attribute is recommended for derived classes. It is not included automatically.

Constructors

ImqItem( );
The default constructor.

ImqItem(const ImqItem & *item* **);**
The copy constructor.

Class methods (public)

static ImqBoolean structureIdIs(const char * *structure-id-to-test*, **const ImqMessage &** *msg* **);**

Returns TRUE if the **structure id** of the next ImqItem in the incoming *msg* is the same as *structure-id-to-test*. The next item is identified as that part of the message buffer currently addressed by the ImqCache **data pointer**. This method relies on the **structure id** and therefore is not guaranteed to work for all ImqItem derived classes.

Object methods (public)

void operator = (const ImqItem & *item* **);**

Copies instance data from *item*, replacing the existing instance data.

virtual ImqBoolean copyOut(ImqMessage & *msg* **) = 0 ;**

Writes this object as the next item in an outgoing message buffer, appending it to any existing items. If the write operation is successful, increases the ImqCache **data length**. This method returns TRUE if successful.

Override this method to work with a specific subclass.

virtual ImqBoolean pasteIn(ImqMessage & *msg* **) = 0 ;**

Reads this object *destructively* from the incoming message buffer. The read is destructive in that the ImqCache **data pointer** is moved on. However, the buffer content remains the same, so data can be re-read by resetting the ImqCache **data pointer**.

The (sub)class of this object must be consistent with the **structure id** found next in the message buffer of the *msg* object.

The **encoding** of the *msg* object should be MQENC_NATIVE. It is recommended that messages be retrieved with the ImqMessage **encoding** set to MQENC_NATIVE, and with the ImqGetMessageOptions **options** including MQGMO_CONVERT.

If the read operation is successful, the ImqCache **data length** is reduced. This method returns TRUE if successful.

Override this method to work with a specific subclass.

Reason codes

- MQRC_ENCODING_ERROR
- MQRC_STRUC_ID_ERROR
- MQRC_INCONSISTENT_FORMAT
- MQRC_INSUFFICIENT_BUFFER
- MQRC_INSUFFICIENT_DATA

ImqMessage

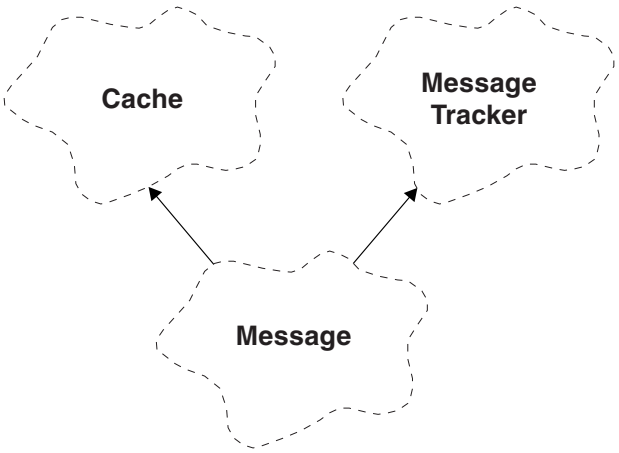

Figure 15. ImqMessage class

This class encapsulates an MQMD data structure (see Table 16 on page 166), and also handles the construction and reconstruction of message data.

Other relevant classes

- ImqCache (see "ImqCache" on page 42)
- ImqItem (see "ImqItem" on page 74)
- ImqMessageTracker (see "ImqMessageTracker" on page 84)
- ImqString (see "ImqString" on page 138)

Object attributes

application id data
Identity information associated with a message. The initial value is a null string.

application origin data
Origin information associated with a message. The initial value is a null string.

backout count
The number of times that a message has been tentatively retrieved and subsequently backed out. The initial value is zero. This attribute is read-only.

character set
Coded Character Set Id. The initial value is MQCCSI_Q_MGR. The following additional values are possible:

- MQCCSI_INHERIT
- MQCCSI_EMBEDDED

You can also use a Coded Character Set Id of your choice. For information about this, see the code page conversion tables in the WebSphere MQ Application Programming Reference.

encoding
The machine encoding of the message data. The initial value is MQENC_NATIVE.

expiry A time-dependent quantity that controls how long WebSphere MQ retains an unretrieved message before discarding it. The initial value is MQEI_UNLIMITED.

format
The name of the format (template) that describes the layout of data in the buffer. Names longer than eight characters are truncated to eight characters. Names are always padded with blanks to eight characters. The initial constant value is MQFMT_NONE. The following additional constants are possible:

- MQFMT_ADMIN
- MQFMT_CICS
- MQFMT_COMMAND_1
- MQFMT_COMMAND_2
- MQFMT_DEAD_LETTER_HEADER
- MQFMT_DIST_HEADER
- MQFMT_EVENT
- MQFMT_IMS
- MQFMT_IMS_VAR_STRING
- MQFMT_MD_EXTENSION
- MQFMT_PCF
- MQFMT_REF_MSG_HEADER
- MQFMT_RF_HEADER
- MQFMT_STRING
- MQFMT_TRIGGER
- MQFMT_WORK_INFO_HEADER
- MQFMT_XMIT_Q_HEADER

You can also use an application-specific string of your choice. For more information about this, see the *Format* field of the message descriptor (MQMD) in the WebSphere MQ Application Programming Reference.

message flags
Segmentation control information. The initial value is MQMF_SEGMENTATION_INHIBITED. The following additional values are possible:

- MQMF_SEGMENTATION_ALLOWED
- MQMF_MSG_IN_GROUP
- MQMF_LAST_MSG_IN_GROUP
- MQMF_SEGMENT
- MQMF_LAST_SEGMENT
- MQMF_NONE

message type
The broad categorization of a message. The initial value is MQMT_DATAGRAM. The following additional values are possible:

- MQMT_SYSTEM_FIRST
- MQMT_SYSTEM_LAST

- MQMT_DATAGRAM
- MQMT_REQUEST
- MQMT_REPLY
- MQMT_REPORT
- MQMT_APPL_FIRST
- MQMT_APPL_LAST

You can also use an application-specific value of your choice. For more information about this, see the *MsgType* field of the message descriptor (MQMD) in the WebSphere MQ Application Programming Reference.

offset Offset information. The initial value is zero.

original length
The original length of a segmented message. The initial value is MQOL_UNDEFINED.

persistence
Indicates that the message is important and must at all times be backed up using persistent storage. This option implies a performance penalty. The initial value is MQPER_PERSISTENCE_AS_Q_DEF. The following additional values are possible:

- MQPER_PERSISTENT
- MQPER_NOT_PERSISTENT

priority
The relative priority for transmission and delivery. Messages of the same priority are usually delivered in the same sequence as they were supplied (although there are several criteria that must be satisfied to guarantee this). The initial value is MQPRI_PRIORITY_AS_Q_DEF.

property validation
Specifies whether validation of properties should take place when a property of the message is set. The initial value is MQCMHO_DEFAULT_VALIDATION. The following additional values are possible:

- MQCMHO_VALIDATE
- MQCMHO_NO_VALIDATION

The following methods act on **property validation**:

MQLONG propertyValidation( ) const ;
Returns the **property validation** option.

void setPropertyValidation(const MQLONG *option* **);**
Sets the **property validation** option.

put application name
The name of the application that put a message. The initial value is a null string.

put application type
The type of application that put a message. The initial value is MQAT_NO_CONTEXT. The following additional values are possible:

- MQAT_AIX
- MQAT_CICS
- MQAT_CICS_BRIDGE
- MQAT_DOS

- MQAT_IMS
- MQAT_IMS_BRIDGE
- MQAT_MVS
- MQAT_NOTES_AGENT
- MQAT_OS2
- MQAT_OS390
- MQAT_OS400
- MQAT_QMGR
- MQAT_UNIX
- MQAT_WINDOWS
- MQAT_WINDOWS_NT
- MQAT_XCF
- MQAT_DEFAULT
- MQAT_UNKNOWN
- MQAT_USER_FIRST
- MQAT_USER_LAST

You can also use an application-specific string of your choice. For more information about this, see the *PutApplType* field of the message descriptor (MQMD) in the WebSphere MQ Application Programming Reference.

put date
The date on which a message was put. The initial value is a null string.

put time
The time at which a message was put. The initial value is a null string.

reply-to queue manager name
The name of the queue manager to which any reply should be sent. The initial value is a null string.

reply-to queue name
The name of the queue to which any reply should be sent. The initial value is a null string.

report Feedback information associated with a message. The initial value is MQRO_NONE. The following additional values are possible:

- MQRO_EXCEPTION
- MQRO_EXCEPTION_WITH_DATA
- MQRO_EXCEPTION_WITH_FULL_DATA *
- MQRO_EXPIRATION
- MQRO_EXPIRATION_WITH_DATA
- MQRO_EXPIRATION_WITH_FULL_DATA *
- MQRO_COA
- MQRO_COA_WITH_DATA
- MQRO_COA_WITH_FULL_DATA *
- MQRO_COD
- MQRO_COD_WITH_DATA
- MQRO_COD_WITH_FULL_DATA *
- MQRO_PAN
- MQRO_NAN

- MQRO_NEW_MSG_ID
- MQRO_NEW_CORREL_ID
- MQRO_COPY_MSG_ID_TO_CORREL_ID
- MQRO_PASS_CORREL_ID
- MQRO_DEAD_LETTER_Q
- MQRO_DISCARD_MSG

where * indicates values that are not supported on WebSphere MQ for z/OS.

sequence number
Sequence information identifying a message within a group. The initial value is one.

total message length
The number of bytes that were available during the most recent attempt to read a message. This number will be greater than the ImqCache **message length** if the last message was truncated, or if the last message was not read because truncation would have occurred. This attribute is read-only. The initial value is zero.

This attribute can be useful in any situation involving truncated messages.

user id
A user identity associated with a message. The initial value is a null string.

Constructors

ImqMessage( );
The default constructor.

ImqMessage(const ImqMessage & *msg* **);**
The copy constructor. See the **operator =** method for details.

Object methods (public)

void operator = (const ImqMessage & *msg* **);**
Copies the MQMD and message data from *msg*. If a buffer has been supplied by the user for this object, the amount of data copied is restricted to the available buffer size. Otherwise, the system ensures that a buffer of adequate size is made available for the copied data.

ImqString applicationIdData( ) const ;
Returns a copy of the **application id data**.

void setApplicationIdData(const char * *data* **= 0);**
Sets the **application id data**.

ImqString applicationOriginData( ) const ;
Returns a copy of the **application origin data**.

void setApplicationOriginData(const char * *data* **= 0);**
Sets the **application origin data**.

MQLONG backoutCount( ) const ;
Returns the **backout count**.

MQLONG characterSet( ) const ;
Returns the **character set**.

void setCharacterSet(const MQLONG *ccsid* **= MQCCSI_Q_MGR);**
Sets the **character set**.

MQLONG encoding( ) const ;
Returns the **encoding**.

void setEncoding(const MQLONG *encoding* **= MQENC_NATIVE);**
Sets the **encoding**.

MQLONG expiry( ) const ;
Returns the **expiry**.

void setExpiry(const MQLONG *expiry* **);**
Sets the **expiry**.

ImqString format( ) const ;
Returns a copy of the **format**, including trailing blanks.

ImqBoolean formatIs(const char * *format-to-test* **) const ;**
Returns TRUE if the **format** is the same as *format-to-test*.

void setFormat(const char * *name* **= 0);**
Sets the **format**, padded to eight characters with trailing blanks.

MQLONG messageFlags( ) const ;
Returns the **message flags**.

void setMessageFlags(const MQLONG *flags* **);**
Sets the **message flags**.

MQLONG messageType( ) const ;
Returns the **message type**.

void setMessageType(const MQLONG *type* **);**
Sets the **message type**.

MQLONG offset( ) const ;
Returns the **offset**.

void setOffset(const MQLONG *offset* **);**
Sets the **offset**.

MQLONG originalLength( ) const ;
Returns the **original length**.

void setOriginalLength(const MQLONG *length* **);**
Sets the **original length**.

MQLONG persistence( ) const ;
Returns the **persistence**.

void setPersistence(const MQLONG *persistence* **);**
Sets the **persistence**.

MQLONG priority( ) const ;
Returns the **priority**.

void setPriority(const MQLONG *priority* **);**
Sets the **priority**.

ImqString putApplicationName( ) const ;
Returns a copy of the **put application name**.

void setPutApplicationName(const char * *name* **= 0);**
Sets the **put application name**.

MQLONG putApplicationType( ) const ;
Returns the **put application type**.

void setPutApplicationType(const MQLONG *type* **= MQAT_NO_CONTEXT);**
Sets the **put application type**.

ImqString putDate( ) const ;
Returns a copy of the **put date**.

void setPutDate(const char * *date* **= 0);**
Sets the **put date**.

ImqString putTime( ) const ;
Returns a copy of the **put time**.

void setPutTime(const char * *time* **= 0);**
Sets the **put time**.

ImqBoolean readItem(ImqItem & *item* **);**
Reads into the *item* object from the message buffer, using the ImqItem **pasteIn** method. It returns TRUE if successful.

ImqString replyToQueueManagerName( ) const ;
Returns a copy of the **reply-to queue manager name**.

void setReplyToQueueManagerName(const char * *name* **= 0);**
Sets the **reply-to queue manager name**.

ImqString replyToQueueName( ) const ;
Returns a copy of the **reply-to queue name**.

void setReplyToQueueName(const char * *name* **= 0);**
Sets the **reply-to queue name**.

MQLONG report( ) const ;
Returns the **report**.

void setReport(const MQLONG *report* **);**
Sets the **report**.

MQLONG sequenceNumber( ) const ;
Returns the **sequence number**.

void setSequenceNumber(const MQLONG *number* **);**
Sets the **sequence number**.

size_t totalMessageLength( ) const ;
Returns the **total message length**.

ImqString userId( ) const ;
Returns a copy of the **user id**.

void setUserId(const char * *id* **= 0);**
Sets the **user id**.

ImqBoolean writeItem(ImqItem & *item* **);**
Writes from the *item* object into the message buffer, using the ImqItem **copyOut** method. Writing can take the form of insertion, replacement, or an append: this depends on the class of the *item* object. This method returns TRUE if successful.

Object methods (protected)

static void setVersionSupported(const MQLONG);
Sets the **MQMD version**. Defaults to **MQMD_VERSION_2**.

Object data (protected)

MQMD1 *omqmd*
(WebSphere MQ for z/OS only.) The MQMD data structure.

MQMD2 *omqmd*
(Platforms other than z/OS.) The MQMD data structure.

ImqMessageTracker

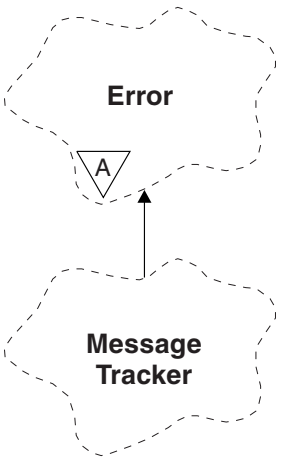

Figure 16. ImqMessageTracker class

This class encapsulates those attributes of an ImqMessage or ImqQueue object that can be associated with either object. It relates to the MQI calls listed in Table 17 on page 166.

Other relevant classes

- ImqBinary (see "ImqBinary" on page 40)
- ImqError (see "ImqError" on page 63)
- ImqMessage (see "ImqMessage" on page 76)
- ImqQueue (see "ImqQueue" on page 102)

Object attributes

accounting token
A binary value (MQBYTE32) of length MQ_ACCOUNTING_TOKEN_LENGTH. The initial value is MQACT_NONE.

correlation id
A binary value (MQBYTE24) of length MQ_CORREL_ID_LENGTH that you assign to correlate messages. The initial value is MQCI_NONE. The additional value, MQCI_NEW_SESSION, is possible.

feedback
Feedback information to be sent with a message. The initial value is MQFB_NONE. The following additional values are possible:

- MQFB_SYSTEM_FIRST
- MQFB_SYSTEM_LAST
- MQFB_APPL_FIRST
- MQFB_APPL_LAST
- MQFB_COA
- MQFB_COD
- MQFB_EXPIRATION
- MQFB_PAN

- MQFB_NAN
- MQFB_QUIT
- MQFB_DATA_LENGTH_ZERO
- MQFB_DATA_LENGTH_NEGATIVE
- MQFB_DATA_LENGTH_TOO_BIG
- MQFB_BUFFER_OVERFLOW
- MQFB_LENGTH_OFF_BY_ONE
- MQFB_IIH_ERROR
- MQFB_NOT_AUTHORIZED_FOR_IMS
- MQFB_IMS_ERROR
- MQFB_IMS_FIRST
- MQFB_IMS_LAST
- MQFB_CICS_APPL_ABENDED
- MQFB_CICS_APPL_NOT_STARTED
- MQFB_CICS_BRIDGE_FAILURE
- MQFB_CICS_CCSID_ERROR
- MQFB_CICS_CIH_ERROR
- MQFB_CICS_COMMAREA_ERROR
- MQFB_CICS_CORREL_ID_ERROR
- MQFB_CICS_DLQ_ERROR
- MQFB_CICS_ENCODING_ERROR
- MQFB_CICS_INTERNAL_ERROR
- MQFB_CICS_NOT_AUTHORIZED
- MQFB_CICS_UOW_BACKED_OUT
- MQFB_CICS_UOW_ERROR

You can also use an application-specific string of your choice. For more information about this, see the *Feedback* field of the message descriptor (MQMD) in the WebSphere MQ Application Programming Reference.

group id
A binary value (MQBYTE24) of length MQ_GROUP_ID_LENGTH unique within a queue. The initial value is MQGI_NONE.

message id
A binary value (MQBYTE24) of length MQ_MSG_ID_LENGTH unique within a queue. The initial value is MQMI_NONE.

Constructors

ImqMessageTracker( );
The default constructor.

ImqMessageTracker(const ImqMessageTracker & *tracker* **);**
The copy constructor. See the **operator =** method for details.

Object methods (public)

void operator = (const ImqMessageTracker & *tracker* **);**
Copies instance data from *tracker*, replacing the existing instance data.

ImqBinary accountingToken( ) const ;
Returns a copy of the **accounting token**.

ImqBoolean setAccountingToken(const ImqBinary & *token*);
Sets the **accounting token**. The **data length** of *token* must be either zero or MQ_ACCOUNTING_TOKEN_LENGTH. This method returns TRUE if successful.

void setAccountingToken(const MQBYTE32 *token* = 0);
Sets the **accounting token**. *token* can be zero, which is the same as specifying MQACT_NONE. If *token* is nonzero, it must address MQ_ACCOUNTING_TOKEN_LENGTH bytes of binary data. When using predefined values such as MQACT_NONE, you might need to make a cast to ensure a signature match; for example, (MQBYTE *)MQACT_NONE.

ImqBinary correlationId( ) const ;
Returns a copy of the **correlation id**.

ImqBoolean setCorrelationId(const ImqBinary & *token*);
Sets the **correlation id**. The **data length** of *token* must be either zero or MQ_CORREL_ID_LENGTH. This method returns TRUE if successful.

void setCorrelationId(const MQBYTE24 *id* = 0);
Sets the **correlation id**. *id* can be zero, which is the same as specifying MQCI_NONE. If *id* is nonzero, it must address MQ_CORREL_ID_LENGTH bytes of binary data. When using predefined values such as MQCI_NONE, you might need to make a cast to ensure a signature match; for example, (MQBYTE *)MQCI_NONE.

MQLONG feedback( ) const ;
Returns the **feedback**.

void setFeedback(const MQLONG *feedback*);
Sets the **feedback**.

ImqBinary groupId( ) const ;
Returns a copy of the **group id**.

ImqBoolean setGroupId(const ImqBinary & *token*);
Sets the **group id**. The **data length** of *token* must be either zero or MQ_GROUP_ID_LENGTH. This method returns TRUE if successful.

void setGroupId(const MQBYTE24 *id* = 0);
Sets the **group id**. *id* can be zero, which is the same as specifying MQGI_NONE. If *id* is nonzero, it must address MQ_GROUP_ID_LENGTH bytes of binary data. When using predefined values such as MQGI_NONE, you might need to make a cast to ensure a signature match, for example (MQBYTE *)MQGI_NONE.

ImqBinary messageId( ) const ;
Returns a copy of the **message id**.

ImqBoolean setMessageId(const ImqBinary & *token*);
Sets the **message id**. The **data length** of *token* must be either zero or MQ_MSG_ID_LENGTH. This method returns TRUE if successful.

void setMessageId(const MQBYTE24 *id* = 0);
Sets the **message id**. *id* can be zero, which is the same as specifying MQMI_NONE. If *id* is nonzero, it must address MQ_MSG_ID_LENGTH bytes of binary data. When using predefined values such as MQMI_NONE, you might need to make a cast to ensure a signature match, for example (MQBYTE *)MQMI_NONE.

Reason codes

- MQRC_BINARY_DATA_LENGTH_ERROR

ImqNamelist

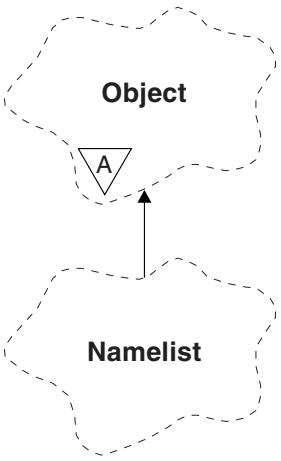

Figure 17. ImqNamelist class

This class encapsulates a namelist. It relates to the MQI calls listed in Table 18 on page 166.

Other relevant classes

- ImqObject (see "ImqObject" on page 90)
- ImqString (see "ImqString" on page 138)

Object attributes

name count
The number of object names in **namelist names**. This attribute is read-only.

namelist names
Object names, the number of which is indicated by the **name count**. This attribute is read-only.

Constructors

ImqNamelist( );
The default constructor.

ImqNamelist(const ImqNamelist & *list* **);**
The copy constructor. The ImqObject **open status** is false.

ImqNamelist(const char * *name*);
Sets the ImqObject name to **name**.

Object methods (public)

void operator = (const ImqNamelist & *list* **);**
Copies instance data from *list*, replacing the existing instance data. The ImqObject **open status** is false.

ImqBoolean nameCount(MQLONG & *count* **);**
Provides a copy of the **name count**. It returns TRUE if successful.

MQLONG nameCount ( );
Returns the **name count** without any indication of possible errors.

ImqBoolean namelistName (const MQLONG *index*, **ImqString &** *name* **);**
Provides a copy of one the **namelist names** by zero based index. It returns TRUE if successful.

ImqString namelistName (const MQLONG *index* **);**
Returns one of the **namelist names** by zero-based index without any indication of possible errors.

Reason codes

- MQRC_INDEX_ERROR
- MQRC_INDEX_NOT_PRESENT

ImqObject

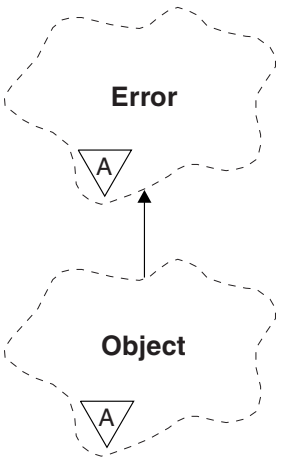

Figure 18. ImqObject class

This class is abstract. When an object of this class is destroyed, it is automatically closed, and its ImqQueueManager connection severed. This class relates to the MQI calls listed in Table 19 on page 167.

Other relevant classes

- ImqBinary (see "ImqBinary" on page 40)
- ImqError (see "ImqError" on page 63)
- ImqNamelist (see "ImqNamelist" on page 88)
- ImqQueue (see "ImqQueue" on page 102)
- ImqQueueManager (see "ImqQueueManager" on page 115)
- ImqString (see "ImqString" on page 138)

Class attributes

behavior
Controls the behavior of implicit opening.

IMQ_IMPL_OPEN (8L)
Implicit opening is allowed. This is the default.

Object attributes

alteration date
The alteration date. This attribute is read-only.

alteration time
The alteration time. This attribute is read-only.

alternate user id
The alternate user id, up to MQ_USER_ID_LENGTH characters. The initial value is a null string.

alternate security id
The alternate security id. A binary value (MQBYTE40) of length MQ_SECURITY_ID_LENGTH. The initial value is MQSID_NONE.

close options
Options that apply when an object is closed. The initial value is MQCO_NONE. This attribute is ignored during implicit reopen operations, where a value of MQCO_NONE is always used.

connection reference
A reference to an ImqQueueManager object that provides the required connection to a (local) queue manager. For an ImqQueueManager object, it is the object itself. The initial value is zero.

Note: Do not confuse this with the **queue manager name** that identifies a queue manager (possibly remote) for a named queue.

description
The descriptive name (up to 64 characters) of the queue manager, queue, namelist, or process. This attribute is read-only.

name The name (up to 48 characters) of the queue manager, queue, namelist, or process. The initial value is a null string. The name of a model queue changes after an **open** to the name of the resulting dynamic queue.

Note: An ImqQueueManager can have a null name, representing the default queue manager. The name changes to the actual queue manager after a successful **open**. An ImqDistributionList is dynamic and must have a null name.

next managed object
This is the next object of this class, in no particular order, having the same **connection reference** as this object. The initial value is zero.

open options
Options that apply when an object is opened. The initial value is MQOO_INQUIRE. There are two ways to set appropriate values:

1. Do not set the **open options** and do not use the **open** method. WebSphere MQ automatically adjusts the **open options** and automatically opens, reopens, and closes objects as required. This can result in unnecessary reopen operations, because WebSphere MQ uses the **openFor** method, and this adds **open options** incrementally only.
2. Set the **open options** before using any methods that result in an MQI call (see Chapter 15, "MQI cross reference," on page 161). This ensures that unnecessary reopen operations do not occur. Set open options explicitly if any of the potential reopen problems are likely to occur (see "Reopen" on page 25).

   If you use the **open** method, you ***must*** ensure that the **open options** are appropriate first. However, using the **open** method is not mandatory; WebSphere MQ still exhibits the same behavior as in case 1, but in this circumstance, the behavior is efficient.

Zero is not a valid value; set the appropriate value before attempting to open the object. This can be done using either **setOpenOptions**(*lOpenOptions*) followed by **open**( ), or **openFor**(*lRequiredOpenOption*).

Note:

1. MQOO_OUTPUT is substituted for MQOO_INQUIRE during the **open** method for a distribution list, as MQOO_OUTPUT is the only valid

open option at this time. However, it is good practice always to set MQOO_OUTPUT explicitly in application programs that use the **open** method.

2. Specify MQOO_RESOLVE_NAMES if you want to use the **resolved queue manager name** and **resolved queue name** attributes of the class.

open status
Whether the object is open (TRUE) or closed (FALSE). The initial value is FALSE. This attribute is read-only.

previous managed object
The previous object of this class, in no particular order, having the same **connection reference** as this object. The initial value is zero.

queue manager identifier
The queue manager identifier. This attribute is read-only.

Constructors

ImqObject( );
The default constructor.

ImqObject(const ImqObject & *object* **);**
The copy constructor. The **open status** will be FALSE.

Class methods (public)

static MQLONG behavior( );
Returns the **behavior**.

void setBehavior(const MQLONG *behavior* **= 0);**
Sets the **behavior**.

Object methods (public)

void operator = (const ImqObject & *object* **);**
Performs a close if necessary, and copies the instance data from *object*. The **open status** will be FALSE.

ImqBoolean alterationDate(ImqString & *date* **);**
Provides a copy of the **alteration date**. It returns TRUE if successful.

ImqString alterationDate( );
Returns the **alteration date** without any indication of possible errors.

ImqBoolean alterationTime(ImqString & *time* **);**
Provides a copy of the **alteration time**. It returns TRUE if successful.

ImqString alterationTime( );
Returns the **alteration time** without any indication of possible errors.

ImqString alternateUserId( ) const ;
Returns a copy of the **alternate user id**.

ImqBoolean setAlternateUserId(const char * *id* **);**
Sets the **alternate user id**. The **alternate user id** can be set only while the **open status** is FALSE. This method returns TRUE if successful.

ImqBinary alternateSecurityId( ) const ;
Returns a copy of the **alternate security id.**

ImqBoolean setAlternateSecurityId(const ImqBinary & *token* **);**
Sets the **alternate security id**. The **alternate security id** can be set only

while the **open status** is FALSE. The data length of *token* must be either zero or MQ_SECURITY_ID_LENGTH. It returns TRUE if successful.

ImqBoolean setAlternateSecurityId(const MQBYTE* *token* **= 0);**
Sets the **alternate security id**. *token* can be zero, which is the same as specifying MQSID_NONE. If *token* is nonzero, it must address MQ_SECURITY_ID_LENGTH bytes of binary data. When using predefined values such as MQSID_NONE, you might need to make a cast to ensure signature match; for example, (MQBYTE *)MQSID_NONE.

The **alternate security id** can be set only while the **open status** is TRUE. It returns TRUE if successful.

ImqBoolean setAlternateSecurityId(const unsigned char * *id* **= 0);**
Sets the **alternate security id**.

ImqBoolean close( );
Sets the **open status** to FALSE. It returns TRUE if successful.

MQLONG closeOptions( ) const ;
Returns the **close options**.

void setCloseOptions(const MQLONG *options* **);**
Sets the **close options**.

ImqQueueManager * connectionReference( ) const ;
Returns the **connection reference**.

void setConnectionReference(ImqQueueManager & *manager* **);**
Sets the **connection reference**.

void setConnectionReference(ImqQueueManager * *manager* **= 0);**
Sets the **connection reference**.

virtual ImqBoolean description(ImqString & *description* **) = 0 ;**
Provides a copy of the **description**. It returns TRUE if successful.

ImqString description( );
Returns a copy of the **description** without any indication of possible errors.

virtual ImqBoolean name(ImqString & *name* **);**
Provides a copy of the **name**. It returns TRUE if successful.

ImqString name( );
Returns a copy of the **name** without any indication of possible errors.

ImqBoolean setName(const char * *name* **= 0);**
Sets the **name**. The **name** can only be set while the **open status** is FALSE, and, for an ImqQueueManager, while the **connection status** is FALSE. It returns TRUE if successful.

ImqObject * nextManagedObject( ) const ;
Returns the **next managed object**.

ImqBoolean open( );
Changes the **open status** to TRUE by opening the object as necessary, using amongst other attributes the **open options** and the **name**. This method uses the **connection reference** information and the ImqQueueManager **connect** method if necessary to ensure that the ImqQueueManager **connection status** is TRUE. It returns the **open status**.

ImqBoolean openFor(const MQLONG *required-options* **= 0);**
Attempts to ensure that the object is open with **open options**, or with **open options** that guarantee the behavior implied by the *required-options* parameter value..

If *required-options* is zero, input is required, and any input option suffices. So, if the **open options** already contain one of:

- MQOO_INPUT_AS_Q_DEF
- MQOO_INPUT_SHARED
- MQOO_INPUT_EXCLUSIVE

the **open options** are already satisfactory and are not changed; if the **open options** do not already contain any of the above, MQOO_INPUT_AS_Q_DEF is set in the **open options**.

If *required-options* is nonzero, the required options are added to the **open options**; if *required-options* is any of the above, the others are reset.

If any of the **open options** are changed and the object is already open, the object is closed temporarily and reopened in order to adjust the **open options**.

It returns TRUE if successful. Success indicates that the object is open with appropriate options.

MQLONG openOptions( ) const ;
Returns the **open options**.

ImqBoolean setOpenOptions(const MQLONG *options* **);**
Sets the **open options**. The **open options** can be set only while the **open status** is FALSE. It returns TRUE if successful.

ImqBoolean openStatus( ) const ;
Returns the **open status**.

ImqObject * previousManagedObject( ) const ;
Returns the **previous managed object**.

ImqBoolean queueManagerIdentifier(ImqString & *id* **);**
Provides a copy of the **queue manager identifier**. It returns TRUE if successful.

ImqString queueManagerIdentifier( );
Returns the **queue manager identifier** without any indication of possible errors.

Object methods (protected)

virtual ImqBoolean closeTemporarily( );
Closes an object safely before reopening. It returns TRUE if successful. This method assumes that the **open status** is TRUE.

MQHCONN connectionHandle( ) const ;
Returns the MQHCONN associated with the **connection reference**. This value is zero if there is no **connection reference** or if the Manager is not connected.

ImqBoolean inquire(const MQLONG *int-attr*, **MQLONG &** *value* **);**
Returns an integer value, the index of which is an MQIA_* value. In case of error, the value is set to MQIAV_UNDEFINED.

ImqBoolean inquire(const MQLONG *char-attr*, **char * &** *buffer*, **const size_t** *length* **);**
Returns a character string, the index of which is an MQCA_* value.

Note: Both the above methods return only a single attribute value. If a *snapshot* is required of more than one value, where the values are consistent with each other for an instant, WebSphere MQ C++ does not provide this facility and you must use the MQINQ call with appropriate parameters.

virtual void openInformationDisperse( );
Disperses information from the variable section of the MQOD data structure immediately after an MQOPEN call.

virtual ImqBoolean openInformationPrepare( );
Prepares information for the variable section of the MQOD data structure immediately before an MQOPEN call, and returns TRUE if successful.

ImqBoolean set(const MQLONG *int-attr*, **const MQLONG** *value* **);**
Sets a WebSphere MQ integer attribute.

ImqBoolean set(const MQLONG *char-attr*, **const char *** *buffer*, **const size_t** *required-length* **);**
Sets a WebSphere MQ character attribute.

void setNextManagedObject(const ImqObject * *object* **= 0);**
Sets the **next managed object**.

Attention: Use this function only if you are sure it will not break the managed object list.

void setPreviousManagedObject(const ImqObject * *object* **= 0);**
Sets the **previous managed object**.

Attention: Use this function only if you are sure it will not break the managed object list.

Object data (protected)

MQHOBJ *ohobj*
The WebSphere MQ object handle (valid only when **open status** is TRUE).

MQOD *omqod*
The embedded MQOD data structure. The amount of storage allocated for this data structure is that required for an MQOD Version 2. Inspect the version number *(omqod.Version)* and access the other fields as follows:

MQOD_VERSION_1
All other fields in *omqod* can be accessed.

MQOD_VERSION_2
All other fields in *omqod* can be accessed.

MQOD_VERSION_3
omqod.pmqod is a pointer to a dynamically allocated, larger, MQOD. No other fields in *omqod* can be accessed. All fields addressed by *omqod.pmqod* can be accessed.

Note: *omqod.pmqod.Version* can be less than *omqod.Version*, indicating that the WebSphere MQ client has more functionality than the WebSphere MQ server.

Reason codes

- MQRC_ATTRIBUTE_LOCKED

ImqProcess

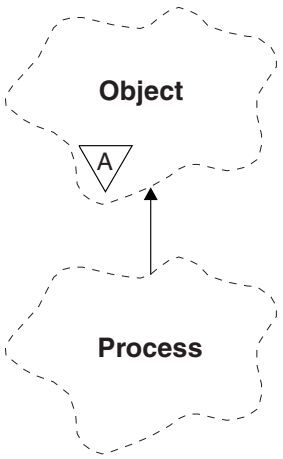

Figure 19. ImqProcess class

This class encapsulates an application process (a WebSphere MQ object of type MQOT_PROCESS) that can be triggered by a trigger monitor (see Table 20 on page 167).

Other relevant classes

- ImqObject (see "ImqObject" on page 90)

Object attributes

application id
The identity of the application process. This attribute is read-only.

application type
The type of the application process. This attribute is read-only.

environment data
The environment information for the process. This attribute is read-only.

user data
User data for the process. This attribute is read-only.

Constructors

ImqProcess( );
The default constructor.

ImqProcess(const ImqProcess & *process* **);**
The copy constructor. The ImqObject **open status** is FALSE.

ImqProcess(const char * *name* **);**
Sets the ImqObject **name**.

Object methods (public)

void operator = (const ImqProcess & *process* **);**
Performs a close if necessary, and then copies instance data from *process*. The ImqObject **open status** will be FALSE.

ImqBoolean applicationId(ImqString & *id*);
Provides a copy of the **application id**. It returns TRUE if successful.

ImqString applicationId( );
Returns the **application id** without any indication of possible errors.

ImqBoolean applicationType(MQLONG & *type*);
Provides a copy of the **application type**. It returns TRUE if successful.

MQLONG applicationType( );
Returns the **application type** without any indication of possible errors.

ImqBoolean environmentData(ImqString & *data*);
Provides a copy of the **environment data**. It returns TRUE if successful.

ImqString environmentData( );
Returns the **environment data** without any indication of possible errors.

ImqBoolean userData(ImqString & *data*);
Provides a copy of the **user data**. It returns TRUE if successful.

ImqString userData( );
Returns the **user data** without any indication of possible errors.

ImqPutMessageOptions

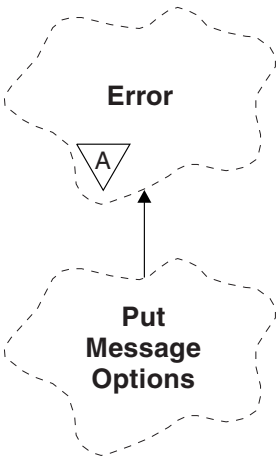

Figure 20. ImqPutMessageOptions class

This class encapsulates the MQPMO data structure (see Table 21 on page 167).

Other relevant classes

- ImqError (see "ImqError" on page 63)
- ImqMessage (see "ImqMessage" on page 76)
- ImqQueue (see "ImqQueue" on page 102)
- ImqString (see "ImqString" on page 138)

Object attributes

context reference
An ImqQueue that provides a context for messages. Initially there is no reference.

options
The put message options. The initial value is MQPMO_NONE. The following additional values are possible:

- MQPMO_SYNCPOINT
- MQPMO_NO_SYNCPOINT
- MQPMO_NEW_MSG_ID
- MQPMO_NEW_CORREL_ID
- MQPMO_LOGICAL_ORDER
- MQPMO_NO_CONTEXT
- MQPMO_DEFAULT_CONTEXT
- MQPMO_PASS_IDENTITY_CONTEXT
- MQPMO_PASS_ALL_CONTEXT
- MQPMO_SET_IDENTITY_CONTEXT
- MQPMO_SET_ALL_CONTEXT
- MQPMO_ALTERNATE_USER_AUTHORITY
- MQPMO_FAIL_IF_QUIESCING

record fields
The flags that control the inclusion of put message records when a message is put. The initial value is MQPMRF_NONE. The following additional values are possible:

- MQPMRF_MSG_ID
- MQPMRF_CORREL_ID
- MQPMRF_GROUP_ID
- MQPMRF_FEEDBACK
- MQPMRF_ACCOUNTING_TOKEN

ImqMessageTracker attributes are taken from the object for any field that is specified. ImqMessageTracker attributes are taken from the ImqMessage object for any field that is *not* specified.

resolved queue manager name
Name of a destination queue manager determined during a put. The initial value is null. This attribute is read-only.

resolved queue name
Name of a destination queue determined during a put. The initial value is null. This attribute is read-only.

syncpoint participation
TRUE when messages are put under syncpoint control.

Constructors

ImqPutMessageOptions( );
The default constructor.

ImqPutMessageOptions(const ImqPutMessageOptions & *pmo* **);**
The copy constructor.

Object methods (public)

void operator = (const ImqPutMessageOptions & *pmo* **);**
Copies instance data from *pmo*, replacing the existing instance data.

ImqQueue * contextReference( ) const ;
Returns the **context reference**.

void setContextReference(const ImqQueue & *queue* **);**
Sets the **context reference**.

void setContextReference(const ImqQueue * *queue* **= 0);**
Sets the **context reference**.

MQLONG options( ) const ;
Returns the **options**.

void setOptions(const MQLONG *options* **);**
Sets the **options**, including the **syncpoint participation** value.

MQLONG recordFields( ) const ;
Returns the **record fields**.

void setRecordFields(const MQLONG *fields* **);**
Sets the **record fields**.

ImqString resolvedQueueManagerName( ) const ;
Returns a copy of the **resolved queue manager name**.

ImqString resolvedQueueName( ) const ;
Returns a copy of the **resolved queue name**.

ImqBoolean syncPointParticipation( ) const ;
Returns the **syncpoint participation** value, which is TRUE if the **options** include MQPMO_SYNCPOINT.

void setSyncPointParticipation(const ImqBoolean *sync* **);**
Sets the **syncpoint participation** value. If *sync* is TRUE, the **options** are altered to include MQPMO_SYNCPOINT, and to exclude MQPMO_NO_SYNCPOINT. If *sync* is FALSE, the **options** are altered to include MQPMO_NO_SYNCPOINT, and to exclude MQPMO_SYNCPOINT.

Object data (protected)

MQPMO *omqpmo*
The MQPMO data structure.

Reason codes

- MQRC_STORAGE_NOT_AVAILABLE

ImqQueue

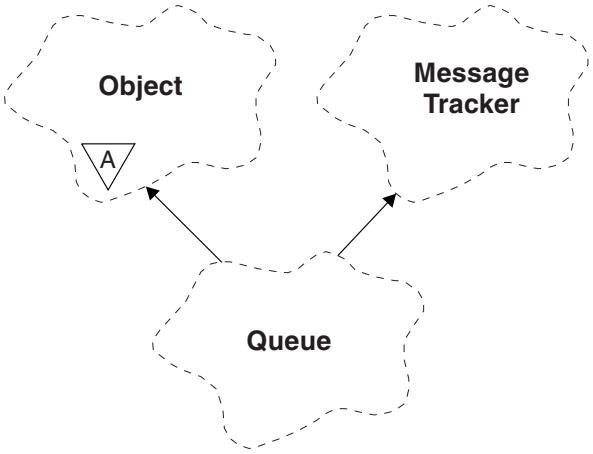

Figure 21. ImqQueue class

This class encapsulates a message queue (a WebSphere MQ object of type MQOT_Q). It relates to the MQI calls listed in Table 22 on page 168.

Other relevant classes

- ImqCache (see "ImqCache" on page 42)
- ImqDistributionList (see "ImqDistributionList" on page 61)
- ImqGetMessageOptions (see "ImqGetMessageOptions" on page 65)
- ImqMessage (see "ImqMessage" on page 76)
- ImqMessageTracker (see "ImqMessageTracker" on page 84)
- ImqObject (see "ImqObject" on page 90)
- ImqPutMessageOptions (see "ImqPutMessageOptions" on page 99)
- ImqQueueManager (see "ImqQueueManager" on page 115)
- ImqString (see "ImqString" on page 138)

Object attributes

backout requeue name
Excessive backout requeue name. This attribute is read-only.

backout threshold
Backout threshold. This attribute is read-only.

base queue name
Name of the queue that the alias resolves to. This attribute is read-only.

cluster name
Cluster name. This attribute is read-only.

cluster namelist name
Cluster namelist name. This attribute is read-only.

cluster workload rank
Cluster workload rank. This attribute is read-only.

cluster workload priority
Cluster workload priority. This attribute is read-only.

cluster workload use queue
Cluster workload use queue value. This attribute is read-only.

creation date
Queue creation data. This attribute is read-only.

creation time
Queue creation time. This attribute is read-only.

current depth
Number of messages on the queue. This attribute is read-only.

default bind
Default bind. This attribute is read-only.

default input open option
Default open-for-input option. This attribute is read-only.

default persistence
Default message persistence. This attribute is read-only.

default priority
Default message priority. This attribute is read-only.

definition type
Queue definition type. This attribute is read-only.

depth high event
Control attribute for queue depth high events. This attribute is read-only.

depth high limit
High limit for the queue depth. This attribute is read-only.

depth low event
Control attribute for queue depth low events. This attribute is read-only.

depth low limit
Low limit for the queue depth. This attribute is read-only.

depth maximum event
Control attribute for queue depth maximum events. This attribute is read-only.

distribution list reference
Optional reference to an ImqDistributionList that can be used to distribute messages to more than one queue, including this one. The initial value is null.

Note: When an ImqQueue object is opened, any open ImqDistributionList object that it references is automatically closed.

distribution lists
The capability of a transmission queue to support distribution lists. This attribute is read-only.

dynamic queue name
Dynamic queue name. The initial value is AMQ.* for all Personal Computer and UNIX® platforms.

harden get backout
Whether to harden the backout count. This attribute is read-only.

index type
Index type. This attribute is read-only.

inhibit get
Whether get operations are allowed. The initial value is dependent on the queue definition. This attribute is valid for an alias or local queue only.

inhibit put
Whether put operations are allowed. The initial value is dependent on the queue definition.

initiation queue name
Name of the initiation queue. This attribute is read-only.

maximum depth
Maximum number of messages allowed on the queue. This attribute is read-only.

maximum message length
Maximum length for any message on this queue, which can be less than the maximum for any queue managed by the associated queue manager. This attribute is read-only.

message delivery sequence
Whether message priority is relevant. This attribute is read-only.

next distributed queue
Next object of this class, in no particular order, having the same **distribution list reference** as this object. The initial value is zero.

If an object in a chain is deleted, the previous object and next object are updated so that their distributed queue links no longer point to the deleted object.

non-persistent message class
Level of reliability for non-persistent messages put to this queue. This attribute is read-only.

open input count
Number of ImqQueue objects that are open for input. This attribute is read-only.

open output count
Number of ImqQueue objects that are open for output. This attribute is read-only.

previous distributed queue
Previous object of this class, in no particular order, having the same **distribution list reference** as this object. The initial value is zero.

If an object in a chain is deleted, the previous object and next object are updated so that their distributed queue links no longer point to the deleted object.

process name
Name of the process definition. This attribute is read-only.

queue accounting
Level of accounting information for queues. This attribute is read-only.

queue manager name
Name of the queue manager (possibly remote) where the queue resides. Do not confuse the queue manager named here with the ImqObject **connection reference**, which references the (local) queue manager providing a connection. The initial value is null.

queue monitoring
Level of monitoring data collection for the queue. This attribute is read-only.

queue statistics
Level of statistics data for the queue. This attribute is read-only.

queue type
Queue type. This attribute is read-only.

remote queue manager name
Name of the remote queue manager. This attribute is read-only.

remote queue name
Name of the remote queue as known on the remote queue manager. This attribute is read-only.

resolved queue manager name
Resolved queue manager name. This attribute is read-only.

resolved queue name
Resolved queue name. This attribute is read-only.

retention interval
Queue retention interval. This attribute is read-only.

scope Scope of the queue definition. This attribute is read-only.

service interval
Service interval. This attribute is read-only.

service interval event
Control attribute for service interval events. This attribute is read-only.

shareability
Whether the queue can be shared. This attribute is read-only.

storage class
Storage class. This attribute is read-only.

transmission queue name
Name of the transmission queue. This attribute is read-only.

trigger control
Trigger control. The initial value depends on the queue definition. This attribute is valid for a local queue only.

trigger data
Trigger data. The initial value depends on the queue definition. This attribute is valid for a local queue only.

trigger depth
Trigger depth. The initial value depends on the queue definition. This attribute is valid for a local queue only.

trigger message priority
Threshold message priority for triggers. The initial value depends on the queue definition. This attribute is valid for a local queue only.

trigger type
Trigger type. The initial value depends on the queue definition. This attribute is valid for a local queue only.

usage Usage. This attribute is read-only.

Constructors

ImqQueue( );
The default constructor.

ImqQueue(const ImqQueue & *queue* **);**
The copy constructor. The ImqObject **open status** will be FALSE.

ImqQueue(const char * *name* **);**
Sets the ImqObject **name**.

Object methods (public)

void operator = (const ImqQueue & *queue* **);**
Performs a close if necessary, and then copies instance data from *queue*. The ImqObject **open status** will be FALSE.

ImqBoolean backoutRequeueName(ImqString & *name* **);**
Provides a copy of the **backout requeue name**. It returns TRUE if successful.

ImqString backoutRequeueName( );
Returns the **backout requeue name** without any indication of possible errors.

ImqBoolean backoutThreshold(MQLONG & *threshold* **);**
Provides a copy of the **backout threshold**. It returns TRUE if successful.

MQLONG backoutThreshold( );
Returns the **backout threshold** value without any indication of possible errors.

ImqBoolean baseQueueName(ImqString & *name* **);**
Provides a copy of the **base queue name**. It returns TRUE if successful.

ImqString baseQueueName( );
Returns the **base queue name** without any indication of possible errors.

ImqBoolean clusterName(ImqString & *name* **);**
Provides a copy of the **cluster name**. It returns TRUE if successful.

ImqString clusterName( );
Returns the **cluster name** without any indication of possible errors.

ImqBoolean clusterNamelistName(ImqString & *name* **);**
Provides a copy of the **cluster namelist name**. It returns TRUE if successful.

ImqString clusterNamelistName( );
Returns the **cluster namelist name** without any indication of errors.

ImqBoolean clusterWorkLoadPriority (MQLONG & priority);
Provides a copy of the cluster workload priority value. It returns TRUE if successful.

MQLONG clusterWorkLoadPriority ( );
Returns the cluster workload priority value without any indication of possible errors.

ImqBoolean clusterWorkLoadRank (MQLONG & rank);
Provides a copy of the cluster workload rank value. It returns TRUE if successful.

MQLONG clusterWorkLoadRank ( );
Returns the cluster workload rank value without any indication of possible errors.

ImqBoolean clusterWorkLoadUseQ (MQLONG & useq);
Provides a copy of the cluster workload use queue value. It returns TRUE if successful.

MQLONG clusterWorkLoadUseQ ( );
Returns the cluster workload use queue value without any indication of possible errors.

ImqBoolean creationDate(ImqString & *date* **);**
Provides a copy of the **creation date**. It returns TRUE if successful.

ImqString creationDate( );
Returns the **creation date** without any indication of possible errors.

ImqBoolean creationTime(ImqString & *time* **);**
Provides a copy of the **creation time**. It returns TRUE if successful.

ImqString creationTime( );
Returns the **creation time** without any indication of possible errors.

ImqBoolean currentDepth(MQLONG & *depth* **);**
Provides a copy of the **current depth**. It returns TRUE if successful.

MQLONG currentDepth( );
Returns the **current depth** without any indication of possible errors.

ImqBoolean defaultInputOpenOption(MQLONG & *option* **);**
Provides a copy of the **default input open option**. It returns TRUE if successful.

MQLONG defaultInputOpenOption( );
Returns the **default input open option** without any indication of possible errors.

ImqBoolean defaultPersistence(MQLONG & *persistence* **);**
Provides a copy of the **default persistence**. It returns TRUE if successful.

MQLONG defaultPersistence( );
Returns the **default persistence** without any indication of possible errors.

ImqBoolean defaultPriority(MQLONG & *priority* **);**
Provides a copy of the **default priority**. It returns TRUE if successful.

MQLONG defaultPriority( );
Returns the **default priority** without any indication of possible errors.

ImqBoolean defaultBind(MQLONG & *bind* **);**
Provides a copy of the **default bind**. It returns TRUE if successful.

MQLONG defaultBind( );
Returns the **default bind** without any indication of possible errors.

ImqBoolean definitionType(MQLONG & *type* **);**
Provides a copy of the **definition type**. It returns TRUE if successful.

MQLONG definitionType( );
Returns the **definition type** without any indication of possible errors.

ImqBoolean depthHighEvent(MQLONG & *event* **);**
Provides a copy of the enablement state of the **depth high event**. It returns TRUE if successful.

MQLONG depthHighEvent( );
Returns the enablement state of the **depth high event** without any indication of possible errors.

ImqBoolean depthHighLimit(MQLONG & *limit* **);**
Provides a copy of the **depth high limit**. It returns TRUE if successful.

MQLONG depthHighLimit( );
Returns the **depth high limit** value without any indication of possible errors.

ImqBoolean depthLowEvent(MQLONG & *event* **);**
Provides a copy of the enablement state of the **depth low event**. It returns TRUE if successful.

MQLONG depthLowEvent( );
Returns the enablement state of the **depth low event** without any indication of possible errors.

ImqBoolean depthLowLimit(MQLONG & *limit* **);**
Provides a copy of the **depth low limit**. It returns TRUE if successful.

MQLONG depthLowLimit( );
Returns the **depth low limit** value without any indication of possible errors.

ImqBoolean depthMaximumEvent(MQLONG & *event* **);**
Provides a copy of the enablement state of the **depth maximum event**. It returns TRUE if successful.

MQLONG depthMaximumEvent( );
Returns the enablement state of the **depth maximum event** without any indication of possible errors.

ImqDistributionList * distributionListReference( ) const ;
Returns the **distribution list reference**.

void setDistributionListReference(ImqDistributionList & *list* **);**
Sets the **distribution list reference**.

void setDistributionListReference(ImqDistributionList * *list* **= 0);**
Sets the **distribution list reference**.

ImqBoolean distributionLists(MQLONG & *support* **);**
Provides a copy of the **distribution lists** value. It returns TRUE if successful.

MQLONG distributionLists( );
Returns the **distribution lists** value without any indication of possible errors.

ImqBoolean setDistributionLists(const MQLONG *support* **);**
Sets the **distribution lists** value. It returns TRUE if successful.

ImqString dynamicQueueName( ) const ;
Returns a copy of the **dynamic queue name**.

ImqBoolean setDynamicQueueName(const char * *name* **);**
Sets the **dynamic queue name**. The **dynamic queue name** can be set only while the ImqObject **open status** is FALSE. It returns TRUE if successful.

ImqBoolean get(ImqMessage & *msg*, **ImqGetMessageOptions &** *options* **);**
Retrieves a message from the queue, using the specified *options*. Invokes the ImqObject **openFor** method if necessary to ensure that the ImqObject

open options include either one of the MQOO_INPUT_* values, or the MQOO_BROWSE value, depending on the *options*. If the *msg* object has an ImqCache **automatic buffer**, the buffer grows to accommodate any message retrieved. The **clearMessage** method is invoked against the *msg* object before retrieval.

This method returns TRUE if successful.

Note: The result of the method invocation is FALSE if the ImqObject **reason code** is MQRC_TRUNCATED_MSG_FAILED, even though this **reason code** is classified as a warning. If a truncated message is accepted, the ImqCache **message length** reflects the truncated length. In either event, the ImqMessage **total message length** indicates the number of bytes that were available.

ImqBoolean get(ImqMessage & *msg* **);**
As for the previous method, except that default get message options are used.

ImqBoolean get(ImqMessage & *msg*, **ImqGetMessageOptions &** *options*, **const size_t** *buffer-size* **);**
As for the previous two methods, except that an overriding *buffer-size* is indicated. If the *msg* object employs an ImqCache **automatic buffer**, the **resizeBuffer** method is invoked on the *msg* object prior to message retrieval, and the buffer does not grow further to accommodate any larger message.

ImqBoolean get(ImqMessage & *msg*, **const size_t** *buffer-size* **);**
As for the previous method, except that default get message options are used.

ImqBoolean hardenGetBackout(MQLONG & *harden* **);**
Provides a copy of the **harden get backout** value. It returns TRUE if successful.

MQLONG hardenGetBackout( );
Returns the **harden get backout** value without any indication of possible errors.

ImqBoolean indexType(MQLONG & *type* **);**
Provides a copy of the **index type**. It returns TRUE if successful.

MQLONG indexType( );
Returns the **index type** without any indication of possible errors.

ImqBoolean inhibitGet(MQLONG & *inhibit* **);**
Provides a copy of the **inhibit get** value. It returns TRUE if successful.

MQLONG inhibitGet( );
Returns the **inhibit get** value without any indication of possible errors.

ImqBoolean setInhibitGet(const MQLONG *inhibit* **);**
Sets the **inhibit get** value. It returns TRUE if successful.

ImqBoolean inhibitPut(MQLONG & *inhibit* **);**
Provides a copy of the **inhibit put** value. It returns TRUE if successful.

MQLONG inhibitPut( );
Returns the **inhibit put** value without any indication of possible errors.

ImqBoolean setInhibitPut(const MQLONG *inhibit* **);**
Sets the **inhibit put** value. It returns TRUE if successful.

ImqBoolean initiationQueueName(ImqString & *name*);
Provides a copy of the **initiation queue name**. It returns TRUE if successful.

ImqString initiationQueueName( );
Returns the **initiation queue name** without any indication of possible errors.

ImqBoolean maximumDepth(MQLONG & *depth*);
Provides a copy of the **maximum depth**. It returns TRUE if successful.

MQLONG maximumDepth( );
Returns the **maximum depth** without any indication of possible errors.

ImqBoolean maximumMessageLength(MQLONG & *length*);
Provides a copy of the **maximum message length**. It returns TRUE if successful.

MQLONG maximumMessageLength( );
Returns the **maximum message length** without any indication of possible errors.

ImqBoolean messageDeliverySequence(MQLONG & *sequence*);
Provides a copy of the **message delivery sequence**. It returns TRUE if successful.

MQLONG messageDeliverySequence( );
Returns the **message delivery sequence** value without any indication of possible errors.

ImqQueue * nextDistributedQueue( ) const ;
Returns the **next distributed queue**.

ImqBoolean nonPersistentMessageClass (MQLONG & monq);
Provides a copy of the non persistent message class value. It returns TRUE if successful.

MQLONG nonPersistentMessageClass ( );
Returns the non persistent message class value without any indication of possible errors.

ImqBoolean openInputCount(MQLONG & *count*);
Provides a copy of the **open input count**. It returns TRUE if successful.

MQLONG openInputCount( );
Returns the **open input count** without any indication of possible errors.

ImqBoolean openOutputCount(MQLONG & *count*);
Provides a copy of the **open output count**. It returns TRUE if successful.

MQLONG openOutputCount( );
Returns the **open output count** without any indication of possible errors.

ImqQueue * previousDistributedQueue( ) const ;
Returns the **previous distributed queue**.

ImqBoolean processName(ImqString & *name*);
Provides a copy of the **process name**. It returns TRUE if successful.

ImqString processName( );
Returns the **process name** without any indication of possible errors.

ImqBoolean put(ImqMessage & *msg*);
Places a message onto the queue, using default put message options. Uses

the ImqObject **openFor** method if necessary to ensure that the ImqObject **open options** include MQOO_OUTPUT.

This method returns TRUE if successful.

ImqBoolean put(ImqMessage & *msg*, **ImqPutMessageOptions &** *pmo* **);**
Places a message onto the queue, using the specified *pmo*. Uses the ImqObject **openFor** method as necessary to ensure that the ImqObject **open options** include MQOO_OUTPUT, and (if the *pmo* **options** include any of MQPMO_PASS_IDENTITY_CONTEXT, MQPMO_PASS_ALL_CONTEXT, MQPMO_SET_IDENTITY_CONTEXT, or MQPMO_SET_ALL_CONTEXT) corresponding MQOO_*_CONTEXT values.

This method returns TRUE if successful.

Note: If the *pmo* includes a **context reference**, the referenced object is opened, if necessary, to provide a context.

ImqBoolean queueAccounting (MQLONG & acctq);
Provides a copy of the queue accounting value. It returns TRUE if successful.

MQLONG queueAccounting ( );
Returns the queue accounting value without any indication of possible errors.

ImqString queueManagerName( ) const ;
Returns the **queue manager name**.

ImqBoolean setQueueManagerName(const char * *name* **);**
Sets the **queue manager name**. The **queue manager name** can be set only while the ImqObject **open status** is FALSE. This method returns TRUE if successful.

ImqBoolean queueMonitoring (MQLONG & monq);
Provides a copy of the queue monitoring value. It returns TRUE if successful.

MQLONG queueMonitoring ( );
Returns the queue monitoring value without any indication of possible errors.

ImqBoolean queueStatistics (MQLONG & statq);
Provides a copy of the queue statistics value. It returns TRUE if successful.

MQLONG queueStatistics ( );
Returns the queue statistics value without any indication of possible errors.

ImqBoolean queueType(MQLONG & *type* **);**
Provides a copy of the **queue type** value. It returns TRUE if successful.

MQLONG queueType( );
Returns the **queue type** without any indication of possible errors.

ImqBoolean remoteQueueManagerName(ImqString & *name* **);**
Provides a copy of the **remote queue manager name**. It returns TRUE if successful.

ImqString remoteQueueManagerName( );
Returns the **remote queue manager name** without any indication of possible errors.

ImqBoolean remoteQueueName(ImqString & *name* **);**
Provides a copy of the **remote queue name**. It returns TRUE if successful.

ImqString remoteQueueName( );
Returns the **remote queue name** without any indication of possible errors.

ImqBoolean resolvedQueueManagerName(ImqString & *name* **);**
Provides a copy of the **resolved queue manager name**. It returns TRUE if successful.

Note: This method fails unless MQOO_RESOLVE_NAMES is among the ImqObject **open options**.

ImqString resolvedQueueManagerName( ) ;
Returns the **resolved queue manager name**, without any indication of possible errors.

ImqBoolean resolvedQueueName(ImqString & *name* **);**
Provides a copy of the **resolved queue name**. It returns TRUE if successful.

Note: This method fails unless MQOO_RESOLVE_NAMES is among the ImqObject **open options**.

ImqString resolvedQueueName( ) ;
Returns the **resolved queue name**, without any indication of possible errors.

ImqBoolean retentionInterval(MQLONG & *interval* **);**
Provides a copy of the **retention interval**. It returns TRUE if successful.

MQLONG retentionInterval( );
Returns the **retention interval** without any indication of possible errors.

ImqBoolean scope(MQLONG & *scope* **);**
Provides a copy of the **scope**. It returns TRUE if successful.

MQLONG scope( );
Returns the **scope** without any indication of possible errors.

ImqBoolean serviceInterval(MQLONG & *interval* **);**
Provides a copy of the **service interval**. It returns TRUE if successful.

MQLONG serviceInterval( );
Returns the **service interval** without any indication of possible errors.

ImqBoolean serviceIntervalEvent(MQLONG & *event* **);**
Provides a copy of the enablement state of the **service interval event**. It returns TRUE if successful.

MQLONG serviceIntervalEvent( );
Returns the enablement state of the **service interval event** without any indication of possible errors.

ImqBoolean shareability(MQLONG & *shareability* **);**
Provides a copy of the **shareability** value. It returns TRUE if successful.

MQLONG shareability( );
Returns the **shareability** value without any indication of possible errors.

ImqBoolean storageClass(ImqString & *class* **);**
Provides a copy of the **storage class**. It returns TRUE if successful.

ImqString storageClass( );
Returns the **storage class** without any indication of possible errors.

ImqBoolean transmissionQueueName(ImqString & *name*);
Provides a copy of the **transmission queue name**. It returns TRUE if successful.

ImqString transmissionQueueName( );
Returns the **transmission queue name** without any indication of possible errors.

ImqBoolean triggerControl(MQLONG & *control*);
Provides a copy of the **trigger control** value. It returns TRUE if successful.

MQLONG triggerControl( );
Returns the **trigger control** value without any indication of possible errors.

ImqBoolean setTriggerControl(const MQLONG *control*);
Sets the **trigger control** value. It returns TRUE if successful.

ImqBoolean triggerData(ImqString & *data*);
Provides a copy of the **trigger data**. It returns TRUE if successful.

ImqString triggerData( );
Returns a copy of the **trigger data** without any indication of possible errors.

ImqBoolean setTriggerData(const char * *data*);
Sets the **trigger data**. It returns TRUE if successful.

ImqBoolean triggerDepth(MQLONG & *depth*);
Provides a copy of the **trigger depth**. It returns TRUE if successful.

MQLONG triggerDepth( );
Returns the **trigger depth** without any indication of possible errors.

ImqBoolean setTriggerDepth(const MQLONG *depth*);
Sets the **trigger depth**. It returns TRUE if successful.

ImqBoolean triggerMessagePriority(MQLONG & *priority*);
Provides a copy of the **trigger message priority**. It returns TRUE if successful.

MQLONG triggerMessagePriority( );
Returns the **trigger message priority** without any indication of possible errors.

ImqBoolean setTriggerMessagePriority(const MQLONG *priority*);
Sets the **trigger message priority**. It returns TRUE if successful.

ImqBoolean triggerType(MQLONG & *type*);
Provides a copy of the **trigger type**. It returns TRUE if successful.

MQLONG triggerType( );
Returns the **trigger type** without any indication of possible errors.

ImqBoolean setTriggerType(const MQLONG *type*);
Sets the **trigger type**. It returns TRUE if successful.

ImqBoolean usage(MQLONG & *usage*);
Provides a copy of the **usage** value. It returns TRUE if successful.

MQLONG usage( );
Returns the **usage** value without any indication of possible errors.

Object methods (protected)

void setNextDistributedQueue(ImqQueue * *queue* = 0);
Sets the **next distributed queue**.

Attention: Use this function only if you are sure it will not break the distributed queue list.

void setPreviousDistributedQueue(ImqQueue * *queue* = 0);
Sets the **previous distributed queue**.

Attention: Use this function only if you are sure it will not break the distributed queue list.

Reason codes

- MQRC_ATTRIBUTE_LOCKED
- MQRC_CONTEXT_OBJECT_NOT_VALID
- MQRC_CONTEXT_OPEN_ERROR
- MQRC_CURSOR_NOT_VALID
- MQRC_NO_BUFFER
- MQRC_REOPEN_EXCL_INPUT_ERROR
- MQRC_REOPEN_INQUIRE_ERROR
- MQRC_REOPEN_TEMPORARY_Q_ERROR
- (reason codes from MQGET)
- (reason codes from MQPUT)

ImqQueueManager

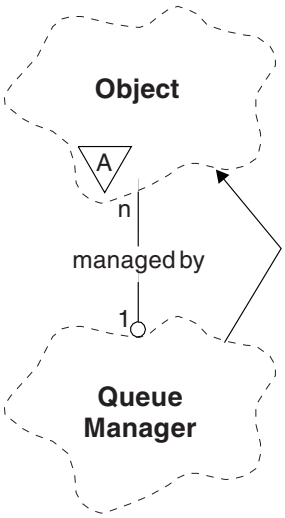

Figure 22. ImqQueueManager class

This class encapsulates a queue manager (a WebSphere MQ object of type MQOT_Q_MGR). It relates to the MQI calls listed in Table 23 on page 170. Not all the listed methods are applicable to all platforms; see the description of the ALTER QMGR command in WebSphere MQ Script (MQSC) Command Reference for more details.

Other relevant classes

- ImqAuthenticationRecord (see "ImqAuthenticationRecord" on page 37)
- ImqChannel (see "ImqChannel" on page 45)
- ImqObject (see "ImqObject" on page 90)

Class attributes

behavior

Controls the behavior of implicit connection and disconnection.

IMQ_EXPL_DISC_BACKOUT (0L)
An explicit call to the **disconnect** method implies backout. This attribute is mutually exclusive with IMQ_EXPL_DISC_COMMIT.

IMQ_EXPL_DISC_COMMIT (1L)
An explicit call to the **disconnect** method implies commit (the default). This attribute is mutually exclusive with IMQ_EXPL_DISC_BACKOUT.

IMQ_IMPL_CONN (2L)
Implicit connection is allowed (the default).

IMQ_IMPL_DISC_BACKOUT (0L)
An implicit call to the **disconnect** method, which can occur during object destruction, implies backout. This attribute is mutually exclusive with the IMQ_IMPL_DISC_COMMIT.

IMQ_IMPL_DISC_COMMIT (4L)
An implicit call to the **disconnect** method, which can occur during

object destruction, implies commit (the default). This attribute is mutually exclusive with IMQ_IMPL_DISC_BACKOUT.

Object attributes

accounting connections override
Allows applications to override the setting of the MQI accounting and queue accounting values.This attribute is read-only.

accounting interval
How long before intermediate accounting records are written (in seconds). This attribute is read-only.

activity recording
Controls the generation of activity reports. This attribute is read-only.

adopt new mca check
The elements checked to determine if an MCA should be adopted when a new inbound channel is detected that has the same name as an MCA that is already active. This attribute is read-only.

adopt new mca type
Whether an orphaned instance of an MCA of a given channel type should be restarted automatically when a new inbound channel request matching the adopt new mca check parameters is detected. This attribute is read-only.

authentication type
Indicates the type of authentication which is being performed.

authority event
Controls authority events. This attribute is read-only.

begin options
Options that apply to the **begin** method. The initial value is MQBO_NONE.

bridge event
Whether IMS Bridge events are generated. This attribute is read-only.

channel auto definition
Channel auto definition value. This attribute is read-only.

channel auto definition event
Channel auto definition event value. This attribute is read-only.

channel auto definition exit
Channel auto definition exit name. This attribute is read-only.

channel event
Whether channel events are generated. This attribute is read-only.

channel initiator adapters
The number of adapter subtasks to use for processing WebSphere MQ calls. This attribute is read-only.

channel initiator control
Whether the Channel Initiator should be started automatically when the Queue Manager is started. This attribute is read-only.

channel initiator dispatchers
The number of dispatchers to use for the channel initiator. This attribute is read-only.

channel initiator trace autostart
Whether channel initiator trace should start automatically or not. This attribute is read-only.

channel initiator trace table size
The size of the channel initiator's trace data space (in MB). This attribute is read-only.

channel monitoring
Controls the collection of online monitoring data for channels. This attribute is read-only.

channel reference
A reference to a channel definition for use during client connection. While connected, this attribute can be set to null, but cannot be changed to any other value. The initial value is null.

channel statistics
Controls the collection of statistics data for channels. This attribute is read-only.

character set
Coded character set identifier (CCSID). This attribute is read-only.

cluster sender monitoring
Controls the collection of online monitoring data for automatically-defined cluster sender channels. This attribute is read-only.

cluster sender statistics
Controls the collection of statistics data for automatically defined cluster sender channels. This attribute is read-only.

cluster workload data
Cluster workload exit data. This attribute is read-only.

cluster workload exit
Cluster workload exit name. This attribute is read-only.

cluster workload length
Cluster workload length. This attribute is read-only.

cluster workload mru
Cluster workload most recently used channels value. This attribute is read-only.

cluster workload use queue
Cluster workload use queue value. This attribute is read-only.

command event
Whether command events are generated. This attribute is read-only.

command input queue name
System command input queue name. This attribute is read-only.

command level
Command level supported by the queue manager. This attribute is read-only.

command server control
Whether the Command Server should be started automatically when the Queue Manager is started. This attribute is read-only.

connect options
Options that apply to the **connect** method. The initial value is MQCNO_NONE. The following additional values may be possible, depending on platform:
- MQCNO_STANDARD_BINDING
- MQCNO_FASTPATH_BINDING
- MQCNO_HANDLE_SHARE_NONE
- MQCNO_HANDLE_SHARE_BLOCK
- MQCNO_HANDLE_SHARE_NO_BLOCK
- MQCNO_SERIALIZE_CONN_TAG_Q_MGR
- MQCNO_SERIALIZE_CONN_TAG_QSG
- MQCNO_RESTRICT_CONN_TAG_Q_MGR
- MQCNO_RESTRICT_CONN_TAG_QSG

connection id
A unique identifier that allows MQ to reliably identify an application.

connection status
TRUE when connected to the queue manager. This attribute is read-only.

connection tag
A tag to be associated with a connection. This attribute can only be set when not connected. The initial value is null.

cryptographic hardware
Configuration details for cryptographic hardware. For MQ client connections.

dead-letter queue name
Name of the dead-letter queue. This attribute is read-only.

default transmission queue name
Default transmission queue name. This attribute is read-only.

distribution lists
Capability of the queue manager to support distribution lists.

dns group
The name of the group that the TCP listener that handles inbound transmissions for the queue-sharing group should join when using Workload Manager Dynamic Domain Name Services support. This attribute is read-only.

dns wlm
Whether the TCP listener that handles inbound transmissions for the queue-sharing group should register with Workload Manager for Dynamic Domain Name Services. This attribute is read-only.

first authentication record
The first of one or more objects of class ImqAuthenticationRecord, in no particular order, in which the ImqAuthenticationRecord connection reference addresses this object. For MQ client connections.

first managed object
The first of one or more objects of class ImqObject, in no particular order, in which the ImqObject **connection reference** addresses this object. The initial value is zero.

inhibit event
Controls inhibit events. This attribute is read-only.

ip address version
Which IP protocol (IPv4 or IPv6) to use for a channel connection. This attribute is read-only.

key repository
Location of the key database file in which keys and certificates are stored. For WebSphere MQ client connections.

key reset count
The number of unencrypted bytes sent and received within an SSL conversation before the secret key is renegotiated. This attribute applies only to client connections using MQCONNX. See also ssl key reset count.

listener timer
The time interval (in seconds) between attempts by WebSphere MQ to restart the listener if there has been an APPC or TCP/IP failure. This attribute is read-only.

local event
Controls local events. This attribute is read-only.

logger event
Controls whether recovery log events are generated. This attribute is read-only.

lu group name
The generic LU name that the LU 6.2 listener that handles inbound transmissions for the queue-sharing group should use. This attribute is read-only.

lu name
The name of the LU to use for outbound LU 6.2 transmissions. This attribute is read-only.

lu62 arm suffix
The suffix of the SYS1.PARMLIB member APPCPMxx, that nominates the LUADD for this channel initiator. This attribute is read-only.

lu62 channels
The maximum number of channels that can be current or clients that can be connected, that use the LU 6.2 transmission protocol. This attribute is read-only.

maximum active channels
The maximum number of channels that can be active at any time. This attribute is read-only.

maximum channels
The maximum number of channels that can be current (including server-connection channels with connected clients). This attribute is read-only.

maximum handles
Maximum number of handles. This attribute is read-only.

maximum message length
Maximum possible length for any message on any queue managed by this queue manager. This attribute is read-only.

maximum priority
Maximum message priority. This attribute is read-only.

maximum uncommitted messages
Maximum number of uncommitted messages within a unit or work. This attribute is read-only.

mqi accounting
Controls the collection of accounting information for MQI data. This attribute is read-only.

mqi statistics
Controls the collection of statistics monitoring information for the queue manager. This attribute is read-only.

outbound port maximum
The higher end of the range of port numbers to be used when binding outgoing channels. This attribute is read-only.

outbound port minimum
The lower end of the range of port numbers to be used when binding outgoing channels. This attribute is read-only.

password
password associated with user ID

performance event
Controls performance events. This attribute is read-only.

platform
Platform on which the queue manager resides. This attribute is read-only.

queue accounting
Controls the collection of accounting information for queues. This attribute is read-only.

queue monitoring
Controls the collection of online monitoring data for queues. This attribute is read-only.

queue statistics
Controls the collection of statistics data for queues. This attribute is read-only.

receive timeout
Approximately how long a TCP/IP message channel will wait to receive data, including heartbeats, from its partner, before returning to the inactive state. This attribute is read-only.

receive timeout minimum
The minimum time that a TCP/IP channel will wait to receive data, including heartbeats, from its partner, before returning to the inactive state. This attribute is read-only.

receive timeout type
A qualifier applied to **receive timeout**. This attribute is read-only.

remote event
Controls remote events. This attribute is read-only.

repository name
Repository name. This attribute is read-only.

repository namelist
Repository namelist name. This attribute is read-only.

shared queue manager name
Whether MQOPENs of a shared queue where the ObjectQMgrName is another queue manager in the queue–sharing group should resolve to an open of the shared queue on the local queue manager. This attribute is read-only.

ssl event
Whether SSL events are generated. This attribute is read-only.

ssl FIPS required
Whether only FIPS-certified algorithms should be used if the cryptography is executed in WebSphere MQ software. This attribute is read-only.

ssl key reset count
The number of unencrypted bytes sent and received within an SSL conversation before the secret key is renegotiated. This attribute is read-only.

start-stop event
Controls start-stop events. This attribute is read-only.

statistics interval
How often statistics monitoring data is written to the monitoring queue. This attribute is read-only.

syncpoint availability
Availability of syncpoint participation. This attribute is read-only.

Note: Queue manager-coordinated global units of work are not supported on the i5/OS platform. You can program a unit of work, externally coordinated by i5/OS, using the _Rcommit and _Rback native system calls. Start this type of unit of work by starting the WebSphere MQ application under job-level commitment control using the STRCMTCTL command. See the WebSphere MQ Application Programming Guide for further details. **Backout** and **commit** are supported on the i5/OS platform for local units of work coordinated by a queue manager.

tcp channels
The maximum number of channels that can be current or clients that can be connected, that use the TCP/IP transmission protocol. This attribute is read-only.

tcp keepalive
Whether the TCP KEEPALIVE facility is to be used to check that the other end of the connection is still available. This attribute is read-only.

tcp name
The name of either the sole or default TCP/IP system to be used, depending on the value of **tcp stack type**. This attribute is read-only.

tcp stack type
Whether the channel initiator is permitted to only use the TCP/IP address space specified in **tcp name** or can bind to any selected TCP/IP address. This attribute is read-only.

trace route recording
Controls the recording of route tracing information. This attribute is read-only.

trigger interval
Trigger interval. This attribute is read-only.

user id
On UNIX platforms, the application's real user ID. On Windows® platforms, the application's user ID.

Constructors

ImqQueueManager( );
The default constructor.

ImqQueueManager(const ImqQueueManager & *manager* **);**
The copy constructor. The **connection status** will be FALSE.

ImqQueueManager(const char * *name* **);**
Sets the ImqObject **name** to *name*.

Destructors

When an ImqQueueManager object is destroyed, it is automatically disconnected.

Class methods (public)

static MQLONG behavior( );
Returns the **behavior**.

void setBehavior(const MQLONG *behavior* **= 0);**
Sets the **behavior**.

Object methods (public)

void operator = (const ImqQueueManager & *mgr* **);**
Disconnects if necessary, and copies instance data from *mgr*. The **connection status** is be FALSE.

ImqBoolean accountingConnOverride (MQLONG & statint);
Provides a copy of the accounting connections override value. It returns TRUE if successful.

MQLONG accountingConnOverride ( );
Returns the accounting connections override value without any indication of possible errors.

ImqBoolean accountingInterval (MQLONG & statint);
Provides a copy of the accounting interval value. It returns TRUE if successful.

MQLONG accountingInterval ( );
Returns the accounting interval value without any indication of possible errors.

ImqBoolean activityRecording (MQLONG & rec);
Provides a copy of the activity recording value. It returns TRUE if successful.

MQLONG activityRecording ( );
Returns the activity recording value without any indication of possible errors.

ImqBoolean adoptNewMCACheck (MQLONG & check);
Provides a copy of the adopt new MCA check value. It returns TRUE if successful.

MQLONG adoptNewMCACheck ( );
Returns the adopt new MCA check value without any indication of possible errors.

ImqBoolean adoptNewMCAType (MQLONG & type);
Provides a copy of the adopt new MCA type. It returns TRUE if successful.

MQLONG adoptNewMCAType ( );
Returns the adopt new MCA type without any indication of possible errors.

QLONG authenticationType ( ) const;
Returns the authentication type.

void setAuthenticationType (const MQLONG type = MQCSP_AUTH_NONE);
Sets the authentication type.

ImqBoolean authorityEvent(MQLONG & *event* **);**
Provides a copy of the enablement state of the **authority event**. It returns TRUE if successful.

MQLONG authorityEvent( );
Returns the enablement state of the **authority event** without any indication of possible errors.

ImqBoolean backout( );
Backs out uncommitted changes. It returns TRUE if successful.

ImqBoolean begin( );
Begins a unit of work. The **begin options** affect the behavior of this method. It returns TRUE if successful, but it also returns TRUE even if the underlying MQBEGIN call returns MQRC_NO_EXTERNAL_PARTICIPANTS or MQRC_PARTICIPANT_NOT_AVAILABLE (which are both associated with MQCC_WARNING).

MQLONG beginOptions( ) const ;
Returns the **begin options**.

void setBeginOptions(const MQLONG *options* **= MQBO_NONE);**
Sets the **begin options**.

ImqBoolean bridgeEvent (MQLONG & event);
Provides a copy of the bridge event value. It returns TRUE if successful.

MQLONG bridgeEvent ( );
Returns the bridge event value without any indication of possible errors.

ImqBoolean channelAutoDefinition(MQLONG & *value* **);**
Provides a copy of the **channel auto definition** value. It returns TRUE if successful.

MQLONG channelAutoDefinition( );
Returns the **channel auto definition** value without any indication of possible errors.

ImqBoolean channelAutoDefinitionEvent(MQLONG & *value* **);**
Provides a copy of the **channel auto definition event** value. It returns TRUE if successful.

MQLONG channelAutoDefinitionEvent( );
Returns the **channel auto definition event** value without any indication of possible errors.

ImqBoolean channelAutoDefinitionExit(ImqString & *name*);
Provides a copy of the **channel auto definition exit** name. It returns TRUE if successful.

ImqString channelAutoDefinitionExit( );
Returns the **channel auto definition exit** name without any indication of possible errors.

ImqBoolean channelEvent (MQLONG & event);
Provides a copy of the channel event value. It returns TRUE if successful.

MQLONG channelEvent( );
Returns the channel event value without any indication of possible errors.

MQLONG channelInitiatorAdapters ( );
Returns the channel initiator adapters value without any indication of possible errors.

ImqBoolean channelInitiatorAdapters (MQLONG & adapters);
Provides a copy of the channel initiator adapters value. It returns TRUE if successful.

MQLONG channelInitiatorControl ( );
Returns the channel initiator startup value without any indication of possible errors.

ImqBoolean channelInitiatorControl (MQLONG & init);
Provides a copy of the channel initiator control startup value. It returns TRUE if successful.

MQLONG channelInitiatorDispatchers ( );
Returns the channel initiator dispatchers value without any indication of possible errors.

ImqBoolean channelInitiatorDispatchers (MQLONG & dispatchers);
Provides a copy of the channel initiator dispatchers value. It returns TRUE if successful.

MQLONG channelInitiatorTraceAutoStart ( );
Returns the channel initiator trace auto start value without any indication of possible errors.

ImqBoolean channelInitiatorTraceAutoStart (MQLONG & auto);
Provides a copy of the channel initiator trace auto start value. It returns TRUE if successful.

MQLONG channelInitiatorTraceTableSize ( );
Returns the channel initiator trace table size value without any indication of possible errors.

ImqBoolean channelInitiatorTraceTableSize (MQLONG & size);
Provides a copy of the channel initiator trace table size value. It returns TRUE if successful.

ImqBoolean channelMonitoring (MQLONG & monchl);
Provides a copy of the channel monitoring value. It returns TRUE if successful.

MQLONG channelMonitoring ( );
Returns the channel monitoring value without any indication of possible errors.

ImqBoolean channelReference(ImqChannel * & *pchannel* **);**
Provides a copy of the **channel reference**. If the **channel reference** is invalid, sets *pchannel* to null. This method returns TRUE if successful.

ImqChannel * channelReference( );
Returns the **channel reference** without any indication of possible errors.

ImqBoolean setChannelReference(ImqChannel & *channel* **);**
Sets the **channel reference**. This method returns TRUE if successful.

ImqBoolean setChannelReference(ImqChannel * *channel* **= 0);**
Sets or resets the **channel reference**. This method returns TRUE if successful.

ImqBoolean channelStatistics (MQLONG & statchl);
Provides a copy of the channel statistics value. It returns TRUE if successful.

MQLONG channelStatistics ( );
Returns the channel statistics value without any indication of possible errors.

ImqBoolean characterSet(MQLONG & *ccsid* **);**
Provides a copy of the **character set**. It returns TRUE if successful.

MQLONG characterSet( );
Returns a copy of the **character set**, without any indication of possible errors.

MQLONG clientSslKeyResetCount ( ) const;
Returns the SSL key reset count value used on client connections.

void setClientSslKeyResetCount(const MQLONG count);
Sets the SSL key reset count used on client connections.

ImqBoolean clusterSenderMonitoring (MQLONG & monacls);
Provides a copy of the cluster sender monitoring default value. It returns TRUE if successful.

MQLONG clusterSenderMonitoring ( );
Returns the cluster sender monitoring default value without any indication of possible errors.

ImqBoolean clusterSenderStatistics (MQLONG & statacls);
Provides a copy of the cluster sender statistics value. It returns TRUE if successful.

MQLONG clusterSenderStatistics ( );
Returns the cluster sender statistics value without any indication of possible errors.

ImqBoolean clusterWorkloadData(ImqString & *data* **);**
Provides a copy of the **cluster workload exit data**. It returns TRUE if successful.

ImqString clusterWorkloadData( );
Returns the **cluster workload exit data** without any indication of possible errors.

ImqBoolean clusterWorkloadExit(ImqString & *name* **);**
Provides a copy of the **cluster workload exit name**. It returns TRUE if successful.

ImqString clusterWorkloadExit( );
Returns the **cluster workload exit name** without any indication of possible errors.

ImqBoolean clusterWorkloadLength(MQLONG & *length* **);**
Provides a copy of the **cluster workload length**. It returns TRUE if successful.

MQLONG clusterWorkloadLength( );
Returns the **cluster workload length** without any indication of possible errors.

ImqBoolean clusterWorkLoadMRU (MQLONG & mru);
Provides a copy of the cluster workload most recently used channels value. It returns TRUE if successful.

MQLONG clusterWorkLoadMRU ( );
Returns the cluster workload most recently used channels value without any indication of possible errors.

ImqBoolean clusterWorkLoadUseQ (MQLONG & useq);
Provides a copy of the cluster workload use queue value. It returns TRUE if successful.

MQLONG clusterWorkLoadUseQ ( );
Returns the cluster workload use queue value without any indication of possible errors.

ImqBoolean commandEvent (MQLONG & event);
Provides a copy of the command event value. It returns TRUE if successful.

MQLONG commandEvent ( );
Returns the command event value without any indication of possible errors.

ImqBoolean commandInputQueueName(ImqString & *name* **);**
Provides a copy of the **command input queue name**. It returns TRUE if successful.

ImqString commandInputQueueName( );
Returns the **command input queue name** without any indication of possible errors.

ImqBoolean commandLevel(MQLONG & *level* **);**
Provides a copy of the **command level**. It returns TRUE if successful.

MQLONG commandLevel( );
Returns the **command level** without any indication of possible errors.

MQLONG commandServerControl ( );
Returns the command server startup value without any indication of possible errors.

ImqBoolean commandServerControl (MQLONG & server);
Provides a copy of the command server control startup value. It returns TRUE if successful.

ImqBoolean commit( );
Commits uncommitted changes. It returns TRUE if successful.

ImqBoolean connect( );
Connects to the queue manager with the given ImqObject **name**, the default being the local queue manager. If you want to connect to a specific

queue manager, use the ImqObject **setName** method before connection. If there is a **channel reference**, it is used to pass information about the channel definition to MQCONNX in an MQCD. The ChannelType in the MQCD is set to MQCHT_CLNTCONN. **channel reference** information, which is only meaningful for client connections, is ignored for server connections. The **connect options** affect the behavior of this method. This method sets the **connection status** to TRUE if successful. It returns the new connection status.

If there is a first authentication record, the chain of authentication records is used to authenticate digital certificates for secure client channels.

You can connect more than one ImqQueueManager object to the same queue manager. All use the same MQHCONN connection handle and share UOW functionality for the connection associated with the thread. The first ImqQueueManager to connect obtains the MQHCONN handle. The last ImqQueueManager to disconnect performs the MQDISC.

For a multithreaded program, it is recommended that a separate ImqQueueManager object is used for each thread.

ImqBinary connectionId ( ) const ;
Returns the connection ID.

ImqBinary connectionTag ( ) const ;
Returns the **connection tag**.

ImqBoolean setConnectionTag (const MQBYTE128 *tag* **= 0);**
Sets the **connection tag**. If *tag* is zero, clears the **connection tag**. This method returns TRUE if successful.

ImqBoolean setConnectionTag (const ImqBinary & *tag* **);**
Sets the **connection tag**. The **data length** of *tag* must be either zero (to clear the **connection tag**) or MQ_CONN_TAG_LENGTH. This method returns TRUE if successful.

MQLONG connectOptions( ) const ;
Returns the **connect options**.

void setConnectOptions(const MQLONG *options* **= MQCNO_NONE);**
Sets the **connect options**.

ImqBoolean connectionStatus( ) const ;
Returns the **connection status**.

ImqString cryptographicHardware ( );
Returns the **cryptographic hardware**.

ImqBoolean setCryptographicHardware (const char * *hardware* **= 0);**
Sets the **cryptographic hardware**. This method returns TRUE if successful.

ImqBoolean deadLetterQueueName(ImqString & *name* **);**
Provides a copy of the **dead-letter queue name**. It returns TRUE if successful.

ImqString deadLetterQueueName( );
Returns a copy of the **dead-letter queue name**, without any indication of possible errors.

ImqBoolean defaultTransmissionQueueName(ImqString & *name* **);**
Provides a copy of the **default transmission queue name**. It returns TRUE if successful.

ImqString defaultTransmissionQueueName( );
Returns the **default transmission queue name** without any indication of possible errors.

ImqBoolean disconnect( );
Disconnects from the queue manager and sets the **connection status** to FALSE. Closes all ImqProcess and ImqQueue objects associated with this object, and severs their **connection reference** before disconnection. If more than one ImqQueueManager object is connected to the same queue manager, only the last to disconnect performs a physical disconnection; others perform a logical disconnection. Uncommitted changes are committed on physical disconnection only.

This method returns TRUE if successful. If it is called when there is no existing connection, the return code is also true.

ImqBoolean distributionLists(MQLONG & *support* **);**
Provides a copy of the **distribution lists** value. It returns TRUE if successful.

MQLONG distributionLists( );
Returns the **distribution lists** value without any indication of possible errors.

ImqBoolean dnsGroup (ImqString & group);
Provides a copy of the DNS group name. It returns TRUE if successful.

ImqString dnsGroup ( );
Returns the DNS group name without any indication of possible errors.

ImqBoolean dnsWlm (MQLONG & wlm);
Provides a copy of the DNS WLM value. It returns TRUE if successful.

MQLONG dnsWlm ( );
Returns the DNS WLM value without any indication of possible errors.

ImqAuthenticationRecord * firstAuthenticationRecord ( ) const ;
Returns the **first authentication record**.

void setFirstAuthenticationRecord (const ImqAuthenticationRecord * *air* **= 0);**
Sets the **first authentication record**.

ImqObject * firstManagedObject( ) const ;
Returns the **first managed object**.

ImqBoolean inhibitEvent(MQLONG & *event* **);**
Provides a copy of the enablement state of the **inhibit event**. It returns TRUE if successful.

MQLONG inhibitEvent( );
Returns the enablement state of the **inhibit event** without any indication of possible errors.

ImqBoolean ipAddressVersion (MQLONG & version);
Provides a copy of the IP address version value. It returns TRUE if successful.

MQLONG ipAddressVersion ( );
Returns the IP address version value without any indication of possible errors.

ImqBoolean keepAlive (MQLONG & keepalive);
Provides a copy of the keep alive value. It returns TRUE if successful.

MQLONG keepAlive ( );
Returns the keep alive value without any indication of possible errors.

ImqString keyRepository ( );
Returns the **key repository**.

ImqBoolean setKeyRepository (const char * *repository* **= 0);**
Sets the **key repository**. It returns TRUE if successful.

ImqBoolean listenerTimer (MQLONG & timer);
Provides a copy of the listener timer value. It returns TRUE if successful.

MQLONG listenerTimer ( );
Returns the listener timer value without any indication of possible errors.

ImqBoolean localEvent(MQLONG & *event* **);**
Provides a copy of the enablement state of the **local event**. It returns TRUE if successful.

MQLONG localEvent( );
Returns the enablement state of the **local event** without any indication of possible errors.

ImqBoolean loggerEvent (MQLONG & count);
Provides a copy of the logger event value. It returns TRUE if successful.

MQLONG loggerEvent ( );
Returns the logger event value without any indication of possible errors.

ImqBoolean luGroupName (ImqString & name);.
Provides a copy of the LU group name. It returns TRUE if successful

ImqString luGroupName ( );
Returns the LU group name without any indication of possible errors.

ImqBoolean lu62ARMSuffix (ImqString & suffix);
Provides a copy of the LU62 ARM suffix. It returns TRUE if successful.

ImqString lu62ARMSuffix ( );
Returns the LU62 ARM suffix without any indication of possible errors

ImqBoolean luName (ImqString & name);
Provides a copy of the LU name. It returns TRUE if successful.

ImqString luName ( );
Returns the LU name without any indication of possible errors.

ImqBoolean maximumActiveChannels (MQLONG & channels);
Provides a copy of the maximum active channels value. It returns TRUE if successful.

MQLONG maximumActiveChannels ( );
Returns the maximum active channels value without any indication of possible errors.

ImqBoolean maximumCurrentChannels (MQLONG & channels);
Provides a copy of the maximum current channels value. It returns TRUE if successful.

MQLONG maximumCurrentChannels ( );
Returns the maximum current channels value without any indication of possible errors.

ImqBoolean maximumHandles(MQLONG & *number* **);**
Provides a copy of the **maximum handles**. It returns TRUE if successful.

MQLONG maximumHandles( );
Returns the **maximum handles** without any indication of possible errors.

ImqBoolean maximumLu62Channels (MQLONG & channels);
Provides a copy of the maximum LU62 channels value. It returns TRUE if successful.

MQLONG maximumLu62Channels ( );.
Returns the maximum LU62 channels value without any indication of possible errors

ImqBoolean maximumMessageLength(MQLONG & *length* **);**
Provides a copy of the **maximum message length**. It returns TRUE if successful.

MQLONG maximumMessageLength( );
Returns the **maximum message length** without any indication of possible errors.

ImqBoolean maximumPriority(MQLONG & *priority* **);**
Provides a copy of the **maximum priority**. It returns TRUE if successful.

MQLONG maximumPriority( );
Returns a copy of the **maximum priority**, without any indication of possible errors.

ImqBoolean maximumTcpChannels (MQLONG & channels);
Provides a copy of the maximum TCP channels value. It returns TRUE if successful.

MQLONG maximumTcpChannels ( );
Returns the maximum TCP channels value without any indication of possible errors.

ImqBoolean maximumUncommittedMessages(MQLONG & *number* **);**
Provides a copy of the **maximum uncommitted messages**. It returns TRUE if successful.

MQLONG maximumUncommittedMessages( );
Returns the **maximum uncommitted messages** without any indication of possible errors.

ImqBoolean mqiAccounting (MQLONG & statint);
Provides a copy of the MQI accounting value. It returns TRUE if successful.

MQLONG mqiAccounting ( );
Returns the MQI accounting value without any indication of possible errors.

ImqBoolean mqiStatistics (MQLONG & statmqi);
Provides a copy of the MQI statistics value. It returns TRUE if successful.

MQLONG mqiStatistics ( );
Returns the MQI statistics value without any indication of possible errors.

ImqBoolean outboundPortMax (MQLONG & max);
Provides a copy of the maximum outbound port value. It returns TRUE if successful.

MQLONG outboundPortMax ( );
Returns the maximum outbound port value without any indication of possible errors.

ImqBoolean outboundPortMin (MQLONG & min);
Provides a copy of the minimum outbound port value. It returns TRUE if successful.

MQLONG outboundPortMin ( );
Returns the minimum outbound port value without any indication of possible errors.

ImqBinary password ( ) const;
Returns the password used on client connections.

ImqBoolean setPassword (const ImqString & password);
Sets the password used on client connections.

ImqBoolean setPassword (const char * = 0 password);
Sets the password used on client connections.

ImqBoolean setPassword (const ImqBinary & password);
Sets the password used on client connections.

ImqBoolean performanceEvent(MQLONG & *event* **);**
Provides a copy of the enablement state of the **performance event**. It returns TRUE if successful.

MQLONG performanceEvent( );
Returns the enablement state of the **performance event** without any indication of possible errors.

ImqBoolean platform(MQLONG & *platform* **);**
Provides a copy of the **platform**. It returns TRUE if successful.

MQLONG platform( );
Returns the **platform** without any indication of possible errors.

ImqBoolean queueAccounting (MQLONG & acctq);
Provides a copy of the queue accounting value. It returns TRUE if successful.

MQLONG queueAccounting ( );
Returns the queue accounting value without any indication of possible errors.

ImqBoolean queueMonitoring (MQLONG & monq);
Provides a copy of the queue monitoring value. It returns TRUE if successful.

MQLONG queueMonitoring ( );
Returns the queue monitoring value without any indication of possible errors.

ImqBoolean queueStatistics (MQLONG & statq);
Provides a copy of the queue statistics value. It returns TRUE if successful.

MQLONG queueStatistics ( );
Returns the queue statistics value without any indication of possible errors.

ImqBoolean receiveTimeout (MQLONG & timeout);
Provides a copy of the receive timeout value. It returns TRUE if successful.

MQLONG receiveTimeout ( );
Returns the receive timeout value without any indication of possible errors.

ImqBoolean receiveTimeoutMin (MQLONG & min);
Provides a copy of the minimum receive timeout value. It returns TRUE if successful.

MQLONG receiveTimeoutMin ( );
Returns the minimum receive timeout value without any indication of possible errors.

ImqBoolean receiveTimeoutType (MQLONG & type);
Provides a copy of the receive timeout type. It returns TRUE if successful.

MQLONG receiveTimeoutType ( );
Returns the receive timeout type without any indication of possible errors.

ImqBoolean remoteEvent(MQLONG & *event* **);**
Provides a copy of the enablement state of the **remote event**. It returns TRUE if successful.

MQLONG remoteEvent( );
Returns the enablement state of the **remote event** without any indication of possible errors.

ImqBoolean repositoryName(ImqString & *name* **);**
Provides a copy of the **repository name**. It returns TRUE if successful.

ImqString repositoryName( );
Returns the **repository name** without any indication of possible errors.

ImqBoolean repositoryNamelistName(ImqString & *name* **);**
Provides a copy of the **repository namelist name**. It returns TRUE if successful.

ImqString repositoryNamelistName( );
Returns a copy of the **repository namelist name** without any indication of possible errors.

ImqBoolean sharedQueueQueueManagerName (MQLONG & name);
Provides a copy of the shared queue queue manager name value. It returns TRUE if successful.

MQLONG sharedQueueQueueManagerName ( );
Returns the shared queue queue manager name value without any indication of possible errors.

ImqBoolean sslEvent (MQLONG & event);
Provides a copy of the SSL event value. It returns TRUE if successful.

MQLONG sslEvent ( );
Returns the SSL event value without any indication of possible errors.

ImqBoolean sslFips (MQLONG & sslfips);
Provides a copy of the SSL FIPS value. It returns TRUE if successful.

MQLONG sslFips ( );
Returns the SSL FIPS value without any indication of possible errors.

ImqBoolean sslKeyResetCount (MQLONG & count);
Provides a copy of the SSL key reset count value. It returns TRUE if successful.

MQLONG sslKeyResetCount ( );
Returns the SSL key reset count value without any indication of possible errors.

ImqBoolean startStopEvent(MQLONG & *event* **);**
Provides a copy of the enablement state of the **start-stop event**. It returns TRUE if successful.

MQLONG startStopEvent( );
Returns the enablement state of the **start-stop event** without any indication of possible errors.

ImqBoolean statisticsInterval (MQLONG & statint);
Provides a copy of the statistics interval value. It returns TRUE if successful.

MQLONG statisticsInterval ( );
Returns the statistics interval value without any indication of possible errors.

ImqBoolean syncPointAvailability(MQLONG & *sync* **);**
Provides a copy of the **syncpoint availability** value. It returns TRUE if successful.

MQLONG syncPointAvailability( );
Returns a copy of the **syncpoint availability** value, without any indication of possible errors.

ImqBoolean tcpName (ImqString & name);
Provides a copy of the TCP system name. It returns TRUE if successful.

ImqString tcpName ( );
Returns the TCP system name without any indication of possible errors.

ImqBoolean tcpStackType (MQLONG & type);
Provides a copy of the TCP stack type. It returns TRUE if successful.

MQLONG tcpStackType ( );
Returns the TCP stack type without any indication of possible errors.

ImqBoolean traceRouteRecording (MQLONG & routerec);
Provides a copy of the trace route recording value. It returns TRUE if successful.

MQLONG traceRouteRecording ( );
Returns the trace route recording value without any indication of possible errors.

ImqBoolean triggerInterval(MQLONG & *interval* **);**
Provides a copy of the **trigger interval**. It returns TRUE if successful.

MQLONG triggerInterval( );
Returns the **trigger interval** without any indication of possible errors.

ImqBinary userId ( ) const;
Returns the user ID used on client connections.

ImqBoolean setUserId (const ImqString & id);
Sets the user ID used on client connections.

ImqBoolean setUserId (const char * = 0 id);
Sets the user ID used on client connections.

ImqBoolean setUserId (const ImqBinary & id);
Sets the user ID used on client connections.

Object methods (protected)

void setFirstManagedObject(const ImqObject * *object* **= 0);**
Sets the **first managed object**.

Object data (protected)

MQHCONN *ohconn*
The WebSphere MQ connection handle (meaningful only while the **connection status** is TRUE).

Reason codes

- MQRC_ATTRIBUTE_LOCKED
- MQRC_ENVIRONMENT_ERROR
- MQRC_FUNCTION_NOT_SUPPORTED
- MQRC_REFERENCE_ERROR
- (reason codes for MQBACK)
- (reason codes for MQBEGIN)
- (reason codes for MQCMIT)
- (reason codes for MQCONNX)
- (reason codes for MQDISC)
- (reason codes for MQCONN)

ImqReferenceHeader

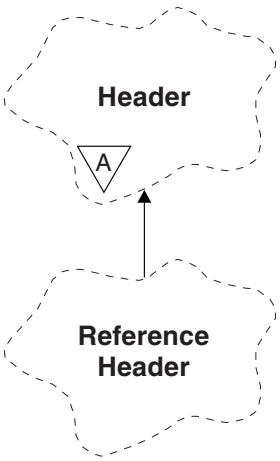

Figure 23. ImqReferenceHeader class

This class encapsulates features of the MQRMH data structure. It relates to the MQI calls listed in Table 24 on page 173.

Other relevant classes

- ImqBinary (see "ImqBinary" on page 40)
- ImqHeader (see "ImqHeader" on page 69)
- ImqItem (see "ImqItem" on page 74)
- ImqMessage (see "ImqMessage" on page 76)
- ImqString (see "ImqString" on page 138)

Object attributes

destination environment
Environment for the destination. The initial value is a null string.

destination name
Name of the data destination. The initial value is a null string.

instance id
Instance identifier. A binary value (MQBYTE24) of length MQ_OBJECT_INSTANCE_ID_LENGTH. The initial value is MQOII_NONE.

logical length
Logical, or intended, length of message data that follows this header. The initial value is zero.

logical offset
Logical offset for the message data that follows, to be interpreted in the context of the data as a whole, at the ultimate destination. The initial value is zero.

logical offset 2
High-order extension to the **logical offset**. The initial value is zero.

reference type
Reference type. The initial value is a null string.

source environment
Environment for the source. The initial value is a null string.

source name
Name of the data source. The initial value is a null string.

Constructors

ImqReferenceHeader( );
The default constructor.

ImqReferenceHeader(const ImqReferenceHeader & *header* **);**
The copy constructor.

Overloaded ImqItem methods

virtual ImqBoolean copyOut(ImqMessage & *msg* **);**
Inserts an MQRMH data structure into the message buffer at the beginning, moving existing message data further along, and sets the *msg* **format** to MQFMT_REF_MSG_HEADER.

See the ImqHeader class method description on "ImqHeader" on page 69 for further details.

virtual ImqBoolean pasteIn(ImqMessage & *msg* **);**
Reads an MQRMH data structure from the message buffer.

To be successful, the ImqMessage **format** must be MQFMT_REF_MSG_HEADER.

See the ImqHeader class method description on "ImqHeader" on page 69 for further details.

Object methods (public)

void operator = (const ImqReferenceHeader & *header* **);**
Copies instance data from *header*, replacing the existing instance data.

ImqString destinationEnvironment( ) const ;
Returns a copy of the **destination environment**.

void setDestinationEnvironment(const char * *environment* **= 0);**
Sets the **destination environment**.

ImqString destinationName( ) const ;
Returns a copy of the **destination name**.

void setDestinationName(const char * *name* **= 0);**
Sets the **destination name**.

ImqBinary instanceId( ) const ;
Returns a copy of the **instance id**.

ImqBoolean setInstanceId(const ImqBinary & *id* **);**
Sets the **instance id**. The **data length** of *token* must be either 0 or MQ_OBJECT_INSTANCE_ID_LENGTH. This method returns TRUE if successful.

void setInstanceId(const MQBYTE24 *id* **= 0);**
Sets the **instance id**. *id* can be zero, which is the same as specifying MQOII_NONE. If *id* is nonzero, it must address MQ_OBJECT_INSTANCE_ID_LENGTH bytes of binary data. When using

pre-defined values such as MQOII_NONE, you might need to make a cast to ensure a signature match, for example (MQBYTE *)MQOII_NONE.

MQLONG logicalLength( ) const ;
Returns the **logical length**.

void setLogicalLength(const MQLONG *length* **);**
Sets the **logical length**.

MQLONG logicalOffset( ) const ;
Returns the **logical offset**.

void setLogicalOffset(const MQLONG *offset* **);**
Sets the **logical offset**.

MQLONG logicalOffset2( ) const ;
Returns the **logical offset 2**.

void setLogicalOffset2(const MQLONG *offset* **);**
Sets the **logical offset 2**.

ImqString referenceType( ) const ;
Returns a copy of the **reference type**.

void setReferenceType(const char * *name* **= 0);**
Sets the **reference type**.

ImqString sourceEnvironment( ) const ;
Returns a copy of the **source environment**.

void setSourceEnvironment(const char * *environment* **= 0);**
Sets the **source environment**.

ImqString sourceName( ) const ;
Returns a copy of the **source name**.

void setSourceName(const char * *name* **= 0);**
Sets the **source name**.

Object data (protected)

MQRMH *omqrmh*
The MQRMH data structure.

- MQRC_STRUC_ID_ERROR
- MQRC_INSUFFICIENT_DATA
- MQRC_INCONSISTENT_FORMAT
- MQRC_ENCODING_ERROR

ImqString

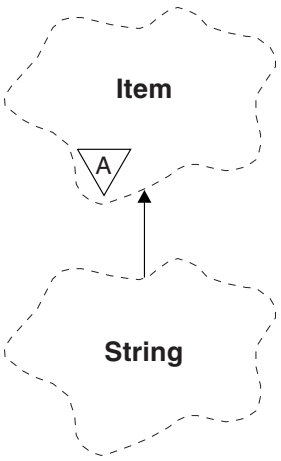

Figure 24. ImqString class

This class provides character string storage and manipulation for null-terminated strings. Use an ImqString in place of a **char** * in most situations where a parameter calls for a **char** *.

Other relevant classes

- ImqItem (see "ImqItem" on page 74)
- ImqMessage (see "ImqMessage" on page 76)

Object attributes

characters
Characters in the **storage** that precede a trailing null.

length Number of bytes in the **characters**. If there is no **storage**, the **length** is zero. The initial value is zero.

storage
A volatile array of bytes of arbitrary size. A trailing null must always be present in the **storage** after the **characters**, so that the end of the **characters** can be detected. Methods ensure that this situation is maintained, but ensure, when setting bytes in the array directly, that a trailing null exists after modification. Initially, there is no **storage** attribute.

Constructors

ImqString( );
The default constructor.

ImqString(const ImqString & *string* **);**
The copy constructor.

ImqString(const char *c* **);**
The **characters** comprise *c*.

ImqString(const char * *text* **);**
The **characters** are copied from *text*.

ImqString(const void * *buffer*, const size_t *length*);
Copies *length* bytes starting from *buffer* and assigns them to the **characters**. Substitution is made for any null characters copied. The substitution character is a period (.). No special consideration is given to any other non-printable or non-displayable characters copied.

Class methods (public)

static ImqBoolean copy(char * *destination-buffer*, const size_t *length*, const char * *source-buffer*, const char *pad* = 0);
Copies up to *length* bytes from *source-buffer* to *destination-buffer*. If the number of characters in *source-buffer* is insufficient, fills the remaining space in *destination-buffer* with *pad* characters. *source-buffer* can be zero. *destination-buffer* can be zero if *length* is also zero. Any error codes are lost. This method returns TRUE if successful.

static ImqBoolean copy (char * *destination-buffer*, const size_t *length*, const char * *source-buffer*, ImqError & *error-object*, const char *pad* = 0);
Copies up to *length* bytes from *source-buffer* to *destination-buffer*. If the number of characters in *source-buffer* is insufficient, fills the remaining space in *destination-buffer* with *pad* characters. *source-buffer* can be zero. *destination-buffer* can be zero if *length* is also zero. Any error codes are set in *error-object*. This method returns TRUE if successful.

Overloaded ImqItem methods

virtual ImqBoolean copyOut(ImqMessage & *msg*);
Copies the **characters** to the message buffer, replacing any existing content. Sets the *msg* **format** to MQFMT_STRING.

See the parent class method description for further details.

virtual ImqBoolean pasteIn(ImqMessage & *msg*);
Sets the **characters** by transferring the remaining data from the message buffer, replacing the existing **characters**.

To be successful, the **encoding** of the *msg* object must be MQENC_NATIVE. Retrieve messages with MQGMO_CONVERT to MQENC_NATIVE.

To be successful, the ImqMessage **format** must be MQFMT_STRING.

See the parent class method description for further details.

Object methods (public)

char & operator [ ] (const size_t *offset*) const ;
References the character at offset *offset* in the **storage**. Ensure that the relevant byte exists and is addressable.

ImqString operator ( ) (const size_t *offset*, const size_t *length* = 1) const ;
Returns a substring by copying bytes from the **characters** starting at *offset*. If *length* is zero, returns the rest of the **characters**. If the combination of *offset* and *length* does not produce a reference within the **characters**, returns an empty ImqString.

void operator = (const ImqString & *string*);
Copies instance data from *string*, replacing the existing instance data.

ImqString operator + (const char *c*) const ;
Returns the result of appending *c* to the **characters**.

ImqString operator + (const char * *text*) const ;
Returns the result of appending *text* to the **characters**. This can also be inverted. For example:

```
strOne + "string two" ;
"string one" + strTwo ;
```

Note: Although most compilers accept **strOne + "string two";** Microsoft Visual C++ requires **strOne + (char *)"string two" ;**

ImqString operator + (const ImqString & *string1*) const ;
Returns the result of appending *string1* to the **characters**.

ImqString operator + (const double *number*) const ;
Returns the result of appending *number* to the **characters** after conversion to text.

ImqString operator + (const long *number*) const ;
Returns the result of appending *number* to the **characters** after conversion to text.

void operator += (const char *c*);
Appends *c* to the **characters**.

void operator += (const char * *text*);
Appends *text* to the **characters**.

void operator += (const ImqString & *string*);
Appends *string* to the **characters**.

void operator += (const double *number*);
Appends *number* to the **characters** after conversion to text.

void operator += (const long *number*);
Appends *number* to the **characters** after conversion to text.

operator char * ( ) const ;
Returns the address of the first byte in the **storage**. This value can be zero, and is volatile. Use this method only for read-only purposes.

ImqBoolean operator < (const ImqString & *string*) const ;
Compares the **characters** with those of *string* using the **compare** method. The result is TRUE if less than and FALSE if greater than or equal to.

ImqBoolean operator > (const ImqString & *string*) const ;
Compares the **characters** with those of *string* using the **compare** method. The result is TRUE if greater than and FALSE if less than or equal to.

ImqBoolean operator <= (const ImqString & *string*) const ;
Compares the **characters** with those of *string* using the **compare** method. The result is TRUE if less than or equal to and FALSE if greater than.

ImqBoolean operator >= (const ImqString & *string*) const ;
Compares the **characters** with those of *string* using the **compare** method. The result is TRUE if greater than or equal to and FALSE if less than.

ImqBoolean operator == (const ImqString & *string*) const ;
Compares the **characters** with those of *string* using the **compare** method. It returns either TRUE or FALSE.

ImqBoolean operator != (const ImqString & *string*) const ;
Compares the **characters** with those of *string* using the **compare** method. It returns either TRUE or FALSE.

short compare(const ImqString & *string* **) const ;**

Compares the **characters** with those of *string*. The result is zero if the **characters** are equal, negative if less than and positive if greater than. Comparison is case sensitive. A null ImqString is regarded as less than a nonnull ImqString.

ImqBoolean copyOut(char * *buffer*, **const size_t** *length*, **const char** *pad* **= 0);**

Copies up to *length* bytes from the **characters** to the *buffer*. If the number of **characters** is insufficient, fills the remaining space in *buffer* with *pad* characters. *buffer* can be zero if *length* is also zero. It returns TRUE if successful.

size_t copyOut(long & *number* **) const ;**

Sets *number* from the **characters** after conversion from text, and returns the number of characters involved in the conversion. If this is zero, no conversion has been performed and *number* is not set. A convertible character sequence must begin with the following values:

```
<blank(s)>
<+|->
digit(s)
```

size_t copyOut(ImqString & *token*, **const char** *c* **= ' ') const ;**

If the **characters** contain one or more characters that are different from *c*, identifies a token as the first contiguous sequence of such characters. In this case *token* is set to that sequence, and the value returned is the sum of the number of leading characters *c* and the number of bytes in the sequence. Otherwise, returns zero and does not set *token*.

size_t cutOut(long & *number* **);**

Sets *number* as for the **copy** method, but also removes from **characters** the number of bytes indicated by the return value. For example, the string shown in the following example can be cut into three numbers by using **cutOut**(*number*) three times:

```
strNumbers = "-1 0     +55 ";

while ( strNumbers.cutOut( number ) );
number becomes -1, then 0, then 55
leaving strNumbers == " "
```

size_t cutOut(ImqString & *token*, **const char** *c* **= ' ');**

Sets *token* as for the **copyOut** method, and removes from **characters** the *strToken* characters and also any characters *c* that precede the *token* characters. If *c* is not a blank, removes characters *c* that directly succeed the *token* characters. Returns the number of characters removed. For example, the string shown in the following example can be cut into three tokens by using **cutOut**(*token*) three times:

```
strText = "  Program Version 1.1  ";

while ( strText.cutOut( token ) );

// token becomes "Program", then "Version",
// then "1.1" leaving strText == "  "
```

The following example shows how to parse a DOS path name:

```
strPath = "C:\OS2\BITMAP\OS2LOGO.BMP"

strPath.cutOut( strDrive, ':' );
strPath.stripLeading( ':' );
while ( strPath.cutOut( strFile, '\' ) );
```

```
// strDrive becomes "C".
// strFile becomes "OS2", then "BITMAP",
// then "OS2LOGO.BMP" leaving strPath empty.
```

ImqBoolean find(const ImqString & *string* **);**
Searches for an exact match for *string* anywhere within the **characters**. If no match is found, it returns FALSE. Otherwise, it returns TRUE. If *string* is null, it returns TRUE.

ImqBoolean find(const ImqString & *string*, **size_t &** *offset* **);**
Searches for an exact match for *string* somewhere within the **characters** from offset *offset* onwards. If *string* is null, it returns TRUE without updating *offset*. If no match is found, it returns FALSE (the value of *offset* might have been increased). If a match is found, it returns TRUE and updates *offset* to the offset of *string* within the **characters**.

size_t length( ) const ;
Returns the **length**.

ImqBoolean pasteIn(const double *number*, **const char** * *format* **= "%f");**
Appends *number* to the **characters** after conversion to text. It returns TRUE if successful.

The specification *format* is used to format the floating point conversion. If specified, it must be one suitable for use with **printf** and floating point numbers, for example **%.3f**.

ImqBoolean pasteIn(const long *number* **);**
Appends *number* to the **characters** after conversion to text. It returns TRUE if successful.

ImqBoolean pasteIn(const void * *buffer*, **const size_t** *length* **);**
Appends *length* bytes from *buffer* to the **characters**, and adds a final trailing null. Substitutes any null characters copied. The substitution character is a period (.). No special consideration is given to any other nonprintable or nondisplayable characters copied. This method returns TRUE if successful.

ImqBoolean set(const char * *buffer*, **const size_t** *length* **);**
Sets the **characters** from a fixed-length character field, which might contain a null. Appends a null to the characters from the fixed-length field if necessary. This method returns TRUE if successful.

ImqBoolean setStorage(const size_t *length* **);**
Allocates (or reallocates) the **storage**. Preserves any original **characters**, including any trailing null, if there is still room for them, but does not initialize any additional storage.

This method returns TRUE if successful.

size_t storage( ) const ;
Returns the number of bytes in the **storage**.

size_t stripLeading(const char *c* **= ' ');**
Strips leading characters *c* from the **characters** and returns the number removed.

size_t stripTrailing(const char *c* **= ' ');**
Strips trailing characters *c* from the **characters** and returns the number removed.

ImqString upperCase( ) const ;
Returns an uppercase copy of the **characters**.

Object methods (protected)

ImqBoolean assign(const ImqString & *string* **);**

Equivalent to the equivalent **operator =** method, but non-virtual. It returns TRUE if successful.

Reason codes

- MQRC_DATA_TRUNCATED
- MQRC_NULL_POINTER
- MQRC_STORAGE_NOT_AVAILABLE
- MQRC_BUFFER_ERROR
- MQRC_INCONSISTENT_FORMAT

ImqTrigger

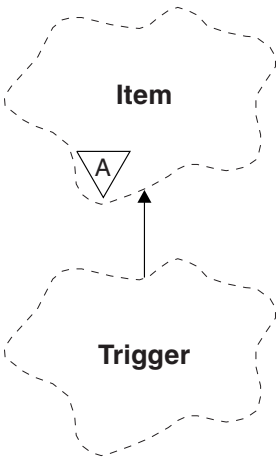

Figure 25. ImqTrigger class

This class encapsulates the MQTM data structure (see Table 25 on page 173). Objects of this class are typically used by a trigger monitor program, whose task is to wait for these particular messages and act on them to ensure that other WebSphere MQ applications are started when messages are waiting for them.

See the IMQSTRG sample program for a usage example.

Other relevant classes

- ImqGetMessageOptions (see "ImqGetMessageOptions" on page 65)
- ImqItem (see "ImqItem" on page 74)
- ImqMessage (see "ImqMessage" on page 76)
- ImqString (see "ImqString" on page 138)

Object attributes

application id
Identity of the application that sent the message. The initial value is a null string.

application type
Type of application that sent the message. The initial value is zero. The following additional values are possible:

- MQAT_AIX
- MQAT_CICS
- MQAT_DOS
- MQAT_IMS
- MQAT_MVS
- MQAT_NOTES_AGENT
- MQAT_OS2
- MQAT_OS390
- MQAT_OS400
- MQAT_UNIX

- MQAT_WINDOWS
- MQAT_WINDOWS_NT
- MQAT_USER_FIRST
- MQAT_USER_LAST

environment data
Environment data for the process. The initial value is a null string.

process name
Process name. The initial value is a null string.

queue name
Name of the queue to be started. The initial value is a null string.

trigger data
Trigger data for the process. The initial value is a null string.

user data
User data for the process. The initial value is a null string.

Constructors

ImqTrigger( );
The default constructor.

ImqTrigger(const ImqTrigger & *trigger* **);**
The copy constructor.

Overloaded ImqItem methods

virtual ImqBoolean copyOut(ImqMessage & *msg* **);**
Writes an MQTM data structure to the message buffer, replacing any existing content. Sets the *msg* **format** to MQFMT_TRIGGER.

See the ImqItem class method description on "ImqItem" on page 74 for further details.

virtual ImqBoolean pasteIn(ImqMessage & *msg* **);**
Reads an MQTM data structure from the message buffer.

To be successful, the ImqMessage **format** must be MQFMT_TRIGGER.

See the ImqItem class method description on "ImqItem" on page 74 for further details.

Object methods (public)

void operator = (const ImqTrigger & *trigger* **);**
Copies instance data from *trigger*, replacing the existing instance data.

ImqString applicationId( ) const ;
Returns a copy of the **application id**.

void setApplicationId(const char * *id* **);**
Sets the **application id**.

MQLONG applicationType( ) const ;
Returns the **application type**.

void setApplicationType(const MQLONG *type* **);**
Sets the **application type**.

ImqBoolean copyOut(MQTMC2 * *ptmc2*);
Encapsulates the MQTM data structure, which is the one received on initiation queues. Fills in an equivalent MQTMC2 data structure provided by the caller, and sets the QMgrName field (which is not present in the MQTM data structure) to all blanks. The MQTMC2 data structure is traditionally used as a parameter to applications started by a trigger monitor. This method returns TRUE if successful.

ImqString environmentData( ) const ;
Returns a copy of the **environment data**.

void setEnvironmentData(const char * *data*);
Sets the **environment data**.

ImqString processName( ) const ;
Returns a copy of the **process name**.

void setProcessName(const char * *name*);
Sets the **process name**, padded with blanks to 48 characters.

ImqString queueName( ) const ;
Returns a copy of the **queue name**.

void setQueueName(const char * *name*);
Sets the **queue name**, padding with blanks to 48 characters.

ImqString triggerData( ) const ;
Returns a copy of the **trigger data**.

void setTriggerData(const char * *data*);
Sets the **trigger data**.

ImqString userData( ) const ;
Returns a copy of the **user data**.

void setUserData(const char * *data*);
Sets the **user data**.

Object data (protected)

MQTM *omqtm*
The MQTM data structure.

Reason codes

- MQRC_NULL_POINTER
- MQRC_INCONSISTENT_FORMAT
- MQRC_ENCODING_ERROR
- MQRC_STRUC_ID_ERROR

ImqWorkHeader

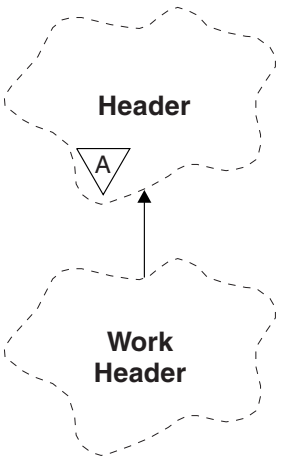

Figure 26. ImqWorkHeader class

This class encapsulates specific features of the MQWIH data structure (see Table 26 on page 174). Objects of this class are used by applications putting messages to the queue managed by the z/OS Workload Manager.

Other relevant classes

- ImqBinary (see "ImqBinary" on page 40)
- ImqHeader (see "ImqHeader" on page 69)
- ImqItem (see "ImqItem" on page 74)
- ImqMessage (see "ImqMessage" on page 76)
- ImqString (see "ImqString" on page 138)

Object attributes

message token
Message token for the z/OS Workload Manager, of length MQ_MSG_TOKEN_LENGTH. The initial value is MQMTOK_NONE.

service name
The 32-character name of a process. The name is initially blanks.

service step
The 8-character name of a step within the process. The name is initially blanks.

Constructors

ImqWorkHeader( );
The default constructor.

ImqWorkHeader(const ImqWorkHeader & *header* **);**
The copy constructor.

Overloaded ImqItem methods

virtual ImqBoolean copyOut(ImqMessage & *msg*);
Inserts an MQWIH data structure into the beginning of the message buffer, moving the existing message data further along, and sets the *msg* **format** to MQFMT_WORK_INFO_HEADER.

See the parent class method description for more details.

virtual ImqBoolean pasteIn(ImqMessage & *msg*);
Reads an MQWIH data structure from the message buffer.

To be successful, the encoding of the *msg* object must be MQENC_NATIVE. Retrieve messages with MQGMO_CONVERT to MQENC_NATIVE.

The ImqMessage format must be MQFMT_WORK_INFO_HEADER.

See the parent class method description for more details.

Object methods (public)

void operator = (const ImqWorkHeader & *header*);
Copies instance data from *header*, replacing the existing instance data.

ImqBinary messageToken ( ) const;
Returns the **message token**.

ImqBoolean setMessageToken(const ImqBinary & *token*);
Sets the **message token**. The data length of *token* must be either zero or MQ_MSG_TOKEN_LENGTH. It returns TRUE if successful.

void setMessageToken(const MQBYTE16 *token* = 0);
Sets the **message token**. *token* can be zero, which is the same as specifying MQMTOK_NONE. If *token* is nonzero, it must address MQ_MSG_TOKEN_LENGTH bytes of binary data.

When using predefined values such as MQMTOK_NONE, you might need make a cast to ensure a signature match; for example, (MQBYTE *)MQMTOK_NONE.

ImqString serviceName ( ) const;
Returns the **service name**, including trailing blanks.

void setServiceName(const char * *name*);
Sets the **service name**.

ImqString serviceStep ( ) const;
Returns the **service step**, including trailing blanks.

void setServiceStep(const char * *step*);
Sets the **service step**.

Object data (protected)

MQWIH omqwih
The MQWIH data structure.

Reason codes

- MQRC_BINARY_DATA_LENGTH_ERROR

Chapter 14. Building WebSphere MQ C++ programs

The URL of supported compilers is listed, together with the commands to use to compile, link and run C++ programs and samples on WebSphere MQ platforms.

The compilers for each supported platform and version of WebSphere MQ are listed at http://www.ibm.com/software/integration/wmq/requirements/index.html.

The command you need to compile and link your WebSphere MQ C++ program depends on your installation and requirements. The examples that follow show typical compile and link commands for some of the compilers using the default installation of WebSphere MQ on a number of platforms.

AIX®

Build WebSphere MQ C++ programs on AIX using the XL C Enterprise Edition compiler.

Client

32-bit unthreaded application

```

HP-UX

Build WebSphere MQ C++ programs on HP-UX using the aC++ or aCC compilers.

The HP ANSI C++ compiler supports two distinct runtime environments for C++ applications, the Classic C++ runtime and the Standard C++ runtime.

On HP-UX (PA-RISC) MQ supports both the Classic and Standard runtimes. Use the aC++ compiler

- libimqi23ah.sl provides the WMQ C++ classes for the Classic runtime.
- libimqi23bh.sl provides the WMQ C++ classes for the Standard runtime.

On HP-UX Itanium MQ supports only the Standard runtime. Use the aCC compiler.

- libimqi23bh.sl provides the WMQ C++ classes for the Standard runtime.
- For compatability with earlier releases, a symlink is provided for libimqi23ah.sl to libimqi23bh.sl.

PA-RISC using Classic runtime

Client: PA-RISC Classic

32-bit unthreaded application

```
aCC -Wl,+b,: -D_HPUX_SOURCE -o imqsputc_32 imqsput.cpp -I/opt/mqm/inc
-L/opt/mqm/lib -L/usr/lib -limqi23ah -lmqic
```

32-bit threaded application

```
aCC -Wl,+b,: -D_HPUX_SOURCE -o imqsputc_32_r imqsput.cpp -I/opt/mqm/inc
-L/opt/mqm/lib -L/usr/lib -limqi23ah_r -lmqic_r -lpthread
```

64-bit unthreaded application

```
aCC +DD64 -Wl,+noenvvar -D_HPUX_SOURCE -o imqsputc_64 imqsput.cpp

HP OpenVMS

Build WebSphere MQ C++ programs on HP OpenVMS using the HP C++ compiler

Client

Alpha and IA64(IPF)

Create a DCL script file, compile_link_client.com, containing the lines:

```
$CXX /include_directory=mqs_include imqsput.cxx
$CXXLINK/exe=imqsputc imqsput.obj,sys$input/options
sys$share:imqc/shareable
sys$share:imqb/shareable
$ EXIT
```

Run the DCL script with the command

```
$ @compile_link_client.com
```

Server

Alpha and IA64(IPF)

Create a DCL script file, compile_link_server.com, containing the lines:

```
$CXX /include_directory=mqs_include imqsput.cxx
$CXXLINK/exe=imqsput imqsput.obj,sys$input/options
sys$share:imqs/shareable
sys$share:imqb/shareable
$ EXIT
```

Run the DCL script with the command

```
$ @compile_link_server.com
```

i5

Build WebSphere MQ C++ programs on i5 using the ILE C++ compiler.

IBM® ILE C++ for i5/OS is a native compiler for C++ programs. The following instructions describe how to use it compiler to create WebSphere MQ C++ applications using the *Hello World!* WebSphere MQ sample program as an example.

1. Install the ILE C++ for i5/OS compiler as directed in the *Read Me first!* manual that accompanies the product.
2. Ensure that the QCXXN library is in your library list.
3. Create the HELLO WORLD sample program:
   a. Create a module:

```
CRTCPPMOD MODULE(MYLIB/IMQWRLD) +
SRCSTMF('/QIBM/ProdData/mqm/samp/imqwrld.cpp') +
INCDIR('/QIBM/ProdData/mqm/inc') DFTCHAR(*SIGNED) +
TERASPACE(*YES)
```

The source for the C++ sample programs can be found in /QIBM/ProdData/mqm/samp and the include files in /QIBM/ProdData/mqm/inc.

Alternatively, the source can be found in library SRCFILE(QCPPSRC/LIB) SRCMBR(IMQWRLD).

b. Bind this with WebSphere MQ-supplied service programs to produce a program object:

```
CRTPGM PGM(MYLIB/IMQWRLD) MODULE(MYLIB/IMQWRLD) +
BNDSRVPGM(QMQM/IMQB23I4 QMQM/IMQS23I4)
```

To build a threaded application use the re-entrant service programs:

```
CRTPGM PGM(MYLIB/IMQWRLD) MODULE(MYLIB/IMQWRLD) +
BNDSRVPGM(QMQM/IMQB23I4[_R] QMQM/IMQS23I4[_R])
```

c. Execute the HELLO WORLD sample program, using SYSTEM.DEFAULT.LOCAL.QUEUE:

```
CALL PGM(MYLIB/IMQWRLD)
```

Linux

Build WebSphere MQ C++ programs on Linux using the GNU g++ compiler.

```

Windows

Build WebSphere MQ C++ programs on Windows using the Microsoft Visual Studio C++ compiler.

Library (.lib) files and dll files for use with 32-bit applications are installed in *install_location*/Tools/Lib, files for use with 64-bit applications are installed in *install_location*/Tools/Lib64.

Client

```
cl -MD imqsput.cpp /Feimqsputc.exe imqb23vn.lib imqc23vn.lib
```

Server

```
cl -MD imqsput.cpp /Feimqsput.exe imqb23vn.lib imqs23vn.lib
```

z/OS Batch, RRS Batch and CICS

Build WebSphere MQ C++ programs on z/OS for the Batch, RRS batch or CICS environments and run the sample programs.

You can write C++ programs for three of the environments that WebSphere MQ for z/OS supports:

- Batch
- RRS batch
- CICS

Compile, prelink and link

Create an z/OS application by compiling, pre-linking, and link-editing your C++ source code.

WebSphere MQ C++ for z/OS is implemented as z/OS DLLs for the IBM C++ for z/OS language. Using DLLs, you concatenate the supplied definition side-decks with the compiler output at pre-link time. This allows the linker to check your calls to the WebSphere MQ C++ member functions.

Note: There are three sets of side-decks for each of the three environments.

To build a WebSphere MQ for z/OS C++ application, create and run JCL. Use the following procedure:

1. If your application runs under CICS, use the CICS-supplied procedure to translate CICS commands in your program.

   In addition, for CICS applications you need to:

   a. Add the SCSQLOAD library to the DFHRPL concatenation.
   b. Define the CSQCAT1 CEDA group using the member IMQ4B100 in the SCSQPROC library.
   c. Install CSQCAT1.
2. Compile the program to produce object code. The JCL for your compilation must include statements that make the product data definition files available to the compiler. The data definitions are supplied in the following WebSphere MQ for z/OS libraries:

   - **thlqual**.SCSQC370
   - **thlqual**.SCSQHPPS

   Be sure to specify the `/cxx` compiler option.

   Note: The name **thlqual** is the high level qualifier of the WebSphere MQ installation library on z/OS.
3. Pre-link the object code created in step 2, including the following definition side-decks, which are supplied in **thlqual**.SCSQDEFS:

   a. imqs23dm and imqb23dm for batch
   b. imqs23dr and imqb23dr for RRS batch
   c. imqs23dc and imqb23dc for CICS

   These are the corresponding DLLs.

   a. imqs23im and imqb23im for batch
   b. imqs23ir and imqb23ir for RRS batch

c. imqs23ic and imqb23ic for CICS

4. Link-edit the object code created in step 3 on page 157, to produce a load module, and store it in your application load library.

To run batch or RRS batch programs, include the libraries **thlqual**.SCSQAUTH and **thlqual**.SCSQLOAD in the STEPLIB or JOBLIB data set concatenation.

To run a CICS program, first get your system administrator to define it to CICS as a WebSphere MQ program and transaction. You can then run it in the usual way.

Run the sample programs

The programs are described in Chapter 8, "Sample programs," on page 19.

The sample applications are supplied in source form only. The files are:

Table 4. z/OS sample program files

Sample	Source program (in library thlqual.SCSQCPPS)	JCL (in library thlqual.SCSQPROC)
HELLO WORLD	imqwrld	imqwrldr
SPUT	imqsput	imqsputr
SGET	imqsget	imqsgetr

To run the samples, compile and link-edit them as with any C++ program (see "z/OS Batch, RRS Batch and CICS" on page 157). Use the supplied JCL to construct and run a batch job. You must initially customize the JCL, by following the commentary included with it.

z/OS UNIX System Services

Build WebSphere MQ C++ programs on z/OS for Unix System Services.

To build an application under the UNIX System Services shell, you must give the compiler access to the WebSphere MQ include files (located in thlqual.SCSQC370 and hlqual.SCSQHPPS), and link against two of the DLL side-decks (located in thlqual.SCSQDEFS). At runtime, the application needs access to the WebSphere MQ data sets thlqual.SCSQLOAD, thlqual.SCSQAUTH, and one of the language specific data sets, such as thlqual.SCSQANLE[1].

Compiling

1. Copy the sample into the HFS using the TSO oput command, or use FTP. The rest of this example assumes that you have copied the sample into a directory called /u/fred/sample, and named it imqwrld.cpp.
2. Log into the UNIX System Services shell, and change to the directory where you placed the sample.
3. Set up the C++ compiler so that it can accept the DLL side-deck and .cpp files as input:

```
/u/fred/sample:> export _CXX_EXTRA_ARGS=1
/u/fred/sample:> export _CXX_CXXSUFFIX="cpp"
```

1. You can link with any of the side-decks listed in "Pre-link the object code" to run your UNIX system service in any of the three environments, "z/OS Batch, RRS Batch and CICS" on page 157

4. Compile and link the sample program. The following command links the program with the batch side-decks; the RRS batch side-decks can be used instead. The \ character is used to split the command over more than one line. Do not enter this character; enter the command as a single line:

```
/u/fred/sample:> c++ -o imqwrld -I "//'thlqual.SCSQC370'" \
-I "//'thlqual.SCSQHPPS'" imqwrld.cpp \
"//'thlqual.SCSQDEFS(IMQS23DM)'" "//'thlqual.SCSQDEFS(IMQB23DM)'"
```

For more information on the TSO oput command, refer to the *z/OS UNIX System Services Command Reference*.

You can also use the make utility to simplify building C++ programs. Here is a sample makefile to build the HELLO WORLD C++ sample program. It separates the compile and link stages. Set up the environment as in step 3 on page 158 above before running make.

```
flags = -I "//'thlqual.SCSQC370'" -I "//'thlqual.SCSQHPPS'"
decks = "//'thlqual.SCSQDEFS(IMQS23DM)'" "//'thlqual.SCSQDEFS(IMQB23DM)'"

imqwrld: imqwrld.o
   c++ -o imqwrld imqwrld.o $(decks)

imqwrld.o: imqwrld.cpp
   c++ -c -o imqwrld $(flags) imqwrld.cpp
```

Refer to *z/OS UNIX System Services Programming Tools* for more information on using make.

Running

1. Log into the UNIX System Services shell, and change to the directory where you built the sample.
2. Set up the STEPLIB environment variable to include the WebSphere MQ data sets:

```
/u/fred/sample:> export STEPLIB=$STEPLIB:thlqual.SCSQLOAD
/u/fred/sample:> export STEPLIB=$STEPLIB:thlqual.SCSQAUTH
/u/fred/sample:> export STEPLIB=$STEPLIB:thlqual.SCSQANLE
```

3. Run the sample:

```
/u/fred/sample:> ./imqwrld
```

Chapter 15. MQI cross reference

This appendix contains information relating C++ to the MQI; read it together with the WebSphere MQ Application Programming Reference.

The information covers:

- "Data structure, class, and include-file cross reference"
- "Class attribute cross reference" on page 162

Data structure, class, and include-file cross reference

Table 5. Data structure, class, and include-file cross reference

Data structure	Class	Include file
MQAIR	ImqAuthenticationRecord	imqair.hpp
	ImqBinary	imqbin.hpp
	ImqCache	imqcac.hpp
MQCD	ImqChannel	imqchl.hpp
MQCIH	ImqCICSBridgeHeader	imqcih.hpp
MQDLH	ImqDeadLetterHeader	imqdlh.hpp
MQOR	ImqDistributionList	imqdst.hpp
	ImqError	imqerr.hpp
MQGMO	ImqGetMessageOptions	imqgmo.hpp
	ImqHeader	imqhdr.hpp
MQIIH	ImqIMSBridgeHeader	imqiih.hpp
	ImqItem	imqitm.hpp
MQMD	ImqMessage	imqmsg.hpp
	ImqMessageTracker	imqmtr.hpp
	ImqNamelist	imqnml.hpp
MQOD, MQRR	ImqObject	imqobj.hpp
MQPMO, MQPMR, MQRR	ImqPutMessageOptions	imqpmo.hpp
	ImqProcess	imqpro.hpp
	ImqQueue	imqque.hpp
MQBO, MQCNO, MQCSP	ImqQueueManager	imqmgr.hpp
MQRMH	ImqReferenceHeader	imqrfh.hpp
	ImqString	imqstr.hpp
MQTM	ImqTrigger	imqtrg.hpp
MQTMC		
MQTMC2	ImqTrigger	imqtrg.hpp
MQXQH		
MQWIH	ImqWorkHeader	imqwih.hpp

Class attribute cross reference

Table 6 to Table 26 on page 174 contain cross-reference information for each C++ class. These cross references relate to the use of the underlying WebSphere MQ procedural interfaces. Read this together with the WebSphere MQ Application Programming Reference. The classes ImqBinary, ImqDistributionList, and ImqString have no attributes that fall into this category and are excluded.

ImqAuthenticationRecord

Table 6. ImqAuthenticationRecord cross reference

Attribute	Data structure	Field	Call
connection name	MQAIR	AuthInfoConnName	MQCONNX
password	MQAIR	LDAPPassword	MQCONNX
type	MQAIR	AuthInfoType	MQCONNX
user name	MQAIR	LDAPUserNamePtr	MQCONNX
	MQAIR	LDAPUserNameOffset	MQCONNX
	MQAIR	LDAPUserNameLength	MQCONNX

ImqCache

Table 7. ImqCache cross reference

Attribute	Call
automatic buffer	MQGET
buffer length	MQGET
buffer pointer	MQGET, MQPUT
data length	MQGET
data offset	MQGET
data pointer	MQGET
message length	MQGET, MQPUT

ImqChannel

Table 8. ImqChannel cross reference

Attribute	Data structure	Field	Call
batch heart-beat	MQCD	BatchHeartbeat	MQCONNX
channel name	MQCD	ChannelName	MQCONNX
connection name	MQCD	ConnectionName	MQCONNX
	MQCD	ShortConnectionName	MQCONNX
header compression	MQCD	HdrCompList	MQCONNX
heart-beat interval	MQCD	HeartbeatInterval	MQCONNX
keep alive interval	MQCD	KeepAliveInterval	MQCONNX
local address	MQCD	LocalAddress	MQCONNX
maximum message length	MQCD	MaxMsgLength	MQCONNX
message compression	MQCD	MsgCompList	MQCONNX

Table 8. ImqChannel cross reference (continued)

Attribute	Data structure	Field	Call
mode name	MQCD	ModeName	MQCONNX
password	MQCD	Password	MQCONNX
receive exit count	MQCD		MQCONNX
receive exit names	MQCD	ReceiveExit	MQCONNX
	MQCD	ReceiveExitsDefined	MQCONNX
	MQCD	ReceiveExitPtr	MQCONNX
receive user data	MQCD	ReceiveUserData	MQCONNX
	MQCD	ReceiveUserDataPtr	MQCONNX
security exit name	MQCD	SecurityExit	MQCONNX
security user data	MQCD	SecurityUserData	MQCONNX
send exit count	MQCD		MQCONNX
send exit names	MQCD	SendExit	MQCONNX
	MQCD	SendExitsDefined	MQCONNX
	MQCD	SendExitPtr	MQCONNX
send user data	MQCD	SendUserData	MQCONNX
	MQCD	SendUserDataPtr	MQCONNX
SSL CipherSpec	MQCD	sslCipherSpecification	MQCONNX
SSL client authentication type	MQCD	sslClientAuthentication	MQCONNX
SSL peer name	MQCD	sslPeerName	MQCONNX
transaction program name	MQCD	TpName	MQCONNX
transport type	MQCD	TransportType	MQCONNX
user id	MQCD	UserIdentifier	MQCONNX

ImqCICSBridgeHeader

Table 9. ImqCICSBridgeHeader cross reference

Attribute	Data structure	Field
bridge abend code	MQCIH	AbendCode
ADS descriptor	MQCIH	AdsDescriptor
attention identifier	MQCIH	AttentionId
authenticator	MQCIH	Authenticator
bridge completion code	MQCIH	BridgeCompletionCode
bridge error offset	MQCIH	ErrorOffset
bridge reason code	MQCIH	BridgeReason
bridge cancel code	MQCIH	CancelCode
conversational task	MQCIH	ConversationalTask
cursor position	MQCIH	CursorPosition
facility token	MQCIH	Facility
facility keep time	MQCIH	FacilityKeepTime
facility like	MQCIH	FacilityLike

Table 9. ImqCICSBridgeHeader cross reference (continued)

Attribute	Data structure	Field
function	MQCIH	Function
get wait interval	MQCIH	GetWaitInterval
link type	MQCIH	LinkType
next transaction identifier	MQCIH	NextTransactionId
output data length	MQCIH	OutputDataLength
reply-to format	MQCIH	ReplyToFormat
bridge return code	MQCIH	ReturnCode
start code	MQCIH	StartCode
task end status	MQCIH	TaskEndStatus
transaction identifier	MQCIH	TransactionId
uow control	MQCIH	UowControl
version	MQCIH	Version

ImqDeadLetterHeader

Table 10. ImqDeadLetterHeader cross reference

Attribute	Data structure	Field
dead-letter reason code	MQDLH	Reason
destination queue manager name	MQDLH	DestQMgrName
destination queue name	MQDLH	DestQName
put application name	MQDLH	PutApplName
put application type	MQDLH	PutApplType
put date	MQDLH	PutDate
put time	MQDLH	PutTime

ImqError

Table 11. ImqError cross reference

Attribute	Call
completion code	MQBACK, MQBEGIN, MQCLOSE, MQCMIT, MQCONN, MQCONNX, MQDISC, MQGET, MQINQ, MQOPEN, MQPUT, MQSET
reason code	MQBACK, MQBEGIN, MQCLOSE, MQCMIT, MQCONN, MQCONNX, MQDISC, MQGET, MQINQ, MQOPEN, MQPUT, MQSET

ImqGetMessageOptions

Table 12. ImqGetMessageOptions cross reference

Attribute	Data structure	Field
group status	MQGMO	GroupStatus
match options	MQGMO	MatchOptions
message token	MQGMO	MessageToken
options	MQGMO	Options

Table 12. ImqGetMessageOptions cross reference (continued)

Attribute	Data structure	Field
resolved queue name	MQGMO	ResolvedQName
returned length	MQGMO	ReturnedLength
segmentation	MQGMO	Segmentation
segment status	MQGMO	SegmentStatus
	MQGMO	Signal1
	MQGMO	Signal2
syncpoint participation	MQGMO	Options
wait interval	MQGMO	WaitInterval

ImqHeader

Table 13. ImqHeader cross reference

Attribute	Data structure	Field
character set	MQDLH, MQIIH	CodedCharSetId
encoding	MQDLH, MQIIH	Encoding
format	MQDLH, MQIIH	Format
header flags	MQIIH, MQRMH	Flags

ImqIMSBridgeHeader

Table 14. ImqIMSBridgeHeader cross reference

Attribute	Data structure	Field
authenticator	MQIIH	Authenticator
commit mode	MQIIH	CommitMode
logical terminal override	MQIIH	LTermOverride
message format services map name	MQIIH	MFSMapName
reply-to format	MQIIH	ReplyToFormat
security scope	MQIIH	SecurityScope
transaction instance id	MQIIH	TranInstanceId
transaction state	MQIIH	TranState

ImqItem

Table 15. ImqItem cross reference

Attribute	Call
structure id	MQGET

ImqMessage

Table 16. ImqMessage cross reference

Attribute	Data structure	Field	Call
application id data	MQMD	ApplIdentityData	
application origin data	MQMD	ApplOriginData	
backout count	MQMD	BackoutCount	
character set	MQMD	CodedCharSetId	
encoding	MQMD	Encoding	
expiry	MQMD	Expiry	
format	MQMD	Format	
message flags	MQMD	MsgFlags	
message type	MQMD	MsgType	
offset	MQMD	Offset	
original length	MQMD	OriginalLength	
persistence	MQMD	Persistence	
priority	MQMD	Priority	
put application name	MQMD	PutApplName	
put application type	MQMD	PutApplType	
put date	MQMD	PutDate	
put time	MQMD	PutTime	
reply-to queue manager name	MQMD	ReplyToQMgr	
reply-to queue name	MQMD	ReplyToQ	
report	MQMD	Report	
sequence number	MQMD	MsgSeqNumber	
total message length		DataLength	MQGET
user id	MQMD	UserIdentifier	

ImqMessageTracker

Table 17. ImqMessageTracker cross reference

Attribute	Data structure	Field
accounting token	MQMD	AccountingToken
correlation id	MQMD	CorrelId
feedback	MQMD	Feedback
group id	MQMD	GroupId
message id	MQMD	MsgId

ImqNamelist

Table 18. ImqNamelist cross reference

Attribute	Inquiry	Call
name count	MQIA_NAME_COUNT	MQINQ

Table 18. ImqNamelist cross reference (continued)

Attribute	Inquiry	Call
namelist name	MQCA_NAMELIST_NAME	MQINQ

ImqObject

Table 19. ImqObject cross reference

Attribute	Data structure	Field	Inquiry	Call
alteration date			MQCA_ALTERATION_DATE	MQINQ
alteration time			MQCA_ALTERATION_TIME	MQINQ
alternate user id	MQOD	AlternateUserId		
alternate security id				
close options				MQCLOSE
description			MQCA_Q_DESC, MQCA_Q_MGR_DESC, MQCA_PROCESS_DESC	MQINQ
name	MQOD	ObjectName	MQCA_Q_MGR_NAME, MQCQ_Q_NAME, MQCA_PROCESS_NAME	MQINQ
open options				MQOPEN
open status				MQOPEN, MQCLOSE
queue manager identifier	queue manager identifier		MQCA_Q_MGR_IDENTIFIER	MQINQ

ImqProcess

Table 20. ImqProcess cross reference

Attribute	Inquiry	Call
application id	MQCA_APPL_ID	MQINQ
application type	MQIA_APPL_TYPE	MQINQ
environment data	MQCA_ENV_DATA	MQINQ
user data	MQCA_USER_DATA	MQINQ

ImqPutMessageOptions

Table 21. ImqPutMessageOptions cross reference

Attribute	Data structure	Field
context reference	MQPMO	Context
	MQPMO	InvalidDestCount
	MQPMO	KnownDestCount
options	MQPMO	Options
record fields	MQPMO	PutMsgRecFields

Table 21. ImqPutMessageOptions cross reference (continued)

Attribute	Data structure	Field
resolved queue manager name	MQPMO	ResolvedQMgrName
resolved queue name	MQPMO	ResolvedQName
	MQPMO	Timeout
	MQPMO	UnknownDestCount
syncpoint participation	MQPMO	Options

ImqQueue

Table 22. ImqQueue cross reference

Attribute	Data structure	Field	Inquiry	Call
backout requeue name			MQCA_BACKOUT_REQ_Q_NAME	MQINQ
backout threshold			MQIA_BACKOUT_THRESHOLD	MQINQ
base queue name			MQCA_BASE_Q_NAME	MQINQ
cluster name			MQCA_CLUSTER_NAME	MQINQ
cluster namelist name			MQCA_CLUSTER_NAMELIST	MQINQ
cluster workload rank			MQIA_CLWL_Q_RANK	MQINQ
cluster workload priority			MQIA_CLWL_Q_PRIORITY	MQINQ
cluster workload use queue			MQIA_CLWL_USEQ	MQINQ
creation date			MQCA_CREATION_DATE	MQINQ
creation time			MQCA_CREATION_TIME	MQINQ
current depth			MQIA_CURRENT_Q_DEPTH	MQINQ
default bind			MQIA_DEF_BIND	MQINQ
default input open option			MQIA_DEF_INPUT_OPEN_OPTION	MQINQ
default persistence			MQIA_DEF_PERSISTENCE	MQINQ
default priority			MQIA_DEF_PRIORITY	MQINQ
definition type			MQIA_DEFINITION_TYPE	MQINQ
depth high event			MQIA_Q_DEPTH_HIGH_EVENT	MQINQ
depth high limit			MQIA_Q_DEPTH_HIGH_LIMIT	MQINQ
depth low event			MQIA_Q_DEPTH_LOW_EVENT	MQINQ
depth low limit			MQIA_Q_DEPTH_LOW_LIMIT	MQINQ
depth maximum event			MQIA_Q_DEPTH_MAX_LIMIT	MQINQ
distribution lists			MQIA_DIST_LISTS	MQINQ, MQSET
dynamic queue name	MQOD	DynamicQName		
harden get backout			MQIA_HARDEN_GET_BACKOUT	MQINQ
index type			MQIA_INDEX_TYPE	MQINQ
inhibit get			MQIA_INHIBIT_GET	MQINQ, MQSET

Table 22. ImqQueue cross reference (continued)

Attribute	Data structure	Field	Inquiry	Call
inhibit put			MQIA_INHIBIT_PUT	MQINQ, MQSET
initiation queue name			MQCA_INITIATION_Q_NAME	MQINQ
maximum depth			MQIA_MAX_Q_DEPTH	MQINQ
maximum message length			MQIA_MAX_MSG_LENGTH	MQINQ
message delivery sequence			MQIA_MSG_DELIVERY_SEQUENCE	MQINQ
next distributed queue				
non persistent message class			MQIA_NPM_CLASS	MQINQ
open input count			MQIA_OPEN_INPUT_COUNT	MQINQ
open output count			MQIA_OPEN_OUTPUT_COUNT	MQINQ
previous distributed queue				
process name			MQCA_PROCESS_NAME	MQINQ
queue accounting			MQIA_ACCOUNTING_Q	MQINQ
queue manager name	MQOD	ObjectQMgrName		
queue monitoring			MQIA_MONITORING_Q	MQINQ
queue statistics			MQIA_STATISTICS_Q	MQINQ
queue type			MQIA_Q_TYPE	MQINQ
remote queue manager name			MQCA_REMOTE_Q_MGR_NAME	MQINQ
remote queue name			MQCA_REMOTE_Q_NAME	MQINQ
resolved queue manager name	MQOD	ResolvedQMgrName		
resolved queue name	MQOD	ResolvedQName		
retention interval			MQIA_RETENTION_INTERVAL	MQINQ
scope			MQIA_SCOPE	MQINQ
service interval			MQIA_Q_SERVICE_INTERVAL	MQINQ
service interval event			MQIA_Q_SERVICE_INTERVAL_EVENT	MQINQ
shareability			MQIA_SHAREABILITY	MQINQ
storage class			MQCA_STORAGE_CLASS	MQINQ
transmission queue name			MQCA_XMIT_Q_NAME	MQINQ
trigger control			MQIA_TRIGGER_CONTROL	MQINQ, MQSET
trigger data			MQCA_TRIGGER_DATA	MQINQ, MQSET
trigger depth			MQIA_TRIGGER_DEPTH	MQINQ, MQSET
trigger message priority			MQIA_TRIGGER_MSG_PRIORITY	MQINQ, MQSET

Table 22. ImqQueue cross reference (continued)

Attribute	Data structure	Field	Inquiry	Call
trigger type			MQIA_TRIGGER_TYPE	MQINQ, MQSET
usage			MQIA_USAGE	MQINQ

ImqQueueManager

Table 23. ImqQueueManager cross reference

Attribute	Data structure	Field	Inquiry	Call
accounting connections override			MQIA_ACCOUNTING_CONN_OVERRIDE	MQINQ
accounting interval			MQIA_ACCOUNTING_INTERVAL	MQINQ
activity recording			MQIA_ACTIVITY_RECORDING	MQINQ
adopt new mca check			MQIA_ADOPTNEWMCA_CHECK	MQINQ
adopt new mca type			MQIA_ADOPTNEWMCA_TYPE	MQINQ
authentication type	MQCSP	AuthenticationType		MQCONNX
authority event			MQIA_AUTHORITY_EVENT	MQINQ
begin options	MQBO	Options		MQBEGIN
bridge event			MQIA_BRIDGE_EVENT	MQINQ
channel auto definition			MQIA_CHANNEL_AUTO_DEF	MQINQ
channel auto definition event			MQIA_CHANNEL_AUTO_EVENT	MQIA
channel auto definition exit			MQIA_CHANNEL_AUTO_EXIT	MQIA
channel event			MQIA_CHANNEL_EVENT	MQINQ
channel initiator adapters			MQIA_CHINIT_ADAPTERS	MQINQ
channel initiator control			MQIA_CHINIT_CONTROL	MQINQ
channel initiator dispatchers			MQIA_CHINIT_DISPATCHERS	MQINQ
channel initiator trace auto start			MQIA_CHINIT_TRACE_AUTO_START	MQINQ
channel initiator trace table size			MQIA_CHINIT_TRACE_TABLE_SIZE	MQINQ
channel monitoring			MQIA_MONITORING_CHANNEL	MQINQ
channel reference	MQCD	ChannelType		MQCONNX
channel statistics			MQIA_STATISTICS_CHANNEL	MQINQ
character set			MQIA_CODED_CHAR_SET_ID	MQINQ
cluster sender monitoring			MQIA_MONITORING_AUTO_CLUSSDR	MQINQ

Table 23. ImqQueueManager cross reference (continued)

Attribute	Data structure	Field	Inquiry	Call
cluster sender statistics			MQIA_STATISTICS_AUTO_CLUSSDR	MQINQ
cluster workload data			MQCA_CLUSTER_WORKLOAD_DATA	MQINQ
cluster workload exit			MQCA_CLUSTER_WORKLOAD_EXIT	MQINQ
cluster workload length			MQIA_CLUSTER_WORKLOAD_LENGTH	MQINQ
cluster workload mru			MQIA_CLWL_MRU_CHANNELS	MQINQ
cluster workload use queue			MQIA_CLWL_USEQ	MQINQ
command event			MQIA_COMMAND_EVENT	MQINQ
command input queue name			MQCA_COMMAND_INPUT_Q_NAME	MQINQ
command level			MQIA_COMMAND_LEVEL	MQINQ
command server control			MQIA_CMD_SERVER_CONTROL	MQINQ
connect options	MQCNO	Options		MQCONN, MQCONNX
connection id	MQCNO	ConnectionId		MQCONNX
connection status				MQCONN, MQCONNX, MQDISC
connection tag	MQCD	ConnTag		MQCONNX
cryptographic hardware	MQSCO	CryptoHardware		MQCONNX
dead-letter queue name			MQCA_DEAD_LETTER_Q_NAME	MQINQ
default transmission queue name			MQCA_DEF_XMIT_Q_NAME	MQINQ
distribution lists			MQIA_DIST_LISTS	MQINQ
dns group			MQCA_DNS_GROUP	MQINQ
dns wlm			MQIA_DNS_WLM	MQINQ
first authentication record	MQSCO	AuthInfoRecOffset		MQCONNX
	MQSCO	AuthInfoRecPtr		MQCONNX
inhibit event			MQIA_INHIBIT_EVENT	MQINQ
ip address version			MQIA_IP_ADDRESS_VERSION	MQINQ
key repository	MQSCO	KeyRepository		MQCONNX
key reset count	MQSCO	KeyResetCount		MQCONNX
listener timer			MQIA_LISTENER_TIMER	MQINQ
local event			MQIA_LOCAL_EVENT	MQINQ
logger event			MQIA_LOGGER_EVENT	MQINQ

Table 23. ImqQueueManager cross reference (continued)

Attribute	Data structure	Field	Inquiry	Call
lu group name			MQCA_LU_GROUP_NAME	MQINQ
lu name			MQCA_LU_NAME	MQINQ
lu62 arm suffix			MQCA_LU62_ARM_SUFFIX	MQINQ
lu62 channels			MQIA_LU62_CHANNELS	MQINQ
maximum active channels			MQIA_ACTIVE_CHANNELS	MQINQ
maximum channels			MQIA_MAX_CHANNELS	MQINQ
maximum handles			MQIA_MAX_HANDLES	MQINQ
maximum message length			MQIA_MAX_MSG_LENGTH	MQINQ
maximum priority			MQIA_MAX_PRIORITY	MQINQ
maximum uncommitted messages			MQIA_MAX_UNCOMMITTED_MSGS	MQINQ
mqi accounting			MQIA_ACCOUNTING_MQI	MQINQ
mqi statistics			MQIA_STATISTICS_MQI	MQINQ
outbound port maximum			MQIA_OUTBOUND_PORT_MAX	MQINQ
outbound port minimum			MQIA_OUTBOUND_PORT_MIN	MQINQ
password	MQCSP	CSPPasswordPtr		MQCONNX
	MQCSP	CSPPasswordOffset		MQCONNX
	MQCSP	CSPPasswordLength		MQCONNX
performance event			MQIA_PERFORMANCE_EVENT	MQINQ
platform			MQIA_PLATFORM	MQINQ
queue accounting			MQIA_ACCOUNTING_Q	MQINQ
queue monitoring			MQIA_MONITORING_Q	MQINQ
queue statistics			MQIA_STATISTICS_Q	MQINQ
receive timeout			MQIA_RECEIVE_TIMEOUT	MQINQ
receive timeout minimum			MQIA_RECEIVE_TIMEOUT_MIN	MQINQ
receive timeout type			MQIA_RECEIVE_TIMEOUT_TYPE	MQINQ
remote event			MQIA_REMOTE_EVENT	MQINQ
repository name			MQCA_REPOSITORY_NAME	MQINQ
repository namelist			MQCA_REPOSITORY_NAMELIST	MQINQ
shared queue queue manager name			MQIA_SHARED_Q_Q_MGR_NAME	MQINQ
ssl event			MQIA_SSL_EVENT	MQINQ
ssl fips			MQIA_SSL_FIPS_REQUIRED	MQINQ
ssl key reset count			MQIA_SSL_RESET_COUNT	MQINQ
start-stop event			MQIA_START_STOP_EVENT	MQINQ
statistics interval			MQIA_STATISTICS_INTERVAL	MQINQ

Table 23. ImqQueueManager cross reference (continued)

Attribute	Data structure	Field	Inquiry	Call
syncpoint availability			MQIA_SYNCPOINT	MQINQ
tcp channels			MQIA_TCP_CHANNELS	MQINQ
tcp keep alive			MQIA_TCP_KEEP_ALIVE	MQINQ
tcp name			MQCA_TCP_NAME	MQINQ
tcp stack type			MQIA_TCP_STACK_TYPE	MQINQ
trace route recording			MQIA_TRACE_ROUTE_RECORDING	MQINQ
trigger interval			MQIA_TRIGGER_INTERVAL	MQINQ
user id	MQCSP	CSPUserIdPtr		MQCONNX
	MQCSP	CSPUserIdOffset		MQCONNX
	MQCSP	CSPUserIdLength		MQCONNX

ImqReferenceHeader

Table 24. ImqReferenceHeader

Attribute	Data structure	Field
destination environment	MQRMH	DestEnvLength, DestEnvOffset
destination name	MQRMH	DestNameLength, DestNameOffset
instance id	MQRMH	ObjectInstanceId
logical length	MQRMH	DataLogicalLength
logical offset	MQRMH	DataLogicalOffset
logical offset 2	MQRMH	DataLogicalOffset2
reference type	MQRMH	ObjectType
source environment	MQRMH	SrcEnvLength, SrcEnvOffset
source name	MQRMH	SrcNameLength, SrcNameOffset

ImqTrigger

Table 25. ImqTrigger cross reference

Attribute	Data structure	Field
application id	MQTM	ApplId
application type	MQTM	ApplType
environment data	MQTM	EnvData
process name	MQTM	ProcessName
queue name	MQTM	QName
trigger data	MQTM	TriggerData
user data	MQTM	UserData

ImqWorkHeader

Table 26. ImqWorkHeader cross reference

Attribute	Data structure	Field
message token	MQWIH	MessageToken
service name	MQWIH	ServiceName
service step	MQWIH	ServiceStep

Notices

This information was developed for products and services offered in the United States. IBM may not offer the products, services, or features discussed in this information in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this information. The furnishing of this information does not give you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing,
IBM Corporation,
North Castle Drive,
Armonk, NY 10504-1785,
U.S.A.

For license inquiries regarding double-byte (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

IBM World Trade Asia Corporation,
Licensing,
2-31 Roppongi 3-chome, Minato-k,u
Tokyo 106, Japan

Sending your comments to IBM

If you especially like or dislike anything about this book, please use one of the methods listed below to send your comments to IBM.

Feel free to comment on what you regard as specific errors or omissions, and on the accuracy, organization, subject matter, or completeness of this book.

Please limit your comments to the information in this book and the way in which the information is presented.

To make comments about the functions of IBM products or systems, talk to your IBM representative or to your IBM authorized remarketer.

When you send comments to IBM , you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate, without incurring any obligation to you.

You can send your comments to IBM in any of the following ways:

- By mail, to this address:

  User Technologies Department (MP095)
  IBM United Kingdom Laboratories
  Hursley Park
  WINCHESTER,
  Hampshire
  SO21 2JN
  United Kingdom
- By fax:
  - From outside the U.K., after your international access code use 44-1962-816151
  - From within the U.K., use 01962-816151
- Electronically, use the appropriate network ID:
  - IBM Mail Exchange: GBIBM2Q9 at IBMMAIL
  - IBMLink™: HURSLEY(IDRCF)
  - Internet: idrcf@hursley.ibm.com

Whichever method you use, ensure that you include:

- The publication title and order number
- The topic to which your comment applies
- Your name and address/telephone number/fax number/network ID.
