IBM MQ .NET classes and interfaces are listed alphabetically. The properties, methods and constructors are described.

"IBM MQ C++ classes" on page 1839
The IBM MQ C++ classes encapsulate the IBM MQ Message Queue Interface (MQI). There is a single C++ header file, **imqi.hpp**, which covers all of these classes.

# Code examples

Use the reference information in this section to accomplish the tasks that address your business needs.

## C language examples

This collection of topics is mostly taken from the IBM MQ for z/OS sample applications. They are applicable to all platforms, except where noted.

### *Connecting to a queue manager*

This example demonstrates how to use the MQCONN call to connect a program to a queue manager in z/OS batch.

This extract is taken from the Browse sample application (program CSQ4BCA1) supplied with IBM MQ for z/OS. For the names and locations of the sample applications on other platforms, see Sample procedural programs (platforms except z/OS ).

```
#include <cmqc.h>
.
.
.
static char Parm1[MQ_Q_MGR_NAME_LENGTH] ;

int  main(int argc, char *argv[] )
   {
   /*                                                  */
   /*     Variables for MQ calls                       */
   /*                                                  */
   MQHCONN Hconn;      /* Connection handle            */
   MQLONG  CompCode;   /* Completion code              */
   MQLONG  Reason;     /* Qualifying reason            */

   /* Copy the queue manager name, passed in the       */
   /* parm field, to Parm1                             */
   strncpy(Parm1,argv[1],MQ_Q_MGR_NAME_LENGTH);

   /*                                                  */
   /* Connect to the specified queue manager.          */
   /*   Test the output of the connect call.  If the   */
   /*   call fails, print an error message showing the */
   /*   completion code and reason code, then leave the*/
   /*   program.                                       */
   /*                                                  */
   MQCONN(Parm1,
          &Hconn,
          &CompCode,
          &Reason);
   if ((CompCode != MQCC_OK) | (Reason != MQRC_NONE))
      {
      sprintf(pBuff, MESSAGE_4_E,
              ERROR_IN_MQCONN, CompCode, Reason);
      PrintLine(pBuff);
      RetCode = CSQ4_ERROR;
      goto AbnormalExit2;
      }
      .
      .
      .
}
```

### *Disconnecting from a queue manager*

This example demonstrates how to use the MQDISC call to disconnect a program from a queue manager in z/OS batch.

The variables used in this code extract are those that were set in "Connecting to a queue manager" on page 8. This extract is taken from the Browse sample application (program CSQ4BCA1) supplied with IBM MQ for z/OS. For the names and locations of the sample applications on other platforms, see Sample procedural programs (platforms except z/OS ).

```
⋮
   /*                                                  */
   /*   Disconnect from the queue manager.  Test the   */
   /*   output of the disconnect call.  If the call    */
   /*   fails, print an error message showing the      */
   /*   completion code and reason code.               */
   /*                                                  */
   MQDISC(&Hconn,
          &CompCode,
          &Reason);
   if ((CompCode != MQCC_OK) || (Reason != MQRC_NONE))
      {
      sprintf(pBuff, MESSAGE_4_E,
              ERROR_IN_MQDISC, CompCode, Reason);
      PrintLine(pBuff);
      RetCode = CSQ4_ERROR;
      }
⋮
```

### *Creating a dynamic queue*

This example demonstrates how to use the MQOPEN call to create a dynamic queue.

This extract is taken from the Mail Manager sample application (program CSQ4TCD1) supplied with IBM MQ for z/OS. For the names and locations of the sample applications on other platforms, see Sample procedural programs (platforms except z/OS ).

```
⋮
MQLONG  HCONN = 0;   /* Connection handle      */
MQHOBJ  HOBJ;        /* MailQ Object handle    */
MQHOBJ  HobjTempQ;   /* TempQ Object Handle    */
MQLONG  CompCode;    /* Completion code        */
MQLONG  Reason;      /* Qualifying reason      */
MQOD    ObjDesc = {MQOD_DEFAULT};
                     /* Object descriptor      */
MQLONG  OpenOptions; /* Options control MQOPEN */

   /*---------------------------------------- */
   /* Initialize the Object Descriptor (MQOD)  */
   /* control block.  (The remaining fields    */
   /* are already initialized.)                */
   /*----------------------------------------*/
   strncpy( ObjDesc.ObjectName,
            SYSTEM_REPLY_MODEL,
            MQ_Q_NAME_LENGTH );
   strncpy( ObjDesc.DynamicQName,
            SYSTEM_REPLY_INITIAL,
            MQ_Q_NAME_LENGTH );
   OpenOptions = MQOO_INPUT_AS_Q_DEF;
   /*----------------------------------------*/
   /* Open the model queue and, therefore,     */
   /* create and open a temporary dynamic      */
   /* queue                                    */
   /*----------------------------------------*/
   MQOPEN( HCONN,
           &ObjDesc,
           OpenOptions,
           &HobjTempQ,
           &CompCode,
           &Reason );
   if ( CompCode == MQCC_OK ) {

   }
   else {
      /*---------------------------------------*/
```

```
      /* Build an error message to report the  */
      /* failure of the opening of the model   */
      /* queue                                 */
      /*---------------------------------------*/
      MQMErrorHandling( "OPEN TEMPQ", CompCode,
                        Reason );
      ErrorFound = TRUE;
   }
   return ErrorFound;
}
.
```

### *Opening an existing queue*

This example demonstrates how to use the MQOPEN call to open a queue that has already been defined.

This extract is taken from the Browse sample application (program CSQ4BCA1) supplied with IBM MQ for z/OS. For the names and locations of the sample applications on other platforms, see Sample procedural programs (platforms except z/OS ).

```
#include <cmqc.h>
.
static char Parm1[MQ_Q_MGR_NAME_LENGTH];
.
int  main(int argc, char *argv[] )
   {
   /*
   /*     Variables for MQ calls                         */
   /*
   MQHCONN Hconn ;            /* Connection handle       */
   MQLONG  CompCode;          /* Completion code         */
   MQLONG  Reason;            /* Qualifying reason       */
   MQOD    ObjDesc = { MQOD_DEFAULT };
                              /* Object descriptor       */
   MQLONG  OpenOptions;       /* Options that control    */
                              /*  the MQOPEN call        */
   MQHOBJ  Hobj;              /* Object handle           */
   .
   /*  Copy the queue name, passed in the parm field,    */
   /*  to Parm2 strncpy(Parm2,argv[2],         */
   /*  MQ_Q_NAME_LENGTH);                                */
   .
   /*                                                    */
   /*  Initialize the object descriptor (MQOD) control   */
   /*  block.  (The initialization default sets StrucId, */
   /*  Version, ObjectType, ObjectQMgrName,              */
   /*  DynamicQName, and AlternateUserid fields)         */
   /*                                                    */
   strncpy(ObjDesc.ObjectName,Parm2,MQ_Q_NAME_LENGTH);
   .
   /*  Initialize the other fields required for the open */
   /*  call (Hobj is set by the MQCONN call).            */
   /*                                                    */
   OpenOptions  = MQOO_BROWSE;
   .
   /*                                                    */
   /* Open the queue.                                    */
   /*   Test the output of the open call.  If the call   */
   /*   fails, print an error message showing the        */
   /*   completion code and reason code, then bypass     */
   /*   processing, disconnect and leave the program.    */
   /*                                                    */
   MQOPEN(Hconn,
          &ObjDesc,
          OpenOptions,
          &Hobj,
          &CompCode,
          &Reason);
```

```
   if ((CompCode != MQCC_OK) || (Reason != MQRC_NONE))
      {
      sprintf(pBuff, MESSAGE_4_E,
              ERROR_IN_MQOPEN, CompCode, Reason);
      PrintLine(pBuff);
      RetCode = CSQ4_ERROR;
      goto AbnormalExit1;       /* disconnect processing */
```

```
      }
   .
   .
   } /* end of main */
```

### *Closing a queue*

This example demonstrates how to use the MQCLOSE call to close a queue.

This extract is taken from the Browse sample application (program CSQ4BCA1) supplied with IBM MQ for z/OS. For the names and locations of the sample applications on other platforms, see Sample procedural programs (platforms except z/OS ).

```
.
   /*                                                  */
   /*   Close the queue.                               */
   /*   Test the output of the close call.  If the call  */
   /*   fails, print an error message showing the        */
   /*   completion code and reason code.               */
   /*                                                  */
   MQCLOSE(Hconn,
           &Hobj,
           MQCO_NONE,
           &CompCode,
           &Reason);
   if ((CompCode != MQCC_OK) || (Reason != MQRC_NONE))
      {
      sprintf(pBuff, MESSAGE_4_E,
              ERROR_IN_MQCLOSE, CompCode, Reason);
      PrintLine(pBuff);
      RetCode = CSQ4_ERROR;
      }
.
```

### *Putting a message using MQPUT*

This example demonstrates how to use the MQPUT call to put a message on a queue.

This extract is not taken from the sample applications supplied with IBM MQ. For the names and locations of the sample applications, see Sample procedural programs (platforms except z/OS ) z/OS and Sample programs for IBM MQ for z/OS .

```
.
qput()
{
     MQMD    MsgDesc;
     MQPMO   PutMsgOpts;
     MQLONG  CompCode;
     MQLONG  Reason;
     MQHCONN Hconn;
     MQHOBJ  Hobj;
     char message_buffer[] = "MY MESSAGE";
    /*-------------------------------*/
    /*  Set up PMO structure.        */
    /*-------------------------------*/
     memset(&PutMsgOpts, '\0', sizeof(PutMsgOpts));
     memcpy(PutMsgOpts.StrucId, MQPMO_STRUC_ID,
            sizeof(PutMsgOpts.StrucId));
     PutMsgOpts.Version = MQPMO_VERSION_1;
     PutMsgOpts.Options = MQPMO_SYNCPOINT;

    /*-------------------------------*/
    /*  Set up MD structure.         */
    /*-------------------------------*/
    memset(&MsgDesc, '\0', sizeof(MsgDesc));
    memcpy(MsgDesc.StrucId, MQMD_STRUC_ID,
           sizeof(MsgDesc.StrucId));
    MsgDesc.Version     =  MQMD_VERSION_1;

## COBOL examples

This collection of topics is taken from the IBM MQ for z/OS sample applications. They are applicable to all platforms, except where noted.

### *Connecting to a queue manager*

This example demonstrates how to use the MQCONN call to connect a program to a queue manager in z/OS batch.

This extract is taken from the Browse sample application (program CSQ4BVA1) supplied with IBM MQ for z/OS. For the names and locations of the sample applications on other platforms, see Sample procedural programs (platforms except z/OS ).

     ⋮
```

### *Disconnecting from a queue manager*

This example demonstrates how to use the MQDISC call to disconnect a program from a queue manager in z/OS batch.

The variables used in this code extract are those that were set in “Connecting to a queue manager” on page 23. This extract is taken from the Browse sample application (program CSQ4BVA1) supplied with IBM MQ for z/OS. For the names and locations of the sample applications on other platforms, see Sample procedural programs (platforms except z/OS ).

```
⋮
*
* Disconnect from the queue manager
*
     CALL 'MQDISC' USING W03-HCONN
                         W03-COMPCODE
                         W03-REASON.
*
*    Test the output of the disconnect call.  If the
*    call fails, print an error message showing the
*    completion code and reason code.
*
     IF (W03-COMPCODE NOT = MQCC-OK) THEN
⋮
           END-IF.
⋮
```

### *Creating a dynamic queue*

This example demonstrates how to use the MQOPEN call to create a dynamic queue.

This extract is taken from the Credit Check sample application (program CSQ4CVB1) supplied with IBM MQ for z/OS. For the names and locations of the sample applications on other platforms, see Sample procedural programs (platforms except z/OS ).

### *Closing a queue*

This example demonstrates how to use the MQCLOSE call.

The variables used in this code extract are those that were set in "Connecting to a queue manager" on page 23. This extract is taken from the Browse sample application (program CSQ4BVA1) supplied with IBM MQ for z/OS. For the names and locations of the sample applications on other platforms, see Sample procedural programs (platforms except z/OS ).

```
⋮
*
*    Close the queue
*
     MOVE MQCO-NONE TO W03-OPTIONS.
*
     CALL 'MQCLOSE' USING W03-HCONN
                          W03-HOBJ
                          W03-OPTIONS
                          W03-COMPCODE
                          W03-REASON.
*
*    Test the output of the MQCLOSE call.  If the call
*    fails, print an error message showing the
*    completion code and reason code.
*
     IF (W03-COMPCODE NOT = MQCC-OK) THEN
        MOVE 'CLOSE'       TO W04-MSG4-TYPE
        MOVE W03-COMPCODE  TO W04-MSG4-COMPCODE
        MOVE W03-REASON    TO W04-MSG4-REASON

# Constants

Use the reference information in this section to accomplish the tasks that address your business needs.

## IBM MQ COPY, header, include, and module files

This information is general-use programming interface information.

This section contains information to help you use the MQI for various programming languages, as follows.

### *C header files*

Header files are provided to help you write C application programs that use the MQI. These header files are summarized in the table:

*Table 1. C header files - call prototypes, data types, return codes, constants, and structures*

| File name | Description | IBM i | UNIX and Linux® systems | Windows | z/OS |
|---|---|---|---|---|---|
| **Call prototypes, data types, return codes, constants, and structures** | | | | | |
| CMQC | MQI definitions | C | C | C | C |
| CMQBC | MQAI definitions | C | C | C | |
| CMQEC | Interface Entry Points definition (includes CMQC, CMQXC and CMQZC) | | C | C | |
| CMQCFC | PCF definitions | C | C | C | C |
| CMQPSC | Publish/Subscribe definitions | C | C | C | C |
| CMQXC | Channel and exit definitions | C | C | C | C |
| CMQZC | Installable services definitions | C | C | C | |
| **Key:** C= Files provided | | | | | |

### *COBOL COPY files*

Various COPY files are provided to help you write COBOL application programs that use the MQI. These files are summarized in the table:

| *Table 2. COBOL copy files - return codes, constants, and structures* | | | | | |
|---|---|---|---|---|---|
| **File name** | **Description** | **IBM i** | **UNIX systems** | **Windows** | **z/OS** |
| **Return codes and constants** | | | | | |
| CMQx | MQI definitions | V | V | V | V |
| CMQCFx | PCF definitions | V | V | V | V |
| CMQPSx | Publish/Subscribe definitions | V | V | V | V |
| CMQXx | Channel and exit definitions | V | V | V | V |
| **Structures** | | | | | |
| CMQAIRx | MQAIR - Authentication information record | | V L | V L | |
| CMQBOx | MQBO - Begin options | V L | V L | V L | |
| CMQCDx | MQCD - Channel definition | V L | V L | V L | V L |
| CMQCFBFx | MQCFBF - PCF byte string filter parameter | V L | V L | V L | V L |
| CMQCFBSx | MQCFBS - PCF byte string parameter | V L | V L | V L | V L |
| CMQCFGRx | MQCFGR - PCF group parameter | V L | V L | V L | V L |
| CMQCFHx | MQCFH - PCF header | V L | V L | V L | V L |
| CMQCFIFx | MQCFIF - PCF integer filter parameter | V L | V L | V L | V L |
| CMQCFILx | MQCFIL - PCF integer list parameter | V L | V L | V L | V L |
| CMQCFINx | MQCFIN - PCF integer parameter | V L | V L | V L | V L |
| CMQCFSFx | MQCFSF - PCF string filter parameter | V L | V L | V L | V L |
| CMQCFSLx | MQCFSL - PCF string list parameter | V L | V L | V L | V L |
| CMQCFSTx | MQCFST - PCF string parameter | V L | V L | V L | V L |
| CMQCFXLx | MQCFIL64 - PCF 64-bit integer list parameter | V L | V L | V L | V L |
| CMQCFXNx | MQCFIN64 - PCF 64-bit integer parameter | V L | V L | V L | V L |
| CMQCHRVx | MQCHARV - Variable length string | V L | V L | V L | V L |
| CMQCIHx | MQCIH - CICS® bridge header | V L | V L | V L | V L |
| CMQCNOx | MQCNO - Connect options | V L | V L | V L | V L |
| CMQCSPx | MQCSP - Security parameters | V L | V L | V L | V L |
| CMQCXPx | MQCXP - Channel exit parameters | V L | | | V L |
| CMQDHx | MQDH - Distribution header | V L | V L | V L | V L |
| CMQDLHx | MQDLH - Dead-letter header | V L | V L | V L | V L |

*Table 2. COBOL copy files - return codes, constants, and structures (continued)*

| File name | Description | IBM i | UNIX systems | Windows | z/OS |
|---|---|---|---|---|---|
| CMQDXPx | MQDXP - Data conversion exit parameters | V L | | V L | |
| CMQEPHx | MQEPH - Embedded PCF header | V L | V L | V L | V L |
| CMQGMOx | MQGMO - Get message options | V L | V L | V L | V L |
| CMQIIHx | MQIIH - IMS information header | V L | V L | V L | V L |
| CMQMDx | MQMD - Message descriptor | V L | V L | V L | V L |
| CMQMD1x | MQMD1 - Message descriptor version 1 | V L | V L | V L | V L |
| CMQMD2x | MQMD2 - Message descriptor version 2 | V L | V L | V L | V L |
| CMQMDEx | MQMDE - Message descriptor extended | V L | V L | V L | V L |
| CMQODx | MQOD - Object descriptor | V L | V L | V L | V L |
| CMQORx | MQOR - Object record | V L | V L | V L | V L |
| CMQPMOx | MQPMO - Put message options | V L | V L | V L | V L |
| CMQRFHx | MQRFH - Rules and formatting header | V L | V L | V L | V L |
| CMQRFH2x | MQRFH2 - Rules and formatting header 2 | V L | V L | V L | V L |
| CMQRMHx | MQRMH - Reference message header | V L | V L | V L | V L |
| CMQRRx | MQRR - Response record | V L | V L | V L | |
| CMQSCOx | MQSCO - SSL configuraton options | | V L | V L | |
| CMQTMx | MQTM - Trigger message | V L | | V L | V L |
| CMQTMCx | MQTMC - Trigger message character | V L | V L | | |
| CMQTMC2x | MQTMC2 - Trigger message 2 character | V L | V L | V L | V L |
| CMQWIHx | MQWIH - Work information header | V L | V L | V L | V L |
| CMQXQHx | MQXQH - Transmission queue header | V L | V L | V L | V L |

**Key:**

- Files with initial values provided, x=V
- Files without initial values provided, x=L

### *PL/I include files*

The following INCLUDE files are provided for the PL/I programming language. These files are available on z/OS only.

| Table 3. PL/I include files - data types, return codes, constants, and structures | | | | | |
|---|---|---|---|---|---|
| **File name** | **Description** | **IBM i** | **UNIX systems** | **Windows** | **z/OS** |
| **Data types, return codes, constants, and structures** | | | | | |
| CMQP | MQI definitions | | | | P |
| CMQCFP | PCF definitions | | | | P |
| CMQEPP | Entry point definitions | | | | P |
| CMQPSP | Publish/Subscribe definitions | | | | P |
| CMQXP | Channel and exit definitions | | | | P |
| **Key:** P= File provided | | | | | |

### *RPG copy files*

The following COPY files are provided for the RPG programming language. These files are available only on IBM i.

| Table 4. RPG copy files - return codes, constants, and structures | | | | | |
|---|---|---|---|---|---|
| **File name** | **Description** | **IBM i** | **UNIX systems** | **Windows** | **z/OS** |
| **Return codes and constants** | | | | | |
| CMQx | MQI definitions | G R | | | |
| CMQCFx | PCF definitions | G | | | |
| CMQPSx | Publish/Subscribe definitions | G | | | |
| CMQXx | Channel and exit definitions | G R | | | |
| **Structures** | | | | | |
| CMQBOx | MQBO - Begin options | G H | | | |
| CMQCDx | MQCD - Channel definition | G H R | | | |

| CMQRRx | MQRR - Response record | G H R | | | |
| CMQTMx | MQTM - Trigger message | G H R | | | |
| CMQTMCx | MQTMC - Trigger message character | G H R | | | |

| *Table 4. RPG copy files - return codes, constants, and structures (continued)* | | | | | |
|---|---|---|---|---|---|
| **File name** | **Description** | **IBM i** | **UNIX systems** | **Windows** | **z/OS** |
| CMQTMC2x | MQTMC2 - Trigger message 2 character | G H R | | | |
| CMQWIHx | MQWIH - Work information header | G H | | | |
| CMQXQHx | MQXQH - Transmission queue header | G H R | | | |

**Key:**

- File for static linkage, initialized, provided x=G
- File for static linkage, not initialized, provided x=H
- File for dynamic linkage, initialized, provided, x=R

### *Visual Basic module files*

Header (or form) files are provided to help you write Visual Basic application programs that use the MQI. These header files are supplied in 32-bit versions only and are summarized in the table:

| *Table 5. Visual Basic module files - call declarations, data types, return codes, constants, and structures* | | | | | |
|---|---|---|---|---|---|
| **File name** | **Description** | **IBM i** | **UNIX and Linux systems** | **Windows** | **z/OS** |
| **Call declarations, data types, return codes, constants, and structures** | | | | | |
| CMQB | MQI definitions | | | B | |
| CMQBB | MQAI definitions | | | B | |
| CMQCFB | PCF definitions | | | B | |
| CMQXB | Channel and exit definitions | | | B | |

**Key:** B= File provided

### *z/OS Assembler COPY files*

Various COPY files are provided to help you write z/OS Assembler application programs that use the MQI. These files are summarized in the table:

| *Table 6. z/OS Assembler copy files - data types, return codes, constants, and structures* | | | | | |
|---|---|---|---|---|---|
| **File name** | **Description** | **IBM i** | **UNIX systems** | **Windows** | **z/OS** |
| **Data types, return codes, and constants** | | | | | |
| CMQA | MQI definitions | | | | A |
| CMQCFA | PCF definitions | | | | A |
| CMQPSA | Publish/Subscribe definitions | | | | A |
| CMQVERA | Structure version control | | | | A |
| CMQXA | Channel and exit definitions | | | | A |
| **Structures** | | | | | |

*Table 6. z/OS Assembler copy files - data types, return codes, constants, and structures (continued)*

| File name | Description | IBM i | UNIX systems | Windows | z/OS |
|---|---|---|---|---|---|
| CMQCDA | MQCD - Channel definition | | | | |
| CMQCFBFA | MQCFBF - PCF byte string filter parameter | | | | |
| CMQCFBSA | MQCFBS - PCF byte string parameter | | | | A |
| CMQCFGRA | MQCFGR - PCF group parameter | | | | A |
| CMQCFHA | MQCFH - PCF header | | | | A |
| CMQCFIFA | MQCFIF - PCF integer filter parameter | | | | A |
| CMQCFILA | MQCFIL - PCF integer list parameter | | | | A |
| CMQCFINA | MQCFIN - PCF integer parameter | | | | A |
| CMQCFSFA | MQCFSF - PCF string filter parameter | | | | A |
| CMQCFSLA | MQCFSL - PCF string list parameter | | | | A |
| CMQCFSTA | MQCFST - PCF string parameter | | | | A |
| CMQCFXLA | MQCFIL64 - PCF 64-bit integer list parameter | | | | A |

| MQACTT_OS400_ACCOUNT_TOKEN | X'08' |
| MQACTT_WINDOWS_DEFAULT | X'09' |
| MQACTT_NT_SECURITY_ID | X'0B' |
| MQACTT_USER | X'19' |

## MQADOPT_* (Adopt New MCA Checks and Adopt New MCA Types)

### Adopt New MCA Checks

*Table 15. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQADOPT_CHECK_NONE | 0 | X'00000000' |
| MQADOPT_CHECK_ALL | 1 | X'00000001' |
| MQADOPT_CHECK_Q_MGR_NAME | 2 | X'00000002' |
| MQADOPT_CHECK_NET_ADDR | 4 | X'00000004' |

### Adopt New MCA Types

*Table 16. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQADOPT_TYPE_NO | 0 | X'00000000' |
| MQADOPT_TYPE_ALL | 1 | X'00000001' |
| MQADOPT_TYPE_SVR | 2 | X'00000002' |
| MQADOPT_TYPE_SDR | 4 | X'00000004' |
| MQADOPT_TYPE_RCVR | 8 | X'00000008' |
| MQADOPT_TYPE_CLUSRCVR | 16 | X'00000010' |

## MQAIR_* (Authentication information record structure)

*Table 17. Structures of constants*

| Name | Structure |
|---|---|
| MQAIR_STRUC_ID | "AIR¬" |
| MQAIR_STRUC_ID_ARRAY | 'A','I','R','¬' |

**Note:** The symbol ¬ represents a single blank character.

*Table 18. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQAIR_VERSION_1 | 1 | X'00000001' |
| MQAIR_VERSION_2 | 2 | X'00000002' |
| MQAIR_CURRENT_VERSION | 2 | X'00000002' |

## MQAIT_* (Authentication Information Type)

*Table 19. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQAIT_ALL | 0 | X'00000000' |
| MQAIT_CRL_LDAP | 1 | X'00000001' |
| MQAIT_OCSP | 2 | X'00000002' |
| MQAIT_IDPW_OS | 3 | X'00000003' |
| MQAIT_IDPW_LDAP | 4 | X'00000004' |

## MQAS_* (Command format Asynchronous State Values)

*Table 20. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQAS_NONE | 0 | X'00000000' |
| MQAS_STARTED | 1 | X'00000001' |
| MQAS_START_WAIT | 2 | X'00000002' |
| MQAS_STOPPED | 3 | X'00000003' |
| MQAS_SUSPENDED | 4 | X'00000004' |
| MQAS_SUSPENDED_TEMPORARY | 5 | X'00000005' |
| MQAS_ACTIVE | 6 | X'00000006' |
| MQAS_INACTIVE | 7 | X'00000007' |

## MQAT_* (Put Application Types)

*Table 21. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQAT_UNKNOWN | -1 | X'FFFFFFFF' |
| MQAT_NO_CONTEXT | 0 | X'00000000' |
| MQAT_CICS | 1 | X'00000001' |
| MQAT_MVS | 2 | X'00000002' |
| MQAT_OS390 | 2 | X'00000002' |
| MQAT_ZOS | 2 | X'00000002' |
| MQAT_IMS | 3 | X'00000003' |
| MQAT_OS2 | 4 | X'00000004' |
| MQAT_DOS | 5 | X'00000005' |

| MQCBO_LIST_FORM_INHIBITED | 0 | X'00000000' |
| MQCBO_REORDER_AS_REQUIRED | 4 | X'00000004' |
| MQCBO_DO_NOT_REORDER | 0 | X'00000000' |
| MQCBO_CHECK_SELECTORS | 8 | X'00000008' |
| MQCBO_DO_NOT_CHECK_SELECTORS | 0 | X'00000000' |

## MQCBT_* (MQCBD constants This is the type of the Callback Function)

| Table 53. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCBT_MESSAGE_CONSUMER | 1 | X'00000001' |
| MQCBT_EVENT_HANDLER | 2 | X'00000002' |

## MQCC_* (Completion Codes)

| Table 54. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCC_OK | 0 | X'00000000' |
| MQCC_WARNING | 1 | X'00000001' |

| Table 54. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCC_FAILED | 2 | X'00000002' |
| MQCC_UNKNOWN | -1 | X'FFFFFFFF' |

## MQCCSI_* (Coded Character Set Identifiers)

| Table 55. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCCSI_UNDEFINED | 0 | X'00000000' |
| MQCCSI_DEFAULT | 0 | X'00000000' |
| MQCCSI_Q_MGR | 0 | X'00000000' |
| MQCCSI_INHERIT | -2 | X'FFFFFFFE' |
| MQCCSI_EMBEDDED | -1 | X'FFFFFFFF' |
| MQCCSI_APPL | -3 | X'FFFFFFFD' |

## MQCCT_* ( CICS information header Conversational Task Options)

| Table 56. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCCT_YES | 1 | X'00000001' |
| MQCCT_NO | 0 | X'00000000' |

## MQCD_* (Channel definition structure)

| Table 57. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCD_VERSION_1 | 1 | X'00000001' |
| MQCD_VERSION_2 | 2 | X'00000002' |
| MQCD_VERSION_3 | 3 | X'00000003' |
| MQCD_VERSION_4 | 4 | X'00000004' |
| MQCD_VERSION_5 | 5 | X'00000005' |
| MQCD_VERSION_6 | 6 | X'00000006' |
| MQCD_VERSION_7 | 7 | X'00000007' |
| MQCD_VERSION_8 | 8 | X'00000008' |
| MQCD_VERSION_9 | 9 | X'00000009' |
| MQCD_VERSION_10 | 10 | X'0000000A' |
| MQCD_VERSION_11 | 11 | X'0000000B' |
| MQCD_CURRENT_VERSION | 11 | X'0000000B' |
| MQCD_LENGTH_4 | (value differs by platform or version) | |
| MQCD_LENGTH_5 | (value differs by platform or version) | |
| MQCD_LENGTH_6 | (value differs by platform or version) | |

| Table 57. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCD_LENGTH_7 | (value differs by platform or version) | |
| MQCD_LENGTH_8 | (value differs by platform or version) | |
| MQCD_LENGTH_9 | (value differs by platform or version) | |
| MQCD_LENGTH_10 | (value differs by platform or version) | |
| MQCD_LENGTH_11 | (value differs by platform or version) | |
| MQCD_CURRENT_LENGTH | (value differs by platform or version) | |

## MQCDC_* (Channel Data Conversion)

| Table 58. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCDC_SENDER_CONVERSION | 1 | X'00000001' |
| MQCDC_NO_SENDER_CONVERSION | 0 | X'00000000' |

## MQCERT_* (Certificate Validation Policy Type)

| | | |
|---|---|---|
| MQ_CERT_VAL_POLICY_DEFAULT | 0 | X'00000000' |
| MQ_CERT_VAL_POLICY_ANY | 0 | X'00000000' |
| MQ_CERT_VAL_POLICY_RFC5280 | 1 | X'00000001' |

## MQCF_* (Capability Flags)

| Table 59. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCF_NONE | 0 | X'00000000' |
| MQCF_DIST_LISTS | 1 | X'00000001' |

## MQCFAC_* ( CICS information header Facility)

| Table 60. Constant names and values | |
|---|---|
| **Name** | **Hexadecimal value** |
| MQCFAC_NONE | X'00...00' (8 nulls) |
| MQCFAC_NONE_ARRAY | '\0','\0',... (8 nulls) |

## MQCFBF_* (Command format byte string filter parameter structure)

| Table 61. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCFBF_STRUC_LENGTH_FIXED | 20 | X'00000014' |

## MQCFBS_* (Command format byte string parameter structure)

*Table 62. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFBS_STRUC_LENGTH_FIXED | 16 | X'00000010' |

## MQCFC_* (Command format header Control Options)

*Table 63. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFC_LAST | 1 | X'00000001' |
| MQCFC_NOT_LAST | 0 | X'00000000' |

## MQCFGR_* (Command format group parameter structure)

*Table 64. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFGR_STRUC_LENGTH | 16 | X'00000010' |

## MQCFH_* (Command format header structure)

*Table 65. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFH_STRUC_LENGTH | 36 | X'00000024' |
| MQCFH_VERSION_1 | 1 | X'00000001' |
| MQCFH_VERSION_2 | 2 | X'00000002' |
| MQCFH_VERSION_3 | 3 | X'00000003' |
| MQCFH_CURRENT_VERSION | 3 | X'00000003' |

## MQCFIF_* (Command format integer filter parameter structure)

*Table 66. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFIF_STRUC_LENGTH | 20 | X'00000014' |

## MQCFIL_* (Command format integer list parameter structure)

*Table 67. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFIL_STRUC_LENGTH_FIXED | 16 | X'00000010' |

## MQCFIL64_* (Command format 64-bit integer list parameter structure)

*Table 68. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFIL64_STRUC_LENGTH_FIXED | 16 | X'00000010' |

## MQCFIN_* (Command format integer parameter structure)

*Table 69. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFIN_STRUC_LENGTH | 16 | X'00000010' |

## MQCFIN64_* (Command format 64-bit integer parameter structure)

*Table 70. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFIN64_STRUC_LENGTH | 24 | X'00000018' |

## MQCFO_* (Command format Refresh Repository Options and Command format Remove Queues Options )

### Command format Refresh Repository Options

*Table 71. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFO_REFRESH_REPOSITORY_YES | 1 | X'00000001' |
| MQCFO_REFRESH_REPOSITORY_NO | 0 | X'00000000' |

### Command format Remove Queues Options

*Table 72. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFO_REMOVE_QUEUES_YES | 1 | X'00000001' |
| MQCFO_REMOVE_QUEUES_NO | 0 | X'00000000' |

## MQCFOP_* (Command format Filter Operators)

*Table 73. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFOP_LESS | 1 | X'00000001' |
| MQCFOP_EQUAL | 2 | X'00000002' |
| MQCFOP_GREATER | 4 | X'00000004' |
| MQCFOP_NOT_LESS | 6 | X'00000006' |
| MQCFOP_NOT_EQUAL | 5 | X'00000005' |
| MQCFOP_NOT_GREATER | 3 | X'00000003' |
| MQCFOP_LIKE | 18 | X'00000012' |
| MQCFOP_NOT_LIKE | 21 | X'00000015' |
| MQCFOP_CONTAINS | 10 | X'0000000A' |
| MQCFOP_EXCLUDES | 13 | X'0000000D' |
| MQCFOP_CONTAINS_GEN | 26 | X'0000001A' |
| MQCFOP_EXCLUDES_GEN | 29 | X'0000001D' |

## MQCFR_* (CF Recoverability)

*Table 74. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFR_YES | 1 | X'00000001' |
| MQCFR_NO | 0 | X'00000000' |

## MQCFSF_* (Command format string filter parameter structure)

*Table 75. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFSF_STRUC_LENGTH_FIXED | 24 | X'00000018' |

## MQCFSL_* (Command format string list parameter structure)

*Table 76. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFSL_STRUC_LENGTH_FIXED | 24 | X'00000018' |

## MQCFST_* (Command format string parameter structure)

*Table 77. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFST_STRUC_LENGTH_FIXED | 20 | X'00000014' |

## MQCFSTATUS_* (Command format CF Status)

*Table 78. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFSTATUS_NOT_FOUND | 0 | X'00000000' |
| MQCFSTATUS_ACTIVE | 1 | X'00000001' |
| MQCFSTATUS_IN_RECOVER | 2 | X'00000002' |
| MQCFSTATUS_IN_BACKUP | 3 | X'00000003' |
| MQCFSTATUS_FAILED | 4 | X'00000004' |
| MQCFSTATUS_NONE | 5 | X'00000005' |
| MQCFSTATUS_UNKNOWN | 6 | X'00000006' |
| MQCFSTATUS_ADMIN_INCOMPLETE | 20 | X'00000014' |
| MQCFSTATUS_NEVER_USED | 21 | X'00000015' |
| MQCFSTATUS_NO_BACKUP | 22 | X'00000016' |
| MQCFSTATUS_NOT_FAILED | 23 | X'00000017' |
| MQCFSTATUS_NOT_RECOVERABLE | 24 | X'00000018' |
| MQCFSTATUS_XES_ERROR | 25 | X'00000019' |

## MQCFT_* (Command format Types of Structure)

*Table 79. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFT_NONE | 0 | X'00000000' |
| MQCFT_COMMAND | 1 | X'00000001' |
| MQCFT_RESPONSE | 2 | X'00000002' |
| MQCFT_INTEGER | 3 | X'00000003' |
| MQCFT_STRING | 4 | X'00000004' |
| MQCFT_INTEGER_LIST | 5 | X'00000005' |
| MQCFT_STRING_LIST | 6 | X'00000006' |
| MQCFT_EVENT | 7 | X'00000007' |
| MQCFT_USER | 8 | X'00000008' |
| MQCFT_BYTE_STRING | 9 | X'00000009' |
| MQCFT_TRACE_ROUTE | 10 | X'0000000A' |
| MQCFT_REPORT | 12 | X'0000000C' |
| MQCFT_INTEGER_FILTER | 13 | X'0000000D' |
| MQCFT_STRING_FILTER | 14 | X'0000000E' |
| MQCFT_BYTE_STRING_FILTER | 15 | X'0000000F' |
| MQCFT_COMMAND_XR | 16 | X'00000010' |
| MQCFT_XR_MSG | 17 | X'00000011' |
| MQCFT_XR_ITEM | 18 | X'00000012' |
| MQCFT_XR_SUMMARY | 19 | X'00000013' |
| MQCFT_GROUP | 20 | X'00000014' |
| MQCFT_STATISTICS | 21 | X'00000015' |
| MQCFT_ACCOUNTING | 22 | X'00000016' |
| MQCFT_INTEGER64 | 23 | X'00000017' |
| MQCFT_INTEGER64_LIST | 25 | X'00000019' |

## MQCFTYPE_* (Command format CF Types)

*Table 80. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCFTYPE_APPL | 0 | X'00000000' |
| MQCFTYPE_ADMIN | 1 | X'00000001' |

## MQCFUNC_* ( CICS information header Functions)

*Table 81. Structures of constants*

| Name | Structure |
|---|---|
| MQCFUNC_MQCONN | "CONN" |
| MQCFUNC_MQGET | "GET¬" |
| MQCFUNC_MQINQ | "INQ¬" |
| MQCFUNC_MQOPEN | "OPEN" |

| Table 81. Structures of constants (continued) | |
|---|---|
| **Name** | **Structure** |
| MQCFUNC_MQPUT | "PUT¬" |
| MQCFUNC_MQPUT1 | "PUT1" |
| MQCFUNC_NONE | "¬¬¬¬" |
| MQCFUNC_MQCONN_ARRAY | 'C','O','N','N' |
| MQCFUNC_MQGET_ARRAY | 'G','E','T','¬' |
| MQCFUNC_MQINQ_ARRAY | 'I','N','Q','¬' |
| MQCFUNC_MQOPEN_ARRAY | 'O','P','E','N' |
| MQCFUNC_MQPUT_ARRAY | 'P','U','T','¬' |
| MQCFUNC_MQPUT1_ARRAY | 'P','U','T','1' |
| MQCFUNC_NONE_ARRAY | '¬','¬','¬','¬' |

**Note:** The symbol ¬ represents a single blank character.

## MQCGWI_* ( CICS information header Get Wait Interval)

| Table 82. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCGWI_DEFAULT | -2 | X'FFFFFFFE' |

## MQCHAD_* (Channel Auto Definition)

| Table 83. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCHAD_DISABLED | 0 | X'00000000' |
| MQCHAD_ENABLED | 1 | X'00000001' |

## MQCHIDS_* (Command format Indoubt Status)

| Table 84. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCHIDS_NOT_INDOUBT | 0 | X'00000000' |
| MQCHIDS_INDOUBT | 1 | X'00000001' |

## MQCHLD_* (Command format Channel Dispositions)

| Table 85. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCHLD_ALL | -1 | X'FFFFFFFF' |
| MQCHLD_DEFAULT | 1 | X'00000001' |
| MQCHLD_SHARED | 2 | X'00000002' |
| MQCHLD_PRIVATE | 4 | X'00000004' |
| MQCHLD_FIXSHARED | 5 | X'00000005' |

## MQCHS_* (Command format Channel Status)

*Table 86. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCHS_INACTIVE | 0 | X'00000000' |
| MQCHS_BINDING | 1 | X'00000001' |
| MQCHS_STARTING | 2 | X'00000002' |
| MQCHS_RUNNING | 3 | X'00000003' |
| MQCHS_STOPPING | 4 | X'00000004' |
| MQCHS_RETRYING | 5 | X'00000005' |
| MQCHS_STOPPED | 6 | X'00000006' |
| MQCHS_REQUESTING | 7 | X'00000007' |
| MQCHS_PAUSED | 8 | X'00000008' |
| MQCHS_INITIALIZING | 13 | X'0000000D' |
| MQCHS_SWITCHING | 14 | X'0000000E' |

## MQCHSH_* (Command format Channel Shared Restart Options)

*Table 87. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCHSH_RESTART_NO | 0 | X'00000000' |
| MQCHSH_RESTART_YES | 1 | X'00000001' |

## MQCHSR_* (Command format Channel Stop Options)

*Table 88. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCHSR_STOP_NOT_REQUESTED | 0 | X'00000000' |
| MQCHSR_STOP_REQUESTED | 1 | X'00000001' |

## MQCHSSTATE_* (Command format Channel Substates)

*Table 89. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCHSSTATE_OTHER | 0 | X'00000000' |
| MQCHSSTATE_END_OF_BATCH | 100 | X'00000064' |
| MQCHSSTATE_SENDING | 200 | X'000000C8' |
| MQCHSSTATE_RECEIVING | 300 | X'0000012C' |
| MQCHSSTATE_SERIALIZING | 400 | X'00000190' |
| MQCHSSTATE_RESYNCHING | 500 | X'000001F4' |
| MQCHSSTATE_HEARTBEATING | 600 | X'00000258' |
| MQCHSSTATE_IN_SCYEXIT | 700 | X'000002BC' |
| MQCHSSTATE_IN_RCVEXIT | 800 | X'00000320' |
| MQCHSSTATE_IN_SENDEXIT | 900 | X'00000384' |
| MQCHSSTATE_IN_MSGEXIT | 1000 | X'000003E8' |

| Table 89. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCHSSTATE_IN_MREXIT | 1100 | X'0000044C' |
| MQCHSSTATE_IN_CHADEXIT | 1200 | X'000004B0' |
| MQCHSSTATE_NET_CONNECTING | 1250 | X'000004E2' |
| MQCHSSTATE_SSL_HANDSHAKING | 1300 | X'00000514' |
| MQCHSSTATE_NAME_SERVER | 1400 | X'00000578' |
| MQCHSSTATE_IN_MQPUT | 1500 | X'000005DC' |
| MQCHSSTATE_IN_MQGET | 1600 | X'00000640' |
| MQCHSSTATE_IN_MQI_CALL | 1700 | X'000006A4' |
| MQCHSSTATE_COMPRESSING | 1800 | X'00000708' |

## MQCHT_* (Channel Types)

| Table 90. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCHT_SENDER | 1 | X'00000001' |
| MQCHT_SERVER | 2 | X'00000002' |
| MQCHT_RECEIVER | 3 | X'00000003' |
| MQCHT_REQUESTER | 4 | X'00000004' |
| MQCHT_ALL | 5 | X'00000005' |
| MQCHT_CLNTCONN | 6 | X'00000006' |
| MQCHT_SVRCONN | 7 | X'00000007' |
| MQCHT_CLUSRCVR | 8 | X'00000008' |
| MQCHT_CLUSSDR | 9 | X'00000009' |

## MQCHTAB_* (Command format Channel Table Types)

| Table 91. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCHTAB_Q_MGR | 1 | X'00000001' |
| MQCHTAB_CLNTCONN | 2 | X'00000002' |

## MQCI_* (Correlation Identifier)

| Table 92. Constant names and values | |
|---|---|
| **Name** | **Value** |
| MQCI_NONE | X'00...00' (24 nulls) |
| MQCI_NONE_ARRAY | '\0','\0',... (24 nulls) |
| MQCI_NEW_SESSION | X'414D5121...' |
| MQCI_NEW_SESSION_ARRAY | '\x41','\x4D','\51','\x21',... |

## MQCIH_* ( CICS information header structure and Flags)

### CICS information header structure

*Table 93. Structures of constants*

| Name | Structure |
|---|---|
| MQCIH_STRUC_ID | "CIH¬" |
| MQCIH_STRUC_ID_ARRAY | 'C','I','H','¬' |

**Note:** The symbol ¬ represents a single blank character.

*Table 94. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCIH_VERSION_1 | 1 | X'00000001' |
| MQCIH_VERSION_2 | 2 | X'00000002' |
| MQCIH_CURRENT_VERSION | 2 | X'00000002' |
| MQCIH_LENGTH_1 | 164 | X'000000A4' |
| MQCIH_LENGTH_2 | 180 | X'000000B4' |
| MQCIH_CURRENT_LENGTH | 180 | X'000000B4' |

### CICS information header Flags

*Table 95. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCIH_NONE | 0 | X'00000000' |
| MQCIH_PASS_EXPIRATION | 1 | X'00000001' |
| MQCIH_UNLIMITED_EXPIRATION | 0 | X'00000000' |
| MQCIH_REPLY_WITHOUT_NULLS | 2 | X'00000002' |
| MQCIH_REPLY_WITH_NULLS | 0 | X'00000000' |
| MQCIH_SYNC_ON_RETURN | 4 | X'00000004' |
| MQCIH_NO_SYNC_ON_RETURN | 0 | X'00000000' |

## MQCLCT_* (Cluster Cache Types)

*Table 96. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCLCT_STATIC | 0 | X'00000000' |
| MQCLCT_DYNAMIC | 1 | X'00000001' |

## MQCLRS_* (Command format Clear Topic String Scope)

*Table 97. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCLRS_LOCAL | 1 | X'00000001' |
| MQCLRS_GLOBAL | 2 | X'00000002' |

## MQCLRT_* (Command format Clear Topic String Type)

| *Table 98. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCLRT_RETAINED | 1 | X'00000001' |

## MQCLT_* ( CICS information header Link Types)

| *Table 99. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCLT_PROGRAM | 1 | X'00000001' |
| MQCLT_TRANSACTION | 2 | X'00000002' |

## MQCLWL_* (Cluster Workload)

| *Table 100. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCLWL_USEQ_LOCAL | 0 | X'00000000' |
| MQCLWL_USEQ_ANY | 1 | X'00000001' |
| MQCLWL_USEQ_AS_Q_MGR | -3 | X'FFFFFFFD' |

## MQCLXQ_* (Cluster transmission queue type)

MQCLXQ_* are the values you can set in the DEFCLXQ queue manager attribute. The DEFCLXQ attribute controls which transmission queue is selected by default by cluster-sender channels to get messages from, to send the messages to cluster-receiver channels.

| *Table 101. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCLXQ_SCTQ | 0 | X'00000000' |
| MQCLXQ_CHANNEL | 1 | X'00000001' |

**Related reference**

"DefClusterXmitQueueType (MQLONG)" on page 791
The DefClusterXmitQueueType attribute controls which transmission queue is selected by default by cluster-sender channels to get messages from, to send the messages to cluster-receiver channels.

Change Queue Manager

Inquire Queue Manager

Inquire Queue Manager (Response)

"MQINQ - Inquire object attributes" on page 685
The MQINQ call returns an array of integers and a set of character strings containing the attributes of an object.

## MQCMD_* (Command Codes)

| *Table 102. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCMD_NONE | 0 | X'00000000' |
| MQCMD_CHANGE_Q_MGR | 1 | X'00000001' |
| MQCMD_INQUIRE_Q_MGR | 2 | X'00000002' |

*Table 102. Values of constants (continued)*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQCMD_CHANGE_PROCESS | 3 | X'00000003' |
| MQCMD_COPY_PROCESS | 4 | X'00000004' |
| MQCMD_CREATE_PROCESS | 5 | X'00000005' |
| MQCMD_DELETE_PROCESS | 6 | X'00000006' |
| MQCMD_INQUIRE_PROCESS | 7 | X'00000007' |
| MQCMD_CHANGE_Q | 8 | X'00000008' |

## MQCMDL_* (Command Levels)

| Table 104. Constant names and values | |
|---|---|
| **Name** | **Value** |
| MQCMDL_LEVEL_600 | 600 |
| MQCMDL_LEVEL_700 | 700 |
| MQCMDL_LEVEL_701 | 701 |
| MQCMDL_LEVEL_710 | 710 |
| MQCMDL_LEVEL_711 | 711 |
| MQCMDL_LEVEL_750 | 750 |
| MQCMDL_LEVEL_800 | 800 |

| Table 104. Constant names and values (continued) | |
|---|---|
| **Name** | **Value** |
| V 8.0.0.2 V 8.0.0.2 MQCMDL_LEVEL_801 | 801 |
| V 8.0.0.3 V 8.0.0.3 MQCMDL_LEVEL_802 | 802 |

**Notes:**

1. MQCMDL_LEVEL_801 applies only to UNIX platforms and IBM i, when you install IBM MQ 8.0.0, Fix Pack 2.
2. V 8.0.0.3 MQCMDL_LEVEL_802 applies only to Windows, UNIX platforms, and IBM i, when you install IBM MQ Version 8.0.0, Fix Pack 3

## MQCMHO_* (Create message handle options and structure)

### Create message handle options structure

| Table 105. Structures of constants | |
|---|---|
| **Name** | **Structure** |
| MQCMHO_STRUC_ID | "CMHO" |
| MQCMHO_STRUC_ID_ARRAY | 'C','M','H','O' |

**Note:** The symbol ¬ represents a single blank character.

| Table 106. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCMHO_VERSION_1 | 1 | X'00000001' |
| MQCMHO_CURRENT_VERSION | 1 | X'00000001' |

### Create Message Handle Options

| Table 107. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCMHO_DEFAULT_VALIDATION | 0 | X'00000000' |
| MQCMHO_NO_VALIDATION | 1 | X'00000001' |
| MQCMHO_VALIDATE | 2 | X'00000002' |
| MQCMHO_NONE | 0 | X'00000000' |

## MQCNO_* (Connect options and structure)

### Connect options structure

| Table 108. Structures of constants | |
|---|---|
| **Name** | **Structure** |
| MQCNO_STRUC_ID | "CNO¬" |
| MQCNO_STRUC_ID_ARRAY | 'C','N','O','¬' |

**Note:** The symbol ¬ represents a single blank character.

| *Table 109. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCNO_VERSION_1 | 1 | X'00000001' |
| MQCNO_VERSION_2 | 2 | X'00000002' |
| MQCNO_VERSION_3 | 3 | X'00000003' |
| MQCNO_VERSION_4 | 4 | X'00000004' |
| MQCNO_VERSION_5 | 5 | X'00000005' |
| MQCNO_CURRENT_VERSION | 5 | X'00000005' |

## Connect Options

| *Table 110. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCNO_STANDARD_BINDING | 0 | X'00000000' |

| MQCRC_SECURITY_ERROR | 6 | X'00000006' |
| MQCRC_PROGRAM_NOT_AVAILABLE | 7 | X'00000007' |
| MQCRC_BRIDGE_TIMEOUT | 8 | X'00000008' |
| MQCRC_TRANSID_NOT_AVAILABLE | 9 | X'00000009' |

## MQCS_* (MQCBC constants Consumer state)

| Table 118. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCS_NONE | 0 | X'00000000' |
| MQCS_SUSPENDED_TEMPORARY | 1 | X'00000001' |
| MQCS_SUSPENDED_USER_ACTION | 2 | X'00000002' |
| MQCS_SUSPENDED | 3 | X'00000003' |
| MQCS_STOPPED | 4 | X'00000004' |

## MQCSC_* ( CICS information header Start Codes)

| Table 119. Structures of constants | |
|---|---|
| **Name** | **Structure** |
| MQCSC_START | "S¬¬¬" |
| MQCSC_STARTDATA | "SD¬¬" |
| MQCSC_TERMINPUT | "TD¬¬" |

| *Table 119. Structures of constants (continued)* | |
|---|---|
| **Name** | **Structure** |
| MQCSC_NONE | "¬¬¬¬" |
| MQCSC_START_ARRAY | 'S','¬','¬','¬' |
| MQCSC_STARTDATA_ARRAY | 'S','D','¬','¬' |
| MQCSC_TERMINPUT_ARRAY | 'T','D','¬','¬' |
| MQCSC_NONE_ARRAY | '¬','¬','¬','¬' |

**Note:** The symbol ¬ represents a single blank character.

## MQCSP_* (Connection security parameters structure and Authentication Types)

### Connection security parameters structure

| *Table 120. Structures of constants* | |
|---|---|
| **Name** | **Structure** |
| MQCSP_STRUC_ID | "CSP¬" |
| MQCSP_STRUC_ID_ARRAY | 'C','S','P','¬' |

**Note:** The symbol ¬ represents a single blank character.

| *Table 121. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCSP_VERSION_1 | 1 | X'00000001' |
| MQCSP_CURRENT_VERSION | 1 | X'00000001' |

### Connection security parameters Authentication Types

| *Table 122. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCSP_AUTH_NONE | 0 | X'00000000' |
| MQCSP_AUTH_USER_ID_AND_PWD | 1 | X'00000001' |

## MQCSRV_* (Command Server Options)

| *Table 123. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCSRV_CONVERT_NO | 0 | X'00000000' |
| MQCSRV_CONVERT_YES | 1 | X'00000001' |
| MQCSRV_DLQ_NO | 0 | X'00000000' |
| MQCSRV_DLQ_YES | 1 | X'00000001' |

## MQCT_* (Queue Manager Connection Tag)

| *Table 124. Constant names and values* | |
|---|---|
| **Name** | **Value** |
| MQCT_NONE | X'00...00' (128 nulls) |

| Table 124. Constant names and values (continued) | |
|---|---|
| **Name** | **Value** |
| MQCT_NONE_ARRAY | '\0','\0',... (128 nulls) |

## MQCTES_* ( CICS information header Task End Status)

| Table 125. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCTES_NOSYNC | 0 | X'00000000' |
| MQCTES_COMMIT | 256 | X'00000100' |
| MQCTES_BACKOUT | 4352 | X'00001100' |
| MQCTES_ENDTASK | 65536 | X'00010000' |

## MQCTLO_* (MQCTL options structure and Consumer Control Options)

### MQCTL options structure

| Table 126. Structures of constants | |
|---|---|
| **Name** | **Structure** |
| MQCTLO_STRUC_ID | "CTLO" |
| MQCTLO_STRUC_ID_ARRAY | 'C','T','L','O' |

**Note:** The symbol ¬ represents a single blank character.

| Table 127. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCTLO_VERSION_1 | 1 | X'00000001' |
| MQCTLO_CURRENT_VERSION | 1 | X'00000001' |

### MQCTL options Consumer Control Options

| Table 128. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCTLO_NONE | 0 | X'00000000' |
| MQCTLO_THREAD_AFFINITY | 1 | X'00000001' |
| MQCTLO_FAIL_IF_QUIESCING | 8192 | X'00002000' |

## MQCUOWC_* ( CICS information header Unit-of-Work Controls)

| Table 129. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCUOWC_ONLY | 273 | X'00000111' |
| MQCUOWC_CONTINUE | 65536 | X'00010000' |
| MQCUOWC_FIRST | 17 | X'00000011' |
| MQCUOWC_MIDDLE | 16 | X'00000010' |
| MQCUOWC_LAST | 272 | X'00000110' |
| MQCUOWC_COMMIT | 256 | X'00000100' |

| Table 129. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCUOWC_BACKOUT | 4352 | X'00001100' |

## MQCXP_* (Channel exit parameter structure)

| Table 130. Structures of constants | |
|---|---|
| **Name** | **Structure** |
| MQCXP_STRUC_ID | "CXP¬" |
| MQCXP_STRUC_ID_ARRAY | 'C','X','P','¬' |

**Note:** The symbol ¬ represents a single blank character.

| Table 131. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQCXP_VERSION_1 | 1 | X'00000001' |
| MQCXP_VERSION_2 | 2 | X'00000002' |
| MQCXP_VERSION_3 | 3 | X'00000003' |
| MQCXP_VERSION_4 | 4 | X'00000004' |
| MQCXP_VERSION_5 | 5 | X'00000005' |
| MQCXP_VERSION_6 | 6 | X'00000006' |
| MQCXP_VERSION_7 | 7 | X'00000007' |
| MQCXP_VERSION_8 | 8 | X'00000008' |
| MQCXP_VERSION_9 | 9 | X'00000009' |
| z/OS z/OS MQCXP_CURRENT_VERSION | 8 | X'00000008' |
| distributed distributed MQCXP_CURRENT_VERSION | 9 | X'00000009' |

## MQDC_* (Destination Class)

| Table 132. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQDC_MANAGED | 1 | X'00000001' |
| MQDC_PROVIDED | 2 | X'00000002' |

## MQDCC_* (Conversion Options, and Masks and Factors)

### Conversion Options

| Table 133. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQDCC_DEFAULT_CONVERSION | 1 | X'00000001' |
| MQDCC_FILL_TARGET_BUFFER | 2 | X'00000002' |
| MQDCC_INT_DEFAULT_CONVERSION | 4 | X'00000004' |
| MQDCC_SOURCE_ENC_NATIVE | (value differs by platform or version) | |
| MQDCC_SOURCE_ENC_NORMAL | 16 | X'00000010' |

| Table 133. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQDCC_SOURCE_ENC_REVERSED | 32 | X'00000020' |
| MQDCC_SOURCE_ENC_UNDEFINED | 0 | X'00000000' |
| MQDCC_TARGET_ENC_NATIVE | (value differs by platform or version) | |
| MQDCC_TARGET_ENC_NORMAL | 256 | X'00000100' |
| MQDCC_TARGET_ENC_REVERSED | 512 | X'00000200' |
| MQDCC_TARGET_ENC_UNDEFINED | 0 | X'00000000' |
| MQDCC_NONE | 0 | X'00000000' |

### Conversion Options Masks and Factors

| Table 134. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQDCC_SOURCE_ENC_MASK | 240 | X'000000F0' |
| MQDCC_TARGET_ENC_MASK | 3840 | X'00000F00' |
| MQDCC_SOURCE_ENC_FACTOR | 16 | X'00000010' |
| MQDCC_TARGET_ENC_FACTOR | 256 | X'00000100' |

## MQDELO_* (Publish/Subscribe Delete Options)

| Table 135. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQDELO_NONE | 0 | X'00000000' |
| MQDELO_LOCAL | 4 | X'00000004' |

## MQDH_* (Distribution header structure)

| Table 136. Structures of constants | |
|---|---|
| **Name** | **Structure** |
| MQDH_STRUC_ID | "DH¬¬" |
| MQDH_STRUC_ID_ARRAY | 'D','H','¬','¬' |

**Note:** The symbol ¬ represents a single blank character.

| Table 137. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQDH_VERSION_1 | 1 | X'00000001' |
| MQDH_CURRENT_VERSION | 1 | X'00000001' |

## MQDHF_* (Distribution header Flags)

| Table 138. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQDHF_NEW_MSG_IDS | 1 | X'00000001' |
| MQDHF_NONE | 0 | X'00000000' |

## MQDISCONNECT_* (Command format Disconnect Types)

*Table 139. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQDISCONNECT_NORMAL | 0 | X'00000000' |
| MQDISCONNECT_IMPLICIT | 1 | X'00000001' |
| MQDISCONNECT_Q_MGR | 2 | X'00000002' |

## MQDL_* (Distribution Lists)

*Table 140. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQDL_SUPPORTED | 1 | X'00000001' |
| MQDL_NOT_SUPPORTED | 0 | X'00000000' |

## MQDLH_* (Dead-letter header structure)

*Table 141. Structures of constants*

| Name | Structure |
|---|---|
| MQDLH_STRUC_ID | "DLH¬" |
| MQDLH_STRUC_ID_ARRAY | 'D','L','H','¬' |

**Note:** The symbol ¬ represents a single blank character.

*Table 142. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQDLH_VERSION_1 | 1 | X'00000001' |
| MQDLH_CURRENT_VERSION | 1 | X'00000001' |

## MQDLV_* (Persistent/Non-persistent Message Delivery)

*Table 143. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQDLV_AS_PARENT | 0 | X'00000000' |
| MQDLV_ALL | 1 | X'00000001' |
| MQDLV_ALL_DUR | 2 | X'00000002' |
| MQDLV_ALL_AVAIL | 3 | X'00000003' |

## MQDMHO_* (Delete message handle options and structure)

### Delete message handle options structure

*Table 144. Structures of constants*

| Name | Structure |
|---|---|
| MQDMHO_STRUC_ID | "DMHO" |
| MQDMHO_STRUC_ID_ARRAY | 'D','M','H','O' |

**Note:** The symbol ¬ represents a single blank character.

| Table 145. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQDMHO_VERSION_1 | 1 | X'00000001' |
| MQDMHO_CURRENT_VERSION | 1 | X'00000001' |

### Delete Message Handle Options

| Table 146. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQDMHO_NONE | 0 | X'00000000' |

## MQDMPO_* (Delete message property options and structure)

### Delete message property options structure

| Table 147. Structures of constants | |
|---|---|
| **Name** | **Structure** |
| MQDMPO_STRUC_ID | "DMPO" |
| MQDMPO_STRUC_ID_ARRAY | 'D','M','P','O' |

**Note:** The symbol ¬ represents a single blank character.

| Table 148. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQDMPO_VERSION_1 | 1 | X'00000001' |
| MQDMPO_CURRENT_VERSION | 1 | X'00000001' |

### Delete Message Property Options

| Table 149. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQDMPO_DEL_FIRST | 0 | X'00000000' |
| MQDMPO_DEL_PROP_UNDER_CURSOR | 1 | X'00000001' |
| MQDMPO_NONE | 0 | X'00000000' |

## MQDNSWLM_* (DNS WLM)

| Table 150. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQDNSWLM_NO | 0 | X'00000000' |
| MQDNSWLM_YES | 1 | X'00000001' |

## MQDT_* (Destination Types)

| Table 151. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQDT_APPL | 1 | X'00000001' |
| MQDT_BROKER | 2 | X'00000002' |

## MQDXP_* (Conversion exit parameter structure)

*Table 152. Structures of constants*

| Name | Structure |
|---|---|
| MQDXP_STRUC_ID | "DXP¬" |
| MQDXP_STRUC_ID_ARRAY | 'D','X','P','¬' |

**Note:** The symbol ¬ represents a single blank character.

*Table 153. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQDXP_VERSION_1 | 1 | X'00000001' |
| MQDXP_VERSION_2 | 2 | X'00000002' |
| MQDXP_CURRENT_VERSION | 2 | X'00000002' |

## MQEC_* (Signal Values)

*Table 154. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQEC_MSG_ARRIVED | 2 | X'00000002' |
| MQEC_WAIT_INTERVAL_EXPIRED | 3 | X'00000003' |
| MQEC_WAIT_CANCELED | 4 | X'00000004' |
| MQEC_Q_MGR_QUIESCING | 5 | X'00000005' |
| MQEC_CONNECTION_QUIESCING | 6 | X'00000006' |

## MQEI_* (Expiry)

*Table 155. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQEI_UNLIMITED | -1 | X'FFFFFFFF' |

## MQENC_* (Encoding)

## MQENC_* (Encoding)

*Table 156. Values of constants by platform*

| Name | Platform | Decimal value | Hexadecimal value |
|---|---|---|---|
| MQENC_NATIVE | IBM i | 273 | X'00000111' |
| | Linux | 546 | X'00000222' |
| | Linux on SPARC | 273 | X'00000111' |
| | Linux on x86 | 546 | X'00000222' |
| | Solaris on SPARC | 273 | X'00000111' |
| | UNIX systems | 273 | X'00000111' |
| | Windows | 546 | X'00000222' |
| | Micro Focus COBOL on Windows | 17 | X'00000011' |
| | z/OS | 785 | X'00000311' |

### MQENC_* (Encoding Masks)

*Table 157. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQENC_INTEGER_MASK | 15 | X'0000000F' |
| MQENC_DECIMAL_MASK | 240 | X'000000F0' |
| MQENC_FLOAT_MASK | 3840 | X'00000F00' |
| MQENC_RESERVED_MASK | -4096 | X'FFFFF000' |

### MQENC_* (Encodings for Binary Integers)

*Table 158. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQENC_INTEGER_UNDEFINED | 0 | X'00000000' |
| MQENC_INTEGER_NORMAL | 1 | X'00000001' |
| MQENC_INTEGER_REVERSED | 2 | X'00000002' |

### MQENC_* (Encodings for Packed Decimal Integers)

*Table 159. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQENC_DECIMAL_UNDEFINED | 0 | X'00000000' |
| MQENC_DECIMAL_NORMAL | 16 | X'00000010' |
| MQENC_DECIMAL_REVERSED | 32 | X'00000020' |

### MQENC_* (Encodings for Floating Point Numbers)

*Table 160. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQENC_FLOAT_UNDEFINED | 0 | X'00000000' |
| MQENC_FLOAT_IEEE_NORMAL | 256 | X'00000100' |
| MQENC_FLOAT_IEEE_REVERSED | 512 | X'00000200' |
| MQENC_FLOAT_S390 | 768 | X'00000300' |
| MQENC_FLOAT_TNS | 1024 | X'00000400' |

## MQEPH_* (Embedded command format header structure and Flags)

### Embedded command format header structure

*Table 161. Structures of constants*

| Name | Structure |
|---|---|
| MQEPH_STRUC_ID | "EPH¬" |
| MQEPH_STRUC_ID_ARRAY | 'E','P','H','¬' |

**Note:** The symbol ¬ represents a single blank character.

| *Table 162. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQEPH_STRUC_LENGTH_FIXED | 68 | X'00000044' |
| MQEPH_VERSION_1 | 1 | X'00000001' |
| MQEPH_CURRENT_VERSION | 1 | X'00000001' |

### Embedded command format header Flags

| *Table 163. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQEPH_NONE | 0 | X'00000000' |
| MQEPH_CCSID_EMBEDDED | 1 | X'00000001' |

## MQET_* (Command format Escape Types)

| *Table 164. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQET_MQSC | 1 | X'00000001' |

## MQEVO_* (Command format Event Origins)

| *Table 165. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQEVO_OTHER | 0 | X'00000000' |
| MQEVO_CONSOLE | 1 | X'00000001' |
| MQEVO_INIT | 2 | X'00000002' |
| MQEVO_MSG | 3 | X'00000003' |
| MQEVO_MQSET | 4 | X'00000004' |
| MQEVO_INTERNAL | 5 | X'00000005' |

## MQEVR_* (Command format Event Recording)

| *Table 166. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQEVR_DISABLED | 0 | X'00000000' |
| MQEVR_ENABLED | 1 | X'00000001' |
| MQEVR_EXCEPTION | 2 | X'00000002' |
| MQEVR_NO_DISPLAY | 3 | X'00000003' |

## MQEXPI_* (Expiration Scan Interval)

| *Table 167. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQEXPI_OFF | 0 | X'00000000' |

## MQFB_* (Feedback Values)

*Table 168. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQFB_NONE | 0 | X'00000000' |
| MQFB_SYSTEM_FIRST | 1 | X'00000001' |
| MQFB_QUIT | 256 | X'00000100' |
| MQFB_EXPIRATION | 258 | X'00000102' |
| MQFB_COA | 259 | X'00000103' |
| MQFB_COD | 260 | X'00000104' |
| MQFB_CHANNEL_COMPLETED | 262 | X'00000106' |
| MQFB_CHANNEL_FAIL_RETRY | 263 | X'00000107' |
| MQFB_CHANNEL_FAIL | 264 | X'00000108' |
| MQFB_APPL_CANNOT_BE_STARTED | 265 | X'00000109' |
| MQFB_TM_ERROR | 266 | X'0000010A' |
| MQFB_APPL_TYPE_ERROR | 267 | X'0000010B' |
| MQFB_STOPPED_BY_MSG_EXIT | 268 | X'0000010C' |
| MQFB_ACTIVITY | 269 | X'0000010D' |
| MQFB_XMIT_Q_MSG_ERROR | 271 | X'0000010F' |
| MQFB_PAN | 275 | X'00000113' |

## MQIAMO64_* (Command format 64-bit Integer Monitoring Parameter Types)

*Table 188. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQIAMO64_AVG_Q_TIME | 703 | X'000002BF' |
| MQIAMO64_Q_TIME_AVG | 741 | X'000002E5' |
| MQIAMO64_Q_TIME_MAX | 742 | X'000002E6' |
| MQIAMO64_Q_TIME_MIN | 743 | X'000002E7' |
| MQIAMO64_BROWSE_BYTES | 745 | X'000002E9' |
| MQIAMO64_BYTES | 746 | X'000002EA' |
| MQIAMO64_GET_BYTES | 747 | X'000002EB' |
| MQIAMO64_PUT_BYTES | 748 | X'000002EC' |
| MQIAMO64_TOPIC_PUT_BYTES | 783 | X'0000030F' |
| MQIAMO64_PUBLISH_MSG_BYTES | 785 | X'00000311' |

## MQIASY_* (Integer System Selectors)

*Table 189. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQIASY_FIRST | -1 | X'FFFFFFFF' |
| MQIASY_CODED_CHAR_SET_ID | -1 | X'FFFFFFFF' |
| MQIASY_TYPE | -2 | X'FFFFFFFE' |
| MQIASY_COMMAND | -3 | X'FFFFFFFD' |
| MQIASY_MSG_SEQ_NUMBER | -4 | X'FFFFFFFC' |
| MQIASY_CONTROL | -5 | X'FFFFFFFB' |
| MQIASY_COMP_CODE | -6 | X'FFFFFFFA' |
| MQIASY_REASON | -7 | X'FFFFFFF9' |
| MQIASY_BAG_OPTIONS | -8 | X'FFFFFFF8' |
| MQIASY_VERSION | -9 | X'FFFFFFF7' |
| MQIASY_LAST_USED | -9 | X'FFFFFFF7' |
| MQIASY_LAST | -2000 | X'FFFFF830' |

## MQIAUT_* ( IMS information header Authenticator)

*Table 190. Constant names and values*

| Name | Value |
|---|---|
| MQIAUT_NONE | "¬¬¬¬¬¬¬¬" |
| MQIAUT_NONE_ARRAY | '¬','¬','¬','¬','¬','¬','¬','¬' |

**Note:** The symbol ¬ represents a single blank character.

## MQIAV_* (Integer Attribute Values)

*Table 191. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQIAV_NOT_APPLICABLE | -1 | X'FFFFFFFF' |

| Table 191. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQIAV_UNDEFINED | -2 | X'FFFFFFFE' |

## MQICM_* ( IMS information header Commit Modes)

| Table 192. Constant names and values | |
|---|---|
| **Name** | **Value** |
| MQICM_COMMIT_THEN_SEND | '0' |
| MQICM_SEND_THEN_COMMIT | '1' |

## MQIDO_* (Command format Indoubt Options)

| Table 193. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQIDO_COMMIT | 1 | X'00000001' |
| MQIDO_BACKOUT | 2 | X'00000002' |

## MQIEP_* (Interface entry points)

### Connection security parameters structure

| Table 194. Structures of constants | |
|---|---|
| **Name** | **Structure** |
| MQIEP_STRUC_ID | "IEP¬" |
| MQIEP_STRUC_ID_ARRAY | 'I','E','P','¬' |

**Note:** The symbol ¬ represents a single blank character.

| Table 195. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQIEP_VERSION_1 | 1 | X'00000001' |
| MQDXP_CURRENT_VERSION | 1 | X'00000001' |

## MQIGQ_* (Intra-Group queuing)

| Table 196. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQIGQ_DISABLED | 0 | X'00000000' |
| MQIGQ_ENABLED | 1 | X'00000001' |

## MQIGQPA_* (Intra-Group queuing Put Authority)

| Table 197. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQIGQPA_DEFAULT | 1 | X'00000001' |
| MQIGQPA_CONTEXT | 2 | X'00000002' |
| MQIGQPA_ONLY_IGQ | 3 | X'00000003' |

| Table 197. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQIGQPA_ALTERNATE_OR_IGQ | 4 | X'00000004' |

## MQIIH_* ( IMS information header structure and Flags)

### IMS information header structure

| Table 198. Structures of constants | |
|---|---|
| **Name** | **Structure** |
| MQIIH_STRUC_ID | "IIH¬" |
| MQIIH_STRUC_ID_ARRAY | 'I','I','H','¬' |

**Note:** The symbol ¬ represents a single blank character.

| Table 199. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQIIH_VERSION_1 | 1 | X'00000001' |
| MQIIH_CURRENT_VERSION | 1 | X'00000001' |
| MQIIH_LENGTH_1 | 84 | X'00000054' |

### IMS information header Flags

| Table 200. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQIIH_NONE | 0 | X'00000000' |
| MQIIH_PASS_EXPIRATION | 1 | X'00000001' |
| MQIIH_UNLIMITED_EXPIRATION | 0 | X'00000000' |
| MQIIH_REPLY_FORMAT_NONE | 8 | X'00000008' |
| MQIIH_IGNORE_PURG | 16 | X'00000010' |
| MQIIH_CM0_REQUEST_RESPONSE | 32 | X'00000020' |

## MQIMPO_* (Inquire message property options and structure)

### Inquire message property options structure

| Table 201. Structures of constants | |
|---|---|
| **Name** | **Structure** |
| MQIMPO_STRUC_ID | "IMPO" |
| MQIMPO_STRUC_ID_ARRAY | 'I','M','P','O' |

**Note:** The symbol ¬ represents a single blank character.

| Table 202. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQIMPO_VERSION_1 | 1 | X'00000001' |
| MQIMPO_CURRENT_VERSION | 1 | X'00000001' |

### Inquire Message Property Options

*Table 203. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQIMPO_CONVERT_TYPE | 2 | X'00000002' |
| MQIMPO_QUERY_LENGTH | 4 | X'00000004' |
| MQIMPO_INQ_FIRST | 0 | X'00000000' |
| MQIMPO_INQ_NEXT | 8 | X'00000008' |
| MQIMPO_INQ_PROP_UNDER_CURSOR | 16 | X'00000010' |
| MQIMPO_CONVERT_VALUE | 32 | X'00000020' |
| MQIMPO_NONE | 0 | X'00000000' |

## MQINBD_* (Command format Inbound Dispositions)

*Table 204. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQINBD_Q_MGR | 0 | X'00000000' |
| MQINBD_GROUP | 3 | X'00000003' |

## MQIND_* (Special Index Values)

*Table 205. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQIND_NONE | -1 | X'FFFFFFFF' |
| MQIND_ALL | -2 | X'FFFFFFFE' |

## MQIPADDR_* (IP Address Versions)

*Table 206. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQIPADDR_IPv4 | 0 | X'00000000' |
| MQIPADDR_IPv6 | 1 | X'00000001' |

## MQISS_* ( IMS information header Security Scopes)

*Table 207. Constant names and values*

| Name | Value |
|---|---|
| MQISS_CHECK | 'C' |
| MQISS_FULL | 'F' |

## MQIT_* (Index Types)

*Table 208. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQIT_NONE | 0 | X'00000000' |
| MQIT_MSG_ID | 1 | X'00000001' |
| MQIT_CORREL_ID | 2 | X'00000002' |

| Table 208. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQIT_MSG_TOKEN | 4 | X'00000004' |
| MQIT_GROUP_ID | 5 | X'00000005' |

## MQITEM_* (Item Type for mqInquireItemInfo)

| Table 209. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQITEM_INTEGER | 1 | X'00000001' |
| MQITEM_STRING | 2 | X'00000002' |
| MQITEM_BAG | 3 | X'00000003' |
| MQITEM_BYTE_STRING | 4 | X'00000004' |
| MQITEM_INTEGER_FILTER | 5 | X'00000005' |
| MQITEM_STRING_FILTER | 6 | X'00000006' |
| MQITEM_INTEGER64 | 7 | X'00000007' |
| MQITEM_BYTE_STRING_FILTER | 8 | X'00000008' |

## MQITII_* ( IMS information header Transaction Instance Identifier)

| Table 210. Constant names and values | |
|---|---|
| **Name** | **Value** |
| MQITII_NONE | X'00...00' (16 nulls) |
| MQITII_NONE_ARRAY | '\0','\0',... (16 nulls) |

## MQITS_* ( IMS information header Transaction States)

| Table 211. Constant names and values | |
|---|---|
| **Name** | **Value** |
| MQITS_IN_CONVERSATION | 'C' |
| MQITS_NOT_IN_CONVERSATION | '¬' |
| MQITS_ARCHITECTED | 'A' |

**Note:** The symbol ¬ represents a single blank character.

## MQKAI_* (KeepAlive Interval)

| Table 212. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQKAI_AUTO | -1 | X'FFFFFFFF' |

## MQMASTER_* (Master administration)

| Table 213. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQMASTER_NO | 0 | X'00000000' |
| MQMASTER_YES | 1 | X'00000001' |

## MQMCAS_* (Command format Message Channel Agent Status)

*Table 214. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQMCAS_STOPPED | 0 | X'00000000' |
| MQMCAS_RUNNING | 3 | X'00000003' |

## MQMCAT_* (MCA Types)

*Table 215. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQMCAT_PROCESS | 1 | X'00000001' |
| MQMCAT_THREAD | 2 | X'00000002' |

## MQMCD_* (Publish/Subscribe Options Tag Information)

### Publish/Subscribe Options Tag Message Content Descriptor (mcd) Tags

*Table 216. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQMCD_FOLDER_VERSION | 1 | X'00000001' |

### Publish/Subscribe Options Tag Tag names

*Table 217. Constant names and values*

| Name | Value |
|---|---|
| MQMCD_MSG_DOMAIN | "Msd" |
| MQMCD_MSG_SET | "Set" |
| MQMCD_MSG_TYPE | "Type" |
| MQMCD_MSG_FORMAT | "Fmt" |

### Publish/Subscribe Options Tag XML tag names

*Table 218. Constant names and values*

| Name | Value |
|---|---|
| MQMCD_MSG_DOMAIN_B | "<Msd>" |
| MQMCD_MSG_DOMAIN_E | "</Msd>" |
| MQMCD_MSG_SET_B | "<Set>" |
| MQMCD_MSG_SET_E | "</Set>" |
| MQMCD_MSG_TYPE_B | "<Type>" |
| MQMCD_MSG_TYPE_E | "</Type>" |
| MQMCD_MSG_FORMAT_B | "<Fmt>" |
| MQMCD_MSG_FORMAT_E | "</Fmt>" |

### Publish/Subscribe Options Tag Tag values

*Table 219. Constant names and values*

| Name | Value |
|---|---|
| MQMCD_DOMAIN_NONE | "none" |
| MQMCD_DOMAIN_NEON | "neon" |
| MQMCD_DOMAIN_MRM | "mrm" |
| MQMCD_DOMAIN_JMS_NONE | "jms_none" |
| MQMCD_DOMAIN_JMS_TEXT | "jms_text" |
| MQMCD_DOMAIN_JMS_OBJECT | "jms_object" |
| MQMCD_DOMAIN_JMS_MAP | "jms_map" |
| MQMCD_DOMAIN_JMS_STREAM | "jms_stream" |
| MQMCD_DOMAIN_JMS_BYTES | "jms_bytes" |

## MQMD_* (Message descriptor structure)

*Table 220. Structures of constants*

| Name | Structure |
|---|---|
| MQMD_STRUC_ID | "MD¬¬" |
| MQMD_STRUC_ID_ARRAY | 'M','D','¬','¬' |

**Note:** The symbol ¬ represents a single blank character.

*Table 221. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQMD_VERSION_1 | 1 | X'00000001' |
| MQMD_VERSION_2 | 2 | X'00000002' |
| MQMD_CURRENT_VERSION | 2 | X'00000002' |

## MQMDE_* (Message descriptor extension structure)

*Table 222. Structures of constants*

| Name | Structure |
|---|---|
| MQMDE_STRUC_ID | "MDE¬" |
| MQMDE_STRUC_ID_ARRAY | 'M','D','E','¬' |

**Note:** The symbol ¬ represents a single blank character.

*Table 223. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQMDE_VERSION_2 | 2 | X'00000002' |
| MQMDE_CURRENT_VERSION | 2 | X'00000002' |
| MQMDE_LENGTH_2 | 72 | X'00000048' |

## MQMDEF_* (Message descriptor extension Flags)

*Table 224. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQMDEF_NONE | 0 | X'00000000' |

## MQMDS_* (Message Delivery Sequence)

*Table 225. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQMDS_PRIORITY | 0 | X'00000000' |
| MQMDS_FIFO | 1 | X'00000001' |

## MQMF_* (Message Flags)

*Table 226. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQMF_SEGMENTATION_INHIBITED | 0 | X'00000000' |
| MQMF_SEGMENTATION_ALLOWED | 1 | X'00000001' |
| MQMF_MSG_IN_GROUP | 8 | X'00000008' |
| MQMF_LAST_MSG_IN_GROUP | 16 | X'00000010' |
| MQMF_SEGMENT | 2 | X'00000002' |
| MQMF_LAST_SEGMENT | 4 | X'00000004' |
| MQMF_NONE | 0 | X'00000000' |

## MQMHBO_* (Message handle to buffer options and structure)

### Message handle to buffer options structure

*Table 227. Structures of constants*

| Name | Structure |
|---|---|
| MQMHBO_STRUC_ID | "MHBO" |
| MQMHBO_STRUC_ID_ARRAY | 'M','H','B','O' |

**Note:** The symbol ¬ represents a single blank character.

*Table 228. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQMHBO_VERSION_1 | 1 | X'00000001' |
| MQMHBO_CURRENT_VERSION | 1 | X'00000001' |

### Message Handle To Buffer Options

*Table 229. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQMHBO_PROPERTIES_IN_MQRFH2 | 1 | X'00000001' |
| MQMHBO_DELETE_PROPERTIES | 2 | X'00000002' |
| MQMHBO_NONE | 0 | X'00000000' |

## MQMI_* (Message Identifier)

*Table 230. Constant names and values*

| Name | Value |
|---|---|
| MQMI_NONE | X'00...00' (24 nulls) |
| MQMI_NONE_ARRAY | '\0','\0',... (24 nulls) |

## MQMMBI_* (Message Mark-Browse Interval)

*Table 231. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQMMBI_UNLIMITED | -1 | X'FFFFFFFF' |

## MQMO_* (Match Options)

*Table 232. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQMO_MATCH_MSG_ID | 1 | X'00000001' |
| MQMO_MATCH_CORREL_ID | 2 | X'00000002' |
| MQMO_MATCH_GROUP_ID | 4 | X'00000004' |
| MQMO_MATCH_MSG_SEQ_NUMBER | 8 | X'00000008' |
| MQMO_MATCH_OFFSET | 16 | X'00000010' |
| MQMO_MATCH_MSG_TOKEN | 32 | X'00000020' |
| MQMO_NONE | 0 | X'00000000' |

## MQMODE_* (Command format Mode Options)

*Table 233. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQMODE_FORCE | 0 | X'00000000' |
| MQMODE_QUIESCE | 1 | X'00000001' |
| MQMODE_TERMINATE | 2 | X'00000002' |

## MQMON_* (Monitoring Values)

*Table 234. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQMON_NOT_AVAILABLE | -1 | X'FFFFFFFF' |
| MQMON_NONE | -1 | X'FFFFFFFF' |
| MQMON_Q_MGR | -3 | X'FFFFFFFD' |
| MQMON_OFF | 0 | X'00000000' |
| MQMON_ON | 1 | X'00000001' |
| MQMON_DISABLED | 0 | X'00000000' |
| MQMON_ENABLED | 1 | X'00000001' |
| MQMON_LOW | 17 | X'00000011' |
| MQMON_MEDIUM | 33 | X'00000021' |

| Table 234. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQMON_HIGH | 65 | X'00000041' |

## MQMT_* (Message Types)

| Table 235. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQMT_SYSTEM_FIRST | 1 | X'00000001' |
| MQMT_REQUEST | 1 | X'00000001' |
| MQMT_REPLY | 2 | X'00000002' |
| MQMT_DATAGRAM | 8 | X'00000008' |
| MQMT_REPORT | 4 | X'00000004' |
| MQMT_MQE_FIELDS_FROM_MQE | 112 | X'00000070' |
| MQMT_MQE_FIELDS | 113 | X'00000071' |
| MQMT_SYSTEM_LAST | 65535 | X'0000FFFF' |
| MQMT_APPL_FIRST | 65536 | X'00010000' |
| MQMT_APPL_LAST | 999999999 | X'3B9AC9FF' |

## MQMTOK_* (Message Token)

| Table 236. Constant names and values | |
|---|---|
| **Name** | **Value** |
| MQMTOK_NONE | X'00...00' (16 nulls) |
| MQMTOK_NONE_ARRAY | '\0','\0',... (16 nulls) |

| Table 237. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQMTOK_NONE | X'00...00' | (16 nulls) |
| MQMTOK_NONE_ARRAY | '\0','\0',... | (16 nulls) |

## MQNC_* (Name Count)

| Table 238. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQNC_MAX_NAMELIST_NAME_COUNT | 256 | X'00000100' |

## MQNPM_* (Nonpersistent Message Class)

| Table 239. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQNPM_CLASS_NORMAL | 0 | X'00000000' |
| MQNPM_CLASS_HIGH | 10 | X'0000000A' |

## MQNPMS_* (NonPersistent-Message Speeds)

*Table 240. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQNPMS_NORMAL | 1 | X'00000001' |
| MQNPMS_FAST | 2 | X'00000002' |

## MQNT_* (Namelist Types)

*Table 241. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQNT_NONE | 0 | X'00000000' |
| MQNT_Q | 1 | X'00000001' |
| MQNT_CLUSTER | 2 | X'00000002' |
| MQNT_AUTH_INFO | 4 | X'00000004' |
| MQNT_ALL | 1001 | X'000003E9' |

## MQNVS_* (Names for Name/Value String)

*Table 242. Constant names and values*

| Name | Value |
|---|---|
| MQNVS_APPL_TYPE | "OPT_APP_GRP¬" |
| MQNVS_MSG_TYPE | "OPT_MSG_TYPE¬" |

**Note:** The symbol ¬ represents a single blank character.

## MQOA_* (Limits for Selectors for Object Attributes)

*Table 243. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQOA_FIRST | 1 | X'00000001' |
| MQOA_LAST | 9000 | X'00002328' |

## MQOD_* (Object descriptor structure)

*Table 244. Structures of constants*

| Name | Structure |
|---|---|
| MQOD_STRUC_ID | "OD¬¬" |
| MQOD_STRUC_ID_ARRAY | 'O','D','¬','¬' |

**Note:** The symbol ¬ represents a single blank character.

*Table 245. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQOD_VERSION_1 | 1 | X'00000001' |
| MQOD_VERSION_2 | 2 | X'00000002' |
| MQOD_VERSION_3 | 3 | X'00000003' |
| MQOD_VERSION_4 | 4 | X'00000004' |

| Table 245. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQOD_CURRENT_VERSION | 4 | X'00000004' |
| MQOD_CURRENT_LENGTH | (value differs by platform or version) | |

## MQOII_* (Object Instance Identifier)

| Table 246. Constant names and values | |
|---|---|
| **Name** | **Value** |
| MQOII_NONE | X'00...00' (24 nulls) |
| MQOII_NONE_ARRAY | '\0','\0',... (24 nulls) |

## MQOL_* (Original Length)

| Table 247. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQOL_UNDEFINED | -1 | X'FFFFFFFF' |

## MQOM_* (Obsolete Db2 Messages options on Inquire Group)

| Table 248. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQOM_NO | 0 | X'00000000' |
| MQOM_YES | 1 | X'00000001' |

## MQOO_* (Open Options)

| Table 249. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQOO_BIND_AS_Q_DEF | 0 | X'00000000' |
| MQOO_READ_AHEAD_AS_Q_DEF | 0 | X'00000000' |
| MQOO_INPUT_AS_Q_DEF | 1 | X'00000001' |
| MQOO_INPUT_SHARED | 2 | X'00000002' |
| MQOO_INPUT_EXCLUSIVE | 4 | X'00000004' |
| MQOO_BROWSE | 8 | X'00000008' |
| MQOO_OUTPUT | 16 | X'00000010' |
| MQOO_INQUIRE | 32 | X'00000020' |
| MQOO_SET | 64 | X'00000040' |
| MQOO_SAVE_ALL_CONTEXT | 128 | X'00000080' |
| MQOO_PASS_IDENTITY_CONTEXT | 256 | X'00000100' |
| MQOO_PASS_ALL_CONTEXT | 512 | X'00000200' |
| MQOO_SET_IDENTITY_CONTEXT | 1024 | X'00000400' |
| MQOO_SET_ALL_CONTEXT | 2048 | X'00000800' |
| MQOO_ALTERNATE_USER_AUTHORITY | 4096 | X'00001000' |
| MQOO_FAIL_IF_QUIESCING | 8192 | X'00002000' |

| Table 249. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQOO_BIND_ON_OPEN | 16384 | X'00004000' |
| MQOO_BIND_NOT_FIXED | 32768 | X'00008000' |
| MQOO_CO_OP | 131072 | X'00020000' |
| MQOO_RESOLVE_LOCAL_TOPIC | 262144 | X'00040000' |
| MQOO_NO_READ_AHEAD | 524288 | X'00080000' |
| MQOO_READ_AHEAD | 1048576 | X'00100000' |
| MQOO_BIND_ON_GROUP | 4194304 | X'00400000' |

### MQOO_* (Following used in C++ only)

| Table 250. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQOO_RESOLVE_NAMES | 65536 | X'00010000' |
| MQOO_RESOLVE_LOCAL_Q | 262144 | X'00040000' |

## MQOP_* (Operation codes for MQCTL and MQCB)

### Operation codes for MQCTL

| Table 251. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQOP_START | 1 | X'00000001' |
| MQOP_START_WAIT | 2 | X'00000002' |
| MQOP_STOP | 4 | X'00000004' |

### Operation codes for MQCB

| Table 252. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQOP_REGISTER | 256 | X'00000100' |
| MQOP_DEREGISTER | 512 | X'00000200' |

### Operation codes for MQCTL and MQCB

| Table 253. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQOP_SUSPEND | 65536 | X'00010000' |
| MQOP_RESUME | 131072 | X'00020000' |

## MQOPEN_* (Values related to MQOPEN_PRIV structure)

| Table 254. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQOPEN_PRIV_VERSION_1 | 1 | X'00000001' |
| MQOPEN_PRIV_CURRENT_VERSION | 1 | X'00000001' |

## MQOPER_* (Activity Operations)

*Table 255. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQOPER_SYSTEM_FIRST | 0 | X'00000000' |
| MQOPER_UNKNOWN | 0 | X'00000000' |
| MQOPER_BROWSE | 1 | X'00000001' |
| MQOPER_DISCARD | 2 | X'00000002' |
| MQOPER_GET | 3 | X'00000003' |
| MQOPER_PUT | 4 | X'00000004' |
| MQOPER_PUT_REPLY | 5 | X'00000005' |
| MQOPER_PUT_REPORT | 6 | X'00000006' |
| MQOPER_RECEIVE | 7 | X'00000007' |
| MQOPER_SEND | 8 | X'00000008' |
| MQOPER_TRANSFORM | 9 | X'00000009' |
| MQOPER_PUBLISH | 10 | X'0000000A' |
| MQOPER_EXCLUDED_PUBLISH | 11 | X'0000000B' |
| MQOPER_DISCARDED_PUBLISH | 12 | X'0000000C' |
| MQOPER_SYSTEM_LAST | 65535 | X'0000FFFF' |
| MQOPER_APPL_FIRST | 65536 | X'00010000' |
| MQOPER_APPL_LAST | 999999999 | X'3B9AC9FF' |

## MQOT_* (Object Types and Extended Object Types)

### Object Types

*Table 256. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQOT_NONE | 0 | X'00000000' |
| MQOT_Q | 1 | X'00000001' |
| MQOT_NAMELIST | 2 | X'00000002' |
| MQOT_PROCESS | 3 | X'00000003' |
| MQOT_STORAGE_CLASS | 4 | X'00000004' |
| MQOT_Q_MGR | 5 | X'00000005' |
| MQOT_CHANNEL | 6 | X'00000006' |
| MQOT_AUTH_INFO | 7 | X'00000007' |
| MQOT_TOPIC | 8 | X'00000008' |
| MQOT_CF_STRUC | 10 | X'0000000A' |
| MQOT_LISTENER | 11 | X'0000000B' |
| MQOT_SERVICE | 12 | X'0000000C' |
| MQOT_RESERVED_1 | 999 | X'000003E7' |

### Extended Object Types

*Table 257. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQOT_ALL | 1001 | X'000003E9' |
| MQOT_ALIAS_Q | 1002 | X'000003EA' |
| MQOT_MODEL_Q | 1003 | X'000003EB' |
| MQOT_LOCAL_Q | 1004 | X'000003EC' |
| MQOT_REMOTE_Q | 1005 | X'000003ED' |
| MQOT_SENDER_CHANNEL | 1007 | X'000003EF' |
| MQOT_SERVER_CHANNEL | 1008 | X'000003F0' |
| MQOT_REQUESTER_CHANNEL | 1009 | X'000003F1' |
| MQOT_RECEIVER_CHANNEL | 1010 | X'000003F2' |
| MQOT_CURRENT_CHANNEL | 1011 | X'000003F3' |
| MQOT_SAVED_CHANNEL | 1012 | X'000003F4' |
| MQOT_SVRCONN_CHANNEL | 1013 | X'000003F5' |
| MQOT_CLNTCONN_CHANNEL | 1014 | X'000003F6' |
| MQOT_SHORT_CHANNEL | 1015 | X'000003F7' |
| MQOT_CHLAUTH | 1016 | X'000003F8' |
| MQOT_REMOTE_Q_MGR_NAME | 1017 | X'000003F9' |
| MQOT_PROT_POLICY | 1019 | X'000003FB' |
| MQOT_TT_CHANNEL | 1020 | X'000003FC' |
| MQOT_AMQP_CHANNEL | 1021 | X'000003FD' |
| V 8.0.0.4 V 8.0.0.4 MQOT_AUTH_REC | 1022 | X'000003FE' |

## MQPA_* (Put Authority)

*Table 258. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQPA_DEFAULT | 1 | X'00000001' |
| MQPA_CONTEXT | 2 | X'00000002' |
| MQPA_ONLY_MCA | 3 | X'00000003' |
| MQPA_ALTERNATE_OR_MCA | 4 | X'00000004' |

## MQPD_* (Property descriptor, support and context)

### Property descriptor structure

*Table 259. Structures of constants*

| Name | Structure |
|---|---|
| MQPD_STRUC_ID | "PD¬¬" |
| MQPD_STRUC_ID_ARRAY | 'P','D','¬','¬' |

**Note:** The symbol ¬ represents a single blank character.

| Table 260. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQPD_VERSION_1 | 1 | X'00000001' |
| MQPD_CURRENT_VERSION | 1 | X'00000001' |

**Note:** The symbol ¬ represents a single blank character.

### Property Descriptor Options

| Table 261. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQPD_NONE | 0 | X'00000000' |

### Property Support Options

| Table 262. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQPD_SUPPORT_OPTIONAL | 1 | X'00000001' |
| MQPD_SUPPORT_REQUIRED | 1048576 | X'00100000' |
| MQPD_SUPPORT_REQUIRED_IF_LOCAL | 1024 | X'00000400' |
| MQPD_REJECT_UNSUP_MASK | -1048576 | X'FFF00000' |
| MQPD_ACCEPT_UNSUP_IF_XMIT_MASK | 1047552 | X'000FFC00' |
| MQPD_ACCEPT_UNSUP_MASK | 1023 | X'000003FF' |

### Property Context

| Table 263. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQPD_NO_CONTEXT | 0 | X'00000000' |
| MQPD_USER_CONTEXT | 1 | X'00000001' |

## MQPER_* (Persistence Values)

| Table 264. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQPER_PERSISTENCE_AS_PARENT | -1 | X'FFFFFFFF' |
| MQPER_NOT_PERSISTENT | 0 | X'00000000' |
| MQPER_PERSISTENT | 1 | X'00000001' |
| MQPER_PERSISTENCE_AS_Q_DEF | 2 | X'00000002' |
| MQPER_PERSISTENCE_AS_TOPIC_DEF | 2 | X'00000002' |

## MQPL_* (Platforms)

| Table 265. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQPL_MVS | 1 | X'00000001' |
| MQPL_OS390 | 1 | X'00000001' |

| Table 265. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQPL_ZOS | 1 | X'00000001' |
| MQPL_OS2 | 2 | X'00000002' |
| MQPL_AIX | 3 | X'00000003' |
| MQPL_UNIX | 3 | X'00000003' |
| MQPL_OS400 | 4 | X'00000004' |
| MQPL_WINDOWS | 5 | X'00000005' |
| MQPL_WINDOWS_NT | 11 | X'0000000B' |
| MQPL_VMS | 12 | X'0000000C' |
| MQPL_NSK | 13 | X'0000000D' |
| MQPL_NSS | 13 | X'0000000D' |
| MQPL_OPEN_TP1 | 15 | X'0000000F' |
| MQPL_VM | 18 | X'00000012' |
| MQPL_TPF | 23 | X'00000017' |
| MQPL_VSE | 27 | X'0000001B' |
| V 8.0.0.2 V 8.0.0.2 MQPL_APPLIANCE | 28 | X'0000001C' |
| MQPL_NATIVE | 1 | X'00000001' |

## MQPMO_* (Put message options and structure for publish mask)

### Put message options structure

| Table 266. Structures of constants | |
|---|---|
| **Name** | **Structure** |
| MQPMO_STRUC_ID | "PMO¬" |
| MQPMO_STRUC_ID_ARRAY | 'P','M','O','¬' |

**Note:** The symbol ¬ represents a single blank character.

| Table 267. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQPMO_VERSION_1 | 1 | X'00000001' |
| MQPMO_VERSION_2 | 2 | X'00000002' |
| MQPMO_VERSION_3 | 3 | X'00000003' |
| MQPMO_CURRENT_VERSION | 3 | X'00000003' |
| MQPMO_CURRENT_LENGTH | (value differs by platform or version) | |

### Put Message Options

| Table 268. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQPMO_SYNCPOINT | 2 | X'00000002' |
| MQPMO_NO_SYNCPOINT | 4 | X'00000004' |

| Table 268. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQPMO_DEFAULT_CONTEXT | 32 | X'00000020' |
| MQPMO_NEW_MSG_ID | 64 | X'00000040' |
| MQPMO_NEW_CORREL_ID | 128 | X'00000080' |
| MQPMO_PASS_IDENTITY_CONTEXT | 256 | X'00000100' |
| MQPMO_PASS_ALL_CONTEXT | 512 | X'00000200' |
| MQPMO_SET_IDENTITY_CONTEXT | 1024 | X'00000400' |
| MQPMO_SET_ALL_CONTEXT | 2048 | X'00000800' |
| MQPMO_ALTERNATE_USER_AUTHORITY | 4096 | X'00001000' |
| MQPMO_FAIL_IF_QUIESCING | 8192 | X'00002000' |
| MQPMO_NO_CONTEXT | 16384 | X'00004000' |
| MQPMO_LOGICAL_ORDER | 32768 | X'00008000' |
| MQPMO_ASYNC_RESPONSE | 65536 | X'00010000' |
| MQPMO_SYNC_RESPONSE | 131072 | X'00020000' |
| MQPMO_RESOLVE_LOCAL_Q | 262144 | X'00040000' |
| MQPMO_RETAIN | 2097152 | X'00200000' |
| MQPMO_MD_FOR_OUTPUT_ONLY | 8388608 | X'00800000' |
| MQPMO_SCOPE_QMGR | 67108864 | X'04000000' |
| MQPMO_SUPPRESS_REPLYTO | 134217728 | X'08000000' |
| MQPMO_NOT_OWN_SUBS | 268435456 | X'10000000' |
| MQPMO_RESPONSE_AS_Q_DEF | 0 | X'00000000' |
| MQPMO_RESPONSE_AS_TOPIC_DEF | 0 | X'00000000' |
| MQPMO_NONE | 0 | X'00000000' |

### Put Message Options for publish mask

| Table 269. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQPMO_PUB_OPTIONS_MASK | 2097152 | X'00200000' |

## MQPMRF_* (Put Message Record Fields)

| Table 270. Values of constants | | |

| MQSCA_REQUIRED | 0 | X'00000000' |
| MQSCA_OPTIONAL | 1 | X'00000001' |

## MQSCO_* (SSL configuration options)

### SSL configuration options structure

*Table 332. Structures of constants*

| Name | Structure |
|---|---|
| MQSCO_STRUC_ID | "SCO¬" |
| MQSCO_STRUC_ID_ARRAY | 'S','C','O','¬' |

**Note:** The symbol ¬ represents a single blank character.

*Table 333. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSCO_VERSION_1 | 1 | X'00000001' |
| MQSCO_VERSION_2 | 2 | X'00000002' |
| MQSCO_VERSION_3 | 3 | X'00000003' |
| MQSCO_VERSION_4 | 4 | X'00000004' |
| MQSCO_CURRENT_VERSION | 4 | X'00000004' |

**Note:** The symbol ¬ represents a single blank character.

### SSL configuration options Key Reset Count

*Table 334. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSCO_RESET_COUNT_DEFAULT | 0 | X'00000000' |

### Command format Queue Definition Scope

*Table 335. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSCO_Q_MGR | 1 | X'00000001' |
| MQSCO_CELL | 2 | X'00000002' |

## MQSCOPE_* (Publish scope)

*Table 336. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSCOPE_ALL | 0 | X'00000000' |
| MQSCOPE_AS_PARENT | 1 | X'00000001' |
| MQSCOPE_QMGR | 4 | X'00000004' |

## MQSCYC_* (Security Case)

*Table 337. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSCYC_UPPER | 0 | X'00000000' |
| MQSCYC_MIXED | 1 | X'00000001' |

## MQSD_* (Object descriptor structure)

*Table 338. Constant names and structures*

| Name | Structure |
|---|---|
| MQSD_STRUC_ID | "SD¬¬" |
| MQSD_STRUC_ID_ARRAY | 'S','D','¬','¬' |

**Note:** The symbol ¬ represents a single blank character.

*Table 339. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSD_VERSION_1 | 1 | X'00000001' |
| MQSD_CURRENT_VERSION | 1 | X'00000001' |

## MQSECITEM_* (Command format Security Items)

*Table 340. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSECITEM_ALL | 0 | X'00000000' |
| MQSECITEM_MQADMIN | 1 | X'00000001' |
| MQSECITEM_MQNLIST | 2 | X'00000002' |

| Table 340. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQSECITEM_MQPROC | 3 | X'00000003' |
| MQSECITEM_MQQUEUE | 4 | X'00000004' |
| MQSECITEM_MQCONN | 5 | X'00000005' |
| MQSECITEM_MQCMDS | 6 | X'00000006' |
| MQSECITEM_MXADMIN | 7 | X'00000007' |
| MQSECITEM_MXNLIST | 8 | X'00000008' |
| MQSECITEM_MXPROC | 9 | X'00000009' |
| MQSECITEM_MXQUEUE | 10 | X'0000000A' |
| MQSECITEM_MXTOPIC | 11 | X'0000000B' |

## MQSECSW_* (Command format Security Switches and Switch States)

### Command format Security Switches

| Table 341. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQSECSW_PROCESS | 1 | X'00000001' |
| MQSECSW_NAMELIST | 2 | X'00000002' |
| MQSECSW_Q | 3 | X'00000003' |
| MQSECSW_TOPIC | 4 | X'00000004' |
| MQSECSW_CONTEXT | 6 | X'00000006' |
| MQSECSW_ALTERNATE_USER | 7 | X'00000007' |
| MQSECSW_COMMAND | 8 | X'00000008' |
| MQSECSW_CONNECTION | 9 | X'00000009' |
| MQSECSW_SUBSYSTEM | 10 | X'0000000A' |
| MQSECSW_COMMAND_RESOURCES | 11 | X'0000000B' |
| MQSECSW_Q_MGR | 15 | X'0000000F' |
| MQSECSW_QSG | 16 | X'00000010' |

### Command format Security Switch States

| Table 342. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQSECSW_OFF_FOUND | 21 | X'00000015' |
| MQSECSW_ON_FOUND | 22 | X'00000016' |
| MQSECSW_OFF_NOT_FOUND | 23 | X'00000017' |
| MQSECSW_ON_NOT_FOUND | 24 | X'00000018' |
| MQSECSW_OFF_ERROR | 25 | X'00000019' |
| MQSECSW_ON_OVERRIDDEN | 26 | X'0000001A' |

## MQSECTYPE_* (Command format Security Types)

*Table 343. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSECTYPE_AUTHSERV | 1 | X'00000001' |
| MQSECTYPE_SSL | 2 | X'00000002' |
| MQSECTYPE_CLASSES | 3 | X'00000003' |

## MQSEG_* (Segmentation)

*Table 344. Constant names and values*

| Name | Value |
|---|---|
| MQSEG_INHIBITED | '¬' |
| MQSEG_ALLOWED | 'A' |

**Note:** The symbol ¬ represents a single blank character.

## MQSEL_* (Special Selector Values)

*Table 345. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSEL_ANY_SELECTOR | -30001 | X'FFFF8ACF' |
| MQSEL_ANY_USER_SELECTOR | -30002 | X'FFFF8ACE' |
| MQSEL_ANY_SYSTEM_SELECTOR | -30003 | X'FFFF8ACD' |
| MQSEL_ALL_SELECTORS | -30001 | X'FFFF8ACF' |
| MQSEL_ALL_USER_SELECTORS | -30002 | X'FFFF8ACE' |
| MQSEL_ALL_SYSTEM_SELECTORS | -30003 | X'FFFF8ACD' |

## MQSELTYPE_* (Selector Types)

*Table 346. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSELTYPE_NONE | 0 | X'00000000' |
| MQSELTYPE_STANDARD | 1 | X'00000001' |
| MQSELTYPE_EXTENDED | 2 | X'00000002' |

## MQSID_* (Security Identifier)

*Table 347. Constant names and values*

| Name | Value |
|---|---|
| MQSID_NONE | X'00...00' (40 nulls) |
| MQSID_NONE_ARRAY | '\0','\0',... (40 nulls) |

## MQSIDT_* (Security Identifier Types)

*Table 348. Constant names and values*

| Name | Hexadecimal value |
|---|---|
| MQSIDT_NONE | X'00' |

| Table 348. Constant names and values (continued) | |
|---|---|
| **Name** | **Hexadecimal value** |
| MQSIDT_NT_SECURITY_ID | X'01' |
| MQSIDT_WAS_SECURITY_ID | X'02' |

| | |
|---|---|
| MQSIDT_NONE | X'00' |
| MQSIDT_NT_SECURITY_ID | X'01' |
| MQSIDT_WAS_SECURITY_ID | X'02' |

## MQSMPO_* (Set message property options and structure)

### Set message property options structure

| Table 349. Structures of constants | |
|---|---|
| **Name** | **Structure** |
| MQSMPO_STRUC_ID | "SMPO" |
| MQSMPO_STRUC_ID_ARRAY | 'S','M','P','O' |

**Note:** The symbol ¬ represents a single blank character.

| Table 350. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQSMPO_VERSION_1 | 1 | X'00000001' |
| MQSMPO_CURRENT_VERSION | 1 | X'00000001' |

### Set Message Property Options

| Table 351. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQSMPO_SET_FIRST | 0 | X'00000000' |
| MQSMPO_SET_PROP_UNDER_CURSOR | 1 | X'00000001' |
| MQSMPO_SET_PROP_AFTER_CURSOR | 2 | X'00000002' |
| MQSMPO_APPEND_PROPERTY | 4 | X'00000004' |
| MQSMPO_SET_PROP_BEFORE_CURSOR | 8 | X'00000008' |
| MQSMPO_NONE | 0 | X'00000000' |

## MQSO_* (Subscribe Options)

| Table 352. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQSO_NONE | 0 | X'00000000' |
| MQSO_NON_DURABLE | 0 | X'00000000' |
| MQSO_READ_AHEAD_AS_Q_DEF | 0 | X'00000000' |
| MQSO_ALTER | 1 | X'00000001' |
| MQSO_CREATE | 2 | X'00000002' |
| MQSO_RESUME | 4 | X'00000004' |

| Table 352. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQSO_DURABLE | 8 | X'00000008' |
| MQSO_GROUP_SUB | 16 | X'00000010' |
| MQSO_MANAGED | 32 | X'00000020' |
| MQSO_SET_IDENTITY_CONTEXT | 64 | X'00000040' |
| MQSO_FIXED_USERID | 256 | X'00000100' |
| MQSO_ANY_USERID | 512 | X'00000200' |
| MQSO_PUBLICATIONS_ON_REQUEST | 2048 | X'00000800' |
| MQSO_NEW_PUBLICATIONS_ONLY | 4096 | X'00001000' |
| MQSO_FAIL_IF_QUIESCING | 8192 | X'00002000' |
| MQSO_ALTERNATE_USER_AUTHORITY | 262144 | X'00040000' |
| MQSO_WILDCARD_CHAR | 1048576 | X'00100000' |
| MQSO_WILDCARD_TOPIC | 2097152 | X'00200000' |
| MQSO_SET_CORREL_ID | 4194304 | X'00400000' |
| MQSO_SCOPE_QMGR | 67108864 | X'04000000' |
| MQSO_NO_READ_AHEAD | 134217728 | X'08000000' |
| MQSO_READ_AHEAD | 268435456 | X'10000000' |

## MQSP_* (Sync point Availability)

| Table 353. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQSP_AVAILABLE | 1 | X'00000001' |
| MQSP_NOT_AVAILABLE | 0 | X'00000000' |

## MQSQQM_* (Shared Queue Queue Manager Name)

| Table 354. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQSQQM_USE | 0 | X'00000000' |
| MQSQQM_IGNORE | 1 | X'00000001' |

## MQSR_* (Action)

| Table 355. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQSR_ACTION_PUBLICATION | 1 | X'00000001' |

## MQSRO_* (Subscription request options structure)

| Table 356. Structures of constants | |
|---|---|
| **Name** | **Structure** |
| MQSRO_STRUC_ID | "SRO¬" |
| MQSRO_STRUC_ID_ARRAY | 'S','R','O','¬' |

**Note:** The symbol ¬ represents a single blank character.

*Table 357. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSRO_VERSION_1 | 1 | X'00000001' |
| MQSRO_CURRENT_VERSION | 1 | X'00000001' |
| MQSRO_NONE | 0 | X'00000000' |
| MQSRO_FAIL_IF_QUIESCING | 8192 | X'00002000' |

## MQSS_* (Segment Status)

*Table 358. Constant names and structures*

| Name | Structure |
|---|---|
| MQSS_NOT_A_SEGMENT | '¬' |
| MQSS_SEGMENT | 'S' |
| MQSS_LAST_SEGMENT | 'L' |

**Note:** The symbol ¬ represents a single blank character.

## MQSSL_* (SSL FIPS Requirements)

*Table 359. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSSL_FIPS_NO | 0 | X'00000000' |
| MQSSL_FIPS_YES | 1 | X'00000001' |

## MQSTAT_* (Stat Options)

*Table 360. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSTAT_TYPE_ASYNC_ERROR | 0 | X'00000000' |
| MQSTAT_TYPE_RECONNECTION | 0 | X'00000000' |
| MQSTAT_TYPE_RECONNECTION_ERROR | 0 | X'00000000' |

## MQSTS_* (Status reporting structure structure)

*Table 361. Structures of constants*

| Name | Structure |
|---|---|
| MQSTS_STRUC_ID | "STAT" |
| MQSTS_STRUC_ID_ARRAY | 'S','T','A','T' |

**Note:** The symbol ¬ represents a single blank character.

*Table 362. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSTS_VERSION_1 | 1 | X'00000001' |
| MQSTS_CURRENT_VERSION | 1 | X'00000001' |

## MQSUB_* (Durable subscriptions)

### Durable subscriptions

*Table 363. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSUB_DURABLE_AS_PARENT | 0 | X'00000000' |
| MQSUB_DURABLE_ALLOWED | 1 | X'00000001' |
| MQSUB_DURABLE_INHIBITED | 2 | X'00000002' |

### Durable Subscriptions

*Table 364. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSUB_DURABLE_ALL | -1 | X'FFFFFFFF' |
| MQSUB_DURABLE_YES | 1 | X'00000001' |
| MQSUB_DURABLE_NO | 2 | X'00000002' |

## MQSUBTYPE_* (Command format Subscription Types)

*Table 365. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSUBTYPE_API | 1 | X'00000001' |
| MQSUBTYPE_ADMIN | 2 | X'00000002' |
| MQSUBTYPE_PROXY | 3 | X'00000003' |
| MQSUBTYPE_ALL | -1 | X'FFFFFFFF' |
| MQSUBTYPE_USER | -2 | X'FFFFFFFE' |

## MQSUS_* (Command format Suspend Status)

*Table 366. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSUS_YES | 1 | X'00000001' |
| MQSUS_NO | 0 | X'00000000' |

## MQSVC_* (Service)

### Service Types

*Table 367. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSVC_TYPE_COMMAND | 0 | X'00000000' |
| MQSVC_TYPE_SERVER | 1 | X'00000001' |

### Service Controls

*Table 368. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSVC_CONTROL_Q_MGR | 0 | X'00000000' |
| MQSVC_CONTROL_Q_MGR_START | 1 | X'00000001' |
| MQSVC_CONTROL_MANUAL | 2 | X'00000002' |

### Service Status

*Table 369. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSVC_STATUS_STOPPED | 0 | X'00000000' |
| MQSVC_STATUS_STARTING | 1 | X'00000001' |
| MQSVC_STATUS_RUNNING | 2 | X'00000002' |
| MQSVC_STATUS_STOPPING | 3 | X'00000003' |
| MQSVC_STATUS_RETRYING | 4 | X'00000004' |

## MQSYNCPOINT_* (Command format Syncpoint values for Pub/Sub migration)

*Table 370. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSYNCPOINT_YES | 0 | X'00000000' |
| MQSYNCPOINT_IFPER | 1 | X'00000001' |

## MQSYSP_* (Command format System Parameter Values)

*Table 371. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQSYSP_NO | 0 | X'00000000' |
| MQSYSP_YES | 1 | X'00000001' |
| MQSYSP_EXTENDED | 2 | X'00000002' |
| MQSYSP_TYPE_INITIAL | 10 | X'0000000A' |
| MQSYSP_TYPE_SET | 11 | X'0000000B' |
| MQSYSP_TYPE_LOG_COPY | 12 | X'0000000C' |
| MQSYSP_TYPE_LOG_STATUS | 13 | X'0000000D' |
| MQSYSP_TYPE_ARCHIVE_TAPE | 14 | X'0000000E' |
| MQSYSP_ALLOC_BLK | 20 | X'00000014' |
| MQSYSP_ALLOC_TRK | 21 | X'00000015' |
| MQSYSP_ALLOC_CYL | 22 | X'00000016' |
| MQSYSP_STATUS_BUSY | 30 | X'0000001E' |
| MQSYSP_STATUS_PREMOUNT | 31 | X'0000001F' |
| MQSYSP_STATUS_AVAILABLE | 32 | X'00000020' |
| MQSYSP_STATUS_UNKNOWN | 33 | X'00000021' |
| MQSYSP_STATUS_ALLOC_ARCHIVE | 34 | X'00000022' |

| Table 371. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQSYSP_STATUS_COPYING_BSDS | 35 | X'00000023' |
| MQSYSP_STATUS_COPYING_LOG | 36 | X'00000024' |

## MQTA_* (Topic attributes)

### Wildcards

| Table 372. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQTA_BLOCK | 1 | X'00000001' |
| MQTA_PASSTHRU | 2 | X'00000002' |

### Subscriptions Allowed

| Table 373. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQTA_SUB_AS_PARENT | 0 | X'00000000' |
| MQTA_SUB_INHIBITED | 1 | X'00000001' |
| MQTA_SUB_ALLOWED | 2 | X'00000002' |

### Proxy Sub Propagation

| Table 374. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQTA_PROXY_SUB_FORCE | 1 | X'00000001' |
| MQTA_PROXY_SUB_FIRSTUSE | 2 | X'00000002' |

### Publications Allowed

| Table 375. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQTA_PUB_AS_PARENT | 0 | X'00000000' |
| MQTA_PUB_INHIBITED | 1 | X'00000001' |
| MQTA_PUB_ALLOWED | 2 | X'00000002' |

## MQTC_* (Trigger Controls)

| Table 376. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQTC_OFF | 0 | X'00000000' |
| MQTC_ON | 1 | X'00000001' |

## MQTCPKEEP_* (TCP Keepalive)

*Table 377. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQTCPKEEP_NO | 0 | X'00000000' |
| MQTCPKEEP_YES | 1 | X'00000001' |

## MQTCPSTACK_* (TCP Stack Types)

*Table 378. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQTCPSTACK_SINGLE | 0 | X'00000000' |
| MQTCPSTACK_MULTIPLE | 1 | X'00000001' |

## MQTIME_* (Command format Time units)

*Table 379. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQTIME_UNIT_MINS | 0 | X'00000000' |
| MQTIME_UNIT_SECS | 1 | X'00000001' |

## MQTM_* (Trigger message structure)

*Table 380. Structures of constants*

| Name | Structure |
|---|---|
| MQTM_STRUC_ID | "TM¬¬" |
| MQTM_STRUC_ID_ARRAY | 'T','M','¬','¬' |

**Note:** The symbol ¬ represents a single blank character.

*Table 381. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQTM_VERSION_1 | 1 | X'00000001' |
| MQTM_CURRENT_VERSION | 1 | X'00000001' |

## MQTMC_* (Trigger message character format structure)

*Table 382. Structures of constants*

| Name | Structure |
|---|---|
| MQTMC_STRUC_ID | "TMC¬" |
| MQTMC_STRUC_ID_ARRAY | 'T','M','C','¬' |
| MQTMC_VERSION_1 | "¬¬¬1" |
| MQTMC_VERSION_2 | "¬¬¬2" |
| MQTMC_CURRENT_VERSION | "¬¬¬2" |
| MQTMC_VERSION_1_ARRAY | '¬','¬','¬','1' |
| MQTMC_VERSION_2_ARRAY | '¬','¬','¬','2' |
| MQTMC_CURRENT_VERSION_ARRAY | '¬','¬','¬','2' |

## MQTOPT_* (Topic Type)

*Table 383. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQTOPT_LOCAL | 0 | X'00000000' |
| MQTOPT_CLUSTER | 1 | X'00000001' |
| MQTOPT_ALL | 2 | X'00000002' |

## MQTRAXSTR_* (Channel Initiator Trace Autostart)

*Table 384. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQTRAXSTR_NO | 0 | X'00000000' |
| MQTRAXSTR_YES | 1 | X'00000001' |

## MQTSCOPE_* (Subscription Scope)

*Table 385. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQTSCOPE_QMGR | 1 | X'00000001' |
| MQTSCOPE_ALL | 2 | X'00000002' |

## MQTT_* (Trigger Types)

*Table 386. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQTT_NONE | 0 | X'00000000' |
| MQTT_FIRST | 1 | X'00000001' |
| MQTT_EVERY | 2 | X'00000002' |
| MQTT_DEPTH | 3 | X'00000003' |

## MQTYPE_* (Property data types)

*Table 387. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQTYPE_AS_SET | 0 | X'00000000' |
| MQTYPE_NULL | 2 | X'00000002' |
| MQTYPE_BOOLEAN | 4 | X'00000004' |
| MQTYPE_BYTE_STRING | 8 | X'00000008' |
| MQTYPE_INT8 | 16 | X'00000010' |
| MQTYPE_INT16 | 32 | X'00000020' |
| MQTYPE_INT32 | 64 | X'00000040' |
| MQTYPE_LONG | 64 | X'00000040' |
| MQTYPE_INT64 | 128 | X'00000080' |
| MQTYPE_FLOAT32 | 256 | X'00000100' |
| MQTYPE_FLOAT64 | 512 | X'00000200' |

| Table 387. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQTYPE_STRING | 1024 | X'00000400' |

## MQUA_* (Publish/Subscribe User Attribute Selectors)

| Table 388. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQUA_FIRST | 65536 | X'00010000' |
| MQUA_LAST | 999999999 | X'3B9AC9FF' |

## MQUIDSUPP_* (Command format User ID Support)

| Table 389. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQUIDSUPP_NO | 0 | X'00000000' |
| MQUIDSUPP_YES | 1 | X'00000001' |

## MQUNDELIVERED_* (Command format Undelivered values for Pub/Sub migration)

| Table 390. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQUNDELIVERED_NORMAL | 0 | X'00000000' |
| MQUNDELIVERED_SAFE | 1 | X'00000001' |
| MQUNDELIVERED_DISCARD | 2 | X'00000002' |
| MQUNDELIVERED_KEEP | 3 | X'00000003' |

## MQUOWST_* (Command format UOW States)

| Table 391. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQUOWST_NONE | 0 | X'00000000' |
| MQUOWST_ACTIVE | 1 | X'00000001' |
| MQUOWST_PREPARED | 2 | X'00000002' |
| MQUOWST_UNRESOLVED | 3 | X'00000003' |

## MQUOWT_* (Command format UOW Types)

| Table 392. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQUOWT_Q_MGR | 0 | X'00000000' |
| MQUOWT_CICS | 1 | X'00000001' |
| MQUOWT_RRS | 2 | X'00000002' |
| MQUOWT_IMS | 3 | X'00000003' |
| MQUOWT_XA | 4 | X'00000004' |

## MQUS_* (Queue Usages)

*Table 393. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQUS_NORMAL | 0 | X'00000000' |
| MQUS_TRANSMISSION | 1 | X'00000001' |

## MQUSAGE_* (Command format Page Set Usage Values and Data Set Usage Values)

### Command format Page Set Usage Values

*Table 394. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQUSAGE_PS_AVAILABLE | 0 | X'00000000' |
| MQUSAGE_PS_DEFINED | 1 | X'00000001' |
| MQUSAGE_PS_OFFLINE | 2 | X'00000002' |
| MQUSAGE_PS_NOT_DEFINED | 3 | X'00000003' |
| MQUSAGE_PS_SUSPENDED | 4 | X'00000004' |
| MQUSAGE_EXPAND_USER | 1 | X'00000001' |
| MQUSAGE_EXPAND_SYSTEM | 2 | X'00000002' |
| MQUSAGE_EXPAND_NONE | 3 | X'00000003' |

### Command format Data Set Usage Values

*Table 395. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQUSAGE_DS_OLDEST_ACTIVE_UOW | 10 | X'0000000A' |
| MQUSAGE_DS_OLDEST_PS_RECOVERY | 11 | X'0000000B' |
| MQUSAGE_DS_OLDEST_CF_RECOVERY | 12 | X'0000000C' |

## MQVL_* (Value Length)

*Table 396. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQVL_NULL_TERMINATED | -1 | X'FFFFFFFF' |
| MQVL_EMPTY_STRING | 0 | X'00000000' |

## MQVU_* (Variable User ID)

*Table 397. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQVU_FIXED_USER | 1 | X'00000001' |
| MQVU_ANY_USER | 2 | X'00000002' |

## MQWDR_* (Cluster workload exit destination record structure)

| *Table 398. Structures of constants* | |
|---|---|
| **Name** | **Structure** |
| MQWDR_STRUC_ID | "WDR¬" |
| MQWDR_STRUC_ID_ARRAY | 'W','D','R','¬' |

**Note:** The symbol ¬ represents a single blank character.

| *Table 399. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQWDR_VERSION_1 | 1 | X'00000001' |
| MQWDR_VERSION_2 | 2 | X'00000002' |
| MQWDR_CURRENT_VERSION | 2 | X'00000002' |
| MQWDR_LENGTH_1 | 124 | X'0000007C' |
| MQWDR_LENGTH_2 | 136 | X'00000088' |
| MQWDR_CURRENT_LENGTH | 136 | X'00000088' |

## MQWI_* (Wait Interval)

| *Table 400. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQWI_UNLIMITED | -1 | X'FFFFFFFF' |

## MQWIH_* (Workload information header structure and Flags)

### Workload information header structure

| *Table 401. Structures of constants* | |
|---|---|
| **Name** | **Structure** |
| MQWIH_STRUC_ID | "WIH¬" |
| MQWIH_STRUC_ID_ARRAY | 'W','I','H','¬' |

**Note:** The symbol ¬ represents a single blank character.

| *Table 402. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQWIH_VERSION_1 | 1 | X'00000001' |
| MQWIH_CURRENT_VERSION | 1 | X'00000001' |
| MQWIH_LENGTH_1 | 120 | X'00000078' |
| MQWIH_CURRENT_LENGTH | 120 | X'00000078' |

### Workload information header Flags

| *Table 403. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQWIH_NONE | 0 | X'00000000' |

## MQWQR_* (Cluster workload exit queue record structure)

*Table 404. Structures of constants*

| Name | Structure |
|---|---|
| MQWQR_STRUC_ID | "WQR¬" |
| MQWQR_STRUC_ID_ARRAY | 'W','Q','R','¬' |

**Note:** The symbol ¬ represents a single blank character.

*Table 405. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQWQR_VERSION_1 | 1 | X'00000001' |
| MQWQR_VERSION_2 | 2 | X'00000002' |
| MQWQR_VERSION_3 | 3 | X'00000003' |
| MQWQR_CURRENT_VERSION | 3 | X'00000003' |
| MQWQR_LENGTH_1 | 200 | X'000000C8' |
| MQWQR_LENGTH_2 | 208 | X'000000D0' |
| MQWQR_LENGTH_3 | 212 | X'000000D4' |
| MQWQR_CURRENT_LENGTH | 212 | X'000000D4' |

## MQWS_* (Wildcard Schema)

*Table 406. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQWS_DEFAULT | 0 | X'00000000' |
| MQWS_CHAR | 1 | X'00000001' |
| MQWS_TOPIC | 2 | X'00000002' |

## MQWXP_* (Cluster workload exit parameter structure)

## MQWXP_* (Cluster workload exit parameter structure)

*Table 407. Structures of constants*

| Name | Structure |
|---|---|
| MQWXP_STRUC_ID | "WXP¬" |
| MQWXP_STRUC_ID_ARRAY | 'W','X','P','¬' |

**Note:** The symbol ¬ represents a single blank character.

*Table 408. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQWXP_VERSION_1 | 1 | X'00000001' |
| MQWXP_VERSION_2 | 2 | X'00000002' |
| MQWXP_VERSION_3 | 3 | X'00000003' |
| MQWXP_VERSION_4 | 4 | X'00000004' |
| MQWXP_CURRENT_VERSION | 4 | X'00000004' |

## MQWXP_* (Cluster Workload Flags)

*Table 409. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQWXP_PUT_BY_CLUSTER_CHL | 2 | X'00000002' |

**Related reference**

Description of the fields in the MQWXP - Cluster workload exit parameter structure

## MQXACT_* (API Caller Types)

*Table 410. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQXACT_EXTERNAL | 1 | X'00000001' |
| MQXACT_INTERNAL | 2 | X'00000002' |

## MQXC_* (Exit Commands)

*Table 411. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQXC_MQOPEN | 1 | X'00000001' |
| MQXC_MQCLOSE | 2 | X'00000002' |
| MQXC_MQGET | 3 | X'00000003' |
| MQXC_MQPUT | 4 | X'00000004' |
| MQXC_MQPUT1 | 5 | X'00000005' |
| MQXC_MQINQ | 6 | X'00000006' |
| MQXC_MQSET | 8 | X'00000008' |
| MQXC_MQBACK | 9 | X'00000009' |
| MQXC_MQCMIT | 10 | X'0000000A' |

## MQXCC_* (Exit Responses)

*Table 412. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQXCC_OK | 0 | X'00000000' |
| MQXCC_SUPPRESS_FUNCTION | -1 | X'FFFFFFFF' |
| MQXCC_SKIP_FUNCTION | -2 | X'FFFFFFFE' |
| MQXCC_SEND_AND_REQUEST_SEC_MSG | -3 | X'FFFFFFFD' |
| MQXCC_SEND_SEC_MSG | -4 | X'FFFFFFFC' |
| MQXCC_SUPPRESS_EXIT | -5 | X'FFFFFFFB' |
| MQXCC_CLOSE_CHANNEL | -6 | X'FFFFFFFA' |
| MQXCC_REQUEST_ACK | -7 | X'FFFFFFF9' |
| MQXCC_FAILED | -8 | X'FFFFFFF8' |

## MQXDR_* (Exit Response)

*Table 413. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQXDR_OK | 0 | X'00000000' |
| MQXDR_CONVERSION_FAILED | 1 | X'00000001' |

## MQXE_* (Environments)

*Table 414. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQXE_OTHER | 0 | X'00000000' |
| MQXE_MCA | 1 | X'00000001' |
| MQXE_MCA_SVRCONN | 2 | X'00000002' |
| MQXE_COMMAND_SERVER | 3 | X'00000003' |
| MQXE_MQSC | 4 | X'00000004' |

## MQXEPO_* (Register Entry Point Options structure and Exit Options)

### Register Entry Point Options structure

*Table 415. Structures of constants*

| Name | Structure |
|---|---|
| MQXEPO_STRUC_ID | "XEPO" |
| MQXEPO_STRUC_ID_ARRAY | 'X','E','P','O' |

**Note:** The symbol ¬ represents a single blank character.

*Table 416. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQXEPO_VERSION_1 | 1 | X'00000001' |
| MQXEPO_CURRENT_VERSION | 1 | X'00000001' |

### Exit Options

*Table 417. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQXEPO_NONE | 0 | X'00000000' |

## MQXF_* (API Function Identifiers)

*Table 418. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQXF_INIT | 1 | X'00000001' |
| MQXF_TERM | 2 | X'00000002' |
| MQXF_CONN | 3 | X'00000003' |
| MQXF_CONNX | 4 | X'00000004' |
| MQXF_DISC | 5 | X'00000005' |

| Table 418. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQXF_OPEN | 6 | X'00000006' |
| MQXF_CLOSE | 7 | X'00000007' |
| MQXF_PUT1 | 8 | X'00000008' |
| MQXF_PUT | 9 | X'00000009' |
| MQXF_GET | 10 | X'0000000A' |
| MQXF_DATA_CONV_ON_GET | 11 | X'0000000B' |
| MQXF_INQ | 12 | X'0000000C' |
| MQXF_SET | 13 | X'0000000D' |
| MQXF_BEGIN | 14 | X'0000000E' |
| MQXF_CMIT | 15 | X'0000000F' |
| MQXF_BACK | 16 | X'00000010' |
| MQXF_STAT | 18 | X'00000012' |
| MQXF_CB | 19 | X'00000013' |
| MQXF_CTL | 20 | X'00000014' |
| MQXF_CALLBACK | 21 | X'00000015' |
| MQXF_SUB | 22 | X'00000016' |
| MQXF_SUBRQ | 23 | X'00000017' |
| MQXF_XACLOSE | 24 | X'00000018' |
| MQXF_XACOMMIT | 25 | X'00000019' |
| MQXF_XACOMPLETE | 26 | X'0000001A' |
| MQXF_XAEND | 27 | X'0000001B' |
| MQXF_XAFORGET | 28 | X'0000001C' |
| MQXF_XAOPEN | 29 | X'0000001D' |
| MQXF_XAPREPARE | 30 | X'0000001E' |
| MQXF_XARECOVER | 31 | X'0000001F' |
| MQXF_XAROLLBACK | 32 | X'00000020' |
| MQXF_XASTART | 33 | X'00000021' |
| MQXF_AXREG | 34 | X'00000022' |
| MQXF_AXUNREG | 35 | X'00000023' |

## MQXP_* (API crossing exit parameter structure)

| Table 419. Structures of constants | |
|---|---|
| **Name** | **Structure** |
| MQXP_STRUC_ID | "XP¬¬" |
| MQXP_STRUC_ID_ARRAY | 'X','P','¬','¬' |

**Note:** The symbol ¬ represents a single blank character.

| Table 420. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQXP_VERSION_1 | 1 | X'00000001' |

## MQXPDA_* (Problem Determination Area)

*Table 421. Constant names and values*

| Name | Value |
|---|---|
| MQXPDA_NONE | X'00...00' (48 nulls) |
| MQXPDA_NONE_ARRAY | '\0','\0',... (48 nulls) |

## MQXPT_* (Transport Types)

*Table 422. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQXPT_ALL | -1 | X'FFFFFFFF' |
| MQXPT_LOCAL | 0 | X'00000000' |
| MQXPT_LU62 | 1 | X'00000001' |
| MQXPT_TCP | 2 | X'00000002' |
| MQXPT_NETBIOS | 3 | X'00000003' |
| MQXPT_SPX | 4 | X'00000004' |
| MQXPT_DECNET | 5 | X'00000005' |
| MQXPT_UDP | 6 | X'00000006' |

## MQXQH_* (Transmission queue header structure)

*Table 423. Structures of constants*

| Name | Structure |
|---|---|
| MQXQH_STRUC_ID | "XQH¬" |
| MQXQH_STRUC_ID_ARRAY | 'X','Q','H','¬' |

**Note:** The symbol ¬ represents a single blank character.

*Table 424. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQXQH_VERSION_1 | 1 | X'00000001' |
| MQXQH_CURRENT_VERSION | 1 | X'00000001' |

## MQXR_* (Exit Reasons)

*Table 425. Values of constants*

| Name | Decimal value | Hexadecimal value |
|---|---|---|
| MQXR_BEFORE | 1 | X'00000001' |
| MQXR_AFTER | 2 | X'00000002' |
| MQXR_CONNECTION | 3 | X'00000003' |
| MQXR_INIT | 11 | X'0000000B' |
| MQXR_TERM | 12 | X'0000000C' |
| MQXR_MSG | 13 | X'0000000D' |
| MQXR_XMIT | 14 | X'0000000E' |
| MQXR_SEC_MSG | 15 | X'0000000F' |
| MQXR_INIT_SEC | 16 | X'00000010' |

| Table 425. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQXR_RETRY | 17 | X'00000011' |
| MQXR_AUTO_CLUSSDR | 18 | X'00000012' |
| MQXR_AUTO_RECEIVER | 19 | X'00000013' |
| MQXR_CLWL_OPEN | 20 | X'00000014' |
| MQXR_CLWL_PUT | 21 | X'00000015' |
| MQXR_CLWL_MOVE | 22 | X'00000016' |
| MQXR_CLWL_REPOS | 23 | X'00000017' |
| MQXR_CLWL_REPOS_MOVE | 24 | X'00000018' |
| MQXR_END_BATCH | 25 | X'00000019' |
| MQXR_ACK_RECEIVED | 26 | X'0000001A' |
| MQXR_AUTO_SVRCONN | 27 | X'0000001B' |
| MQXR_AUTO_CLUSRCVR | 28 | X'0000001C' |
| MQXR_SEC_PARMS | 29 | X'0000001D' |

## MQXR2_* (Exit Response 2)

| Table 426. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQXR2_PUT_WITH_DEF_ACTION | 0 | X'00000000' |
| MQXR2_PUT_WITH_DEF_USERID | 1 | X'00000001' |
| MQXR2_PUT_WITH_MSG_USERID | 2 | X'00000002' |
| MQXR2_USE_AGENT_BUFFER | 0 | X'00000000' |
| MQXR2_USE_EXIT_BUFFER | 4 | X'00000004' |
| MQXR2_DEFAULT_CONTINUATION | 0 | X'00000000' |
| MQXR2_CONTINUE_CHAIN | 8 | X'00000008' |
| MQXR2_SUPPRESS_CHAIN | 16 | X'00000010' |
| MQXR2_STATIC_CACHE | 0 | X'00000000' |
| MQXR2_DYNAMIC_CACHE | 32 | X'00000020' |

## MQXT_* (Exit Identifiers)

| Table 427. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQXT_API_CROSSING_EXIT | 1 | X'00000001' |
| MQXT_API_EXIT | 2 | X'00000002' |
| MQXT_CHANNEL_SEC_EXIT | 11 | X'0000000B' |
| MQXT_CHANNEL_MSG_EXIT | 12 | X'0000000C' |
| MQXT_CHANNEL_SEND_EXIT | 13 | X'0000000D' |
| MQXT_CHANNEL_RCV_EXIT | 14 | X'0000000E' |
| MQXT_CHANNEL_MSG_RETRY_EXIT | 15 | X'0000000F' |
| MQXT_CHANNEL_AUTO_DEF_EXIT | 16 | X'00000010' |
| MQXT_CLUSTER_WORKLOAD_EXIT | 20 | X'00000014' |

| Table 427. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQXT_PUBSUB_ROUTING_EXIT | 21 | X'00000015' |

## MQXUA_* (Exit User Area Value)

| Table 428. Constant names and values | |
|---|---|
| **Name** | **Value** |
| MQXUA_NONE | X'00...00' (16 nulls) |
| MQXUA_NONE_ARRAY | '\0','\0',... (16 nulls) |

## MQXWD_* (Exit wait descriptor structure)

| Table 429. Structures of constants | |
|---|---|
| **Name** | **Structure** |
| MQXWD_STRUC_ID | "XWD¬" |
| MQXWD_STRUC_ID_ARRAY | 'X','W','D','¬' |

**Note:** The symbol ¬ represents a single blank character.

| Table 430. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQXWD_VERSION_1 | 1 | X'00000001' |

## MQZAC_* (Application context structure)

| Table 431. Structures of constants | |
|---|---|
| **Name** | **Structure** |
| MQZAC_STRUC_ID | "ZAC¬" |
| MQZAC_STRUC_ID_ARRAY | 'Z','A','C','¬' |

**Note:** The symbol ¬ represents a single blank character.

| Table 432. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZAC_VERSION_1 | 1 | X'00000001' |
| MQZAC_CURRENT_VERSION | 1 | X'00000001' |

## MQZAD_* (Authority data structure)

| Table 433. Structures of constants | |
|---|---|
| **Name** | **Structure** |
| MQZAD_STRUC_ID | "ZAD¬" |
| MQZAD_STRUC_ID_ARRAY | 'Z','A','D','¬' |

**Note:** The symbol ¬ represents a single blank character.

| Table 434. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZAD_VERSION_1 | 1 | X'00000001' |
| MQZAD_VERSION_2 | 2 | X'00000002' |
| MQZAD_CURRENT_VERSION | 2 | X'00000002' |

## MQZAET_* (Installable Services Entity Types)

| Table 435. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZAET_NONE | 0 | X'00000000' |
| MQZAET_PRINCIPAL | 1 | X'00000001' |
| MQZAET_GROUP | 2 | X'00000002' |
| MQZAET_UNKNOWN | 3 | X'00000003' |

## MQZAO_* (Installable Services Authorizations)

| Table 436. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZAO_CONNECT | 1 | X'00000001' |
| MQZAO_BROWSE | 2 | X'00000002' |
| MQZAO_INPUT | 4 | X'00000004' |
| MQZAO_OUTPUT | 8 | X'00000008' |

| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZFP_VERSION_1 | 1 | X'00000001' |
| MQZFP_CURRENT_VERSION | 1 | X'00000001' |

## MQZIC_* (Identity context structure)

| *Table 444. Structures of constants* | |
|---|---|
| **Name** | **Structure** |
| MQZIC_STRUC_ID | "ZIC¬" |
| MQZIC_STRUC_ID_ARRAY | 'Z','I','C','¬' |

**Note:** The symbol ¬ represents a single blank character.

| *Table 445. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZIC_VERSION_1 | 1 | X'00000001' |
| MQZIC_CURRENT_VERSION | 1 | X'00000001' |

## MQZID_* (Function ids for services)

### Function ids common to all services

| *Table 446. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZID_INIT | 0 | X'00000000' |
| MQZID_TERM | 1 | X'00000001' |

### Function ids for Authority service

| *Table 447. Values of constants* | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZID_INIT_AUTHORITY | 0 | X'00000000' |
| MQZID_TERM_AUTHORITY | 1 | X'00000001' |
| MQZID_CHECK_AUTHORITY | 2 | X'00000002' |
| MQZID_COPY_ALL_AUTHORITY | 3 | X'00000003' |
| MQZID_DELETE_AUTHORITY | 4 | X'00000004' |
| MQZID_SET_AUTHORITY | 5 | X'00000005' |
| MQZID_GET_AUTHORITY | 6 | X'00000006' |

| Table 447. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZID_GET_EXPLICIT_AUTHORITY | 7 | X'00000007' |
| MQZID_REFRESH_CACHE | 8 | X'00000008' |
| MQZID_ENUMERATE_AUTHORITY_DATA | 9 | X'00000009' |
| MQZID_AUTHENTICATE_USER | 10 | X'0000000A' |
| MQZID_FREE_USER | 11 | X'0000000B' |
| MQZID_INQUIRE | 12 | X'0000000C' |
| MQZID_CHECK_PRIVILEGED | 13 | X'0000000D' |

### Function ids for Name service

| Table 448. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZID_INIT_NAME | 0 | X'00000000' |
| MQZID_TERM_NAME | 1 | X'00000001' |
| MQZID_LOOKUP_NAME | 2 | X'00000002' |
| MQZID_INSERT_NAME | 3 | X'00000003' |
| MQZID_DELETE_NAME | 4 | X'00000004' |

### Function ids for Userid service

| Table 449. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZID_INIT_USERID | 0 | X'00000000' |
| MQZID_TERM_USERID | 1 | X'00000001' |
| MQZID_FIND_USERID | 2 | X'00000002' |

## MQZIO_* (Installable Services Initialization Options)

| Table 450. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZIO_PRIMARY | 0 | X'00000000' |
| MQZIO_SECONDARY | 1 | X'00000001' |

## MQZNS_* (Name Service Interface Version)

| Table 451. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZNS_VERSION_1 | 1 | X'00000001' |

## MQZSE_* (Installable Services Start-Enumeration Indicator)

| Table 452. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZSE_START | 1 | X'00000001' |

| Table 452. Values of constants (continued) | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZSE_CONTINUE | 0 | X'00000000' |

### MQZSL_* (Installable Services Selector Indicator)

| Table 453. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZSL_NOT_RETURNED | 0 | X'00000000' |
| MQZSL_RETURNED | 1 | X'00000001' |

### MQZTO_* (Installable Services Termination Options)

| Table 454. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZTO_PRIMARY | 0 | X'00000000' |
| MQZTO_SECONDARY | 1 | X'00000001' |

### MQZUS_* (Userid Service Interface Version)

| Table 455. Values of constants | | |
|---|---|---|
| **Name** | **Decimal value** | **Hexadecimal value** |
| MQZUS_VERSION_1 | 1 | X'00000001' |

## Data types used in the MQI

Information on the data types that can be used in the Message Queue Interface (MQI). Descriptions, fields, and language declarations for relevant languages with each data type.

### Introducing data types used in the MQI

This section introduces the data types used in the MQI, and gives you some guidance on using them in the supported programming languages.

#### *Elementary data types*

This section contains information about data types used in the MQI (or in exit functions). These are described in detail, followed by examples showing how to declare the elementary data types in the supported programming languages in the following topics.

The data types used in the MQI (or in exit functions) are either:

- Elementary data types, or
- Aggregates of elementary data types (arrays or structures)

The following elementary data types are used in the MQI (or in exit functions):

| Elementary data type name | Data type | Description |
|---|---|---|
| MQBOOL | Boolean | The MQBOOL data type represents a boolean value. The value 0 represents false. Any other value represents true. An MQBOOL must be aligned as for the MQLONG data type. |

| Elementary data type name | Data type | Description |
|---|---|---|
| MQBYTE | Byte | The MQBYTE data type represents a single byte of data. No particular interpretation is placed on the byte; it is treated as a string of bits, and not as a binary number or character. No special alignment is required.<br><br>When MQBYTE data is sent between queue managers that use different character sets or encodings, the MQBYTE data is *not* converted in any way. The *MsgId* and *CorrelId* fields in the MQMD structure are like this.<br><br>An array of MQBYTE is sometimes used to represent an area of main storage that is not known to the queue manager. For example, the area might contain application message data or a structure. The boundary alignment of this area must be compatible with the nature of the data contained within it.<br><br>In the C programming language, any data type can be used for function parameters that are shown as arrays of MQBYTE. This is because such parameters are always passed by address, and in C the function parameter is declared as a pointer-to-void. |

| Elementary data type name | Data type | Description |
|---|---|---|
| MQBYTEn | String of *n* bytes | Each MQBYTEn data type represents a string of *n* bytes, where *n* can take any of the following values: 8, 16, 24, 32, 40, or 128. Each byte is described by the MQBYTE data type. No special alignment is required.<br><br>If the data in the byte string is shorter than the defined length of the string, the data must be padded with nulls to fill the string.<br><br>When the queue manager returns byte strings to the application (for example, on the MQGET call), the queue manager pads with nulls to the defined length of the string.<br><br>Named constants are available to define the lengths of byte string fields. These are listed in "Constants" on page 61 |
| MQCHAR | Character | The MQCHAR data type represents a single-byte character, or one byte of a double-byte or multi-byte character. No special alignment is required.<br><br>When MQCHAR data is sent between queue managers that use different character sets or encodings, the MQCHAR data usually requires conversion in order for the data to be interpreted correctly. The queue manager does this automatically for MQCHAR data in the MQMD structure. Conversion of MQCHAR data in the application message data is controlled by the MQGMO_CONVERT option specified on the MQGET call; see the description of this option in "MQGMO - Get-message options" on page 355 for further details. |

| Elementary data type name | Data type | Description |
|---|---|---|
| MQCHARn | String of *n* characters | Each MQCHARn data type represents a string of *n* characters, where *n* can take any of the following values: 4, 8, 12, 20, 28, 32, 48, 64, 128, or 256. Each character is described by the MQCHAR data type. No special alignment is required.<br><br>If the data in the string is shorter than the defined length of the string, the data must be padded with blanks to fill the string. In some cases a null character can be used to end the string prematurely, instead of padding with blanks; the null character and characters following it are treated as blanks, up to the defined length of the string. The places where a null can be used are identified in the call and data type descriptions.<br><br>When the queue manager returns character strings to the application (for example, on the MQGET call), the queue manager always pads with blanks to the defined length of the string; the queue manager does not use the null character to delimit the string.<br><br>Named constants are available that define the lengths of character string fields and are listed in "Constants" on page 61. |
| MQFLOAT32 | 32-bit floating point number | The MQFLOAT32 data type is a 32-bit floating-point number represented using the standard IEEE floating-point format. An MQFLOAT32 must be aligned on a 4-byte boundary.<br><br>The use of MQFLOAT32 in C on z/OS requires the use of the FLOAT(IEEE) compiler flag.<br><br>The use of MQFLOAT32 in COBOL is limited to compilers that support floating-point numbers in IEEE format. This might require the use of the FLOAT(NATIVE) compiler flag. |

| Elementary data type name | Data type | Description |
|---|---|---|
| MQFLOAT64 | 64-bit floating point number | The MQFLOAT64 data type is a 64-bit floating-point number represented using the standard IEEE floating-point format. An MQFLOAT64 must be aligned on an 8-byte boundary.<br>The use of MQFLOAT64 in C on z/OS requires the use of the FLOAT(IEEE) compiler flag.<br>The use of MQFLOAT64 in COBOL is limited to compilers that support floating-point numbers in IEEE format. This might require the use of the FLOAT(NATIVE) compiler flag. |
| MQHCONFIG | Configuration handle | The MQHCONFIG data type represents a configuration handle, that is, the component that is being configured for a particular installable service. A configuration handle must be aligned on its natural boundary.<br>Applications must not rely on the format of the data stored inside this handle. If valid, its value is intended to be usable in further MQI calls, but is not intended to have any meaning besides that purpose. |
| MQHCONN | Connection handle | The MQHCONN data type represents a connection handle, that is, the connection to a particular queue manager. A connection handle must be aligned on a 4-byte boundary.<br>Applications must not rely on the format of the data stored inside this handle. If valid, its value is intended to be usable in further MQI calls, but is not intended to have any meaning besides that purpose. |

| Elementary data type name | Data type | Description |
|---|---|---|
| MQHMSG | Message handle | The MQHMSG data type represents a message handle that gives access to a message. A message handle must be aligned on an 8-byte boundary.<br><br>Applications must not rely on the format of the data stored inside this handle. If valid, its value is intended to be usable in further MQI calls, but is not intended to have any meaning besides that purpose. |
| MQHOBJ | Object handle | The MQHOBJ data type represents an object handle that gives access to an object. An object handle must be aligned on a 4-byte boundary.<br><br>Applications must not rely on the format of the data stored inside this handle. If valid, its value is intended to be usable in further MQI calls, but is not intended to have any meaning besides that purpose. |
| MQINT8 | 8-bit signed integer | The MQINT8 data type is an 8-bit signed integer that can take any value in the range -128 to +127, unless otherwise restricted by the context. |
| MQINT16 | 16-bit signed integer | The MQINT16 data type is a 16-bit signed integer that can take any value in the range -32 768 to +32 767, unless otherwise restricted by the context. An MQINT16 must be aligned on a 2-byte boundary. |
| MQINT32 | 32-bit signed integer | The MQINT32 data type is a 32-bit signed binary integer that can take any value in the range -2 147 483 648 through +2 147 483 647, unless otherwise restricted by the context.<br><br>See the definition of MQLONG. |

| Elementary data type name | Data type | Description |
|---|---|---|
| MQINT64 | 64-bit signed integer | The MQINT64 data type is a 64-bit signed integer that can take any value in the range -9 223 372 036 854 775 808 through +9 223 372 036 854 775 807, unless otherwise restricted by the context.<br>For COBOL, the valid range is limited to -999 999 999 999 999 999 through +999 999 999 999 999 999. A 64-bit integer must be aligned on an 8-byte boundary. |
| MQLONG | 32-bit signed integer | The MQLONG data type is a 32-bit signed binary integer that can take any value in the range -2 147 483 648 through +2 147 483 647, unless otherwise restricted by the context.<br>For COBOL, the valid range is limited to -999 999 999 through +999 999 999. An MQLONG must be aligned on a 4-byte boundary. |
| MQPID | Process identifier | The IBM MQ process identifier.<br>This is the same identifier used in MQ trace and FFST™ dumps, but might be different from the operating system process identifier. |
| MQPTR | Pointer | The MQPTR data type is the address of data of any type. A pointer must be aligned on its natural boundary; this is a 16-byte boundary on IBM i, and an 8-byte boundary on other platforms.<br>Some programming languages support typed pointers; the MQI also uses these in a few cases (for example, PMQCHAR and PMQLONG in the C programming language). |
| MQTID | Thread identifier | The IBM MQ thread identifier.<br>This is the same identifier used in MQ trace and FFST™ dumps, but might be different from the operating system thread identifier. |

| Elementary data type name | Data type | Description |
|---|---|---|
| MQUINT8 | 8-bit unsigned integer | The MQUINT8 data type is an 8-bit unsigned integer that can take any value in the range 0 to +255, unless otherwise restricted by the context. |
| MQUINT16 | 16-bit unsigned integer | The MQUINT16 data type is a 16-bit unsigned integer that can take any value in the range 0 through +65 535, unless otherwise restricted by the context. An MQUINT16 must be aligned on a 2-byte boundary. |
| MQUINT32 | 32-bit unsigned integer | The MQUINT32 data type is a 32-bit unsigned binary integer.<br>See the definition of MQULONG. |
| MQUINT64 | 64-bit unsigned integer | The MQINT64 data type is a 64-bit unsigned integer that can take any value in the range 0 through +18 446 744 073 709 551 615, unless otherwise restricted by the context.<br>For COBOL, the valid range is limited to 0 through +999 999 999 999 999 999. A 64-bit integer must be aligned on an 8-byte boundary. |
| MQULONG | 32-bit unsigned integer | The MQULONG data type is a 32-bit unsigned binary integer that can take any value in the range 0 through +4 294 967 294, unless otherwise restricted by the context.<br>For COBOL, the valid range is limited to 0 through +999 999 999. An MQULONG must be aligned on a 4-byte boundary. |
| PMQACH | Pointer | Pointer to a data structure of type MQACH |
| PMQAIR | Pointer | Pointer to a data structure of type MQAIR |
| PMQAXC | Pointer | Pointer to a data structure of type MQAXC |
| PMQAXP | Pointer | Pointer to a data structure of type MQAXP |
| PMQBMHO | Pointer | Pointer to a data structure of type MQBMHO |

| Elementary data type name | Data type | Description |
|---|---|---|
| PMQBO | Pointer | Pointer to a data structure of type MQBO |
| PMQBOOL | Pointer | Pointer to data of type MQBOOL |
| PMQBYTE | Pointer | Pointer to data of type MQBYTE |
| PMQBYTEn | Pointer | Pointer to data of type MQBYTEn, where n can be 8, 16, 24, 32, 40, 128 |
| PMQCBC | Pointer | Pointer to a data structure of type MQCBC |
| PMQCBD | Pointer | Pointer to a data structure of type MQCBD |
| PMQCHAR | Pointer | Pointer to data of type MQCHAR |
| PMQCHARN | Pointer | Pointer to a data type of MQCHARN, where n can be 4, 8, 12, 20, 28, 32, 48, 64, 128, 256, 264 |
| PMQCHARV | Pointer | Pointer to a data structure of type MQCHARV |
| PMQCIH | Pointer | Pointer to a data structure of type MQCIH |
| PMQCMHO | Pointer | Pointer to a data structure of type MQCMHO |
| PMQCNO | Pointer | Pointer to a data structure of type MQCNO |
| PMQCSP | Pointer | Pointer to a data structure of type MQCSP |
| PMQCTLO | Pointer | Pointer to a data structure of type MQCTLO |
| PMQDH | Pointer | Pointer to a data structure of type MQDH |
| PMQDHO | Pointer | Pointer to a data structure of type MQDHO |
| PMQDLH | Pointer | Pointer to a data structure of type MQDLH |
| PMQDMHO | Pointer | Pointer to a data structure of type MQDMHO |
| PMQDMPO | Pointer | Pointer to a data structure of type MQDMPO |
| PMQEPH | Pointer | Pointer to a data structure of type MQEPH |
| PMQFLOAT32 | Pointer | Pointer to a data structure of type MQFLOAT32 |

| Elementary data type name | Data type | Description |
|---|---|---|
| PMQFLOAT64 | Pointer | Pointer to a data structure of type MQFLOAT64 |
| PMQFUNC | Pointer | Pointer to a function |
| PMQGMO | Pointer | Pointer to a data structure of type MQGMO |
| PMQHCONFIG | Pointer | Pointer to data of type MQHCONFIG |
| PMQHCONN | Pointer | Pointer to data of type MQHCONN |
| PMQHMSG | Pointer | Pointer to data of type MQHMSG |
| PMQHOBJ | Pointer | Pointer to data of type MQHOBJ |
| PMQIIH | Pointer | Pointer to a data structure of type MQIIH |
| PMQIMPO | Pointer | Pointer to a data structure of type MQIMPO |
| PMQINT8 | Pointer | Pointer to data of type MQINT8 |
| PMQINT16 | Pointer | Pointer to data of type MQINT16 |
| PMQINT32 | Pointer | Pointer to data of type MQINT32 |
| PMQINT64 | Pointer | Pointer to data of type MQINT64 |
| PMQLONG | Pointer | Pointer to data of type MQLONG |
| PMQMD | Pointer | Pointer to structure of type MQMD |
| PMQMDE | Pointer | Pointer to a data structure of type MQMDE |
| PMQMD1 | Pointer | Pointer to a data structure of type MQMD1 |
| PMQMD2 | Pointer | Pointer to a data structure of type MQMD2 |
| PMQMHBO | Pointer | Pointer to a data structure of type MQMHBO |
| PMQOD | Pointer | Pointer to a data structure of type MQOD |
| PMQOR | Pointer | Pointer to a data structure of type MQOR |
| PMQPD | Pointer | Pointer to a data structure of type MQPD |
| PMQPID | Pointer | Pointer to a process identifier |
| PMQMD | Pointer | Pointer to a data structure of type MQMD |
| PMQPMO | Pointer | Pointer to a data structure of type MQPMO |

| Elementary data type name | Data type | Description |
|---|---|---|
| PMQPTR | Pointer | Pointer to data of type MQPTR |
| PMQRFH | Pointer | Pointer to a data structure of type MQRFH |
| PMQRFH2 | Pointer | Pointer to a data structure of type MQRFH2 |
| PMQRMH | Pointer | Pointer to a data structure of type MQRMH |
| PMQRR | Pointer | Pointer to a data structure of type MQRR |
| PMQSCO | Pointer | Pointer to a data structure of type MQSCO |
| PMQSD | Pointer | Pointer to a data structure of type MQSD |
| PMQSMPO | Pointer | Pointer to a data structure of type MQSMPO |
| PMQSRO | Pointer | Pointer to a data structure of type MQSRO |
| PMSSTS | Pointer | Pointer to a data structure of type MQSTS |
| PMQTID | Pointer | Pointer to a thread ID |
| PMQTM | Pointer | Pointer to a data structure of type MQTM |
| PMQTMC2 | Pointer | Pointer to a data structure of type MQTMC2 |
| PMQUINT8 | Pointer | Pointer to a data type of MQUINT8 |
| PMQUINT16 | Pointer | Pointer to a data type of MQUINT16 |
| PMQUINT32 | Pointer | Pointer to a data type of MQUINT32 |
| PMQUINT64 | Pointer | Pointer to a data type of MQUINT64 |
| PMQULONG | Pointer | Pointer to a data type of MQULONG |
| PMQVOID | Pointer | |
| PMQWIH | Pointer | Pointer to a data structure of type MQWIH |
| PMQXQH | Pointer | Pointer to a data structure of type MQXQH |

*C declarations*

| Data type | Representation |
|---|---|
| MQBOOL | `typedef MQLONG MQBOOL;` |
| MQBYTE | `typedef unsigned char MQBYTE;` |
| MQBYTE8 | `typedef MQBYTE MQBYTE8[8];` |

| MQHOBJ | `DS F` |
| MQINT8 | `DS XL1` |
| MQINT16 | `DS H` |
| MQINT64 | `DS D` |
| MQLONG | `DS F` |
| MQPTR | `DS F` |
| MQUINT8 | `DS XL1` |
| MQUINT16 | `DS H` |
| MQUINT64 | `DS D` |
| MQULONG | `DS F` |

## *Structure data types - introduction*

This section introduces the structure data types used in the MQI. The structure data types themselves are described in subsequent sections.

*Summary*

The following tables summarize the structure data types used in the MQI.

*Table 456. Structure data types used on MQI calls (or exit functions):*

| Structure | Description | Calls where used |
|---|---|---|
| MQACH | API exit chain header | |

| *Table 456. Structure data types used on MQI calls (or exit functions): (continued)* | | |
|---|---|---|
| **Structure** | **Description** | **Calls where used** |
| MQAIR | Authentication information record | MQCONNX |
| MQAXC | API exit context | |
| MQAXP | API exit parameter | |
| MQBMHO | Buffer to message handle options | MQBUFMH |
| MQBO | Begin options | MQBEGIN |
| MQCBD | Callback descriptor | MQCB |
| MQCBO | Create-bag options | mqCreateBag |
| MQCHARV | Variable length string | MQINQMP |
| MQCNO | Connect options | MQCONNX |
| MQCSP | Security parameters | MQCONNX |
| MQCTLO | Callback options | MQCTL |
| MQDMPO | Delete message property options | MQDLTMP |
| MQGMO | Get-message options | MQGET |
| MQIMPO | Inquire message property options | MQINQMP |
| MQMD | Message descriptor | MQBUFMH, MQMHBUF, MQCB, MQGET, MQPUT, MQPUT1 |
| MQMHBO | Message handle to buffer options | MQMHBUF |
| MQOD | Object descriptor | MQOPEN, MQPUT1 |
| MQOR | Object record | MQOPEN, MQPUT1 |
| MQPD | Property descriptor | MQSETMP |
| MQPMO | Put-message options | MQPUT, MQPUT1 |
| MQPMR | Put-message record | MQPUT, MQPUT1 |
| MQRR | Response record | MQOPEN, MQPUT, MQPUT1 |
| MQSCO | SSL configuration options | MQCONNX |
| MQSD | Subscription descriptor | MQSUB |
| MQSMPO | Set message property option | MQSETMP |
| MQSRO | Subscription request options | MQSUBRQ |
| MQSTS | Status reporting structure | MQSTAT |

| *Table 457. Structure data types used in message data:* | |
|---|---|
| **Structure** | **Description** |
| MQCIH | CICS information header |

| Table 457. Structure data types used in message data: (continued) | |
|---|---|
| **Structure** | **Description** |
| MQCFH | PCF header |
| MQEPH | Embedded PCF header |
| MQDH | Distribution header |
| MQDLH | Dead letter (undelivered message) header |
| MQIIH | IMS information header |
| MQMDE | Message descriptor extension |
| MQRFH | Rules and formatting header |
| MQRFH2 | Rules and formatting header 2 |
| MQRMH | Reference message header |
| MQTM | Trigger message |
| MQTMC2 | Trigger message (character format 2) |
| MQWIH | Work information header |
| MQXQH | Transmission queue header |

**Note:** The MQDXP structure (data conversion exit parameter) is described in "Data-conversion exit" on page 879, together with the associated data conversion calls.

*Rules for structure data types*

Programming languages vary in their level of support for structures, and certain rules and conventions are adopted to map the MQI structures consistently in each programming language:

1. Structures must be aligned on their natural boundaries.
   - Most MQI structures require 4-byte alignment.
   - On IBM i, structures containing pointers require 16-byte alignment; these are: MQCNO, MQOD, MQPMO.
2. Each field in a structure must be aligned on its natural boundary.
   - Fields with data types that equate to MQLONG must be aligned on 4-byte boundaries.
   - Fields with data types that equate to MQPTR must be aligned on 16-byte boundaries on IBM i, and 4-byte boundaries in other environments.
   - Other fields are aligned on 1-byte boundaries.
3. The length of a structure must be a multiple of its boundary alignment.
   - Most MQI structures have lengths that are multiples of 4 bytes.
   - On IBM i, structures containing pointers have lengths that are multiples of 16 bytes.
4. Where necessary, padding bytes or fields must be added to ensure compliance with the preceding rules.

*Conventions used in the descriptions*

The description of each structure data type includes:

- An overview of the purpose and use of the structure
- Descriptions of the fields in the structure, in a form that is independent of the programming language
- Examples of how the structure is declared in each of the supported programming languages

The description of each structure data type contains the following sections:

**Structure name**
The name of the structure, followed by a summary of the fields in the structure.

**Overview**
A brief description of the purpose and use of the structure.

**Fields**
Descriptions of the fields. For each field, the name of the field is followed by its elementary data type in parentheses ( ). In text, field names are shown using an italic typeface; for example *Version*.

There is also a description of the purpose of the field, together with a list of any values that the field can take. Names of constants are shown in uppercase; for example MQGMO_STRUC_ID. A set of constants having the same prefix is shown using the * character, for example: MQIA_*.

In the descriptions of the fields, the following terms are used:

**input**
You supply information in the field when you make a call.

**output**
The queue manager returns information in the field when the call completes or fails.

**input/output**
You supply information in the field when you make a call, and the queue manager changes the information when the call completes or fails.

**Initial values**
A table showing the initial values for each field in the data definition files supplied with the MQI.

**C declaration**
Typical declaration of the structure in C.

**COBOL declaration**
Typical declaration of the structure in COBOL.

**PL/I declaration**
Typical declaration of the structure in PL/I.

**System/390 assembler declaration**
Typical declaration of the structure in System/390 assembler language.

**Visual Basic declaration**
Typical declaration of the structure in Visual Basic.

## *C programming*

This section contains information to help you use the MQI from the C programming language.

*Header files*

Header files are provided to help you write C application programs that use the MQI.

These header files are summarized in Table 458 on page 258.

*Table 458. C header files*

| File | Contents |
|---|---|
| CMQC | Function prototypes, data types, and named constants for the main MQI |
| CMQXC | Function prototypes, data types, and named constants for the data conversion exit |
| CMQEC | Function prototypes, data types, and named constants for the main MQI, data conversion exit and Interface Entry Points structure (CMQEC includes CMQXC and CMQC.) |

| Table 458. C header files (continued) | |
|---|---|
| **File** | **Contents** |
| CMQSTRC | Functions that convert MQI constant definitions to the text equivalent.<br> **Attention:** z/OS Not applicable to z/OS. |

To improve the portability of applications, code the name of the header file in lowercase on the `#include` preprocessor directive:

```
#include "cmqec.h"
```

*Functions*
You do not need to specify all parameters that are passed by address every time you invoke a function.

- Pass parameters that are *input-only* and of type MQHCONN, MQHOBJ, or MQLONG by value.
- Pass all other parameters by address.

Where a particular parameter is not required, use a null pointer as the parameter on the function invocation, in place of the address of the parameter data. Parameters for which this is possible are identified in the call descriptions.

No parameter is returned as the value of the function; in C terminology, this means that all functions return `void` .

The attributes of the function are defined by the MQENTRY macro variable; the value of this macro variable depends on the environment.

*Parameters with undefined data type*

The *`Buffer`* parameter on the MQGET, MQPUT, and MQPUT1 functions has an undefined data type. This parameter is used to send and receive the application's message data.

Parameters of this sort are shown in the C examples as arrays of MQBYTE. You can declare the parameters in this way, but it is usually more convenient to declare them as the particular structure that describes the layout of the data in the message. Declare the actual function parameter as a pointer-to-void, and specify the address of any sort of data as the parameter on the function invocation.

*Data types*

Define all data types using the C `typedef` statement. For each data type, also define the corresponding pointer data type. The name of the pointer data type is the name of the elementary or structure data type prefixed with the letter P to denote a pointer. Define the attributes of the pointer using the MQPOINTER macro variable; the value of this macro variable depends on the environment. The following illustrates how to declare pointer data types:

```
#define MQPOINTER *               /* depends on environment */
...
typedef MQLONG MQPOINTER PMQLONG;  /* pointer to MQLONG */
typedef MQMD   MQPOINTER PMQMD;    /* pointer to MQMD */
```

*Manipulating binary strings*
Declare strings of binary data as one of the MQBYTEn data types.

Whenever you copy, compare, or set fields of this type, use the C functions `memcpy` , `memcmp` , or `memset` ; for example:

```
#include <string.h>
#include "cmqc.h"
```

```
MQMD MyMsgDesc;

memcpy(MyMsgDesc.MsgId,           /* set "MsgId" field to nulls    */
       MQMI_NONE,                 /* ...using named constant      */
       sizeof(MyMsgDesc.MsgId));

memset(MyMsgDesc.CorrelId,        /* set "CorrelId" field to nulls */
       0x00,                      /* ...using a different method   */
       sizeof(MQBYTE24));
```

Do not use the string functions `strcpy` , `strcmp` , `strncpy` , or `strncmp` , because these do not work correctly for data declared with the MQBYTEn data types.

*Manipulating character strings*
When the queue manager returns character data to the application, the queue manager always pads the character data with blanks to the defined length of the field; the queue manager *does not* return null-terminated strings.

Therefore, when copying, comparing, or concatenating such strings, use the string functions `strncpy` , `strncmp` , or `strncat` .

Do not use the string functions that require the string to be terminated by a null ( `strcpy` , `strcmp` , `strcat` ). Also, do not use the function `strlen` to determine the length of the string; use instead the `sizeof` function to determine the length of the field.

*Initial values for structures*
The header files define various macro variables that you can use to provide initial values for the MQ structures when you declare instances of those structures.

These macro variables have names of the form MQxxx_DEFAULT, where MQxxx represents the name of the structure. They are used in the following way:

```
MQMD   MyMsgDesc = {MQMD_DEFAULT};
MQPMO  MyPutOpts = {MQPMO_DEFAULT};
```

For some character fields (for example, the *StrucId* fields that occur in most structures, or the *Format* field that occurs in MQMD), the MQI defines particular values that are valid. For each of the valid values, *two* macro variables are provided:

- One macro variable defines the value as a string with a length, excluding the implied null matches, exactly the defined length of the field. For example, for the *Format* field in MQMD the following macro variable is provided ( ¬ represents a blank character):

  ```
  #define MQFMT_STRING "MQSTR¬¬¬"
  ```

  Use this form with the `memcpy` and `memcmp` functions.
- The other macro variable defines the value as an array of characters; the name of this macro variable is the name of the string form suffixed with _ARRAY. For example:

  ```
  #define MQFMT_STRING_ARRAY 'M','Q','S','T','R','¬','¬','¬'
  ```

  Use this form to initialize the field when you declare an instance of the structure with values different from those provided by the MQMD_DEFAULT macro variable. (This is not always necessary; in some environments you can use the string form of the value in both situations. However, you can use the array form for declarations, because this is required for compatibility with the C++ programming language.)

*Initial values for dynamic structures*

When a variable number of instances of a structure is required, the instances are typically created in main storage obtained dynamically using the `calloc` or `malloc` functions. To initialize the fields in such structures, consider the following technique:

1. Declare an instance of the structure using the appropriate MQxxx_DEFAULT macro variable to initialize the structure. This instance becomes the model for other instances:

```
MQMD Model = {MQMD_DEFAULT}; /* declare model instance */
```

   The `static` or `auto` keywords can be coded on the declaration in order to give the model instance static or dynamic lifetime, as required.
2. Use the `calloc` or `malloc` functions to obtain storage for a dynamic instance of the structure:

```
PMQMD Instance;
Instance = malloc(sizeof(MQMD)); /* get storage for dynamic instance */
```

3. Use the `memcpy` function to copy the model instance to the dynamic instance:

```
memcpy(Instance,&Model,sizeof(MQMD)); /* initialize dynamic instance */
```

*Use from C++*

For the C++ programming language, the header files contain the following additional statements that are included only when you use a C++ compiler:

```
#ifdef __cplusplus
  extern "C" {
#endif

/* rest of header file */

#ifdef __cplusplus
  }
#endif
```

*Notational conventions*
This information shows how to invoke the functions and declare parameters.

In some cases, the parameters are arrays with a size that is not fixed. For these, a lowercase n is used to represent a numeric constant. When you code the declaration for that parameter, replace the n with the numeric value required.

## *COBOL programming*

This section contains information to help you use the MQI from the COBOL programming language.

*COPY files*
Various COPY files are provided to help you write COBOL application programs that use the MQI. There are two files containing named constants, and two files for each of the structures.

Each structure is provided in two forms: a form with initial values, and a form without:

- Use the structures with initial values in the WORKING-STORAGE SECTION of a COBOL program; they are contained in COPY files with names suffixed with the letter V (for Values).
- Use the structures without initial values in the `LINKAGE SECTION` of a COBOL program; they are contained in COPY files with names suffixed with the letter L (for Linkage).

The COPY files are summarized in Table 459 on page 261. Not all the files listed are available in all environments.

*Table 459. COBOL COPY files*

| File (with initial values) | File (without initial values) | Contents |
|---|---|---|
| CMQAIRV | CMQAIRL | Authentication information record |

| *Table 459. COBOL COPY files (continued)* | | |
|---|---|---|
| **File (with initial values)** | **File (without initial values)** | **Contents** |
| CMQBOV | CMQBOL | Begin options structure |
| CMQCIHV | CMQCIHL | CICS information header structure |
| CMQCNOV | CMQCNOL | Connect options structure |
| CMQDHV | CMQDHL | Distribution header structure |
| CMQDLHV | CMQDLHL | Dead letter header structure |
| CMQDXPV | CMQDXPL | Data conversion exit parameter structure |
| CMQGMOV | CMQGMOL | Get message options structure |
| CMQIIHV | CMQIIHL | IMS information header structure |
| CMQMDV | CMQMDL | Message descriptor structure |
| CMQMDEV | CMQMDEL | Message descriptor extension structure |
| CMQMD1V | CMQMD1L | Message descriptor structure version 1 |
| CMQODV | CMQODL | Object descriptor structure |
| CMQORV | CMQORL | Object record structure |
| CMQPMOV | CMQPMOL | Put message options structure |
| CMQRFHV | CMQRFHL | Rules and formatting header structure |
| CMQRFH2V | CMQRFH2L | Rules and formatting header structure version 2 |
| CMQRMHV | CMQRMHL | Reference message header structure |
| CMQRRV | CMQRRL | Response record structure |
| CMQSCOV | CMQSCOL | SSL configuration options |
| CMQTMV | CMQTML | Trigger message structure |
| CMQTMCV | CMQTMCL | Trigger message structure (character format) |
| CMQTMC2V | CMQTMC2L | Trigger message structure (character format) version 2 |
| CMQWIHV | CMQWIHL | Work information header structure |
| CMQXQHV | CMQXQHL | Transmission queue header structure |
| CMQV | - | Named constants for main MQI |
| CMQXV | - | Named constants for data conversion exit |
| CMQMD2V | CMQMD2L | Message descriptor structure version 2 |

*Structures*

In the COPY file, each structure declaration begins with a level-10 item; this enables you to declare several instances of the structure by coding the level-01 declaration and then using the COPY statement to copy in the remainder of the structure declaration. To refer to the appropriate instance, use the IN keyword:

```
* Declare two instances of MQMD
 01  MY-MQMD.
     COPY CMQMDV.
 01  MY-OTHER-MQMD.
```

```
     COPY CMQMDV.
*
* Set MSGTYPE field in MY-OTHER-MQMD
     MOVE MQMT-REQUEST TO MQMD-MSGTYPE IN MY-OTHER-MQMD.
```

Align the structures on appropriate boundaries. If you use the COPY statement to include a structure following an item that is not the level-01 item, ensure that the structure begins at the appropriate offset from the start of the level-01 item. Most MQI structures require 4-byte alignment; the exceptions to this are MQCNO, MQOD, and MQPMO, which require 16-byte alignment on IBM i.

In this section, the names of fields in structures are shown without a prefix. In COBOL, the field names are prefixed with the name of the structure followed by a hyphen. However, if the structure name ends with a numeric digit, indicating that the structure is a second or later version of the original structure, the numeric digit is omitted from the prefix. Field names in COBOL are shown in uppercase (although lowercase or mixed case can be used if required). For example, the field *MsgType* described in "MQMD - Message descriptor" on page 402 becomes MQMD-MSGTYPE in COBOL.

The V-suffix structures are declared with initial values for all the fields; you need to set only those fields where you want a value that is different from the supplied initial value.

*Pointers*

Some structures need to address optional data that might be discontiguous with the structure, such as the MQOR and MQRR records addressed by the MQOD structure.

To address this optional data, the structures contain fields that are declared with the pointer data type. However, COBOL does not support the pointer data type in all environments. Because of this, the optional data can also be addressed using fields that contain the offset of the data from the start of the structure.

If you want to port an application between environments, ascertain whether the pointer data type is available in all the intended environments. If it is not, the application must address the optional data using the offset fields instead of the pointer fields.

In those environments where pointers are not supported, declare the pointer fields as byte strings of the appropriate length, with the initial value being the all-null byte string. Do not alter this initial value if you are using the offset fields.

*Named constants*

In this section, the names of constants are shown containing the underscore character (_) as part of the name. In COBOL, use the hyphen character (-) in place of the underscore.

Constants that have character-string values use the single quotation mark as the string delimiter ('). In some environments, you might have to specify an appropriate compiler option to cause the compiler to accept the single quotation mark as the string delimiter in place of the double quotation mark.

The named constants are declared in the COPY files as level-10 items. To use the constants, declare the level-01 item explicitly, and then use the COPY statement to copy in the declarations of the constants:

```
* Declare a structure to hold the constants
 01  MY-MQ-CONSTANTS.
     COPY CMQV.
```

The preceding method causes the constants to occupy storage in the program even if they are not referenced. If you include the constants in many separate programs within the same run unit, multiple copies of the constants exist, consuming main storage unnecessarily. Avoid this effect by using one of the following techniques:

- Add the GLOBAL clause to the level-01 declaration:

```
* Declare a global structure to hold the constants
 01  MY-MQ-CONSTANTS GLOBAL.
     COPY CMQV.
```

This causes allocates storage for only one set of constants within the run unit. The constants, however, can be referenced by any program within the run unit, not just the program that contains the level-01 declaration.

**Note:** The GLOBAL clause is not supported in all environments.

- Manually copy into each program only those constants that are referenced by that program. Do not use the COPY statement to copy all the constants into the program.

*Notational conventions*

The latter topics in this section show how to invoke the calls and declare parameters. In some cases, the parameters are tables or character strings the size of which is not fixed. For these, a lowercase n is used to represent a numeric constant. When you code the declaration for that parameter, replace the n with the numeric value required.

## *System/390 assembler programming*

This section contains information to help to you use the MQI from the System/390 Assembler programming language.

*Macros*

Various macros are provided to help you to write assembler application programs that use the MQI.

There are two macros for named constants, and one macro for each of the structures. These files are summarized in Table 460 on page 264.

*Table 460. Assembler macros*

| File | Contents |
|---|---|
| CMQA | Named constants (equates) for main MQI |
| CMQCIHA | CICS information header structure |
| CMQCNOA | Connect options structure |
| CMQDLHA | Dead letter header structure |
| CMQDXPA | Data conversion exit parameter structure |
| CMQGMOA | Get message options structure |
| CMQIIHA | IMS information header structure |
| CMQMDA | Message descriptor structure |
| CMQMDEA | Message descriptor extension structure |
| CMQODA | Object descriptor structure |
| CMQPMOA | Put message options structure |
| CMQRFHA | Rules and formatting header structure |
| CMQRFH2A | Rules and formatting header structure version 2 |
| CMQRMHA | Reference message header structure |
| CMQTMA | Trigger message structure |
| CMQTMC2A | Trigger message structure (character format) version 2 |
| CMQVERA | Structure version control |
| CMQWIHA | Work information header structure |
| CMQXA | Named constants for data conversion exit |
| CMQXPA | API crossing exit parameter structure |

| *Table 460. Assembler macros (continued)* | |
|---|---|
| **File** | **Contents** |
| CMQXQHA | Transmission queue header structure |

*Structures*
The structures are generated by macros that have various parameters to control the action of the macro. These parameters are described in the following sections.

From time to time new versions of the MQ structures are introduced. The additional fields in a new version can cause a structure that previously was smaller than 256 bytes to become larger than 256 bytes. Because of this, write assembler instructions that are intended to copy an MQ structure, or to set an MQ structure to nulls, to work correctly with structures that might be larger than 256 bytes. Alternatively, use the DCLVER macro parameter or CMQVERA macro with the VERSION parameter to declare a specific version of the structure.

*Specifying the name of the structure*
To declare more than one instance of a structure, the macro prefixes the name of each field in the structure with a user-specifiable string and an underscore.

The string used is the label specified on the invocation of the macro. If no label is specified, the name of the structure is used to construct the prefix:

```
* Declare two object descriptors
         CMQODA  ,        Prefix used="MQOD_" (the default)
MY_MQOD  CMQODA  ,        Prefix used="MY_MQOD_"
```

The structure declarations shown in this section use the default prefix.

*Specifying the form of the structure*

Structure declarations can be generated by the macro in one of two forms, controlled by the DSECT parameter:

**DSECT=YES**
An assembler DSECT instruction is used to start a new data section; the structure definition immediately follows the DSECT statement. The label on the macro invocation is used as the name of the data section; if no label is specified, the name of the structure is used.

**DSECT=NO**
Assembler DC instructions are used to define the structure at the current position in the routine. The fields are initialized with values, which can be specified by coding the relevant parameters on the macro invocation. Fields for which no values are specified on the macro invocation are initialized with default values.

The value specified must be uppercase. If the DSECT parameter is not specified, DSECT=NO is assumed.

*Controlling the version of the structure*
By default, the macros always declare the most recent version of each structure.

Although you can use the VERSION macro parameter to specify a value for the *Version* field in the structure, that parameter defines the initial value for the *Version* field, and does not control the version of the structure actually declared. To control the version of the structure that is declared, use the DCLVER parameter:

**DCLVER=CURRENT**
The version declared is the current (most recent) version.

**DCLVER=SPECIFIED**
The version declared is the version specified by the VERSION parameter. If you omit the VERSION parameter, the default is version 1.

If you specify the VERSION parameter, the value must be a self-defining numeric constant, or the named constant for the version required (for example, MQCNO_VERSION_3). If you specify some other value, the structure is declared as if DCLVER=CURRENT had been specified, even if the value of VERSION resolves to a valid value.

The value specified must be uppercase. If you omit the DCLVER parameter, the value used is taken from the MQDCLVER global macro variable. You can set this variable using the CMQVERA macro.

*Declaring one structure embedded within another*

To declare one structure as a component of another structure, use the NESTED parameter:

**NESTED=YES**
The structure declaration is nested within another.

**NESTED=NO**
The structure declaration is not nested within another.

The value specified must be uppercase. If you omit the NESTED parameter, NESTED=NO is assumed.

*Specifying initial values for fields*
Specify the value to be used to initialize a field in a structure by coding the name of that field (without the prefix) as a parameter on the macro invocation, accompanied by the value required.

For example, to declare a message-descriptor structure with the *MsgType* field initialized with MQMT_REQUEST, and the *ReplyToQ* field initialized with the string "MY_REPLY_TO_QUEUE", use the following:

```
MY_MQMD  CMQMDA  MSGTYPE=MQMT_REQUEST,                              X
               REPLYTOQ=MY_REPLY_TO_QUEUE
```

If you specify a named constant (equate) as a value on the macro invocation, use the CMQA macro to define the named constant. Do not enclose character string values in single quotation marks.

*Controlling the listing*

Control the appearance of the structure declaration in the assembler listing using the LIST parameter:

**LIST=YES**
The structure declaration appears in the assembler listing.

**LIST=NO**
The structure declaration does not appear in the assembler listing.

The value specified must be uppercase. If you omit the LIST parameter, LIST=NO is assumed.

*CMQVERA macro*

This macro allows you to set the default value to be used for the DCLVER parameter on the structure macros. The value specified by CMQVERA is used by the structure macro only if you omit the DCLVER parameter from the invocation of the structure macro. The default value is set by coding the CMQVERA macro with the DCLVER parameter:

**DCLVER=CURRENT**
The default version is set to the current (most recent) version.

**DCLVER=SPECIFIED**
The default version is set to the version specified by the VERSION parameter.

You must specify the DCLVER parameter, and the value must be uppercase. The value set by CMQVERA remains the default value until the next invocation of CMQVERA, or the end of the assembly. If you omit CMQVERA, the default is DCLVER=CURRENT .

*Notational conventions*

Later sections show how to invoke the calls and declare parameters. In some cases, the parameters are arrays or character strings with a size that is not fixed for which, a lowercase n is used to represent a

numeric constant. When you code the declaration for that parameter, replace the n with the numeric value required.

## MQAIR - Authentication information record

The MQAIR structure represents the authentication information record.

The following table summarizes the fields in the structure.

| *Table 461. Fields in MQAIR* | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| StrucId | Structure identifier | StrucId |
| Version | Structure version number | Version |
| AuthInfoType | Type of authentication information | AuthInfoType |
| AuthInfoConnName | Connection name of LDAP CRL server | AuthInfoConnName |
| LDAPUserNamePtr | Address of LDAP user name | LDAPUserNamePtr |
| LDAPUserNameOffset | Offset of LDAP user name from start of MQSCO | LDAPUserNameOffset |
| LDAPUserNameLength | Length of LDAP user name | LDAPUserNameLength |
| LDAPPassword | Password to access LDAP server | LDAPPassword |
| **Note:** The remaining fields are ignored if *Version* is less than MQAIR_VERSION_2. | | |
| OCSPResponderURL | URL at which the OCSP responder can be contacted | OCSPResponderURL |

### *Overview for MQAIR*

The MQAIR structure allows an application running as an IBM MQ MQI client to specify information about an authenticator that is to be used for the client connection. The structure is an input parameter on the MQCONNX call.

**Availability**: AIX, HP-UX, Solaris, Linux and Windows clients.

**Character set and encoding**: Data in MQAIR must be in the character set and encoding of the local queue manager; these are given by the **CodedCharSetId** queue manager attribute and MQENC_NATIVE.

### *Fields for MQAIR*

The MQAIR structure contains the following fields; the fields are described in **alphabetical order**:

*AuthInfoConnName (MQCHAR264)*
This is either the host name or the network address of a host on which the LDAP server is running. This can be followed by an optional port number, enclosed in parentheses. The default port number is 389.

If the value is shorter than the length of the field, terminate the value with a null character, or pad it with blanks to the length of the field. If the value is not valid, the call fails with reason code MQRC_AUTH_INFO_CONN_NAME_ERROR.

This is an input field. The length of this field is given by MQ_AUTH_INFO_CONN_NAME_LENGTH. The initial value of this field is the null string in C, and blank characters in other programming languages.

*AuthInfoType (MQLONG)*
This is the type of authentication information contained in the record.

The value can be one of the two following parameters:

**MQAIT_CRL_LDAP**
Certificate revocation checking using LDAP server.

**MQAIT_OCSP**
Certificate revocation checking using OCSP.

If the value is not valid, the call fails with reason code MQRC_AUTH_INFO_TYPE_ERROR.

This is an input field. The initial value of this field is MQAIT_CRL_LDAP.

*LDAPPassword (MQCHAR32)*
This is the password needed to access the LDAP CRL server. If the value is shorter than the length of the field, terminate the value with a null character, or pad it with blanks to the length of the field.

If the LDAP server does not require a password, or you omit the LDAP user name, *LDAPPassword* must be null or blank. If you omit the LDAP user name and *LDAPPassword* is not null or blank, the call fails with reason code MQRC_LDAP_PASSWORD_ERROR.

This is an input field. The length of this field is given by MQ_LDAP_PASSWORD_LENGTH. The initial value of this field is the null string in C, and blank characters in other programming languages.

*LDAPUserNameLength (MQLONG)*

This is the length in bytes of the LDAP user name addressed by the *LDAPUserNamePtr* or *LDAPUserNameOffset* field. The value must be in the range zero through MQ_DISTINGUISHED_NAME_LENGTH. If the value is not valid, the call fails with reason code MQRC_LDAP_USER_NAME_LENGTH_ERR.

If the LDAP server involved does not require a user name, set this field to zero.

This is an input field. The initial value of this field is 0.

*LDAPUserNameOffset (MQLONG)*
This is the offset in bytes of the LDAP user name from the start of the MQAIR structure.

The offset can be positive or negative. The field is ignored if *LDAPUserNameLength* is zero.

You can use either *LDAPUserNamePtr* or *LDAPUserNameOffset* to specify the LDAP user name, but not both; see the description of the *LDAPUserNamePtr* field for details.

This is an input field. The initial value of this field is 0.

*LDAPUserNamePtr (PMQCHAR)*
This is the LDAP user name.

It consists of the Distinguished Name of the user who is attempting to access the LDAP CRL server. If the value is shorter than the length specified by *LDAPUserNameLength*, terminate the value with a null character, or pad it with blanks to the length *LDAPUserNameLength*. The field is ignored if *LDAPUserNameLength* is zero.

You can supply the LDAP user name in one of two ways:

- By using the pointer field *LDAPUserNamePtr*

  In this case, the application can declare a string that is separate from the MQAIR structure, and set *LDAPUserNamePtr* to the address of the string.

  Consider using *LDAPUserNamePtr* for programming languages that support the pointer data type in a fashion that is portable to different environments (for example, the C programming language).
- By using the offset field *LDAPUserNameOffset*

  In this case, the application must declare a compound structure containing the MQSCO structure followed by the array of MQAIR records followed by the LDAP user name strings, and set *LDAPUserNameOffset* to the offset of the appropriate name string from the start of the MQAIR structure. Ensure that this value is correct, and has a value that can be accommodated within

an MQLONG (the most restrictive programming language is COBOL, for which the valid range is -999 999 999 through +999 999 999).

Consider using *LDAPUserNameOffset* for programming languages that do not support the pointer data type, or that implement the pointer data type in a fashion that might not be portable to different environments (for example, the COBOL programming language).

Whichever technique is chosen, use only one of *LDAPUserNamePtr* and *LDAPUserNameOffset* ; the call fails with reason code MQRC_LDAP_USER_NAME_ERROR if both are nonzero.

This is an input field. The initial value of this field is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise.

**Note:** On platforms where the programming language does not support the pointer data type, this field is declared as a byte string of the appropriate length.

*OCSPResponderURL (MQCHAR256)*
For an MQAIR structure that represents connection details for an OCSP responder, this field contains the URL at which the responder can be contacted.

The value of this field is an HTTP URL. This field takes priority over a URL in an AuthorityInfoAccess (AIA) certificate extension.

The value is ignored unless both the following statements are true:

- The MQAIR structure is Version 2 or later (the Version field is set to MQAIR_VERSION_2 or greater).
- The AuthInfoType field is set to MQAIT_OCSP.

If the field does not contain an HTTP URL in the correct format (and is not being ignored), the MQCONNX call fails with reason code MQRC_OCSP_URL_ERROR.

This field is case-sensitive. It must start with the string http:// in lowercase. The rest of the URL might be case-sensitive, depending on the OCSP server implementation.

This field is not subject to data conversion.

*StrucId (MQCHAR4)*

The value must be:

**MQAIR_STRUC_ID**
Identifier for the authentication information record.

For the C programming language, the constant MQAIR_STRUC_ID_ARRAY is also defined; this has the same value as MQAIR_STRUC_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQAIR_STRUC_ID.

*Version (MQLONG)*
The version number of the MQAIR structure.

The value must be one of the following:

**MQAIR_VERSION_1**
Version-1 authentication information record.

**MQAIR_VERSION_2**
Version-2 authentication information record.

The following constant specifies the version number of the current version:

**MQAIR_CURRENT_VERSION**
Current version of authentication information record.

This is always an input field. The initial value of this field is MQAIR_VERSION_1.

### *Initial values and language declarations for MQAIR*

*Table 462. Initial values of fields in MQAIR*

| Field name | Name of constant | Value of constant |
|---|---|---|
| StrucId | MQAIR_STRUC_ID | 'AIR¬' |
| Version | MQAIR_VERSION_1 | 1 |
| AuthInfoType | MQAIT_CRL_LDAP | 1 |
| AuthInfoConnName | None | Null string or blanks |
| LDAPUserNamePtr | None | Null pointer or null bytes |
| LDAPUserNameOffset | None | 0 |
| LDAPUserNameLength | None | 0 |
| LDAPPassword | None | Null string or blanks |
| OCSPResponderURL | None | Null string or blanks |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. In the C programming language, the macro variable MQAIR_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQAIR MyAIR = {MQAIR_DEFAULT};
```

*C declaration*

```
typedef struct tagMQAIR MQAIR;
struct tagMQAIR {
  MQCHAR4    StrucId;             /* Structure identifier */
  MQLONG     Version;             /* Structure version number */
  MQLONG     AuthInfoType;        /* Type of authentication
                                     information */
  MQCHAR264  AuthInfoConnName;    /* Connection name of CRL LDAP
                                     server */
  PMQCHAR    LDAPUserNamePtr;     /* Address of LDAP user name */
  MQLONG     LDAPUserNameOffset;  /* Offset of LDAP user name from start
                                     of MQAIR structure */
  MQLONG     LDAPUserNameLength;  /* Length of LDAP user name */
  MQCHAR32   LDAPPassword;        /* Password to access LDAP server */
  MQCHAR256  OCSPResponderURL;    /* URL of OCSP responder */

};
```

*COBOL declaration*

```
**   MQAIR structure
  10 MQAIR.
**    Structure identifier
   15 MQAIR-STRUCID            PIC X(4).
**    Structure version number
   15 MQAIR-VERSION            PIC S9(9) BINARY.
**    Type of authentication information
   15 MQAIR-AUTHINFOTYPE       PIC S9(9) BINARY.
**    Connection name of CRL LDAP server
   15 MQAIR-AUTHINFOCONNNAME   PIC X(264).
**    Address of LDAP user name
   15 MQAIR-LDAPUSERNAMEPTR    POINTER.
**    Offset of LDAP user name from start of MQAIR structure
   15 MQAIR-LDAPUSERNAMEOFFSET PIC S9(9) BINARY.
**    Length of LDAP user name
   15 MQAIR-LDAPUSERNAMELENGTH PIC S9(9) BINARY.
```

```
**    Password to access LDAP server
   15 MQAIR-LDAPPASSWORD       PIC X(32).
**    URL of OCSP responder
   15 MQAIR-OCSPRESPONDERURL   PIC X(256).
```

*Visual Basic declaration*

```
Type MQAIR
  StrucId            As String*4   'Structure identifier'
  Version            As Long       'Structure version number'
  AuthInfoType       As Long       'Type of authentication information'
  AuthInfoConnName   As String*264 'Connection name of CRL LDAP server'
  LDAPUserNamePtr    As MQPTR      'Address of LDAP user name'
  LDAPUserNameOffset As Long       'Offset of LDAP user name from start'
                                   'of MQAIR structure'
  LDAPUserNameLength As Long       'Length of LDAP user name'
  LDAPPassword       As String*32  'Password to access LDAP server'
End Type
```

## MQBMHO - Buffer to message handle options

The following table summarizes the fields in the structure. MQBMHO structure - buffer to message handle options

*Table 463. Fields in MQBMHO*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *Options* | Options controlling the action of MQBMHO | Options |

### *Overview for MQBMHO*

**Availability**: All. Buffer to message handle options structure - overview

**Purpose**: The MQBMHO structure allows applications to specify options that control how message handles are produced from buffers. The structure is an input parameter on the MQBUFMH call.

**Character set and encoding**: Data in MQBMHO must be in the character set of the application and encoding of the application (MQENC_NATIVE).

### *Fields for MQBMHO*

Buffer to message handle options structure - fields

The MQBMHO structure contains the following fields; the fields are described in **alphabetical order**:

*Options (MQLONG)*
Buffer to message handle structure - Options field

The value can be:

**MQBMHO_DELETE_PROPERTIES**
Properties that are added to the message handle are deleted from the buffer. If the call fails no properties are deleted.

Default options: If you do not need the option described, use the following option:

**MQBMHO_NONE**
No options specified.

This is always an input field. The initial value of this field is MQBMHO_DELETE_PROPERTIES.

*StrucId (MQCHAR4)*
Buffer to message handle structure - StrucId field

This is the structure identifier. The value must be:

**MQBMHO_STRUC_ID**
Identifier for buffer to message handle structure.

For the C programming language, the constant MQBMHO_STRUC_ID_ARRAY is also defined; this has the same value as MQBMHO_STRUC_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQBMHO_STRUC_ID.

*Version (MQLONG)*
Buffer to message handle structure - Version field

This is the structure version number. The value must be:

**MQBMHO_VERSION_1**
Version number for buffer to message handle structure.

The following constant specifies the version number of the current version:

**MQBMHO_CURRENT_VERSION**
Current version of buffer to message handle structure.

This is always an input field. The initial value of this field is MQBMHO_VERSION_1.

## *Initial values and language declarations for MQBMHO*

Buffer to message handle structure - Initial values

*Table 464. Initial values of fields in MQBMHO*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQBMHO_STRUC_ID | 'BMHO' |
| *Version* | MQBMHO_VERSION_1 | 1 |
| *Options* | MQBMHO_NONE | 0 |

**Notes:**

1. In the C programming language, the macro variable MQBMHO_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQBMHO MyBMHO = {MQBMHO_DEFAULT};
```

*C declaration*
Buffer to message handle structure - C language declaration

```
typedef struct tagMQBMHO MQBMHO;
struct tagMQBMHO {
  MQCHAR4  StrucId;        /* Structure identifier */
  MQLONG   Version;        /* Structure version number */
  MQLONG   Options;        /* Options that control the action of
                              MQBUFMH */
};
```

*COBOL declaration*
Buffer to message handle structure - COBOL language declaration

```
**   MQBMHO structure
  10 MQBMHO.
```

```
**    Structure identifier
   15 MQBMHO-STRUCID               PIC X(4).
**    Structure version number
   15 MQBMHO-VERSION               PIC S9(9) BINARY.
**    Options that control the action of MQBUFMH
   15 MQBMHO-OPTIONS               PIC S9(9) BINARY.
```

*PL/I declaration*
Buffer to message handle structure - PL/I language declaration

```
Dcl
 1 MQBMHO based,
  3 StrucId        char(4),       /* Structure identifier */
  3 Version        fixed bin(31), /* Structure version number */
  3 Options        fixed bin(31), /* Options that control the action
                                     of MQBUFMH */
```

*High Level Assembler declaration*
Buffer to message handle structure - Assembler language declaration

```
MQBMHO                      DSECT
MQBMHO_STRUCID              DS   CL4  Structure identifier
MQBMHO_VERSION              DS   F    Structure version number
MQBMHO_OPTIONS              DS   F    Options that control the
*                                     action of MQBUFMH
MQBMHO_LENGTH               EQU  *-MQBMHO
MQBMHO_AREA                 DS   CL(MQBMHO_LENGTH)
```

## MQBO - Begin options

The following table summarizes the fields in the structure.

| *Table 465. Fields in MQBO* | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *Options* | Options that control the action of MQBEGIN | Options |

### *Overview for MQBO*

**Availability**: AIX, HP-UX, IBM i, Solaris, Linux, Windows ; not available for IBM MQ MQI clients.

**Purpose**: The MQBO structure allows the application to specify options relating to the creation of a unit of work. The structure is an input/output parameter on the MQBEGIN call.

**Character set and encoding**: Data in MQBO must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

### *Fields for MQBO*

The MQBO structure contains the following fields; the fields are described in **alphabetical order**:

*Options (MQLONG)*
This field is always an input field. Its initial value is MQBO_NONE.

The value must be:

**MQBO_NONE**
No options specified.

*StrucId (MQCHAR4)*
This field is always an input field. Its initial value is MQBO_STRUC_ID.

The value must be:

**MQBO_STRUC_ID**
Identifier for begin-options structure.

For the C programming language, the constant MQBO_STRUC_ID_ARRAY is also defined; this has the same value as MQBO_STRUC_ID, but is an array of characters instead of a string.

*Version (MQLONG)*
This field is always an input field. Its initial value is MQBO_VERSION_1.

The value must be:

**MQBO_VERSION_1**
Version number for begin-options structure.

The following constant specifies the version number of the current version:

**MQBO_CURRENT_VERSION**
Current version of begin-options structure.

## *Initial values and language declarations for MQBO*

*Table 466. Initial values of fields in MQBO for MQBO*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQBO_STRUC_ID | 'BO¬¬' |
| *Version* | MQBO_VERSION_1 | 1 |
| *Options* | MQBO_NONE | 0 |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. In the C programming language, the macro variable MQBO_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQBO MyBO = {MQBO_DEFAULT};
```

*C declaration*

```
typedef struct tagMQBO MQBO;
struct tagMQBO {
  MQCHAR4  StrucId;  /* Structure identifier */
  MQLONG   Version;  /* Structure version number */
  MQLONG   Options;  /* Options that control the action of MQBEGIN */
};
```

*COBOL declaration*

```
**   MQBO structure
  10 MQBO.
**    Structure identifier
   15 MQBO-STRUCID PIC X(4).
**    Structure version number
   15 MQBO-VERSION PIC S9(9) BINARY.
**    Options that control the action of MQBEGIN
   15 MQBO-OPTIONS PIC S9(9) BINARY.
```

*PL/I declaration*

```
dcl
 1 MQBO based,
  3 StrucId char(4),       /* Structure identifier */
  3 Version fixed bin(31), /* Structure version number */
  3 Options fixed bin(31); /* Options that control the action of
                              MQBEGIN */
```

*Visual Basic declaration*

```
Type MQBO
  StrucId As String*4 'Structure identifier'
  Version As Long     'Structure version number'
  Options As Long     'Options that control the action of MQBEGIN'
End Type
```

## MQCBC - Callback context

The following table summarizes the fields in the structure. Structure describing the callback routine.

*Table 467. Fields in MQCBC*

| Field | Description | Topic |
|---|---|---|
| *StrucID* | Structure identifier | StrucID |
| *Version* | Structure version number | Version |
| *CallType* | Why function has been called | CallType |
| *Hobj* | Object handle | Hobj |
| *CallbackArea* | Field for callback function to use | CallbackArea |
| *ConnectionArea* | Field for callback function to use | ConnectionArea |
| *CompCode* | Completion code | CompCode |
| *Reason* | Reason code | Reason |
| *State* | Indication of the state of the current consumer | State |
| *DataLength* | Message length | DataLength |
| *BufferLength* | Length of message buffer in bytes | BufferLength |
| *Flags* | General flags | Flags |
| **Note:** The remaining field is ignored if Version is less than MQCBC_VERSION_2 | | |
| *ReconnectDelay* | Number of milliseconds before reconnection attempt | ReconnectDelay |

### *Overview for MQCBC*

**Availability**: AIX, HP-UX, IBM i, Solaris, Linux, Windows, z/OS, plus IBM MQ MQI clients connected to these systems.

**Purpose**: The MQCBC structure is used to specify context information that is passed to a callback function.

The structure is an input/output parameter on the call to a message consumer routine.

**Version**: The current version of MQCBC is MQCBC_VERSION_2.

**Character set and encoding**: Data in MQCBC must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC_NATIVE. However, if the application is running as an MQ MQI client, the structure will be in the character set and encoding of the client.

## *Fields for MQCBC*

Alphabetic list of fields for the MQCBC structure.

The MQCBC structure contains the following fields; the fields are described in alphabetical order:

*BufferLength (MQLONG)*
This field is the length in bytes of the message buffer that has been passed to this function.

The buffer can be larger than both the MaxMsgLength value defined for the consumer and the ReturnedLength value in the MQGMO.

The actual message length is supplied in DataLength field.

The application can use the entire buffer for its own purposes for the duration of the callback function.

This is an input field to the message consumer function; it is not relevant to an exception handler function.

*CallbackArea (MQPTR)*
This field is available for the callback function to use.

The queue manager makes no decisions based on the contents of this field and it is passed unchanged from the CallbackArea field in the MQCBD structure, which is a parameter on the MQCB call used to define the callback function.

Changes to the *CallbackArea* are preserved across the invocations of the callback function for an *HObj*. This field is not shared with callback functions for other handles.

This is an input/output field to the callback function. The initial value of this field is a null pointer or null bytes.

*CallType (MQLONG)*
Field containing information about why this function has been called; the following are defined.

Message delivery call types: These call types contain information about a message. The *DataLength* and *BufferLength* parameters are valid for these call types.

**MQCBCT_MSG_REMOVED**
The message consumer function has been invoked with a message that has been destructively removed from the object handle.

If the value of *CompCode* is MQCC_WARNING, the value of the *Reason* field is MQRC_TRUNCATED_MSG_ACCEPTED or one of the codes indicating a data conversion problem.

**MQCBCT_MSG_NOT_REMOVED**
The message consumer function has been invoked with a message that has not yet been destructively removed from the object handle. The message can be destructively removed from the object handle using the *MsgToken*.

The message might not have been removed because:

- The MQGMO options requested a browse operation, MQGMO_BROWSE_*
- The message is larger than the available buffer and the MQGMO options do not specify MQGMO_ACCEPT_TRUNCATED_MSG

If the value of *CompCode* is MQCC_WARNING, the value of the *Reason* field is MQRC_TRUNCATED_MSG_FAILED or one of the codes indicating a data conversion problem.

Callback control call types: These call types contain information about the control of the callback and do not contain details about a message. These call types are requested using Options in the MQCBD structure.

The *DataLength* and *BufferLength* parameters are not valid for these call types.

**MQCBCT_REGISTER_CALL**
The purpose of this call type is to allow the callback function to perform some initial setup.

The callback function is invoked is immediately after the callback is registered, that is, upon return from an MQCB call using a value for the *Operation* field of MQOP_REGISTER.

This call type is used both for message consumers and event handlers.

If requested, this is the first invocation of the callback function.

The value of the *Reason* field is MQRC_NONE.

**MQCBCT_START_CALL**
The purpose of this call type is to allow the callback function to perform some setup when it is started, for example, reinstating resources that were cleaned up when it was previously stopped.

The callback function is invoked when the connection is started using either MQOP_START or MQOP_START_WAIT.

If a callback function is registered within another callback function, this call type is invoked when the callback returns.

This call type is used for message consumers only.

The value of the *Reason* field is MQRC_NONE.

**MQCBCT_STOP_CALL**
The purpose of this call type is to allow the callback function to perform some cleanup when it is stopped for a while, for example, cleaning up additional resources that have been acquired during the consuming of messages.

The callback function is invoked when an MQCTL call is issued using a value for the *Operation* field of MQOP_STOP.

This call type is used for message consumers only.

The value of the *Reason* field is set to indicate the reason for stopping.

**MQCBCT_DEREGISTER_CALL**
The purpose of this call type is to allow the callback function to perform final cleanup at the end of the consume process. The callback function is invoked when the:

- Callback function is deregistered using an MQCB call with MQOP_DEREGISTER.
- Queue is closed, causing an implicit deregister. In this instance the callback function is passed MQHO_UNUSABLE_HOBJ as the object handle.
- MQDISC call completes - causing an implicit close and, therefore, a deregister. In this case the connection is not disconnected immediately, and any ongoing transaction is not yet committed.

If any of these actions are taken inside the callback function itself, the action is invoked once the callback returns.

This call type is used both for message consumers and event handlers.

If requested, this is the last invocation of the callback function.

The value of the *Reason* field is set to indicate the reason for stopping.

**MQCBCT_EVENT_CALL**
**Event handler function**

The event handler function has been invoked without a message when the queue manager or connection stops or quiesces.

This call can be used to take appropriate action for all callback functions.

**Message consumer function**

The message consumer function has been invoked without a message when an error (*CompCode* = MQCC_FAILED) has been detected that is specific to the object handle; for example *Reason* code = MQRC_GET_INHIBITED.

The value of the *Reason* field is set to indicate the reason for the call.

**MQCBCT_MC_EVENT_CALL**

The event handler function has been invoked for multicast events; The event handler is sent IBM MQ Multicast events instead of 'normal' IBM MQ events.

For more information about MQCBCT_MC_EVENT_CALL, see Multicast exception reporting.

*CompCode (MQLONG)*
This field is the completion code. It indicates whether there were any problems consuming the message.

The value is one of the following:

**MQCC_OK**
Successful completion

**MQCC_WARNING**
Warning (partial completion)

**MQCC_FAILED**
Call failed

This is an input field. The initial value of this field is MQCC_OK.

*ConnectionArea (MQPTR)*
This field is available for the callback function to use.

The queue manager makes no decisions based on the contents of this field and it is passed unchanged from the ConnectionArea field in the MQCTLO structure, which is a parameter on the MQCTL call used to control the callback function.

Any changes made to this field by the callback functions are preserved across the invocations of the callback function. This area can be used to pass information that is to be shared by all callback functions. Unlike *CallbackArea*, this area is common across all callbacks for a connection handle.

This is an input and output field. The initial value of this field is a null pointer or null bytes.

*DataLength (MQLONG)*
This is the length in bytes of the application data in the message. If the value is zero, it means that the message contains no application data.

The DataLength field contains the length of the message but not necessarily the length of the message data passed to the consumer. It could be that the message was truncated. Use the ReturnedLength field in the MQGMO to determine how much data has actually been passed to the consumer.

If the reason code indicates the message has been truncated, you can use the DataLength field to determine how large the actual message is. This allows you to determine the size of the buffer required to accommodate the message data, and then issue an MQCB call to update the MaxMsgLength with an appropriate value.

If the MQGMO_CONVERT option is specified, the converted message could be larger than the value returned for DataLength. In such cases, the application probably needs to issue an MQCB call to update the MaxMsgLength to to be greater than the value returned by the queue manager for DataLength.

To avoid message truncation problems, specify MaxMsgLength as MQCBD_FULL_MSG_LENGTH. This causes the queue manager to allocate a buffer for the full message length after data conversion. Be aware, however, that even if this option is specified, it is still possible that sufficient storage is not

available to correctly process the request. Applications should always check the returned reason code. For example, if it is not possible to allocate sufficient storage to convert the message, the messages is returned to the application unconverted.

This is an input field to the message consumer function; it is not relevant to an event handler function.

*Flags (MQLONG)*
Flags containing information about this consumer.

The following option is defined:

**MQCBCF_READA_BUFFER_EMPTY**
This flag can be returned if a previous MQCLOSE call using the MQCO_QUIESCE option failed with a reason code of MQRC_READ_AHEAD_MSGS.

This code indicated that the last read ahead message is being returned and that the buffer is now empty. If the application issues another MQCLOSE call using the MQCO_QUIESCE) option, it succeeds.

Note, that an application is not guaranteed to be given a message with this flag set, as there might still be messages in the read-ahead buffer that do not match the current selection criteria. In this instance, the consumer function is invoked with the reason code MQRC_HOBJ_QUIESCED.

If the read ahead buffer is completely empty, the consumer is invoked with the MQCBCF_READA_BUFFER_EMPTY flag and the reason code MQRC_HOBJ_QUIESCED_NO_MSGS.

This is an input field to the message consumer function; it is not relevant to an event handler function.

*Hobj (MQHOBJ)*
This is the object handle for calls to the message consumer.

For an event handler, this value is MQHO_NONE

The application can use this handle and the message token in the Get Message Options block to get the message if a message has not been removed from the queue.

This is always an input field. The initial value of this field is MQHO_UNUSABLE_HOBJ

*Reason (MQLONG)*
This is the reason code qualifying the *CompCode*.

This is an input field. The initial value of this field is MQRC_NONE.

*State (MQLONG)*
An indication as to the state of the current consumer. This field is of most value to an application when a nonzero reason code is passed to the consumer function.

You can use this field to simplify application programming because you do not need to code behavior for each reason code.

This is an input field. The initial value of this field is MQCS_NONE

| **State** | **Queue manager action** | **Value of constant** |
|---|---|---|
| *MQCS_NONE*<br>This reason code represents a normal call with no additional reason information | None; this is the normal operation. | 0 |

| State | Queue manager action | Value of constant |
|---|---|---|
| *MQCS_SUSPENDED_TEMPORARY*<br>These reason codes represent temporary conditions. | The callback routine is called to report the condition and then suspended. After a period of time the system might attempt the operation again, which can lead to the same condition being raised again. | 1 |
| *MQCS_SUSPENDED_USER_ACTION*<br>These reason codes represent conditions where the callback needs to take action to resolve the condition. | The consumer is suspended and the callback routine is called to report the condition. The callback routine should resolve the condition if possible and either RESUME or close down the connection. | 2 |
| *MQCS_SUSPENDED*<br>These reason codes represent failures that prevent further message callbacks. | The queue manager automatically suspends the callback function. If the callback function is resumed it is likely to receive the same reason code again. | 3 |
| *MQCS_STOPPED*<br>These reason codes represent the end of message consumption. | Delivered to the exception handler and to callbacks that specified MQCBDO_STOP_CALL. No further messages can be consumed. | 4 |

*StrucId (MQCHAR4)*
The value in this field is the structure identifier.

The value must be:

**MQCBC_STRUC_ID**
Identifier for callback context structure.

For the C programming language, the constant MQCBC_STRUC_ID_ARRAY is also defined; this has the same value as MQCBC_STRUC_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQCBC_STRUC_ID.

*Version (MQLONG)*
The value in this field is the structure version number.

The value must be:

**MQCBC_VERSION_1**
Version-1 callback context structure.

The following constant specifies the version number of the current version:

**MQCBC_CURRENT_VERSION**
Current version of the callback context structure.

This is always an input field. The initial value of this field is MQCBC_VERSION_1.

The callback function is always passed the latest version of the structure.

*ReconnectDelay (MQLONG)*
ReconnectDelay indicates how long the queue manager will wait before trying to reconnect. The field can be modified by an event handler to change the delay or stop reconnection altogether.

Use the `ReconnectDelay` field only if the value of the `Reason` field in the Callback Context is `MQRC_RECONNECTING`.

On entry to the event handler the value of `ReconnectDelay` is the number of milliseconds the queue manager is going to wait before making a reconnection attempt. Table 468 on page 281 lists the values that you can set to modify the behavior of the queue manager on return from the event handler.

| *Table 468. ReconnectDelay values* | | |
|---|---|---|
| **Name** | **Value** | **Description** |
| MQRD_NO_RECONNECT | -1 | Make no more reconnection attempts. An error is returned to the application. |
| MQRD_NO_DELAY | 0 | Try to reconnect immediately. |
| *Milliseconds* | >0 | Wait for this many milliseconds before retrying the connection. |

## *Initial values and language declarations for MQCBC*

Callback context structure - initial values

There are no initial values for the **MQCBC** structure. The structure is passed as a parameter to a callback routine. The queue manager initializes the structure; applications never initialize it.

*C declaration*

Callback context structure - C language declaration

```
typedef struct tagMQCBC MQCBC;
struct tagMQCBC {
   MQCHAR4   StrucId;                /* Structure identifier */
   MQLONG    Version;                /* Structure version number */
   MQLONG    CallType;               /* Why Function was called */
   MQHOBJ    Hobj;                   /* Object Handle */
   MQPTR     CallbackArea;           /* Callback data passed to the function */
   MQPTR     ConnectionArea;         /* MQCTL data area passed to the function */
   MQLONG    CompCode;               /* Completion Code */
   MQLONG    Reason;                 /* Reason Code */
   MQLONG    State;                  /* Consumer State */
   MQLONG    DataLength;             /* Message Data Length */
   MQLONG    BufferLength;           /* Buffer Length */
   MQLONG    Flags;                  /* Flags containing information about
                                        this consumer */
  /* Ver:1 */
   MQLONG    ReconnectDelay;         /* Number of milliseconds before */
  /* Ver:2 */  };                    /* reconnect attempt */
```

*COBOL declaration*

```
** MQCBC structure
 10  MQCBC.
** Structure Identifier
 15  MQCBC-STRUCID                    PIC X(4).

## MQCBD - Callback descriptor

The following table summarizes the fields in the structure. Structure specifying the callback function.

*Table 469. Fields in MQCBD*

| Field | Description | Topic |
|---|---|---|
| *StrucID* | Structure identifier | StrucID |
| *Version* | Structure version number | Version |
| *CallbackType* | Type of callback function | CallbackType |
| *Options* | Options controlling message consumption | Options |
| *Callback Area* | Field for callback function to use | CallbackArea |
| *CallbackFunction* | Whether the function is invoked as an API call | CallbackFunction |
| *CallbackName* | Whether the function is invoked as a dynamically-linked program | CallbackName |
| *MaxMsgLength* | Length of longest message that can be read | MaxMsgLength |

### *Overview for MQCBD*

**Availability**: AIX, HP-UX, IBM i, Solaris, Linux, Windows, z/OS, and IBM MQ MQI clients connected to these systems.

**Purpose**: The MQCBD structure is used to specify a callback function and the options controlling its use by the queue manager.

The structure is an input parameter on the MQCB call.

**Version**: The current version of MQCBD is MQCBD_VERSION_1.

**Character set and encoding**: Data in MQCBD must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

## *Fields for MQCBD*

Alphabetic list of fields for the MQCBD structure.

The MQCBD structure contains the following fields; the fields are described in alphabetical order:

*CallbackArea (MQPTR)*
Callback descriptor structure - CallbackArea field

This is a field that is available for the callback function to use.

The queue manager makes no decisions based on the contents of this field and it is passed unchanged from the CallbackArea field in the MQCBC structure, which is a parameter on the callback function declaration.

The value is used only on an *Operation* having a value MQOP_REGISTER, with no currently defined callback, it does not replace a previous definition.

This is an input and output field to the callback function. The initial value of this field is a null pointer or null bytes.

*CallbackFunction (MQPTR)*
Callback descriptor structure - CallbackFunction field

The callback function is invoked as a function call.

Use this field to specify a pointer to the callback function.

You *must* specify either *CallbackFunction* or *CallbackName*. If you specify both, the reason code MQRC_CALLBACK_ROUTINE_ERROR is returned.

If neither *CallbackName* nor *CallbackFunction* is set, the call fails with the reason code MQRC_CALLBACK_ROUTINE_ERROR.

This option is not supported in the following environment: Programming languages and compilers that do not support function-pointer references. In such situations, the call fails with the reason code MQRC_CALLBACK_ROUTINE_ERROR.

On z/OS the function must expect to be called with OS linkage conventions. For example, in the C programming language, specify:

```
#pragma linkage(MQCB_FUNCTION,OS)
```

This is an input field. The initial value of this field is a null pointer or null bytes.

**Note:** When using CICS with IBM MQ V7.0.1, asynchronous consumption is supported if:

- Apar PK66866 is applied to CICS TS 3.2
- Apar PK89844 is applied to CICS TS 4.1

*CallbackName (MQCHAR128)*
Callback descriptor structure - CallbackName field

The callback function is invoked as a dynamically linked program.

You *must* specify either *CallbackFunction* or *CallbackName*. If you specify both, the reason code MQRC_CALLBACK_ROUTINE_ERROR is returned.

If neither *CallbackName* nor *CallbackFunction* is not set, the call fails with the reason code MQRC_CALLBACK_ROUTINE_ERROR.

The module is loaded when the first callback routine to use is registered, and unloaded when the last callback routine to use it deregisters.

Except where noted in the following text, the name is left-justified within the field, with no embedded blanks; the name itself is padded with blanks to the length of the field. In the descriptions that follow, square brackets ([ ]) denote optional information:

**IBM i**
The callback name can be one of the following formats:

- Library "/" Program
- Library "/" ServiceProgram "("FunctionName")"

For example, `MyLibrary/MyProgram(MyFunction)`.

The library name can be *LIBL. Both the library and program names are limited to a maximum of 10 characters.

**UNIX systems**
The callback name is the name of a dynamically-loadable module or library, suffixed with the name of a function residing in that library. The function name must be enclosed in parentheses. The library name can optionally be prefixed with a directory path:

```
[path]library(function)
```

If the path is not specified the system search path is used.

The name is limited to a maximum of 128 characters.

**Windows**
The callback name is the name of a dynamic-link library, suffixed with the name of a function residing in that library. The function name must be enclosed in parentheses .The library name can optionally be prefixed with a directory path and drive:

```
[d:][path]library(function)
```

If the drive and path are not specified the system search path is used.

The name is limited to a maximum of 128 characters.

**z/OS**
The callback name is the name of a load module that is valid for specification on the EP parameter of the LINK or LOAD macro.

The name is limited to a maximum of 8 characters.

**z/OS CICS**
The callback name is the name of a load module that is valid for specification on the PROGRAM parameter of the EXEC CICS LINK command macro.

The name is limited to a maximum of 8 characters.

The program can be defined as remote using the REMOTESYTEM option of the installed PROGRAM definition or by the dynamic routing program.

The remote CICS region must be connected to IBM MQ if the program is to use IBM MQ API calls. Note, however, that the Hobj field in the MQCBC structure is not valid in a remote system.

If a failure occurs trying to load *CallbackName*, one of the following error codes is returned to the application:

- MQRC_MODULE_NOT_FOUND
- MQRC_MODULE_INVALID
- MQRC_MODULE_ENTRY_NOT_FOUND

A message is also written to the error log containing the name of the module for which the load was attempted, and the failing reason code from the operating system.

This is an input field. The initial value of this field is a null string or blanks.

*CallbackType (MQLONG)*
Callback descriptor structure - CallbackType field

This is the type of the callback function. The value must be one of:

**MQCBT_MESSAGE_CONSUMER**
Defines this callback as a message consumer function.

A message consumer callback function is called when a message, meeting the selection criteria specified, is available on an object handle and the connection is started.

**MQCBT_EVENT_HANDLER**
Defines this callback as the asynchronous event routine; it is not driven to consume messages for a handle.

*Hobj* is not required on the MQCB call defining the event handler and is ignored if specified.

The event handler is called for conditions that affect the whole message consumer environment. The consumer function is invoked without a message when an event, for example, a queue manager or connection stopping, or quiescing, occurs. It is not called for conditions that are specific to a single message consumer, for example, MQRC_GET_INHIBITED.

Events are delivered to the application, regardless of whether the connection is started or stopped, except in the following environments:

- CICS on z/OS environment
- nonthreaded applications

If the caller does not pass one of these values, the call fails with a *Reason* code of MQRC_CALLBACK_TYPE_ERROR

This is always an input field. The initial value of this field is MQCBT_MESSAGE_CONSUMER.

*MaxMsgLength (MQLONG)*
This is the length in bytes of the longest message that can be read from the handle and given to the callback routine. Callback descriptor structure - MaxMsgLength field

If a message has a longer length, the callback routine receives *MaxMsgLength* bytes of the message, and reason code:

- MQRC_TRUNCATED_MSG_FAILED or
- MQRC_TRUNCATED_MSG_ACCEPTED if you specified MQGMO_ACCEPT_TRUNCATED_MSG.

The actual message length is supplied in the DataLength field of the MQCBC structure.

The following special value is defined:

**MQCBD_FULL_MSG_LENGTH**
The buffer length is adjusted by the system to return messages without truncation.

If insufficient memory is available to allocate a buffer to receive the message, the system calls the callback function with an MQRC_STORAGE_NOT_AVAILABLE reason code.

If, for example, you request data conversion, and there is insufficient memory available to convert the message data, the unconverted message is passed to the callback function.

This is an input field. The initial value of the *MaxMsgLength* field is MQCBD_FULL_MSG_LENGTH.

*Options (MQLONG)*
Callback descriptor structure - Options field

You can specify one or more of these options. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

**MQCBDO_FAIL_IF_QUIESCING**
The MQCB call fails if the queue manager is in the quiescing state.

On z/OS, this option also forces the MQCB call to fail if the connection (for a CICS or IMS application) is in the quiescing state.

Specify MQGMO_FAIL_IF_QUIESCING, in the MQGMO options passed on the MQCB call, to cause notification to message consumers when they are quiescing.

**Control options**: The following options control whether the callback function is called, without a message, when the state of the consumer changes:

**MQCBDO_REGISTER_CALL**
The callback function is invoked with call type MQCBCT_REGISTER_CALL.

**MQCBDO_START_CALL**
The callback function is invoked with call type MQCBCT_START_CALL.

**MQCBDO_STOP_CALL**
The callback function is invoked with call type MQCBCT_STOP_CALL.

**MQCBDO_DEREGISTER_CALL**
The callback function is invoked with call type MQCBCT_DEREGISTER_CALL.

**MQCBDO_EVENT_CALL**
The callback function is invoked with call type MQCBCT_EVENT_CALL.

**MQCBDO_MC_EVENT_CALL**
The callback function is invoked with call type MQCBCT__MC_EVENT_CALL.

See CallType for further details about these call types.

**Default option**: If you do not need any of the options described, use the following option:

**MQCBDO_NONE**
Use this value to indicate that no other options have been specified; all options assume their default values.

MQCBDO_NONE is defined to aid program documentation; it is not intended that this option be used with any other, but as its value is zero, such use cannot be detected.

This is an input field. The initial value of the *Options* field is MQCBDO_NONE.

*StrucId (MQCHAR4)*
Callback descriptor structure - StrucId field

This is the structure identifier; the value must be:

**MQCBD_STRUC_ID**
Identifier for callback descriptor structure.

For the C programming language, the constant MQCBD_STRUC_ID_ARRAY is also defined; this has the same value as MQCBD_STRUC_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQCBD_STRUC_ID.

*Version (MQLONG)*
Callback descriptor structure - Version field

This is the structure version number; the value must be:

**MQCBD_VERSION_1**
Version-1 callback descriptor structure.

The following constant specifies the version number of the current version:

**MQCBD_CURRENT_VERSION**
Current version of callback descriptor structure.

This is always an input field. The initial value of this field is MQCBD_VERSION_1.

## *Initial values and language declarations for MQCBD*

Callback descriptor structure - Initial values

*Table 470. Initial values of fields in MQCBD*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQCBD_STRUC_ID | 'CBD¬' |
| *Version* | MQCBD_VERSION_1 | 1 |
| *CallBackType* | MQCBT_MESSAGE_CONSUMER | 1 |
| *Options* | MQCBDO_NONE | 0 |
| *CallbackArea* | None | Null pointer or null blanks |
| *CallbackFunction* | None | Null pointer or null blanks |
| *CallbackName* | None | Null string or blanks |
| *MaxMsgLength* | MQCBD_FULL_MSG_LENGTH | -1 |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. The value Null string or blanks denotes the null sting in the C programming language, and blank characters in other programming languages.
3. In the C programming language, the macro variable MQCBD_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQCBD MyCBD = {MQCBD_DEFAULT};
```

*C declaration*
Callback descriptor structure - C language declaration

```
typedef struct tagMQCBD MQCBD;
 struct tagMQCBD {
   MQCHAR4    StrucId;                /* Structure identifier */
   MQLONG     Version;                /* Structure version number */
   MQLONG     CallBackType;           /* Callback function type */
   MQLONG     Options;                /* Options controlling message
                                         consumption */
   MQPTR      CallbackArea;           /* User data passed to the function */
   MQPTR      CallbackFunction;       /* Callback function pointer */
   MQCHAR128  CallbackName;           /* Callback name */
   MQLONG     MaxMsgLength;           /* Maximum message length */
 };
```

*COBOL declaration*

```
** MQCBCD structure
 10  MQCBD.
** Structure Identifier
 15  MQCBD-STRUCID                    PIC X(4).
** Structure Version
```

```
 15  MQCBD-VERSION                      PIC S9(9) BINARY.
 ** Callback Type
 15  MQCBD-CALLBACKTYPE                PIC S9(9) BINARY.
** Options
 15  MQCBD-OPTIONS                     PIC S9(9) BINARY.
** Callback User Area
 15  MQCBD-CALLBACKAREA                POINTER
** Callback Function Pointer
 15  MQCBD-CALLBACKFUNCTION            FUNCTION-POINTER
** Callback Program Name
 15  MQCBD-CALLBACKNAME                PIC X(128)
** Maximum Message Length
 15  MQCDB-MAXMSGLENGTH                PIC S9(9) BINARY.
```

*PL/I declaration*

```
dcl
 1 MQCBD based,
  3 StrucId             char(4),       /* Structure identifier*/
  3 Version             fixed bin(31), /* Structure version*/
  3 CallbackType        fixed bin(31), /* Callback function type */
  3 Options             fixed bin(31), /* Options */
  3 CallbackArea        pointer,       /* User area passed to the function */
  3 CallbackFunction    pointer,       /* Callback Function Pointer */
  3 CallbackName        char(128),     /* Callback Program Name */
  3 MaxMsgLength        fixed bin(31); /* Maximum Message Length */
```

## MQCHARV - Variable Length String

The following table summarizes the fields in the structure.

| Field | Description | Topic |
|---|---|---|
| *VSPtr* | Pointer to the variable length string | VSPtr |
| *VSOffset* | Offset in bytes of the variable length string from the start of the structure that contains this MQCHARV structure | VSOffset |
| *VSLength* | The length in bytes of the variable length string addressed by the VSPtr or VSOffset field. | VSLength |
| *VSBufSize* | The size in bytes of the buffer addressed by the VSPtr or VSOffset field. | VSBufSize |
| *VSCCSID* | The character set identifier of the variable length string addressed by the VSPtr or VSOffset field. | VSCCSID |

### *Overview for MQCHARV*

**Availability**: AIX, HP-UX, Solaris, Linux, IBM i, Windows, plus IBM MQ MQI clients connected to these systems.

**Purpose**: Use the MQCHARV structure to describe a variable length string.

**Character set and encoding**: Data in the MQCHARV must be in the encoding of the local queue manager that is given by MQENC_NATIVE and the character set of the VSCCSID field within the structure. If the application is running as an MQ client, the structure must be in the encoding of the client. Some character sets have a representation that depends on the encoding. If VSCCSID is one of these character sets, the encoding used is the same encoding as that of the other fields in the MQCHARV. The character set identified by VSCCSID can be a double-byte character set (DBCS).

**Usage**: The MQCHARV structure addresses data that might be discontiguous with the structure containing it. To address this data, fields declared with the pointer data type can be used. Be aware that COBOL does not support the pointer data type in all environments. Because of this, the data can also be addressed using fields that contain the offset of the data from the start of the structure containing the MQCHARV.

## COBOL programming

If you want to port an application between environments, you must ascertain whether the pointer data type is available in all the intended environments. If not, the application must address the data using the offset fields instead of the pointer fields.

In those environments where pointers are not supported, you can declare the pointer fields as byte strings of the appropriate length, with the initial value being the all-null byte string. Do not alter this initial value if you are using the offset fields. One way to do this without changing the supplied copy books is to use the following:

```
COPY CMQCHRVV REPLACING POINTER BY ==BINARY PIC S9(9)==.
```

where CMQCHRVV can be exchanged for the copy book to be used.

### *Fields for MQCHARV*

The MQCHARV structure contains the following fields; the fields are described in **alphabetical order**:

*VSBufSize (MQLONG)*
This is the size in bytes of the buffer addressed by the VSPtr or VSOffset field.

When the MQCHARV structure is used as an output field on a function call, this field must be initialised with the length of the buffer provided. If the value of VSLength is greater than VSBufSize then only VSBufSize bytes of data are returned to the caller in the buffer.

This value must be a value greater than or equal to zero, or the following special value which is recognized:

**MQVS_USE_VSLENGTH**
When specified, the length of the buffer is taken from the VSLength field in the MQCHARV structure. Do not use this value when using the structure as an output field and a buffer is provided.

This is the initial value of this field.

*VSCCSID (MQLONG)*
This is the character set identifier of the variable length string addressed by the **VSPtr** or **VSOffset** field.

The initial value of this field is *MQCCSI_APPL*, which is defined by MQ to indicate that it should be changed to the true character set identifier of the current process. As a result, the value of constant *MQCCSI_APPL* is never associated with a variable length string.

The initial value of this field can be changed by defining a different value for the constant *MQCCSI_APPL* for your compile unit. How you do this depends on your application's programming language.

z/OS On z/OS systems, the default application CCSID used by *MQCCSI_APPL* is defined as follows:

- For batch LE applications using the DLL interface, the default is the CODESET associated with the current locale at the time **MQCONN** is issued (default value is 1047).
- For batch LE applications bound with one of the batch MQ stubs, the default is the CODESET associated with the current locale at the time of the first MQI call issued after **MQCONN** (default value is 1047).
- For batch non-LE applications running on a USS thread, the default is the value of THLICCSID at the time of the first MQI call issued after **MQCONN** (default value is 1047).
- For other batch applications, the default is the CCSID of the queue manager.

*VSLength (MQLONG)*
The length in bytes of the variable length string addressed by the VSPtr or VSOffset field.

The initial value of this field is 0. The value must be either greater than or equal to zero or the following special value which is recognized:

**MQVS_NULL_TERMINATED**

If MQVS_NULL_TERMINATED is not specified, VSLength bytes are included as part of the string. If null characters are present they do not delimit the string.

If MQVS_NULL_TERMINATED is specified, the string is delimited by the first null encountered in the string. The null itself is not included as part of that string.

**Note:** The null character used to terminate a string if MQVS_NULL_TERMINATED is specified is a null from the codeset specified by VSCCSID.

For example, in UTF-16 (UCS-2 CCSIDs 1200 and 13488), this is the two byte Unicode encoding where a null is represented by a 16-bit number of all zeros. In UTF-16 it is common to find single bytes set to all zero which are part of characters (7-bit ASCII characters for instance), but the strings will only be null terminated when two 'zero' bytes are found on an even byte boundary. It is possible to get two 'zero' bytes on an odd boundary when they are each part of valid characters. For example x'01' x'00 x'00' x'30' represents two valid Unicode characters and does not null terminate the string.

*VSOffset (MQLONG)*
The offset can be positive or negative. You can use either the VSPtr or VSOffset field to specify the variable length string, but not both. The offset in bytes of the variable length string from the start of the MQCHARV, or the structure containing it.

When the MQCHARV structure is embedded within another structure, this value is the offset in bytes of the variable length string from the start of the structure that contains this MQCHARV structure. When the MQCHARV structure is not embedded within another structure, for example, if it is specified as a parameter on a function call, the offset is relative to the start of the MQCHARV structure.

The initial value of this field is 0.

*VSPtr (MQPTR)*
This is a pointer to the variable length string.

You can use either the VSPtr or VSOffset field to specify the variable length string, but not both.

The initial value of this field is a null pointer or null bytes.

## *Initial values and language declarations for MQCHARV*

### Initial values of fields in MQCHARV

| Field name | Name of constant | Value of constant |
|---|---|---|
| *VSPtr* | None | Null pointer or null bytes. |
| *VSOffset* | None | 0 |
| *VSBufSize* | MQVS_USE_VSLENGTH | 0 |
| *VSLength* | None | 0 |
| *VSCCSID* | MQCCSI_APPL | -3 |

**Note:** In the C programming language, the macro variable MQCHARV_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQCHARV MyVarStr = {MQCHARV_DEFAULT};
```

*C declaration*

```
typedef struct tagMQCHARV MQCHARV;
struct tagMQCHARV {
  MQPTR     VSPtr;              /* Address of variable length string */
  MQLONG    VSOffset;           /* Offset of variable length string */
  MQLONG    VSBufSize;          /* Size of buffer */
  MQLONG    VSLength;           /* Length of variable length string */
  MQLONG    VSCCSID;            /* CCSID of variable length string */
};
```

*COBOL declaration for MQCHARV*

```
** MQCHARV structure
 10  MQCHARV.
** Address of variable length string
 15  MQCHARV-VSPTR        POINTER.
** Offset of variable length string
 15  MQCHARV-VSOFFSET     PIC S9(9) BINARY.
** Size of buffer
 15  MQCHARV-VSBUFSIZE    PIC S9(9) BINARY.
** Length of variable length string
 15  MQCHARV-VSLENGTH     PIC S9(9) BINARY.
** CCSID of variable length string
 15  MQCHARV-VSCCSID      PIC S9(9) BINARY.
```

*PL/I declaration*

```
dcl
 1 MQCHARV based,
   3 VSPtr       pointer,       /* Address of variable length string */
   3 VSOffset    fixed bin(31), /* Offset of variable length string */
   3 VSBufSize   fixed bin(31), /* Size of buffer */
   3 VSLength    fixed bin(31), /* Length of variable length string */
   3 VSCCSID     fixed bin(31); /* CCSID of variable length string */
```

*High Level Assembler declaration*

```
MQCHARV             DSECT
MQCHARV_VSPTR       DS   F     Address of variable length string
MQCHARV_VSOFFSET    DS   F     Offset of variable length string
MQCHARV_VSBUFSIZE   DS   F     Size of buffer
MQCHARV_VSLENGTH    DS   F     Length of variable length string
MQCHARV_VSCCSID     DS   F     CCSID of variable length string
*
MQCHARV_LENGTH      EQU  *-MQCHARV
                    ORG  MQCHARV
MQCHARV_AREA        DS   CL(MQCHARV_LENGTH)
```

### *Redefinition of MQCCSI_APPL*

The following examples show how you can override the value of MQCCSI_APPL in various programming languages. You can change the value of MQCCSI_APPL, removing the need to set the VSCCSID for each variable length string separately.

In these examples the CCSID is set to 1208; change this to the value you require. This becomes the default value, which you can override by setting the VSCCSID in any specific instance of MQCHARV.

## C usage

```
#define MQCCSI_APPL 1208
#include <cmqc.h>
```

### COBOL usage

```
COPY CMQXYZV REPLACING -3 BY 1208.
```

### PL/I usage

```
%MQCCSI_APPL = '1208';
%include syslib(cmqp);
```

### System/390 assembler usage

```
MQCCSI_APPL EQU 1208
CMQA LIST=NO
```

## MQCIH - CICS bridge header

The following table summarizes the fields in the structure.

*Table 471. Fields in MQCIH*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *StrucLength* | Length of MQCIH structure | StrucLength |
| *Encoding* | Reserved | Encoding |
| *CodedCharSetId* | Reserved | CodedCharSetId |
| *Format* | MQ format name of data that follows MQCIH | Format |
| *Flags* | Flags | Flags |
| *ReturnCode* | Return code from bridge | ReturnCode |
| *CompCode* | MQ completion code or CICS EIBRESP | CompCode |
| *Reason* | MQ reason or feedback code, or CICS EIBRESP2 | Reason |
| *UOWControl* | Unit-of-work control | UOWControl |
| *GetWaitInterval* | Wait interval for MQGET call issued by bridge task | GetWaitInterval |
| *LinkType* | Link type | LinkType |
| *OutputDataLength* | Output COMMAREA data length | OutputDataLength |
| *FacilityKeepTime* | Bridge facility release time | FacilityKeepTime |
| *ADSDescriptor* | Send/receive ADS descriptor | ADSDescriptor |
| *ConversationalTask* | Whether task can be conversational | ConversationalTask |
| *TaskEndStatus* | Status at end of task | TaskEndStatus |
| *Facility* | Bridge facility token | Facility |
| *Function* | MQ call name or CICS EIBFN function | Function |

| Table 471. Fields in MQCIH (continued) | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *AbendCode* | Abend code | AbendCode |
| *Authenticator* | Password or passticket | Authenticator |
| *Reserved1* | Reserved | Reserved1 |
| *ReplyToFormat* | MQ format name of reply message | ReplyToFormat |
| *RemoteSysId* | Remote CICS system Id to use | RemoteSysId |
| *RemoteTransId* | CICS RTRANSID to use | RemoteTransId |
| *TransactionId* | Transaction to attach | TransactionId |
| *FacilityLike* | Terminal emulated attributes | FacilityLike |
| *AttentionId* | AID key | AttentionId |
| *StartCode* | Transaction start code | StartCode |
| *CancelCode* | Abend transaction code | CancelCode |
| *NextTransactionId* | Next transaction to attach | NextTransactionId |
| *Reserved2* | Reserved | Reserved2 |
| *Reserved3* | Reserved | Reserved3 |
| **Note:** The remaining fields are not present if *Version* is less than MQCIH_VERSION_2. | | |
| *CursorPosition* | Cursor position | CursorPosition |
| *ErrorOffset* | Offset of error in message | ErrorOffset |
| *InputItem* | Reserved | InputItem |
| *Reserved4* | Reserved | Reserved4 |

### *Overview for MQCIH*

The MQCIH structure describes the header information for a message sent to CICS across the CICS bridge. For any IBM MQ supported platform you can create and transmit a message that includes the MQCIH structure, but only an IBM MQ for z/OS queue manager can use the CICS bridge. Therefore, for the message to get to CICS from a non-z/OS queue manager, your queue manager network must include at least one z/OS queue manager through which the message can be routed.

**Availability**: AIX, HP-UX, z/OS, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

**Purpose**: The MQCIH structure describes the information that can be present at the start of a message sent to the CICS bridge through IBM MQ for z/OS.

**Format name**: MQFMT_CICS.

**Version**: The current version of MQCIH is MQCIH_VERSION_2. Fields that exist only in the more-recent version of the structure are identified as such in the descriptions that follow.

The header, COPY, and INCLUDE files provided for the supported programming languages contain the most-recent version of MQCIH, with the initial value of the *Version* field set to MQCIH_VERSION_2.

**Character set and encoding**: Special conditions apply to the character set and encoding used for the MQCIH structure and application message data:

- Applications that connect to the queue manager that owns the CICS bridge queue must provide an MQCIH structure that is in the character set and encoding of the queue manager. This is because data conversion of the MQCIH structure is not performed in this case.
- Applications that connect to other queue managers can provide an MQCIH structure that is in any of the supported character sets and encodings; the receiving message channel agent connected to the queue manager that owns the CICS bridge queue converts the MQCIH structure.
- The application message data following the MQCIH structure must be in the same character set and encoding as the MQCIH structure. You cannot use the *CodedCharSetId* and *Encoding* fields in the MQCIH structure to specify the character set and encoding of the application message data.

  You must provide a data-conversion exit to convert the application message data if the data is not one of the built-in formats supported by the queue manager.

**Usage**: If the application requires values that are the same as the initial values shown in Table 473 on page 303, and the bridge is running with AUTH=LOCAL or AUTH=IDENTIFY, you can omit the MQCIH structure from the message. In all other cases, the structure must be present.

The bridge accepts either a version-1 or a version-2 MQCIH structure, but for 3270 transactions, you must use a version-2 structure.

The application must ensure that fields documented as request fields have appropriate values in the message sent to the bridge; these fields are input to the bridge.

Fields documented as response fields are set by the CICS bridge in the reply message that the bridge sends to the application. Error information is returned in the *ReturnCode*, *Function*, *CompCode*, *Reason*, and *AbendCode* fields, but not all of them are set in all cases. Table 472 on page 294 shows which fields are set for different values of *ReturnCode*.

*Table 472. Contents of error information fields in MQCIH structure for MQCIH*

| ***ReturnCode*** | ***Function*** | ***CompCode*** | ***Reason*** | ***AbendCode*** |
|---|---|---|---|---|
| MQCRC_OK | - | - | - | - |
| MQCRC_BRIDGE_ERROR | - | - | MQFB_CICS_* | - |
| MQCRC_MQ_API_ERROR<br>MQCRC_BRIDGE_TIMEOUT | MQ call name | MQ *CompCode* | MQ *Reason* | - |
| MQCRC_CICS_EXEC_ERROR<br>MQCRC_SECURITY_ERROR<br>MQCRC_PROGRAM_NOT_AVAILABLE<br>MQCRC_TRANSID_NOT_AVAILABLE | CICS EIBFN | CICS EIBRESP | CICS EIBRESP2 | - |
| MQCRC_BRIDGE_ABEND<br>MQCRC_APPLICATION_ABEND | - | - | - | CICS ABCODE |

## *Fields for MQCIH*

The MQCIH structure contains the following fields; the fields are described in **alphabetical order**:

*AbendCode (MQCHAR4)*
AbendCode is a response field. The length of this field is given by MQ_ABEND_CODE_LENGTH. The initial value of this field is 4 blank characters.

The value returned in this field is significant only if the *ReturnCode* field has the value MQCRC_APPLICATION_ABEND or MQCRC_BRIDGE_ABEND. If it does, *AbendCode* contains the CICS ABCODE value.

*ADSDescriptor (MQLONG)*
This field is an indicator specifying whether to send ADS descriptors on SEND and RECEIVE BMS requests.

The following values are defined:

**MQCADSD_NONE**
Do not send or receive ADS descriptors.

**MQCADSD_SEND**
Send ADS descriptors.

**MQCADSD_RECV**
Receive ADS descriptors.

**MQCADSD_MSGFORMAT**
Use message format for the ADS descriptors.

This sends or receives the ADS descriptors using the long form of the ADS descriptor. The long form has fields that are aligned on 4-byte boundaries.

Set the *ADSDescriptor* field as follows:

- If you are not using ADS descriptors, set the field to MQCADSD_NONE.
- If you are using ADS descriptors with the *same* CCSID in each environment, set the field to the sum of MQCADSD_SEND and MQCADSD_RECV.
- If you are using ADS descriptors with *different* CCSIDs in each environment, set the field to the sum of MQCADSD_SEND, MQCADSD_RECV, and MQCADSD_MSGFORMAT.

This is a request field used only for 3270 transactions. The initial value of this field is MQCADSD_NONE.

*AttentionId (MQCHAR4)*
The value in this field determines the initial value of the AID key when the transaction is started. It is a 1 byte value, left-aligned.

AttentionId is a request field used only for 3270 transactions. The length of this field is given by MQ_ATTENTION_ID_LENGTH. The initial value of this field is four blanks.

*Authenticator (MQCHAR8)*
The value of this field is the password or passticket.

If user-identifier authentication is active for the CICS bridge, *Authenticator* is used with the user identifier in the MQMD identity context to authenticate the sender of the message.

This is a request field. The length of this field is given by MQ_AUTHENTICATOR_LENGTH. The initial value of this field is 8 blanks.

*CancelCode (MQCHAR4)*
The value in this field is the abend code to be used to terminate the transaction (normally a conversational transaction that is requesting more data). Otherwise this field is set to blanks.

This field is a request field used only for 3270 transactions. The length of this field is given by MQ_CANCEL_CODE_LENGTH. The initial value of this field is four blanks.

*CodedCharSetId (MQLONG)*
CodedCharSetId is a reserved field; its value is not significant. The initial value of this field is 0.

The Character Set ID for supported structures which follow an MQCIH structure is the same as the Character Set ID of the MQCIH structure itself and is taken from any preceding IBM MQ header.

*CompCode (MQLONG)*
This field is a response field. Its initial value is MQCC_OK

The value returned in this field depends on *ReturnCode* ; see Table 472 on page 294.

*ConversationalTask (MQLONG)*
This field is an indicator specifying whether to allow the task to issue requests for more information, or to stop the task and issue an abend message.

The value must be one of the following options:

**MQCCT_YES**
The task is conversational.

**MQCCT_NO**
The task is not conversational.

This field is a request field used only for 3270 transactions. The initial value of this field is MQCCT_NO.

*CursorPosition (MQLONG)*
The value in this field shows the initial cursor position when the transaction is started. For conversational transactions, the cursor position is in the RECEIVE vector.

This field is a request field used only for 3270 transactions. The initial value of this field is 0. This field is not present if *Version* is less than MQCIH_VERSION_2.

*Encoding (MQLONG)*
This field is a reserved field; its value is not significant. Its initial value is 0.

The Encoding for supported structures which follow an MQCIH structure is the same as the Encoding of the MQCIH structure itself and taken from any preceding IBM MQ header.

*ErrorOffset (MQLONG)*
The ErrorOffset field shows the position of invalid data detected by the bridge exit. This field provides the offset from the start of the message to the location of the invalid data.

ErrorOffset is a response field used only for 3270 transactions. The initial value of this field is 0. This field is not present if *Version* is less than MQCIH_VERSION_2.

*Facility (MQBYTE8)*
This field shows the 8-byte bridge facility token.

A bridge facility token enables multiple transactions in a pseudo-conversation to use the same bridge facility (virtual 3270 terminal). In the first, or only, message in a pseudo-conversation, set a value of MQCFAC_NONE. This value tells CICS to allocate a new bridge facility for this message. A bridge facility token is returned in response messages when a nonzero *FacilityKeepTime* is specified on the input message. Subsequent input messages within a pseudo-conversation must then use the same bridge facility token.

The following special value is defined:

**MQCFAC_NONE**
No facility token specified.

For the C programming language, the constant MQCFAC_NONE_ARRAY is also defined, and has the same value as MQCFAC_NONE, but is an array of characters instead of a string.

This field is both a request and a response field used only for 3270 transactions. The length of this field is given by MQ_FACILITY_LENGTH. The initial value of this field is MQCFAC_NONE.

*FacilityKeepTime (MQLONG)*
FacilityKeepTime is the length of time in seconds that the bridge facility is kept after the user transaction ends.

For pseudo-conversational transactions, specify a value that corresponds to the expected duration of a pseudo-conversation; specify zero for the last transaction of a pseudo-conversation, and for other transaction types specify zero.

This field is a request field used only for 3270 transactions. The initial value of this field is 0.

*FacilityLike (MQCHAR4)*
FacilityLike is the name of an installed terminal that is to be used as a model for the bridge facility.

A value of blanks means that *FacilityLike* is taken from the bridge transaction profile definition, or a default value is used.

This field is a request field used only for 3270 transactions. The length of this field is given by MQ_FACILITY_LIKE_LENGTH. The initial value of this field is four blanks.

*Flags (MQLONG)*
This field is a request field. The initial value of this field is MQCIH_NONE.

The value must be:

**MQCIH_NONE**
No flags.

**MQCIH_PASS_EXPIRATION**
The reply message contains:

- The same expiry report options as the request message.
- The remaining expiry time from the request message with no adjustment made for the processing time of the bridge.

If you omit this value, the expiry time is set to *unlimited*.

**MQCIH_REPLY_WITHOUT_NULLS**
The reply message length of a CICS DPL program request is adjusted to exclude trailing nulls (X'00') at the end of the COMMAREA returned by the DPL program. If this value is not set, the nulls might be significant, and the full COMMAREA is returned.

**MQCIH_SYNC_ON_RETURN**
The CICS link for DPL requests uses the SYNCONRETURN option, causing CICS to take a sync point when the program completes if it is shipped to another CICS region. The bridge does not specify to which CICS region to ship the request; that is controlled by the CICS program definition or workload balancing facilities.

*Format (MQCHAR8)*
This field shows the IBM MQ format name of the data that follows the MQCIH structure.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The rules for coding this field are the same as the rules for coding the *Format* field in MQMD.

This format name is also used for the reply message, if the *ReplyToFormat* field has the value MQFMT_NONE.

- For DPL requests, *Format* must be the format name of the COMMAREA.
- For 3270 requests, *Format* must be CSQCBDCI, and the bridge sets the format to CSQCBDC0 for Reply messages.

The data-conversion exits for these formats must be installed on the queue manager where they are to run.

If the request message generates an error reply message, the error reply message has a format name of MQFMT_STRING.

This field is a request field. The length of this field is given by MQ_FORMAT_LENGTH. The initial value of this field is MQFMT_NONE.

*Function (MQCHAR4)*
This field is a response field. The length of this field is given by MQ_FUNCTION_LENGTH. The initial value of this field is MQCFUNC_NONE.

The value returned in this field depends on *ReturnCode* ; see Table 472 on page 294. The following values are possible when *Function* contains an IBM MQ call name:

**MQCFUNC_MQCONN**
MQCONN call.

**MQCFUNC_MQGET**
MQGET call.

**MQCFUNC_MQINQ**
MQINQ call.

**MQCFUNC_MQOPEN**
MQOPEN call.

**MQCFUNC_MQPUT**
MQPUT call.

**MQCFUNC_MQPUT1**
MQPUT1 call.

**MQCFUNC_NONE**
No call.

In all cases, for the C programming language the constants MQCFUNC_*_ARRAY are also defined; these constants have the same values as the corresponding MQCFUNC_* constants, but are arrays of characters instead of strings.

*GetWaitInterval (MQLONG)*
This field is a request field. Its initial value is MQCGWI_DEFAULT.

This field applies only when *UOWControl* has the value MQCUOWC_FIRST. It enables the sending application to specify the approximate time in milliseconds that the MQGET calls issued by the bridge will wait for second and subsequent request messages for the unit of work started by this message. This facility overrides the default wait interval used by the bridge. You can use the following special values:

**MQCGWI_DEFAULT**
Default wait interval.

This value causes the CICS bridge to wait for the time specified when the bridge was started.

**MQWI_UNLIMITED**
Unlimited wait interval.

*InputItem (MQLONG)*
This field is a reserved field. The value must be 0.

This field is not present if *Version* is less than MQCIH_VERSION_2.

*LinkType (MQLONG)*
This field is a request field. Its initial value is MQCLT_PROGRAM.

This value indicates the type of object that the bridge tries to link. It must be one of the following values:

**MQCLT_PROGRAM**
DPL program.

**MQCLT_TRANSACTION**
3270 transaction.

*NextTransactionId (MQCHAR4)*
This value is the name of the next transaction returned by the user transaction (usually by EXEC CICS RETURN TRANSID). If there is no next transaction, this field is set to blanks.

This field is a response field used only for 3270 transactions. The length of this field is given by MQ_TRANSACTION_ID_LENGTH. The initial value of this field is four blanks.

*OutputDataLength (MQLONG)*
This field is a request field used only for DPL programs. Its initial value is MQCODL_AS_INPUT.

This value is the length of the user data to be returned to the client in a reply message. This length includes the 8-byte program name. The length of the COMMAREA passed to the linked program is the maximum of this field and the length of the user data in the request message, minus 8.

**Note:** The length of the user data in a message is the length of the message excluding the MQCIH structure.

If the length of the user data in the request message is smaller than *OutputDataLength*, the DATALENGTH option of the LINK command is used, enabling the LINK to be function-shipped efficiently to another CICS region.

You can use the following special value:

**MQCODL_AS_INPUT**
Output length is same as input length.

This value might be needed even if no reply is requested, in order to ensure that the COMMAREA passed to the linked program is of sufficient size.

*Reason (MQLONG)*
This field is a response field. Its initial value is MQRC_NONE.

The value returned in this field depends on *ReturnCode* ; see Table 472 on page 294.

*RemoteSysId (MQCHAR4)*
This field shows the CICS system identifier of the CICS system processing the request.

If this field is blank, the CICS system request is processed on the same CICS system as the bridge monitor. The SYSID used is returned in the Reply message.

For a 3270 pseudo-conversation, all subsequent messages in the conversation must specify the remote SYSID returned in the initial reply. If specified, the SYSID must:

- Be active.
- Have access to the IBM MQ Request queue.
- Be accessible by the CICS ISC links from the CICS system of the bridge monitor.

*RemoteTransId (MQCHAR4)*
This field is an optional Request field. The length of this field is given by MQ_TRANSACTION_ID_LENGTH.

If specified, the field is used as the RTRANSID value of CICS START.

*ReplyToFormat (MQCHAR8)*
The value of this field is the IBM MQ format name of the reply message that is sent in response to the current message.

The rules for coding this field are the same as those rules for coding the *Format* field in MQMD.

This field is a request field used only for DPL programs. The length of this field is given by MQ_FORMAT_LENGTH. The initial value of this field is MQFMT_NONE.

*Reserved1 (MQCHAR8)*
This field is a reserved field. The value must be 8 blanks.

*Reserved2 (MQCHAR8)*
This field is a reserved field. The value must be 8 blanks.

*Reserved3 (MQCHAR8)*
This field is a reserved field. The value must be 8 blanks.

*Reserved4 (MQLONG)*
This field is a reserved field. The value must be 0.

This field is not present if *Version* is less than MQCIH_VERSION_2.

*ReturnCode (MQLONG)*
The value of this field is the return code from the CICS bridge describing the outcome of the processing performed by the bridge. This field is a response field, with an initial value of MQCRC_OK.

The *Function*, *CompCode*, *Reason*, and *AbendCode* fields might contain additional information (see Table 472 on page 294 ). The value is one of the following:

**MQCRC_APPLICATION_ABEND**
(5, X'005') Application ended abnormally.

**MQCRC_BRIDGE_ABEND**
(4, X'004') CICS bridge ended abnormally.

**MQCRC_BRIDGE_ERROR**
(3, X'003') CICS bridge detected an error.

**MQCRC_BRIDGE_TIMEOUT**
(8, X'008') Second or later message within current unit of work not received within specified time.

**MQCRC_CICS_EXEC_ERROR**
(1, X'001') EXEC CICS statement detected an error.

**MQCRC_MQ_API_ERROR**
(2, X'002') MQ call detected an error.

**MQCRC_OK**
(0, X'000') No error.

**MQCRC_PROGRAM_NOT_AVAILABLE**
(7, X'007') Program not available.

**MQCRC_SECURITY_ERROR**
(6, X'006') Security error occurred.

**MQCRC_TRANSID_NOT_AVAILABLE**
(9, X'009') Transaction not available.

*StartCode (MQCHAR4)*
The value of this field is an indicator specifying whether the bridge emulates a terminal transaction or a transaction initiated with START.

The value must be one of the following:

**MQCSC_START**
Start.

**MQCSC_STARTDATA**
Start data.

**MQCSC_TERMINPUT**
Terminal input.

**MQCSC_NONE**
None.

In all cases, for the C programming language the constants MQCSC_*_ARRAY are also defined; these constants have the same values as the corresponding MQCSC_* constants, but are arrays of characters instead of strings.

In the response from the bridge, this field is set to the start code appropriate to the next transaction ID contained in the *NextTransactionId* field. The following start codes are possible in the response:

- MQCSC_START
- MQCSC_STARTDATA
- MQCSC_TERMINPUT

For CICS Transaction Server Version 1.2, this field is a request field only; its value in the response is undefined.

For CICS Transaction Server Version 1.3 and subsequent releases, this field is both a request and a response field.

This field is used only for 3270 transactions. The length of this field is given by MQ_START_CODE_LENGTH. The initial value of this field is MQCSC_NONE.

*StrucId (MQCHAR4)*
This field is a request field, with an initial value of MQCIH_STRUC_ID.

The value must be:

**MQCIH_STRUC_ID**
Identifier for CICS information header structure.

For the C programming language, the constant MQCIH_STRUC_ID_ARRAY is also defined; this has the same value as MQCIH_STRUC_ID, but is an array of characters instead of a string.

*StrucLength (MQLONG)*
This field is a request field, with an initial value of MQCIH_LENGTH_2.

The value must be one of the following:

**MQCIH_LENGTH_1**
Length of version-1 CICS information header structure.

**MQCIH_LENGTH_2**
Length of version-2 CICS information header structure.

The following constant specifies the length of the current version:

**MQCIH_CURRENT_LENGTH**
Length of current version of CICS information header structure.

*TaskEndStatus (MQLONG)*
This field is a response field, showing the status of the user transaction at end of task. The field is used only for 3270 transactions, and its initial value is MQCTES_NOSYNC.

One of the following values is returned:

**MQCTES_NOSYNC**
Not synchronized.

The user transaction has not yet completed and has not syncpointed. The *MsgType* field in MQMD is MQMT_REQUEST in this case.

**MQCTES_COMMIT**
Commit unit of work.

The user transaction has not yet completed, but has syncpointed the first unit of work. The *MsgType* field in MQMD is MQMT_DATAGRAM in this case.

**MQCTES_BACKOUT**
Back out unit of work.

The user transaction has not yet completed. The current unit of work is backed out. The *MsgType* field in MQMD is MQMT_DATAGRAM in this case.

**MQCTES_ENDTASK**
End task.

The user transaction has ended (or abended). The *MsgType* field in MQMD is MQMT_REPLY in this case.

*TransactionId (MQCHAR4)*
This field is a request field. Its length is given by MQ_TRANSACTION_ID_LENGTH. The initial value of this field is four blanks.

If *LinkType* has the value MQCLT_TRANSACTION, *TransactionId* is the transaction identifier of the user transaction to be run; specify a nonblank value in this case.

If *LinkType* has the value MQCLT_PROGRAM, *TransactionId* is the transaction code under which all programs within the unit of work are to be run. If you specify a blank value, the CICS DPL bridge default transaction code (CKBP) is used. If the value is nonblank, you must have defined it to CICS as a local transaction with an initial program that is CSQCBP00. This field applies only when *UOWControl* has the value MQCUOWC_FIRST or MQCUOWC_ONLY.

*UOWControl (MQLONG)*
This field is a request field which controls the unit-of-work processing performed by the CICS bridge. The initial value of this field is MQCUOWC_ONLY.

You can request the bridge to run a single transaction, or one or more programs within a unit of work. The field indicates whether the CICS bridge starts a unit of work, performs the requested function within the current unit of work, or ends the unit of work by committing it or backing it out. Various combinations are supported, to optimize the data transmission flows.

The value must be one of the following:

**MQCUOWC_ONLY**
Start unit of work, perform function, then commit the unit of work.

**MQCUOWC_CONTINUE**
Additional data for the current unit of work (3270 only).

**MQCUOWC_FIRST**
Start unit of work and perform function.

**MQCUOWC_MIDDLE**
Perform function within current unit of work

**MQCUOWC_LAST**
Perform function, then commit the unit of work.

**MQCUOWC_COMMIT**
Commit the unit of work (DPL only).

**MQCUOWC_BACKOUT**
Back out the unit of work (DPL only).

*Version (MQLONG)*
This field is a request field. Its initial value is MQCIH_VERSION_2.

The value must be one of the following:

**MQCIH_VERSION_1**
Version-1 CICS information header structure.

**MQCIH_VERSION_2**
Version-2 CICS information header structure.

Fields that exist only in the more-recent version of the structure are identified as such in the descriptions of the fields. The following constant specifies the version number of the current version:

**MQCIH_CURRENT_VERSION**
Current version of CICS information header structure.

### *Initial values and language declarations for MQCIH*

*Table 473. Initial values of fields in MQCIH for MQCIH*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQCIH_STRUC_ID | 'CIH¬' |
| *Version* | MQCIH_VERSION_2 | 2 |
| *StrucLength* | MQCIH_LENGTH_2 | 180 |
| *Encoding* | None | 0 |
| *CodedCharSetId* | None | 0 |
| *Format* | MQFMT_NONE | Blanks |
| *Flags* | MQCIH_NONE | 0 |
| *ReturnCode* | MQCRC_OK | 0 |
| *CompCode* | MQCC_OK | 0 |
| *Reason* | MQRC_NONE | 0 |
| *UOWControl* | MQCUOWC_ONLY | 273 |
| *GetWaitInterval* | MQCGWI_DEFAULT | -2 |
| *LinkType* | MQCLT_PROGRAM | 1 |
| *OutputDataLength* | MQCODL_AS_INPUT | -1 |
| *FacilityKeepTime* | None | 0 |
| *ADSDescriptor* | MQCADSD_NONE | 0 |
| *ConversationalTask* | MQCCT_NO | 0 |
| *TaskEndStatus* | MQCTES_NOSYNC | 0 |
| *Facility* | MQCFAC_NONE | Nulls |
| *Function* | MQCFUNC_NONE | Blanks |
| *AbendCode* | None | Blanks |
| *Authenticator* | None | Blanks |
| *Reserved1* | None | Blanks |
| *ReplyToFormat* | MQFMT_NONE | Blanks |
| *RemoteSysId* | None | Blanks |
| *RemoteTransId* | None | Blanks |
| *TransactionId* | None | Blanks |
| *FacilityLike* | None | Blanks |
| *AttentionId* | None | Blanks |
| *StartCode* | MQCSC_NONE | Blanks |
| *CancelCode* | None | Blanks |
| *NextTransactionId* | None | Blanks |
| *Reserved2* | None | Blanks |

| *Table 473. Initial values of fields in MQCIH for MQCIH (continued)* | | |
|---|---|---|
| **Field name** | **Name of constant** | **Value of constant** |
| *Reserved3* | None | Blanks |
| *CursorPosition* | None | 0 |
| *ErrorOffset* | None | 0 |
| *InputItem* | None | 0 |
| *Reserved4* | None | 0 |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. In the C programming language, the macro variable MQCIH_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQCIH MyCIH = {MQCIH_DEFAULT};
```

*C declaration*

```
typedef struct tagMQCIH MQCIH;
struct tagMQCIH {
  MQCHAR4  StrucId;             /* Structure identifier */
  MQLONG   Version;             /* Structure version number */

## MQCMHO - Create message handle options

The following table summarizes the fields in the structure.

| Table 474. Fields in MQCMHO | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *Options* | Options | Options |

## *Overview for MQCMHO*

**Availability**: AIX, HP-UX, IBM i, Solaris, Linux, Windows, z/OS and IBM MQ clients.

**Purpose**: The **MQCMHO** structure allows applications to specify options that control how message handles are created. The structure is an input parameter on the **MQCRTMH** call.

**Character set and encoding**: Data in **MQCMHO** must be in the character set of the application and encoding of the application ( **MQENC_NATIVE** ).

## *Fields for MQCMHO*

The MQCMHO structure contains the following fields; the fields are described in **alphabetical order**:

*Options (MQLONG)*
This field is always an input field. Its initial value is MQCMHO_DEFAULT_VALIDATION.

One of the following options can be specified:

**MQCMHO_VALIDATE**

When **MQSETMP** is called to set a property in this message handle, the property name is validated to ensure that it:

- contains no invalid characters.
- does not begin JMS or usr.JMS except for the following:
  - JMSCorrelationID
  - JMSReplyTo
  - JMSType
  - JMSXGroupID
  - JMSXGroupSeq

  These names are reserved for JMS properties.
- is not one of the following keywords, in any mixture of uppercase or lowercase:
  - AND
  - BETWEEN
  - ESCAPE
  - FALSE
  - IN
  - IS
  - LIKE
  - NOT
  - NULL
  - OR
  - TRUE

- does not begin Body. or Root. (except for Root.MQMD.).

If the property is MQ-defined (mq.*) and the name is recognized, the property descriptor fields are set to the correct values for the property. If the property is not recognized, the *Support* field of the property descriptor is set to **MQPD_OPTIONAL**.

**MQCMHO_DEFAULT_VALIDATION**

This value specifies that the default level of validation of property names occur.

The default level of validation is equivalent to the level specified by **MQCMHO_VALIDATE**.

This value is the default value.

**MQCMHO_NO_VALIDATION**

No validation on the property name occurs. See the description of **MQCMHO_VALIDATE**.

**Default option:** If none of the preceding options described is required, the following option can be used:

**MQCMHO_NONE**

All options assume their default values. Use this value to indicate that no other options have been specified. **MQCMHO_NONE** aids program documentation; it is not intended that this option is used with any other, but as its value is zero, such use cannot be detected.

*StrucId (MQCHAR4)*
This field is always an input field. Its initial value is MQCMHO_STRUC_ID.

This is the structure identifier; the value must be:

**MQCMHO_STRUC_ID**
Identifier for create message handle options structure.

For the C programming language, the constant **MQCMHO_STRUC_ID_ARRAY** is also defined; this has the same value as **MQCMHO_STRUC_ID**, but is an array of characters instead of a string.

*Version (MQLONG)*
This field is always an input field. Its initial value is MQCMHO_VERSION_1.

This is the structure version number; the value must be:

**MQCMHO_VERSION_1**
Version-1 create message handle options structure.

The following constant specifies the version number of the current version:

**MQCMHO_CURRENT_VERSION**
Current version of create message handle options structure.

## *Initial values and language declarations for MQCMHO*

*Table 475. Initial values of fields in MQCMHO*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQCMHO_STRUC_ID | 'CMHO' |
| *Version* | MQCMHO_VERSION_1 | 1 |
| *Options* | MQCMHO_DEFAULT_VALIDATION | 0 |

| Table 475. Initial values of fields in MQCMHO (continued) | | |
|---|---|---|
| **Field name** | **Name of constant** | **Value of constant** |

**Notes:**

1. In the C programming language, the macro variable MQCMHO_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQCMHO MyCMHO = {MQCMHO_DEFAULT};
```

*C declaration*

```
struct tagMQCMHO {
  MQCHAR4   StrucId;         /* Structure identifier */
  MQLONG    Version;         /* Structure version number */
  MQLONG    Options;         /* Options that control the action of MQCRTMH */
};
```

*COBOL declaration*

```
**   MQCMHO structure
  10 MQCMHO.
**    Structure identifier
   15 MQCMHO-STRUCID        PIC X(4).
**    Structure version number
   15 MQCMHO-VERSION        PIC S9(9) BINARY.
**    Options that control the action of MQCRTMH
   15 MQCMHO-OPTIONS        PIC S9(9) BINARY.
```

*PL/I declaration*

```

## MQCNO - Connect options

The following table summarizes the fields in the structure.

| Table 476. Fields in MQCNO | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *Options* | Options that control the action of MQCONNX | Options |

| Table 476. Fields in MQCNO (continued) | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| **Note:** The remaining fields are ignored if *Version* is less than MQCNO_VERSION_2. | | |
| *ClientConnOffset* | Offset of MQCD structure for client connection | ClientConnOffset |
| *ClientConnPtr* | Address of MQCD structure for client connection | ClientConnPtr |
| **Note:** The remaining fields are ignored if *Version* is less than MQCNO_VERSION_3. | | |
| *ConnTag* | Queue-manager connection tag | ConnTag |
| **Note:** The remaining fields are ignored if *Version* is less than MQCNO_VERSION_4. | | |
| *SSLConfigPtr* | Address of MQSCO structure for client connection | SSLConfigPtr |
| *SSLConfigOffset* | Offset of MQSCO structure for client connection | SSLConfigOffset |
| **Note:** The remaining fields are ignored if *Version* is less than MQCNO_VERSION_5. | | |
| *ConnectionId* | Unique connection ID | ConnectionId |
| *SecurityParmsOffset* | Security parameters | SecurityParmsOffset |
| *SecurityParmsPtr* | Security parameters | SecurityParmsPtr |

**Related tasks**
Using MQCONNX

## *Overview for MQCNO*

**Availability**: All versions except MQCNO_VERSION_4: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

**Purpose**: The MQCNO structure allows the application to specify options relating to the connection to the local queue manager. The structure is an input/output parameter on the MQCONNX call. For more information about using shared handles, and the MQCONNX call, see Shared (thread independent) connections with MQCONNX .

**Version**: The header, COPY, and INCLUDE files provided for the supported programming languages contain the most-recent version of MQCNO, but with the initial value of the *Version* field set to MQCNO_VERSION_1. To use fields that are not present in the version-1 structure, the application must set the *Version* field to the version number of the version required.

**Character set and encoding**: Data in MQCNO must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC_NATIVE. However, if the application is running as an IBM MQ MQI client, the structure must be in the character set and encoding of the client.

## *Fields for MQCNO*

The MQCNO structure contains the following fields; the fields are described in **alphabetical order**:

*ClientConnOffset (MQLONG)*
ClientConnOffset is the offset in bytes of an MQCD channel definition structure from the start of the MQCNO structure. The offset can be positive or negative. This field is an input field with an initial value of 0.

Use *ClientConnOffset* only when the application issuing the MQCONNX call is running as an IBM MQ MQI client. For information about how to use this field, see the description of the *ClientConnPtr* field.

This field is ignored if *Version* is less than MQCNO_VERSION_2.

*ClientConnPtr (MQPTR)*
ClientConnPtr is an input field. Its initial value is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise.

Use *ClientConnOffset* and *ClientConnPtr* only when the application issuing the MQCONNX call is running as an IBM MQ MQI client. By specifying one or other of these fields, the application can control the definition of the client connection channel by providing an MQCD channel definition structure that contains the values required.

If the application is running as an IBM MQ MQI client, but does not provide an MQCD structure, the MQSERVER environment variable is used to select the channel definition. If MQSERVER is not set, the client channel table is used.

If the application is not running as an IBM MQ MQI client, *ClientConnOffset* and *ClientConnPtr* are ignored.

If the application provides an MQCD structure, set the fields listed to the values required; other fields in MQCD are ignored. You can pad character strings with blanks to the length of the field, or terminated them with a null character. See "Fields" on page 1502 for more information about the fields in the MQCD structure.

| Field in MQCD | Value |
|---|---|
| *ChannelName* | Channel name. |
| *Version* | Structure version number. Must not be less than MQCD_VERSION_7. |
| *TransportType* | Any supported transport type. |
| *ModeName* | LU 6.2 mode name. |
| *TpName* | LU 6.2 transaction program name. |
| *SecurityExit* | Name of channel security exit. |
| *SendExit* | Name of channel send exit. |
| *ReceiveExit* | Name of channel receive exit. |
| *MaxMsgLength* | Maximum length in bytes of messages that can be sent over the client connection channel. |
| *SecurityUserData* | User data for security exit. |
| *SendUserData* | User data for send exit. |
| *ReceiveUserData* | User data for receive exit. |
| *UserIdentifier* | User identifier to be used to establish an LU 6.2 session. |
| *Password* | Password to be used to establish an LU 6.2 session. |
| *ConnectionName* | Connection name. |
| *HeartbeatInterval* | Time in seconds between heartbeat flows. |
| *StrucLength* | Length of the MQCD structure. |

| Field in MQCD | Value |
|---|---|
| *ExitNameLength* | Length of exit names addressed by *SendExitPtr* and *ReceiveExitPtr*. Must be greater than zero if *SendExitPtr* or *ReceiveExitPtr* is set to a value that is not the null pointer. |
| *ExitDataLength* | Length of exit data addressed by *SendUserDataPtr* and *ReceiveUserDataPtr*. Must be greater than zero if *SendUserDataPtr* or *ReceiveUserDataPtr* is set to a value that is not the null pointer. |
| *SendExitsDefined* | Number of send exits addressed by *SendExitPtr*. If zero, *SendExit* and *SendUserData* provide the exit name and data. If greater than zero, *SendExitPtr* and *SendUserDataPtr* provide the exit names and data, and *SendExit* and *SendUserData* must be blank. |
| *ReceiveExitsDefined* | Number of receive exits addressed by *ReceiveExitPtr*. If zero, *ReceiveExit* and *ReceiveUserData* provide the exit name and data. If greater than zero, *ReceiveExitPtr* and *ReceiveUserDataPtr* provide the exit names and data, and *ReceiveExit* and *ReceiveUserData* must be blank. |
| *SendExitPtr* | Address of name of first send exit. |
| *SendUserDataPtr* | Address of data for first send exit. |
| *ReceiveExitPtr* | Address of name of first receive exit. |
| *ReceiveUserDataPtr* | Address of data for first receive exit. |
| *LongRemoteUserIdLength* | Length of long remote user identifier. |
| *LongRemoteUserIdPtr* | Address of long remote user identifier. |
| *RemoteSecurityId* | Remote security identifier. |
| *SSLCipherSpec* | SSL CipherSpec. |
| *SSLPeerNamePtr* | Address of SSL peer name. |
| *SSLPeerNameLength* | Length of SSL peer name. |
| *KeepAliveInterval* | Value passed to the communications stack for keepalive timing for the channel |
| *LocalAddress* | The local communications address, including the IP address of the local network adapter to use, and a range of ports to use for outgoing connections. |

Provide the channel definition structure in one of two ways:

- By using the offset field *ClientConnOffset*

  In this case, the application must declare a compound structure containing an MQCNO followed by the channel definition structure MQCD, and set *ClientConnOffset* to the offset of the channel definition structure from the start of the MQCNO. Ensure that this offset is correct. *ClientConnPtr* must be set to the null pointer or null bytes.

  Use *ClientConnOffset* for programming languages that do not support the pointer data type, or that implement the pointer data type in a way that is not portable to different environments (for example, the COBOL programming language).

  For the Visual Basic programming language, a compound structure called MQCNOCD is provided in the header file CMQXB.BAS; this structure contains an MQCNO structure followed by an MQCD structure. Initialize MQCNOCD by invoking the MQCNOCD_DEFAULTS subroutine. MQCNOCD is used with the

MQCONNXAny variant of the MQCONNX call; see the description of the MQCONNX call for further details.

- By using the pointer field *ClientConnPtr*

  In this case, the application can declare the channel definition structure separately from the MQCNO structure, and set *ClientConnPtr* to the address of the channel definition structure. Set *ClientConnOffset* to zero.

  Use *ClientConnPtr* for programming languages that support the pointer data type in a way that is portable to different environments (for example, the C programming language).

  In the C programming language, you can use the macro variable MQCD_CLIENT_CONN_DEFAULT to provide initial values for the structure that are more suitable for use on the MQCONNX call than the initial values provided by MQCD_DEFAULT.

Whichever technique you choose, you can use only one of *ClientConnOffset* and *ClientConnPtr* ; the call fails with reason code MQRC_CLIENT_CONN_ERROR if both are nonzero.

When the MQCONNX call has completed, the MQCD structure is not referenced again.

This field is ignored if *Version* is less than MQCNO_VERSION_2.

**Note:** On platforms where the programming language does not support the pointer data type, this field is declared as a byte string of the appropriate length, with the initial value being the all-null byte string.

*ConnectionId (MQBYTE24)*
ConnectionId is a unique 24-byte identifier that allows IBM MQ to reliably identify an application. An application can use this identifier for correlation in PUT and GET calls. This output parameter has an initial value of 24 null bytes in all programming languages.

The queue manager assigns a unique ID to all connections, however they are established. If an MQCONNX establishes the connection with a version 5 MQCNO, the application can determine the ConnectionId from the returned MQCNO. The assigned identifier is guaranteed to be unique among all other identifiers that IBM MQ generates, such as CorrelId, MsgID, and GroupId.

Use the ConnectionId to identify long running units of work using the PCF command Inquire Connection or the MQSC command DISPLAY CONN. The ConnectionId used by MQSC commands (CONN) is derived from the ConnectionId returned here. The PCF Inquire and Stop Connection commands can use the ConnectionId returned here without modification.

You can use the ConnectionId to force the end of a long running unit of work, by specifying the ConnectionId using the PCF command Stop Connection or the MQSC command STOP CONN. See Stop Connection and STOP CONN for more information about using these commands.

This field is not returned if Version is less than MQCNO_VERSION_5.

The length of this field is given by MQ_CONNECTION_ID_LENGTH.

*ConnTag (MQBYTE128)*
ConnTag is a tag that the queue manager associates with the resources that are affected by the application during this connection. Each application or application instance must use a different value for the tag, so that the queue manager can correctly serialize access to the affected resources. This field is an input field, and its initial value is MQCT_NONE.

See the descriptions of the MQCNO_*_CONN_TAG_* options for further details about values to be used by different applications. The tag ceases to be valid when the application terminates or issues the MQDISC call.

**Note:** Connection tag values beginning with MQ in upper, lower, or mixed case in either ASCII or EBCDIC are reserved for use by IBM products. Do not use connection tag values beginning with these letters.

Use the following special value if you require no tag:

**MQCT_NONE**
The value is binary zero for the length of the field.

For the C programming language, the constant MQCT_NONE_ARRAY is also defined; this constant has the same value as MQCT_NONE, but is an array of characters instead of a string.

This field is used when connecting to a z/OS queue manager. In other environments, specify the value MQCT_NONE.

The length of this field is given by MQ_CONN_TAG_LENGTH. This field is ignored if *Version* is less than MQCNO_VERSION_3.

*Options (MQLONG)*
Options that control the action of MQCONNX.

## Accounting options

The following options control the type of accounting if the *AccountingConnOverride* queue manager attribute is set to MQMON_ENABLED:

**MQCNO_ACCOUNTING_MQI_ENABLED**
When monitoring data collection is switched off in the queue manager definition by setting the *MQIAccounting* attribute to MQMON_OFF, setting this flag enables MQI accounting data collection.

**MQCNO_ACCOUNTING_MQI_DISABLED**
When monitoring data collection is switched off in the queue manager definition by setting the *MQIAccounting* attribute to MQMON_OFF, setting this flag stops MQI accounting data collection.

**MQCNO_ACCOUNTING_Q_ENABLED**
When queue-accounting data collection is switched off in the queue manager definition by setting the *MQIAccounting* attribute to MQMON_OFF, setting this flag enables accounting data collection for those queues that specify a queue manager in the *MQIAccounting* field of their queue definition.

**MQCNO_ACCOUNTING_Q_DISABLED**
When queue-accounting data collection is switched off in the queue manager definition by setting the *MQIAccounting* attribute to MQMON_OFF, setting this flag switches off accounting data collection for those queues that specify a queue manager in the *MQIAccounting* field of their queue definition.

If none of these flags are defined, the accounting for the connection is as defined in the Queue Manager attributes.

## Binding options

The following options control the type of IBM MQ binding to use. Specify only one of these options:

**MQCNO_STANDARD_BINDING**
The application and the local queue manager agent (the component that manages queuing operations) run in separate units of execution (typically, in separate processes). This arrangement maintains the integrity of the queue manager; that is, it protects the queue manager from errant programs.

If the queue manager supports multiple binding types, and you set MQCNO_STANDARD_BINDING, the queue manager uses the *DefaultBindType* attribute in the *Connection* stanza in the `qm.ini` file to select the actual type of binding. If this stanza is not defined, or the value cannot be used or is not appropriate for the application, the queue manager selects an appropriate binding type. The queue manager sets the actual binding type used in the connect options.

Use MQCNO_STANDARD_BINDING in situations where the application might not have been fully tested, or might be unreliable or untrustworthy. MQCNO_STANDARD_BINDING is the default.

This option is supported in all environments.

If you are linking to the mqm library, then a standard server connection using the default bind type is attempted first. If the underlying server library failed to load, a client connection is attempted instead.

- If the MQ_CONNECT_TYPE environment variable is specified, one of the following options can be supplied to change the behavior of MQCONN or MQCONNX if MQCNO_STANDARD_BINDING is specified. (The exception to this is if MQCNO_FASTPATH_BINDING is specified with MQ_CONNECT_TYPE set to LOCAL or STANDARD to allow fastpath connections to be downgraded by the administrator without a related change to the application:

| Value | Meaning |
|---|---|
| CLIENT | A client connection only is attempted. |
| FASTPATH | This value was supported in previous releases, but is now ignored if specified. |
| LOCAL | A server connection only is attempted. Fastpath connections are downgraded to a standard server connection. |
| STANDARD | Supported for compatibility with previous releases. This value is now treated as LOCAL. |

- If the MQ_CONNECT_TYPE environment variable is not set when MQCONNX is called, a standard server connection using the default bind type is attempted. If the server library fails to load, a client connection is attempted.

**MQCNO_FASTPATH_BINDING**

The application and the local queue manager agent are part of the same unit of execution. This is in contrast to the typical method of binding, where the application and the local queue manager agent run in separate units of execution.

MQCNO_FASTPATH_BINDING is ignored if the queue manager does not support this type of binding; processing continues as though the option had not been specified.

MQCNO_FASTPATH_BINDING can be of advantage in situations where multiple processes consume more resources than the overall resource used by the application. An application that uses the fastpath binding is known as a *trusted application*.

Consider the following important points when deciding whether to use the fastpath binding:

- Using the MQCNO_FASTPATH_BINDING option does not prevent an application altering or corrupting messages and other data areas belonging to the queue manager. Use this option only in situations where you have fully evaluated these issues.
- The application must not use asynchronous signals or timer interrupts (such as `sigkill`) with MQCNO_FASTPATH_BINDING. There are also restrictions on the use of shared memory segments.
- The application must use the MQDISC call to disconnect from the queue manager.
- The application must finish before you end the queue manager with the `endmqm` command.
- On IBM i, the job must run under a user profile that belongs to the `QMQMADM` group. Also, the program must not stop abnormally, otherwise unpredictable results can occur.
- On UNIX systems, the `mqm` user identifier must be the effective user identifier, and the `mqm` group identifier must be the effective group identifier. To make the application run in this way, configure the program so that it is owned by the `mqm` user identifier and `mqm` group identifier, and then set the `setuid` and `setgid` permission bits on the program.

  The IBM MQ Object Authority Manager (OAM) still uses the real user ID for authority checking.
- On Windows, the program must be a member of the `mqm` group. Fastpath binding is not supported for 64 bit applications.

The MQCNO_FASTPATH_BINDING option is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, and Windows.

z/OS On z/OS, the option is accepted but ignored.

For more information about the implications of using trusted applications, see Restrictions for trusted applications.

**MQCNO_SHARED_BINDING**

With MQCNO_SHARED_BINDING, the application and the local-queue-manager agent share some resources. MQCNO_SHARED_BINDING is ignored if the queue manager does not support this type of binding. Processing continues as though the option had not been specified.

**MQCNO_ISOLATED_BINDING**

In this case, the application process and the local queue manager agent are isolated from each other in that they do not share resources. MQCNO_ISOLATED_BINDING is ignored if the queue manager does not support this type of binding. Processing continues as though the option had not been specified.

**MQCNO_CLIENT_BINDING**

Specify this option to make the application attempt a client connection only. This option has the following limitations:

- z/OS MQCNO_CLIENT_BINDING is ignored on z/OS.
- MQCNO_CLIENT_BINDING is rejected with MQRC_OPTIONS_ERROR if it is specified with any MQCNO binding option other than MQCNO_STANDARD_BINDING.
- MQCNO_CLIENT_BINDING is not available for Java or .NET as they have their own mechanisms for choosing the bind type.

**MQCNO_LOCAL_BINDING**

Specify this option to make the application attempt a server connection. If either MQCNO_FASTPATH_BINDING, MQCNO_ISOLATED_BINDING, or MQCNO_SHARED_BINDING is also specified, then the connection is of that type instead, and is documented in this section. Otherwise a standard server connection is attempted using the default bind type. MQCNO_LOCAL_BINDING has the following limitations:

- z/OS MQCNO_LOCAL_BINDING is ignored on z/OS.
- MQCNO_LOCAL_BINDING is rejected with MQRC_OPTIONS_ERROR if it is specified with any MQCNO reconnect option other than MQCNO_RECONNECT_AS_DEF.
- MQCNO_LOCAL_BINDING is not available for Java or .NET as they have their own mechanisms for choosing the bind type.

On AIX, HP-UX, Solaris, Linux, and Windows, you can use the environment variable MQ_CONNECT_TYPE with the bind type specified by the *Options* field, to control the type of binding used. If you specify this environment variable, it must have the value FASTPATH or STANDARD ; if it has a different value, it is ignored. The value of the environment variable is case sensitive; see MQCONNX environment variable for more information.

The environment variable and *Options* field interact as follows:

- If you omit the environment variable, or give it a value that is not supported, use of the fastpath binding is determined solely by the *Options* field.
- If you give the environment variable a supported value, the fastpath binding is used only if *both* the environment variable and *Options* field specify the fastpath binding.

## Connection-tag options

z/OS

These options are supported only when connecting to a z/OS queue manager and they control the use of the connection tag *ConnTag* . You can specify only one of these options:

**MQCNO_SERIALIZE_CONN_TAG_Q_MGR**

This option requests exclusive use of the connection tag within the local queue manager. If the connection tag is already in use in the local queue manager, the MQCONNX call fails with reason code MQRC_CONN_TAG_IN_USE. The outcome of the call is not affected by using the connection tag elsewhere in the queue-sharing group to which the local queue manager belongs.

**MQCNO_SERIALIZE_CONN_TAG_QSG**

This option requests exclusive use of the connection tag within the queue-sharing group to which the local queue manager belongs. If the connection tag is already in use in the queue-sharing group, the MQCONNX call fails with reason code MQRC_CONN_TAG_IN_USE.

**MQCNO_RESTRICT_CONN_TAG_Q_MGR**

This option requests shared use of the connection tag within the local queue manager. If the connection tag is already in use in the local queue manager, the MQCONNX call can succeed if the requesting application is running in the same processing scope as the existing user of the tag. If this condition is not satisfied, the MQCONNX call fails with reason code MQRC_CONN_TAG_IN_USE. The outcome of the call is not affected by use of the connection tag elsewhere in the queue-sharing group to which the local queue manager belongs.

- Applications must run within the same MVS address space to share the connection tag. If the application using the connection tag is a client application, MQCNO_RESTRICT_CONN_TAG_Q_MGR is not allowed.

**MQCNO_RESTRICT_CONN_TAG_QSG**

This option requests shared use of the connection tag within the queue-sharing group to which the local queue manager belongs. If the connection tag is already in use in the queue-sharing group, the MQCONNX call can succeed provided the requesting application is running in the same processing scope and is connected to the same queue manager, as the existing user of the tag.

If these conditions are not satisfied, the MQCONNX call fails with reason code MQRC_CONN_TAG_IN_USE.

- Applications must run within the same MVS address space to share the connection tag. If the application using the connection tag is a client application, MQCNO_RESTRICT_CONN_TAG_QSG is not allowed.

If none of these options are specified, *ConnTag* is not used. These options are not valid if *Version* is less than MQCNO_VERSION_3.

## Handle-sharing options

These options are supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, and Windows. They control the sharing of handles between different threads (units of parallel processing) within the same process. You can specify only one of these options:

**MQCNO_HANDLE_SHARE_NONE**

This option indicates that connection and object handles can be used only by the thread that caused the handle to be allocated (that is, the thread that issued the MQCONN, MQCONNX , or MQOPEN call). The handles cannot be used by other threads belonging to the same process.

**MQCNO_HANDLE_SHARE_BLOCK**

This option indicates that connection and object handles allocated by one thread of a process can be used by other threads belonging to the same process. However, only one thread at a time can use any particular handle; that is, only serial use of a handle is permitted. If a thread tries to use a handle that is already in use by another thread, the call blocks (waits) until the handle becomes available.

**MQCNO_HANDLE_SHARE_NO_BLOCK**

This is the same as MQCNO_HANDLE_SHARE_BLOCK, except that if the handle is in use by another thread, the call completes immediately with MQCC_FAILED and MQRC_CALL_IN_PROGRESS instead of blocking until the handle becomes available.

A thread can have zero or one non-shared handles:

- Each MQCONN or MQCONNX call that specifies MQCNO_HANDLE_SHARE_NONE returns a new nonshared handle on the first call, and the same non-shared handle on the second and later calls (assuming no intervening MQDISC call). The reason code is MQRC_ALREADY_CONNECTED for the second and later calls.
- Each MQCONNX call that specifies MQCNO_HANDLE_SHARE_BLOCK or MQCNO_HANDLE_SHARE_NO_BLOCK returns a new shared handle on each call.

Object handles inherit the same sharing properties as the connection handle specified on the MQOPEN call that created the object handle. Also, units of work inherit the same sharing properties as the connection handle used to start the unit of work; if the unit of work is started in one thread using a shared handle, the unit of work can be updated in another thread using the same handle.

If you do not specify a handle-sharing option, the default is determined by the environment:

- In the Microsoft Transaction Server (MTS) environment, the default is the same as MQCNO_HANDLE_SHARE_BLOCK.
- In other environments, the default is the same as MQCNO_HANDLE_SHARE_NONE.

## Reconnection options

Reconnection options determine if a connection is reconnectable. Only client connections are reconnectable.

**MQCNO_RECONNECT_AS_DEF**

The reconnection option is resolved to its default value. If no default is set, the value of this option resolves to DISABLED. The value of the option is passed to the server, and can be queried by PCF and MQSC.

**MQCNO_RECONNECT**

The application can be reconnected to any queue manager consistent with the value of the `QmgrName` parameter of `MQCONNX`. Use the MQCNO_RECONNECT option only if there is no affinity between the client application and the queue manager with which it initially established a connection. The value of the option is passed to the server, and can be queried by PCF and MQSC.

**MQCNO_RECONNECT_DISABLED**

The application cannot be reconnected. The value of the option is not passed to the server.

**MQCNO_RECONNECT_Q_MGR**

The application can be reconnected only to the queue manager with which it originally connected. Use this value if a client can be reconnected, but there is an affinity between the client application and the queue manager with which it originally established a connection. Choose this value if you want a client to automatically reconnect to the standby instance of a highly available queue manager. The value of the option is passed to the server, and can be queried by PCF and MQSC.

Use the options MQCNO_RECONNECT, MQCNO_RECONNECT_DISABLED and MQCNO_RECONNECT_Q_MGR only for client connections. If the options are used for a binding connection, `MQCONNX` fails with completion code `MQCC_FAILED` and reason code `MQRC_OPTIONS_ERROR`. Automatic client reconnect is not supported by IBM MQ classes for Java

## Conversation-sharing options

The following options apply only to TCP/IP client connections. For SNA, SPX and NetBios channels, these values are ignored and the channel runs as in previous versions of the product

**MQCNO_NO_CONV_SHARING**

This option does not permit conversation sharing.

You might use MQCNO_NO_CONV_SHARING in situations where conversations are heavily loaded and, therefore, where contention is a possibility on the server-connection end of the channel instance on which the sharing conversations exist. MQCNO_NO_CNV_SHARING behaves like sharecnv(1) when connected to a channel that supports conversation sharing, and sharecnv(0) when connected to a channel that does not support conversation sharing.

**MQCNO_ALL_CONVS_SHARE**

This option permits conversation sharing; the application does not place any limit on the number of connections on the channel instance. This option is the default value.

If the application indicates that the channel instance can share, but the *SharingConversations* (SHARECNV) definition on the server-connection end of the channel is set to one, no sharing occurs and no warning is given to the application.

Similarly, if the application indicates that sharing is permitted but the server-connection *SharingConversations* definition is set to zero, no warning is given, and the application exhibits the same behavior as a client in versions of the product earlier than Version 7.0; the application setting relating to sharing conversations is ignored.

MQCNO_NO_CONV_SHARING and MQCNO_ALL_CONVS_SHARE are mutually exclusive. If both options are specified on a particular connection, the connection is rejected with a reason code of MQRC_OPTIONS_ERROR.

## Channel definition options

The following options control the use of the channel definition structure passed in the MQCNO:

**MQCNO_CD_FOR_OUTPUT_ONLY**

This option permits channel definition structure in the MQCNO to be used only to return the channel name used on a successful MQCONNX call.

If a valid channel definition structure is not provided, the call fails with the reason code MQRC_CD_ERROR.

If the application is not running as a client, the option is ignored.

The returned channel name can be used on a subsequent MQCONNX call using the MQCNO_USE_CD_SELECTION option to reconnect using the same channel definition. This can be useful when there are multiple applicable channel definitions in the client channel table.

**MQCNO_USE_CD_SELECTION**

This option permits MQCONNX call to connect using the channel name contained in the channel definition structure passed in the MQCNO.

If the MQSERVER environment variable is set, the channel definition defined by it is used. If MQSERVER is not set, the client channel table is used.

If a channel definition with matching channel name and queue manager name is not found, the call fails with reason code MQRC_Q_MGR_NAME_ERROR.

If a valid channel definition structure is not provided, the call fails with the reason code MQRC_CD_ERROR.

If the application is not running as a client, the option is ignored.

## Default option

If you require none of the options described above, you can use the following option:

**MQCNO_NONE**

No options are specified.

Use MQCNO_NONE to aid program documentation. It is not intended that this option is used with any other MQCNO_* option, but because its value is zero, such use cannot be detected.

*SecurityParmsOffset (MQLONG)*
SecurityParmsOffset is the offset in bytes of the MQCSP structure from the start of the MQCNO structure. The offset can be positive or negative. This field is an input field, with an initial value of 0.

This field is ignored if *Version* is less than MQCNO_VERSION_5.

The MQCSP structure is defined in "MQCSP - Security parameters" on page 325.

*SecurityParmsPtr (PMQCSP)*
SecurityParmsPtr is the address of the MQCSP structure, used to specify a user ID and password for authentication by the authorization service. This field is an input field, and its initial value is a null pointer or null bytes.

This field is ignored if *Version* is less than MQCNO_VERSION_5.

The MQCSP structure is defined in "MQCSP - Security parameters" on page 325.

*SSLConfigOffset (MQLONG)*
SSLConfigOffset is the offset in bytes of an MQSCO structure from the start of the MQCNO structure. The offset can be positive or negative. This field is an input field, with an initial value of 0.

Use *SSLConfigOffset* only when the application issuing the MQCONNX call is running as an IBM MQ MQI client. For information about how to use this field, see the description of the *SSLConfigPtr* field.

This field is ignored if *Version* is less than MQCNO_VERSION_4.

*SSLConfigPtr (PMQSCO)*
SSLConfigPtr is an input field. Its initial value is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise.

Use *SSLConfigPtr* and *SSLConfigOffset* only when the application issuing the MQCONNX call is running as an IBM MQ MQI client and the channel protocol is TCP/IP. If the application is not running as an IBM MQ client, or the channel protocol is not TCP/IP, *SSLConfigPtr* and *SSLConfigOffset* are ignored.

By specifying *SSLConfigPtr* or *SSLConfigOffset*, plus either *ClientConnPtr* or *ClientConnOffset*, the application can control the use of SSL for the client connection. When the SSL information is specified in this way, the environment variables MQSSLKEYR and MQSSLCRYP are ignored; any SSL-related information in the client channel definition table (CCDT) is also ignored.

The SSL information can be specified only on:

- The first MQCONNX call of the client process, or
- A subsequent MQCONNX call when all previous SSL/TLS connections to the queue manager have been concluded using MQDISC.

These are the only states in which the process-wide SSL environment can be initialized. If an MQCONNX call is issued specifying SSL information when the SSL environment already exists, the SSL information on the call is ignored and the connection is made using the existing SSL environment; the call returns completion code MQCC_WARNING and reason code MQRC_SSL_ALREADY_INITIALIZED in this case.

You can provide the MQSCO structure in the same way as the MQCD structure, either by specifying an address in *SSLConfigPtr*, or by specifying an offset in *SSLConfigOffset* ; see the description of *ClientConnPtr* for details of how to do this. However, you can use no more than one of *SSLConfigPtr* and *SSLConfigOffset* ; the call fails with reason code MQRC_SSL_CONFIG_ERROR. if both are nonzero.

Once the MQCONNX call has completed, the MQSCO structure is not referenced again.

This field is ignored if *Version* is less than MQCNO_VERSION_4.

**Note:** On platforms where the programming language does not support the pointer data type, this field is declared as a byte string of the appropriate length.

*StrucId (MQCHAR4)*
StrucId is always an input field. Its initial value is MQCNO_STRUC_ID.

The value must be:

**MQCNO_STRUC_ID**
Identifier for connect-options structure.

For the C programming language, the constant MQCNO_STRUC_ID_ARRAY is also defined; this constant has the same value as MQCNO_STRUC_ID, but is an array of characters instead of a string.

*Version (MQLONG)*
Version is always an input field. Its initial value is MQCNO_VERSION_1.

The value must be one of the following:

**MQCNO_VERSION_1**
Version-1 connect-options structure.

**MQCNO_VERSION_2**
Version-2 connect-options structure.

**MQCNO_VERSION_3**
Version-3 connect-options structure.

**MQCNO_VERSION_4**
Version-4 connect-options structure.

**MQCNO_VERSION_5**
Version-5 connect-options structure.

This version of the MQCNO structure extends MQCNO_VERSION_3 on z/OS, and MQCNO_VERSION_4 on all other platforms.

Fields that exist only in the more-recent versions of the structure are identified as such in the descriptions of the fields. The following constant specifies the version number of the current version:

**MQCNO_CURRENT_VERSION**
Current version of connect-options structure.

## *Initial values and language declarations for MQCNO*

*Table 477. Initial values of fields in MQCNO for MQCNO*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQCNO_STRUC_ID | 'CNO¬' |
| *Version* | MQCNO_VERSION_1 | 1 |
| *Options* | MQCNO_NONE | 0 |
| *ClientConnOffset* | None | 0 |
| *ClientConnPtr* | None | Null pointer or null bytes |
| *ConnTag* | MQCT_NONE | Nulls |

| *Table 477. Initial values of fields in MQCNO for MQCNO (continued)* | | |
|---|---|---|
| **Field name** | **Name of constant** | **Value of constant** |
| *SSLConfigPtr* | None | Null pointer or null bytes |
| *SSLConfigOffset* | None | 0 |
| *ConnectionId* | None | Null pointer or null bytes |
| *SecurityParmsOffset* | None | Null pointer or null bytes |
| *SecurityParmsPtr* | None | Null pointer or null bytes |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. In the C programming language, the macro variable MQCNO_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQCNO MyCNO = {MQCNO_DEFAULT};
```

*C declaration*

```
typedef struct tagMQCNO MQCNO;
struct tagMQCNO {
  MQCHAR4    StrucId;           /* Structure identifier */
  MQLONG     Version;           /* Structure version number */
  MQLONG     Options;           /* Options that control the action of
                                   MQCONNX */
  MQLONG     ClientConnOffset;  /* Offset of MQCD structure for client
                                   connection */
  MQPTR      ClientConnPtr;     /* Address of MQCD structure for client
                                   connection */
  MQBYTE128  ConnTag;           /* Queue-manager connection tag */
  PMQSCO     SSLConfigPtr;      /* Address of MQSCO structure for client
                                   connection */
  MQLONG     SSLConfigOffset;   /* Offset of MQSCO structure for client
                                   connection */
  MQBYTE24   ConnectionId;      /* Unique connection identifier */
  MQLONG     SecurityParmsOffset /* Security fields */
  PMQCSP     SecurityParmsPtr   /* Security parameters */
};
```

*COBOL declaration*

```
**   MQCNO structure
  10 MQCNO.
**    Structure identifier
   15 MQCNO-STRUCID          PIC X(4).
**    Structure version number
   15 MQCNO-VERSION          PIC S9(9) BINARY.
**    Options that control the action of MQCONNX
   15 MQCNO-OPTIONS          PIC S9(9) BINARY.
**    Offset of MQCD structure for client connection
   15 MQCNO-CLIENTCONNOFFSET PIC S9(9) BINARY.
**    Address of MQCD structure for client connection
   15 MQCNO-CLIENTCONNPTR    POINTER.
**    Queue-manager connection tag
   15 MQCNO-CONNTAG          PIC X(128).
**    Address of MQSCO structure for client connection
   15 MQCNO-SSLCONFIGPTR     POINTER.
**    Offset of MQSCO structure for client connection
   15 MQCNO-SSLCONFIGOFFSET  PIC S9(9) BINARY.
**    Unique connection identifier
   15 MQCNO-CONNECTIONID     PIC X(24).
**    Offset of MQCSP structure for security parameters
   15 MQCNO-SECURITYPARMSOFFSET PIC S9(9) BINARY.
```

```
**    Address of MQCSP structure for security parameters
   15 MQCNO-SECURITYPARMSPTR POINTER.
```

*PL/I declaration*

```
dcl
 1 MQCNO based,

## MQCSP - Security parameters

The following table summarizes the fields in the structure.

**Warning:** In some cases, the password in an MQCSP structure for a client application will be sent across a network in plain text. To ensure that client application passwords are protected appropriately, see IBM MQCSP password protection.

*Table 478. Fields in MQCSP*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *AuthenticationType* | Type of authentication | AuthenticationType |
| *Reserved1* | Required for pointer alignment on IBM i | Reserved1 |
| *CSPUserIdPtr* | Address of user ID | CSPUserIdPtr |
| *CSPUserIdOffset* | Offset of user ID | CSPUserIdOffset |
| *CSPUserIdLength* | Length of user ID | CSPUserIdLength |
| *Reserved2* | Required for pointer alignment on IBM i | Reserved2 |
| *CSPPasswordPtr* | Address of password | CSPPasswordPtr |
| *CSPPasswordOffset* | Offset of password | CSPPasswordOffset |
| *CSPPasswordLength* | Length of password | CSPPasswordLength |

### *Overview for MQCSP*

**Availability**: All IBM MQ products.

**Purpose**: The MQCSP structure enables the authorization service to authenticate a user ID and password. You specify the MQCSP connection security parameters structure on an MQCONNX call.

**Warning:** In some cases, the password in an MQCSP structure for a client application will be sent across a network in plain text. To ensure that client application passwords are protected appropriately, see IBM MQCSP password protection.

**Character set and encoding**: Data in MQCSP must be in the character set and encoding of the local queue manager; these are given by the *CodedCharSetId* queue-manager attribute and MQENC_NATIVE, respectively.

### *Fields for MQCSP*

The MQCSP structure contains the following fields; the fields are described in **alphabetical order**:

*AuthenticationType (MQLONG)*
AuthenticationType is an input field. Its initial value is MQCSP_AUTH_NONE.

This is the type of authentication to perform. Valid values are:

**MQCSP_AUTH_NONE**
Do not use user ID and password fields.

**MQCSP_AUTH_USER_ID_AND_PWD**
Authenticate user ID and password fields.

The default value is MQCSP_AUTH_NONE. With the default setting, no password protection is done.

If you require authentication, you have to set **MQCSP**.**AuthenticationType** to MQCSP_AUTH_USER_ID_AND_PWD.

See MQCSP password protection for more information.

*CSPPasswordLength (MQLONG)*
This field is the length of the password to be used in authentication.

The maximum length of the password is MQ_CSP_PASSWORD_LENGTH. If the length of the password is greater than the maximum length permitted, the authentication request fails with MQRC_NOT_AUTHORIZED.

The value of MQ_CSP_PASSWORD_LENGTH is 256.

This field is an input field. The initial value of this field is 0.

*CSPPasswordOffset (MQLONG)*
This is the offset in bytes of the password to be used in authentication. The offset can be positive or negative.

This is an input field. The initial value of this field is 0.

*CSPPasswordPtr (MQPTR)*
This is the address in bytes of the password to be used in authentication.

This is an input field. The initial value of this field is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise. This field is ignored if *Version* is less than MQCNO_VERSION_5.

This field can contain an empty password which is rejected by the operating system or LDAP password checking, depending on setup, but is not rejected by IBM MQ before passing it the authentication method.

*CSPUserIdLength (MQLONG)*
This field is the length of the user ID to be used in authentication.

The maximum length of the user ID is dependent on the platform, see User IDs. If the length of the user ID is greater than the maximum length permitted, the authentication request fails with MQRC_NOT_AUTHORIZED.

This field is an input field. The initial value of this field is 0.

*CSPUserIdOffset (MQLONG)*
This is the offset in bytes of the user ID to be used in authentication. The offset can be positive or negative.

This is an input field. The initial value of this field is 0.

*CSPUserIdPtr (MQPTR)*
This is the address in bytes of the user ID to be used in authentication.

This is an input field. The initial value of this field is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise. This field is ignored if *Version* is less than MQCNO_VERSION_5.

This field can contain an operating system user ID when an **AUTHTYPE** of *IDPWOS* is named in the CONNAUTH field of the queue manager.

On Windows this can be a fully qualified domain user ID.

This field can contain an LDAP User ID when an **AUTHTYPE** of *IDPWLDAP* is named in the CONNAUTH field of the queue manager.

*Reserved1 (MQBYTE4)*
A reserved field, required for pointer alignment on IBM i.

This is an input field. The initial value of this field is all null.

*Reserved2 (MQBYTE8)*
A reserved field, required for pointer alignment on IBM i.

This is an input field. The initial value of this field is all null.

*StrucId (MQCHAR4)*
Structure identifier.

The value must be:

**MQCSP_STRUC_ID**
Identifier for the security parameters structure.

For the C programming language, the constant MQCSP_STRUC_ID_ARRAY is also defined; this has the same value as MQCSP_STRUC_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQCSPSTRUC_ID.

*Version (MQLONG)*
Structure version number.

The value must be:

**MQCSP_VERSION_1**
Version-1 security parameters structure.

The following constant specifies the version number of the current version:

**MQCSP_CURRENT_VERSION**
Current version of security parameters structure.

This is always an input field. The initial value of this field is MQCSP_VERSION_1.

## *Initial values and language declarations for MQCSP*

*Table 479. Initial values of fields in MQCSP for MQCSP*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQCSP_STRUC_ID | 'CSP¬' |
| *Version* | MQCSP_VERSION_1 | 1 |
| *AuthenticationType* | None | MQCSP_AUTH_NONE |
| *Reserved1* | None | Null string or blanks |
| *CSPUserIdPtr* | None | Null pointer or null bytes |
| *CSPUserIdOffset* | None | 0 |
| *CSPUserIdLength* | None | 0 |
| *Reserved2* | None | Null string or blanks |
| *CSPPasswordPtr* | None | Null pointer or null bytes |
| *CSPPasswordOffset* | None | 0 |
| *CSPPasswordLength* | None | 0 |

*Table 479. Initial values of fields in MQCSP for MQCSP (continued)*

| Field name | Name of constant | Value of constant |
|---|---|---|

**Notes:**

1. The symbol ¬ represents a single blank character.
2. In the C programming language, the macro variable MQCSP_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQCSP MyCSP = {MQCSP_DEFAULT};
```

*C declaration*

```
typedef struct tagMQCSP MQCSP;
struct tagMQCSP {
  MQCHAR4    StrucId;            /* Structure identifier */
  MQLONG     Version;            /* Structure version number */
  MQLONG     AuthenticationType; /* Type of authentication */
  MQBYTE4    Reserved1;          /* Required for IBM i pointer
                                    alignment */
  MQPTR      CSPUserIdPtr;       /* Address of user ID */
  MQLONG     CSPUserIdOffset;    /* Offset of user ID */
  MQLONG     CSPUserIdLength;    /* Length of user ID */
  MQBYTE8    Reserved2;          /* Required for IBM i pointer
                                    alignment */
                                  alignment */
  MQPTR      CSPPasswordPtr;     /* Address of password */
  MQLONG     CSPPasswordOffset;  /* Offset of password */
  MQLONG     CSPPasswordLength;  /* Length of password */
  };
```

*COBOL declaration*

```

## MQCTLO - Control callback options structure

The following table summarizes the fields in the structure. Structure specifying the control callback function.

*Table 480. Fields in MQCTLO*

| Field | Description | Topic |
|---|---|---|
| *StrucID* | Structure identifier | StrucID |
| *Version* | Structure version number | Version |
| *Options* | Options | Options |
| *Reserved* | Reserved field | Options |
| *ConnectionArea* | Field for callback function to use | ConnectionArea |

### *Overview for MQCTLO*

**Availability**: AIX, HP-UX, IBM i, Solaris, Linux, Windows, z/OS, and IBM MQ MQI clients connected to these systems. Overview of the MQCTLO structure.

**Purpose**: The MQCTLO structure is used to specify options relating to a control callbacks function.

The structure is an input and output parameter on the MQCTL call.

**Version**: The current version of MQCTLO is MQCTLO_VERSION_1.

**Character set and encoding**: Data in MQCTLO must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

### *Fields for MQCTLO*

Alphabetic list of fields for the MQCTLO structure.

The MQCTLO structure contains the following fields; the fields are described in alphabetical order:

*ConnectionArea (MQPTR)*
Control options structure - ConnectionArea field

This is a field that is available for the callback function to use.

The queue manager makes no decisions based on the contents of this field and it is passed unchanged to the ConnectionArea field in the MQCBC structure, which is an input parameter to the callback.

This field is ignored for all operations other than MQOP_START and MQOP_START_WAIT.

This is an input and output field to the callback function. The initial value of this field is a null pointer or null bytes.

*Options (MQLONG)*
Control options structure - Options field

Options that control the action of MQCTL.

**MQCTLO_FAIL_IF_QUIESCING**
Force the MQCTL call to fail if the queue manager or connection is in the quiescing state.

Specify MQGMO_FAIL_IF_QUIESCING, in the MQGMO options passed on the MQCB call, to cause notification to message consumers when they are quiescing.

**MQCTLO_THREAD_AFFINITY**
This option informs the system that the application requires that all message consumers, for the same connection, are called on the same thread. This thread will be used for all invocations of the consumers until the connection is stopped.

**Default option**: If you do not need any of the options described, use the following option:

**MQCTLO_NONE**
Use this value to indicate that no other options have been specified; all options assume their default values. MQCTLO_NONE is defined to aid program documentation; it is not intended that this option be used with any other, but as its value is zero, such use cannot be detected.

This is an input field. The initial value of the *Options* field is MQCTLO_NONE.

*Reserved (MQLONG)*

This is a reserved field. The value must be zero.

*StrucId (MQCHAR4)*
Control options structure - StrucId field

This is the structure identifier; the value must be:

**MQCTLO_STRUC_ID**
Identifier for Control Options structure.

For the C programming language, the constant MQCTLO_STRUC_ID_ARRAY is also defined; this has the same value as MQCTLO_STRUC_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQCTLO_STRUC_ID.

*Version (MQLONG)*
Control options structure - Version field

This is the structure version number; the value must be:

**MQCTLO_VERSION_1**
Version-1 Control options structure.

The following constant specifies the version number of the current version:

**MQCTLO_CURRENT_VERSION**
Current version of Control options structure.

This is always an input field. The initial value of this field is MQCTLO_VERSION_1.

### *Initial values and language declarations for MQCTLO*

Control options structure - Initial values

*Table 481. Initial values of fields in MQCTLO*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQCTLO_STRUC_ID | 'CTLO' |
| *Version* | MQCTLO_VERSION_1 | 1 |
| *Options* | MQCTLO_NONE | Nulls |
| *Reserved* | Reserved field | |
| *ConnectionArea* | None | Null pointer or null bytes |

**Notes:**

1. In the C programming language, the macro variable MQCTLO_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQCTLO MyCTLO = {MQCTLO_DEFAULT};
```

*C declaration*

Control Options structure - C language declaration

```
typedef struct tagMQCTLO MQCTLO;
 struct tagMQCTLO {
  MQCHAR4   StrucId;        /* Structure identifier */
  MQLONG    Version;        /* Structure version number */
  MQLONG    Options;        /* Options that control the action of MQCTL */
  MQLONG    Reserved;       /* Reserved field */

MQPTR     ConnectionArea; /* Connection work area passed to the function */
 };
```

*COBOL declaration*

```
** MQCTLO structure
 10  MQCTLO.
** Structure Identifier
 15  MQCTLO-STRUCID                    PIC X(4).
** Structure Version
 15  MQCTLO-VERSION                    PIC S9(9) BINARY.
 ** Options
 15  MQCTLO-OPTIONS                    PIC S9(9) BINARY.
** Reserved
 15  MQCTLO-RESERVED                   PIC S9(9) BINARY.
** ConnectionArea
 15  MQCTLO-CONNECTIONAREA             POINTER
```

*PL/I declaration*

```
dcl
 1 MQCTLO based,
  3 StrucId             char(4),       /* Structure identifier */
  3 Version             fixed bin(31), /* Structure version */
  3 Options             fixed bin(31), /* Options */
  3 Reserved            fixed bin(31),
  3 ConnectionArea      pointer;       /* Connection work area */
```

## MQDH - Distribution header

The following table summarizes the fields in the structure.

| *Table 482. Fields in MQDH* | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *StrucLength* | Length of MQDH structure plus following records | StrucLength |
| *Encoding* | Numeric encoding of data that follows array of MQPMR records | Encoding |
| *CodedCharSetId* | Character set identifier of data that follows array of MQPMR records | CodedCharSetId |
| *Format* | Format name of data that follows array of MQPMR records | Format |
| *Flags* | General flags | Flags |
| *PutMsgRecFields* | Flags indicating which MQPMR fields are present | PutMsgRecFields |
| *RecsPresent* | Number of object records present | RecsPresent |
| *ObjectRecOffset* | Offset of first object record from start of MQDH | ObjectRecOffset |
| *PutMsgRecOffset* | Offset of first put-message record from start of MQDH | PutMsgRecOffset |

### *Overview for MQDH*

**Availability**: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.

**Purpose**: The MQDH structure describes the additional data that is present in a message when that message is a distribution-list message stored on a transmission queue. A distribution-list message is a message that is sent to multiple destination queues. The additional data consists of the MQDH structure followed by an array of MQOR records and an array of MQPMR records.

This structure is used by specialized applications that put messages directly on transmission queues, or that remove messages from transmission queues (for example: message channel agents).

Applications that want to put messages to distribution lists must not use this structure. Instead, they must use the MQOD structure to define the destinations in the distribution list, and the MQPMO structure to specify message properties or receive information about the messages sent to the individual destinations.

**Format name**: MQFMT_DIST_HEADER.

**Character set and encoding**: Data in MQDH must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC_NATIVE.

Set the character set and encoding of the MQDH into the *CodedCharSetId* and *Encoding* fields in:

- The MQMD (if the MQDH structure is at the start of the message data), or
- The header structure that precedes the MQDH structure (all other cases).

**Usage**: When an application puts a message to a distribution list, and some or all of the destinations are remote, the queue manager prefixes the application message data with the MQXQH and MQDH structures, and places the message on the relevant transmission queue. The data therefore occurs in the following sequence when the message is on a transmission queue:

- MQXQH structure
- MQDH structure plus arrays of MQOR and MQPMR records
- Application message data

Depending on the destinations, the queue manager can generate more than one such message, and place it on different transmission queues. In this case, the MQDH structures in those messages identify different subsets of the destinations defined by the distribution list opened by the application.

An application that puts a distribution-list message directly on a transmission queue must conform to the sequence described earlier, and must ensure that the MQDH structure is correct. If the MQDH structure is not valid, the queue manager can fail the MQPUT or MQPUT1 call with reason code MQRC_DH_ERROR.

You can store messages on a queue in distribution-list form only if you have defined the queue as being able to support distribution list messages (see the *DistLists* queue attribute described in "Attributes for queues" on page 810 ). If an application puts a distribution-list message directly on a queue that does not support distribution lists, the queue manager splits the distribution list message into individual messages, and places those on the queue instead.

## *Fields for MQDH*

The MQDH structure contains the following fields; the fields are described in **alphabetical order**:

*CodedCharSetId (MQLONG)*

This is the character set identifier of the data that follows the arrays of MQOR and MQPMR records; it does not apply to character data in the MQDH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. You can use the following special value:

**MQCCSI_INHERIT**
Inherit character-set identifier of this structure.

Character data in the data *following* this structure is in the same character set as this structure.

The queue manager changes this value in the structure sent in the message to the actual character-set identifier of the structure. Provided no error occurs, the MQGET call does not return the value MQCCSI_INHERIT.

You cannot use MQCCSI_INHERIT if the value of the *PutApplType* field in MQMD is MQAT_BROKER.

This value is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.

The initial value of this field is MQCCSI_UNDEFINED.

*Encoding (MQLONG)*

This is the numeric encoding of the data that follows the arrays of MQOR and MQPMR records; it does not apply to numeric data in the MQDH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data.

The initial value of this field is 0.

*Flags (MQLONG)*

You can specify the following flag:

**MQDHF_NEW_MSG_IDS**
Generate a new message identifier for each destination in the distribution list. Set this only when there are no put-message records present, or when the records are present but they do not contain the *MsgId* field.

Using this flag defers generation of the message identifiers until the moment when the distribution-list message is finally split into individual messages. This minimizes the amount of control information that must flow with the distribution-list message.

When an application puts a message to a distribution list, the queue manager sets MQDHF_NEW_MSG_IDS in the MQDH that it generates when both of the following are true:

- There are no put-message records provided by the application, or the records provided do not contain the *MsgId* field.
- The *MsgId* field in MQMD is MQMI_NONE, or the *Options* field in MQPMO includes MQPMO_NEW_MSG_ID

If no flags are needed, specify the following:

**MQDHF_NONE**
No flags have been specified. MQDHF_NONE is defined to aid program documentation. It is not intended that this constant be used with any other, but as its value is zero, such use cannot be detected.

The initial value of this field is MQDHF_NONE.

*Format (MQCHAR8)*

This is the format name of the data that follows the arrays of MQOD and MQPMR records (whichever occurs last).

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The rules for coding this field are the same as those for the *Format* field in MQMD.

The initial value of this field is MQFMT_NONE.

*ObjectRecOffset (MQLONG)*

This gives the offset in bytes of the first record in the array of MQOR object records containing the names of the destination queues. There are *RecsPresent* records in this array. These records (plus any bytes skipped between the first object record and the previous field) are included in the length given by the *StrucLength* field.

A distribution list must always contain at least one destination, so *ObjectRecOffset* must always be greater than zero.

The initial value of this field is 0.

*PutMsgRecFields (MQLONG)*

You can specify none or more of the following flags:

**MQPMRF_MSG_ID**
Message-identifier field is present.

**MQPMRF_CORREL_ID**
Correlation-identifier field is present.

**MQPMRF_GROUP_ID**
Group-identifier field is present.

**MQPMRF_FEEDBACK**
Feedback field is present.

**MQPMRF_ACCOUNTING_TOKEN**
Accounting-token field is present.

If no MQPMR fields are present, specify the following:

**MQPMRF_NONE**
No put-message record fields are present. MQPMRF_NONE is defined to aid program documentation. It is not intended that this constant be used with any other, but as its value is zero, such use cannot be detected.

The initial value of this field is MQPMRF_NONE.

*PutMsgRecOffset (MQLONG)*

This gives the offset in bytes of the first record in the array of MQPMR put message records containing the message properties. If present, there are *RecsPresent* records in this array. These records (plus any bytes skipped between the first put message record and the previous field) are included in the length given by the *StrucLength* field.

Put message records are optional; if no records are provided, *PutMsgRecOffset* is zero, and *PutMsgRecFields* has the value MQPMRF_NONE.

The initial value of this field is 0.

*RecsPresent (MQLONG)*

This is the number of destinations. A distribution list must always contain at least one destination, so *RecsPresent* must always be greater than zero.

The initial value of this field is 0.

*StrucId (MQCHAR4)*

The value must be:

**MQDH_STRUC_ID**
Identifier for distribution header structure.

For the C programming language, the constant MQDH_STRUC_ID_ARRAY is also defined; this has the same value as MQDH_STRUC_ID, but is an array of characters instead of a string.

The initial value of this field is MQDH_STRUC_ID.

*StrucLength (MQLONG)*

This is the number of bytes from the start of the MQDH structure to the start of the message data following the arrays of MQOR and MQPMR records. The data occurs in the following sequence:

- MQDH structure
- Array of MQOR records
- Array of MQPMR records
- Message data

The arrays of MQOR and MQPMR records are addressed by offsets contained within the MQDH structure. If these offsets result in unused bytes between one or more of the MQDH structure, the arrays of records, and the message data, those unused bytes must be included in the value of *StrucLength*, but the content of those bytes is not preserved by the queue manager. It is valid for the array of MQPMR records to precede the array of MQOR records.

The initial value of this field is 0.

*Version (MQLONG)*

The value must be:

**MQDH_VERSION_1**
Version number for distribution header structure.

The following constant specifies the version number of the current version:

**MQDH_CURRENT_VERSION**
Current version of distribution header structure.

The initial value of this field is MQDH_VERSION_1.

### *Initial values and language declarations for MQDH*

*Table 483. Initial values of fields in MQDH for MQDH*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQDH_STRUC_ID | 'DH¬¬' |
| *Version* | MQDH_VERSION_1 | 1 |
| *StrucLength* | None | 0 |
| *Encoding* | None | 0 |
| *CodedCharSetId* | MQCCSI_UNDEFINED | 0 |
| *Format* | MQFMT_NONE | Blanks |
| *Flags* | MQDHF_NONE | 0 |
| *PutMsgRecFields* | MQPMRF_NONE | 0 |
| *RecsPresent* | None | 0 |
| *ObjectRecOffset* | None | 0 |
| *PutMsgRecOffset* | None | 0 |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. In the C programming language, the macro variable MQDH_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQDH MyDH = {MQDH_DEFAULT};
```

*C declaration*

```
typedef struct tagMQDH MQDH;
struct tagMQDH {
  MQCHAR4  StrucId;          /* Structure identifier */
  MQLONG   Version;          /* Structure version number */
  MQLONG   StrucLength;      /* Length of MQDH structure plus following
                                MQOR and MQPMR records */
  MQLONG   Encoding;         /* Numeric encoding of data that follows
                                the MQOR and MQPMR records */
  MQLONG   CodedCharSetId;   /* Character set identifier of data that
                                follows the MQOR and MQPMR records */
  MQCHAR8  Format;           /* Format name of data that follows the
                                MQOR and MQPMR records */
  MQLONG   Flags;            /* General flags */
  MQLONG   PutMsgRecFields;  /* Flags indicating which MQPMR fields are
                                present */
  MQLONG   RecsPresent;      /* Number of MQOR records present */
  MQLONG   ObjectRecOffset;  /* Offset of first MQOR record from start
                                of MQDH */
  MQLONG   PutMsgRecOffset;  /* Offset of first MQPMR record from start
                                of MQDH */
};
```

*COBOL declaration*

```
**   MQDH structure
  10 MQDH.
**    Structure identifier
```

```
   15 MQDH-STRUCID         PIC X(4).
**    Structure version number
   15 MQDH-VERSION         PIC S9(9) BINARY.
**    Length of MQDH structure plus following MQOR and MQPMR records
   15 MQDH-STRUCLENGTH     PIC S9(9) BINARY.
**    Numeric encoding of data that follows the MQOR and MQPMR records
   15 MQDH-ENCODING        PIC S9(9) BINARY.
**    Character set identifier of data that follows the MQOR and MQPMR
**    records
   15 MQDH-CODEDCHARSETID  PIC S9(9) BINARY.
**    Format name of data that follows the MQOR and MQPMR records
   15 MQDH-FORMAT          PIC X(8).
**    General flags
   15 MQDH-FLAGS           PIC S9(9) BINARY.
**    Flags indicating which MQPMR fields are present
   15 MQDH-PUTMSGRECFIELDS PIC S9(9) BINARY.
**    Number of MQOR records present
   15 MQDH-RECSPRESENT     PIC S9(9) BINARY.
**    Offset of first MQOR record from start of MQDH
   15 MQDH-OBJECTRECOFFSET PIC S9(9) BINARY.
**    Offset of first MQPMR record from start of MQDH
   15 MQDH-PUTMSGRECOFFSET PIC S9(9) BINARY.
```

*PL/I declaration*

```
dcl
 1 MQDH based,
  3 StrucId         char(4),       /* Structure identifier */
  3 Version         fixed bin(31), /* Structure version number */
  3 StrucLength     fixed bin(31), /* Length of MQDH structure plus
                                      following MQOR and MQPMR
                                      records */
  3 Encoding        fixed bin(31), /* Numeric encoding of data that
                                      follows the MQOR and MQPMR

## MQDLH - Dead-letter header

The following table summarizes the fields in the structure.

| *Table 484. Fields in MQDLH* | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *Reason* | Reason message arrived on dead-letter queue | Reason |
| *DestQName* | Name of original destination queue | DestQName |
| *DestQMgrName* | Name of original destination queue manager | DestQMgrName |
| *Encoding* | Numeric encoding of data that follows MQDLH | Encoding |
| *CodedCharSetId* | Character set identifier of data that follows MQDLH | CodedCharSetId |
| *Format* | Format name of data that follows MQDLH | Format |
| *PutApplType* | Type of application that put message on dead-letter queue | PutApplType |
| *PutApplName* | Name of application that put message on dead-letter queue | PutApplName |
| *PutDate* | Date when message was put on dead-letter queue | PutDate |
| *PutTime* | Time when message was put on dead-letter queue | PutTime |

### *Overview for MQDLH*

**Availability**: All IBM MQ platforms.

**Purpose**: The MQDLH structure describes the information that prefixes the application message data of messages on the dead-letter (undelivered-message) queue. A message can arrive on the dead-letter queue either because the queue manager or message channel agent has redirected it to the queue, or because an application has put the message directly on the queue.

**Format name**: MQFMT_DEAD_LETTER_HEADER.

**Character set and encoding**: The fields in the MQDLH structure are in the character set and encoding given by the *CodedCharSetId* and *Encoding* fields. These are specified in the header structure that precedes the MQDLH, or in the MQMD structure if the MQDLH is at the start of the application message data.

The character set must be one that has single-byte characters for the characters that are valid in queue names.

If you are using the WMQ classes for Java/JMS, and the code page defined in the MQMD is not supported by the Java virtual machine, then the MQDLH is written in the UTF-8 character set.

**Usage**: Applications that put messages directly on the dead-letter queue must prefix the message data with an MQDLH structure, and initialize the fields with appropriate values. However, the queue manager does not require that an MQDLH structure be present, or that valid values have been specified for the fields.

If a message is too long to put on the dead-letter queue, the application must do one of the following:

- Truncate the message data to fit on the dead-letter queue.

- Record the message on auxiliary storage and place an exception report message on the dead-letter queue indicating this.
- Discard the message and return an error to its originator. If the message is (or might be) a critical message, do this only if it is known that the originator still has a copy of the message; for example, a message received by a message channel agent from a communication channel.

Which of the preceding actions is appropriate (if any) depends on the design of the application.

The queue manager performs special processing when a message that is a segment is put with an MQDLH structure at the front; see the description of the MQMDE structure for further details.

**Putting messages on the dead-letter queue**: When a message is put on the dead-letter queue, the MQMD structure used for the MQPUT or MQPUT1 call must be identical to the MQMD associated with the message (usually the MQMD returned by the MQGET call), with the exception of the following:

- Set the *CodedCharSetId* and *Encoding* fields to whatever character set and encoding are used for fields in the MQDLH structure.
- Set the *Format* field to MQFMT_DEAD_LETTER_HEADER to indicate that the data begins with a MQDLH structure.
- Set the context fields (*AccountingToken*, *ApplIdentityData*, *ApplOriginData*, *PutApplName*, *PutApplType*, *PutDate*, *PutTime*, *UserIdentifier*) by using a context option appropriate to the circumstances:
  - An application putting on the dead-letter queue a message that is not related to any preceding message must use the MQPMO_DEFAULT_CONTEXT option; this causes the queue manager to set all of the context fields in the message descriptor to their default values.
  - A server application putting on the dead-letter queue a messagethat it has just received must use the MQPMO_PASS_ALL_CONTEXT option to preserve the original context information.
  - A server application putting on the dead-letter queue a *reply* to a message that it has just received must use the MQPMO_PASS_IDENTITY_CONTEXT option; this preserves the identity information but sets the origin information to be that of the server application.
  - A message channel agent putting on the dead-letter queue a messagethat it received from its communication channel must use the MQPMO_SET_ALL_CONTEXT option to preserve the original context information.

In the MQDLH structure itself, set the fields as follows:

- Set the *CodedCharSetId*, *Encoding*, and *Format* fields to the values that describe the data that follows the MQDLH structure, usually the values from the original message descriptor.
- Set the context fields *PutApplType*, *PutApplName*, *PutDate*, and *PutTime* to values appropriate to the application that is putting the message on the dead-letter queue; these values are not related to the original message.
- Set other fields as appropriate.

Ensure that all fields have valid values, and that character fields are padded with blanks to the defined length of the field; do not end the character data prematurely by using a null character, because the queue manager does not convert the null and subsequent characters to blanks in the MQDLH structure.

**Getting messages from the dead-letter queue**: Applications that get messages from the dead-letter queue must verify that the messages begin with an MQDLH structure. The application can determine whether an MQDLH structure is present by examining the *Format* field in the message descriptor MQMD; if the field has the value MQFMT_DEAD_LETTER_HEADER, the message data begins with an MQDLH structure. Be aware also that messages that applications get from the dead-letter queue might be truncated if they were originally too long for the queue.

## *Fields for MQDLH*

The MQDLH structure contains the following fields; the fields are described in **alphabetical order**:

*CodedCharSetId (MQLONG)*
CodedCharSetId is the character set identifier of the data that flows through the MQDLH structure (usually the data from the original message); it does not apply to character data in the MQDLH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The following special value can be used:

**MQCCSI_INHERIT**
Character data in the data following this structure is in the same character set as this structure.

The queue manager changes this value in the structure sent in the message to the actual character-set identifier of the structure. Provided no error occurs, the value MQCCSI_INHERIT is not returned by the MQGET call.

You cannot use MQCCSI_INHERIT if the value of the *PutApplType* field in MQMD is MQAT_BROKER.

This value is supported in the following environments: AIX, HP-UX, z/OS, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

The initial value of this field is MQCCSI_UNDEFINED.

*DestQMgrName (MQCHAR48)*
DestQMgrName is the name of the queue manager that was the original destination for the message.

The length of this field is given by MQ_Q_MGR_NAME_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*DestQName (MQCHAR48)*
DestQName is the name of the message queue that was the original destination for the message.

The length of this field is given by MQ_Q_NAME_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*Encoding (MQLONG)*
Encoding is the numeric encoding of the data that follows the MQDLH structure (usually the data from the original message); it does not apply to numeric data in the MQDLH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data.

The initial value of this field is `0`.

*Format (MQCHAR8)*
Format is the format name of the data that follows the MQDLH structure (usually the data from the original message).

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The rules for coding this field are the same as those rules for coding the *Format* field in MQMD.

The length of this field is given by MQ_FORMAT_LENGTH. The initial value of this field is MQFMT_NONE.

*PutApplName (MQCHAR28)*
PutApplName is the name of the application that put the message on the dead-letter (undelivered-message) queue.

The format of the name depends on the *PutApplType* field. The format can vary release to release. See the description of the *PutApplName* field in "MQMD - Message descriptor" on page 402.

If the queue manager redirects the message to the dead-letter queue, *PutApplName* contains the first 28 characters of the queue-manager name, padded with blanks if necessary.

The length of this field is given by MQ_PUT_APPL_NAME_LENGTH. The initial value of this field is the null string in C, and 28 blank characters in other programming languages.

*PutApplType (MQLONG)*
PutApplType is the type of application that put the message on the dead-letter (undelivered-message) queue.

This field has the same meaning as the *PutApplType* field in the message descriptor MQMD (see "MQMD - Message descriptor" on page 402 for details).

If the queue manager redirects the message to the dead-letter queue, *PutApplType* has the value MQAT_QMGR.

The initial value of this field is `0`.

*PutDate (MQCHAR8)*
PutDate is the date when the message was put on the dead-letter (undelivered-message) queue.

The format used for the date when this field is generated by the queue manager is:

- YYYYMMDD

where the characters represent:

**YYYY**
year (four numeric digits)

**MM**
month of year (01 through 12)

**DD**
day of month (01 through 31)

Greenwich Mean Time (GMT) is used for the *PutDate* and *PutTime* fields, subject to the system clock being set accurately to GMT.

The length of this field is given by MQ_PUT_DATE_LENGTH. The initial value of this field is the null string in C, and eight blank characters in other programming languages.

*PutTime (MQCHAR8)*
PutTime is the time when the message was put on the dead-letter (undelivered-message) queue.

The format used for the time when this field is generated by the queue manager is:

- HHMMSSTH

where the characters represent:

**HH**
hours (00 through 23)

**MM**
minutes (00 through 59)

**SS**
seconds (00 through 59; see note)

**T**
tenths of a second (0 through 9)

**H**
hundredths of a second (0 through 9)

**Note:** If the system clock is synchronized to an very accurate time standard, it is possible on rare occasions for 60 or 61 to be returned for the seconds in *PutTime*. This happens when leap seconds are inserted into the global time standard.

Greenwich Mean Time (GMT) is used for the *PutDate* and *PutTime* fields, subject to the system clock being set accurately to GMT.

The length of this field is given by MQ_PUT_TIME_LENGTH. The initial value of this field is the null string in C, and eight blank characters in other programming languages.

*Reason (MQLONG)*
The Reason field identifies the reason why the message was placed on the dead-letter queue instead of on the original destination queue.

This identifies the reason why the message was placed on the dead-letter queue instead of on the original destination queue. It should be one of the MQFB_* or MQRC_* values (for example, MQRC_Q_FULL). See the description of the *Feedback* field in "MQMD - Message descriptor" on page 402 for details of the common MQFB_* values that can occur.

If the value is in the range MQFB_IMS_FIRST through MQFB_IMS_LAST, the actual IMS error code can be determined by subtracting MQFB_IMS_ERROR from the value of the *Reason* field.

Some MQFB_* values occur only in this field. They relate to repository messages, trigger messages, or transmission-queue messages that have been transferred to the dead-letter queue. These are:

**MQFB_APPL_CANNOT_BE_STARTED (X'00000109')**
An application processing a trigger message cannot start the application named in the *ApplId* field of the trigger message (see "MQTM - Trigger message" on page 579 ).

On z/OS, the CKTI CICS transaction is an example of an application that processes trigger messages.

**MQFB_APPL_TYPE_ERROR (X'0000010B')**
An application processing a trigger message cannot start the application because the *ApplType* field of the trigger message is not valid (see "MQTM - Trigger message" on page 579 ).

On z/OS, the CKTI CICS transaction is an example of an application that processes trigger messages.

**MQFB_BIND_OPEN_CLUSRCVR_DEL (X'00000119')**
The message was on the SYSTEM.CLUSTER.TRANSMIT.QUEUE intended for a cluster queue that was opened with the MQOO_BIND_ON_OPEN option, but the remote cluster-receiver channel to be used to transmit the message to the destination queue was deleted before the message could be sent. Because MQOO_BIND_ON_OPEN was specified, only the channel selected when the queue was opened can be used to transmit the message. As this channel is no longer available, the message is placed on the dead-letter queue.

**MQFB_NOT_A_REPOSITORY_MSG (X'00000118')**
The message is not a repository message.

**MQFB_STOPPED_BY_CHAD_EXIT (X'00000115')**
The message was stopped by channel auto-definition exit.

**MQFB_STOPPED_BY_MSG_EXIT (X'0000010D')**
The message was stopped by channel message exit.

**MQFB_TM_ERROR (X'0000010A')**
The *Format* field in MQMD specifies MQFMT_TRIGGER, but the message does not begin with a valid MQTM structure. For example, the *StrucId* mnemonic eye-catcher might not be valid, the *Version* might not be recognized, or the length of the trigger message might be insufficient to contain the MQTM structure.

On z/OS, the CKTI CICS transaction is an example of an application that processes trigger messages and can generate this feedback code.

**MQFB_XMIT_Q_MSG_ERROR (X'0000010F')**
A message channel agent has found that a message on the transmission queue is not in the correct format. The message channel agent puts the message on the dead-letter queue using this feedback code.

One common cause is that a message has been put directly to the transmission queue, so the message does not have the expected XQH header. Messages should be put to a transmission queue through a remote queue, unless the application builds the MQXQH header.

The initial value of this field is MQRC_NONE.

*StrucId (MQCHAR4)*
StrucId is the structure identifier.

The value must be:

**MQDLH_STRUC_ID**
Identifier for dead-letter header structure.

For the C programming language, the constant MQDLH_STRUC_ID_ARRAY is also defined; this has the same value as MQDLH_STRUC_ID, but is an array of characters instead of a string.

The initial value of this field is MQDLH_STRUC_ID.

*Version (MQLONG)*
Version is the structure version number.

The value must be:

**MQDLH_VERSION_1**
Version number for dead-letter header structure.

The following constant specifies the version number of the current version:

**MQDLH_CURRENT_VERSION**
Current version of dead-letter header structure.

The initial value of this field is MQDLH_VERSION_1.

## *Initial values and language declarations for MQDLH*

*Table 485. Initial values of fields in MQDLH for MQDLH*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQDLH_STRUC_ID | 'DLH¬' |
| *Version* | MQDLH_VERSION_1 | 1 |
| *Reason* | MQRC_NONE | 0 |
| *DestQName* | None | Null string or blanks |
| *DestQMgrName* | None | Null string or blanks |
| *Encoding* | None | 0 |
| *CodedCharSetId* | MQCCSI_UNDEFINED | 0 |
| *Format* | MQFMT_NONE | Blanks |
| *PutApplType* | None | 0 |
| *PutApplName* | None | Null string or blanks |
| *PutDate* | None | Null string or blanks |
| *PutTime* | None | Null string or blanks |

*Table 485. Initial values of fields in MQDLH for MQDLH (continued)*

| Field name | Name of constant | Value of constant |
|---|---|---|

**Notes:**

1. The symbol ¬ represents a single blank character.
2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
3. In the C programming language, the macro variable MQDLH_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQDLH MyDLH = {MQDLH_DEFAULT};
```

*C declaration*

```
typedef struct tagMQDLH MQDLH;
struct tagMQDLH {

## MQDMHO - Delete message handle options

The following table summarizes the fields in the structure.

| *Table 486. Fields in MQDMHO* | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *Options* | Options | Options |

### *Overview for MQDMHO*

**Availability**: All IBM MQ systems and IBM MQ clients.

**Purpose**: The **MQDMHO** structure allows applications to specify options that control how message handles are deleted. The structure is an input parameter on the **MQDLTMH** call.

**Character set and encoding**: Data in **MQDMHO** must be in the character set of the application and encoding of the application ( **MQENC_NATIVE** ).

### *Fields for MQDMHO*

The MQDMHO structure contains the following fields; the fields are described in **alphabetical order**:

*Options (MQLONG)*

The value must be:

**MQDMHO_NONE**

No options specified.

This is always an input field. The initial value of this field is **MQDMHO_NONE**.

*StrucId (MQCHAR4)*

This is the structure identifier; the value must be:

**MQDMHO_STRUC_ID**

Identifier for delete message handle options structure.

For the C programming language, the constant **MQDMHO_STRUC_ID_ARRAY** is also defined; this has the same value as **MQDMHO_STRUC_ID**, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is **MQDMHO_STRUC_ID**.

*Version (MQLONG)*

This is the structure version number; the value must be:

**MQDMHO_VERSION_1**
Version-1 delete message handle options structure.

The following constant specifies the version number of the current version:

**MQDMHO_CURRENT_VERSION**
Current version of delete message handle options structure.

This is always an input field. The initial value of this field is **MQDMHO_VERSION_1**.

## *Initial values and language declarations for MQDMHO*

*Table 487. Initial values of fields in MQDMHO*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQDMHO_STRUC_ID | 'DMHO' |
| *Version* | MQDMHO_VERSION_1 | 1 |
| *Options* | MQDMHO_NONE | 0 |

**Notes:**

1. In the C programming language, the macro variable MQDMHO_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQDMHO MyDMHO = {MQDMHO_DEFAULT};
```

*C declaration*

```
typedef struct tagMQDMHO;
struct tagMQDMHO {
  MQCHAR4   StrucId;         /* Structure identifier */
  MQLONG    Version;         /* Structure version number */
  MQLONG    Options;         /* Options that control the action of MQDLTMH */
};
```

*COBOL declaration*

```
**   MQDMHO structure
  10 MQDMHO.
**    Structure identifier
   15 MQDMHO-STRUCID       PIC X(4).
**    Structure version number
   15 MQDMHO-VERSION       PIC S9(9) BINARY.
**    Options that control the action of MQDLTMH
   15 MQDMHO-OPTIONS       PIC S9(9) BINARY.
```

*PL/I declaration*

```
dcl
 1 MQDMHO based,
  3 StrucId        char(4),       /* Structure identifier */
```

```
  3 Version        fixed bin(31), /* Structure version number */
  3 Options        fixed bin(31), /* Options that control the action of MQDLTMH */
```

*High Level Assembler declaration*

```
MQDMHO                DSECT
MQDMHO_STRUCID        DS   CL4   Structure identifier
MQDMHO_VERSION        DS   F     Structure version number
MQDMHO_OPTIONS        DS   F     Options that control the action of
*                                MQDLTMH
MQDMHO_LENGTH         EQU  *-MQDMHO
MQDMHO_AREA           DS   CL(MQDMHO_LENGTH)
```

## MQDMPO - Delete message property options

The following table summarizes the fields in the structure. MQDMPO structure - delete message property options

| *Table 488. Fields in MQDMPO* | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *Options* | Options controlling the action of MQDMPO | Options |

### *Overview for MQDMPO*

**Availability**: All IBM MQ systems and IBM MQ clients.

**Purpose**: The MQDMPO structure allows applications to specify options that control how properties of messages are deleted. The structure is an input parameter on the MQDLTMP call.

**Character set and encoding**: Data in MQDMPO must be in the character set of the application and encoding of the application (MQENC_NATIVE).

### *Fields for MQDMPO*

Delete message property options structure - fields

The MQDMPO structure contains the following fields; the fields are described in **alphabetical order**:

*Options (MQLONG)*
Delete message property options structure - Options field

**Location options:** The following options relate to the relative location of the property compared to the property cursor.

**MQDMPO_DEL_FIRST**
Deletes the first property that matches the specified name.

**MQDMPO_DEL_PROP_UNDER_CURSOR**
Deletes the property pointed to by the property cursor; that is the property that was last inquired by using either the MQIMPO_INQ_FIRST or the MQIMPO_INQ_NEXT option.

The property cursor is reset when the message handle is reused. It is also reset when the message handle is specified in the *MsgHandle* field of the MQGMO structure on an MQGET call, or MQPMO structure on an MQPUT call.

If this option is used when the property cursor has not yet been established, the call fails with completion code MQCC_FAILED and reason MQRC_PROPERTY_NOT_AVAILABLE. If the property pointed to by the property cursor has already been deleted, the call also fails with completion code MQCC_FAILED and reason MQRC_PROPERTY_NOT_AVAILABLE.

If neither of thees options is required, the following option can be used:

**MQDMPO_NONE**
No options specified.

This field is always an input field. The initial value of this field is MQDMPO_DEL_FIRST.

*StrucId (MQCHAR4)*
Delete message property options structure - StrucId field

This is the structure identifier. The value must be:

**MQDMPO_STRUC_ID**
Identifier for delete message property options structure.

For the C programming language, the constant MQDMPO_STRUC_ID_ARRAY is also defined; this has the same value as MQDMPO_STRUC_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQDMPO_STRUC_ID.

*Version (MQLONG)*
Delete message property options structure - Version field

This is the structure version number. The value must be:

**MQDMPO_VERSION_1**
Version number for delete message property options structure.

The following constant specifies the version number of the current version:

**MQDMPO_CURRENT_VERSION**
Current version of delete message property options structure.

This is always an input field. The initial value of this field is MQDMPO_VERSION_1.

## *Initial values and language declarations for MQDMPO*

Delete message property options structure - Initial values

*Table 489. Initial values of fields in MQDPMO*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQDMPO_STRUC_ID | 'DMPO' |
| *Version* | MQDMPO_VERSION_1 | 1 |
| *Options* | Options that control the action of MQDLTMP | MQDMPO_NONE |

**Notes:**

1. In the C programming language, the macro variable MQDMPO_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQDMPO MyDMPO = {MQDMPO_DEFAULT};
```

*C declaration*
Delete message property options structure - C language declaration

```
typedef struct tagMQDMPO MQDMPO;
struct tagMQDMPO {
  MQCHAR4  StrucId;        /* Structure identifier */
  MQLONG   Version;        /* Structure version number */
  MQLONG   Options;        /* Options that control the action of
                              MQDLTMP */
};
```

*COBOL declaration*
Delete message property options structure - COBOL language declaration

```
**   MQDMPO structure
  10 MQDMPO.
**    Structure identifier
   15 MQDMPO-STRUCID               PIC X(4).
**    Structure version number
   15 MQDMPO-VERSION               PIC S9(9) BINARY.
**    Options that control the action of MQDLTMP
   15 MQDMPO-OPTIONS               PIC S9(9) BINARY.
```

*PL/I declaration*
Delete message property options structure - PL/I language declaration

```
Dcl
 1 MQDPMO based,
   3 StrucId        char(4),       /* Structure identifier */
   3 Version        fixed bin(31), /* Structure version number */
   3 Options        fixed bin(31), /* Options that control the action
                                      of MQDLTMP */
```

*                                  action of MQDLTMP
MQDMPO_LENGTH            EQU  *-MQDMPO
MQDMPO_AREA              DS   CL(MQDMPO_LENGTH)
```

## MQEPH - Embedded PCF header

The following table summarizes the fields in the structure.

*Table 490. Fields in MQEPH*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *StrucLength* | Length of MQEPH structure plus the MQCFH and parameter structures that follow it | StrucLength |
| *Encoding* | Numeric encoding of data that follows last PCF parameter structure | Encoding |
| *CodedCharSetId* | Character set identifier of data that follows last PCF parameter structure | CodedCharSetId |
| *Format* | Format name of data that follows last PCF parameter structure | Format |
| *Flags* | Flags | Flags |
| *PCFHeader* | Programmable command format (PCF) header | PCFHeader |

### *Overview for MQEPH*

**Availability**: All IBM MQ platforms.

**Purpose**: The MQEPH structure describes the additional data that is present in a message when that message is a programmable command format (PCF) message. The *PCFHeader* field defines the PCF parameters that follow this structure and this allows you to follow the PCF message data with other headers.

**Format name**: MQFMT_EMBEDDED_PCF

**Character set and encoding**: Data in MQEPH must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC_NATIVE.

Set the character set and encoding of the MQEPH into the *CodedCharSetId* and *Encoding* fields in:

- The MQMD (if the MQEPH structure is at the start of the message data), or
- The header structure that precedes the MQEPH structure (all other cases).

**Usage**: You cannot use MQEPH structures to send commands to the command server or any other queue manager PCF-accepting server.

Similarly, the command server or any other queue manager PCF-accepting server do not generate responses or events containing MQEPH structures.

## *Fields for MQEPH*

The MQEPH structure contains the following fields; the fields are described in **alphabetical order**:

*CodedCharSetId (MQLONG)*

This is the character set identifier of the data that follows the MQEPH structure and the associated PCF parameters; it does not apply to character data in the MQEPH structure itself.

The initial value of this field is MQCCSI_UNDEFINED.

*Encoding (MQLONG)*

This is the numeric encoding of the data that follows the MQEPH structure and the associated PCF parameters; it does not apply to character data in the MQEPH structure itself.

The initial value of this field is 0.

*Flags (MQLONG)*

The following values are available:

**MQEPH_NONE**
No flags have been specified. MQEPH_NONE is defined to aid program documentation. It is not intended that this constant be used with any other, but as its value is zero, such use cannot be detected.

**MQEPH_CCSID_EMBEDDED**
The character set of the parameters containing character data is specified individually within the CodedCharSetId field in each structure. The character set of the StrucId and Format fields is defined by the CodedCharSetId field in the header structure that precedes the MQEPH structure, or by the CodedCharSetId field in the MQMD if the MQEPH is at the start of the message.

The initial value of this field is MQEPH_NONE.

*Format (MQCHAR8)*

This is the format name of the data that follows the MQEPH structure and the associated PCF parameters.

The initial value of this field is MQFMT_NONE.

*PCFHeader (MQCFH)*

This is the programmable command format (PCF) header, defining the PCF parameters that follow the MQEPH structure. This enables you to follow the PCF message data with other headers.

The PCF header is initially defined with the following values:

| *Table 491. Initial values of fields in MQCFH* | | |
|---|---|---|
| **Field name** | **Name of constant** | **Value of constant** |
| *Type* | MQCFT_NONE | 0 |
| *StrucLength* | MQCFH_STRUC_LENGTH | 36 |
| *Version* | MQCFH_VERSION_3 | 3 |
| *StrucLength* | None | 0 |
| *Command* | MQCMD_NONE | 0 |
| *MsgSeqNumber* | None | 1 |
| *Control* | MQCFC_LAST | 1 |
| *CompCode* | MQCC_OK | 0 |
| *Reason* | MQRC_NONE | 0 |
| *ParameterCount* | None | 0 |

The application must change the Type from MQCFT_NONE to a valid structure type for the use it is making of the embedded PCF header.

*StrucId (MQCHAR4)*

The value must be:

**MQEPH_STRUC_ID**
Identifier for distribution header structure.

For the C programming language, the constant MQEPH_STRUC_ID_ARRAY is also defined; this has the same value as MQDH_STRUC_ID, but is an array of characters instead of a string.

The initial value of this field is MQEPH_STRUC_ID.

*StrucLength (MQLONG)*

This is the amount of data preceding the next header structure. It includes:

- The length of the MQEPH header
- The length of all PCF parameters following the header
- Any blank padding following those parameters

StrucLength must be a multiple of 4.

The fixed length part of the structure is defined by MQEPH_STRUC_LENGTH_FIXED.

The initial value of this field is 68.

*Version (MQLONG)*

The value must be:

**MQEPH_VERSION_1**
Version number for embedded PCF header structure.

The following constant specifies the version number of the current version:

**MQCFH_VERSION_3**
Current version of embedded PCF header structure.

The initial value of this field is MQEPH_VERSION_1.

### *Initial values and language declarations for MQEPH*

*Table 492. Initial values of fields in MQEPH for MQEPH*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQEPH_STRUC_ID | 'EPH¬' |
| *Version* | MQEPH_VERSION_1 | 1 |
| *StrucLength* | MQEPH_STRUC_LENGTH_FIXED | 68 |
| *Encoding* | None | 0 |
| *CodedCharSetId* | MQCCSI_UNDEFINED | 0 |
| *Format* | MQFMT_NONE | Blanks |
| *Flags* | MQEPH_NONE | 0 |
| *PCFHeader* | Names and values as defined in Table 491 on page 352 | 0 |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. In the C programming language, the macro variable MQEPH_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQEPH MyEPH = {MQEPH_DEFAULT};
```

*C declaration*

```
typedef struct tagMQEPH MQEPH;
struct tagMQDH {
  MQCHAR4  StrucId;          /* Structure identifier */
  MQLONG   Version;          /* Structure version number */
  MQLONG   StrucLength;      /* Total length of MQEPH including the MQCFH
                                and parameter structures that follow it */
  MQLONG   Encoding;         /* Numeric encoding of data that follows last
                                PCF parameter structure */
  MQLONG   CodedCharSetId;   /* Character set identifier of data that

## MQGMO - Get-message options

The following table summarizes the fields in the structure.

*Table 493. Fields in MQGMO*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *Options* | Options that control the action of MQGET | MQGMO - Options field |
| *WaitInterval* | Wait interval | WaitInterval |
| *Signal1* | Signal | Signal1 |
| *Signal2* | Signal identifier | Signal2 |
| *ResolvedQName* | Resolved name of destination queue | ResolvedQName |
| **Note:** The remaining fields are ignored if *Version* is less than MQGMO_VERSION_2. | | |
| *MatchOptions* | Options controlling selection criteria used for MQGET | MatchOptions |
| *GroupStatus* | Flag indicating whether message retrieved is in a group | GroupStatus |
| *SegmentStatus* | Flag indicating whether message retrieved is a segment of a logical message | SegmentStatus |
| *Segmentation* | Flag indicating whether further segmentation is allowed for the message retrieved | Segmentation |
| *Reserved1* | Reserved | Reserved1 |
| **Note:** The remaining fields are ignored if *Version* is less than MQGMO_VERSION_3. | | |
| *MsgToken* | Message token | MsgToken |

| Table 493. Fields in MQGMO (continued) | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *ReturnedLength* | Length of message data returned (bytes) | ReturnedLength |
| **Note:** The remaining fields are ignored if *Version* is less than MQGMO_VERSION_4. | | |
| *Reserved2* | Reserved | Reserved2 |
| *MsgHandle* | The handle to a message that is to be populated with the properties of the message being retrieved from the queue. | MsgHandle |

## *Overview for MQGMO*

**Availability**: All IBM MQ platforms.

**Purpose**: The MQGMO structure allows the application to control how messages are removed from queues. The structure is an input/output parameter on the MQGET call.

**Version**: The current version of MQGMO is MQGMO_VERSION_4. Certain fields are available only in certain versions of MQGMO. If you need to port applications between several environments, you must ensure that the version of MQGMO is consistent across all environments. Fields that exist only in particular versions of the structure are identified as such in "MQGMO - Get-message options" on page 355 and in the field descriptions.

The header, COPY, and INCLUDE files provided for the supported programming languages contain the most-recent version of MQGMO that is supported by the environment, but with the initial value of the *Version* field set to MQGMO_VERSION_1. To use fields that are not present in the version-1 structure, set the *Version* field to the version number of the version required.

**Character set and encoding**: Data in MQGMO must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

## *Fields for MQGMO*

The MQGMO structure contains the following fields; the fields are described in **alphabetical order**:

*GroupStatus (MQCHAR)*
This flag indicates whether the message retrieved is in a group.

It has one of the following values:

**MQGS_NOT_IN_GROUP**
Message is not in a group.

**MQGS_MSG_IN_GROUP**
Message is in a group, but is not the last in the group.

**MQGS_LAST_MSG_IN_GROUP**
Message is the last in the group.

This is also the value returned if the group consists of only one message.

This is an output field. The initial value of this field is MQGS_NOT_IN_GROUP. This field is ignored if *Version* is less than MQGMO_VERSION_2.

*MatchOptions (MQLONG)*

These options allow the application to choose which fields in the *MsgDesc* parameter to use to select the message returned by the MQGET call. The application sets the required options in this field, and then sets the corresponding fields in the *MsgDesc* parameter to the values required for those fields. Only messages that have those values in the MQMD for the message are candidates for retrieval using that

*MsgDesc* parameter on the MQGET call. Fields for which the corresponding match option is *not* specified are ignored when selecting the message to be returned. If you specify no selection criteria on the MQGET call (that is, *any* message is acceptable), set *MatchOptions* to MQMO_NONE.

- On z/OS, the selection criteria that can be used might be restricted by the type of index used for the queue. See the *IndexType* queue attribute for further details.

If you specify MQGMO_LOGICAL_ORDER, only certain messages are eligible for return by the next MQGET call:

- If there is no current group or logical message, only messages that have *MsgSeqNumber* equal to 1 and *Offset* equal to 0 are eligible for return. In this situation, you can use one or more of the following match options to select which of the eligible messages is returned:
  - MQMO_MATCH_MSG_ID
  - MQMO_MATCH_CORREL_ID
  - MQMO_MATCH_GROUP_ID
- If there *is* a current group or logical message, only the next message in the group or next segment in the logical message is eligible for return, and this cannot be altered by specifying MQMO_* options.

In both of the preceding cases, you can specify match options that do not apply, but the value of the relevant field in the *MsgDesc* parameter must match the value of the corresponding field in the message to be returned; the call fails with reason code MQRC_MATCH_OPTIONS_ERROR is this condition is not satisfied.

*MatchOptions* is ignored if you specify either MQGMO_MSG_UNDER_CURSOR or MQGMO_BROWSE_MSG_UNDER_CURSOR.

Getting messages based on message property is not done using match options; for more information, see "SelectionString (MQCHARV)" on page 469.

You can specify one or more of the following match options:

**MQMO_MATCH_MSG_ID**
The message to be retrieved must have a message identifier that matches the value of the *MsgId* field in the *MsgDesc* parameter of the MQGET call. This match is in addition to any other matches that might apply (for example, the correlation identifier).

If you omit this option, the *MsgId* field in the *MsgDesc* parameter is ignored, and any message identifier will match.

**Note:** The message identifier MQMI_NONE is a special value that matches *any* message identifier in the MQMD for the message. Therefore, specifying MQMO_MATCH_MSG_ID with MQMI_NONE is the same as *not* specifying MQMO_MATCH_MSG_ID.

**MQMO_MATCH_CORREL_ID**
The message to be retrieved must have a correlation identifier that matches the value of the *CorrelId* field in the *MsgDesc* parameter of the MQGET call. This match is in addition to any other matches that might apply (for example, the message identifier).

If you omit this option, the *CorrelId* field in the *MsgDesc* parameter is ignored, and any correlation identifier will match.

**Note:** The correlation identifier MQCI_NONE is a special value that matches *any* correlation identifier in the MQMD for the message. Therefore, specifying MQMO_MATCH_CORREL_ID with MQCI_NONE is the same as *not* specifying MQMO_MATCH_CORREL_ID.

**MQMO_MATCH_GROUP_ID**
The message to be retrieved must have a group identifier that matches the value of the *GroupId* field in the *MsgDesc* parameter of the MQGET call. This match is in addition to any other matches that might apply (for example, the correlation identifier).

If you omit this option, the *GroupId* field in the *MsgDesc* parameter is ignored, and any group identifier will match.

**Note:** The group identifier MQGI_NONE is a special value that matches *any* group identifier in the MQMD for the message. Therefore, specifying MQMO_MATCH_GROUP_ID with MQGI_NONE is the same as *not* specifying MQMO_MATCH_GROUP_ID.

**MQMO_MATCH_MSG_SEQ_NUMBER**
The message to be retrieved must have a message sequence number that matches the value of the *MsgSeqNumber* field in the *MsgDesc* parameter of the MQGET call. This match is in addition to any other matches that might apply (for example, the group identifier).

If you omit this option, the *MsgSeqNumber* field in the *MsgDesc* parameter is ignored, and any message sequence number will match.

**MQMO_MATCH_OFFSET**
The message to be retrieved must have an offset that matches the value of the *Offset* field in the *MsgDesc* parameter of the MQGET call. This match is in addition to any other matches that might apply (for example, the message sequence number).

If you omit this option is not specified, the *Offset* field in the *MsgDesc* parameter is ignored, and any offset will match.

- This option is not supported on z/OS.

**MQMO_MATCH_MSG_TOKEN**
The message to be retrieved must have a message token that matches the value of the *MsgToken* field in the MQGMO structure specified on the MQGET call.

You can specify this option for all local queues. If you specify it for a queue that has an *IndexType* of MQIT_MSG_TOKEN (a WLM-managed queue), you can specify no other match options with MQMO_MATCH_MSG_TOKEN.

You cannot specify MQMO_MATCH_MSG_TOKEN with MQGMO_WAIT or MQGMO_SET_SIGNAL. If the application wants to wait for a message to arrive on a queue that has an *IndexType* of MQIT_MSG_TOKEN, specify MQMO_NONE.

If you omit this option, the *MsgToken* field in MQGMO is ignored, and any message token will match.

If you specify none of the options described, you can use the following option:

**MQMO_NONE**
Use no matches in selecting the message to be returned; all messages on the queue are eligible for retrieval (but subject to control by the MQGMO_ALL_MSGS_AVAILABLE, MQGMO_ALL_SEGMENTS_AVAILABLE, and MQGMO_COMPLETE_MSG options).

MQMO_NONE aids program documentation. It is not intended that this option be used with any other MQMO_* option, but as its value is zero, such use cannot be detected.

This is an input field. The initial value of this field is MQMO_MATCH_MSG_ID with MQMO_MATCH_CORREL_ID. This field is ignored if *Version* is less than MQGMO_VERSION_2.

**Note:** The initial value of the *MatchOptions* field is defined for compatibility with earlier MQSeries® queue managers. However, when reading a series of messages from a queue without using selection criteria, this initial value requires the application to reset the *MsgId* and *CorrelId* fields to MQMI_NONE and MQCI_NONE before each MQGET call. Avoid the need to reset *MsgId* and *CorrelId* by setting *Version* to MQGMO_VERSION_2, and *MatchOptions* to MQMO_NONE.

**Related concepts**
Message selectors in JMS

*MsgHandle (MQHMSG)*

If the MQGMO_PROPERTIES_AS_Q_DEF option is specified and the `PropertyControl` queue attribute is not set to MQPROP_FORCE_MQRFH2 then this is the handle to a message which will be populated with the properties of the message being retrieved from the queue. The handle is created by an MQCRTMH call. Any properties already associated with the handle will be cleared before retrieving a message.

The following value can also be specified:
MQHM_NONE
No message handle supplied.

No message descriptor is required on the MQGET call if a valid message handle is supplied and used on output to contain the message properties, the message descriptor associated with the message handle is used for input fields.

If a message descriptor is specified on the MQGET call, it always takes precedence over the message descriptor associated with a message handle.

If MQGMO_PROPERTIES_FORCE_MQRFH2 is specified, or the MQGMO_PROPERTIES_AS_Q_DEF is specified and the `PropertyControl` queue attribute is MQPROP_FORCE_MQRFH2 then the call fails with reason code MQRC_MD_ERROR when no message descriptor parameter is specified.

On return from the MQGET call, the properties and message descriptor associated with this message handle are updated to reflect the state of the message retrieved (as well as the message descriptor if one was supplied on the MQGET call). The properties of the message can then be inquired using the MQINQMP call.

Except for message descriptor extensions, when present, a property that can be inquired with the MQINQMP call is not contained in the message data; if the message on the queue contained properties in the message data these are removed from the message data before the data is returned to the application.

If no message handle is provided or Version is less than MQGMO_VERSION_4 then you must supply a valid message descriptor on the MQGET call. Any message properties (except those contained in the message descriptor) are returned in the message data subject to the value of the property options in the MQGMO structure and the `PropertyControl` queue attribute.

This is an always an input field. The initial value of this field is MQHM_NONE. This field is ignored if `Version` is less than MQGMO_VERSION_4.

*MsgToken (MQBYTE16)*
MsgToken field - MQGMO structure. This field is used by the queue manager to uniquely identify a message.

This is a byte string that is generated by the queue manager to identify a message uniquely on a queue. The message token is generated when the message is first placed on the queue manager, and remains with the message until the message is permanently removed from the queue manager, unless the queue manager is restarted.

When the message is removed from the queue, the *MsgToken* that identified that instance of the message is no longer valid, and is never reused. If the queue manager is restarted, the *MsgToken* that identified a message on the queue before restart might not be valid after restart. However, the *MsgToken* is never reused to identify a different message instance. The *MsgToken* is generated by the queue manager and is not visible to any external application.

When a message is returned by a call to MQGET where a Version 3 or higher MQGMO is supplied, the *MsgToken* identifying the message on the queue is returned in the MQGMO by the queue manager. There is one exception to this: when the message is being removed from the queue outside syncpoint, the queue manager might not return a *MsgToken* because it is not useful to identify the returned message on a subsequent MQGET call. Applications should only use *MsgToken* to refer to the message on subsequent MQGET calls.

If a *MsgToken* is supplied and the *MatchOption* MQMO_MATCH_MSG_TOKEN is specified and neither MQGMO_MSG_UNDER_CURSOR nor MQGMO_BROWSE_MSG_UNDER_CURSOR is specified, only the message identified by that *MsgToken* can be returned. The option is valid on all local queues regardless of INDXTYPE, and on z/OS you must use INDXTYPE(MSGTOKEN) only on Workload Manager (WLM) queues.

Any other *MatchOptions* specified are checked, and if they do not match, MQRC_NO_MSG_AVAILABLE is returned. If MQGMO_BROWSE_NEXT is coded with MQMO_MATCH_MSG_TOKEN, the message identified by the *MsgToken* is returned only if it is beyond the browse-cursor for the calling handle.

If MQGMO_MSG_UNDER_CURSOR or MQGMO_BROWSE_MSG_UNDER_CURSOR is specified, MQMO_MATCH_MSG_TOKEN is ignored.

MQMO_MATCH_MSG_TOKEN is not valid with the following get message options:

- MQGMO_WAIT
- MQGMO_SET_SIGNAL

For an MQGET call specifying MQMO_MATCH_MSG_TOKEN, an MQGMO of version 3 or later must be supplied to the call, otherwise MQRC_WRONG_GMO_VERSION is returned.

If the *MsgToken* is not valid at this time, MQCC_FAILED with MQRC_NO_MSG_AVAILABLE is returned, unless there is another error.

*Options (MQLONG)*

**MQGMO** options control the action of MQGET. You can specify zero or more of the options. If you need more than one optional value:

- Add the values (do not add the same constant more than once), or
- Combine the values using the bitwise OR operation (if the programming language supports bit operations).

Combinations of options that are not valid are noted; all other combinations are valid.

**Wait options**: The following options relate to waiting for messages to arrive on the queue:

**MQGMO_WAIT**
The application waits until a suitable message arrives. The maximum time that the application waits is specified in *WaitInterval* .

**Important:** There is no wait, or delay, if a suitable message is available immediately.

If MQGET requests are inhibited, or MQGET requests become inhibited while waiting, the wait is canceled. The call completes with MQCC_FAILED and reason code MQRC_GET_INHIBITED, regardless of whether there are suitable messages on the queue.

You can use MQGMO_WAIT with the MQGMO_BROWSE_FIRST or MQGMO_BROWSE_NEXT options.

If several applications are waiting on the same shared queue, the following rules select which application is activated when a suitable message arrives:

*Table 494. Rules for activating MQGET calls on a shared queue.*

| **Number of MQGET calls waiting to be activated** | | **Result** |
|---|---|---|
| **With a BROWSE option** | **Without a BROWSE option** [1] | |
| None | One or more | One MQGET call without a BROWSE option is activated. |
| One or more | None | All MQGET calls with a BROWSE option are activated. |
| One or more | One or more | One MQGET call without a BROWSE option is activated. The number of MQGET calls with a BROWSE option that are activated is unpredictable. |

If more than one MQGET call without a BROWSE option is waiting on the same queue, only one is activated. The queue manager attempts to give priority to waiting calls in the following order:

1. Specific get-wait requests that can be satisfied only by certain messages, for example, ones with a specific *MsgId* or *CorrelId* (or both).
2. General get-wait requests that can be satisfied by any message.

[1] An MQGET call specifying the MQGMO_LOCK option is treated as a nonbrowse call.

**Note:**

- Within the first category, no additional priority is given to more specific get-wait requests. For example, requests that specify both *MsgId* and *CorrelId* .
- Within either category, it cannot be predicted which application is selected. In particular, the application waiting longest is not necessarily the one selected.
- Path length, and priority-scheduling considerations of the operating system, can mean that a waiting application of lower operating system priority than expected retrieves the message.
- It can also happen that an application that is not waiting retrieves the message in preference to one that is.

On z/OS, the following points apply:

- If you want the application to proceed with other work while waiting for the message to arrive, consider using the signal option ( MQGMO_SET_SIGNAL ) instead. However the signal option is environment-specific; applications that you to port between different environments must not use it.
- If there is more than one MQGET call waiting for the same message, with a mixture of wait and signal options, each waiting call is considered equally. It is an error to specify MQGMO_SET_SIGNAL with MQGMO_WAIT . It is also an error to specify this option with a queue handle for which a signal is outstanding.
- If you specify MQGMO_WAIT or MQGMO_SET_SIGNAL for a queue that has an *IndexType* of MQIT_MSG_TOKEN, no selection criteria are permitted. This means that:
  - If you are using a version-1 MQGMO, set the *MsgId* and *CorrelId* fields in the MQMD specified on the MQGET call to MQMI_NONE and MQCI_NONE.
  - If you are using a version-2 or later MQGMO, set the *MatchOptions* field to MQMO_NONE.
- For an MQGET call on a shared queue and the call is a browse request, or a destructive get of a group message, and neither *MsgId* nor *CorrelId* are to be matched, your signal ECB is posted MQEC_MSG_ARRIVED after 200 milliseconds.

  This occurs, even though a suitable message might not have arrived on the queue, until the wait interval has expired, when the queue is posted with MQEC_WAIT_INTERVAL_EXPIRED. When MQEC_MSG_ARRIVED is posted, you must reissue a second MQGET call to retrieve the message, if one is available.

  This technique is used to ensure that you are informed in a timely manner of a message arrival, but can appear as an unexpected processing overhead when compared with a similar call sequence on a nonshared queue.

MQGMO_WAIT is ignored if specified with MQGMO_BROWSE_MSG_UNDER_CURSOR or MQGMO_MSG_UNDER_CURSOR ; no error is raised.

**MQGMO_NO_WAIT**
The application does not wait if no suitable message is available. MQGMO_NO_WAIT is the opposite of the MQGMO_WAIT. MQGMO_NO_WAIT is defined to aid program documentation. It is the default if neither is specified.

**MQGMO_SET_SIGNAL**
Use this option with the *Signal1* and *Signal2* fields. It allows applications to proceed with other work while waiting for a message to arrive. It also allows (if suitable operating system facilities are available) applications to wait for messages arriving on more than one queue.

**Note:** The MQGMO_SET_SIGNAL option is environment-specific; do not use it for applications that you want to port.

In two circumstances, the call completes in the same way as if this option had not been specified:

1. If a currently available message satisfies the criteria specified in the message descriptor.
2. If a parameter error or other synchronous error is detected.

If no message satisfying the criteria specified in the message descriptor is currently available, control returns to the application without waiting for a message to arrive. The *CompCode* and *Reason*

parameters are set to MQCC_WARNING and MQRC_SIGNAL_REQUEST_ACCEPTED. Other output fields in the message descriptor and the output parameters of the MQGET call are not set. When a suitable message arrives later, the signal is delivered by posting the ECB.

The caller must then reissue the MQGET call to retrieve the message. The application can wait for this signal, using functions provided by the operating system.

If the operating system provides a multiple wait mechanism, you can use it to wait for a message arriving on any one of several queues.

If a nonzero *WaitInterval* is specified, the signal is delivered after the wait interval expires. The queue manager can also cancel the wait, in which case the signal is delivered.

More than one MQGET call can set a signal for the same message. The order in which applications are activated is the same as described for MQGMO_WAIT.

If more than one MQGET call is waiting for the same message, each waiting call is considered equally. The calls can include a mixture of wait and signal options.

Under certain conditions the MQGET call can retrieve a message, and a signal resulting from the arrival of the same message can be delivered. When a signal is delivered, an application must be prepared for no message to be available.

A queue handle can have no more than one signal request outstanding.

This option is not valid with any of the following options:

- MQGMO_UNLOCK
- MQGMO_WAIT

For an MQGET call on a shared queue and the call is a browse request, or a destructive get of a group message, and neither *MsgId* or *CorrelId* are to be matched, the user's signal ECB is posted MQEC_MSG_ARRIVED after 200 milliseconds.

This occurs, even though a suitable message might not have arrived on the queue, until the wait interval has expired, when the queue is posted with MQEC_WAIT_INTERVAL_EXPIRED. When MQEC_MSG_ARRIVED is posted, you must reissue a second MQGET call to retrieve the message, if one is available.

This technique is used to ensure that you are informed in a timely manner of a message arrival, but can appear as an unexpected processing overhead when compared with a similar call sequence on a nonshared queue.

This is not an efficient method of message retrieval when messages are added infrequently. To avoid this overhead for the browse case, specify *MsgId* (if non-indexed or indexed by *MsgId*) or *CorrelId* (if indexed by *CorrelId*) matching on the MQGET call.

This option is supported on z/OS only.

**MQGMO_FAIL_IF_QUIESCING**
Force the MQGET call to fail if the queue manager is in the quiescing state.

On z/OS, this option also forces the MQGET call to fail if the connection (for a CICS or IMS application) is in the quiescing state.

If this option is specified with MQGMO_WAIT or MQGMO_SET_SIGNAL, and the wait or signal is outstanding at the time the queue manager enters the quiescing state:

- The wait is canceled and the call returns completion code MQCC_FAILED with reason code MQRC_Q_MGR_QUIESCING or MQRC_CONNECTION_QUIESCING.
- The signal is canceled with an environment-specific signal completion code.

  On z/OS, the signal completes with event completion code MQEC_Q_MGR_QUIESCING or MQEC_CONNECTION_QUIESCING.

If MQGMO_FAIL_IF_QUIESCING is not specified and the queue manager or connection enters the quiescing state, the wait or signal is not canceled.

**Sync point options**: The following options relate to the participation of the MQGET call within a unit of work:

**MQGMO_SYNCPOINT**
The request is to operate within the normal unit-of-work protocols. The message is marked as being unavailable to other applications, but it is deleted from the queue only when the unit of work is committed. The message is made available again if the unit of work is backed out.

You can leave MQGMO_SYNCPOINT and MQGMO_NO_SYNCPOINT unset. In which case, the inclusion of the get request in unit-of-work protocols is determined by the environment running the queue manager. It is not determined by the environment running the application. On z/OS, the get request is within a unit of work. In all other environments, the get request is not within a unit of work.

Because of these differences, an application that you want to port must not allow this option to default; specify MQGMO_SYNCPOINT or MQGMO_NO_SYNCPOINT explicitly.

This option is not valid with any of the following options:

- MQGMO_BROWSE_FIRST
- MQGMO_BROWSE_MSG_UNDER_CURSOR
- MQGMO_BROWSE_NEXT
- MQGMO_LOCK
- MQGMO_NO_SYNCPOINT
- MQGMO_SYNCPOINT_IF_PERSISTENT
- MQGMO_UNLOCK

**MQGMO_SYNCPOINT_IF_PERSISTENT**
The request is to operate within the normal unit-of-work protocols, but *only* if the message retrieved is persistent. A persistent message has the value MQPER_PERSISTENT in the *Persistence* field in MQMD.

- If the message is persistent, the queue manager processes the call as though the application had specified MQGMO_SYNCPOINT.
- If the message is not persistent, the queue manager processes the call as though the application had specified MQGMO_NO_SYNCPOINT.

This option is not valid with any of the following options:

- MQGMO_BROWSE_FIRST
- MQGMO_BROWSE_MSG_UNDER_CURSOR
- MQGMO_BROWSE_NEXT
- MQGMO_COMPLETE_MSG
- MQGMO_MARK_SKIP_BACKOUT
- MQGMO_NO_SYNCPOINT
- MQGMO_SYNCPOINT
- MQGMO_UNLOCK

This option is supported in the following environments: AIX, HP-UX, z/OS, IBM i, Solaris, and Linux, plus IBM MQ MQI clients connected to these systems.

**MQGMO_NO_SYNCPOINT**
The request is to operate outside the normal unit-of-work protocols. If you get a message without a browse option, it is deleted from the queue immediately. The message cannot be made available again by backing out the unit of work.

This option is assumed if you specify MQGMO_BROWSE_FIRST or MQGMO_BROWSE_NEXT.

You can leave MQGMO_SYNCPOINT and MQGMO_NO_SYNCPOINT unset. In which case, the inclusion of the get request in unit-of-work protocols is determined by the environment running the queue

manager. It is not determined by the environment running the application. On z/OS, the get request is within a unit of work. In all other environments, the get request is not within a unit of work.

Because of these differences, an application that you want to port must not allow this option to default; specify either MQGMO_SYNCPOINT or MQGMO_NO_SYNCPOINT explicitly.

This option is not valid with any of the following options:

- MQGMO_MARK_SKIP_BACKOUT
- MQGMO_SYNCPOINT
- MQGMO_SYNCPOINT_IF_PERSISTENT

**MQGMO_MARK_SKIP_BACKOUT**
Back out a unit of work without reinstating on the queue the message that was marked with this option.

This option is supported only on z/OS.

If this option is specified, MQGMO_SYNCPOINT must also be specified. MQGMO_MARK_SKIP_BACKOUT is not valid with any of the following options:

- MQGMO_BROWSE_FIRST
- MQGMO_BROWSE_MSG_UNDER_CURSOR
- MQGMO_BROWSE_NEXT
- MQGMO_LOCK
- MQGMO_NO_SYNCPOINT
- MQGMO_SYNCPOINT_IF_PERSISTENT
- MQGMO_UNLOCK

**Note:** On IMS and CICS, you might have to issue an extran IBM MQ call after backing out a unit of work containing a message marked with MQGMO_MARK_SKIP_BACKOUT. You must issue an IBM MQ call before you commit the new unit of work containing the marked message. The call can be any IBM MQ call you like.

1. On IMS, if you have not applied IMS APAR PN60855 and you are running an IMS MPP or BMP application.
2. On CICS, if you are running any application.

In both cases, issue any IBM MQ call before committing the new unit of work containing the backed out message.

**Note:** Within a unit of work, there can be only one get request marked as skipping backout, as well as none or several unmarked get requests.

If an application backs out of a unit of work, a message that was retrieved using MQGMO_MARK_SKIP_BACKOUT is not restored to its previous state. Other resource updates are backed out. The message is treated as if it had been retrieved in a new unit of work started by the backout request. The message is retrieved without the MQGMO_MARK_SKIP_BACKOUT option.

MQGMO_MARK_SKIP_BACKOUT is useful if, after some resources have been changed, it becomes apparent that the unit of work cannot complete successfully. If you omit this option, backing out the unit of work reinstates the message on the queue. The same sequence of events occurs again, when the message is next retrieved.

However, if you specify MQGMO_MARK_SKIP_BACKOUT on the original MQGET call, backing out the unit of work backs out the updates to the other resources. The message is treated as if it had been retrieved under a new unit of work. The application can perform appropriate error handling. It can send a report message to the sender of the original message, or place the original message on the dead-letter queue. It can then commit the new unit of work. Committing the new unit of work removes the message permanently from the original queue.

MQGMO_MARK_SKIP_BACKOUT marks a single physical message. If the message belongs to a message group, the other messages in the group are not marked. Similarly, if the marked message is a segment of a logical message, the other segments in the logical message are not marked.

Any message in a group can be marked, but if messages are retrieved using MQGMO_LOGICAL_ORDER, it is advantageous to mark the first message in the group. If the unit of work is backed out, the first (marked) message is moved to the new unit of work. The second and later messages in the group are reinstated on the queue. The messages left on the queue cannot be retrieved by another application using MQGMO_LOGICAL_ORDER. The first message in the group is no longer on the queue. However, the application that backed the unit of work out can retrieve the second and later messages into the new unit of work using the MQGMO_LOGICAL_ORDER option. The first message has been retrieved already.

Occasionally you might need to back out the new unit of work. For example, because the dead-letter queue is full and the message must not be discarded. Backing out the new unit of work reinstates the message on the original queue, which prevents the message being lost. However, in this situation processing cannot continue. After backing out the new unit of work, the application must inform the operator or administrator that there is an unrecoverable error, and then finish.

MQGMO_MARK_SKIP_BACKOUT only works if the unit of work containing the get request is interrupted by the application backing it out. If the unit of work containing the get request is backed out because the transaction or system fails, MQGMO_MARK_SKIP_BACKOUT is ignored. Any message retrieved using this option is reinstated on the queue in the same way as messages retrieved without this option.

**Browse options**: The following options relate to browsing messages on the queue:

**MQGMO_BROWSE_FIRST**
When a queue is opened with the MQOO_BROWSE option, a browse cursor is established, positioned logically before the first message on the queue. You can then use MQGET calls specifying the MQGMO_BROWSE_FIRST, MQGMO_BROWSE_NEXT, or MQGMO_BROWSE_MSG_UNDER_CURSOR option to retrieve messages from the queue nondestructively. The browse cursor marks the position, within the messages on the queue, from which the next MQGET call with MQGMO_BROWSE_NEXT searches for a suitable message.

MQGMO_BROWSE_FIRST is not valid with any of the following options:

- MQGMO_BROWSE_MSG_UNDER_CURSOR
- MQGMO_BROWSE_NEXT
- MQGMO_MARK_SKIP_BACKOUT
- MQGMO_MSG_UNDER_CURSOR
- MQGMO_SYNCPOINT
- MQGMO_SYNCPOINT_IF_PERSISTENT
- MQGMO_UNLOCK

It is also an error if the queue was not opened for browse.

An MQGET call with MQGMO_BROWSE_FIRST ignores the previous position of the browse cursor. The first message on the queue that satisfies the conditions specified in the message descriptor is retrieved. The message remains on the queue, and the browse cursor is positioned on this message.

After this call, the browse cursor is positioned on the message that has been returned. The message might be removed from the queue before the next MQGET call with MQGMO_BROWSE_NEXT is issued. In this case, the browse cursor remains at the position in the queue that the message occupied, even though that position is now empty.

Use the MQGMO_MSG_UNDER_CURSOR option with a non-browse MQGET call, to remove the message from the queue.

The browse cursor is not moved by a non-browse MQGET call, even if using the same *Hobj* handle. Nor is it moved by a browse MQGET call that returns a completion code of MQCC_FAILED, or a reason code of MQRC_TRUNCATED_MSG_FAILED.

Specify the MQGMO_LOCK option with this option, to lock the message that is browsed.

You can specify MQGMO_BROWSE_FIRST with any valid combination of the MQGMO_* and MQMO_* options that control the processing of messages in groups and segments of logical messages.

If you specify MQGMO_LOGICAL_ORDER, the messages are browsed in logical order. If you omit that option, the messages are browsed in physical order. If you specify MQGMO_BROWSE_FIRST, you can switch between logical order and physical order. Subsequent MQGET calls using MQGMO_BROWSE_NEXT browse the queue in the same order as the most recent call that specified MQGMO_BROWSE_FIRST for the queue handle.

The queue manager retains two sets of group and segment information for MQGET calls. The group and segment information for browse calls are retained separately from the information for calls that remove messages from the queue. If you specify MQGMO_BROWSE_FIRST, the queue manager ignores the group and segment information for browsing. It scans the queue as though there were no current group and no current logical message. If the MQGET call is successful, completion code MQCC_OK or MQCC_WARNING, the group and segment information for browsing is set to that of the message returned. If the call fails, the group and segment information remain the same as they were before the call.

**MQGMO_BROWSE_NEXT**
Advance the browse cursor to the next message on the queue that satisfies the selection criteria specified on the MQGET call. The message is returned to the application, but remains on the queue.

MQGMO_BROWSE_NEXT is not valid with any of the following options:

- MQGMO_BROWSE_FIRST
- MQGMO_BROWSE_MSG_UNDER_CURSOR
- MQGMO_MARK_SKIP_BACKOUT
- MQGMO_MSG_UNDER_CURSOR
- MQGMO_SYNCPOINT
- MQGMO_SYNCPOINT_IF_PERSISTENT
- MQGMO_UNLOCK

It is also an error if the queue was not opened for browse.

MQGMO_BROWSE_NEXT behaves the same way as MQGMO_BROWSE_FIRST, if it is the first call to browse a queue, after the queue has been opened for browse.

The message under cursor might be removed from the queue before the next MQGET call with MQGMO_BROWSE_NEXT is issued. The browse cursor logically remains at the position in the queue that the message occupied, even though that position is now empty.

Messages are stored on the queue in one of two ways:

- FIFO within priority ( MQMDS_PRIORITY), or
- FIFO *regardless* of priority ( MQMDS_FIFO)

The *MsgDeliverySequence* queue attribute indicates which method applies (see “Attributes for queues” on page 810 for details).

A queue might have a *MsgDeliverySequence* of MQMDS_PRIORITY. A message arrives on the queue that is of a higher priority than the one currently pointed to by the browse cursor. In which case, the higher priority message is not found during the current sweep of the queue using MQGMO_BROWSE_NEXT. It can be found only after the browse cursor has been reset with MQGMO_BROWSE_FIRST, or by reopening the queue.

The MQGMO_MSG_UNDER_CURSOR option can be used with a non-browse MQGET call if required, to remove the message from the queue.

The browse cursor is not moved by non-browse MQGET calls using the same *Hobj* handle.

Specify the MQGMO_LOCK option with this option to lock the message that is browsed.

You can specify MQGMO_BROWSE_NEXT with any valid combination of the MQGMO_* and MQMO_* options that control the processing of messages in groups and segments of logical messages.

If you specify MQGMO_LOGICAL_ORDER, the messages are browsed in logical order. If you omit that option, the messages are browsed in physical order. If you specify MQGMO_BROWSE_FIRST, you can switch between logical order and physical order. Subsequent MQGET calls using MQGMO_BROWSE_NEXT browse the queue in the same order as the most recent call that specified MQGMO_BROWSE_FIRST for the queue handle. The call fails with reason code MQRC_INCONSISTENT_BROWSE if this condition is not satisfied.

**Note:** Take special care when using an MQGET call to browse beyond the end of a message group if MQGMO_LOGICAL_ORDER is not specified. For example, suppose that the last message in the group precedes the first message in the group on the queue. Using MQGMO_BROWSE_NEXT to browse beyond the end of the group, specifying MQMO_MATCH_MSG_SEQ_NUMBER with *MsgSeqNumber* set to 1 returns the first message in the group already browsed. This result can happen immediately, or a number of MQGET calls later if there are intervening groups. The same consideration applies for a logical message not in a group.

The group and segment information for browse calls are retained separately from the information for calls that remove messages from the queue.

**MQGMO_BROWSE_MSG_UNDER_CURSOR**
Retrieve the message pointed to by the browse cursor nondestructively, regardless of the MQMO_* options specified in the *MatchOptions* field in MQGMO.

MQGMO_BROWSE_MSG_UNDER_CURSOR is not valid with any of the following options:

- MQGMO_BROWSE_FIRST
- MQGMO_BROWSE_NEXT
- MQGMO_MARK_SKIP_BACKOUT
- MQGMO_MSG_UNDER_CURSOR
- MQGMO_SYNCPOINT
- MQGMO_SYNCPOINT_IF_PERSISTENT
- MQGMO_UNLOCK

It is also an error if the queue was not opened for browse.

The message pointed to by the browse cursor is the one that was last retrieved using either the MQGMO_BROWSE_FIRST or the MQGMO_BROWSE_NEXT option. The call fails if neither of these calls has been issued for this queue since it was opened. The call also fails if the message that was under the browse cursor has since been retrieved destructively.

The position of the browse cursor is not changed by this call.

The MQGMO_MSG_UNDER_CURSOR option can be used with a non-browse MQGET call, to remove the message from the queue.

The browse cursor is not moved by a non-browse MQGET call, even if using the same *Hobj* handle. Nor is it moved by a browse MQGET call that returns a completion code of MQCC_FAILED, or a reason code of MQRC_TRUNCATED_MSG_FAILED.

If MQGMO_BROWSE_MSG_UNDER_CURSOR is specified with MQGMO_LOCK:

- If there is already a message locked, it must be the one under the cursor, so that is returned without unlocking and locking again. The message remains locked.
- If there is no locked message and there is a message under the browse cursor, it is locked and returned to the application. If there is no message under the browse cursor, the call fails.

If MQGMO_BROWSE_MSG_UNDER_CURSOR is specified without MQGMO_LOCK:

- If there is already a message locked, it must be the one under the cursor. The message is returned to the application and then unlocked. Because the message is now unlocked, there is no guarantee

that it can be browsed again, or retrieved destructively by the same application. It might have been retrieved destructively by another application getting messages from the queue.

- If there is no locked message and there is a message under the browse cursor, it is returned to the application. If there is no message under the browse cursor the call fails.

If MQGMO_COMPLETE_MSG is specified with MQGMO_BROWSE_MSG_UNDER_CURSOR, the browse cursor must identify a message whose *Offset* field in MQMD is zero. If this condition is not satisfied, the call fails with reason code MQRC_INVALID_MSG_UNDER_CURSOR.

The group and segment information for browse calls are retained separately from the information for calls that remove messages from the queue.

**MQGMO_MSG_UNDER_CURSOR**
Retrieve the message pointed to by the browse cursor, regardless of the MQMO_* options specified in the *MatchOptions* field in MQGMO. The message is removed from the queue.

The message pointed to by the browse cursor is the one that was last retrieved using either the MQGMO_BROWSE_FIRST or the MQGMO_BROWSE_NEXT option.

If MQGMO_COMPLETE_MSG is specified with MQGMO_MSG_UNDER_CURSOR, the browse cursor must identify a message whose *Offset* field in MQMD is zero. If this condition is not satisfied, the call fails with reason code MQRC_INVALID_MSG_UNDER_CURSOR.

This option is not valid with any of the following options:

- MQGMO_BROWSE_FIRST
- MQGMO_BROWSE_MSG_UNDER_CURSOR
- MQGMO_BROWSE_NEXT
- MQGMO_UNLOCK

It is also an error if the queue was not opened both for browse and for input. If the browse cursor is not currently pointing to a retrievable message, an error is returned by the MQGET call.

**MQGMO_MARK_BROWSE_HANDLE**
The message that is returned by a successful MQGET, or identified by the returned *MsgToken*, is marked. The mark is specific to the object handle used in the call.

The message is not removed from the queue.

MQGMO_MARK_BROWSE_HANDLE is valid only if one of the following options is also specified:

- MQGMO_BROWSE_FIRST
- MQGMO_BROWSE_MSG_UNDER_CURSOR
- MQGMO_BROWSE_NEXT

MQGMO_MARK_BROWSE_HANDLE is not valid with any of the following options:

- MQGMO_ALL_MSGS_AVAILABLE
- MQGMO_ALL_SEGMENTS_AVAILABLE
- MQGMO_COMPLETE_MSG
- MQGMO_LOCK
- MQGMO_LOGICAL_ORDER
- MQGMO_UNLOCK

The message remains in this state until one of the following events occurs:

- The object handle concerned is closed, either normally or otherwise.
- The message is unmarked for this handle by a call to MQGET with the option MQGMO_UNMARK_BROWSE_HANDLE.
- The message is returned from a call to destructive MQGET, which completes with MQCC_OK or MQCC_WARNING. The message state remains changed even if the MQGET is later rolled-back.

- The message expires.

**MQGMO_MARK_BROWSE_CO_OP**
The message that is returned by a successful MQGET, or identified by the returned *MsgToken*, is marked for all handles in the cooperating set.

The cooperative level mark is in addition to any handle level mark that might have been set.

The message is not removed from the queue.

MQGMO_MARK_BROWSE_CO_OP is valid only if the object handle used was returned by a call to MQOPEN that specified MQOO_CO_OP. You must also specify one of the following MQGMO options:

- MQGMO_BROWSE_FIRST
- MQGMO_BROWSE_MSG_UNDER_CURSOR
- MQGMO_BROWSE_NEXT

This option is not valid with any of the following options:

- MQGMO_ALL_MSGS_AVAILABLE
- MQGMO_ALL_SEGMENTS_AVAILABLE
- MQGMO_COMPLETE_MSG
- MQGMO_LOCK
- MQGMO_LOGICAL_ORDER
- MQGMO_UNLOCK

If the message is already marked, and the option MQGMO_UNMARKED_BROWSE_MSG is not specified, the call fails with MQCC_FAILED and reason code MQRC_MSG_MARKED_BROWSE_CO_OP.

The message remains in this state until one of the following events occurs:

- All object handles in the cooperating set are closed.
- The message is unmarked for cooperating browsers by a call to MQGET with the option MQGMO_UNMARK_BROWSE_CO_OP.
- The message is automatically unmarked by the queue manager.
- The message is returned from a call to a non-browse MQGET. The message state remains changed even if the MQGET is later rolled-back.
- The message expires.

**MQGMO_UNMARKED_BROWSE_MSG**
A call to MQGET that specifies MQGMO_UNMARKED_BROWSE_MSG returns a message that is considered to be unmarked for its handle. It does not return a message if the message was marked for its handle. It also does not return the message if the queue was opened by a call to MQOPEN, with the option MQOO_CO_OP, and the message has been marked by a member of the cooperating set.

This option is not valid with any of the following options:

- MQGMO_ALL_MSGS_AVAILABLE
- MQGMO_ALL_SEGMENTS_AVAILABLE
- MQGMO_COMPLETE_MSG
- MQGMO_LOCK
- MQGMO_LOGICAL_ORDER
- MQGMO_UNLOCK

**MQGMO_UNMARK_BROWSE_CO_OP**
After a call to MQGET that specifies this option, the message is no longer considered by any open handles in the set of cooperating handles to be marked for the cooperating set. The message is still considered to be marked at handle level if it was marked at handle level before this call.

Using MQGMO_UNMARK_BROWSE_CO_OP is valid only with a handle returned by a successful call to MQOPEN with the option MQOO_CO_OP. The MQGET succeeds even if the message is not considered to be marked by the cooperating set of handles.

MQGMO_UNMARK_BROWSE_CO_OP is not valid on a non-browse MQGET call, or with any of the following options:

- MQGMO_ALL_MSGS_AVAILABLE
- MQGMO_ALL_SEGMENTS_AVAILABLE
- MQGMO_COMPLETE_MSG
- MQGMO_LOCK
- MQGMO_LOGICAL_ORDER
- MQGMO_MARK_BROWSE_CO_OP
- MQGMO_UNLOCK
- MQGMO_UNMARKED_BROWSE_MSG

**MQGMO_UNMARK_BROWSE_HANDLE**
After a call to MQGET that specifies this option, the message located is no longer considered to be marked by this handle.

The call succeeds even if the message is not marked for this handle.

This option is not valid on a non-browse MQGET call, or with any of the following options:

- MQGMO_ALL_MSGS_AVAILABLE
- MQGMO_ALL_SEGMENTS_AVAILABLE
- MQGMO_COMPLETE_MSG
- MQGMO_LOCK
- MQGMO_LOGICAL_ORDER
- MQGMO_MARK_BROWSE_CO_OP
- MQGMO_UNLOCK
- MQGMO_UNMARKED_BROWSE_MSG

**Lock options**: The following options relate to locking messages on the queue:

**MQGMO_LOCK**
Lock the message that is browsed, so that the message becomes invisible to any other handle open for the queue. The option can be specified only if one of the following options is also specified:

- MQGMO_BROWSE_FIRST
- MQGMO_BROWSE_NEXT
- MQGMO_BROWSE_MSG_UNDER_CURSOR

Only one message can be locked for each queue handle. The message can be a logical message or a physical message:

- If you specify MQGMO_COMPLETE_MSG, all the message segments that make up the logical message are locked to the queue handle. The messages must all be present on the queue and available for retrieval.
- If you omit MQGMO_COMPLETE_MSG, only a single physical message is locked to the queue handle. If this message happens to be a segment of a logical message, the locked segment prevents other applications using MQGMO_COMPLETE_MSG to retrieve or browse the logical message.

The locked message is always the one under the browse cursor. The message can be removed from the queue by a later MQGET call that specifies the MQGMO_MSG_UNDER_CURSOR option. Other MQGET calls using the queue handle can also remove the message (for example, a call that specifies the message identifier of the locked message).

If the call returns completion code MQCC_FAILED, or MQCC_WARNING with reason code MQRC_TRUNCATED_MSG_FAILED, no message is locked.

If the application does not remove the message from the queue, the lock is released by one of the following actions:

- Issuing another MQGET call for this handle, specifying either MQGMO_BROWSE_FIRST or MQGMO_BROWSE_NEXT. The lock is released if the call completes with MQCC_OK or MQCC_WARNING. The message remains locked if the call completes with MQCC_FAILED. However, the following exceptions apply:
  - The message is not unlocked if MQCC_WARNING is returned with MQRC_TRUNCATED_MSG_FAILED.
  - The message is unlocked if MQCC_FAILED is returned with MQRC_NO_MSG_AVAILABLE.

  If you also specify MQGMO_LOCK, the message returned is locked. If you omit MQGMO_LOCK, there is no locked message after the call.

  If you specify MQGMO_WAIT, and no message is immediately available, the original message is unlocked before the start of the wait.
- Issuing another MQGET call for this handle, with MQGMO_BROWSE_MSG_UNDER_CURSOR, without MQGMO_LOCK. The lock is released if the call completes with MQCC_OK or MQCC_WARNING. The message remains locked if the call completes with MQCC_FAILED. However, the following exception applies:
  - The message is not unlocked if MQCC_WARNING is returned with MQRC_TRUNCATED_MSG_FAILED.
- Issuing another MQGET call for this handle with MQGMO_UNLOCK.
- Issuing an MQCLOSE call using the handle. The MQCLOSE might be implicit, caused by the application ending.

No special MQOPEN option is required to specify MQGMO_LOCK, other than MQOO_BROWSE, which is needed to specify an accompanying browse option.

MQGMO_LOCK is not valid with any of the following options:

- MQGMO_MARK_SKIP_BACKOUT
- MQGMO_SYNCPOINT
- MQGMO_SYNCPOINT_IF_PERSISTENT
- MQGMO_UNLOCK

MQGMO_LOCK is not possible when you are using an IBM MQ client on HP Integrity NonStop Server to a z/OS queue manager when coordinated by TMF.

**MQGMO_UNLOCK**
The message to be unlocked must have been previously locked by an MQGET call with the MQGMO_LOCK option. If there is no message locked for this handle, the call completes with MQCC_WARNING and MQRC_NO_MSG_LOCKED.

The *MsgDesc*, *BufferLength*, *Buffer*, and *DataLength* parameters are not checked or altered if you specify MQGMO_UNLOCK. No message is returned in *Buffer*.

No special open option is required to specify MQGMO_UNLOCK (although MQOO_BROWSE is needed to issue the lock request in the first place).

This option is not valid with any options except the following:

- MQGMO_NO_WAIT
- MQGMO_NO_SYNCPOINT

Both of these options are assumed whether specified or not.

**Message-data options**: The following options relate to the processing of the message data when the message is read from the queue:

**MQGMO_ACCEPT_TRUNCATED_MSG**
If the message buffer is too small to hold the complete message, allow the MQGET call to fill the buffer. MQGET fills the buffer with as much of the message it can. It issues a warning completion code, and completes its processing. This means that:

- When browsing messages, the browse cursor is advanced to the returned message.
- When removing messages, the returned message is removed from the queue.
- Reason code MQRC_TRUNCATED_MSG_ACCEPTED is returned if no other error occurs.

Without this option, the buffer is still filled with as much of the message as it can hold. A warning completion code is issued, but processing is not completed. This means that:

- When browsing messages, the browse cursor is not advanced.
- When removing messages, the message is not removed from the queue.
- Reason code MQRC_TRUNCATED_MSG_FAILED is returned if no other error occurs.

**MQGMO_CONVERT**
This option converts the application data in the message to conform to the *CodedCharSetId* and *Encoding* values specified in the *MsgDesc* parameter on the MQGET call. The data is converted before it is copied to the *Buffer* parameter.

The *Format* field specified when the message was put is assumed by the conversion process to identify the nature of the data in the message. The message data is converted by the queue manager for built-in formats, and by a user-written exit for other formats. See "Data-conversion exit" on page 879 for details of the data-conversion exit.

- If conversion is successful, the *CodedCharSetId* and *Encoding* fields specified in the *MsgDesc* parameter are unchanged on return from the MQGET call.
- If only conversion fails the message data is returned unconverted The *CodedCharSetId* and *Encoding* fields in *MsgDesc* are set to the values for the unconverted message. The completion code is MQCC_WARNING in this case.

In either case, these fields describe the character-set identifier and encoding of the message data that is returned in the *Buffer* parameter.

See the *Format* field described in "MQMD - Message descriptor" on page 402 for a list of format names for which the queue manager performs the conversion.

**Group and segment options**: The following options relate to the processing of messages in groups and segments of logical messages. Before the option descriptions, here are some definitions of important terms:

**Physical message**
A physical message is the smallest unit of information that can be placed on or removed from a queue. It often corresponds to the information specified or retrieved on a single MQPUT, MQPUT1, or MQGET call. Every physical message has its own message descriptor, MQMD. Typically, physical messages are distinguished by differing values for the message identifier, the *MsgId* field in MQMD. The queue manager does not enforce different values.

**Logical message**
A logical message is a single unit of application information. In the absence of system constraints, a logical message is the same as a physical message. If logical messages are large, system constraints might make it advisable or necessary to split a logical message into two or more physical messages, called segments.

A logical message that has been segmented consists of two or more physical messages that have the same nonnull group identifier, *GroupId* field in MQMD. They have the same message sequence number, *MsgSeqNumber* field in MQMD. The segments are distinguished by differing values for the segment offset, *Offset* field in MQMD. The segment offset is the offset of the data in the physical

message from the start of the data in the logical message. Because each segment is a physical message, the segments in a logical message typically have different message identifiers.

A logical message that has not been segmented, but for which segmentation has been permitted by the sending application, also has a nonnull group identifier. In this case there is only one physical message with that group identifier if the logical message does not belong to a message group. Logical messages, for which segmentation has been inhibited by the sending application, have a null group identifier, MQGI_NONE, unless the logical message belongs to a message group.

**Message group**

A message group is a set of one or more logical messages that have the same nonnull group identifier. The logical messages in the group are distinguished by different values for the message sequence number. The sequence number is an integer in the range 1 through n, where n is the number of logical messages in the group. If one or more of the logical messages is segmented, there are more than n physical messages in the group.

**MQGMO_LOGICAL_ORDER**

MQGMO_LOGICAL_ORDER controls the order in which messages are returned by successive MQGET calls for the queue handle. The option must be specified on each call.

If MQGMO_LOGICAL_ORDER is specified for successive MQGET calls for the same queue handle, messages in groups are returned in the order of their message sequence numbers. Segments of logical messages are returned in the order given by their segment offsets. This order might be different from the order in which those messages and segments occur on the queue.

**Note:** Specifying MQGMO_LOGICAL_ORDER has no adverse consequences on messages that do not belong to groups and that are not segments. In effect, such messages are treated as though each belonged to a message group consisting of only one message. It is safe to specify MQGMO_LOGICAL_ORDER when retrieving messages from queues that contain a mixture of messages in groups, message segments, and unsegmented messages not in groups.

To return the messages in the required order, the queue manager retains the group and segment information between successive MQGET calls. The group and segment information identifies the current message group and current logical message for the queue handle. It also identifies the current position within the group and logical message, and whether the messages are being retrieved within a unit of work. Because the queue manager retains this information, the application does not need to set the group and segment information before each MQGET call. Specifically, it means that the application does not need to set the *GroupId*, *MsgSeqNumber*, and *Offset* fields in MQMD. However, the application must set the MQGMO_SYNCPOINT or MQGMO_NO_SYNCPOINT option correctly on each call.

When the queue is opened, there is no current message group and no current logical message. A message group becomes the current message group when a message that has the MQMF_MSG_IN_GROUP flag is returned by the MQGET call. With MQGMO_LOGICAL_ORDER specified on successive calls, that group remains the current group until a message is returned that has:

- MQMF_LAST_MSG_IN_GROUP without MQMF_SEGMENT (that is, the last logical message in the group is not segmented), or
- MQMF_LAST_MSG_IN_GROUP with MQMF_LAST_SEGMENT (that is, the message returned is the last segment of the last logical message in the group).

When such a message is returned, the message group is terminated, and on successful completion of the MQGET call there is no longer a current group. In a similar way, a logical message becomes the current logical message when a message that has the MQMF_SEGMENT flag is returned by the MQGET call. The logical message is terminated when the message that has the MQMF_LAST_SEGMENT flag is returned.

If no selection criteria are specified, successive MQGET calls return, in the correct order, the messages for the first message group on the queue. They then return the messages for the second message group, and so on, until there are no more messages available. It is possible to select the particular message groups returned by specifying one or more of the following options in the *MatchOptions* field:

- MQMO_MATCH_MSG_ID
- MQMO_MATCH_CORREL_ID
- MQMO_MATCH_GROUP_ID

However, these options are effective only when there is no current message group or logical message. See the *MatchOptions* field described in "MQGMO - Get-message options" on page 355 for further details.

Table 495 on page 374 shows the values of the *MsgId*, *CorrelId*, *GroupId*, *MsgSeqNumber*, and *Offset* fields that the queue manager looks for when attempting to find a message to return on the MQGET call. The rules apply both to removing messages from the queue, and browsing messages on the queue. In the table, Either means Yes or No:

**LOG ORD**
Indicates whether the MQGMO_LOGICAL_ORDER option is specified on the call.

**Cur grp**
Indicates whether a current message group exists before the call.

**Cur log msg**
Indicates whether a current logical message exists before the call.

**Other columns**
Show the values that the queue manager looks for. Previous denotes the value returned for the field in the previous message for the queue handle.

*Table 495. MQGET options relating to messages in groups and segments of logical messages*

| Options you specify | Group and log-msg status before call | | Values the queue manager looks for | | | | |
|---|---|---|---|---|---|---|---|
| **LOG ORD** | **Cur grp** | **Cur log msg** | *MsgId* | *CorrelId* | *GroupId* | *MsgSeqNumber* | *Offset* |
| Yes | No | No | Controlled by *MatchOptions* | Controlled by *MatchOptions* | Controlled by *MatchOptions* | 1 | 0 |
| Yes | No | Yes | Any message identifier | Any correlation identifier | Previous group identifier | 1 | Previous offset + previous segment length |
| Yes | Yes | No | Any message identifier | Any correlation identifier | Previous group identifier | Previous sequence number + 1 | 0 |
| Yes | Yes | Yes | Any message identifier | Any correlation identifier | Previous group identifier | Previous sequence number | Previous offset + previous segment length |
| No | Either | Either | Controlled by *MatchOptions* | Controlled by *MatchOptions* | Controlled by *MatchOptions* | Controlled by *MatchOptions* | Controlled by *MatchOptions* |

If multiple message groups are present on the queue and eligible for return, the groups are returned in the order determined by the position on the queue of the first segment of the first logical message in each group. That is, the physical messages that have message sequence numbers of 1, and offsets of 0, determine the order in which eligible groups are returned.

The MQGMO_LOGICAL_ORDER option affects units of work as follows:

- If the first logical message or segment in a group is retrieved within a unit of work, all the other logical messages and segments in the group must be retrieved within a unit of work, if the same queue handle is used. However, they need not be retrieved within the same unit of work. This allows a message group consisting of many physical messages to be split across two or more consecutive units of work for the queue handle.
- If the first logical message or segment in a group is *not* retrieved within a unit of work, and the same queue handle is used, none of the other logical messages and segments in the group can be retrieved within a unit of work.

If these conditions are not satisfied, the MQGET call fails with reason code MQRC_INCONSISTENT_UOW.

When MQGMO_LOGICAL_ORDER is specified, the MQGMO supplied on the MQGET call must not be less than MQGMO_VERSION_2, and the MQMD must not be less than MQMD_VERSION_2. If this condition is not satisfied, the call fails with reason code MQRC_WRONG_GMO_VERSION or MQRC_WRONG_MD_VERSION, as appropriate.

If MQGMO_LOGICAL_ORDER is *not* specified for successive MQGET calls for the queue handle, messages are returned without regard for whether they belong to message groups, or whether they are segments of logical messages. This means that messages or segments from a particular group or logical message might be returned out of order, or intermingled with messages or segments from other groups or logical messages, or with messages that are not in groups and are not segments. In this situation, the particular messages that are returned by successive MQGET calls is controlled by the MQMO_* options specified on those calls (see the *MatchOptions* field described in "MQGMO - Get-message options" on page 355 for details of these options).

This is the technique that can be used to restart a message group or logical message in the middle, after a system failure has occurred. When the system restarts, the application can set the *GroupId*, *MsgSeqNumber*, *Offset*, and *MatchOptions* fields to the appropriate values, and then issue the MQGET call with MQGMO_SYNCPOINT or MQGMO_NO_SYNCPOINT set, but *without* specifying MQGMO_LOGICAL_ORDER. If this call is successful, the queue manager retains the group and segment information, and subsequent MQGET calls using that queue handle can specify MQGMO_LOGICAL_ORDER as normal.

The group and segment information that the queue manager retains for the MQGET call is separate from the group and segment information that it retains for the MQPUT call. In addition, the queue manager retains separate information for:

- MQGET calls that remove messages from the queue.
- MQGET calls that browse messages on the queue.

For any given queue handle, the application can mix MQGET calls that specify MQGMO_LOGICAL_ORDER with MQGET calls that do not. However, note the following points:

- If you omit MQGMO_LOGICAL_ORDER, each successful MQGET call causes the queue manager to set the saved group and segment information to the values corresponding to the message returned; this replaces the existing group and segment information retained by the queue manager for the queue handle. Only the information appropriate to the action of the call (browse or remove) is modified.
- If you omit MQGMO_LOGICAL_ORDER, the call does not fail if there is a current message group or logical message; the call might succeed with an MQCC_WARNING completion code. Table 496 on page 376 shows the various cases that can arise. In these cases, if the completion code is not MQCC_OK, the reason code is one of the following (as appropriate):
  - MQRC_INCOMPLETE_GROUP
  - MQRC_INCOMPLETE_MSG
  - MQRC_INCONSISTENT_UOW

  **Note:** The queue manager does not check the group and segment information when browsing a queue, or when closing a queue that was opened for browse but not input; in those cases the completion code is always MQCC_OK (assuming no other errors).

| *Table 496. Outcome when MQGET or MQCLOSE call is not consistent with group and segment information* | | |
|---|---|---|
| **Current call is** | **Previous call was MQGET with MQGMO_LOGICAL_ORDER** | **Previous call was MQGET without MQGMO_LOGICAL_ORDER** |
| MQGET with MQGMO_LOGICAL_ORDER | MQCC_FAILED | MQCC_FAILED |
| MQGET without MQGMO_LOGICAL_ORDER | MQCC_WARNING | MQCC_OK |
| MQCLOSE with an unterminated group or logical message | MQCC_WARNING | MQCC_OK |

Applications that want to retrieve messages and segments in logical order are recommended to specify MQGMO_LOGICAL_ORDER, as this is the simplest option to use. This option relieves the application of the need to manage the group and segment information, because the queue manager manages that information. However, specialized applications might need more control than that provided by the MQGMO_LOGICAL_ORDER option, and this can be achieved by not specifying that option. The application must then ensure that the *MsgId*, *CorrelId*, *GroupId*, *MsgSeqNumber*, and *Offset* fields in MQMD, and the MQMO_* options in *MatchOptions* in MQGMO, are set correctly, before each MQGET call.

For example, an application that wants to *forward* physical messages that it receives, without regard for whether those messages are in groups or segments of logical messages, must *not* specify MQGMO_LOGICAL_ORDER. In a complex network with multiple paths between sending and receiving queue managers, the physical messages might arrive out of order. By specifying neither MQGMO_LOGICAL_ORDER, nor the corresponding MQPMO_LOGICAL_ORDER on the MQPUT call, the forwarding application can retrieve and forward each physical message as soon as it arrives, without having to wait for the next one in logical order to arrive.

You can specify MQGMO_LOGICAL_ORDER with any of the other MQGMO_* options, and with various of the MQMO_* options in appropriate circumstances (see preceding section).

- On z/OS, this option is supported for private and shared queues, but the queue must have an index type of MQIT_GROUP_ID. For shared queues, the CFSTRUCT object that the queue maps to must be at CFLEVEL(3) or higher.
- On AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems, this option is supported for all local queues.

**MQGMO_COMPLETE_MSG**

Only a complete logical message can be returned by the MQGET call. If the logical message is segmented, the queue manager reassembles the segments and returns the complete logical message to the application; the fact that the logical message was segmented is not apparent to the application retrieving it.

**Note:** This is the only option that causes the queue manager to reassemble message segments. If not specified, segments are returned individually to the application if they are present on the queue (and they satisfy the other selection criteria specified on the MQGET call). Applications that do not want to receive individual segments must always specify MQGMO_COMPLETE_MSG.

To use this option, the application must provide a buffer that is big enough to accommodate the complete message, or specify the MQGMO_ACCEPT_TRUNCATED_MSG option.

If the queue contains segmented messages with some of the segments missing (perhaps because they have been delayed in the network and have not yet arrived), specifying MQGMO_COMPLETE_MSG prevents the retrieval of segments belonging to incomplete logical messages. However, those message segments still contribute to the value of the *CurrentQDepth* queue attribute; this means that there might be no retrievable logical messages, even though *CurrentQDepth* is greater than zero.

For *persistent* messages, the queue manager can reassemble the segments only within a unit of work:

- If the MQGET call is operating within a user-defined unit of work, that unit of work is used. If the call fails during the reassembly process, the queue manager reinstates on the queue any segments that were removed during reassembly. However, the failure does not prevent the unit of work being committed successfully.
- If the call is operating outside a user-defined unit of work, and there is no user-defined unit of work in existence, the queue manager creates a unit of work for the duration of the call. If the call is successful, the queue manager commits the unit of work automatically (the application does not need to do this). If the call fails, the queue manager backs out the unit of work.
- If the call is operating outside a user-defined unit of work, but a user-defined unit of work exists, the queue manager cannot reassemble. If the message does not require reassembly, the call can still succeed. But if the message requires reassembly, the call fails with reason code MQRC_UOW_NOT_AVAILABLE.

For *nonpersistent* messages, the queue manager does not require a unit of work to be available to perform reassembly.

Each physical message that is a segment has its own message descriptor. For the segments constituting a single logical message, most of the fields in the message descriptor are the same for all segments in the logical message; typically it is only the *MsgId*, *Offset*, and *MsgFlags* fields that differ between segments in the logical message. However, if a segment is placed on a dead-letter queue at an intermediate queue manager, the DLQ handler retrieves the message specifying the MQGMO_CONVERT option, and this can result in the character set or encoding of the segment being changed. If the DLQ handler successfully sends the segment on its way, the segment might have a character set or encoding that differs from the other segments in the logical message when the segment arrives at the destination queue manager.

A logical message consisting of segments in which the *CodedCharSetId* and *Encoding* fields differ cannot be reassembled by the queue manager into a single logical message. Instead, the queue manager reassembles and returns the first few consecutive segments at the start of the logical message that have the same character-set identifiers and encodings, and the MQGET call completes with completion code MQCC_WARNING and reason code MQRC_INCONSISTENT_CCSIDS or MQRC_INCONSISTENT_ENCODINGS, as appropriate. This happens regardless of whether MQGMO_CONVERT is specified. To retrieve the remaining segments, the application must reissue the MQGET call without the MQGMO_COMPLETE_MSG option, retrieving the segments one by one. MQGMO_LOGICAL_ORDER can be used to retrieve the remaining segments in order.

An application that puts segments can also set other fields in the message descriptor to values that differ between segments. However, there is no advantage in doing this if the receiving application uses MQGMO_COMPLETE_MSG to retrieve the logical message. When the queue manager reassembles a logical message, it returns in the message descriptor the values from the message descriptor for the *first* segment; the only exception is the *MsgFlags* field, which the queue manager sets to indicate that the reassembled message is the only segment.

If MQGMO_COMPLETE_MSG is specified for a report message, the queue manager performs special processing. The queue manager checks the queue to see if all the report messages of that report type relating to the different segments in the logical message are present on the queue. If they are, they can be retrieved as a single message by specifying MQGMO_COMPLETE_MSG. For this to be possible, either the report messages must be generated by a queue manager or MCA which supports segmentation, or the originating application must request at least 100 bytes of message data (that is, the appropriate MQRO_*_WITH_DATA or MQRO_*_WITH_FULL_DATA options must be specified). If less than the full amount of application data is present for a segment, the missing bytes are replaced by nulls in the report message returned.

If MQGMO_COMPLETE_MSG is specified with MQGMO_MSG_UNDER_CURSOR or MQGMO_BROWSE_MSG_UNDER_CURSOR, the browse cursor must be positioned on a message whose *Offset* field in MQMD has a value of 0. If this condition is not satisfied, the call fails with reason code MQRC_INVALID_MSG_UNDER_CURSOR.

MQGMO_COMPLETE_MSG implies MQGMO_ALL_SEGMENTS_AVAILABLE, which need not therefore be specified.

MQGMO_COMPLETE_MSG can be specified with any of the other MQGMO_* options apart from MQGMO_SYNCPOINT_IF_PERSISTENT, and with any of the MQMO_* options apart from MQMO_MATCH_OFFSET.

- On z/OS, this option is supported for private and shared queues, but the queue must have an index type of MQIT_GROUP_ID. For shared queues, the CFSTRUCT object that the queue map to must be at CFLEVEL(3) or higher.
- On AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems, this option is supported for all local queues.

**MQGMO_ALL_MSGS_AVAILABLE**
Messages in a group become available for retrieval only when *all* messages in the group are available. If the queue contains message groups with some of the messages missing (perhaps because they have been delayed in the network and have not yet arrived), specifying MQGMO_ALL_MSGS_AVAILABLE prevents retrieval of messages belonging to incomplete groups. However, those messages still contribute to the value of the *CurrentQDepth* queue attribute; this means that there may be no retrievable message groups, even though *CurrentQDepth* is greater than zero. If there are no other messages that are retrievable, reason code MQRC_NO_MSG_AVAILABLE is returned after the specified wait interval (if any) has expired.

The processing of MQGMO_ALL_MSGS_AVAILABLE depends on whether MQGMO_LOGICAL_ORDER is also specified:

- If both options are specified, MQGMO_ALL_MSGS_AVAILABLE has an effect *only* when there is no current group or logical message. If there *is* a current group or logical message, MQGMO_ALL_MSGS_AVAILABLE is ignored. This means that MQGMO_ALL_MSGS_AVAILABLE can remain on when processing messages in logical order.
- If MQGMO_ALL_MSGS_AVAILABLE is specified without MQGMO_LOGICAL_ORDER, MQGMO_ALL_MSGS_AVAILABLE *always* has an effect. This means that the option must be turned off after the first message in the group has been removed from the queue, in order to be able to remove the remaining messages in the group.

Successful completion of an MQGET call specifying MQGMO_ALL_MSGS_AVAILABLE means that at the time that the MQGET call was issued, all the messages in the group were on the queue. However, be aware that other applications can still remove messages from the group (the group is not locked to the application that retrieves the first message in the group).

If you omit this option, messages belonging to groups can be retrieved even when the group is incomplete.

MQGMO_ALL_MSGS_AVAILABLE implies MQGMO_ALL_SEGMENTS_AVAILABLE, which need not therefore be specified.

MQGMO_ALL_MSGS_AVAILABLE can be specified with any of the other MQGMO_* options, and with any of the MQMO_* options.

- On z/OS, this option is supported for private and shared queues, but the queue must have an index type of MQIT_GROUP_ID. For shared queues, the CFSTRUCT object that the queue map to must be at CFLEVEL(3) or higher.
- On AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems, this option is supported for all local queues.

**MQGMO_ALL_SEGMENTS_AVAILABLE**
Segments in a logical message become available for retrieval only when *all* segments in the logical message are available. If the queue contains segmented messages with some of the segments missing (perhaps because they have been delayed in the network and have not yet arrived), specifying MQGMO_ALL_SEGMENTS_AVAILABLE prevents retrieval of segments belonging to incomplete logical messages. However, those segments still contribute to the value of the *CurrentQDepth* queue attribute; this means that there might be no retrievable logical messages, even though *CurrentQDepth* is greater than zero. If there are no other messages that are retrievable, reason code MQRC_NO_MSG_AVAILABLE is returned after the specified wait interval (if any) has expired.

The processing of MQGMO_ALL_SEGMENTS_AVAILABLE depends on whether MQGMO_LOGICAL_ORDER is also specified:

- If both options are specified, MQGMO_ALL_SEGMENTS_AVAILABLE has an effect *only* when there is no current logical message. If there *is* a current logical message, MQGMO_ALL_SEGMENTS_AVAILABLE is ignored. This means that MQGMO_ALL_SEGMENTS_AVAILABLE can remain on when processing messages in logical order.
- If MQGMO_ALL_SEGMENTS_AVAILABLE is specified without MQGMO_LOGICAL_ORDER, MQGMO_ALL_SEGMENTS_AVAILABLE *always* has an effect. This means that the option must be turned off after the first segment in the logical message has been removed from the queue, in order to be able to remove the remaining segments in the logical message.

If this option is not specified, message segments can be retrieved even when the logical message is incomplete.

While both MQGMO_COMPLETE_MSG and MQGMO_ALL_SEGMENTS_AVAILABLE require all segments to be available before any of them can be retrieved, the former returns the complete message, whereas the latter allows the segments to be retrieved one by one.

If MQGMO_ALL_SEGMENTS_AVAILABLE is specified for a report message, the queue manager checks the queue to see if there is at least one report message for each of the segments that make up the complete logical message. If there is, the MQGMO_ALL_SEGMENTS_AVAILABLE condition is satisfied. However, the queue manager does not check the *type* of the report messages present, and so there might be a mixture of report types in the report messages relating to the segments of the logical message. As a result, the success of MQGMO_ALL_SEGMENTS_AVAILABLE does not imply that MQGMO_COMPLETE_MSG will succeed. If there *is* a mixture of report types present for the segments of a particular logical message, those report messages must be retrieved one by one.

You can specify MQGMO_ALL_SEGMENTS_AVAILABLE with any of the other MQGMO_* options, and with any of the MQMO_* options.

- On z/OS, this option is supported for private and shared queues, but the queue must have an index type of MQIT_GROUP_ID. For shared queues, the CFSTRUCT object that the queue map to must be at CFLEVEL(3) or higher.
- On AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems, this option is supported for all local queues.

**Property options**: The following options relate to the properties of the message:

**MQGMO_PROPERTIES_AS_Q_DEF**

Properties of the message, except those contained in the message descriptor (or extension) should be represented as defined by the *PropertyControl* queue attribute. If a *MsgHandle* is provided this option is ignored and the properties of the message are available via the *MsgHandle*, unless the value of the *PropertyControl* queue attribute is MQPROP_FORCE_MQRFH2.

This is the default action if no property options are specified.

**MQGMO_PROPERTIES_IN_HANDLE**

Properties of the message should be made available via the *MsgHandle*. If no message handle is provided the call fails with reason MQRC_HMSG_ERROR.

**Note:** If the message is later read by an application that does not create a message handle, the queue manager places any message properties into an MQRFH2 structure. You might find that the presence of an unexpected MQRFH2 header disrupts the behavior of an existing application.

**MQGMO_NO_PROPERTIES**

No properties of the message, except those contained in the message descriptor (or extension) will be retrieved. If a *MsgHandle* is provided it will be ignored.

**MQGMO_PROPERTIES_FORCE_MQRFH2**

Properties of the message, except those contained in the message descriptor (or extension) should be represented using MQRFH2 headers. This provides compatibility with earlier version for applications which are expecting to retrieve properties but are unable to be changed to use message handles. If a *MsgHandle* is provided it is ignored.

**MQGMO_PROPERTIES_COMPATIBILITY**

If the message contains a property with a prefix of **"mcd."**, **"jms."**, **"usr."**, or **"mqext."**, all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

**Default option**: If none of the options described is required, the following option can be used:

**MQGMO_NONE**

Use this value to indicate that no other options have been specified; all options assume their default values. MQGMO_NONE aids program documentation; it is not intended that this option be used with any other, but as its value is zero, such use cannot be detected.

The initial value of the *Options* field is MQGMO_NO_WAIT plus MQGMO_PROPERTIES_AS_Q_DEF.

*Reserved1 (MQCHAR)*

This is a reserved field. The initial value of this field is a blank character. This field is ignored if *Version* is less than MQGMO_VERSION_2.

*Reserved2 (MQLONG)*

This is a reserved field. The initial value of this field is a blank character. This field is ignored if *Version* is less than **MQGMO_VERSION_4**.

*ResolvedQName (MQCHAR48)*

This is an output field that the queue manager sets to the local name of the queue from which the message was retrieved, as defined to the local queue manager. This is different from the name used to open the queue if:

- An alias queue was opened (in which case, the name of the local queue to which the alias resolved is returned), or
- A model queue was opened (in which case, the name of the dynamic local queue is returned).

The length of this field is given by MQ_Q_NAME_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*ReturnedLength (MQLONG)*

This is an output field that the queue manager sets to the length in bytes of the message data returned by the MQGET call in the *Buffer* parameter. If the queue manager does not support this capability, *ReturnedLength* is set to the value MQRL_UNDEFINED.

When messages are converted between encodings or character sets, the message data can sometimes change size. On return from the MQGET call:

- If *ReturnedLength* is *not* MQRL_UNDEFINED, the number of bytes of message data returned is given by *ReturnedLength*.
- If *ReturnedLength* has the value MQRL_UNDEFINED, the number of bytes of message data returned is usually given by the smaller of *BufferLength* and *DataLength*, but can be *less than* this if the MQGET call completes with reason code MQRC_TRUNCATED_MSG_ACCEPTED. If this happens, the insignificant bytes in the *Buffer* parameter are set to nulls.

The following special value is defined:

**MQRL_UNDEFINED**
Length of returned data not defined.

On z/OS, the value returned for the *ReturnedLength* field is always MQRL_UNDEFINED.

The initial value of this field is MQRL_UNDEFINED. This field is ignored if *Version* is less than MQGMO_VERSION_3.

*Segmentation (MQCHAR)*

This is a flag that indicates whether further segmentation is allowed for the message retrieved. It has one of the following values:

**MQSEG_INHIBITED**
Segmentation not allowed.

**MQSEG_ALLOWED**
Segmentation allowed.

On z/OS, the queue manager always sets this field to MQSEG_INHIBITED.

This is an output field. The initial value of this field is MQSEG_INHIBITED. This field is ignored if *Version* is less than MQGMO_VERSION_2.

*SegmentStatus (MQCHAR)*

This is a flag that indicates whether the message retrieved is a segment of a logical message. It has one of the following values:

**MQSS_NOT_A_SEGMENT**
Message is not a segment.

**MQSS_SEGMENT**
Message is a segment, but is not the last segment of the logical message.

**MQSS_LAST_SEGMENT**
Message is the last segment of the logical message.

This is also the value returned if the logical message consists of only one segment.

On z/OS, the queue manager always sets this field to MQSS_NOT_A_SEGMENT.

This is an output field. The initial value of this field is MQSS_NOT_A_SEGMENT. This field is ignored if *Version* is less than MQGMO_VERSION_2.

*Signal1 (MQLONG)*

This is an input field that is used only in conjunction with the MQGMO_SET_SIGNAL option; it identifies a signal that is to be delivered when a message is available.

**Note:** The data type and usage of this field are determined by the environment; for this reason, applications that you want to port between different environments must not use signals.

- On z/OS, this field must contain the address of an Event Control Block (ECB). The ECB must be cleared by the application before the MQGET call is issued. The storage containing the ECB must not be freed until the queue is closed. The ECB is posted by the queue manager with one of the signal completion codes described. These completion codes are set in bits 2 through 31 of the ECB, the area defined in the z/OS mapping macro IHAECB as being for a user completion code.
- In all other environments, this is a reserved field; its value is not significant.

The signal completion codes are:

**MQEC_MSG_ARRIVED**
A suitable message has arrived on the queue. This message has not been reserved for the caller; a second MQGET request must be issued, but another application might retrieve the message before the second request is made.

**MQEC_WAIT_INTERVAL_EXPIRED**
The specified *WaitInterval* has expired without a suitable message arriving.

**MQEC_WAIT_CANCELED**
The wait was canceled for an indeterminate reason (such as the queue manager terminating or the queue being disabled). Reissue the request if you want further diagnosis.

**MQEC_Q_MGR_QUIESCING**
The wait was canceled because the queue manager has entered the quiescing state (MQGMO_FAIL_IF_QUIESCING was specified on the MQGET call).

**MQEC_CONNECTION_QUIESCING**
The wait was canceled because the connection has entered the quiescing state (MQGMO_FAIL_IF_QUIESCING was specified on the MQGET call).

The initial value of this field is determined by the environment:

- On z/OS, the initial value is the null pointer.
- In all other environments, the initial value is `0`.

*Signal2 (MQLONG)*

This is an input field that is used only in conjunction with the MQGMO_SET_SIGNAL option. It is a reserved field; its value is not significant.

The initial value of this field is `0`.

*StrucId (MQCHAR4)*

This is the structure identifier. The value must be:

**MQGMO_STRUC_ID**
Identifier for get-message options structure.

For the C programming language, the constant MQGMO_STRUC_ID_ARRAY is also defined; this has the same value as MQGMO_STRUC_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQGMO_STRUC_ID.

*Version (MQLONG)*
Version is the structure version number.

The value must be one of the following:

**MQGMO_VERSION_1**
Version-1 get-message options structure.

This version is supported in all environments.

**MQGMO_VERSION_2**
Version-2 get-message options structure.

This version is supported in all environments.

**MQGMO_VERSION_3**
Version-3 get-message options structure.

This version is supported in all environments.

**MQGMO_VERSION_4**
Version-4 get-message options structure.

This version is supported in all environments.

Fields that exist only in the more-recent versions of the structure are identified as such in the descriptions of the fields. The following constant specifies the version number of the current version:

**MQGMO_CURRENT_VERSION**
Current version of get-message options structure.

This is always an input field. The initial value of this field is MQGMO_VERSION_1.

*WaitInterval (MQLONG)*

This is the approximate time, expressed in milliseconds, that the MQGET call waits for a suitable message to arrive (that is, a message satisfying the selection criteria specified in the *MsgDesc* parameter of the MQGET call.

**Important:** There is no wait, or delay, if a suitable message is available immediately.

See the *MsgId* field described in "MQMD - Message descriptor" on page 402 for more details). If no suitable message has arrived after this time has elapsed, the call completes with MQCC_FAILED and reason code MQRC_NO_MSG_AVAILABLE.

On z/OS, the period of time that the MQGET call actually waits is affected by system loading and work-scheduling considerations, and can vary between the value specified for *WaitInterval* and approximately 100 milliseconds greater than *WaitInterval*.

*WaitInterval* is used in conjunction with the MQGMO_WAIT or MQGMO_SET_SIGNAL option. It is ignored if neither of these is specified. If one of these is specified, *WaitInterval* must be greater than or equal to zero, or the following special value:

**MQWI_UNLIMITED**
Unlimited wait interval.

The initial value of this field is 0.

## *Initial values and language declarations for MQGMO*

*Table 497. Initial values of fields in MQGMO for MQGMO*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQGMO_STRUC_ID | 'GMO¬' |
| *Version* | MQGMO_VERSION_1 | 1 |
| *Options* | MQGMO_NO_WAIT | 0 |
| *WaitInterval* | None | 0 |
| *Signal1* | None | Null pointer on z/OS ; 0 otherwise |
| *Signal2* | None | 0 |
| *ResolvedQName* | None | Null string or blanks |
| *MatchOptions* | MQMO_MATCH_MSG_ID + MQMO_MATCH_CORREL_ID | 3 |
| *GroupStatus* | MQGS_NOT_IN_GROUP | '¬' |
| *SegmentStatus* | MQSS_NOT_A_SEGMENT | '¬' |
| *Segmentation* | MQSEG_INHIBITED | '¬' |
| *Reserved1* | None | '¬' |
| *MsgToken* | MQMTOK_NONE | Nulls |
| *ReturnedLength* | MQRL_UNDEFINED | -1 |
| *Reserved2* | None | '¬' |
| *MsgHandle* | MQHM_NONE | 0 |

*Table 497. Initial values of fields in MQGMO for MQGMO (continued)*

| Field name | Name of constant | Value of constant |
|---|---|---|

**Notes:**

1. The symbol ¬ represents a single blank character.
2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
3. In the C programming language, the macro variable MQGMO_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQGMO MyGMO = {MQGMO_DEFAULT};
```

*C declaration*

```
typedef struct tagMQGMO MQGMO;
struct tagMQGMO {
  MQCHAR4   StrucId;         /* Structure identifier */
  MQLONG    Version;         /* Structure version number */

## MQIIH - IMS information header

The following table summarizes the fields in the structure.

*Table 498. Fields in MQIIH*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *StrucLength* | Length of MQIIH structure | StrucLength |
| *Encoding* | Reserved | Encoding |
| *CodedCharSetId* | Reserved | CodedCharSetId |
| *Format* | MQ format name of data that follows MQIIH | Format |
| *Flags* | Flags | Flags |
| *LTermOverride* | Logical terminal override | LTermOverride |
| *MFSMapName* | Message format services map name | MFSMapName |
| *ReplyToFormat* | MQ format name of reply message | ReplyToFormat |
| *Authenticator* | RACF®™ password or passticket | Authenticator |
| *TranInstanceId* | Transaction instance identifier | TranInstanceId |
| *TranState* | Transaction state | TranState |
| *CommitMode* | Commit mode | CommitMode |
| *SecurityScope* | Security scope | SecurityScope |

| Table 498. Fields in MQIIH (continued) | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *Reserved* | Reserved | Reserved |

## *Overview for MQIIH*

The MQIIH structure describes the header information for a message sent to IMS across the IMS bridge. For any IBM MQ supported platform you can create and transmit a message that includes the MQIIH structure, but only an IBM MQ for z/OS queue manager can use the IMS bridge. Therefore, for the message to get to IMS from a non-z/OS queue manager, your queue manager network must include at least one z/OS queue manager through which the message can be routed.

**Availability**: All IBM MQ systems and IBM MQ clients.

**Purpose**: The MQIIH structure describes the information that must be present at the start of a message sent to the IMS bridge through IBM MQ for z/OS.

**Format name**: MQFMT_IMS.

**Character set and encoding**: Special conditions apply to the character set and encoding used for the MQIIH structure and application message data:

- Applications that connect to the queue manager that owns the IMS bridge queue must provide an MQIIH structure that is in the character set and encoding of the queue manager. This is because data conversion of the MQIIH structure is not performed in this case.
- Applications that connect to other queue managers can provide an MQIIH structure that is in any of the supported character sets and encodings; the receiving message channel agent connected to the queue manager that owns the IMS bridge queue converts the MQIIH.
- The application message data following the MQIIH structure must be in the same character set and encoding as the MQIIH structure. Do not use the *CodedCharSetId* and *Encoding* fields in the MQIIH structure to specify the character set and encoding of the application message data.

  You must provide a data-conversion exit to convert the application message data if the data is not one of the built-in formats supported by the queue manager.

## *Fields for MQIIH*

The MQIIH structure contains the following fields; the fields are described in **alphabetical order**:

*Authenticator (MQCHAR8)*

This is the RACF password or PassTicket. It is optional; if specified, it is used with the user ID in the MQMD security context to build a UTOKEN that is sent to IMS to provide a security context. If it is not specified, the user ID is used without verification. This depends on the setting of the RACF switches, which might require an authenticator to be present.

This is ignored if the first byte is blank or null. The following special value can be used:

**MQIAUT_NONE**
No authentication.

For the C programming language, the constant MQIAUT_NONE_ARRAY is also defined; this has the same value as MQIAUT_NONE, but is an array of characters instead of a string.

The length of this field is given by MQ_AUTHENTICATOR_LENGTH. The initial value of this field is MQIAUT_NONE.

*CodedCharSetId (MQLONG)*

This is a reserved field; its value is not significant. The initial value of this field is 0.

The Character Set Id for supported structures which follow a MQIIH structure is the same as that of the MQIIH structure itself and taken from any preceding MQ header.

*CommitMode (MQCHAR)*

This is the IMS commit mode. See the *OTMA Reference* for more information about IMS commit modes. The value must be one of the following:

**MQICM_COMMIT_THEN_SEND**
Commit then send.

This mode implies double queuing of output, but shorter region occupancy times. Fast-path and conversational transactions cannot run with this mode.

**MQICM_SEND_THEN_COMMIT**
Send then commit.

Any IMS transaction initiated as a result of a commit mode of MQICM_SEND_THEN_COMMIT runs in RESPONSE mode regardless of how the transaction is defined in the IMS system definition (MSGTYPE parameter in the TRANSACT macro). This also applies to transactions initiated by means of a transaction switch.

The initial value of this field is MQICM_COMMIT_THEN_SEND.

*Encoding (MQLONG)*

This is a reserved field; its value is not significant. The initial value of this field is 0.

The Encoding for supported structures which follow a MQIIH structure is the same as that of the MQIIH structure itself and taken from any preceding MQ header.

*Flags (MQLONG)*

The flags value must be:

**MQIIH_NONE**
No flags.

**MQIIH_PASS_EXPIRATION**
The reply message contains:

- The same expiry report options as the request message
- The remaining expiry time from the request message with no adjustment made for the bridge's processing time

If this value is not set, the expiry time is set to *unlimited*.

**MQIIH_REPLY_FORMAT_NONE**
Sets the MQIIH.Format field of the reply to MQFMT_NONE.

**MQIIH_IGNORE_PURG**
Sets the TMAMIPRG indicator in the OTMA prefix, which requests that OTMA ignores PURG calls on the TP PCB for CM0 transactions.

**MQIIH_CM0_REQUEST_RESPONSE**
For Commit Mode 0 (CM0) transactions this flag sets the TMAMHRSP indicator in the OTMA prefix. Setting this indicator requests that OTMA/IMS generate a DFS2082 RESPONSE MODE TRANSACTION TERMINATED WITHOUT REPLY message when the original IMS application program does not reply to the IOPCB nor message switch to another transaction.

The initial value of this field is MQIIH_NONE.

*Format (MQCHAR8)*

This specifies the MQ format name of the data that follows the MQIIH structure.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data.

The length of this field is given by MQ_FORMAT_LENGTH. The initial value of this field is MQFMT_NONE.

*LTermOverride (MQCHAR8)*

The logical terminal override, placed in the IO PCB field. It is optional; if it is not specified, the TPIPE name is used. It is ignored if the first byte is blank, or null.

The length of this field is given by MQ_LTERM_OVERRIDE_LENGTH. The initial value of this field is 8 blank characters.

*MFSMapName (MQCHAR8)*

The message format services map name, placed in the IO PCB field. It is optional. On input it represents the MID, on output it represents the MOD. It is ignored if the first byte is blank or null.

The length of this field is given by MQ_MFS_MAP_NAME_LENGTH. The initial value of this field is 8 blank characters.

*ReplyToFormat (MQCHAR8)*

This is the MQ format name of the reply message that is sent in response to the current message. The length of this field is given by MQ_FORMAT_LENGTH. The initial value of this field is MQFMT_NONE.

To convert the data in the reply message using MQGMO_CONVERT, specify either MQIIH.replyToFormat=MQFMT_STRING or MQIIH.replyToFormat=MQFMT_IMS_VAR_STRING. For an explanation of the use of these fields, see "Format (MQCHAR8)" on page 417.

If the default value (MQIIH.replyToFormat=MQFMT_NONE) is used on the request message and the reply message is retrieved using MQGMO_CONVERT then no data conversion is performed.

*Reserved (MQCHAR)*

This is a reserved field; it must be blank.

*SecurityScope (MQCHAR)*

This indicates the IMS security processing required. The following values are defined:

**MQISS_CHECK**
Check security scope: an ACEE is built in the control region, but not in the dependent region.

**MQISS_FULL**
Full security scope: a cached ACEE is built in the control region and a non-cached ACEE is built in the dependent region. If you use MQISS_FULL, ensure that the user ID for which the ACEE is built has access to the resources used in the dependent region.

If neither MQISS_CHECK nor MQISS_FULL is specified for this field, MQISS_CHECK is assumed.

The initial value of this field is MQISS_CHECK.

*StrucId (MQCHAR4)*

This is the structure identifier. The value must be:

**MQIIH_STRUC_ID**
Identifier for the IMS information header structure.

For the C programming language, the constant MQIIH_STRUC_ID_ARRAY is also defined; this has the same value as MQIIH_STRUC_ID, but is an array of characters instead of a string.

The initial value of this field is MQIIH_STRUC_ID.

*StrucLength (MQLONG)*

This is the length of MQIIH structure. The value must be:

**MQIIH_LENGTH_1**
Length of the IMS information header structure.

The initial value of this field is MQIIH_LENGTH_1.

*TranInstanceId (MQBYTE16)*

This is the transaction instance identifier. This field is used by output messages from IMS, so is ignored on first input. If you set *TranState* to MQITS_IN_CONVERSATION, this must be provided in the next input, and all subsequent inputs, to enable IMS to correlate the messages to the correct conversation. You can use the following special value:

**MQITII_NONE**
No transaction instance identifier.

For the C programming language, the constant MQITII_NONE_ARRAY is also defined; this has the same value as MQITII_NONE, but is an array of characters instead of a string.

The length of this field is given by MQ_TRAN_INSTANCE_ID_LENGTH. The initial value of this field is MQITII_NONE.

*TranState (MQCHAR)*

This indicates the IMS conversation state. This is ignored on first input because no conversation exists. On subsequent inputs it indicates whether a conversation is active or not. On output it is set by IMS. The value must be one of the following:

**MQITS_IN_CONVERSATION**
In conversation.

**MQITS_NOT_IN_CONVERSATION**
Not in conversation.

**MQITS_ARCHITECTED**
Return transaction state data in architected form.

This value is used only with the IMS /DISPLAY TRAN command. It returns the transaction state data in the IMS architected form instead of character form. z/OS For more information, see Writing IMS transaction programs through IBM MQ.

The initial value of this field is MQITS_NOT_IN_CONVERSATION.

*Version (MQLONG)*

This is the structure version number. The value must be:

**MQIIH_VERSION_1**
Version number for IMS information header structure.

The following constant specifies the version number of the current version:

**MQIIH_CURRENT_VERSION**
Current version of IMS information header structure.

The initial value of this field is MQIIH_VERSION_1.

## *Initial values and language declarations for MQIIH*

*Table 499. Initial values of fields in MQIIH for MQIIH*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQIIH_STRUC_ID | 'IIH?' |
| *Version* | MQIIH_VERSION_1 | 1 |
| *StrucLength* | MQIIH_LENGTH_1 | 84 |
| *Encoding* | None | 0 |
| *CodedCharSetId* | None | 0 |
| *Format* | MQFMT_NONE | Blanks |

| Table 499. Initial values of fields in MQIIH for MQIIH (continued) | | |
|---|---|---|
| **Field name** | **Name of constant** | **Value of constant** |
| *Flags* | MQIIH_NONE | 0 |
| *LTermOverride* | None | Blanks |
| *MFSMapName* | None | Blanks |
| *ReplyToFormat* | MQFMT_NONE | Blanks |
| *Authenticator* | MQIAUT_NONE | Blanks |
| *TranInstanceId* | MQITII_NONE | Nulls |
| *TranState* | MQITS_NOT_IN_CONVERSATION | '?' |
| *CommitMode* | MQICM_COMMIT_THEN_SEND | '0' |
| *SecurityScope* | MQISS_CHECK | 'C' |
| *Reserved* | None | '?' |

**Notes:**

1. The symbol ? represents a single blank character.
2. In the C programming language, the macro variable MQIIH_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQIIH MyIIH = {MQIIH_DEFAULT};
```

*C declaration*

```
typedef struct tagMQIIH MQIIH;
struct tagMQIIH {
  MQCHAR4   StrucId;         /* Structure identifier */
  MQLONG    Version;         /* Structure version number */
  MQLONG    StrucLength;     /* Length of MQIIH structure */
  MQLONG    Encoding;        /* Reserved */
  MQLONG    CodedCharSetId;  /* Reserved */
  MQCHAR8   Format;          /* MQ format name of data that follows
                                MQIIH */
  MQLONG    Flags;           /* Flags */
  MQCHAR8   LTermOverride;   /* Logical terminal override */
  MQCHAR8   MFSMapName;      /* Message format services map name */
  MQCHAR8   ReplyToFormat;   /* MQ format name of reply message */
  MQCHAR8   Authenticator;   /* RACF password or passticket */
  MQBYTE16  TranInstanceId;  /* Transaction instance identifier */
  MQCHAR    TranState;       /* Transaction state */
  MQCHAR    CommitMode;      /* Commit mode */
  MQCHAR    SecurityScope;   /* Security scope */
  MQCHAR    Reserved;        /* Reserved */
};
```

*COBOL declaration*

```
**   MQIIH structure
  10 MQIIH.
**    Structure identifier
   15 MQIIH-STRUCID        PIC X(4).
**    Structure version number
   15 MQIIH-VERSION        PIC S9(9) BINARY.
**    Length of MQIIH structure
   15 MQIIH-STRUCLENGTH    PIC S9(9) BINARY.
**    Reserved
```

```
   15 MQIIH-ENCODING       PIC S9(9) BINARY.
**    Reserved
   15 MQIIH-CODEDCHARSETID PIC S9(9) BINARY.
**    MQ format name of data that follows MQIIH
   15 MQIIH-FORMAT         PIC X(8).
**    Flags
   15 MQIIH-FLAGS          PIC S9(9) BINARY.
**    Logical terminal override
   15 MQIIH-LTERMOVERRIDE  PIC X(8).
**    Message format services map name
   15 MQIIH-MFSMAPNAME     PIC X(8).
**    MQ format name of reply message
   15 MQIIH-REPLYTOFORMAT  PIC X(8).
**    RACF password or passticket
   15 MQIIH-AUTHENTICATOR  PIC X(8).
**    Transaction instance identifier
   15 MQIIH-TRANINSTANCEID PIC X(16).
**    Transaction state
   15 MQIIH-TRANSTATE      PIC X.
**    Commit mode
   15 MQIIH-COMMITMODE     PIC X.
**    Security scope
   15 MQIIH-SECURITYSCOPE  PIC X.
**    Reserved
   15 MQIIH-RESERVED       PIC X.
```

*PL/I declaration*

```
dcl

## MQIMPO - Inquire message property options

The following table summarizes the fields in the structure. MQIMPO structure - inquire message property options

*Table 500. Fields in MQIMPO*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *Options* | Options controlling the action of MQINQMP | Options |
| *RequestedEncoding* | Encoding into which the inquired property is to be converted | RequestedEncoding |
| *RequestedCCSID* | Character set of the inquired property | RequestedCCSID |
| *ReturnedEncoding* | Encoding of the returned value | ReturnedEncoding |
| *ReturnedCCSID* | Character set of returned value | ReturnedCCSID |
| *Reserved1* | Reserved field | ReturnedCCSID |
| *ReturnedName* | Name of the inquired property | ReturnedName |
| *TypeString* | String representation of the data type of the property | TypeString |

### *Overview for MQIMPO*

The inquire message properties options structure.

**Availability**: All IBM MQ systems and IBM MQ clients.

**Purpose**: The MQIMPO structure allows applications to specify options that control how properties of messages are inquired. The structure is an input parameter on the MQINQMP call.

**Character set and encoding**: Data in MQIMPO must be in the character set of the application and encoding of the application (MQENC_NATIVE).

### *Fields for MQIMPO*

Inquire message property options structure - fields

The MQIMPO structure contains the following fields; the fields are described in **alphabetical order**:

The following options control the action of MQINQMP. You can specify one or more of these options. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

Combinations of options that are not valid are noted; all other combinations are valid.

**Value data options:** The following options relate to the processing of the value data when the property is retrieved from the message.

**MQIMPO_CONVERT_VALUE**
This option requests that the value of the property be converted to conform to the *RequestedCCSID* and *RequestedEncoding* values specified before the MQINQMP call returns the property value in the *Value* area.

- If conversion is successful, the *ReturnedCCSID* and *ReturnedEncoding* fields are set to the same as *RequestedCCSID* and *RequestedEncoding* on return from the MQINQMP call.
- If conversion fails, but the MQINQMP call otherwise completes without error, the property value is returned unconverted.

  If the property is a string, the *ReturnedCCSID* and *ReturnedEncoding* fields are set to the character set and encoding of the unconverted string.

  The completion code is MQCC_WARNING in this case, with reason code MQRC_PROP_VALUE_NOT_CONVERTED. The property cursor is advanced to the returned property.

If the property value expands during conversion, and exceeds the size of the *Value* parameter, the value is returned unconverted, with completion code MQCC_FAILED; the reason code is set to MQRC_PROPERTY_VALUE_TOO_BIG.

The *DataLength* parameter of the MQINQMP call returns the length that the property value would have converted to, in order to allow the application to determine the size of the buffer required to accommodate the converted property value. The property cursor is unchanged.

This option also requests that:

- If the property name contains a wildcard, and
- The *ReturnedName* field is initialized with an address or offset for the returned name,

then the returned name is converted to conform to the *RequestedCCSID* and *RequestedEncoding* values.

- If conversion is successful, the *VSCCSID* field of *ReturnedName* and the encoding of the returned name are set to the input value of *RequestedCCSID* and *RequestedEncoding*.
- If conversion fails, but the MQINQMP call otherwise completes without error or warning, the returned name is unconverted. The completion code is MQCC_WARNING in this case, with reason code MQRC_PROP_NAME_NOT_CONVERTED.

  The property cursor is advanced to the returned property. MQRC_PROP_VALUE_NOT_CONVERTED is returned if both the value and the name are not converted.

If the returned name expands during conversion, and exceeds the size of the *VSBufsize* field of the *RequestedName*, the returned string is left unconverted, with completion code MQCC_FAILED and the reason code is set to MQRC_PROPERTY_NAME_TOO_BIG.

The *VSLength* field of the MQCHARV structure returns the length that the property value would have converted to, in order to allow the application to determine the size of the buffer required to accommodate the converted property value. The property cursor is unchanged.

**MQIMPO_CONVERT_TYPE**

This option requests that the value of the property be converted from its current data type, into the data type specified on the *Type* parameter of the MQINQMP call.

- If conversion is successful, the *Type* parameter is unchanged on return of the MQINQMP call.
- If conversion fails, but the MQINQMP call otherwise completes without error, the call fails with reason MQRC_PROP_CONV_NOT_SUPPORTED. The property cursor is unchanged.

If the conversion of the data type causes the value to expand during conversion, and the converted value exceeds the size of the *Value* parameter, the value is returned unconverted, with completion code MQCC_FAILED and the reason code is set to MQRC_PROPERTY_VALUE_TOO_BIG.

The *DataLength* parameter of the MQINQMP call returns the length that the property value would have converted to, in order to allow the application to determine the size of the buffer required to accommodate the converted property value. The property cursor is unchanged.

If the value of the *Type* parameter of the MQINQMP call is not valid, the call fails with reason MQRC_PROPERTY_TYPE_ERROR.

If the requested data type conversion is not supported, the call fails with reason MQRC_PROP_CONV_NOT_SUPPORTED. The following data type conversions are supported:

| Property data type | Supported target data types |
|---|---|
| MQTYPE_BOOLEAN | MQTYPE_STRING, MQTYPE_INT8, MQTYPE_INT16, MQTYPE_INT32, MQTYPE_INT64 |
| MQTYPE_BYTE_STRING | MQTYPE_STRING |
| MQTYPE_INT8 | MQTYPE_STRING, MQTYPE_INT16, MQTYPE_INT32, MQTYPE_INT64 |
| MQTYPE_INT16 | MQTYPE_STRING, MQTYPE_INT32, MQTYPE_INT64 |
| MQTYPE_INT32 | MQTYPE_STRING, MQTYPE_INT64 |
| MQTYPE_INT64 | MQTYPE_STRING |
| MQTYPE_FLOAT32 | MQTYPE_STRING, MQTYPE_FLOAT64 |
| MQTYPE_FLOAT64 | MQTYPE_STRING |
| MQTYPE_STRING | MQTYPE_BOOLEAN, MQTYPE_INT8, MQTYPE_INT16, MQTYPE_INT32, MQTYPE_INT64, MQTYPE_FLOAT32, MQTYPE_FLOAT64 |
| MQTYPE_NULL | None |

The general rules governing the supported conversions are as follows:

- Numeric property values can be converted from one data type to another, provided that no data is lost during the conversion.

  For example, the value of a property with data type MQTYPE_INT32 can be converted into a value with data type MQTYPE_INT64, but cannot be converted into a value with data type MQTYPE_INT16.
- A property value of any data type can be converted into a string.
- A string property value can be converted to any other data type provided the string is formatted correctly for the conversion. If an application attempts to convert a string property value that is not formatted correctly, IBM MQ returns reason code MQRC_PROP_NUMBER_FORMAT_ERROR.
- If an application attempts a conversion that is not supported, IBM MQ returns reason code MQRC_PROP_CONV_NOT_SUPPORTED.

The specific rules for converting a property value from one data type to another are as follows:

- When converting an MQTYPE_BOOLEAN property value to a string, the value TRUE is converted to the string "TRUE", and the value false is converted to the string "FALSE".
- When converting an MQTYPE_BOOLEAN property value to a numeric data type, the value TRUE is converted to one, and the value FALSE is converted to zero.
- When converting a string property value to an MQTYPE_BOOLEAN value, the string "TRUE" , or "1" , is converted to TRUE, and the string "FALSE", or "0", is converted to FALSE.

  Note that the terms "TRUE" and "FALSE" are not case sensitive.

  Any other string cannot be converted; IBM MQ returns reason code MQRC_PROP_NUMBER_FORMAT_ERROR.
- When converting a string property value to a value with data type MQTYPE_INT8, MQTYPE_INT16, MQTYPE_INT32 or MQTYPE_INT64, the string must have the following format:

  ```
  [blanks][sign]digits
  ```

  The meanings of the components of the string are as follows:

  **blanks**
  Optional leading blank characters

  **sign**
  An optional plus sign (+) or minus sign (-) character.

  **digits**
  A contiguous sequence of digit characters (0-9). At least one digit character must be present.

  After the sequence of digit characters, the string can contain other characters that are not digit characters, but the conversion stops as soon as the first of these characters is reached. The string is assumed to represent a decimal integer.

  IBM MQ returns reason code MQRC_PROP_NUMBER_FORMAT_ERROR if the string is not formatted correctly.
- When converting a string property value to a value with data type MQTYPE_FLOAT32 or MQTYPE_FLOAT64, the string must have the following format:

  ```
  [blanks][sign]digits[.digits][e_char[e_sign]e_digits]
  ```

  The meanings of the components of the string are as follows:

  **blanks**
  Optional leading blank characters

  **sign**
  An optional plus sign (+) or minus sign (-) character.

  **digits**
  A contiguous sequence of digit characters (0-9). At least one digit character must be present.

  **e_char**
  An exponent character, which is either "E" or "e".

  **e_sign**
  An optional plus sign (+) or minus sign (-) character for the exponent.

  **e_digits**
  A contiguous sequence of digit characters (0-9) for the exponent. At least one digit character must be present if the string contains an exponent character.

  After the sequence of digit characters, or the optional characters representing an exponent, the string can contain other characters that are not digit characters, but the conversion stops as soon as the first of these characters is reached. The string is assumed to represent a decimal floating point number with an exponent that is a power of 10.

IBM MQ returns reason code MQRC_PROP_NUMBER_FORMAT_ERROR if the string is not formatted correctly.

- When converting a numeric property value to a string, the value is converted to the string representation of the value as a decimal number, not the string containing the ASCII character for that value. For example, the integer 65 is converted to the string "65", not the string "A".
- When converting a byte string property value to a string, each byte is converted to the two hexadecimal characters that represent the byte. For example, the byte array {0xF1, 0x12, 0x00, 0xFF} is converted to the string "F11200FF".

**MQIMPO_QUERY_LENGTH**
Query the type and length of the property value. The length is returned in the *DataLength* parameter of the MQINQMP call. The property value is not returned.

If a *ReturnedName* buffer is specified, the *VSLength* field of the MQCHARV structure is filled in with the length of the property name. The property name is not returned.

**Iteration options:** The following options relate to iterating over properties, using a name with a wildcard character

**MQIMPO_INQ_FIRST**
Inquire on the first property that matches the specified name. After this call, a cursor is established on the property that is returned.

This is the default value.

The MQIMPO_INQ_PROP_UNDER_CURSOR option can subsequently be used with an MQINQMP call, if required, to inquire on the same property again.

Note that there is only one property cursor; therefore, if the property name, specified in the MQINQMP call, changes the cursor is reset.

This option is not valid with either of the following options:

MQIMPO_INQ_NEXT
MQIMPO_INQ_PROP_UNDER_CURSOR

**MQIMPO_INQ_NEXT**
Inquires on the next property that matches the specified name, continuing the search from the property cursor. The cursor is advanced to the property that is returned.

If this is the first MQINQMP call for the specified name, then the first property that matches the specified name is returned.

The MQIMPO_INQ_PROP_UNDER_CURSOR option can subsequently be used with an MQINQMP call if required, to inquire on the same property again.

If the property under the cursor has been deleted, MQINQMP returns the next matching property following the one that has been deleted.

If a property is added that matches the wildcard, while an iteration is in progress, the property might or might not be returned during the completion of the iteration. The property is returned once the iteration restarts using MQIMPO_INQ_FIRST.

A property matching the wildcard that was deleted, while the iteration was in progress, is not returned subsequent to its deletion.

This option is not valid with either of the following options:

MQIMPO_INQ_FIRST
MQIMPO_INQ_PROP_UNDER_CURSOR

**MQIMPO_INQ_PROP_UNDER_CURSOR**
Retrieve the value of the property pointed to by the property cursor. The property pointed to by the property cursor is the one that was last inquired, using either the MQIMPO_INQ_FIRST or the MQIMPO_INQ_NEXT option.

The property cursor is reset when the message handle is reused, when the message handle is specified in the *MsgHandle* field of the MQGMO on an MQGET call, or when the message handle is specified in *OriginalMsgHandle* or *NewMsgHandle* fields of the MQPMO structure on an MQPUT call.

If this option is used when the property cursor has not yet been established, or if the property pointed to by the property cursor has been deleted, the call fails with completion code MQCC_FAILED and reason MQRC_PROPERTY_NOT_AVAILABLE.

This option is not valid with either of the following options:

MQIMPO_INQ_FIRST
MQIMPO_INQ_NEXT

If none of the options previously described is required, the following option can be used:

**MQIMPO_NONE**
Use this value to indicate that no other options have been specified; all options assume their default values.

MQIMPO_NONE aids program documentation; it is not intended that this option be used with any other, but as its value is zero, such use cannot be detected.

This is always an input field. The initial value of this field is MQIMPO_INQ_FIRST.

*RequestedCCSID (MQLONG)*
Inquire message property options structure - RequestedCCSID field

The character set that the inquired property value is to be converted into if the value is a character string. This is also the character set into which the *ReturnedName* is to be converted when MQIMPO_CONVERT_VALUE or MQIMPO_CONVERT_TYPE is specified.

The initial value of this field is MQCCSI_APPL.

*RequestedEncoding (MQLONG)*
Inquire message property options structure - RequestedEncoding field

This is the encoding into which the inquired property value is to be converted when MQIMPO_CONVERT_VALUE or MQIMPO_CONVERT_TYPE is specified.

The initial value of this field is MQENC_NATIVE.

*Reserved1 (MQCHAR)*

This is a reserved field. The initial value of this field is a blank character (4 byte field).

*ReturnedCCSID (MQLONG)*
Inquire message property options structure - ReturnedCCSID field

On output, this is the character set of the value returned if the *Type* parameter of the MQINQMP call is MQTYPE_STRING.

If the MQIMPO_CONVERT_VALUE option is specified and conversion was successful, the *ReturnedCCSID* field, on return, is the same value as the value passed in.

The initial value of this field is zero.

*ReturnedEncoding (MQLONG)*
Inquire message property options structure - ReturnedEncoding field

On output, this is the encoding of the value returned.

If the MQIMPO_CONVERT_VALUE option is specified and conversion was successful, the *ReturnedEncoding* field, on return, is the same value as the value passed in.

The initial value of this field is MQENC_NATIVE.

*ReturnedName (MQCHARV)*
Inquire message property options structure - ReturnedName field

The actual name of the inquired property.

On input a string buffer can be passed in using the *VSPtr* or *VSOffset* field of the MQCHARV structure. The length of the string buffer is specified using the *VSBufsize* field of the MQCHARV structure.

On return from the MQINQMP call, the string buffer is completed with the name of the property that was inquired, provided the string buffer was long enough to fully contain the name. The *VSLength* field of the MQCHARV structure is filled in with the length of the property name. The *VSCCSID* field of the MQCHARV structure is filled in to indicate the character set of the returned name, whether or not conversion of the name failed.

This is an input/output field. The initial value of this field is MQCHARV_DEFAULT.

*StrucId (MQCHAR4)*
Inquire message property options structure - StrucId field

This is the structure identifier. The value must be:

**MQIMPO_STRUC_ID**
Identifier for inquire message property options structure.

For the C programming language, the constant MQIMPO_STRUC_ID_ARRAY is also defined; this has the same value as MQIMPO_STRUC_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQIMPO_STRUC_ID.

*TypeString (MQCHAR8)*
Inquire message property options structure - TypeString field

A string representation of the data type of the property.

If the property was specified in an MQRFH2 header and the MQRFH2 `dt` attribute is not recognized, this field can be used to determine the data type of the property. *TypeString* is returned in coded character set 1208 (UTF-8), and is the first eight bytes of the value of the `dt` attribute of the property that failed to be recognized

This is always an output field. The initial value of this field is the null string in the C programming language, and 8 blank characters in other programming languages.

*Version (MQLONG)*
Inquire message property options structure - Version field

This is the structure version number. The value must be:

**MQIMPO_VERSION_1**
Version number for inquire message property options structure.

The following constant specifies the version number of the current version:

**MQIMPO_CURRENT_VERSION**
Current version of inquire message property options structure.

This is always an input field. The initial value of this field is MQIMPO_VERSION_1.

### *Initial values and language declarations for MQIMPO*

Inquire message property options structure - Initial values

*Table 501. Initial values of fields in MQIPMO*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQIMPO_STRUC_ID | 'IMPO' |
| *Version* | MQIMPO_VERSION_1 | 1 |
| *Options* | MQIMPO_INQ_FIRST | |
| *RequestedEncoding* | MQENC_NATIVE | |
| *RequestedCCSID* | MQCCSI_APPL | |
| *ReturnedEncoding* | MQENC_NATIVE | |
| *ReturnedCCSID* | 0 | |
| *Reserved1* | 0 | |
| *ReturnedName* | MQCHARV_DEFAULT | |
| *TypeString* | Null string or blanks | |

**Notes:**

1. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
2. In the C programming language, the macro variable MQIMPO_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQIMPO MyIMPO = {MQIMPO_DEFAULT};
```

*C declaration*

Inquire message property options structure - C language declaration

```
typedef struct tagMQIMPO MQIMPO;
struct tagMQIMPO {

## MQMD - Message descriptor

The following table summarizes the fields in the structure.

*Table 502. Fields in MQMD*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *Report* | Options for report messages | Report |
| *MsgType* | Message type | MsgType |
| *Expiry* | Message lifetime | MQMD - Expiry field |
| *Feedback* | Feedback or reason code | MQMD - Feedback field |
| *Encoding* | Numeric encoding of message data | Encoding |
| *CodedCharSetId* | Character set identifier of message data | CodedCharSetId |
| *Format* | Format name of message data | Format |
| *Priority* | Message priority | Priority |
| *Persistence* | Message persistence | Persistence |
| *MsgId* | Message identifier | MQMD - MsgId field |
| *CorrelId* | Correlation identifier | CorrelId |
| *BackoutCount* | Backout counter | BackoutCount |
| *ReplyToQ* | Name of reply queue | ReplyToQ |
| *ReplyToQMgr* | Name of reply queue manager | ReplyToQMgr |
| *UserIdentifier* | User identifier | UserIdentifier |
| *AccountingToken* | Accounting token | AccountingToken |
| *ApplIdentityData* | Application data relating to identity | ApplIdentityData |
| *PutApplType* | Type of application that put the message | PutApplType |
| *PutApplName* | Name of application that put the message | PutApplName |
| *PutDate* | Date when message was put | PutDate |
| *PutTime* | Time when message was put | PutTime |
| *ApplOriginData* | Application data relating to origin | ApplOriginData |
| **Note:** The remaining fields are ignored if *Version* is less than MQMD_VERSION_2. | | |
| *GroupId* | Group identifier | GroupId |
| *MsgSeqNumber* | Sequence number of logical message within group | MsgSeqNumber |
| *Offset* | Offset of data in physical message from start of logical message | Offset |

| Table 502. Fields in MQMD (continued) | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *MsgFlags* | Message flags | MQMD - MsgFlags field |
| *OriginalLength* | Length of original message | OriginalLength |

## *Overview for MQMD*

**Availability**: All IBM MQ systems, plus IBM MQ MQI clients connected to these systems.

**Purpose**: The MQMD structure contains the control information that accompanies the application data when a message travels between the sending and receiving applications. The structure is an input/output parameter on the MQGET, MQPUT, and MQPUT1 calls.

**Version**: The current version of MQMD is MQMD_VERSION_2. Applications that are intended to be portable between several environments must ensure that the required version of MQMD is supported in all the environments concerned. Fields that exist only in the more-recent versions of the structure are identified as such in the descriptions that follow.

The header, COPY, and INCLUDE files provided for the supported programming languages contain the most-recent version of MQMD that is supported by the environment, but with the initial value of the *Version* field set to MQMD_VERSION_1. To use fields that are not present in the version-1 structure, the application must set the *Version* field to the version number of the version required.

A declaration for the version-1 structure is available with the name MQMD1.

**Character set and encoding**: Data in MQMD must be in the character set and encoding of the local queue manager; these are given by the *CodedCharSetId* queue-manager attribute and MQENC_NATIVE. However, if the application is running as an IBM MQ MQI client, the structure must be in the character set and encoding of the client.

If the sending and receiving queue managers use different character sets or encodings, the data in MQMD is converted automatically. It is not necessary for the application to convert the MQMD.

**Using different versions of MQMD**: A version-2 MQMD is equivalent to using a version-1 MQMD and prefixing the message data with an MQMDE structure. However, if all the fields in the MQMDE structure have their default values, the MQMDE can be omitted. A version-1 MQMD plus MQMDE are used as described:

- On the MQPUT and MQPUT1 calls, if the application provides a version-1 MQMD, the application can optionally prefix the message data with an MQMDE, setting the *Format* field in MQMD to MQFMT_MD_EXTENSION to indicate that an MQMDE is present. If the application does not provide an MQMDE, the queue manager assumes default values for the fields in the MQMDE.

  **Note:** Several of the fields that exist in the version-2 MQMD but not the version-1 MQMD are input/output fields on the MQPUT and MQPUT1 calls. However, the queue manager does *not* return any values in the equivalent fields in the MQMDE on output from the MQPUT and MQPUT1 calls; if the application requires those output values, it must use a version-2 MQMD.
- On the MQGET call, if the application provides a version-1 MQMD, the queue manager prefixes the message returned with an MQMDE, but only if one or more of the fields in the MQMDE has a non-default value. The *Format* field in MQMD will have the value MQFMT_MD_EXTENSION to indicate that an MQMDE is present.

The default values that the queue manager uses for the fields in the MQMDE are the same as the initial values of those fields, shown in Table 507 on page 456.

When a message is on a transmission queue, some of the fields in MQMD are set to particular values; see “MQXQH - Transmission-queue header” on page 598 for details.

**Message context**: Certain fields in MQMD contain the message context. There are two types of message context: *identity context* and *origin context*. Typically:

- Identity context relates to the application that *originally* put the message

- Origin context relates to the application that *most recently* put the message.

These two applications can be the same application, but they can also be different applications (for example, when a message is forwarded from one application to another).

Although identity and origin context typically have the meanings described, the content of both types of context fields in MQMD depends on the MQPMO_*_CONTEXT options that are specified when the message is put. As a result, identity context does not necessarily relate to the application that originally put the message, and origin context does not necessarily relate to the application that most-recently put the message; it depends on the design of the application suite.

The message channel agent (MCA) never alters message context. MCAs that receive messages from remote queue managers use the context option MQPMO_SET_ALL_CONTEXT on the MQPUT or MQPUT1 call. This allows the receiving MCA to preserve exactly the message context that traveled with the message from the sending MCA. However, the result is that the origin context does not relate to either of the MCAs that sent and received the message. The origin context refers to an earlier application that put the message. If all the intermediate applications have passed the message context, the origin context refers to the originating application itself.

In the descriptions, the context fields are described as though they are used as described previously. For more information about message context, see Message context.

## *Fields for MQMD*

The MQMD structure contains the following fields; the fields are described in **alphabetical order**:

*Table 503. Fields in MQMD*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *Report* | Options for report messages | Report |
| *MsgType* | Message type | MsgType |
| *Expiry* | Message lifetime | MQMD - Expiry field |
| *Feedback* | Feedback or reason code | MQMD - Feedback field |
| *Encoding* | Numeric encoding of message data | Encoding |
| *CodedCharSetId* | Character set identifier of message data | CodedCharSetId |
| *Format* | Format name of message data | Format |
| *Priority* | Message priority | Priority |
| *Persistence* | Message persistence | Persistence |
| *MsgId* | Message identifier | MQMD - MsgId field |
| *CorrelId* | Correlation identifier | CorrelId |
| *BackoutCount* | Backout counter | BackoutCount |
| *ReplyToQ* | Name of reply queue | ReplyToQ |
| *ReplyToQMgr* | Name of reply queue manager | ReplyToQMgr |
| *UserIdentifier* | User identifier | UserIdentifier |
| *AccountingToken* | Accounting token | AccountingToken |
| *ApplIdentityData* | Application data relating to identity | ApplIdentityData |
| *PutApplType* | Type of application that put the message | PutApplType |

| Table 503. Fields in MQMD (continued) | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *PutApplName* | Name of application that put the message | PutApplName |
| *PutDate* | Date when message was put | PutDate |
| *PutTime* | Time when message was put | PutTime |
| *ApplOriginData* | Application data relating to origin | ApplOriginData |
| **Note:** The remaining fields are ignored if *Version* is less than MQMD_VERSION_2. | | |
| *GroupId* | Group identifier | GroupId |
| *MsgSeqNumber* | Sequence number of logical message within group | MsgSeqNumber |
| *Offset* | Offset of data in physical message from start of logical message | Offset |
| *MsgFlags* | Message flags | MQMD - MsgFlags field |
| *OriginalLength* | Length of original message | OriginalLength |

*AccountingToken (MQBYTE32)*

This is the accounting token, part of the **identity context** of the message. For more information about message context, see “Overview for MQMD” on page 403 ; also see Message context.

*AccountingToken* allows an application to charge appropriately for work done as a result of the message. The queue manager treats this information as a string of bits and does not check its content.

The queue manager generates this information as follows:

- The first byte of the field is set to the length of the accounting information present in the bytes that follow; this length is in the range zero through 30, and is stored in the first byte as a binary integer.
- The second and subsequent bytes (as specified by the length field) are set to the accounting information appropriate to the environment.
  - On z/OS the accounting information is set to:
    - For z/OS batch, the accounting information from the JES JOB card or from a JES ACCT statement in the EXEC card (comma separators are changed to X'FF'). This information is truncated, if necessary, to 31 bytes.
    - For TSO, the user's account number.
    - For CICS, the LU 6.2 unit of work identifier (UEPUOWDS) (26 bytes).
    - For IMS, the 8-character PSB name concatenated with the 16-character IMS recovery token.
  - On IBM i, the accounting information is set to the accounting code for the job.
  - On UNIX systems, the accounting information is set to the numeric user identifier, in ASCII characters.
  - On Windows, the accounting information is set to a Windows security identifier (SID) in a compressed format. The SID uniquely identifies the user identifier stored in the *UserIdentifier* field. When the SID is stored in the *AccountingToken* field, the 6-byte Identifier Authority (located in the third and subsequent bytes of the SID) is omitted. For example, if the Windows SID is 28 bytes long, 22 bytes of SID information are stored in the *AccountingToken* field.
- The last byte (byte 32) of the accounting field is set to the accounting token type (in this case MQACTT_NT_SECURITY_ID, x '0b'):

  **MQACTT_CICS_LUOW_ID**
  CICS LUOW identifier.

**MQACTT_NT_SECURITY_ID**
Windows security identifier.

**MQACTT_OS400_ACCOUNT_TOKEN**
IBM i accounting token.

**MQACTT_UNIX_NUMERIC_ID**
UNIX systems numeric identifier.

**MQACTT_USER**
User-defined accounting token.

**MQACTT_UNKNOWN**
Unknown accounting-token type.

The accounting-token type is set to an explicit value only in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems. In other environments, the accounting-token type is set to the value MQACTT_UNKNOWN. In these environments use the *PutApplType* field to deduce the type of accounting token received.

- All other bytes are set to binary zero.

For the MQPUT and MQPUT1 calls, this is an input/output field if MQPMO_SET_IDENTITY_CONTEXT or MQPMO_SET_ALL_CONTEXT is specified in the *PutMsgOpts* parameter. If neither MQPMO_SET_IDENTITY_CONTEXT nor MQPMO_SET_ALL_CONTEXT is specified, this field is ignored on input and is an output-only field. For more information about message context, see Message context.

After the successful completion of an MQPUT or MQPUT1 call, this field contains the *AccountingToken* that was transmitted with the message if it was put to a queue. This will be the value of *AccountingToken* that is kept with the message if it is retained (see description of MQPMO_RETAIN in "MQPMO options (MQLONG)" on page 487 for more details about retained publications) but is not used as the *AccountingToken* when the message is sent as a publication to subscribers since they provide a value to override *AccountingToken* in all publications sent to them. If the message has no context, the field is entirely binary zero.

This is an output field for the MQGET call.

This field is not subject to any translation based on the character set of the queue manager; the field is treated as a string of bits, and not as a string of characters.

The queue manager does nothing with the information in this field. The application must interpret the information if it wants to use the information for accounting purposes.

You can use the following special value for the *AccountingToken* field:

**MQACT_NONE**
No accounting token is specified.

The value is binary zero for the length of the field.

For the C programming language, the constant MQACT_NONE_ARRAY is also defined; this has the same value as MQACT_NONE, but is an array of characters instead of a string.

The length of this field is given by MQ_ACCOUNTING_TOKEN_LENGTH. The initial value of this field is MQACT_NONE.

*ApplIdentityData (MQCHAR32)*

This is part of the **identity context** of the message. For more information about message context, see "Overview for MQMD" on page 403 and Message context.

*ApplIdentityData* is information that is defined by the application suite, and can be used to provide additional information about the message or its originator. The queue manager treats this information as character data, but does not define the format of it. When the queue manager generates this information, it is entirely blank.

For the MQPUT and MQPUT1 calls, this is an input/output field if MQPMO_SET_IDENTITY_CONTEXT or MQPMO_SET_ALL_CONTEXT is specified in the *PutMsgOpts* parameter. If a null character is present,

the null and any following characters are converted to blanks by the queue manager. If neither MQPMO_SET_IDENTITY_CONTEXT nor MQPMO_SET_ALL_CONTEXT is specified, this field is ignored on input and is an output-only field. For more information about message context, see Message context.

After the successful completion of an MQPUT or MQPUT1 call, this field contains the *ApplIdentityData* that was transmitted with the message if it was put to a queue. This will be the value of *ApplIdentityData* that is kept with the message if it is retained (see description of MQPMO_RETAIN for more details about retained publications) but is not used as the *ApplIdentityData* when the message is sent as a publication to subscribers because they provide a value to override *ApplIdentityData* in all publications sent to them. If the message has no context, the field is entirely blank.

This is an output field for the MQGET call. The length of this field is given by MQ_APPL_IDENTITY_DATA_LENGTH. The initial value of this field is the null string in C, and 32 blank characters in other programming languages.

*ApplOriginData (MQCHAR4)*

This is part of the **origin context** of the message. For more information about message context, see "Overview for MQMD" on page 403 and Message context.

*ApplOriginData* is information that is defined by the application suite that can be used to provide additional information about the origin of the message. For example, it could be set by applications running with suitable user authority to indicate whether the identity data is trusted.

The queue manager treats this information as character data, but does not define the format of it. When the queue manager generates this information, it is entirely blank.

For the MQPUT and MQPUT1 calls, this is an input/output field if MQPMO_SET_ALL_CONTEXT is specified in the *PutMsgOpts* parameter. Any information following a null character within the field is discarded. The queue manager converts the null character and any following characters to blanks. If MQPMO_SET_ALL_CONTEXT is not specified, this field is ignored on input and is an output-only field.

This is an output field for the MQGET call. The length of this field is given by MQ_APPL_ORIGIN_DATA_LENGTH. The initial value of this field is the null string in C, and 4 blank characters in other programming languages.

When the message is published, although *ApplOriginData* is set, it is blank in the subscription that it receives.

*BackoutCount (MQLONG)*

This is a count of the number of times that the message has been previously returned by the MQGET call as part of a unit of work, and subsequently backed out. It helps the application to detect processing errors that are based on message content. The count excludes MQGET calls that specify any of the MQGMO_BROWSE_* options.

The accuracy of this count is affected by the *HardenGetBackout* queue attribute; see "Attributes for queues" on page 810.

On z/OS, a value of 255 means that the message has been backed out 255 or more times; the value returned is never greater than 255.

This is an output field for the MQGET call. It is ignored for the MQPUT and MQPUT1 calls. The initial value of this field is 0.

*CodedCharSetId (MQLONG)*
This field specifies the character set identifier of character data within the message body.

**Note:** Character data in MQMD and the other MQ data structures that are parameters on calls must be in the character set of the queue manager. This is defined by the queue manager's *CodedCharSetId* attribute; see "Attributes for the queue manager" on page 777 for details of this attribute.

If this field is set to MQCCSI_Q_MGR when calling MQGET with MQGMO_CONVERT in the options, the behavior is different between client and server applications. For server applications, the code page used

for character conversion is the *CodedCharSetId* of the queue manager; for client applications, the code page used for character conversion is the current locale code page.

For client applications, MQCCSI_Q_MGR is filled in, based on the locale of the client rather than the one on the queue manager. The exception to that rule is when you put a message to an IMS bridge queue; what is returned, in the *CodedCharSetId* field of MQMD, is the CCSID of the queue manager.

You must not use the following special value:

**MQCCSI_APPL**
This results in an incorrect value in the *CodedCharSetId* field of the MQMD and causes a return code of MQRC_SOURCE_CCSID_ERROR (or MQRC_FORMAT_ERROR for z/OS ) when the message is received using the MQGET call with the MQGMO_CONVERT option.

You can use the following special values:

**MQCCSI_Q_MGR**
Character data in the message is in the queue manager's character set.

On the MQPUT and MQPUT1 calls, the queue manager changes this value in the MQMD that is sent with the message to the true character set identifier of the queue manager. As a result, the value MQCCSI_Q_MGR is never returned by the MQGET call.

**MQCCSI_DEFAULT**
The *CodedCharSetId* of the data in the *String* field is defined by the *CodedCharSetId* field in the header structure that precedes the MQCFH structure, or by the *CodedCharSetId* field in the MQMD if the MQCFH is at the start of the message.

**MQCCSI_INHERIT**
Character data in the message is in the same character set as this structure; this is the queue manager's character set. (For MQMD only, MQCCSI_INHERIT has the same meaning as MQCCSI_Q_MGR).

The queue manager changes this value in the MQMD that is sent with the message to the actual character set identifier of MQMD. Provided no error occurs, the value MQCCSI_INHERIT is not returned by the MQGET call.

Do not use MQCCSI_INHERIT if the value of the *PutApplType* field in MQMD is MQAT_BROKER.

**MQCCSI_EMBEDDED**
Character data in the message is in a character set with the identifier that is contained within the message data itself. There can be any number of character set identifiers embedded within the message data, applying to different parts of the data. This value must be used for PCF messages (with a format of MQFMT_ADMIN, MQFMT_EVENT, or MQFMT_PCF) that contain data in a mixture of character sets. Each MQCFST, MQCFSL, and MQCFSF structure contained within the PCF message must have an explicit character set identifier specified and not MQCCSI_DEFAULT.

If a message of format MQFMT_EMBEDDED_PCF is to contain data in a mixture of character sets, do not use MQCCSI_EMBEDDED. Instead set MQEPH_CCSID_EMBEDDED in the Flags field in the MQEPH structure. This is equivalent to setting MQCCSI_EMBEDDED in the preceding structure. Each MQCFST, MQCFSL, and MQCFSF structure contained within the PCF message must then have an explicit character set identifier specified and not MQCCSI_DEFAULT. For more information on the MQEPH structure, see “MQEPH - Embedded PCF header” on page 350.

Specify this value only on the MQPUT and MQPUT1 calls. If it is specified on the MQGET call, it prevents conversion of the message.

On the MQPUT and MQPUT1 calls, the queue manager changes the values MQCCSI_Q_MGR and MQCCSI_INHERIT in the MQMD that is sent with the message as described above, but does not change the MQMD specified on the MQPUT or MQPUT1 call. No other check is carried out on the value specified.

Applications that retrieve messages must compare this field against the value the application is expecting; if the values differ, the application might need to convert character data in the message.

If you specify the MQGMO_CONVERT option on the MQGET call, this field is an input/output field. The value specified by the application is the coded character set identifier to which to convert the

message data if necessary. If conversion is successful or unnecessary, the value is unchanged (except that the value MQCCSI_Q_MGR or MQCCSI_INHERIT is converted to the actual value). If conversion is unsuccessful, the value after the MQGET call represents the coded character set identifier of the unconverted message that is returned to the application.

Otherwise, this is an output field for the MQGET call, and an input field for the MQPUT and MQPUT1 calls. The initial value of this field is MQCCSI_Q_MGR.

*CorrelId (MQBYTE24)*
The CorrelId field is property in the message header that may be used to identify a specific message or group of messages.

This is a byte string that the application can use to relate one message to another, or to relate the message to other work that the application is performing. The correlation identifier is a permanent property of the message, and persists across restarts of the queue manager. Because the correlation identifier is a byte string and not a character string, the correlation identifier is *not* converted between character sets when the message flows from one queue manager to another.

For the MQPUT and MQPUT1 calls, the application can specify any value. The queue manager transmits this value with the message and delivers it to the application that issues the get request for the message.

If the application specifies MQPMO_NEW_CORREL_ID, the queue manager generates a unique correlation identifier which is sent with the message, and also returned to the sending application on output from the MQPUT or MQPUT1 call.

A correlation identifier generated by the queue manager consists of a 3-byte product identifier (AMQ or CSQ in either ASCII or EBCDIC), followed by one reserved byte and a product-specific implementation of a unique string. In IBM MQ this product-specific implementation string contains the first 12 characters of the queue-manager name, and a value derived from the system clock. All queue managers that can intercommunicate must therefore have names that differ in the first 12 characters to ensure that message identifiers are unique. The ability to generate a unique string also depends on the system clock not being changed backward. To eliminate the possibility of a message identifier generated by the queue manager duplicating one generated by the application, the application must avoid generating identifiers with initial characters in the range A through I in ASCII or EBCDIC (X'41' through X'49' and X'C1' through X'C9'). However, the application is not prevented from generating identifiers with initial characters in these ranges.

This generated correlation identifier is kept with the message if it is retained, and is used as the correlation identifier when the message is sent as a publication to subscribers who specify MQCI_NONE in the SubCorrelId field in the MQSD passed on the MQSUB call. See MQPMO options for more details about retained publications.

When the queue manager or a message channel agent generates a report message, it sets the *CorrelId* field in the way specified by the *Report* field of the original message, either MQRO_COPY_MSG_ID_TO_CORREL_ID or MQRO_PASS_CORREL_ID. Applications that generate report messages must also do this.

For the MQGET call, *CorrelId* is one of the five fields that can be used to select a particular message to be retrieved from the queue. See the description of the *MsgId* field for details of how to specify values for this field.

Specifying MQCI_NONE as the correlation identifier has the same effect as *not* specifying MQMO_MATCH_CORREL_ID, that is, *any* correlation identifier will match.

If the MQGMO_MSG_UNDER_CURSOR option is specified in the *GetMsgOpts* parameter on the MQGET call, this field is ignored.

On return from an MQGET call, the *CorrelId* field is set to the correlation identifier of the message returned (if any).

The following special values can be used:

**MQCI_NONE**
No correlation identifier is specified.

The value is binary zero for the length of the field.

For the C programming language, the constant MQCI_NONE_ARRAY is also defined; this has the same value as MQCI_NONE, but is an array of characters instead of a string.

**MQCI_NEW_SESSION**
Message is the start of a new session.

This value is recognized by the CICS bridge as indicating the start of a new session, that is, the start of a new sequence of messages.

For the C programming language, the constant MQCI_NEW_SESSION_ARRAY is also defined; this has the same value as MQCI_NEW_SESSION, but is an array of characters instead of a string.

For the MQGET call, this is an input/output field. For the MQPUT and MQPUT1 calls, this is an input field if MQPMO_NEW_CORREL_ID is *not* specified, and an output field if MQPMO_NEW_CORREL_ID *is* specified. The length of this field is given by MQ_CORREL_ID_LENGTH. The initial value of this field is MQCI_NONE.

**Note:**

You cannot pass the correlation identifier of a publication in a hierarchy. The field is used by the queue manager.

*Encoding (MQLONG)*

This specifies the numeric encoding of numeric data in the message; it does not apply to numeric data in the MQMD structure itself. The numeric encoding defines the representation used for binary integers, packed-decimal integers, and floating-point numbers.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The queue manager does not check that the field is valid. The following special value is defined:

**MQENC_NATIVE**
The encoding is the default for the programming language and machine on which the application is running.

**Note:** The value of this constant depends on the programming language and environment. For this reason, applications must be compiled using the header, macro, COPY, or INCLUDE files appropriate to the environment in which the application will run.

Applications that put messages usually specify MQENC_NATIVE. Applications that retrieve messages must compare this field against the value MQENC_NATIVE; if the values differ, the application might need to convert numeric data in the message. Use the MQGMO_CONVERT option to request the queue manager to convert the message as part of the processing of the MQGET call. See “Machine encodings” on page 872 for details of how the *Encoding* field is constructed.

If you specify the MQGMO_CONVERT option on the MQGET call, this field is an input/output field. The value specified by the application is the encoding to which to convert the message data if necessary. If conversion is successful or unnecessary, the value is unchanged. If conversion is unsuccessful, the value after the MQGET call represents the encoding of the unconverted message that is returned to the application.

In other cases, this is an output field for the MQGET call, and an input field for the MQPUT and MQPUT1 calls. The initial value of this field is MQENC_NATIVE.

*Expiry (MQLONG)*

This is a period of time expressed in tenths of a second, set by the application that puts the message. The message becomes eligible to be discarded if it has not been removed from the destination queue before this period of time elapses.

For example, to set one minute for the expiry time, you need to set **MQMD**.**Expiry** to 600.

The value is decremented to reflect the time that the message spends on the destination queue, and also on any intermediate transmission queues if the put is to a remote queue. It can also be decremented by message channel agents to reflect transmission times, if these are significant. Likewise, an application

forwarding this message to another queue might decrement the value if necessary, if it has retained the message for a significant time. However, the expiration time is treated as approximate, and the value need not be decremented to reflect small time intervals.

When the message is retrieved by an application using the MQGET call, the *Expiry* field represents the expiry time that still remains.

After a message's expiry time has elapsed, it becomes eligible to be discarded by the queue manager. The message is discarded when a browse or nonbrowse MQGET call occurs that would have returned the message had it not already expired. For example, a nonbrowse MQGET call with the *MatchOptions* field in MQGMO set to MQMO_NONE reading from a FIFO ordered queue discards all the expired messages up to the first unexpired message. With a priority ordered queue, the same call will discard expired messages of higher priority and messages of an equal priority that arrived on the queue before the first unexpired message.

A message that has expired is never returned to an application (either by a browse or a non-browse MQGET call), so the value in the *Expiry* field of the message descriptor after a successful MQGET call is either greater than zero, or the special value MQEI_UNLIMITED.

If a message is put on a remote queue, the message might expire (and be discarded) while it is on an intermediate transmission queue, before the message reaches the destination queue.

A report is generated when an expired message is discarded, if the message specified one of the MQRO_EXPIRATION_* report options. If none of these options is specified, no such report is generated; the message is assumed to be no longer relevant after this time period (perhaps because a later message has superseded it).

For a message put within syncpoint, the expiry interval begins at the time the message is put, not the time the syncpoint is committed. It is possible that the expiry interval can pass before the syncpoint is committed. In this case the message will be discarded at some time after the commit operation and the message will not be returned to an application in response to an MQGET operation.

Any other program that discards messages based on expiry time must also send an appropriate report message if one was requested.

**Notes:**

1. If a message is put with an *Expiry* time of zero or a number greater than 999 999 999, the MQPUT or MQPUT1 call fails with reason code MQRC_EXPIRY_ERROR; no report message is generated in this case.

   To enable reason code 2013, MQRC_EXPIRY_ERROR, you must enable the environment variable AMQ_ENFORCE_MAX_EXPIRY_ERROR.

   The following uses an example for Linux:

   ```
   $ export AMQ_ENFORCE_MAX_EXPIRY_ERROR=True
   ```

   Note that the:

   - Important thing is to export the variable
   - Actual value is ignored, however, using `True` might be helpful when reviewing the setup.
2. Because a message with an expiry time that has elapsed might not be discarded until later, there might be messages on a queue that have passed their expiry time, and that are not therefore eligible for retrieval. These messages nevertheless count toward the number of messages on the queue for all purposes, including depth triggering.
3. An expiration report is generated, if requested, when the message is discarded, not when it becomes eligible for discarding.
4. Discarding an expired message, and generating an expiration report if requested, are never part of the application's unit of work, even if the message was scheduled for discarding as a result of an MQGET call operating within a unit of work.

5. If a nearly-expired message is retrieved by an MQGET call within a unit of work, and the unit of work is subsequently backed out, the message might become eligible to be discarded before it can be retrieved again.
6. If a nearly-expired message is locked by an MQGET call with MQGMO_LOCK, the message might become eligible to be discarded before it can be retrieved by an MQGET call with MQGMO_MSG_UNDER_CURSOR; reason code MQRC_NO_MSG_UNDER_CURSOR is returned on this subsequent MQGET call if that happens.
7. When a request message with an expiry time greater than zero is retrieved, the application can take one of the following actions when it sends the reply message:
   - Copy the remaining expiry time from the request message to the reply message.
   - Set the expiry time in the reply message to an explicit value greater than zero.
   - Set the expiry time in the reply message to MQEI_UNLIMITED.

   The action to take depends on the design of the application. However, the default action for putting messages to a dead-letter (undelivered-message) queue must be to preserve the remaining expiry time of the message, and to continue to decrement it.
8. Trigger messages are always generated with MQEI_UNLIMITED.
9. A message (normally on a transmission queue) that has a *Format* name of MQFMT_XMIT_Q_HEADER has a second message descriptor within the MQXQH. It therefore has two *Expiry* fields associated with it. The following additional points should be noted in this case:
   - When an application puts a message on a remote queue, the queue manager places the message initially on a local transmission queue, and prefixes the application message data with an MQXQH structure. The queue manager sets the values of the two *Expiry* fields to be the same as that specified by the application.

     If an application puts a message directly on a local transmission queue, the message data must already begin with an MQXQH structure, and the format name must be MQFMT_XMIT_Q_HEADER. In this case, the application need not set the values of these two *Expiry* fields to be the same. (The queue manager checks that the *Expiry* field within the MQXQH contains a valid value, and that the message data is long enough to include it). For an application that can write directly to the transmission queue, the application has to create a transmission queue header with the embedded message descriptor. However, if the expiry value in the message descriptor written to the transmission queue is inconsistent with the value in the embedded message descriptor, an expiry error rejection occurs.
   - When a message with a *Format* name of MQFMT_XMIT_Q_HEADER is retrieved from a queue (whether this is a normal or a transmission queue), the queue manager decrements *both* these *Expiry* fields with the time spent waiting on the queue. No error is raised if the message data is not long enough to include the *Expiry* field in the MQXQH.
   - The queue manager uses the *Expiry* field in the separate message descriptor (that is, not the one in the message descriptor embedded within the MQXQH structure) to test whether the message is eligible for discarding.
   - If the initial values of the two *Expiry* fields are different, the *Expiry* time in the separate message descriptor when the message is retrieved might be greater than zero (so the message is not eligible for discarding), while the time according to the *Expiry* field in the MQXQH has elapsed. In this case the *Expiry* field in the MQXQH is set to zero.
10. The expiry time on a reply message returned from the IMS bridge is unlimited unless MQIIH_PASS_EXPIRATION is set in the Flags field of the MQIIH. See Flags for more information.

The following special value is recognized:

**MQEI_UNLIMITED**
The message has an unlimited expiration time.

This is an output field for the MQGET call, and an input field for the MQPUT and MQPUT1 calls. The initial value of this field is MQEI_UNLIMITED.

*Expired messages on z/OS*
On IBM MQ for z/OS, messages that have expired are discarded by the next appropriate MQGET call.

However, if no such call occurs, the expired message is not discarded, and, for some queues, a large number of expired messages can accumulate. To remedy this, set the queue manager to scan queues periodically and discard expired messages on one or more queues in one of the following ways:

**Periodic scan**
You can specify a period using the EXPRYINT (expiry interval) queue manager attribute. Each time the expiry interval is reached, the queue manager looks for candidate queues that are worth scanning to discard expired messages.

The queue manager maintains information about the expired messages on each queue, and knows whether a scan for expired messages is worthwhile. So, only a selection of queues is scanned at any time.

Shared queues are scanned by only one queue manager in a queue-sharing group. Generally, it is the first queue manager to restart, or the first to have EXPRYINT set. If this queue manager terminates, another queue manager in the queue-sharing group takes over the queue scanning. Set the expiry interval value for all queue managers within a queue-sharing group to the same value.

Note that expiry processing takes place for every queue when a queue manager restarts, regardless of the EXPRYINT setting.

**Explicit request**
Issue the REFRESH QMGR TYPE(EXPIRY) command, specifying the queue or queues that you want scanned.

V 8.0.0.4 *Enforcing lower expiration times*
Administrators can limit the expiry time of any message put to a queue or topic by using the *CAPEXPRY* attribute specified in the **CUSTOM** attribute on the queue or topic.

z/OS To enable this feature on z/OS, you must apply APAR PI50761 and enable the new feature with the MQSC command **RECOVER QMGR (TUNE CAPEXPRY ON)**.

**Important:** The **RECOVER QMGR** command is reserved for use by IBM, and should normally only be used under guidance by IBM support.

z/OS You can either enter the command at a console, or to the queue manager configuration, by adding to a file processed in the CSQINP2 concatenation during queue manager start up. Note that the effect of the command does not persist over a queue manager restart.

An expiry time specified in the **Expiry** field of the MQMD, by an application,which is greater than the *CAPEXPRY* value specified in the **CUSTOM** attribute on the queue or topic will be replaced by that *CAPEXPRY* value. An expiry time specified by an application, which is lower than the *CAPEXPRY* value will be used.

Note that the value of **CAPEXPRY** is expressed in tenths of seconds, so one minute has a value of 600.

If more than one object is used on the resolution path, for example, when a message is put to an alias or remote queue, then the lowest of all the *CAPEXPRY* values is used as the upper limit for message expiry.

Changes to the *CAPEXPRY* values take effect immediately. The expiry value is evaluated for each put to a queue or topic and so is sensitive to the object resolution, which may differ between each put operation.

However, note that existing messages in the queue, prior to a change in **CAPEXPRY**, are not affected by the change (that is, their expiry time remains intact). Only new messages that are put into the queue after the change in **CAPEXPRY** have the new expiry time.

For example, in a cluster where a put is performed to a queue opened with *MQOO_BIND_NOT_FIXED*, messages can be assigned different expiry values on each put, depending on the *CAPEXPRY* value set for the transmission queue, used by the channel, that sends the message to the selected target queue manager.

Note that a put to a queue or topic by a JMS application specifying a delivery delay fails with *MQRC_EXPIRY_ERROR*, if the delivery delay is beyond the resolved expiry time for the target queue or topic. A *CAPEXPRY* attribute set on a queue resolved for a JMS Destination can cause this error.

**Note: CAPEXPRY** must not be used on any queues that will hold IBM MQ internally-generated messages such as any SYSTEM.CLUSTER.* queue and the SYSTEM.PROTECTION.POLICY.QUEUE.

*Feedback (MQLONG)*
The Feedback field is used with a message of type MQMT_REPORT to indicate the nature of the report, and is only meaningful with that type of message.

The field can contain one of the MQFB_* values, or one of the MQRC_* values. Feedback codes are grouped as follows:

**MQFB_NONE**
No feedback provided.

**MQFB_SYSTEM_FIRST**
Lowest value for system-generated feedback.

**MQFB_SYSTEM_LAST**
Highest value for system-generated feedback.

The range of system-generated feedback codes MQFB_SYSTEM_FIRST through MQFB_SYSTEM_LAST includes the general feedback codes listed in this topic (MQFB_*), and also the reason codes (MQRC_*) that can occur when the message cannot be put on the destination queue.

**MQFB_APPL_FIRST**
Lowest value for application-generated feedback.

**MQFB_APPL_LAST**
Highest value for application-generated feedback.

Applications that generate report messages must not use feedback codes in the system range (other than MQFB_QUIT), unless they want to simulate report messages generated by the queue manager or message channel agent.

On the MQPUT or MQPUT1 calls, the value specified must either be MQFB_NONE, or be within the system range or application range. This is checked whatever the value of *MsgType*.

**General feedback codes**:

**MQFB_COA**
Confirmation of arrival on the destination queue (see MQRO_COA).

**MQFB_COD**
Confirmation of delivery to the receiving application (see MQRO_COD).

**MQFB_EXPIRATION**
Message was discarded because it had not been removed from the destination queue before its expiry time had elapsed.

**MQFB_PAN**
Positive action notification (see MQRO_PAN).

**MQFB_NAN**
Negative action notification (see MQRO_NAN).

**MQFB_QUIT**
End application.

This can be used by a workload scheduling program to control the number of instances of an application program that are running. Sending an MQMT_REPORT message with this feedback code to an instance of the application program indicates to that instance that it should stop processing. However, adherence to this convention is a matter for the application; it is not enforced by the queue manager.

**Channel feedback codes:**

**MQFB_CHANNEL_COMPLETED**
A channel ended normally.

**MQFB_CHANNEL_FAIL**
A channel ended abnormally and goes into STOPPED state.

**MQFB_CHANNEL_FAIL_RETRY**
A channel ended abnormally and goes into RETRY state.

**IMS-bridge feedback codes**

These codes are used when an unexpected IMS-OTMA sense code is received. The sense code or, when the sense code is 0x1A the reason code associated with that sense code, is indicated in the *Feedback*.

1. For *Feedback* codes in range MQFB_IMS_FIRST (300) through MQFB_IMS_LAST (399), a sense code other than 0x1A was received. The *sense code* is given by the expression (*Feedback* - MQFB_IMS_FIRST+1)
2. For *Feedback* codes in range MQFB_IMS_NACK_1A_REASON_FIRST (600) through MQFB_IMS_NACK_1A_REASON_LAST (855), a sense code of 0x1A was received. The *reason code* associated with the sense code is given by the expression (*Feedback* - MQFB_IMS_NACK_1A_REASON_FIRST)

The meaning of the IMS-OTMA sense codes and corresponding reason codes are described in *Open Transaction Manager Access Guide and Reference*.

The following feedback codes can be generated by the IMS bridge:

**MQFB_DATA_LENGTH_ZERO**
A segment length was zero in the application data of the message.

**MQFB_DATA_LENGTH_NEGATIVE**
A segment length was negative in the application data of the message.

**MQFB_DATA_LENGTH_TOO_BIG**
A segment length was too large in the application data of the message.

**MQFB_BUFFER_OVERFLOW**
The value of one of the length fields would cause the data to overflow the message buffer.

**MQFB_LENGTH_OFF_BY_ONE**
The value of one of the length fields was 1 byte too short.

**MQFB_IIH_ERROR**
The *Format* field in MQMD specifies MQFMT_IMS, but the message does not begin with a valid MQIIH structure.

**MQFB_NOT_AUTHORIZED_FOR_IMS**
The user ID contained in the message descriptor MQMD, or the password contained in the *Authenticator* field in the MQIIH structure, failed the validation performed by the IMS bridge. As a result the message was not passed to IMS.

**MQFB_IMS_ERROR**
An unexpected error was returned by IMS. Consult the IBM MQ error log on the system on which the IMS bridge resides for more information about the error.

**MQFB_IMS_FIRST**
When the IMS-OTMA sense code is not 0x1A, IMS-generated feedback codes are in the range MQFB_IMS_FIRST (300) through MQFB_IMS_LAST (399). The IMS-OTMA sense code itself is *Feedback* minus MQFB_IMS_ERROR.

**MQFB_IMS_LAST**
Highest value for IMS-generated feedback when the sense code is not 0x1A.

**MQFB_IMS_NACK_1A_REASON_FIRST**
When the sense code is 0x1A, IMS-generated feedback codes are in the range MQFB_IMS_NACK_1A_REASON_FIRST (600) through MQFB_IMS_NACK_1A_REASON_LAST (855).

**MQFB_IMS_NACK_1A_REASON_LAST**
Highest value for IMS-generated feedback when the sense code is 0x1A

**CICS-bridge feedback codes**: The following feedback codes can be generated by the CICS bridge:

**MQFB_CICS_APPL_ABENDED**
The application program specified in the message abnormally ended. This feedback code occurs only in the *Reason* field of the MQDLH structure.

**MQFB_CICS_APPL_NOT_STARTED**
The EXEC CICS LINK for the application program specified in the message failed. This feedback code occurs only in the *Reason* field of the MQDLH structure.

**MQFB_CICS_BRIDGE_FAILURE**
CICS bridge terminated abnormally without completing normal error processing.

**MQFB_CICS_CCSID_ERROR**
Character set identifier not valid.

**MQFB_CICS_CIH_ERROR**
CICS information header structure missing or not valid.

**MQFB_CICS_COMMAREA_ERROR**
Length of CICS COMMAREA not valid.

**MQFB_CICS_CORREL_ID_ERROR**
Correlation identifier not valid.

**MQFB_CICS_DLQ_ERROR**
The CICS bridge task was unable to copy a reply to this request to the dead-letter queue. The request was backed out.

**MQFB_CICS_ENCODING_ERROR**
Encoding not valid.

**MQFB_CICS_INTERNAL_ERROR**
CICS bridge encountered an unexpected error.

This feedback code occurs only in the *Reason* field of the MQDLH structure.

**MQFB_CICS_NOT_AUTHORIZED**
User identifier not authorized or password not valid.

This feedback code occurs only in the *Reason* field of the MQDLH structure.

**MQFB_CICS_UOW_BACKED_OUT**
The unit of work was backed out, for one of the following reasons:

- A failure was detected while processing another request within the same unit of work.
- A CICS abend occurred while the unit of work was in progress.

**MQFB_CICS_UOW_ERROR**
Unit-of-work control field *UOWControl* not valid.

**Trace-route message feedback codes**:

**MQFB_ACTIVITY**
Used with the MQFMT_EMBEDDED_PCF format to allow the option of user data following activity reports.

**MQFB_MAX_ACTIVITIES**
Returned when the trace-route message is discarded because the number of activities the message has been involved in exceeds the maximum activities limit.

**MQFB_NOT_FORWARDED**
Returned when the trace-route message is discarded because it is about to be sent to a remote queue manager that does not support trace-route messages.

**MQFB_NOT_DELIVERED**
Returned when the trace-route message is discarded because it is about to be put on a local queue.

**MQFB_UNSUPPORTED_FORWARDING**
Returned when the trace-route message is discarded because a value in the forwarding parameter is unrecognized, and is in the rejected bit mask.

**MQFB_UNSUPPORTED_DELIVERY**
Returned when the trace-route message is discarded because a value in the delivery parameter is unrecognized, and is in the rejected bit mask.

**IBM MQ reason codes**: For exception report messages, *Feedback* contains an IBM MQ reason code. Among possible reason codes are:

**MQRC_PUT_INHIBITED**
(2051, X'803') Put calls inhibited for the queue.

**MQRC_Q_FULL**
(2053, X'805') Queue already contains maximum number of messages.

**MQRC_NOT_AUTHORIZED**
(2035, X'7F3') Not authorized for access.

**MQRC_Q_SPACE_NOT_AVAILABLE**
(2056, X'808') No space available on disk for queue.

**MQRC_PERSISTENT_NOT_ALLOWED**
(2048, X'800') Queue does not support persistent messages.

**MQRC_MSG_TOO_BIG_FOR_Q_MGR**
(2031, X'7EF') Message length greater than maximum for queue manager.

**MQRC_MSG_TOO_BIG_FOR_Q**
(2030, X'7EE') Message length greater than maximum for queue.

For a full list of reason codes, see:

- For IBM MQ for z/OS, see API completion and reason codes.
- For all other platforms, see API completion and reason codes.

.

This is an output field for the MQGET call, and an input field for MQPUT and MQPUT1 calls. The initial value of this field is MQFB_NONE.

*Format (MQCHAR8)*

This is a name that the sender of the message uses to indicate to the receiver the nature of the data in the message. Any characters that are in the character set of the queue manager can be specified for the name, but you must restrict the name to the following:

- Uppercase A through Z
- Numeric digits 0 through 9

If other characters are used, it might not be possible to translate the name between the character sets of the sending and receiving queue managers.

Pad the name with blanks to the length of the field, or use a null character to terminate the name before the end of the field; the null and any subsequent characters are treated as blanks. Do not specify a name with leading or embedded blanks. For the MQGET call, the queue manager returns the name padded with blanks to the length of the field.

The queue manager does not check that the name complies with the recommendations described above.

Names beginning MQ in upper, lower, and mixed case have meanings that are defined by the queue manager; do not use names beginning with these letters for your own formats. The queue manager built-in formats are:

**MQFMT_NONE**
The nature of the data is undefined: the data cannot be converted when the message is retrieved from a queue using the MQGMO_CONVERT option.

If you specify MQGMO_CONVERT on the MQGET call, and the character set or encoding of data in the message differs from that specified in the *MsgDesc* parameter, the message is returned with the following completion and reason codes (assuming no other errors):

- Completion code MQCC_WARNING and reason code MQRC_FORMAT_ERROR if the MQFMT_NONE data is at the beginning of the message.
- Completion code MQCC_OK and reason code MQRC_NONE if the MQFMT_NONE data is at the end of the message (that is, preceded by one or more MQ header structures). The MQ header structures are converted to the requested character set and encoding in this case.

For the C programming language, the constant MQFMT_NONE_ARRAY is also defined; this has the same value as MQFMT_NONE, but is an array of characters instead of a string.

**MQFMT_ADMIN**
The message is a command-server request or reply message in programmable command format (PCF). Messages of this format can be converted if the MQGMO_CONVERT option is specified on the MQGET call. See Using Programmable Command Formats for more information about using programmable command format messages.

For the C programming language, the constant MQFMT_ADMIN_ARRAY is also defined; this has the same value as MQFMT_ADMIN, but is an array of characters instead of a string.

**MQFMT_CICS**
The message data begins with the CICS information header MQCIH, followed by the application data. The format name of the application data is given by the *Format* field in the MQCIH structure.

On z/OS, specify the MQGMO_CONVERT option on the MQGET call to convert messages that have format MQFMT_CICS.

For the C programming language, the constant MQFMT_CICS_ARRAY is also defined; this has the same value as MQFMT_CICS, but is an array of characters instead of a string.

**MQFMT_COMMAND_1**
The message is an MQSC command-server reply message containing the object count, completion code, and reason code. Messages of this format can be converted if the MQGMO_CONVERT option is specified on the MQGET call.

For the C programming language, the constant MQFMT_COMMAND_1_ARRAY is also defined; this has the same value as MQFMT_COMMAND_1, but is an array of characters instead of a string.

**MQFMT_COMMAND_2**
The message is an MQSC command-server reply message containing information about the objects requested. Messages of this format can be converted if the MQGMO_CONVERT option is specified on the MQGET call.

For the C programming language, the constant MQFMT_COMMAND_2_ARRAY is also defined; this has the same value as MQFMT_COMMAND_2, but is an array of characters instead of a string.

**MQFMT_DEAD_LETTER_HEADER**
The message data begins with the dead-letter header MQDLH. The data from the original message immediately follows the MQDLH structure. The format name of the original message data is given by the *Format* field in the MQDLH structure; see "MQDLH - Dead-letter header" on page 338 for details of this structure. Messages of this format can be converted if the MQGMO_CONVERT option is specified on the MQGET call.

COA and COD reports are not generated for messages that have a *Format* of MQFMT_DEAD_LETTER_HEADER.

For the C programming language, the constant MQFMT_DEAD_LETTER_HEADER_ARRAY is also defined; this has the same value as MQFMT_DEAD_LETTER_HEADER, but is an array of characters instead of a string.

**MQFMT_DIST_HEADER**
The message data begins with the distribution-list header MQDH; this includes the arrays of MQOR and MQPMR records. The distribution-list header can be followed by additional data. The format of the

additional data (if any) is given by the *Format* field in the MQDH structure; see "MQDH - Distribution header" on page 332 for details of this structure. Messages with format MQFMT_DIST_HEADER can be converted if the MQGMO_CONVERT option is specified on the MQGET call.

This format is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

For the C programming language, the constant MQFMT_DIST_HEADER_ARRAY is also defined; this has the same value as MQFMT_DIST_HEADER, but is an array of characters instead of a string.

**MQFMT_EMBEDDED_PCF**
Format for a trace-route message, provided that the PCF command value is set to MQCMD_TRACE_ROUTE. Using this format allows user data to be sent along with the trace-route message, provided that their applications can cope with preceding PCF parameters.

The PCF header **must** be the first header, or the message will not be treated as a trace-route message. This means that the message cannot be in a group, and that trace-route messages cannot be segmented. If a trace-route message is sent in a group the message is rejected with reason code MQRC_MSG_NOT_ALLOWED_IN_GROUP.

Note that MQFMT_ADMIN can also be used for the format of a trace-route message, but in this case no user data can be sent along with the trace-route message.

**MQFMT_EVENT**
The message is an MQ event message that reports an event that occurred. Event messages have the same structure as programmable commands; see PCF command messages for more information about this structure, and Event monitoring for information about events.

Version-1 event messages can be converted in all environments if the MQGMO_CONVERT option is specified on the MQGET call. Version-2 event messages can be converted only on z/OS.

For the C programming language, the constant MQFMT_EVENT_ARRAY is also defined; this has the same value as MQFMT_EVENT, but is an array of characters instead of a string.

**MQFMT_IMS**
The message data begins with the IMS information header MQIIH, which is followed by the application data. The format name of the application data is given by the *Format* field in the MQIIH structure.

For details of how MQIIH structure is handled when using MQGET with MQGMO_CONVERT, see "Format (MQCHAR8)" on page 388 and "ReplyToFormat (MQCHAR8)" on page 389.

For the C programming language, the constant MQFMT_IMS_ARRAY is also defined; this has the same value as MQFMT_IMS, but is an array of characters instead of a string.

**MQFMT_IMS_VAR_STRING**
The message is an IMS variable string, which is a string of the form `llzzccc`, where:

**`ll`**
is a 2-byte length field specifying the total length of the IMS variable string item. This length is equal to the length of `ll` (2 bytes), plus the length of `zz` (2 bytes), plus the length of the character string itself. `ll` is a 2-byte binary integer in the encoding specified by the *Encoding* field.

**`zz`**
is a 2-byte field containing flags that are significant to IMS. `zz` is a byte string consisting of two MQBYTE fields, and is transmitted without change from sender to receiver (that is, `zz` is not subject to any conversion).

**`ccc`**
is a variable-length character string containing `ll-4` characters. `ccc` is in the character set specified by the *CodedCharSetId* field.

On z/OS, the message data can consist of a sequence of IMS variable strings butted together, with each string being of the form `llzzccc`. There must be no bytes skipped between successive IMS variable strings. This means that if the first string has an odd length, the second string will

be misaligned, that is, it will not begin on a boundary that is a multiple of two. Take care when constructing such strings on machines that require alignment of elementary data types.

Use the MQGMO_CONVERT option on the MQGET call to convert messages that have format MQFMT_IMS_VAR_STRING.

For the C programming language, the constant MQFMT_IMS_VAR_STRING_ARRAY is also defined; this has the same value as MQFMT_IMS_VAR_STRING, but is an array of characters instead of a string.

**MQFMT_MD_EXTENSION**
The message data begins with the message-descriptor extension MQMDE, and is optionally followed by other data (usually the application message data). The format name, character set, and encoding of the data that follow the MQMDE are given by the *Format*, *CodedCharSetId*, and *Encoding* fields in the MQMDE. See "MQMDE - Message descriptor extension" on page 452 for details of this structure. Messages of this format can be converted if the MQGMO_CONVERT option is specified on the MQGET call.

For the C programming language, the constant MQFMT_MD_EXTENSION_ARRAY is also defined; this has the same value as MQFMT_MD_EXTENSION, but is an array of characters instead of a string.

**MQFMT_PCF**
The message is a user-defined message that conforms to the structure of a programmable command format (PCF) message. Messages of this format can be converted if the MQGMO_CONVERT option is specified on the MQGET call. See Using Programmable Command Formats for more information about using programmable command format messages.

For the C programming language, the constant MQFMT_PCF_ARRAY is also defined; this has the same value as MQFMT_PCF, but is an array of characters instead of a string.

**MQFMT_REF_MSG_HEADER**
The message data begins with the reference message header MQRMH, and is optionally followed by other data. The format name, character set, and encoding of the data is given by the *Format*, *CodedCharSetId*, and *Encoding* fields in the MQRMH. See "MQRMH - Reference message header" on page 527 for details of this structure. Messages of this format can be converted if the MQGMO_CONVERT option is specified on the MQGET call.

This format is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

For the C programming language, the constant MQFMT_REF_MSG_HEADER_ARRAY is also defined; this has the same value as MQFMT_REF_MSG_HEADER, but is an array of characters instead of a string.

**MQFMT_RF_HEADER**
The message data begins with the rules and formatting header MQRFH, and is optionally followed by other data. The format name, character set, and encoding of the data (if any) are given by the *Format*, *CodedCharSetId*, and *Encoding* fields in the MQRFH. Messages of this format can be converted if the MQGMO_CONVERT option is specified on the MQGET call.

For the C programming language, the constant MQFMT_RF_HEADER_ARRAY is also defined; this has the same value as MQFMT_RF_HEADER, but is an array of characters instead of a string.

**MQFMT_RF_HEADER_2**
The message data begins with the version-2 rules and formatting header MQRFH2, and is optionally followed by other data. The format name, character set, and encoding of the optional data (if any) are given by the *Format*, *CodedCharSetId*, and *Encoding* fields in the MQRFH2. Messages of this format can be converted if the MQGMO_CONVERT option is specified on the MQGET call.

For the C programming language, the constant MQFMT_RF_HEADER_2_ARRAY is also defined; this has the same value as MQFMT_RF_HEADER_2, but is an array of characters instead of a string.

**MQFMT_STRING**
The application message data can be either an SBCS string (single-byte character set), or a DBCS string (double-byte character set). Messages of this format can be converted if the MQGMO_CONVERT option is specified on the MQGET call.

For the C programming language, the constant MQFMT_STRING_ARRAY is also defined; this has the same value as MQFMT_STRING, but is an array of characters instead of a string.

**MQFMT_TRIGGER**
The message is a trigger message, described by the MQTM structure; see "MQTM - Trigger message" on page 579 for details of this structure. Messages of this format can be converted if the MQGMO_CONVERT option is specified on the MQGET call.

For the C programming language, the constant MQFMT_TRIGGER_ARRAY is also defined; this has the same value as MQFMT_TRIGGER, but is an array of characters instead of a string.

**MQFMT_WORK_INFO_HEADER**
The message data begins with the work information header MQWIH, which is followed by the application data. The format name of the application data is given by the *Format* field in the MQWIH structure.

On z/OS, specify the MQGMO_CONVERT option on the MQGET call to convert the *user data* in messages that have format MQFMT_WORK_INFO_HEADER. However, the MQWIH structure itself is always returned in the queue-manager's character set and encoding (that is, the MQWIH structure is converted whether or not the MQGMO_CONVERT option is specified).

For the C programming language, the constant MQFMT_WORK_INFO_HEADER_ARRAY is also defined; this has the same value as MQFMT_WORK_INFO_HEADER, but is an array of characters instead of a string.

**MQFMT_XMIT_Q_HEADER**
The message data begins with the transmission queue header MQXQH. The data from the original message immediately follows the MQXQH structure. The format name of the original message data is given by the *Format* field in the MQMD structure, which is part of the transmission queue header MQXQH. See "MQXQH - Transmission-queue header" on page 598 for details of this structure.

COA and COD reports are not generated for messages that have a *Format* of MQFMT_XMIT_Q_HEADER.

For the C programming language, the constant MQFMT_XMIT_Q_HEADER_ARRAY is also defined; this has the same value as MQFMT_XMIT_Q_HEADER, but is an array of characters instead of a string.

This is an output field for the MQGET call, and an input field for the MQPUT and MQPUT1 calls. The length of this field is given by MQ_FORMAT_LENGTH. The initial value of this field is MQFMT_NONE.

*GroupId (MQBYTE24)*

This is a byte string that is used to identify the particular message group or logical message to which the physical message belongs. *GroupId* is also used if segmentation is allowed for the message. In all these cases, *GroupId* has a non-null value, and one or more of the following flags is set in the *MsgFlags* field:

- MQMF_MSG_IN_GROUP
- MQMF_LAST_MSG_IN_GROUP
- MQMF_SEGMENT
- MQMF_LAST_SEGMENT
- MQMF_SEGMENTATION_ALLOWED

If none of these flags is set, *GroupId* has the special null value MQGI_NONE.

The application does not need to set this field on the MQPUT or MQGET call if:

- On the MQPUT call, MQPMO_LOGICAL_ORDER is specified.
- On the MQGET call, MQMO_MATCH_GROUP_ID is *not* specified.

These are the recommended ways of using these calls for messages that are not report messages. However, if the application requires more control, or the call is MQPUT1, the application must ensure that *GroupId* is set to an appropriate value.

Message groups and segments can be processed correctly only if the group identifier is unique. For this reason, *applications must not generate their own group identifiers* ; instead, applications must do one of the following:

- If MQPMO_LOGICAL_ORDER is specified, the queue manager automatically generates a unique group identifier for the first message in the group or segment of the logical message, and uses that group identifier for the remaining messages in the group or segments of the logical message, so the application does not need to take any special action. This is the recommended procedure.
- If MQPMO_LOGICAL_ORDER is *not* specified, the application must request the queue manager to generate the group identifier, by setting *GroupId* to MQGI_NONE on the first MQPUT or MQPUT1 call for a message in the group or segment of the logical message. The group identifier returned by the queue manager on output from that call must then be used for the remaining messages in the group or segments of the logical message. If a message group contains segmented messages, the same group identifier must be used for all segments and messages in the group.

  When MQPMO_LOGICAL_ORDER is not specified, messages in groups and segments of logical messages can be put in any order (for example, in reverse order), but the group identifier must be allocated by the *first* MQPUT or MQPUT1 call that is issued for any of those messages.

On input to the MQPUT and MQPUT1 calls, the queue manager uses the value described in Physical order on a queue. On output from the MQPUT and MQPUT1 calls, the queue manager sets this field to the value that was sent with the message if the object opened is a single queue and not a distribution list, but leaves it unchanged if the object opened is a distribution list. In the latter case, if the application needs to know the group identifiers generated, the application must provide MQPMR records containing the *GroupId* field.

On input to the MQGET call, the queue manager uses the value described in Table 495 on page 374. On output from the MQGET call, the queue manager sets this field to the value for the message retrieved.

The following special value is defined:

**MQGI_NONE**
No group identifier specified.

The value is binary zero for the length of the field. This is the value that is used for messages that are not in groups, not segments of logical messages, and for which segmentation is not allowed.

For the C programming language, the constant MQGI_NONE_ARRAY is also defined; this has the same value as MQGI_NONE, but is an array of characters instead of a string.

The length of this field is given by MQ_GROUP_ID_LENGTH. The initial value of this field is MQGI_NONE. This field is ignored if *Version* is less than MQMD_VERSION_2.

*MsgFlags (MQLONG)*
MsgFlags are flags that specify attributes of the message, or control its processing.

MsgFlags are divided into the following categories:

- Segmentation flags
- Status flags

**Segmentation flags**: When a message is too big for a queue, an attempt to put the message on the queue typically fails. Segmentation is a technique whereby the queue manager or application splits the message into smaller pieces called segments, and places each segment on the queue as a separate physical message. The application that retrieves the message can either retrieve the segments one by one, or request the queue manager to reassemble the segments into a single message that is returned by the MQGET call. The latter is achieved by specifying the MQGMO_COMPLETE_MSG option on the MQGET call, and supplying a buffer that is big enough to accommodate the complete message. (See “MQGMO - Get-message options” on page 355 for details of the MQGMO_COMPLETE_MSG option.) A message can be segmented at the sending queue manager, at an intermediate queue manager, or at the destination queue manager.

You can specify one of the following to control the segmentation of a message:

**MQMF_SEGMENTATION_INHIBITED**
This option prevents the message being broken into segments by the queue manager. If specified for a message that is already a segment, this option prevents the segment being broken into smaller segments.

The value of this flag is binary zero. This is the default.

**MQMF_SEGMENTATION_ALLOWED**
This option allows the message to be broken into segments by the queue manager. If specified for a message that is already a segment, this option allows the segment to be broken into smaller segments. MQMF_SEGMENTATION_ALLOWED can be set without either MQMF_SEGMENT or MQMF_LAST_SEGMENT being set.

- On z/OS, the queue manager does not support the segmentation of messages. If a message is too big for the queue, the MQPUT or MQPUT1 call fails with reason code MQRC_MSG_TOO_BIG_FOR_Q. However, the MQMF_SEGMENTATION_ALLOWED option can still be specified, and allows the message to be segmented at a remote queue manager.

When the queue manager segments a message, the queue manager turns on the MQMF_SEGMENT flag in the copy of the MQMD that is sent with each segment, but does not alter the settings of these flags in the MQMD provided by the application on the MQPUT or MQPUT1 call. For the last segment in the logical message, the queue manager also turns on the MQMF_LAST_SEGMENT flag in the MQMD that is sent with the segment.

**Note:** Take care when putting messages with MQMF_SEGMENTATION_ALLOWED but without MQPMO_LOGICAL_ORDER. If the message is:

- Not a segment, and
- Not in a group, and
- Not being forwarded,

the application must reset the *GroupId* field to MQGI_NONE before *each* MQPUT or MQPUT1 call, so that the queue manager can generate a unique group identifier for each message. If this is not done, unrelated messages can have the same group identifier, which might lead to incorrect processing subsequently. See the descriptions of the *GroupId* field and the MQPMO_LOGICAL_ORDER option for more information about when to reset the *GroupId* field.

The queue manager splits messages into segments as necessary so that the segments (plus any required header data) fit on the queue. However, there is a lower limit for the size of a segment generated by the queue manager, and only the last segment created from a message can be smaller than this limit (the lower limit for the size of an application-generated segment is one byte). Segments generated by the queue manager might be of unequal length. The queue-manager processes the message as follows:

- User-defined formats are split on boundaries that are multiples of 16 bytes; the queue manager does not generate segments that are smaller than 16 bytes (other than the last segment).
- Built-in formats other than MQFMT_STRING are split at points appropriate to the nature of the data present. However, the queue manager never splits a message in the middle of an IBM MQ header structure. This means that a segment containing a single MQ header structure cannot be split further by the queue manager, and as a result the minimum possible segment size for that message is greater than 16 bytes.

  The second or later segment generated by the queue manager begins with one of the following:

  – An MQ header structure
  – The start of the application message data
  – Part of the way through the application message data
- MQFMT_STRING is split without regard for the nature of the data present (SBCS, DBCS, or mixed SBCS/DBCS). When the string is DBCS or mixed SBCS/DBCS, this might result in segments that cannot be converted from one character set to another. The queue manager never splits

MQFMT_STRING messages into segments that are smaller than 16 bytes (other than the last segment).

- The queue manager sets the *Format*, *CodedCharSetId*, and *Encoding* fields in the MQMD of each segment to describe correctly the data present at the *start* of the segment; the format name is either the name of a built-in format, or the name of a user-defined format.
- The *Report* field in the MQMD of segments with *Offset* greater than zero is modified. For each report type, if the report option is MQRO_*_WITH_DATA, but the segment cannot contain any of the first 100 bytes of user data (that is, the data following any IBM MQ header structures that may be present), the report option is changed to MQRO_*.

The queue manager follows the above rules, but otherwise splits messages unpredictably; do not make assumptions about where a message is split.

For *persistent* messages, the queue manager can perform segmentation only within a unit of work:

- If the MQPUT or MQPUT1 call is operating within a user-defined unit of work, that unit of work is used. If the call fails during the segmentation process, the queue manager removes any segments that were placed on the queue as a result of the failing call. However, the failure does not prevent the unit of work being committed successfully.
- If the call is operating outside a user-defined unit of work, and there is no user-defined unit of work in existence, the queue manager creates a unit of work just for the duration of the call. If the call is successful, the queue manager commits the unit of work automatically. If the call fails, the queue manager backs out the unit of work.
- If the call is operating outside a user-defined unit of work, but a user-defined unit of work exists, the queue manager cannot perform segmentation. If the message does not require segmentation, the call can still succeed. But if the message requires segmentation, the call fails with reason code MQRC_UOW_NOT_AVAILABLE.

For *nonpersistent* messages, the queue manager does not require a unit of work to be available in order to perform segmentation.

Take special care when converting data in messages that might be segmented:

- If the receiving application converts data on the MQGET call, and specifies the MQGMO_COMPLETE_MSG option, the data-conversion exit is passed the complete message for the exit to convert, and the fact that the message was segmented is apparent to the exit.
- If the receiving application retrieves one segment at a time, the data-conversion exit is invoked to convert one segment at a time. The exit must therefore convert the data in a segment independently of the data in any of the other segments.

  If the nature of the data in the message is such that arbitrary segmentation of the data on 16-byte boundaries might result in segments that cannot be converted by the exit, or the format is MQFMT_STRING and the character set is DBCS or mixed SBCS/DBCS, the sending application must create and put the segments, specifying MQMF_SEGMENTATION_INHIBITED to suppress further segmentation. In this way, the sending application can ensure that each segment contains sufficient information to allow the data-conversion exit to convert the segment successfully.
- If sender conversion is specified for a sending message channel agent (MCA), the MCA converts only messages that are not segments of logical messages; the MCA never attempts to convert messages that are segments.

This flag is an input flag on the MQPUT and MQPUT1 calls, and an output flag on the MQGET call. On the latter call, the queue manager also echoes the value of the flag to the *Segmentation* field in MQGMO.

The initial value of this flag is MQMF_SEGMENTATION_INHIBITED.

**Status flags**: These are flags that indicate whether the physical message belongs to a message group, is a segment of a logical message, both, or neither. One or more of the following can be specified on the MQPUT or MQPUT1 call, or returned by the MQGET call:

**MQMF_MSG_IN_GROUP**
Message is a member of a group.

**MQMF_LAST_MSG_IN_GROUP**
Message is the last logical message in a group.

If this flag is set, the queue manager turns on MQMF_MSG_IN_GROUP in the copy of MQMD that is sent with the message, but does not alter the settings of these flags in the MQMD provided by the application on the MQPUT or MQPUT1 call.

It is valid for a group to consist of only one logical message. If this is the case, MQMF_LAST_MSG_IN_GROUP is set, but the *MsgSeqNumber* field has the value one.

**MQMF_SEGMENT**
Message is a segment of a logical message.

When MQMF_SEGMENT is specified without MQMF_LAST_SEGMENT, the length of the application message data in the segment ( *excluding* the lengths of any IBM MQ header structures that might be present) must be at least one. If the length is zero, the MQPUT or MQPUT1 call fails with reason code MQRC_SEGMENT_LENGTH_ZERO.

On z/OS, this option is not supported if the message is being put on a queue that has an index type of MQIT_GROUP_ID.

**MQMF_LAST_SEGMENT**
Message is the last segment of a logical message.

If this flag is set, the queue manager turns on MQMF_SEGMENT in the copy of MQMD that is sent with the message, but does not alter the settings of these flags in the MQMD provided by the application on the MQPUT or MQPUT1 call.

A logical message can consist of only one segment. If so, MQMF_LAST_SEGMENT is set, but the *Offset* field has the value zero.

When MQMF_LAST_SEGMENT is specified, the length of the application message data in the segment ( *excluding* the lengths of any header structures that might be present) can be zero.

On z/OS, this option is not supported if the message is being put on a queue that has an index type of MQIT_GROUP_ID.

The application must ensure that these flags are set correctly when putting messages. If MQPMO_LOGICAL_ORDER is specified, or was specified on the preceding MQPUT call for the queue handle, the settings of the flags must be consistent with the group and segment information retained by the queue manager for the queue handle. The following conditions apply to *successive* MQPUT calls for the queue handle when MQPMO_LOGICAL_ORDER is specified:

- If there is no current group or logical message, all these flags (and combinations of them) are valid.
- Once MQMF_MSG_IN_GROUP has been specified, it must remain on until MQMF_LAST_MSG_IN_GROUP is specified. The call fails with reason code MQRC_INCOMPLETE_GROUP if this condition is not satisfied.
- Once MQMF_SEGMENT has been specified, it must remain on until MQMF_LAST_SEGMENT is specified. The call fails with reason code MQRC_INCOMPLETE_MSG if this condition is not satisfied.
- Once MQMF_SEGMENT has been specified without MQMF_MSG_IN_GROUP, MQMF_MSG_IN_GROUP must remain *off* until after MQMF_LAST_SEGMENT has been specified. The call fails with reason code MQRC_INCOMPLETE_MSG if this condition is not satisfied.

Physical order on a queue shows the valid combinations of the flags, and the values used for various fields.

These flags are input flags on the MQPUT and MQPUT1 calls, and output flags on the MQGET call. On the latter call, the queue manager also echoes the values of the flags to the *GroupStatus* and *SegmentStatus* fields in MQGMO.

You cannot use grouped or segmented messages with Publish/Subscribe.

**Default flags**: The following can be specified to indicate that the message has default attributes:

**MQMF_NONE**
No message flags (default message attributes).

This inhibits segmentation, and indicates that the message is not in a group and is not a segment of a logical message. MQMF_NONE is defined to aid program documentation. It is not intended that this flag be used with any other, but as its value is zero, such use cannot be detected.

The *MsgFlags* field is partitioned into subfields; for details see "Report options and message flags" on page 875.

The initial value of this field is MQMF_NONE. This field is ignored if *Version* is less than MQMD_VERSION_2.

*MsgId (MQBYTE24)*

This is a byte string that is used to distinguish one message from another. Generally, no two messages should have the same message identifier, although this is not disallowed by the queue manager. The message identifier is a permanent property of the message, and persists across restarts of the queue manager. Because the message identifier is a byte string and not a character string, the message identifier is *not* converted between character sets when the message flows from one queue manager to another.

For the MQPUT and MQPUT1 calls, if MQMI_NONE or MQPMO_NEW_MSG_ID is specified by the application, the queue manager generates a unique message identifier [2] when the message is put, and places it in the message descriptor sent with the message. The queue manager also returns this message identifier in the message descriptor belonging to the sending application. The application can use this value to record information about particular messages, and to respond to queries from other parts of the application.

If the message is being put to a topic, the queue manager generates unique message identifiers as necessary for each message published. If MQPMO_NEW_MSG_ID is specified by the application, the queue manager generates a unique message identifier to return on output. If MQMI_NONE is specified by the application, the value of the *MsgId* field in the MQMD is unchanged on return from the call.

See the description of MQPMO_RETAIN in "MQPMO options (MQLONG)" on page 487 for more details about retained publications.

If the message is being put to a distribution list, the queue manager generates unique message identifiers as necessary, but the value of the *MsgId* field in MQMD is unchanged on return from the call, even if MQMI_NONE or MQPMO_NEW_MSG_ID was specified. If the application needs to know the message identifiers generated by the queue manager, the application must provide MQPMR records containing the *MsgId* field.

The sending application can also specify a value for the message identifier other than MQMI_NONE; this stops the queue manager generating a unique message identifier. An application that is forwarding a message can use this to propagate the message identifier of the original message.

The queue manager does not use this field except to:

- Generate a unique value if requested, as described above
- Deliver the value to the application that issues the get request for the message
- Copy the value to the *CorrelId* field of any report message that it generates about this message (depending on the *Report* options)

[2] A *MsgId* generated by the queue manager consists of a 4-byte product identifier (AMQ¬ or CSQ¬ in either ASCII or EBCDIC, where ¬ represents a blank character), followed by a product-specific implementation of a unique string. In IBM MQ this contains the first 12 characters of the queue-manager name, and a value derived from the system clock. All queue managers that can intercommunicate must therefore have names that differ in the first 12 characters, in order to ensure that message identifiers are unique. The ability to generate a unique string also depends on the system clock not being changed backward. To eliminate the possibility of a message identifier generated by the queue manager duplicating one generated by the application, the application must avoid generating identifiers with initial characters in the range A through I in ASCII or EBCDIC (X'41' through X'49' and X'C1' through X'C9'). However, the application is not prevented from generating identifiers with initial characters in these ranges.

When the queue manager or a message channel agent generates a report message, it sets the *MsgId* field in the way specified by the *Report* field of the original message, either MQRO_NEW_MSG_ID or MQRO_PASS_MSG_ID. Applications that generate report messages must also do this.

For the MQGET call, *MsgId* is one of the five fields that can be used to retrieve a particular message from the queue. Normally the MQGET call returns the next message on the queue, but a particular message can be obtained by specifying one or more of the five selection criteria, in any combination; these fields are:

- *MsgId*
- *CorrelId*
- *GroupId*
- *MsgSeqNumber*
- *Offset*

The application sets one or more of these field to the values required, and then sets the corresponding MQMO_* match options in the *MatchOptions* field in MQGMO to use those fields as selection criteria. Only messages that have the specified values in those fields are candidates for retrieval. The default for the *MatchOptions* field (if not altered by the application) is to match both the message identifier and the correlation identifier.

On z/OS, the selection criteria that you can use are restricted by the type of index used for the queue. See the *IndexType* queue attribute for further details.

Normally, the message returned is the *first* message on the queue that satisfies the selection criteria. But if MQGMO_BROWSE_NEXT is specified, the message returned is the *next* message that satisfies the selection criteria; the scan for this message starts with the message *following* the current cursor position.

**Note:** The queue is scanned sequentially for a message that satisfies the selection criteria, so retrieval times are slower than if no selection criteria are specified, especially if many messages have to be scanned before a suitable one is found. The exceptions to this are:

- an MQGET call by *CorrelId* on 64-bit distributed platforms where the *CorrelId* index eliminates the need to perform a true sequential scan.
- an MQGET call by *IndexType* on z/OS.

In both these cases, retrieval performance is improved.

See Table 495 on page 374 for more information about how selection criteria are used in various situations.

Specifying MQMI_NONE as the message identifier has the same effect as *not* specifying MQMO_MATCH_MSG_ID, that is, *any* message identifier matches.

This field is ignored if the MQGMO_MSG_UNDER_CURSOR option is specified in the *GetMsgOpts* parameter on the MQGET call.

On return from an MQGET call, the *MsgId* field is set to the message identifier of the message returned (if any).

The following special value can be used:

**MQMI_NONE**
No message identifier is specified.

The value is binary zero for the length of the field.

For the C programming language, the constant MQMI_NONE_ARRAY is also defined; this has the same value as MQMI_NONE, but is an array of characters instead of a string.

This is an input/output field for the MQGET, MQPUT, and MQPUT1 calls. The length of this field is given by MQ_MSG_ID_LENGTH. The initial value of this field is MQMI_NONE.

*MsgSeqNumber (MQLONG)*
This is the sequence number of a logical message within a group.

Sequence numbers start at 1, and increase by 1 for each new logical message in the group, up to a maximum of 999 999 999. A physical message that is not in a group has a sequence number of 1.

The application does not have to set this field on the MQPUT or MQGET call if:

- On the MQPUT call, MQPMO_LOGICAL_ORDER is specified.
- On the MQGET call, MQMO_MATCH_MSG_SEQ_NUMBER is *not* specified.

These are the recommended ways of using these calls for messages that are not report messages. However, if the application requires more control, or the call is MQPUT1, the application must ensure that *MsgSeqNumber* is set to an appropriate value.

On input to the MQPUT and MQPUT1 calls, the queue manager uses the value described in Physical order on a queue. On output from the MQPUT and MQPUT1 calls, the queue manager sets this field to the value that was sent with the message.

On input to the MQGET call, the queue manager uses the value shown in Table 495 on page 374. On output from the MQGET call, the queue manager sets this field to the value for the message retrieved.

The initial value of this field is one. This field is ignored if *Version* is less than MQMD_VERSION_2.

*MsgType (MQLONG)*

This indicates the type of the message. Message types are grouped as follows:

**MQMT_SYSTEM_FIRST**
Lowest value for system-defined message types.

**MQMT_SYSTEM_LAST**
Highest value for system-defined message types.

The following values are currently defined within the system range:

**MQMT_DATAGRAM**
The message is one that does not require a reply.

**MQMT_REQUEST**
The message is one that requires a reply.

Specify the name of the queue to which to send the reply in the *ReplyToQ* field. The *Report* field indicates how to set the *MsgId* and *CorrelId* of the reply.

**MQMT_REPLY**
The message is the reply to an earlier request message (MQMT_REQUEST). The message must be sent to the queue indicated by the *ReplyToQ* field of the request message. Use the *Report* field of the request to control how to set the *MsgId* and *CorrelId* of the reply.

**Note:** The queue manager does not enforce the request-reply relationship; this is an application responsibility.

**MQMT_REPORT**
The message is reporting on some expected or unexpected occurrence, usually related to some other message (for example, a request message was received that contained data that was not valid). Send the message to the queue indicated by the *ReplyToQ* field of the message descriptor of the original message. Set the *Feedback* field s to indicate the nature of the report. Use the *Report* field of the original message to control how to set the *MsgId* and *CorrelId* of the report message.

Report messages generated by the queue manager or message channel agent are always sent to the *ReplyToQ* queue, with the *Feedback* and *CorrelId* fields set as described above.

Application-defined values can also be used. They must be within the following range:

**MQMT_APPL_FIRST**
Lowest value for application-defined message types.

**MQMT_APPL_LAST**
Highest value for application-defined message types.

For the MQPUT and MQPUT1 calls, the *MsgType* value must be within either the system-defined range or the application-defined range; if it is not, the call fails with reason code MQRC_MSG_TYPE_ERROR.

This is an output field for the MQGET call, and an input field for MQPUT and MQPUT1 calls. The initial value of this field is MQMT_DATAGRAM.

*Offset (MQLONG)*

This is the offset in bytes of the data in the physical message from the start of the logical message of which the data forms part. This data is called a *segment*. The offset is in the range 0 through 999 999 999. A physical message that is not a segment of a logical message has an offset of zero.

The application does not need to set this field on the MQPUT or MQGET call if:

- On the MQPUT call, MQPMO_LOGICAL_ORDER is specified.
- On the MQGET call, MQMO_MATCH_OFFSET is *not* specified.

These are the recommended ways of using these calls for messages that are not report messages. However, if the application does not comply with these conditions, or the call is MQPUT1, the application must ensure that *Offset* is set to an appropriate value.

On input to the MQPUT and MQPUT1 calls, the queue manager uses the value described in Physical order on a queue. On output from the MQPUT and MQPUT1 calls, the queue manager sets this field to the value that was sent with the message.

For a report message reporting on a segment of a logical message, the *OriginalLength* field (provided it is not MQOL_UNDEFINED) is used to update the offset in the segment information retained by the queue manager.

On input to the MQGET call, the queue manager uses the value shown in Table 495 on page 374. On output from the MQGET call, the queue manager sets this field to the value for the message retrieved.

The initial value of this field is zero. This field is ignored if *Version* is less than MQMD_VERSION_2.

*OriginalLength (MQLONG)*

This field is relevant only for report messages that are segments. It specifies the length of the message segment to which the report message relates; it does not specify the length of the logical message of which the segment forms part, or the length of the data in the report message.

**Note:** When generating a report message for a message that is a segment, the queue manager and message channel agent copy into the MQMD for the report message the *GroupId*, *MsgSeqNumber*, *Offset*, and *MsgFlags*, fields from the original message. As a result, the report message is also a segment. Applications that generate report messages must do the same, and set the *OriginalLength* field correctly.

The following special value is defined:

**MQOL_UNDEFINED**
Original length of message not defined.

*OriginalLength* is an input field on the MQPUT and MQPUT1 calls, but the value that the application provides is accepted only in particular circumstances:

- If the message being put is a segment and is also a report message, the queue manager accepts the value specified. The value must be:
  - Greater than zero if the segment is not the last segment
  - Not less than zero if the segment is the last segment
  - Not less than the length of data present in the message

  If these conditions are not satisfied, the call fails with reason code MQRC_ORIGINAL_LENGTH_ERROR.

- If the message being put is a segment but not a report message, the queue manager ignores the field and uses the length of the application message data instead.
- In all other cases, the queue manager ignores the field and uses the value MQOL_UNDEFINED instead.

This is an output field on the MQGET call.

The initial value of this field is MQOL_UNDEFINED. This field is ignored if *Version* is less than MQMD_VERSION_2.

*Persistence (MQLONG)*

This indicates whether the message survives system failures and restarts of the queue manager. For the MQPUT and MQPUT1 calls, the value must be one of the following:

**MQPER_PERSISTENT**
The message survives system failures and restarts of the queue manager. Once the message has been put, and the unit of work in which it was put has been committed (if the message is put as part of a unit of work), the message is preserved on auxiliary storage. It remains there until the message is removed from the queue, and the unit of work in which it was got has been committed (if the message is retrieved as part of a unit of work).

When a persistent message is sent to a remote queue, a store-and-forward mechanism holds the message at each queue manager along the route to the destination, until the message is known to have arrived at the next queue manager.

Persistent messages cannot be placed on:

- Temporary dynamic queues
- Shared queues that map to a CFSTRUCT object at CFLEVEL(2) or below, or where the CFSTRUCT object is defined as RECOVER(NO).

Persistent messages can be placed on permanent dynamic queues, and predefined queues.

**MQPER_NOT_PERSISTENT**
The message does not usually survive system failures or queue manager restarts. This applies even if an intact copy of the message is found on auxiliary storage when the queue manager restarts.

In the case of NPMCLASS (HIGH) queues nonpersistent messages survive a normal queue manager shutdown and restart.

In the case of shared queues, nonpersistent messages survive queue manager restarts in the queue-sharing group, but do not survive failures of the coupling facility used to store messages on the shared queues.

**MQPER_PERSISTENCE_AS_Q_DEF**

- If the queue is a cluster queue, the persistence of the message is taken from the *DefPersistence* attribute defined at the *destination* queue manager that owns the particular instance of the queue on which the message is placed. Usually, all instances of a cluster queue have the same value for the *DefPersistence* attribute, although this is not mandated.

  The value of *DefPersistence* is copied into the *Persistence* field when the message is placed on the destination queue. If *DefPersistence* is changed subsequently, messages that have already been placed on the queue are not affected.
- If the queue is not a cluster queue, the persistence of the message is taken from the *DefPersistence* attribute defined at the *local* queue manager, even if the destination queue manager is remote.

  If there is more than one definition in the queue-name resolution path, the default persistence is taken from the value of this attribute in the *first* definition in the path. This can be:

  – An alias queue
  – A local queue
  – A local definition of a remote queue

- A queue-manager alias
- A transmission queue (for example, the *DefXmitQName* queue)

The value of *DefPersistence* is copied into the *Persistence* field when the message is put. If *DefPersistence* is changed subsequently, messages that have already been put are not affected.

Both persistent and nonpersistent messages can exist on the same queue.

When replying to a message, applications must use the persistence of the request message for the reply message.

For an MQGET call, the value returned is either MQPER_PERSISTENT or MQPER_NOT_PERSISTENT.

This is an output field for the MQGET call, and an input field for the MQPUT and MQPUT1 calls. The initial value of this field is MQPER_PERSISTENCE_AS_Q_DEF.

*Priority (MQLONG)*

For the MQPUT and MQPUT1 calls, the value must be greater than or equal to zero; zero is the lowest priority. The following special value can also be used:

**MQPRI_PRIORITY_AS_Q_DEF**

- If the queue is a cluster queue, the priority for the message is taken from the *DefPriority* attribute as defined at the *destination* queue manager that owns the particular instance of the queue on which the message is placed. Usually, all instances of a cluster queue have the same value for the *DefPriority* attribute, although this is not mandated.

  The value of *DefPriority* is copied into the *Priority* field when the message is placed on the destination queue. If *DefPriority* is changed subsequently, messages that have already been placed on the queue are not affected.
- If the queue is not a cluster queue, the priority for the message is taken from the *DefPriority* attribute as defined at the *local* queue manager, even if the destination queue manager is remote.

  If there is more than one definition in the queue-name resolution path, the default priority is taken from the value of this attribute in the *first* definition in the path. This can be:

  - An alias queue
  - A local queue
  - A local definition of a remote queue
  - A queue-manager alias
  - A transmission queue (for example, the *DefXmitQName* queue)

  The value of *DefPriority* is copied into the *Priority* field when the message is put. If *DefPriority* is changed subsequently, messages that have already been put are not affected.

The value returned by the MQGET call is always greater than or equal to zero; the value MQPRI_PRIORITY_AS_Q_DEF is never returned.

If a message is put with a priority greater than the maximum supported by the local queue manager (this maximum is given by the *MaxPriority* queue-manager attribute), the message is accepted by the queue manager, but placed on the queue at the queue manager's maximum priority; the MQPUT or MQPUT1 call completes with MQCC_WARNING and reason code MQRC_PRIORITY_EXCEEDS_MAXIMUM. However, the *Priority* field retains the value specified by the application that put the message.

On z/OS, if a message with a MsgSeqNumber of 1 is put to a queue that has a message delivery sequence of MQMDS_PRIORITY and an index type of MQIT_GROUP_ID, the queue might treat the message with a different priority. If the message was placed on the queue with a priority of 0 or 1, it is processed as though it has a priority of 2. This is because the order of messages placed on this type of queue is optimized to enable efficient group completeness tests. For more information on the message delivery sequence MQMDS_PRIORITY and the index type MQIT_GROUP_ID, see MsgDeliverySequence attribute.

When replying to a message, applications must use the priority of the request message for the reply message. In other situations, specifying MQPRI_PRIORITY_AS_Q_DEF allows priority tuning to be carried out without changing the application.

This is an output field for the MQGET call, and an input field for the MQPUT and MQPUT1 calls. The initial value of this field is MQPRI_PRIORITY_AS_Q_DEF.

*PutApplName (MQCHAR28)*
This is the name of application that put the message, and is part of the *origin context* of the message. The contents differ between platforms, and might differ between releases.

For more information about message context, see "Overview for MQMD" on page 403 and Message context.

The format of *PutApplName* depends on the value of *PutApplType* and can change from one release to another. Changes are rare, but do happen if the environment changes.

When the queue manager sets this field (that is, for all options except MQPMO_SET_ALL_CONTEXT), it sets the field to a value that is determined by the environment:

- z/OS On z/OS, the queue manager uses:
  - For z/OS batch, the 8-character job name from the JES JOB card
  - For TSO, the 7-character TSO user identifier
  - For CICS, the 8-character applid, followed by the 4-character tranid
  - For IMS, the 8-character IMS system identifier, followed by the 8-character PSB name
  - For XCF, the 8-character XCF group name, followed by the 16-character XCF member name
  - For a message generated by a queue manager, the first 28 characters of the queue manager name
  - For distributed queuing without CICS, the 8-character jobname of the channel initiator followed by the 8-character name of the module putting to the dead-letter queue followed by an 8-character task identifier.

  The name or names are each padded to the right with blanks, as is any space in the remainder of the field. Where there is more than one name, there is no separator between them.
- Windows On Windows systems, the queue manager uses the following names:
  - For a CICS application, the CICS transaction name
  - For a non-CICS application, the rightmost 28 characters of the fully-qualified name of the executable
- IBM i On IBM i, the queue manager uses the fully-qualified job name.
- UNIX On UNIX systems, the queue manager uses the following names:
  - For a CICS application, the CICS transaction name
  - For a non-CICS application, MQ asks the operating system for the name of the process. This is returned as the program file name, without full path. Then MQ places this process name in the MQMD.PutApplName field as follows:

    **AIX**
    If the name is less than or equal to 28 bytes, then the name is inserted, padded to the right with spaces.

    If the name is greater than 28 bytes, then the leftmost 28 bytes of the name are inserted.

    **Linux and Solaris**
    If the name is less than or equal to 15 bytes, then the name is inserted, padded to the right with spaces.

    If the name is greater than 15 bytes, then the leftmost 15 bytes of the name are inserted, padded to the right with spaces.

**HP-UX**
If the name is less than or equal to 14 bytes, then the name is inserted, padded to the right with spaces.

If the name is greater than 14 bytes, then the leftmost 14 bytes of the name are inserted, padded to the right with spaces.

For example, if you run `/opt/mqm/samp/bin/amqsput QNAME QMNAME`, then the PutApplName is `'amqsput '`. There are 21 space characters of padding in this MQCHAR28 field. Note that the full path including `/opt/mqm/samp/bin` is not included in the PutApplName.

For the MQPUT and MQPUT1 calls, this is an input/output field if MQPMO_SET_ALL_CONTEXT is specified in the *PutMsgOpts* parameter. Any information following a null character within the field is discarded. The null character and any following characters are converted to blanks by the queue manager. If MQPMO_SET_ALL_CONTEXT is not specified, this field is ignored on input and is an output-only field.

*PutApplType (MQLONG)*

This is the type of application that put the message, and is part of the **origin context** of the message. For more information about message context, see "Overview for MQMD" on page 403 and Message context.

*PutApplType* can have one of the following standard types. You can also define your own types, but only with values in the range MQAT_USER_FIRST through MQAT_USER_LAST.

**MQAT_AIX**
AIX application (same value as MQAT_UNIX).

V 8.0.0.4 **MQAT_AMQP**
AMQP protocol application

**MQAT_BROKER**
Broker.

**MQAT_CICS**
CICS transaction.

**MQAT_CICS_BRIDGE**
CICS bridge.

**MQAT_CICS_VSE**
CICS/VSE transaction.

**MQAT_DOS**
IBM MQ MQI client application on PC DOS.

**MQAT_DQM**
Distributed queue manager agent.

**MQAT_GUARDIAN**
Tandem Guardian application (same value as MQAT_NSK).

**MQAT_IMS**
IMS application.

**MQAT_IMS_BRIDGE**
IMS bridge.

**MQAT_JAVA**
Java.

**MQAT_MVS**
MVS or TSO application (same value as MQAT_ZOS).

**MQAT_NOTES_AGENT**
Lotus Notes® Agent application.

**MQAT_NSK**
HP Integrity NonStop Server application.

**MQAT_OS390**
OS/390® application (same value as MQAT_ZOS).

**MQAT_OS400**
IBM i application.

**MQAT_QMGR**
Queue manager.

**MQAT_UNIX**
UNIX application.

**MQAT_VOS**
Stratus VOS application.

**MQAT_WINDOWS**
16-bit Windows application.

**MQAT_WINDOWS_NT**
32-bit Windows application.

**MQAT_WLM**
z/OS workload manager application.

**MQAT_XCF**
XCF.

**MQAT_ZOS**
z/OS application.

**MQAT_DEFAULT**
Default application type.

This is the default application type for the platform on which the application is running.

**Note:** The value of this constant is environment-specific. Because of this, always compile the application using the header, include, or COPY files that are appropriate to the platform on which the application will run.

**MQAT_UNKNOWN**
Use this value to indicate that the application type is unknown, even though other context information is present.

**MQAT_USER_FIRST**
Lowest value for user-defined application type.

**MQAT_USER_LAST**
Highest value for user-defined application type.

The following special value can also occur:

**MQAT_NO_CONTEXT**
This value is set by the queue manager when a message is put with no context (that is, the MQPMO_NO_CONTEXT context option is specified).

When a message is retrieved, *PutApplType* can be tested for this value to decide whether the message has context (it is recommended that *PutApplType* is never set to MQAT_NO_CONTEXT, by an application using MQPMO_SET_ALL_CONTEXT, if any of the other context fields are nonblank).

When the queue manager generates this information as a result of an application put, the field is set to a value that is determined by the environment. On IBM i, it is set to MQAT_OS400; the queue manager never uses MQAT_CICS on IBM i.

For the MQPUT and MQPUT1 calls, this is an input/output field if MQPMO_SET_ALL_CONTEXT is specified in the *PutMsgOpts* parameter. If MQPMO_SET_ALL_CONTEXT is not specified, this field is ignored on input and is an output-only field.

This is an output field for the MQGET call. The initial value of this field is MQAT_NO_CONTEXT.

*PutDate (MQCHAR8)*

This is the date when the message was put, and is part of the **origin context** of the message. For more information about message context, see "Overview for MQMD" on page 403 and Message context.

The format used for the date when this field is generated by the queue manager is:

- YYYYMMDD

where the characters represent:

**YYYY**
year (four numeric digits)

**MM**
month of year (01 through 12)

**DD**
day of month (01 through 31)

Greenwich Mean Time (GMT) is used for the *PutDate* and *PutTime* fields, subject to the system clock being set accurately to GMT.

If the message was put as part of a unit of work, the date is that when the message was put, and not the date when the unit of work was committed.

For the MQPUT and MQPUT1 calls, this is an input/output field if MQPMO_SET_ALL_CONTEXT is specified in the *PutMsgOpts* parameter. The contents of the field are not checked by the queue manager, except that any information following a null character within the field is discarded. The queue manager converts the null character and any following characters to blanks. If MQPMO_SET_ALL_CONTEXT is not specified, this field is ignored on input and is an output-only field.

This is an output field for the MQGET call. The length of this field is given by MQ_PUT_DATE_LENGTH. The initial value of this field is the null string in C, and 8 blank characters in other programming languages.

*PutTime (MQCHAR8)*

This is the time when the message was put, and is part of the **origin context** of the message. For more information about message context, see "Overview for MQMD" on page 403 and Message context.

The format used for the time when this field is generated by the queue manager is:

- HHMMSSTH

where the characters represent (in order):

**HH**
hours (00 through 23)

**MM**
minutes (00 through 59)

**SS**
seconds (00 through 59; see note)

**T**
tenths of a second (0 through 9)

**H**
hundredths of a second (0 through 9)

**Note:** If the system clock is synchronized to a very accurate time standard, it is possible on rare occasions for 60 or 61 to be returned for the seconds in *PutTime*. This happens when leap seconds are inserted into the global time standard.

Greenwich Mean Time (GMT) is used for the *PutDate* and *PutTime* fields, subject to the system clock being set accurately to GMT.

If the message was put as part of a unit of work, the time is that when the message was put, and not the time when the unit of work was committed.

For the MQPUT and MQPUT1 calls, this is an input/output field if MQPMO_SET_ALL_CONTEXT is specified in the *PutMsgOpts* parameter. The queue manager does not check the contents of the field, except that any information following a null character within the field is discarded. The queue manager converts the null character and any following characters to blanks. If MQPMO_SET_ALL_CONTEXT is not specified, this field is ignored on input and is an output-only field.

This is an output field for the MQGET call. The length of this field is given by MQ_PUT_TIME_LENGTH. The initial value of this field is the null string in C, and 8 blank characters in other programming languages.

*ReplyToQ (MQCHAR48)*

This is the name of the message queue to which the application that issued the get request for the message sends MQMT_REPLY and MQMT_REPORT messages. The name is the local name of a queue that is defined on the queue manager identified by *ReplyToQMgr*. This queue must not be a model queue, although the sending queue manager does not verify this when the message is put.

For the MQPUT and MQPUT1 calls, this field must not be blank if the *MsgType* field has the value MQMT_REQUEST, or if any report messages are requested by the *Report* field. However, the value specified (or substituted) is passed on to the application that issues the get request for the message, whatever the message type.

If the *ReplyToQMgr* field is blank, the local queue manager looks up the *ReplyToQ* name in its own queue definitions. If a local definition of a remote queue exists with this name, the *ReplyToQ* value in the transmitted message is replaced by the value of the *RemoteQName* attribute from the definition of the remote queue, and this value is returned in the message descriptor when the receiving application issues an MQGET call for the message. If a local definition of a remote queue does not exist, *ReplyToQ* is unchanged.

If the name is specified, it can contain trailing blanks; the first null character and characters following it are treated as blanks. Otherwise no check is made that the name satisfies the naming rules for queues; this is also true for the name transmitted, if the *ReplyToQ* is replaced in the transmitted message. The only check made is that a name has been specified, if the circumstances require it.

If a reply-to queue is not required, set the *ReplyToQ* field to blanks, or (in the C programming language) to the null string, or to one or more blanks followed by a null character; do not leave the field uninitialized.

For the MQGET call, the queue manager always returns the name padded with blanks to the length of the field.

If a message that requires a report message cannot be delivered, and the report message also cannot be delivered to the queue specified, both the original message and the report message go to the dead-letter (undelivered-message) queue (see the *DeadLetterQName* attribute described in "Attributes for the queue manager" on page 777 ).

This is an output field for the MQGET call, and an input field for the MQPUT and MQPUT1 calls. The length of this field is given by MQ_Q_NAME_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*ReplyToQMgr (MQCHAR48)*

This is the name of the queue manager to which to send the reply message or report message. *ReplyToQ* is the local name of a queue that is defined on this queue manager.

If the *ReplyToQMgr* field is blank, the local queue manager looks up the *ReplyToQ* name in its queue definitions. If a local definition of a remote queue exists with this name, the *ReplyToQMgr* value in the transmitted message is replaced by the value of the *RemoteQMgrName* attribute from the definition of the remote queue, and this value is returned in the message descriptor when the receiving application issues an MQGET call for the message. If a local definition of a remote queue does not exist, the *ReplyToQMgr* that is transmitted with the message is the name of the local queue manager.

If the name is specified, it can contain trailing blanks; the first null character and characters following it are treated as blanks. Otherwise no check is made that the name satisfies the naming rules for queue managers, or that this name is known to the sending queue manager; this is also true for the name transmitted, if the *ReplyToQMgr* is replaced in the transmitted message.

If a reply-to queue is not required, set the *ReplyToQMgr* field to blanks, or (in the C programming language) to the null string, or to one or more blanks followed by a null character; do not leave the field uninitialized.

For the MQGET call, the queue manager always returns the name padded with blanks to the length of the field.

This is an output field for the MQGET call, and an input field for the MQPUT and MQPUT1 calls. The length of this field is given by MQ_Q_MGR_NAME_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*Report (MQLONG)*

A report message is a message about another message, used to inform an application about expected or unexpected events that relate to the original message. The *Report* field enables the application sending the original message to specify which report messages are required, whether the application message data is to be included in them, and also (for both reports and replies) how the message and correlation identifiers in the report or reply message are to be set. Any or all (or none) of the following types of report message can be requested:

- Exception
- Expiration
- Confirm on arrival (COA)
- Confirm on delivery (COD)
- Positive action notification (PAN)
- Negative action notification (NAN)

You can specify one or more of these options. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

The application that receives the report message can determine the reason that the report was generated by examining the *Feedback* field in the MQMD; see the *Feedback* field for more details.

The use of report options when putting a message to a topic can cause zero, one, or many report messages to be generated and sent to the application. This is because the publication message may be sent to zero, one, or many subscribing applications.

**Exception options**: Specify one of the options listed to request an exception report message.

**MQRO_EXCEPTION**
A message channel agent generates this type of report when a message is sent to another queue manager and the message cannot be delivered to the specified destination queue. For example, the destination queue or an intermediate transmission queue might be full, or the message might be too big for the queue.

Generation of the exception report message depends on the persistence of the original message, and the speed of the message channel (normal or fast) through which the original message travels:

- For all persistent messages, and for nonpersistent messages traveling through normal message channels, the exception report is generated *only* if the action specified by the sending application for the error condition can be completed successfully. The sending application can specify one of the following actions to control the disposition of the original message when the error condition arises:
  - MQRO_DEAD_LETTER_Q (this places the original message on the dead-letter queue).
  - MQRO_DISCARD_MSG (this discards the original message).

  If the action specified by the sending application cannot be completed successfully, the original message is left on the transmission queue, and no exception report message is generated.
- For nonpersistent messages traveling through fast message channels, the original message is removed from the transmission queue and the exception report generated *even if* the specified action for the error condition cannot be completed successfully. For example, if

MQRO_DEAD_LETTER_Q is specified, but the original message cannot be placed on the dead-letter queue because that queue is full, the exception report message is generated and the original message discarded.

For more information about normal and fast message channels, see Nonpersistent message speed (NPMSPEED).

An exception report is not generated if the application that put the original message can be notified synchronously of the problem by means of the reason code returned by the MQPUT or MQPUT1 call.

Applications can also send exception reports, to indicate that a message cannot be processed (for example, because it is a debit transaction that would cause the account to exceed its credit limit).

Message data from the original message is not included with the report message.

Do not specify more than one of MQRO_EXCEPTION, MQRO_EXCEPTION_WITH_DATA, and MQRO_EXCEPTION_WITH_FULL_DATA.

**MQRO_EXCEPTION_WITH_DATA**
This is the same as MQRO_EXCEPTION, except that the first 100 bytes of the application message data from the original message are included in the report message. If the original message contains one or more MQ header structures, they are included in the report message, in addition to the 100 bytes of application data.

Do not specify more than one of MQRO_EXCEPTION, MQRO_EXCEPTION_WITH_DATA, and MQRO_EXCEPTION_WITH_FULL_DATA.

**MQRO_EXCEPTION_WITH_FULL_DATA**
Exception reports with full data required.

This is the same as MQRO_EXCEPTION, except that all the application message data from the original message is included in the report message.

Do not specify more than one of MQRO_EXCEPTION, MQRO_EXCEPTION_WITH_DATA, and MQRO_EXCEPTION_WITH_FULL_DATA.

**Expiration options**: Specify one of the options listed to request an expiration report message.

**MQRO_EXPIRATION**
This type of report is generated by the queue manager if the message is discarded before delivery to an application because its expiry time has passed (see the *Expiry* field). If this option is not set, no report message is generated if a message is discarded for this reason (even if you specify one of the MQRO_EXCEPTION_* options).

Message data from the original message is not included with the report message.

Do not specify more than one of MQRO_EXPIRATION, MQRO_EXPIRATION_WITH_DATA, and MQRO_EXPIRATION_WITH_FULL_DATA.

**MQRO_EXPIRATION_WITH_DATA**
This is the same as MQRO_EXPIRATION, except that the first 100 bytes of the application message data from the original message are included in the report message. If the original message contains one or more MQ header structures, they are included in the report message, in addition to the 100 bytes of application data.

Do not specify more than one of MQRO_EXPIRATION, MQRO_EXPIRATION_WITH_DATA, and MQRO_EXPIRATION_WITH_FULL_DATA.

**MQRO_EXPIRATION_WITH_FULL_DATA**
This is the same as MQRO_EXPIRATION, except that all the application message data from the original message is included in the report message.

Do not specify more than one of MQRO_EXPIRATION, MQRO_EXPIRATION_WITH_DATA, and MQRO_EXPIRATION_WITH_FULL_DATA.

**Confirm-on-arrival options**: Specify one of the options listed to request a confirm-on-arrival report message.

**MQRO_COA**
This type of report is generated by the queue manager that owns the destination queue when the message is placed on the destination queue. Message data from the original message is not included with the report message.

If the message is put as part of a unit of work, and the destination queue is a local queue, the COA report message generated by the queue manager can be retrieved only if the unit of work is committed.

A COA report is not generated if the *Format* field in the message descriptor is MQFMT_XMIT_Q_HEADER or MQFMT_DEAD_LETTER_HEADER. This prevents a COA report being generated if the message is put on a transmission queue, or is undeliverable and put on a dead-letter queue.

In the case of an IMS bridge queue, the COA report is generated when the message reaches the IMS queue (acknowledgment received from IMS ) and not when the message is put in the MQ bridge queue. That means that if IMS is not active, no COA report is generated until IMS is started and a message is queued on the IMS queue.

The user that runs a program that puts a message with MQMD.Report=MQRO_COA must have +passid authority on the reply queue. If the user does not have +passid authority, the COA report message does not reach the reply queue. An attempt is made to put the report message on the dead letter queue.

Do not specify more than one of MQRO_COA, MQRO_COA_WITH_DATA, and MQRO_COA_WITH_FULL_DATA.

**MQRO_COA_WITH_DATA**
This is the same as MQRO_COA, except that the first 100 bytes of the application message data from the original message are included in the report message. If the original message contains one or more MQ header structures, they are included in the report message, in addition to the 100 bytes of application data.

Do not specify more than one of MQRO_COA, MQRO_COA_WITH_DATA, and MQRO_COA_WITH_FULL_DATA.

**MQRO_COA_WITH_FULL_DATA**
This is the same as MQRO_COA, except that all the application message data from the original message is included in the report message.

Do not specify more than one of MQRO_COA, MQRO_COA_WITH_DATA, and MQRO_COA_WITH_FULL_DATA.

**Confirm-on-delivery options**: Specify one of the options listed to request a confirm-on-delivery report message.

**MQRO_COD**
This type of report is generated by the queue manager when an application retrieves the message from the destination queue in a way that deletes the message from the queue. Message data from the original message is not included with the report message.

If the message is retrieved as part of a unit of work, the report message is generated within the same unit of work, so that the report is not available until the unit of work is committed. If the unit of work is backed out, the report is not sent.

A COD report is not always generated if a message is retrieved with the MQGMO_MARK_SKIP_BACKOUT option. If the primary unit of work is backed out but the secondary unit of work is committed, the message is removed from the queue, but a COD report is not generated.

A COD report is not generated if the *Format* field in the message descriptor is MQFMT_DEAD_LETTER_HEADER. This prevents a COD report being generated if the message is undeliverable and put on a dead-letter queue.

MQRO_COD is not valid if the destination queue is an XCF queue.

Do not specify more than one of MQRO_COD, MQRO_COD_WITH_DATA, and MQRO_COD_WITH_FULL_DATA.

**MQRO_COD_WITH_DATA**
This is the same as MQRO_COD, except that the first 100 bytes of the application message data from the original message are included in the report message. If the original message contains one or more MQ header structures, they are included in the report message, in addition to the 100 bytes of application data.

If MQGMO_ACCEPT_TRUNCATED_MSG is specified on the MQGET call for the original message, and the message retrieved is truncated, the amount of application message data placed in the report message depends on the environment:

- On z/OS, it is the minimum of:
  - The length of the original message
  - The length of the buffer used to retrieve the message
  - 100 bytes.
- In other environments, it is the minimum of:
  - The length of the original message
  - 100 bytes.

MQRO_COD_WITH_DATA is not valid if the destination queue is an XCF queue.

Do not specify more than one of MQRO_COD, MQRO_COD_WITH_DATA, and MQRO_COD_WITH_FULL_DATA.

**MQRO_COD_WITH_FULL_DATA**
This is the same as MQRO_COD, except that all the application message data from the original message is included in the report message.

MQRO_COD_WITH_FULL_DATA is not valid if the destination queue is an XCF queue.

Do not specify more than one of MQRO_COD, MQRO_COD_WITH_DATA, and MQRO_COD_WITH_FULL_DATA.

**Action-notification options**: Specify one or both of the options listed to request that the receiving application send a positive-action or negative-action report message.

**MQRO_PAN**
This type of report is generated by the application that retrieves the message and acts upon it. It indicates that the action requested in the message has been performed successfully. The application generating the report determines whether any data is to be included with the report.

Other than conveying this request to the application retrieving the message, the queue manager takes no action based on this option. The retrieving application must generate the report if appropriate.

**MQRO_NAN**
This type of report is generated by the application that retrieves the message and acts upon it. It indicates that the action requested in the message has *not* been performed successfully. The application generating the report determines whether any data is to be included with the report. For example, you might want to include some data indicating why the request could not be performed.

Other than conveying this request to the application retrieving the message, the queue manager takes no action based on this option. The retrieving application must generate the report if appropriate.

The application must determine which conditions correspond to a positive action and which correspond to a negative action. However, if the request has been only partially performed, generate a NAN report rather than a PAN report if requested. Every possible condition must correspond to either a positive action, or a negative action, but not both.

**Message-identifier options**: Specify one of the options listed to control how the *MsgId* of the report message (or of the reply message) is to be set.

**MQRO_NEW_MSG_ID**
This is the default action, and indicates that if a report or reply is generated as a result of this message, a new *MsgId* is generated for the report or reply message.

**MQRO_PASS_MSG_ID**
If a report or reply is generated as a result of this message, the *MsgId* of this message is copied to the *MsgId* of the report or reply message.

The *MsgId* of a publication message will be different for each subscriber that receives a copy of the publication and therefore the *MsgId* copied into the report or reply message will be different for each one.

If this option is not specified, MQRO_NEW_MSG_ID is assumed.

**Correlation-identifier options**: Specify one of the options listed to control how the *CorrelId* of the report message (or of the reply message) is to be set.

**MQRO_COPY_MSG_ID_TO_CORREL_ID**
This is the default action, and indicates that if a report or reply is generated as a result of this message, the *MsgId* of this message is copied to the *CorrelId* of the report or reply message.

The *MsgId* of a publication message will be different for each subscriber that receives a copy of the publication and therefore the *MsgId* copied into the *CorrelId* of the report or reply message will be different for each one.

**MQRO_PASS_CORREL_ID**
If a report or reply is generated as a result of this message, the *CorrelId* of this message is copied to the *CorrelId* of the report or reply message.

The *CorrelId* of a publication message will be specific to a subscriber unless it uses the MQSO_SET_CORREL_ID option and sets the SubCorrelId field in the MQSD to MQCI_NONE. Therefore it is possible that the *CorrelId* copied into the *CorrelId* of the report or reply message will be different for each one.

If this option is not specified, MQRO_COPY_MSG_ID_TO_CORREL_ID is assumed.

Servers replying to requests or generating report messages must check whether the MQRO_PASS_MSG_ID or MQRO_PASS_CORREL_ID options were set in the original message. If they were, the servers must take the action described for those options. If neither is set, the servers must take the corresponding default action.

**Disposition options**: Specify one of the options listed to control the disposition of the original message when it cannot be delivered to the destination queue. The application can set the disposition options independently of requesting exception reports.

**MQRO_DEAD_LETTER_Q**
This is the default action, and places the message on the dead-letter queue if the message cannot be delivered to the destination queue. This happens in the following situations:

- When the application that put the original message cannot be notified synchronously of the problem by means of the reason code returned by the MQPUT or MQPUT1 call. An exception report message is generated, if one was requested by the sender.
- When the application that put the original message was putting to a topic

**MQRO_DISCARD_MSG**
This discards the message if it cannot be delivered to the destination queue. This happens in the following situations:

- When the application that put the original message cannot be notified synchronously of the problem by means of the reason code returned by the MQPUT or MQPUT1 call. An exception report message is generated, if one was requested by the sender.
- When the application that put the original message was putting to a topic

If you want to return the original message to the sender, without the original message being placed on the dead-letter queue, the sender must specify MQRO_DISCARD_MSG with MQRO_EXCEPTION_WITH_FULL_DATA.

**MQRO_PASS_DISCARD_AND_EXPIRY**
If this option is set on a message, and a report or reply is generated because of it, the message descriptor of the report inherits:

- MQRO_DISCARD_MSG if it was set.
- The remaining expiry time of the message (if this is not an expiry report). If this is an expiry report the expiry time is set to 60 seconds.

**Activity option**

**MQRO_ACTIVITY**
Using this value allows the route of **any** message to be traced throughout a queue manager network. The report option can be specified on any current user message, instantly allowing you to begin calculating the route of the message through the network.

If the application generating the message cannot switch on activity reports, reports can be turned on using an API crossing exit supplied by queue manager administrators.

**Note:**

1. The fewer the queue managers in the network that are able to generate activity reports, the less detailed the route.
2. The activity reports might be difficult to place in the correct order to determine the route taken.
3. The activity reports might not be able to find a route to their requested destination.
4. Messages with this report option set must be accepted by any queue manager, even if they do not understand the option. This allows the report option to be set on any user message, even if they are processed by a non Version 6.0 or later queue manager.
5. If a process, either a queue manager or a user process, performs an activity on a message with this option set it can choose to generate and put an activity report.

**Default option**: Specify the following if no report options are required:

**MQRO_NONE**
Use this value to indicate that no other options have been specified. MQRO_NONE is defined to aid program documentation. It is not intended that this option be used with any other, but as its value is zero, such use cannot be detected.

**General information**:

1. All report types required must be specifically requested by the application sending the original message. For example, if a COA report is requested but an exception report is not, a COA report is generated when the message is placed on the destination queue, but no exception report is generated if the destination queue is full when the message arrives there. If no *Report* options are set, no report messages are generated by the queue manager or message channel agent (MCA).

   Some report options can be specified even though the local queue manager does not recognize them; this is useful when the option is to be processed by the *destination* queue manager. See "Report options and message flags" on page 875 for more details.

   If a report message is requested, the name of the queue to which to send the report must be specified in the *ReplyToQ* field. When a report message is received, the nature of the report can be determined by examining the *Feedback* field in the message descriptor.
2. If the queue manager or MCA that generates a report message cannot put the report message on the reply queue (for example, because the reply queue or transmission queue is full), the report message is placed instead on the dead-letter queue. If that *also* fails, or there is no dead-letter queue, the action taken depends on the type of the report message:

   - If the report message is an exception report, the message that generated the exception report is left on its transmission queue; this ensures that the message is not lost.
   - For all other report types, the report message is discarded and processing continues normally. This is done because either the original message has already been delivered safely (for COA or COD report messages), or is no longer of any interest (for an expiration report message).

Once a report message has been placed successfully on a queue (either the destination queue or an intermediate transmission queue), the message is no longer subject to special processing; it is treated just like any other message.

3. When the report is generated, the *ReplyToQ* queue is opened and the report message put using the authority of the *UserIdentifier* in the MQMD of the message causing the report, except in the following cases:
   - Exception reports generated by a receiving MCA are put with whatever authority the MCA used when it tried to put the message causing the report.
   - COA reports generated by the queue manager are put with whatever authority was used when the message causing the report was put on the queue manager generating the report. For example, if the message was put by a receiving MCA using the MCA's user identifier, the queue manager puts the COA report using the MCA's user identifier.

   Applications generating reports must use the same authority as they use to generate a reply; this is usually the authority of the user identifier in the original message.

   If the report has to travel to a remote destination, senders and receivers can decide whether to accept it, in the same way as they do for other messages.
4. If a report message with data is requested:
   - The report message is always generated with the amount of data requested by the sender of the original message. If the report message is too big for the reply queue, the processing described above occurs; the report message is never truncated to fit on the reply queue.
   - If the *Format* of the original message is MQFMT_XMIT_Q_HEADER, the data included in the report does not include the MQXQH. The report data starts with the first byte of the data beyond the MQXQH in the original message. This occurs whether or not the queue is a transmission queue.
5. If a COA, COD, or expiration report message is received at the reply queue, it is guaranteed that the original message arrived, was delivered, or expired, as appropriate. However, if one or more of these report messages is requested and is *not* received, the reverse cannot be assumed, because one of the following might have occurred:
   a. The report message is held up because a link is down.
   b. The report message is held up because a blocking condition exists at an intermediate transmission queue or at the reply queue (for example, the queue is full or inhibited for puts).
   c. The report message is on a dead-letter queue.
   d. When the queue manager was attempting to generate the report message, it could neither put it on the appropriate queue, nor on the dead-letter queue, so the report message could not be generated.
   e. A failure of the queue manager occurred between the action being reported (arrival, delivery, or expiry), and generation of the corresponding report message. (This does not happen for COD report messages if the application retrieves the original message within a unit of work, as the COD report message is generated within the same unit of work.)

   Exception report messages can be held up in the same way for reasons 1, 2, and 3 above. However, when an MCA cannot generate an exception report message (the report message cannot be put either on the reply queue or the dead-letter queue), the original message remains on the transmission queue at the sender, and the channel is closed. This occurs irrespective of whether the report message was to be generated at the sending or the receiving end of the channel.
6. If the original message is temporarily blocked (resulting in an exception report message being generated and the original message being put on a dead-letter queue), but the blockage clears and an application then reads the original message from the dead-letter queue and puts it again to its destination, the following might occur:
   - Even though an exception report message has been generated, the original message eventually arrives successfully at its destination.

- More than one exception report message is generated in respect of a single original message, because the original message might encounter another blockage later.

**Report messages when putting to a topic**:

1. Reports can be generated when putting a message to a topic. This message will be sent to all subscribers to the topic, which could be zero, one, or many. This should be taken into account when choosing to use report options as many report messages could be generated as a result.
2. When putting a message to a topic, there may be many destination queues that are to be given a copy of the message. If some of these destination queues have a problem, such as queue full, then the successful completion of the MQPUT depends on the setting of NPMSGDLV or PMSGDLV (depending on the persistence of the message). If the setting is such that message delivery to the destination queue must be successful (for example, it is a persistent message to a durable subscriber and PMSGDLV is set to ALL or ALLDUR), then success is defined as one of the following criteria being met:
   - Successful put to the subscriber queue
   - Use of MQRO_DEAD_LETTER_Q and a successful put to the Dead-letter queue if the subscriber queue cannot take the message
   - Use of MQRO_DISCARD_MSG if the subscriber queue cannot take the message.

**Report messages for message segments**:

1. Report messages can be requested for messages that have segmentation allowed (see the description of the MQMF_SEGMENTATION_ALLOWED flag). If the queue manager finds it necessary to segment the message, a report message can be generated for each of the segments that subsequently encounters the relevant condition. Applications must be prepared to receive multiple report messages for each type of report message requested. Use the *GroupId* field in the report message to correlate the multiple reports with the group identifier of the original message, and the *Feedback* field identify the type of each report message.
2. If MQGMO_LOGICAL_ORDER is used to retrieve report messages for segments, be aware that reports of *different types* might be returned by the successive MQGET calls. For example, if both COA and COD reports are requested for a message that is segmented by the queue manager, the MQGET calls for the report messages might return the COA and COD report messages interleaved in an unpredictable fashion. Avoid this by using the MQGMO_COMPLETE_MSG option (optionally with MQGMO_ACCEPT_TRUNCATED_MSG). MQGMO_COMPLETE_MSG causes the queue manager to reassemble report messages that have the same report type. For example, the first MQGET call might reassemble all the COA messages relating to the original message, and the second MQGET call might reassemble all the COD messages. Which is reassembled first depends on which type of report message occurs first on the queue.
3. Applications that themselves put segments can specify different report options for each segment. However, note the following points:
   - If the segments are retrieved using the MQGMO_COMPLETE_MSG option, only the report options in the *first* segment are honored by the queue manager.
   - If the segments are retrieved one by one, and most of them have one of the MQRO_COD_* options, but at least one segment does not, you cannot use the MQGMO_COMPLETE_MSG option to retrieve the report messages with a single MQGET call, or use the MQGMO_ALL_SEGMENTS_AVAILABLE option to detect when all the report messages have arrived.
4. In an MQ network, the queue managers can have different capabilities. If a report message for a segment is generated by a queue manager or MCA that does not support segmentation, the queue manager or MCA does not by default include the necessary segment information in the report message, and this might make it difficult to identify the original message that caused the report to be generated. Avoid this difficulty by requesting data with the report message, that is, by specifying the appropriate MQRO_*_WITH_DATA or MQRO_*_WITH_FULL_DATA options. However, be aware that if MQRO_*_WITH_DATA is specified, *less than* 100 bytes of application message data might be returned to the application that retrieves the report message, if the report message is generated by a queue manager or MCA that does not support segmentation.

**Contents of the message descriptor for a report message**: When the queue manager or message channel agent (MCA) generates a report message, it sets the fields in the message descriptor to the following values, and then puts the message in the normal way.

| Field in MQMD | Value used |
|---|---|
| *StrucId* | MQMD_STRUC_ID |
| *Version* | MQMD_VERSION_2 |
| *Report* | MQRO_NONE |
| *MsgType* | MQMT_REPORT |
| *Expiry* | MQEI_UNLIMITED |
| *Feedback* | As appropriate for the nature of the report (MQFB_COA, MQFB_COD, MQFB_EXPIRATION, or an MQRC_* value) |
| *Encoding* | Copied from the original message descriptor |
| *CodedCharSetId* | Copied from the original message descriptor |
| *Format* | Copied from the original message descriptor |
| *Priority* | Copied from the original message descriptor |
| *Persistence* | Copied from the original message descriptor |
| *MsgId* | As specified by the report options in the original message descriptor |
| *CorrelId* | As specified by the report options in the original message descriptor |
| *BackoutCount* | 0 |
| *ReplyToQ* | Blanks |
| *ReplyToQMgr* | Name of queue manager |
| *UserIdentifier* | As set by the MQPMO_PASS_IDENTITY_CONTEXT option |
| *AccountingToken* | As set by the MQPMO_PASS_IDENTITY_CONTEXT option |
| *ApplIdentityData* | As set by the MQPMO_PASS_IDENTITY_CONTEXT option |
| *PutApplType* | MQAT_QMGR, or as appropriate for the message channel agent |
| *PutApplName* | First 28 bytes of the queue-manager name or message channel agent name. For report messages generated by the IMS bridge, this field contains the XCF group name and XCF member name of the IMS system to which the message relates. |
| *PutDate* | Date when report message is sent |
| *PutTime* | Time when report message is sent |
| *ApplOriginData* | Blanks |
| *GroupId* | Copied from the original message descriptor |
| *MsgSeqNumber* | Copied from the original message descriptor |
| *Offset* | Copied from the original message descriptor |
| *MsgFlags* | Copied from the original message descriptor |
| *OriginalLength* | Copied from the original message descriptor if not MQOL_UNDEFINED, and set to the length of the original message data otherwise |

An application generating a report is recommended to set similar values, except for the following:

- The *ReplyToQMgr* field can be set to blanks (the queue manager changes this to the name of the local queue manager when the message is put).
- Set the context fields using the option that would have been used for a reply, normally MQPMO_PASS_IDENTITY_CONTEXT.

**Analyzing the report field**: The *Report* field contains subfields; because of this, applications that need to check whether the sender of the message requested a particular report must use one of the techniques described in "Analyzing the report field" on page 877.

This is an output field for the MQGET call, and an input field for the MQPUT and MQPUT1 calls. The initial value of this field is MQRO_NONE.

*StrucId (MQCHAR4)*

This is the structure identifier, and must be:

**MQMD_STRUC_ID**
Identifier for message descriptor structure.

For the C programming language, the constant MQMD_STRUC_ID_ARRAY is also defined; this has the same value as MQMD_STRUC_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQMD_STRUC_ID.

*UserIdentifier (MQCHAR12)*

This is part of the **identity context** of the message. For more information about message context, see "Overview for MQMD" on page 403 and Message context.

*UserIdentifier* specifies the user identifier of the application that originated the message. The queue manager treats this information as character data, but does not define the format of it.

After a message has been received, use *UserIdentifier* in the *AlternateUserId* field of the *ObjDesc* parameter of a subsequent MQOPEN or MQPUT1 call to perform the authorization check for the *UserIdentifier* user instead of the application performing the open.

When the queue manager generates this information for an MQPUT or MQPUT1 call:

- On z/OS, the queue manager uses the *AlternateUserId* from the *ObjDesc* parameter of the MQOPEN or MQPUT1 call if the MQOO_ALTERNATE_USER_AUTHORITY or MQPMO_ALTERNATE_USER_AUTHORITY option was specified. If the relevant option was not specified, the queue manager uses a user identifier determined from the environment.
- In other environments, the queue manager always uses a user identifier determined from the environment.

When the user identifier is determined from the environment:

- On z/OS, the queue manager uses:
  - For MVS (batch), the user identifier from the JES JOB card or started task
  - For TSO, the user identifier propagated to the job during job submission
  - For CICS, the user identifier associated with the task
  - For IMS, the user identifier depends on the type of application:
    - For:
      - Nonmessage BMP regions
      - Nonmessage IFP regions
      - Message BMP and message IFP regions that have *not* issued a successful GU call

      the queue manager uses the user identifier from the region JES JOB card or the TSO user identifier. If these are blank or null, it uses the name of the program specification block (PSB).
    - For:

- Message BMP and message IFP regions that *have* issued a successful GU call
- MPP regions

the queue manager uses one of:

- The signed-on user identifier associated with the message
- The logical terminal (LTERM) name
- The user identifier from the region JES JOB card
- The TSO user identifier
- The PSB name

- On IBM i, the queue manager uses the name of the user profile associated with the application job.
- On UNIX systems, the queue manager uses:
  - The application's logon name
  - The effective user identifier of the process if no logon is available
  - The user identifier associated with the transaction, if the application is a CICS transaction
- On Windows systems, the queue manager uses the first 12 characters of the logged-on user name.

This field is normally an output field generated by the queue manager but for an MQPUT or MQPUT1 call you can make this field an input/output field and specify the UserIdentification field instead of letting the queue manager generate this information. Specify either MQPMO_SET_IDENTITY_CONTEXT or MQPMO_SET_ALL_CONTEXT in the PutMsgOpts parameter and specify a user ID in the UserIdentifier field if you do not want the queue manager to generate the UserIdentifier field for an MQPUT or MQPUT1 call.

For the MQPUT and MQPUT1 calls, this is an input/output field if MQPMO_SET_IDENTITY_CONTEXT or MQPMO_SET_ALL_CONTEXT is specified in the *PutMsgOpts* parameter. Any information following a null character within the field is discarded. The queue manager converts the null character and any following characters to blanks. If MQPMO_SET_IDENTITY_CONTEXT or MQPMO_SET_ALL_CONTEXT is not specified, this field is ignored on input and is an output-only field.

After the successful completion of an MQPUT or MQPUT1 call, this field contains the *UserIdentifier* that was transmitted with the message if it was put to a queue. This will be the value of *UserIdentifier* that is kept with the message if it is retained (see description of MQPMO_RETAIN for more details about retained publications) but is not used as the *UserIdentifier* when the message is sent as a publication to subscribers because they provide a value to override *UserIdentifier* in all publications sent to them. If the message has no context, the field is entirely blank.

This is an output field for the MQGET call. The length of this field is given by MQ_USER_ID_LENGTH. The initial value of this field is the null string in C, and 12 blank characters in other programming languages.

*Version (MQLONG)*

This is the structure version number, and must be one of the following:

**MQMD_VERSION_1**
Version-1 message descriptor structure.

This version is supported in all environments.

**MQMD_VERSION_2**
Version-2 message descriptor structure.

This version is supported in all IBM MQ V6.0 and later environments, plus IBM MQ MQI clients connected to these systems.

**Note:** When a version-2 MQMD is used, the queue manager performs additional checks on any MQ header structures that might be present at the beginning of the application message data; for further details see the usage notes for the MQPUT call.

Fields that exist only in the more-recent version of the structure are identified as such in the descriptions of the fields. The following constant specifies the version number of the current version:

**MQMD_CURRENT_VERSION**
Current version of message descriptor structure.

This is always an input field. The initial value of this field is MQMD_VERSION_1.

## *Initial values and language declarations for MQMD*

*Table 504. Initial values of fields in MQMD for MQMD*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQMD_STRUC_ID | 'MD' |
| *Version* | MQMD_VERSION_1 | 1 |
| *Report* | MQRO_NONE | 0 |
| *MsgType* | MQMT_DATAGRAM | 8 |
| *Expiry* | MQEI_UNLIMITED | -1 |
| *Feedback* | MQFB_NONE | 0 |
| *Encoding* | MQENC_NATIVE | Depends on environment |
| *CodedCharSetId* | MQCCSI_Q_MGR | 0 |
| *Format* | MQFMT_NONE | Blanks |
| *Priority* | MQPRI_PRIORITY_AS_Q_DEF | -1 |
| *Persistence* | MQPER_PERSISTENCE_AS_Q_DEF | 2 |
| *MsgId* | MQMI_NONE | Nulls |
| *CorrelId* | MQCI_NONE | Nulls |
| *BackoutCount* | None | 0 |
| *ReplyToQ* | None | Null string or blanks |
| *ReplyToQMgr* | None | Null string or blanks |
| *UserIdentifier* | None | Null string or blanks |
| *AccountingToken* | MQACT_NONE | Nulls |
| *ApplIdentityData* | None | Null string or blanks |
| *PutApplType* | MQAT_NO_CONTEXT | 0 |
| *PutApplName* | None | Null string or blanks |
| *PutDate* | None | Null string or blanks |
| *PutTime* | None | Null string or blanks |
| *ApplOriginData* | None | Null string or blanks |
| *GroupId* | MQGI_NONE | Nulls |

| *Table 504. Initial values of fields in MQMD for MQMD (continued)* | | |
|---|---|---|
| **Field name** | **Name of constant** | **Value of constant** |

**Notes:**

1. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
2. In the C programming language, the macro variable MQMD_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQMD MyMD = {MQMD_DEFAULT};
```

*C declaration*

```
typedef struct tagMQMD MQMD;
struct tagMQMD {
  MQCHAR4   StrucId;           /* Structure identifier */
  MQLONG    Version;           /* Structure version number */
  MQLONG    Report;            /* Options for report messages */
  MQLONG    MsgType;           /* Message type */
  MQLONG    Expiry;            /* Message lifetime */
  MQLONG    Feedback;          /* Feedback or reason code */
  MQLONG    Encoding;          /* Numeric encoding of message data */
  MQLONG    CodedCharSetId;    /* Character set identifier of message
                                  data */
  MQCHAR8   Format;            /* Format name of message data */
  MQLONG    Priority;          /* Message priority */
  MQLONG    Persistence;       /* Message persistence */
  MQBYTE24  MsgId;             /* Message identifier */
  MQBYTE24  CorrelId;          /* Correlation identifier */
  MQLONG    BackoutCount;      /* Backout counter */
  MQCHAR48  ReplyToQ;          /* Name of reply queue */
  MQCHAR48  ReplyToQMgr;       /* Name of reply queue manager */
  MQCHAR12  UserIdentifier;    /* User identifier */
  MQBYTE32  AccountingToken;   /* Accounting token */
  MQCHAR32  ApplIdentityData;  /* Application data relating to
                                  identity */
  MQLONG    PutApplType;       /* Type of application that put the
                                  message */

## MQMDE - Message descriptor extension

The following table summarizes the fields in the structure.

*Table 505. Fields in MQMDE*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *StrucLength* | Length of MQMDE structure | StrucLength |
| *Encoding* | Numeric encoding of data that follows MQMDE | Encoding |
| *CodedCharSetId* | Character set identifier of data that follows MQMDE | CodedCharSetId |
| *Format* | Format name of data that follows MQMDE | Format |
| *Flags* | General flags | Flags |
| *GroupId* | Group identifier | GroupId |
| *MsgSeqNumber* | Sequence number of logical message within group | MsgSeqNumber |
| *Offset* | Offset of data in physical message from start of logical message | Offset |
| *MsgFlags* | Message flags | MsgFlags |
| *OriginalLength* | Length of original message | OriginalLength |

### *Overview for MQMDE*

**Availability**: All IBM MQ systems, plus IBM MQ clients connected to these systems.

**Purpose**: The MQMDE structure describes the data that sometimes occurs preceding the application message data. The structure contains those MQMD fields that exist in the version-2 MQMD, but not in the version-1 MQMD.

**Format name**: MQFMT_MD_EXTENSION.

**Character set and encoding**: Data in MQMDE must be in the character set and encoding of the local queue manager; these are given by the *CodedCharSetId* queue-manager attribute and MQENC_NATIVE for the C programming language.

Set the character set and encoding of the MQMDE into the *CodedCharSetId* and *Encoding* fields in:

- The MQMD (if the MQMDE structure is at the start of the message data), or
- The header structure that precedes the MQMDE structure (all other cases).

If the MQMDE is not in the queue manager's character set and encoding, the MQMDE is accepted but not honored, that is, the MQMDE is treated as message data.

**Note:** On Windows, applications compiled with Micro Focus COBOL use a value of MQENC_NATIVE that is different from the queue-manager's encoding. Although numeric fields in the MQMD structure on the MQPUT, MQPUT1, and MQGET calls must be in the Micro Focus COBOL encoding, numeric fields in the MQMDE structure must be in the queue-manager's encoding. This latter is given by MQENC_NATIVE for the C programming language, and has the value 546.

**Usage**: Applications that use a version-2 MQMD will not encounter an MQMDE structure. However, specialized applications, and applications that continue to use a version-1 MQMD, might encounter an MQMDE in some situations. The MQMDE structure can occur in the following circumstances:

- Specified on the MQPUT and MQPUT1 calls
- Returned by the MQGET call
- In messages on transmission queues

**MQMDE specified on MQPUT and MQPUT1 calls**: On the MQPUT and MQPUT1 calls, if the application provides a version-1 MQMD, the application can optionally prefix the message data with an MQMDE, setting the *Format* field in MQMD to MQFMT_MD_EXTENSION to indicate that an MQMDE is present. If the application does not provide an MQMDE, the queue manager assumes default values for the fields in the MQMDE. The default values that the queue manager uses are the same as the initial values for the structure; see Table 507 on page 456.

If the application provides a version-2 MQMD *and* prefixes the application message data with an MQMDE, the structures are processed as shown in Table 506 on page 453.

*Table 506. Queue-manager action when MQMDE specified on MQPUT or MQPUT1 for MQMDE*

| MQMD version | Values of version-2 fields | Values of corresponding fields in MQMDE | Action taken by queue manager |
|---|---|---|---|
| 1 | - | Valid | MQMDE is honored |
| 2 | Default | Valid | MQMDE is honored |
| 2 | Not default | Valid | MQMDE is treated as message data |
| 1 or 2 | Any | Not valid | Call fails with an appropriate reason code |
| 1 or 2 | Any | MQMDE is in the wrong character set or encoding, or is an unsupported version | MQMDE is treated as message data |

**Note:** On z/OS, if the application specifies a version-1 MQMD with an MQMDE, the queue manager validates the MQMDE only if the queue has an *IndexType* of MQIT_GROUP_ID.

There is one special case. If the application uses a version-2 MQMD to put a message that is a segment (that is, the MQMF_SEGMENT or MQMF_LAST_SEGMENT flag is set), and the format name in the MQMD is MQFMT_DEAD_LETTER_HEADER, the queue manager generates an MQMDE structure and inserts it *between* the MQDLH structure and the data that follows it. In the MQMD that the queue manager retains with the message, the version-2 fields are set to their default values.

Several of the fields that exist in the version-2 MQMD but not the version-1 MQMD are input/output fields on MQPUT and MQPUT1. However, the queue manager does *not* return any values in the equivalent fields in the MQMDE on output from the MQPUT and MQPUT1 calls; if the application requires those output values, it must use a version-2 MQMD.

**MQMDE returned by MQGET call**: On the MQGET call, if the application provides a version-1 MQMD, the queue manager prefixes the message returned with an MQMDE, but only if one or more of the fields in

the MQMDE has a nondefault value. The queue manager sets the *Format* field in MQMD to the value MQFMT_MD_EXTENSION to indicate that an MQMDE is present.

If the application provides an MQMDE at the start of the *Buffer* parameter, the MQMDE is ignored. On return from the MQGET call, it is replaced by the MQMDE for the message (if one is needed), or overwritten by the application message data (if the MQMDE is not needed).

If the MQGET call returns an MQMDE, the data in the MQMDE is usually in the queue manager's character set and encoding. However the MQMDE might be in some other character set and encoding if:

- The MQMDE was treated as data on the MQPUT or MQPUT1 call (see Table 506 on page 453 for the circumstances that can cause this).
- The message was received from a remote queue manager connected by a TCP connection, and the receiving message channel agent (MCA) was not set up correctly.

**Note:** On Windows, applications compiled with Micro Focus COBOL use a value of MQENC_NATIVE that is different from the queue-manager's encoding (see above).

**MQMDE in messages on transmission queues**: Messages on transmission queues are prefixed with the MQXQH structure, which contains within it a version-1 MQMD. An MQMDE might also be present, positioned between the MQXQH structure and application message data, but it is usually present only if one or more of the fields in the MQMDE has a nondefault value.

Other MQ header structures can also occur between the MQXQH structure and the application message data. For example, when the dead-letter header MQDLH is present, and the message is not a segment, the order is:

- MQXQH (containing a version-1 MQMD)
- MQMDE
- MQDLH
- application message data

## *Fields for MQMDE*

The MQMDE structure contains the following fields; the fields are described in **alphabetical order**:

*CodedCharSetId (MQLONG)*

This specifies the character set identifier of the data that follows the MQMDE structure; it does not apply to character data in the MQMDE structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The queue manager does not check that this field is valid. The following special value can be used:

**MQCCSI_INHERIT**
Character data in the data *following* this structure is in the same character set as this structure.

The queue manager changes this value in the structure sent in the message to the actual character-set identifier of the structure. Provided no error occurs, the value MQCCSI_INHERIT is not returned by the MQGET call.

MQCCSI_INHERIT cannot be used if the value of the *PutApplType* field in MQMD is MQAT_BROKER.

This value is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.

The initial value of this field is MQCCSI_UNDEFINED.

*Encoding (MQLONG)*

This specifies the numeric encoding of the data that follows the MQMDE structure; it does not apply to numeric data in the MQMDE structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The queue manager does not check that the field is valid. See the *Encoding* field described in "MQMD - Message descriptor" on page 402 for more information about data encodings.

The initial value of this field is MQENC_NATIVE.

*Flags (MQLONG)*

The following flag can be specified:

**MQMDEF_NONE**
No flags.

The initial value of this field is MQMDEF_NONE.

*Format (MQCHAR8)*

This specifies the format name of the data that follows the MQMDE structure.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The queue manager does not check that this field is valid. See the *Format* field described in"MQMD - Message descriptor" on page 402for more information about format names.

The initial value of this field is MQFMT_NONE.

*GroupId (MQBYTE24)*

See the *GroupId* field described in"MQMD - Message descriptor" on page 402. The initial value of this field is MQGI_NONE.

*MsgFlags (MQLONG)*

See the *MsgFlags* field described in "MQMD - Message descriptor" on page 402. The initial value of this field is MQMF_NONE.

*MsgSeqNumber (MQLONG)*

See the *MsgSeqNumber* field described in"MQMD - Message descriptor" on page 402. The initial value of this field is 1.

*Offset (MQLONG)*

See the *Offset* field described in"MQMD - Message descriptor" on page 402. The initial value of this field is 0.

*OriginalLength (MQLONG)*

See the *OriginalLength* field described in"MQMD - Message descriptor" on page 402. The initial value of this field is MQOL_UNDEFINED.

*StrucId (MQCHAR4)*

The value must be:

**MQMDE_STRUC_ID**
Identifier for message descriptor extension structure.

For the C programming language, the constant MQMDE_STRUC_ID_ARRAY is also defined; this has the same value as MQMDE_STRUC_ID, but is an array of characters instead of a string.

The initial value of this field is MQMDE_STRUC_ID.

*StrucLength (MQLONG)*

This is the length of the MQMDE structure; the following value is defined:

**MQMDE_LENGTH_2**
Length of version-2 message descriptor extension structure.

The initial value of this field is MQMDE_LENGTH_2.

*Version (MQLONG)*

This is the structure version number; the value must be:

**MQMDE_VERSION_2**
Version-2 message descriptor extension structure.

The following constant specifies the version number of the current version:

**MQMDE_CURRENT_VERSION**
Current version of message descriptor extension structure.

The initial value of this field is MQMDE_VERSION_2.

## *Initial values and language declarations for MQMDE*

*Table 507. Initial values of fields in MQMDE for MQMDE*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQMDE_STRUC_ID | 'MDE¬' |
| *Version* | MQMDE_VERSION_2 | 2 |
| *StrucLength* | MQMDE_LENGTH_2 | 72 |
| *Encoding* | MQENC_NATIVE | Depends on environment |
| *CodedCharSetId* | MQCCSI_UNDEFINED | 0 |
| *Format* | MQFMT_NONE | Blanks |
| *Flags* | MQMDEF_NONE | 0 |
| *GroupId* | MQGI_NONE | Nulls |
| *MsgSeqNumber* | None | 1 |
| *Offset* | None | 0 |
| *MsgFlags* | MQMF_NONE | 0 |
| *OriginalLength* | MQOL_UNDEFINED | -1 |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. In the C programming language, the macro variable MQMDE_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQMDE MyMDE = {MQMDE_DEFAULT};
```

*C declaration*

```
typedef struct tagMQMDE MQMDE;
struct tagMQMDE {
  MQCHAR4   StrucId;         /* Structure identifier */
  MQLONG    Version;         /* Structure version number */
  MQLONG    StrucLength;     /* Length of MQMDE structure */
  MQLONG    Encoding;        /* Numeric encoding of data that follows
                                MQMDE */
  MQLONG    CodedCharSetId;  /* Character-set identifier of data that
                                follows MQMDE */
```

```
  MQCHAR8   Format;          /* Format name of data that follows
                                MQMDE */
  MQLONG    Flags;           /* General flags */
  MQBYTE24  GroupId;         /* Group identifier */
  MQLONG    MsgSeqNumber;    /* Sequence number of logical message
                                within group */
  MQLONG    Offset;          /* Offset of data in physical message from
                                start of logical message */
  MQLONG    MsgFlags;        /* Message flags */
  MQLONG    OriginalLength;  /* Length of original message */
};
```

*COBOL declaration*

```
**   MQMDE structure
  10 MQMDE.
**    Structure identifier
   15 MQMDE-STRUCID        PIC X(4).
**    Structure version number
   15 MQMDE-VERSION        PIC S9(9) BINARY.

## MQMHBO - Message handle to buffer options

The following table summarizes the fields in the structure. MQMHBO structure - message handle to buffer options

*Table 508. Fields in MQMHBO*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *Options* | Options controlling the action of MQMHBUF | Options |

### *Overview for MQMHBO*

**Availability**: All IBM MQ systems and IBM MQ MQI clients.

**Purpose**: The MQMHBO structure allows applications to specify options that control how buffers are produced from message handles. The structure is an input parameter on the MQMHBUF call.

**Character set and encoding**: Data in MQMHBO must be in the character set of the application and encoding of the application (MQENC_NATIVE).

### *Fields for MQMHBO*

Message handle to buffer options structure - fields

The MQMHBO structure contains the following fields; the fields are described in **alphabetical order**:

*Options (MQLONG)*
Message handle to buffer options structure - Options field

These options control the action of MQMHBUF.

You must specify the following option:

**MQMHBO_PROPERTIES_IN_MQRFH2**
When converting properties from a message handle into a buffer, convert them into the MQRFH2 format.

Optionally, you can also specify the following option. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

**MQMHBO_DELETE_PROPERTIES**
Properties that are added to the buffer are deleted from the message handle. If the call fails no properties are deleted.

This is always an input field. The initial value of this field is MQMHBO_PROPERTIES_IN_MQRFH2.

*StrucId (MQCHAR4)*
Message handle to buffer options structure - StrucId field

This is the structure identifier. The value must be:

**MQMHBO_STRUC_ID**
Identifier for message handle to buffer options structure.

For the C programming language, the constant MQMHBO_STRUC_ID_ARRAY is also defined; this has the same value as MQMHBO_STRUC_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQMHBO_STRUC_ID.

*Version (MQLONG)*
Message handle to buffer options structure - Version field

This is the structure version number. The value must be:

**MQMHBO_VERSION_1**
Version number for message handle to buffer options structure.

The following constant specifies the version number of the current version:

**MQMHBO_CURRENT_VERSION**
Current version of message handle to buffer options structure.

This is always an input field. The initial value of this field is MQMHBO_VERSION_1.

## *Initial values and language declarations for MQMHBO*

Message handle to buffer structure - Initial values

*Table 509. Initial values of fields in MQMHBO*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQMHBO_STRUC_ID | 'MHBO' |
| *Version* | MQMHBO_VERSION_1 | 1 |
| *Options* | MQMHBO_PROPERTIES_IN_MQRFH2 | |

**Notes:**

1. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
2. In the C programming language, the macro variable MQMHBO_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQMHBO MyMHBO = {MQMHBO_DEFAULT};
```

*C declaration*
Message handle to buffer options structure - C language declaration

```
typedef struct tagMQMHBO MQMHBO;
struct tagMQMHBO {
  MQCHAR4  StrucId;        /* Structure identifier */
  MQLONG   Version;        /* Structure version number */
  MQLONG   Options;        /* Options that control the action of
                              MQMHBUF */
};
```

*COBOL declaration*
Message handle to buffer options structure - COBOL language declaration

```
**  MQMHBO structure
  10 MQMHBO.
**    Structure identifier
   15 MQMHBO-STRUCID               PIC X(4).
**    Structure version number
   15 MQMHBO-VERSION               PIC S9(9) BINARY.
**    Options that control the action of MQMHBUF
   15 MQMHBO-OPTIONS               PIC S9(9) BINARY.
```

*PL/I declaration*
Message handle to buffer options structure - PL/I language declaration

```
Dcl
 1 MQMHBO based,
  3 StrucId        char(4),       /* Structure identifier */
  3 Version        fixed bin(31), /* Structure version number */
  3 Options        fixed bin(31), /* Options that control the action
                                     of MQMHBUF */
```

*High Level Assembler declaration*
Message handle to buffer options structure - Assembler language declaration

```
MQMHBO                   DSECT
MQMHBO_STRUCID           DS   CL4  Structure identifier
MQMHBO_VERSION           DS   F    Structure version number

*                                  action of MQMHBUF
MQMHBO_LENGTH            EQU  *-MQMHBO
MQMHBO_AREA              DS   CL(MQMHBO_LENGTH)
```

## MQOD - Object descriptor

The following table summarizes the fields in the structure.

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *ObjectType* | Object type | ObjectType |
| *ObjectName* | Object name | ObjectName |
| *ObjectQMgrName* | Object queue manager name | ObjectQMgrName |
| *DynamicQName* | Dynamic queue name | DynamicQName |
| *AlternateUserId* | Alternate user identifier | AlternateUserId |

| Field | Description | Topic |
|---|---|---|
| **Note:** The remaining fields are ignored if *Version* is less than MQOD_VERSION_2. | | |
| *RecsPresent* | Number of object records present | RecsPresent |
| *KnownDestCount* | Number of local queues opened successfully | KnownDestCount |
| *UnknownDestCount* | Number of remote queues opened successfully | UnknownDestCount |
| *InvalidDestCount* | Number of queues that failed to open | InvalidDestCount |
| *ObjectRecOffset* | Offset of first object record from start of MQOD | ObjectRecOffset |
| *ResponseRecOffset* | Offset of first response record from start of MQOD | ResponseRecOffset |
| *ObjectRecPtr* | Address of first object record | ObjectRecPtr |
| *ResponseRecPtr* | Address of first response record | ResponseRecPtr |
| **Note:** The remaining fields are ignored if *Version* is less than MQOD_VERSION_3. | | |
| *AlternateSecurityId* | Alternate security identifier | AlternateSecurityId |
| *ResolvedQName* | Resolved queue name | ResolvedQName |
| *ResolvedQMgrName* | Resolved queue manager name | ResolvedQMgrName |
| **Note:** The remaining fields are ignored if *Version* is less than MQOD_VERSION_4. | | |
| *ObjectString* | Long object name | ObjectString |
| *SelectionString* | Selection string | SelectionString |
| *ResObjectString* | Resolved long object name | ResObjectString |
| *ResolvedType* | Resolved object type | ResolvedType |

### *Overview for MQOD*

**Availability**: All IBM MQ systems, plus IBM MQ MQI clients connected to those systems.

**Purpose**: The MQOD structure is used to specify an object by name. The following types of object are valid:

- Queue or distribution list
- Namelist
- Process definition
- Queue manager
- Topic

The structure is an input/output parameter on the MQOPEN and MQPUT1 calls.

**Version**: The current version of MQOD is MQOD_VERSION_4. Applications that you want to port between several environments must ensure that the required version of MQOD is supported in all the environments concerned. Fields that exist only in the more-recent versions of the structure are identified as such in the descriptions that follow.

The header, COPY, and INCLUDE files provided for the supported programming languages contain the most-recent version of MQOD that is supported by the environment, but with the initial value of the *Version* field set to MQOD_VERSION_1. To use fields that are not present in the version-1 structure, the application must set the *Version* field to the version number of the version required.

To open a distribution list, *Version* must be MQOD_VERSION_2 or greater.

**Character set and encoding**: Data in MQOD must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

## *Fields for MQOD*

The MQOD structure contains the following fields; the fields are described in **alphabetical order**:

*AlternateSecurityId (MQBYTE40)*

This is a security identifier that is passed with the *AlternateUserId* to the authorization service to allow appropriate authorization checks to be performed. *AlternateSecurityId* is used only if:

- MQOO_ALTERNATE_USER_AUTHORITY is specified on the MQOPEN call, or
- MQPMO_ALTERNATE_USER_AUTHORITY is specified on the MQPUT1 call,

*and* the *AlternateUserId* field is not entirely blank up to the first null character or the end of the field.

On Windows, *AlternateSecurityId* can be used to supply the Windows security identifier (SID) that uniquely identifies the *AlternateUserId*. The SID for a user can be obtained from the Windows system by use of the `LookupAccountName()` Windows API call.

On z/OS, this field is ignored.

The *AlternateSecurityId* field has the following structure:

- The first byte is a binary integer containing the length of the significant data that follows; the value excludes the length byte itself. If no security identifier is present, the length is zero.
- The second byte indicates the type of security identifier that is present; the following values are possible:

  **MQSIDT_NT_SECURITY_ID**
  Windows security identifier.

  **MQSIDT_NONE**
  No security identifier.
- The third and subsequent bytes up to the length defined by the first byte contain the security identifier itself.
- Remaining bytes in the field are set to binary zero.

You can use the following special value:

**MQSID_NONE**
No security identifier specified.

The value is binary zero for the length of the field.

For the C programming language, the constant MQSID_NONE_ARRAY is also defined; this has the same value as MQSID_NONE, but is an array of characters instead of a string.

This is an input field. The length of this field is given by MQ_SECURITY_ID_LENGTH. The initial value of this field is MQSID_NONE. This field is ignored if *Version* is less than MQOD_VERSION_3.

*AlternateUserId (MQCHAR12)*

If you specify MQOO_ALTERNATE_USER_AUTHORITY for the MQOPEN call, or MQPMO_ALTERNATE_USER_AUTHORITY for the MQPUT1 call, this field contains an alternative user identifier that is used to check the authorization for the open, in place of the user identifier that the application is currently running under. Some checks, however, are still carried out with the current user identifier (for example, context checks).

If MQOO_ALTERNATE_USER_AUTHORITY or MQPMO_ALTERNATE_USER_AUTHORITY is specified and this field is entirely blank up to the first null character or the end of the field, the open can succeed only if no user authorization is needed to open this object with the options specified.

If neither MQOO_ALTERNATE_USER_AUTHORITY nor MQPMO_ALTERNATE_USER_AUTHORITY is specified, this field is ignored.

The following differences exist in the environments indicated:

- On z/OS, only the first 8 characters of *AlternateUserId* are used to check the authorization for the open. However, the current user identifier must be authorized to specify this particular alternative user identifier; all 12 characters of the alternative user identifier are used for this check. The user identifier must contain only characters allowed by the external security manager.

  If *AlternateUserId* is specified for a queue, the value can be used subsequently by the queue manager when messages are put. If the MQPMO_*_CONTEXT options specified on the MQPUT or MQPUT1 call cause the queue manager to generate the identity context information, the queue manager places the *AlternateUserId* into the *UserIdentifier* field in the MQMD of the message, in place of the current user identifier.
- In other environments, *AlternateUserId* is used only for access control checks on the object being opened. If the object is a queue, *AlternateUserId* does not affect the content of the *UserIdentifier* field in the MQMD of messages sent using that queue handle.

This is an input field. The length of this field is given by MQ_USER_ID_LENGTH. The initial value of this field is the null string in C, and 12 blank characters in other programming languages.

*DynamicQName (MQCHAR48)*

This is the name of a dynamic queue that is to be created by the MQOPEN call. This is of relevance only when *ObjectName* specifies the name of a model queue; in all other cases *DynamicQName* is ignored.

The characters that are valid in the name are the same as those for *ObjectName*, except that an asterisk is also valid. A name that is blank (or one in which only blanks occur before the first null character) is not valid if *ObjectName* is the name of a model queue.

If the last nonblank character in the name is an asterisk ( *), the queue manager replaces the asterisk with a string of characters that guarantees that the name generated for the queue is unique at the local queue manager. To allow a sufficient number of characters for this, the asterisk is valid only in positions 1 through 33. There must be no characters other than blanks or a null character following the asterisk.

It is valid for the asterisk to occur in the first character position, in which case the name consists solely of the characters generated by the queue manager.

On z/OS, do not use a name with the asterisk in the first character position, as there can be no security checks made on a queue with a full name that is generated automatically.

This is an input field. The length of this field is given by MQ_Q_NAME_LENGTH. The initial value of this field is determined by the environment:

- On z/OS, the value is `'CSQ.*'`.
- On other platforms, the value is `'AMQ.*'`.

The value is a null-terminated string in C, and a blank-padded string in other programming languages.

*InvalidDestCount (MQLONG)*

This is the number of queues in the distribution list that failed to open successfully. If present, this field is also set when opening a single queue that is not in a distribution list.

**Note:** If present, this field is set *only* if the *CompCode* parameter on the MQOPEN or MQPUT1 call is MQCC_OK or MQCC_WARNING; it is *not* set if the *CompCode* parameter is MQCC_FAILED.

This is an output field. The initial value of this field is 0. This field is ignored if *Version* is less than MQOD_VERSION_1.

*KnownDestCount (MQLONG)*

This is the number of queues in the distribution list that resolve to local queues and that were opened successfully. The count does not include queues that resolve to remote queues (even though a local transmission queue is used initially to store the message). If present, this field is also set when opening a single queue that is not in a distribution list.

This is an output field. The initial value of this field is 0. This field is ignored if *Version* is less than MQOD_VERSION_1.

*ObjectName (MQCHAR48)*

This is the local name of the object as defined on the queue manager identified by *ObjectQMgrName*. The name can contain the following characters:

- Uppercase alphabetic characters (A through Z)
- Lowercase alphabetic characters (a through z)
- Numeric digits (0 through 9)
- Period (.), forward slash (/), underscore (_), percent (%)

The name must not contain leading or embedded blanks, but can contain trailing blanks. Use a null character to indicate the end of significant data in the name; the null and any characters following it are treated as blanks. The following restrictions apply in the environments indicated:

- On systems that use EBCDIC Katakana, lowercase characters cannot be used.
- On z/OS:
  - Avoid names that begin or end with an underscore; they cannot be processed by the operations and control panels.
  - The percent character has a special meaning to RACF. If RACF is used as the external security manager, names must not contain the percent. If they do, those names are not included in any security checks when RACF generic profiles are used.
- On IBM i, names containing lowercase characters, forward slash, or percent, must be enclosed in quotation marks when specified on commands. These quotation marks must not be specified for names that occur as fields in structures or as parameters on calls.

The full topic name can be built from two different fields: *ObjectName* and *ObjectString*. For details of how these two fields are used, see “Using topic strings” on page 560.

The following points apply to the types of object indicated:

- If *ObjectName* is the name of a model queue, the queue manager creates a dynamic queue with the attributes of the model queue, and returns in the *ObjectName* field the name of the queue created. A model queue can be specified only on the MQOPEN call; a model queue is not valid on the MQPUT1 call.
- If *ObjectName* is the name of an alias queue with TARGTYPE(TOPIC), a security check is first made on the named alias queue; this is normal when alias queues are used. When the security check completes successfully, the MQOPEN call will continue and will behave like an MQOPEN call on an MQOT_TOPIC; this includes making a security check against the administrative topic object.
- If *ObjectName* and *ObjectQMgrName* identify a shared queue owned by the queue-sharing group to which the local queue manager belongs, there must not also be a queue definition of the same name on the local queue manager. If there is such a definition (a local queue, alias queue, remote queue, or model queue), the call fails with reason code MQRC_OBJECT_NOT_UNIQUE.
- If the object being opened is a distribution list (that is, *RecsPresent* is present and greater than zero), *ObjectName* must be blank or the null string. If this condition is not satisfied, the call fails with reason code MQRC_OBJECT_NAME_ERROR.
- If *ObjectType* is MQOT_Q_MGR, special rules apply; in this case the name must be entirely blank up to the first null character or the end of the field.

This is an input/output field for the MQOPEN call when *ObjectName* is the name of a model queue, and an input-only field in all other cases. The length of this field is given by MQ_Q_NAME_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*ObjectQMgrName (MQCHAR48)*

This is the name of the queue manager on which the *ObjectName* object is defined. The characters that are valid in the name are the same as those for *ObjectName* (see "ObjectName (MQCHAR48)" on page 464 ). A name that is entirely blank up to the first null character or the end of the field denotes the queue manager to which the application is connected (the local queue manager).

The following points apply to the types of object indicated:

- If *ObjectType* is MQOT_TOPIC, MQOT_NAMELIST, MQOT_PROCESS, or MQOT_Q_MGR, *ObjectQMgrName* must be blank or the name of the local queue manager.
- If *ObjectName* is the name of a model queue, the queue manager creates a dynamic queue with the attributes of the model queue, and returns in the *ObjectQMgrName* field the name of the queue manager on which the queue is created; this is the name of the local queue manager. A model queue can be specified only on the MQOPEN call; a model queue is not valid on the MQPUT1 call.
- If *ObjectName* is the name of a cluster queue, and *ObjectQMgrName* is blank, the destination of messages sent using the queue handle returned by the MQOPEN call is chosen by the queue manager (or cluster workload exit, if one is installed) as follows:
  - If MQOO_BIND_ON_OPEN is specified, the queue manager selects a particular instance of the cluster queue while processing the MQOPEN call, and all messages put using this queue handle are sent to that instance.
  - If MQOO_BIND_NOT_FIXED is specified, the queue manager can choose a different instance of the destination queue (residing on a different queue manager in the cluster) for each successive MQPUT call that uses this queue handle.

  If the application needs to send a message to a *specific* instance of a cluster queue (that is, a queue instance that resides on a particular queue manager in the cluster), the application must specify the name of that queue manager in the *ObjectQMgrName* field. This forces the local queue manager to send the message to the specified destination queue manager.
- If *ObjectName* is the name of a shared queue that is owned by the queue-sharing group to which the local queue manager belongs, *ObjectQMgrName* can be the name of the queue-sharing group, the name of the local queue manager, or blank; the message is placed on the same queue whichever of these values is specified.

  Queue-sharing groups are supported only on z/OS.
- If *ObjectName* is the name of a shared queue that is owned by a remote queue-sharing group (that is, a queue-sharing group to which the local queue manager does *not* belong), *ObjectQMgrName* must be the name of the queue-sharing group. You can use the name of a queue manager that belongs to that group, but this can delay the message if that particular queue manager is not available when the message arrives at the queue-sharing group.
- If the object being opened is a distribution list (that is, *RecsPresent* is greater than zero), *ObjectQMgrName* must be blank or the null string. If this condition is not satisfied, the call fails with reason code MQRC_OBJECT_Q_MGR_NAME_ERROR.

This is an input/output field for the MQOPEN call when *ObjectName* is the name of a model queue, and an input-only field in all other cases. The length of this field is given by MQ_Q_MGR_NAME_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*ObjectRecOffset (MQLONG)*

This is the offset in bytes of the first MQOR object record from the start of the MQOD structure. The offset can be positive or negative. *ObjectRecOffset* is used only when a distribution list is being opened. The field is ignored if *RecsPresent* is zero.

When a distribution list is being opened, an array of one or more MQOR object records must be provided in order to specify the names of the destination queues in the distribution list. This can be done in one of two ways:

- By using the offset field *ObjectRecOffset*.

  In this case, the application must declare its own structure containing an MQOD followed by the array of MQOR records (with as many array elements as are needed), and set *ObjectRecOffset* to the offset of the first element in the array from the start of the MQOD. Ensure that this offset is correct and has a value that can be accommodated within an MQLONG (the most restrictive programming language is COBOL, for which the valid range is -999 999 999 through +999 999 999).

  Use *ObjectRecOffset* for programming languages that do not support the pointer data type, or that implement the pointer data type in a way that is not portable to different environments (for example, the COBOL programming language).

- By using the pointer field *ObjectRecPtr*.

  In this case, the application can declare the array of MQOR structures separately from the MQOD structure, and set *ObjectRecPtr* to the address of the array.

  Use *ObjectRecPtr* for programming languages that support the pointer data type in a way that is portable to different environments (for example, the C programming language).

Whatever technique you choose, use one of *ObjectRecOffset* and *ObjectRecPtr* ; the call fails with reason code MQRC_OBJECT_RECORDS_ERROR if both are zero, or both are nonzero.

This is an input field. The initial value of this field is 0. This field is ignored if *Version* is less than MQOD_VERSION_2.

*ObjectRecPtr (MQPTR)*

This is the address of the first MQOR object record. *ObjectRecPtr* is used only when a distribution list is being opened. The field is ignored if *RecsPresent* is zero.

You can use either *ObjectRecPtr* or *ObjectRecOffset* to specify the object records, but not both; for the description of the *ObjectRecOffset* field, see "ObjectRecOffset (MQLONG)" on page 465. If you do not use *ObjectRecPtr*, set it to the null pointer or null bytes.

This is an input field. The initial value of this field is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise. This field is ignored if *Version* is less than MQOD_VERSION_2.

**Note:** On platforms where the programming language does not support the pointer data type, this field is declared as a byte string of the appropriate length, with the initial value being the all-null byte string.

*ObjectString (MQCHARV)*
The ObjectString field specifies the long object name.

This specifies the long object name to be used. This field is only referenced for certain values of *ObjectType*, and is ignored for all other values. See the description of *ObjectType* for details of which values indicate that this field is used.

If *ObjectString* is specified incorrectly, according to the description of how to use the MQCHARV structure, or if it exceeds the maximum length, the call fails with reason code MQRC_OBJECT_STRING_ERROR.

This is an input field. The initial values of the fields in this structure are the same as those in the MQCHARV structure.

The full topic name can be built from two different fields: *ObjectName* and *ObjectString*. For details of how these two fields are used, see "Using topic strings" on page 560.

*ObjectType (MQLONG)*

The type of object being named in the object descriptor. Possible values are:

**MQOT_CLNTCONN_CHANNEL**
Client connection channel. The name of the object is found in the *ObjectName* field.

**MQOT_Q**
Queue. The name of the object is found in the *ObjectName* field.

**MQOT_NAMELIST**
Namelist. The name of the object is found in the *ObjectName* field

**MQOT_PROCESS**
Process definition. The name of the object is found in the *ObjectName* field

**MQOT_Q_MGR**
Queue manager. The name of the object is found in the *ObjectName* field

**MQOT_TOPIC**
Topic. The full topic name can be built from two different fields: *ObjectName* and *ObjectString*.

For details of how those two fields are used, see "Using topic strings" on page 560.

This is always an input field. The initial value of this field is MQOT_Q.

*RecsPresent (MQLONG)*

This is the number of MQOR object records that have been provided by the application. If this number is greater than zero, it indicates that a distribution list is being opened, with *RecsPresent* being the number of destination queues in the list. A distribution list can contain only one destination.

The value of *RecsPresent* must not be less than zero, and if it is greater than zero *ObjectType* must be MQOT_Q; the call fails with reason code MQRC_RECS_PRESENT_ERROR if these conditions are not satisfied.

On z/OS, this field must be zero.

This is an input field. The initial value of this field is 0. This field is ignored if *Version* is less than MQOD_VERSION_2.

*ResObjectString (MQCHARV)*
The ResObjectString field is the long object name after the queue manager resolves the name provided in the *ObjectName* field.

This field is returned only for topics and queue aliases that reference a topic object.

If the long object name is provided in *ObjectString* and nothing is provided in *ObjectName*, then the value returned in this field is the same as provided in *ObjectString*.

If this field is omitted (that is ResObjectString.VSBufSize is zero) then the *ResObjectString* will not be returned, but the length will be returned in ResObjectString.VSLength.

If the buffer length (provided in ResObjectStrng.VSBufSize) is shorter than the full *ResObjectString*, the string will be truncated and will return as many of the rightmost characters as can fit in the provided buffer.

If *ResObjectString* is specified incorrectly, according to the description of how to use the MQCHARV structure, or if it exceeds the maximum length, the call fails with reason code MQRC_RES_OBJECT_STRING_ERROR.

*ResolvedQMgrName (MQCHAR48)*

This is the name of the destination queue manager after the local queue manager resolves the name. The name returned is the name of the queue manager that owns the queue identified by *ResolvedQName*. *ResolvedQMgrName* can be the name of the local queue manager.

If *ResolvedQName* is a shared queue that is owned by the queue-sharing group to which the local queue manager belongs, *ResolvedQMgrName* is the name of the queue-sharing group. If the queue is owned by some other queue-sharing group, *ResolvedQName* can be the name of the queue-sharing group or the name of a queue manager that is a member of the queue-sharing group (the nature of the value returned is determined by the queue definitions that exist at the local queue manager).

A nonblank value is returned only if the object is a single queue opened for browse, input, or output (or any combination). If the object opened is any of the following, *ResolvedQMgrName* is set to blanks:

- Not a queue
- A queue, but not opened for browse, input, or output
- A cluster queue with MQOO_BIND_NOT_FIXED specified (or with MQOO_BIND_AS_Q_DEF in effect when the *DefBind* queue attribute has the value MQBND_BIND_NOT_FIXED)
- A distribution list

This is an output field. The length of this field is given by MQ_Q_NAME_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages. This field is ignored if *Version* is less than MQOD_VERSION_3.

*ResolvedQName (MQCHAR48)*

This is the name of the destination queue after the local queue manager resolves the name. The name returned is the name of a queue that exists on the queue manager identified by *ResolvedQMgrName*.

A nonblank value is returned only if the object is a single queue opened for browse, input, or output (or any combination). If the object opened is any of the following, *ResolvedQName* is set to blanks:

- Not a queue
- A queue, but not opened for browse, input, or output
- A distribution list
- An alias queue that references a topic object (refer to ResObjectString instead).
- An alias queue that resolves to a topic object.

This is an output field. The length of this field is given by MQ_Q_NAME_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages. This field is ignored if *Version* is less than MQOD_VERSION_3.

*ResolvedType (MQLONG)*
The type of the resolved (base) object being opened.

The possible values are:

**MQOT_Q**
The resolved object is a queue. This value applies when a queue is opened directly or when an alias queue pointing to a queue is opened.

**MQOT_TOPIC**
The resolved object is a topic. This value applies when a topic is opened directly or when an alias queue pointing to a topic object is opened.

**MQOT_NONE**
The resolved type is neither a queue nor a topic.

*ResponseRecOffset (MQLONG)*

This is the offset in bytes of the first MQRR response record from the start of the MQOD structure. The offset can be positive or negative. *ResponseRecOffset* is used only when a distribution list is being opened. The field is ignored if *RecsPresent* is zero.

When a distribution list is being opened, you can provide an array of one or more MQRR response records in order to identify the queues that failed to open (*CompCode* field in MQRR), and the reason for each failure (*Reason* field in MQRR). The data is returned in the array of response records in the same order as the queue names occur in the array of object records. The queue manager sets the response records only when the outcome of the call is mixed (that is, some queues were opened successfully while others failed, or all failed but for different reasons); reason code MQRC_MULTIPLE_REASONS from the call indicates this case. If the same reason code applies to all queues, that reason is returned in the *Reason* parameter of the MQOPEN or MQPUT1 call, and the response records are not set. Response records are optional, but if they are supplied there must be *RecsPresent* of them.

The response records can be provided in the same way as the object records, either by specifying an offset in *ResponseRecOffset*, or by specifying an address in *ResponseRecPtr* ; for details of how to do this, see "ObjectRecOffset (MQLONG)" on page 465. However, no more than one of *ResponseRecOffset* and *ResponseRecPtr* can be used; the call fails with reason code MQRC_RESPONSE_RECORDS_ERROR if both are nonzero.

For the MQPUT1 call, these response records are used to return information about errors that occur when the message is sent to the queues in the distribution list, as well as errors that occur when the queues are opened. The completion code and reason code from the put operation for a queue replace those from the open operation for that queue only if the completion code from the latter was MQCC_OK or MQCC_WARNING.

This is an input field. The initial value of this field is 0. This field is ignored if *Version* is less than MQOD_VERSION_2.

*ResponseRecPtr (MQPTR)*

This is the address of the first MQRR response record. *ResponseRecPtr* is used only when a distribution list is being opened. The field is ignored if *RecsPresent* is zero.

Use either *ResponseRecPtr* or *ResponseRecOffset* to specify the response records, but not both; for details, see "ResponseRecOffset (MQLONG)" on page 468. If you do not use *ResponseRecPtr*, set it to the null pointer or null bytes.

This is an input field. The initial value of this field is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise. This field is ignored if *Version* is less than MQOD_VERSION_2.

**Note:** On platforms where the programming language does not support the pointer data type, this field is declared as a byte string of the appropriate length, with the initial value being the all-null byte string.

*SelectionString (MQCHARV)*
This is the string used to provide the selection criteria used when retrieving messages off a queue.

*SelectionString* must not be provided in the following cases:

- If *ObjectType* is not MQOT_Q
- If the queue being opened is not being opened using one of the MQOO_BROWSE, or MQOO_INPUT_* options

If *SelectionString* is provided in these cases, the call fails with reason code MQRC_SELECTOR_INVALID_FOR_TYPE.

If *SelectionString* is specified incorrectly, according to the description of how to use the "MQCHARV - Variable Length String" on page 288 structure, or if it exceeds the maximum length, the call fails with reason code MQRC_SELECTION_STRING_ERROR. The maximum length of *SelectionString* is MQ_SELECTOR_LENGTH.

*SelectionString* usage is described in Selectors.

*StrucId (MQCHAR4)*

This is the structure identifier; the value must be:

**MQOD_STRUC_ID**
Identifier for object descriptor structure.

For the C programming language, the constant MQOD_STRUC_ID_ARRAY is also defined; this has the same value as MQOD_STRUC_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQOD_STRUC_ID.

*UnknownDestCount (MQLONG)*

This is the number of queues in the distribution list that resolve to remote queues and that were opened successfully. If present, this field is also set when opening a single queue that is not in a distribution list.

This is an output field. The initial value of this field is 0. This field is ignored if *Version* is less than MQOD_VERSION_1.

*Version (MQLONG)*

This is the structure version number; the value must be one of the following:

**MQOD_VERSION_1**
Version-1 object descriptor structure.

**MQOD_VERSION_2**
Version-2 object descriptor structure.

**MQOD_VERSION_3**
Version-3 object descriptor structure.

**MQOD_VERSION_4**
Version-4 object descriptor structure.

All versions are supported in all IBM MQ V7.0 environments.

Fields that exist only in the more-recent versions of the structure are identified as such in the descriptions of the fields. The following constant specifies the version number of the current version:

**MQOD_CURRENT_VERSION**
Current version of object descriptor structure.

This is always an input field. The initial value of this field is MQOD_VERSION_1.

## *Initial values and language declarations for MQOD*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQOD_STRUC_ID | 'OD¬¬' |
| *Version* | MQOD_VERSION_1 | 1 |
| *ObjectType* | MQOT_Q | 1 |
| *ObjectName* | None | Null string or blanks |
| *ObjectQMgrName* | None | Null string or blanks |
| *DynamicQName* | None | 'CSQ.*' on z/OS ; 'AMQ.*' otherwise |
| *AlternateUserId* | None | Null string or blanks |
| *RecsPresent* | None | 0 |
| *KnownDestCount* | None | 0 |
| *UnknownDestCount* | None | 0 |
| *InvalidDestCount* | None | 0 |
| *ObjectRecOffset* | None | 0 |
| *ResponseRecOffset* | None | 0 |
| *ObjectRecPtr* | None | Null pointer or null bytes |
| *ResponseRecPtr* | None | Null pointer or null bytes |
| *AlternateSecurityId* | MQSID_NONE | Nulls |

| Field name | Name of constant | Value of constant |
|---|---|---|
| *ResolvedQName* | None | Null string or blanks |
| *ResolvedQMgrName* | None | Null string or blanks |
| *ObjectString* | MQCHARV_DEFAULT | As defined for MQCHARV |
| *SelectionString* | MQCHARV_DEFAULT | As defined for MQCHARV |
| *ResObjectString* | MQCHARV_DEFAULT | As defined for MQCHARV |
| *ResolvedType* | MQOT_NONE | 0 |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
3. In the C programming language, the macro variable MQOD_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQOD MyOD = {MQOD_DEFAULT};
```

*C declaration*

```
typedef struct tagMQOD MQOD;
struct tagMQOD {
  MQCHAR4    StrucId;             /* Structure identifier */
  MQLONG     Version;             /* Structure version number */
  MQLONG     ObjectType;          /* Object type */
  MQCHAR48   ObjectName;          /* Object name */
  MQCHAR48   ObjectQMgrName;      /* Object queue manager name */
  MQCHAR48   DynamicQName;        /* Dynamic queue name */
  MQCHAR12   AlternateUserId;     /* Alternate user identifier */
  /* Ver:1 */
  MQLONG     RecsPresent;         /* Number of object records present */
  MQLONG     KnownDestCount;      /* Number of local queues opened
                                     successfully */
  MQLONG     UnknownDestCount;    /* Number of remote queues opened
                                     successfully */
  MQLONG     InvalidDestCount;    /* Number of queues that failed to
                                     open */
  MQLONG     ObjectRecOffset;     /* Offset of first object record from
                                     start of MQOD */
  MQLONG     ResponseRecOffset;   /* Offset of first response record
                                     from start of MQOD */
  MQPTR      ObjectRecPtr;        /* Address of first object record */
  MQPTR      ResponseRecPtr;      /* Address of first response record */
  /* Ver:2 */
  MQBYTE40   AlternateSecurityId; /* Alternate security identifier */
  MQCHAR48   ResolvedQName;       /* Resolved queue name */
  MQCHAR48   ResolvedQMgrName;    /* Resolved queue manager name */
  /* Ver:3 */
  MQCHARV    ObjectString;        /* Object Long name */
  MQCHARV    SelectionString;     /* Message Selector */
  MQCHARV    ResObjectString;     /* Resolved Long object name*/
  MQLONG     ResolvedType         /* Alias queue resolved
                                     oject type */
  /* Ver:4 */
};
```

*COBOL declaration*

```

## MQOR - Object record

The following table summarizes the fields in the structure.

*Table 510. Fields in MQOR*

| Field | Description | Topic |
|---|---|---|
| *ObjectName* | Object name | ObjectName |
| *ObjectQMgrName* | Object queue manager name | ObjectQMgrName |

### *Overview for MQOR*

**Availability**: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

**Purpose**: Use the MQOR structure to specify the queue name and queue-manager name of a single destination queue. MQOR is an input structure for the MQOPEN and MQPUT1 calls.

**Character set and encoding**: Data in MQOR must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

**Usage**: By providing an array of these structures on the MQOPEN call, you can open a list of queues; this list is called a *distribution list*. Each message put using the queue handle returned by that MQOPEN call is placed on each of the queues in the list, provided that the queue was opened successfully.

## *Fields for MQOR*

The MQOR structure contains the following fields; the fields are described in **alphabetical order**:

*ObjectName (MQCHAR48)*

This is the same as the *ObjectName* field in the MQOD structure (see MQOD for details), except that:

- It must be the name of a queue.
- It must not be the name of a model queue.

This is always an input field. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*ObjectQMgrName (MQCHAR48)*

This is the same as the *ObjectQMgrName* field in the MQOD structure (see MQOD for details).

This is always an input field. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

## *Initial values and language declarations for MQOR*

*Table 511. Initial values of fields in MQOR for MQOR*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *ObjectName* | None | Null string or blanks |
| *ObjectQMgrName* | None | Null string or blanks |

**Notes:**

1. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
2. In the C programming language, the macro variable MQOR_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQOR MyOR = {MQOR_DEFAULT};
```

*C declaration*

```
typedef struct tagMQOR MQOR;
struct tagMQOR {
  MQCHAR48  ObjectName;      /* Object name */
  MQCHAR48  ObjectQMgrName;  /* Object queue manager name */
};
```

*COBOL declaration*

```
**   MQOR structure
  10 MQOR.
```

```
**    Object name
   15 MQOR-OBJECTNAME     PIC X(48).
**    Object queue manager name
   15 MQOR-OBJECTQMGRNAME PIC X(48).
```

*PL/I declaration*

```
dcl
 1 MQOR based,
  3 ObjectName     char(48), /* Object name */
  3 ObjectQMgrName char(48); /* Object queue manager name */
```

*Visual Basic declaration*

```
Type MQOR
  ObjectName     As String*48 'Object name'
  ObjectQMgrName As String*48 'Object queue manager name'
End Type
```

## MQPD - Property descriptor

The following table summarizes the fields in the structure.

*Table 512. Fields in MQPD*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *Options* | Options | Options |
| *Support* | Required support for message property | Support |
| *Context* | Message context to which property belongs | Context |
| *CopyOptions* | Copy options to which property belongs | CopyOptions |

### *Overview for MQPD*

**Availability**: AIX, HP-UX, IBM i, Solaris, Linux, Windows, z/OS and IBM MQ MQI clients.

**Purpose**: The **MQPD** is used to define the attributes of a property. The structure is an input/output parameter on the MQSETMP call and an output parameter on the MQINQMP call.

**Character set and encoding**: Data in **MQPD** must be in the character set of the application and encoding of the application ( **MQENC_NATIVE** ).

### *Fields for MQPD*

The MQPD structure contains the following fields; the fields are described in **alphabetical order**:

*Context (MQLONG)*

This describes what message context the property belongs to.

When a queue manager receives a message containing an IBM MQ-defined property that the queue manager recognizes as being incorrect, the queue manager corrects the value of the *Context* field.

The following option can be specified:

**MQPD_USER_CONTEXT**
The property is associated with the user context.

No special authorization is required to be able to set a property associated with the user context using the MQSETMP call.

On a IBM WebSphere® MQ 7.0 queue manager, a property associated with the user context is saved as described for MQOO_SAVE_ALL_CONTEXT. An MQPUT call with MQPMO_PASS_ALL_CONTEXT specified, causes the property to be copied from the saved context into the new message.

If the option previously described is not required, the following option can be used:

**MQPD_NO_CONTEXT**
The property is not associated with a message context.

An unrecognized value is rejected with a *Reason* code of MQRC_PD_ERROR

This is an input/output field to the MQSETMP call and an output field from the MQINQMP call. The initial value of this field is MQPD_NO_CONTEXT.

*CopyOptions (MQLONG)*

This describes which type of messages the property should be copied into. This is an output only field for recognized IBM MQ defined properties; IBM MQ sets the appropriate value.

When a queue manager receives a message containing an IBM MQ defined property that the queue manager recognizes as being incorrect, the queue manager corrects the value of the *CopyOptions* field.

You can specify one or more of these options. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

**MQCOPY_FORWARD**
This property is copied into a message being forwarded.

**MQCOPY_PUBLISH**
This property is copied into the message received by a subscriber when a message is being published.

**MQCOPY_REPLY**
This property is copied into a reply message.

**MQCOPY_REPORT**
This property is copied into a report message.

**MQCOPY_ALL**
This property is copied into all types of subsequent messages.

**Default option:** The following option can be specified to supply the default set of copy options:

**MQCOPY_DEFAULT**
This property is copied into a message being forwarded, into a report message, or into a message received by a subscriber when a message is being published.

This is equivalent to specifying the combination of options MQCOPY_FORWARD, plus MQCOPY_REPORT, plus MQCOPY_PUBLISH.

If none of the options that are described previously is required, use the following option:

**MQCOPY_NONE**
Use this value to indicate that no other copy options are specified; programmatically no relationship exists between this property and subsequent messages. This is always returned for message descriptor properties.

This is an input/output field to the MQSETMP call and an output field from the MQINQMP call. The initial value of this field is MQCOPY_DEFAULT.

*Options (MQLONG)*

The value must be:

**MQPD_NONE**
No options specified

This is always an input field. The initial value of this field is MQPD_NONE.

*StrucId (MQCHAR4)*

This is the structure identifier; the value must be:

**MQPD_STRUC_ID**
Identifier for property descriptor structure.

For the C programming language, the constant **MQPD_STRUC_ID_ARRAY** is also defined; this has the same value as **MQPD_STRUC_ID**, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is **MQPD_STRUC_ID**.

*Support (MQLONG)*

This field describes what level of support for the message property is required of the queue manager, in order for the message containing this property to be put to a queue. This applies only to IBM MQ-defined properties; support for all other properties is optional.

The field is automatically set to the correct value when the IBM MQ-defined property is known by the queue manager. If the property is not recognized, MQPD_SUPPORT_OPTIONAL is assigned. When a queue manager receives a message containing an IBM MQ-defined property that the queue manager recognizes as being incorrect, the queue manager corrects the value of the *Support* field.

When setting an IBM MQ-defined property using the MQSETMP call on a message handle where the MQCMHO_NO_VALIDATION option was set, *Support* becomes an input field. This allows an application to put an IBM MQ-defined property, with the correct value, where the property is unsupported by the connected queue manager, but where the message is intended to be processed on another queue manager.

The value MQPD_SUPPORT_OPTIONAL is always assigned to properties that are not IBM MQ-defined properties.

If a IBM WebSphere MQ 7.0 queue manager, that supports message properties, receives a property that contains an unrecognized *Support* value, the property is treated as if:

- MQPD_SUPPORT_REQUIRED was specified if any of the unrecognized values are contained in the MQPD_REJECT_UNSUP_MASK.
- MQPD_SUPPORT_REQUIRED_IF_LOCAL was specified if any of the unrecognized values are contained in the MQPD_ACCEPT_UNSUP_IF_XMIT_MASK
- MQPD_SUPPORT_OPTIONAL was specified otherwise.

One of the following values is returned by the MQINQMP call, or one of the values can be specified, when using the MQSETMP call on a message handle where the MQCMHO_NO_VALIDATION option is set:

**MQPD_SUPPORT_OPTIONAL**
The property is accepted by a queue manager even if it is not supported. The property can be discarded in order for the message to flow to a queue manager that does not support message properties. This value is also assigned to properties that are not IBM MQ-defined.

**MQPD_SUPPORT_REQUIRED**
Support for the property is required. The message is rejected by a queue manager that does not support the IBM MQ-defined property. The MQPUT or MQPUT1 call fails with completion code MQCC_FAILED and reason code MQRC_UNSUPPORTED_PROPERTY.

**MQPD_SUPPORT_REQUIRED_IF_LOCAL**
The message is rejected by a queue manager that does not support the IBM MQ-defined property if the message is destined for a local queue. The MQPUT or MQPUT1 call fails with completion code MQCC_FAILED and reason code MQRC_UNSUPPORTED_PROPERTY.

The MQPUT or MQPUT1 call succeeds if the message is destined for a remote queue manager.

This is an output field on the MQINQMP call and an input field on the MQSETMP call if the message handle was created with the MQCMHO_NO_VALIDATION option set. The initial value of this field is MQPD_SUPPORT_OPTIONAL.

*Version (MQLONG)*

This is the structure version number; the value must be:

**MQPD_VERSION_1**
Version-1 property descriptor structure.

The following constant specifies the version number of the current version:

**MQPD_CURRENT_VERSION**
Current version of property descriptor structure.

This is always an input field. The initial value of this field is **MQPD_VERSION_1**.

## *Initial values and language declarations for MQPD*

*Table 513. Initial values of fields in MQPD*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQPD_STRUC_ID | 'PD' |
| *Version* | MQPD_VERSION_1 | 1 |
| *Options* | MQPD_NONE | 0 |
| *Support* | MQPD_SUPPORT_OPTIONAL | 0 |
| *Context* | MQPD_NO_CONTEXT | 0 |
| *CopyOptions* | MQCOPY_DEFAULT | 0 |

**Notes:**

1. In the C programming language, the macro variable MQPD_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQPD MyPD = {MQPD_DEFAULT};
```

*C declaration*

```
typedef struct tagMQPD MQPD;
struct tagMQPD {
  MQCHAR4  StrucId;     /* Structure identifier */
  MQLONG   Version;     /* Structure version number */

## MQPMO - Put-message options

The following table summarizes the fields in the structure.

| *Table 514. MQPMO structure* | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *Options* | Options that control the action of MQPUT and MQPUT1 | Options |
| *Timeout* | Reserved | Timeout |
| *Context* | Object handle of input queue | Context |
| *KnownDestCount* | Number of messages sent successfully to local queues | KnownDestCount |
| *UnknownDestCount* | Number of messages sent successfully to remote queues | UnknownDestCount |
| *InvalidDestCount* | Number of messages that could not be sent | InvalidDestCount |
| *ResolvedQName* | Resolved name of destination queue | ResolvedQName |
| *ResolvedQMgrName* | Resolved name of destination queue manager | ResolvedQMgrName |
| **Note:** The remaining fields are ignored if *Version* is less than MQPMO_VERSION_2. | | |
| *RecsPresent* | Number of put message records or response records present | RecsPresent |

| Table 514. MQPMO structure (continued) | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *PutMsgRecFields* | Flags indicating which MQPMR fields are present | PutMsgRecFields |
| *PutMsgRecOffset* | Offset of first put-message record from start of MQPMO | PutMsgRecOffset |
| *ResponseRecOffset* | Offset of first response record from start of MQPMO | ResponseRecOffset |
| *PutMsgRecPtr* | Address of first put message record | PutMsgRecPtr |
| *ResponseRecPtr* | Address of first response record | ResponseRecPtr |
| **Note:** The remaining fields are ignored if *Version* is less than MQPMO_VERSION_3. | | |
| *OriginalMsgHandle* | Original message handle | OriginalMsgHandle |
| *NewMsgHandle* | New message handle | NewMsgHandle |
| *Action* | Type of put being performed and the relationship between the original message specified by the *OriginalMsgHandle* field and the new message specified by the *NewMsgHandle* field | Action |
| *PubLevel* | Level of subscription targeted by the publication | PubLevel |

## *Overview for MQPMO*

**Availability**: All IBM MQ systems, plus IBM MQ clients connected to these systems.

**Purpose**: The MQPMO structure allows the application to specify options that control how messages are placed on queues, or published to topics. The structure is an input/output parameter on the MQPUT and MQPUT1 calls.

**Version**: The current version of MQPMO is MQPMO_VERSION_3. Certain fields are available only in certain versions of MQPMO. If you need to port applications between several environments, you must ensure that the version of MQPMO is consistent across all environments. Fields that exist only in particular versions of the structure are identified as such in "MQPMO - Put-message options" on page 480 and in the field descriptions.

The header, COPY, and INCLUDE files provided for the supported programming languages contain the most-recent version of MQPMO that is supported by the environment, but with the initial value of the *Version* field set to MQPMO_VERSION_1. To use fields that are not present in the version-1 structure, the application must set the *Version* field to the version number of the version required.

**Character set and encoding**: Data in MQPMO must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

## *Fields for MQPMO*

The MQPMO structure contains the following fields; the fields are described in **alphabetical order**:

*Action (MQLONG)*
This specifies the type of put being performed and the relationship between the original message specified by the OriginalMsgHandle field and the new message specified by the NewMsgHandle field.

The properties of the message are chosen by the queue manager according to the value of the Action specified.

You can choose to supply the contents of the message descriptor using the MsgDesc parameter on the MQPUT or MQPUT1 calls. Alternatively it is possible not to supply the MsgDesc parameter, or to specify that it is output-only by including MQPMO_MD_FOR_OUTPUT_ONLY in the Options field of the MQPMO structure.

If the MsgDesc parameter is not supplied, or if it is specified to be output-only, then the message descriptor for the new message is populated from the message handle fields of the MQPMO, according to the rules described in this topic.

The context setting and passing activities described in Controlling context information take effect after the message descriptor has been composed.

If an incorrect action value is specified, the call fails with the reason code MQRC_ACTION_ERROR.

Any one of the following actions can be specified:

**MQACTP_NEW**
A new message is being put, and no relationship to a previous message is being specified by the program. The message descriptor is composed as follows:

- If a MsgDesc is supplied on the MQPUT or MQPUT1 call, and MQPMO_MD_FOR_OUTPUT_ONLY is not in the MQPMO.Options, this is used as the message descriptor unmodified.
- If a MsgDesc is not supplied, or MQPMO_MD_FOR_OUTPUT_ONLY is in the MQPMO.Options then the queue manager generates the message descriptor using a combination of properties from OriginalMsgHandle and NewMsgHandle. Any message descriptor fields explicitly set on the new message handle take precedence over those in the original message handle.

Message data is taken from the MQPUT or MQPUT1 Buffer parameter.

**MQACTP_FORWARD**
A previously retrieved message is being forwarded. The original message handle specifies the message that was previously retrieved.

The new message handle specifies any modifications to the properties (including any in the message descriptor) in the original message handle.

The message descriptor is composed as follows:

- If a MsgDesc is supplied on the MQPUT or MQPUT1 call, and MQPMO_MD_FOR_OUTPUT_ONLY is not in the MQPMO.Options, this is used as the message descriptor unmodified.
- If a MsgDesc is not supplied, or MQPMO_MD_FOR_OUTPUT_ONLY is in the MQPMO.Options then the queue manager generates the message descriptor using a combination of properties from OriginalMsgHandle and NewMsgHandle. Any message descriptor fields explicitly set on the new message handle take precedence over those in the original message handle.
- If MQPMO_NEW_MSG_ID or MQPMO_NEW_CORREL_ID are specified in the MQPMO.Options, then these are honoured.

The message properties are composed as follows:

- All properties from the original message handle which have MQCOPY_FORWARD in the MQPD.CopyOptions
- All properties from the new message handle. For each property in the new message handle that has the same name as a property in the original message handle, the value is taken from the new message handle. The only exception to this rule is the special case when the property in the new message handle has the same name as a property in the original message handle, but the value of the property is null. In this case the property is removed from the message.

The message data to be forwarded is taken from the MQPUT or MQPUT1 Buffer parameter.

**MQACTP_REPLY**

A reply is being made to a previously retrieved message. The original message handle specifies the message that was previously retrieved.

The new message handle specifies any modifications to the properties (including any in the message descriptor) in the original message handle.

The message descriptor is composed as follows:

- If a MsgDesc is supplied on the MQPUT or MQPUT1 call, and MQPMO_MD_FOR_OUTPUT_ONLY is not in the MQPMO.Options, this is used as the message descriptor unmodified.
- If a MsgDesc is not supplied, or MQPMO_MD_FOR_OUTPUT_ONLY is in the MQPMO.Options then initial message descriptor fields are chosen as follows:

*Table 515. Reply message handle transformation*

| **Field in MQMD** | **Value used** |
|---|---|
| Report | If MQRO_PASS_DISCARD_AND_EXPIRY and MQRO_DISCARD_MSG are set: MQRO_DISCARD_MSG otherwise MQRO_NONE |
| MsgType | MQMT_REPLY |
| Expiry | If MQRO_PASS_DISCARD_AND_EXPIRY is set: Copied from the input message otherwise MQEI_UNLIMITED |
| Feedback | MQFB_NONE |
| MsgId | If MQPMO_NEW_MSG_ID is set: A new message identifier is generated else if MQRO_PASS_MSG_ID is set: Copied from the input message otherwise MQMI_NONE |
| CorrelId | If MQPMO_NEW_CORREL_ID is set: A new correlation identifier is generated else if MQRO_COPY_MSG_ID_TO_CORREL_ID is set: Copied from the MsgId field of the input message else if MQRO_PASS_CORREL_ID is set: Copied from the CorrelId field of the input message otherwise MQCI_NONE |
| BackoutCount | 0 |
| ReplyToQ | Blanks |
| ReplyToQMgr | Blanks |
| GroupId | MQGI_NONE |

| *Table 515. Reply message handle transformation (continued)* | |
|---|---|
| **Field in MQMD** | **Value used** |
| MsgSeqNumber | 1 |
| Offset | 0 |
| MsgFlags | MQMF_NONE |
| OriginalLength | MQOL_UNDEFINED |

- The message descriptor is then modified by the new message handle - any message descriptor fields explicitly set as properties in the new message handle take precedence over the message descriptor fields as described previously.

The message properties are composed as follows:

- All properties from the original message handle which have MQCOPY_REPLY in the MQPD.CopyOptions
- All properties from the new message handle. For each property in the new message handle that has the same name as a property in the original message handle, the value is taken from the new message handle. The only exception to this rule is the special case when the property in the new message handle has the same name as a property in the original message handle, but the value of the property is null. In this case the property is removed from the message.

The message data to be forwarded is taken from the MQPUT/MQPUT1 Buffer parameter.

**MQACTP_REPORT**

A report is being generated as a result of a previously retrieved message. The original message handle specifies the message causing the report to be generated.

The new message handle specifies any modifications to the properties (including any in the message descriptor) in the original message handle.

The message descriptor is composed as follows:

- If a MsgDesc is supplied on the MQPUT or MQPUT1 call, and MQPMO_MD_FOR_OUTPUT_ONLY is not in the MQPMO.Options, this is used as the message descriptor unmodified.
- If a MsgDesc is not supplied, or MQPMO_MD_FOR_OUTPUT_ONLY is in the MQPMO.Options then initial message descriptor fields are chosen as follows:

| *Table 516. Report message handle transformation* | |
|---|---|
| **Field in MQMD** | **Value used** |
| Report | If MQRO_PASS_DISCARD_AND_EXPIRY and MQRO_DISCARD_MSG are set:<br>MQRO_DISCARD_MSG<br>otherwise<br>MQRO_NONE |
| MsgType | MQMT_REPORT |
| Expiry | If MQRO_PASS_DISCARD_AND_EXPIRY is set:<br>Copied from the input message<br>otherwise<br>MQEI_UNLIMITED |

| *Table 516. Report message handle transformation (continued)* | |
|---|---|
| **Field in MQMD** | **Value used** |
| MsgId | If MQPMO_NEW_MSG_ID is set:<br>A new message identifier is generated<br>else if MQRO_PASS_MSG_ID is set:<br>Copied from the input message<br>otherwise<br>MQMI_NONE |
| CorrelId | If MQPMO_NEW_CORREL_ID is set:<br>A new correlation identifier is generated<br>else if MQRO_COPY_MSG_ID_TO_CORREL_ID is set:<br>Copied from the MsgId field of the<br>input message<br>else if MQRO_PASS_CORREL_ID is set:<br>Copied from the CorrelId field of the<br>input message<br>otherwise<br>MQCI_NONE |
| BackoutCount | 0 |
| ReplyToQ | Blanks |
| ReplyToQMgr | Blanks |
| OriginalLength | Set to the *BufferLength* |

- The message descriptor is then modified by the new message handle - any message descriptor fields explicitly set as properties in the new message handle take precedence over the message descriptor fields as described previously.

The message properties are composed as follows:

- All properties from the original message handle which have MQCOPY_REPORT in the MQPD.CopyOptions
- All properties from the new message handle. For each property in the new message handle that has the same name as a property in the original message handle, the value is taken from the new message handle. The only exception to this rule is the special case when the property in the new message handle has the same name as a property in the original message handle, but the value of the property is null. In this case the property is removed from the message.

The Feedback field in the resultant MQMD represents the report that is to be generated. A Feedback value of MQFB_NONE causes the MQPUT or MQPUT1 call to fail with reason code MQRC_FEEDBACK_ERROR.

To choose the user data of the report message, IBM MQ consults the Report and Feedback fields in the resultant MQMD, and the Buffer and BufferLength parameters of the MQPUT or MQPUT1 call.

- If Feedback is MQFB_COA, MQFB_COD or MQFB_EXPIRATION then the value of Report is inspected.
- If any of the following cases is true, the full message data from Buffer for a length of BufferLength is used.
  - Feedback is MQFB_EXPIRATION and Report contains MQRO_EXPIRATION_WITH_FULL_DATA
  - Feedback is MQFB_COD and Report contains MQRO_COD_WITH_FULL_DATA
  - Feedback is MQFB_COA and Report contains MQRO_COA_WITH_FULL_DATA
- If any of the following cases is true, the first 100 bytes of the message (or BufferLength if this is less than 100) from Buffer are used

  - Feedback is MQFB_EXPIRATION and Report contains MQRO_EXPIRATION_WITH_DATA
  - Feedback is MQFB_COD and Report contains MQRO_COD_WITH_DATA
  - Feedback is MQFB_COA and Report contains MQRO_COA_WITH_DATA
- If Feedback is MQFB_EXPIRATION, MQFB_COD or MQFB_COA, and Report does not contain the *_WITH_FULL_DATA or *_WITH_DATA options relevant to that Feeback value, then no user data is included with the message.
- If Feedback takes a different value from those listed above, then Buffer and BufferLength are used as normal.

The derivation of the user data is shown in the following table:

*Context (MQHOBJ)*

If MQPMO_PASS_IDENTITY_CONTEXT or MQPMO_PASS_ALL_CONTEXT is specified, this field must contain the input queue handle from which context information to be associated with the message being put is taken.

If neither MQPMO_PASS_IDENTITY_CONTEXT nor MQPMO_PASS_ALL_CONTEXT is specified, this field is ignored.

This is an input field. The initial value of this field is `0`.

*InvalidDestCount (MQLONG)*

This is the number of messages that could not be sent to queues in the distribution list. The count includes queues that failed to open, as well as queues that were opened successfully but for which the put operation failed. This field is also set when putting a message to a single queue that is not in a distribution list.

**Note:** This field is set if the *CompCode* parameter on the MQPUT or MQPUT1 call is MQCC_OK or MQCC_WARNING; it might be set if the *CompCode* parameter is MQCC_FAILED, but do not rely on this in application code.

This is an output field. The initial value of this field is 0. This field is not set if *Version* is less than MQPMO_VERSION_1.

This field is undefined on z/OS because distribution lists are not supported.

*KnownDestCount (MQLONG)*

This is the number of messages that the current MQPUT or MQPUT1 call has sent successfully to queues in the distribution list that are local queues. The count does not include messages sent to queues that resolve to remote queues (even though a local transmission queue is used initially to store the message). This field is also set when putting a message to a single queue that is not in a distribution list.

This is an output field. The initial value of this field is 0. This field is not set if *Version* is less than MQPMO_VERSION_1.

This field is undefined on z/OS because distribution lists are not supported.

*NewMsgHandle (MQHMSG)*

This is an optional handle to the message being put subject to the value of the Action field. It defines the properties of the message and overrides the values of the *OriginalMsgHandle*, if specified.

On return from the **MQPUT** or **MQPUT1** call, the contents of the handle reflect the message that was actually put.

This is an input field. The initial value of this field is **MQHM_NONE**. This field is ignored if Version is less than **MQPMO_VERSION_3**.

*MQPMO options (MQLONG)*
The Options field controls the operation of **MQPUT** and **MQPUT1** calls.

**Scope option**. You can specify any or none of the MQPMO options. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations). Combinations that are not valid are noted; any other combinations are valid.

The following option controls the scope of the publications sent:

**MQPMO_SCOPE_QMGR**

The publication is sent only to subscribers that have subscribed on this queue manager. The publication is not forwarded to any remote publish/subscribe queue managers that have made a subscription to this queue manager, which overrides any behavior that has been set using the PUBSCOPE topic attribute.

**Note:** If not set, the publication scope is determined by the PUBSCOPE topic attribute.

**Publishing options**. The following options control the way messages are published to a topic:

**MQPMO_SUPPRESS_REPLYTO**

Any information specified in the *ReplyToQ* and *ReplyToQMgr* fields of the MQMD of this publication is not passed on to subscribers. If this option is used with a report option that requires a *ReplyToQ*, the call fails with MQRC_MISSING_REPLY_TO_Q.

**MQPMO_RETAIN**

The publication being sent is to be retained by the queue manager. This retention allows a subscriber to request a copy of this publication after the time it was published, by using the MQSUBRQ call. It also allows a publication to be sent to applications which make their subscription after the time this publication was made (unless they choose not to be sent it by using the option MQSO_NEW_PUBLICATIONS_ONLY). If an application is sent a publication which was retained, it is indicated by the MQIsRetained message property of that publication.

Only one publication can be retained at each node of the topic tree. Therefore, if there already is a retained publication for this topic, published by any other application, it is replaced with this publication. It is therefore better to avoid having more than one publisher retaining messages on the same topic.

When retained publications are requested by a subscriber, the subscription used might contain a wildcard in the topic, in which case a number of retained publications might match (at various nodes in the topic tree) and several publications might be sent to the requesting application. See the description of the "MQSUBRQ - Subscription request" on page 773 call for more details.

For information about how retained publications interact with subscription levels, see Intercepting publications.

If this option is used and the publication cannot be retained, the message is not published and the call fails with MQRC_PUT_NOT_RETAINED.

**MQPMO_NOT_OWN_SUBS**
Tells the queue manager that the application does not want to send any of its publications to subscriptions it owns. Subscriptions are considered to be owned by the same application if the connection handles are the same.

**MQPMO_WARN_IF_NO_SUBS_MATCHED**
If no subscription matches the publication, return a completion code (*CompCode*) of MQCC_WARNING and reason code MQRC_NO_SUBS_MATCHED.

If MQRC_NO_SUBS_MATCHED is returned by the put operation, the publication was not delivered to any subscriptions. However, if the MQPMO_RETAIN option is specified on the put operation, the message is retained and delivered to any subsequently defined matching subscription.

A subscription on the topic matches the publication if any of the following conditions are met:

- The message is delivered to the subscription queue
- The message would have been delivered to the subscription queue but a problem with the queue means that the message cannot be put to the queue, and it was consequently placed on the dead letter queue or discarded.
- A routing exit is defined that suppresses delivery of the message to the subscription

A subscription on the topic does not match the publication if any of the following conditions are met:

- The subscription has a selection string that does not match the publication
- The subscription specified the MQSO_PUBLICATION_ON_REQUEST option
- The publication is not delivered because the MQPMO_NOT_OWN_SUBS option was specified on the put operation and the subscription matches the identity of the publisher

**Syncpoint options**. The following options relate to the participation of the MQPUT or MQPUT1 call within a unit of work:

**MQPMO_SYNCPOINT**
The request is to operate within the normal unit-of-work protocols. The message is not visible outside the unit of work until the unit of work is committed. If the unit of work is backed out, the message is deleted.

If MQPMO_SYNCPOINT and MQPMO_NO_SYNCPOINT are not specified, the inclusion of the put request in unit-of-work protocols is determined by the environment running the queue manager and not the environment running the application. On z/OS, the put request is within a unit of work. In all other environments, the put request is not within a unit of work.

Because of these differences, an application that you want to port must not allow this option to default; specify either MQPMO_SYNCPOINT or MQPMO_NO_SYNCPOINT explicitly.

Do not specify MQPMO_SYNCPOINT with MQPMO_NO_SYNCPOINT.

**MQPMO_NO_SYNCPOINT**
The request is to operate outside the normal unit-of-work protocols. The message is available immediately, and it cannot be deleted by backing out a unit of work.

If MQPMO_NO_SYNCPOINT and MQPMO_SYNCPOINT are not specified, the inclusion of the put request in unit-of-work protocols is determined by the environment running the queue manager and not the environment running the application. On z/OS, the put request is within a unit of work. In all other environments, the put request is not within a unit of work.

Because of these differences, an application that you want to port must not allow this option to default; specify either MQPMO_SYNCPOINT or MQPMO_NO_SYNCPOINT explicitly.

Do not specify MQPMO_NO_SYNCPOINT with MQPMO_SYNCPOINT.

**Message-identifier and correlation-identifier options**. The following options request the queue manager to generate a new message identifier or correlation identifier:

**MQPMO_NEW_MSG_ID**
The queue manager replaces the contents of the *MsgId* field in MQMD with a new message identifier. This message identifier is sent with the message, and returned to the application on output from the MQPUT or MQPUT1 call.

The MQPMO_NEW_MSG_ID option can also be specified when the message is being put to a distribution list; see the description of the *MsgId* field in the MQPMR structure for details.

Using this option relieves the application of the need to reset the *MsgId* field to MQMI_NONE before each MQPUT or MQPUT1 call.

**MQPMO_NEW_CORREL_ID**
The queue manager replaces the contents of the *CorrelId* field in MQMD with a new correlation identifier. This correlation identifier is sent with the message, and returned to the application on output from the MQPUT or MQPUT1 call.

The MQPMO_NEW_CORREL_ID option can also be specified when the message is being put to a distribution list; see the description of the *CorrelId* field in the MQPMR structure for details.

MQPMO_NEW_CORREL_ID is useful in situations where the application requires a unique correlation identifier.

**Group and segment options**. The following options relate to the processing of messages in groups and segments of logical messages. Read the definitions that follow to help you to understand the option.

**Attention:** You cannot use segmented or grouped messages with Publish/ Subscribe.

**Physical message**

The is the smallest unit of information that can be placed on or removed from a queue; it often corresponds to the information specified or retrieved on a single MQPUT, MQPUT1, or MQGET call. Every physical message has its own message descriptor (MQMD). Generally, physical messages are distinguished by differing values for the message identifier (*MsgId* field in MQMD), although this is not enforced by the queue manager.

**Logical message**

A logical message is a single unit of application information for non- z/OS platforms only. In the absence of system constraints, a logical message is the same as a physical message. But where logical messages are extremely large, system constraints might make it advisable or necessary to split a logical message into two or more physical messages, called *segments*.

A logical message that has been segmented consists of two or more physical messages that have the same non-null group identifier (*GroupId* field in MQMD), and the same message sequence number (*MsgSeqNumber* field in MQMD). The segments are distinguished by differing values for the segment offset (*Offset* field in MQMD), which gives the offset of the data in the physical message from the start of the data in the logical message. Because each segment is a physical message, the segments in a logical message usually have differing message identifiers.

A logical message that has not been segmented, but for which segmentation has been permitted by the sending application, also has a non-null group identifier, although in this case there is only one physical message with that group identifier if the logical message does not belong to a message group. Logical messages for which segmentation has been inhibited by the sending application have a null group identifier (MQGI_NONE), unless the logical message belongs to a message group.

**Message group**

A message group is a set of one or more logical messages that have the same non-null group identifier. The logical messages in the group are distinguished by differing values for the message sequence number, which is an integer in the range 1 through *n*, where *n* is the number of logical messages in the group. If one or more of the logical messages is segmented, there are more than *n* physical messages in the group.

**MQPMO_LOGICAL_ORDER**

This option tells the queue manager how the application puts messages in groups and segments of logical messages. It can be specified only on the MQPUT call; it is not valid on the MQPUT1 call.

If MQPMO_LOGICAL_ORDER is specified, it indicates that the application uses successive MQPUT calls to:

1. Put the segments in each logical message in the order of increasing segment offset, starting from 0, with no gaps.
2. Put all the segments in one logical message before putting the segments in the next logical message.
3. Put the logical messages in each message group in the order of increasing message sequence number, starting from 1, with no gaps. IBM MQ increments the message sequence number automatically.
4. Put all the logical messages in one message group before putting logical messages in the next message group.

For detailed information about MQPMO_LOGICAL_ORDER, see Logical and physical ordering

**Context options**. The following options control the processing of message context:

**MQPMO_NO_CONTEXT**
Both identity and origin context are set to indicate no context. This means that the context fields in MQMD are set to:

- Blanks for character fields
- Nulls for byte fields
- Zeros for numeric fields

**MQPMO_DEFAULT_CONTEXT**
The message is to have default context information associated with it, for both identity and origin. The queue manager sets the context fields in the message descriptor as follows:

| Field in MQMD | Value used |
|---|---|
| *UserIdentifier* | Determined from the environment if possible; set to blanks otherwise. |
| *AccountingToken* | Determined from the environment if possible; set to MQACT_NONE otherwise. |
| *ApplIdentityData* | Set to blanks. |
| *PutApplType* | Determined from the environment. |
| *PutApplName* | Determined from the environment if possible; set to blanks otherwise. |
| *PutDate* | Set to the date when message is put. |
| *PutTime* | Set to the time when message is put. |
| *ApplOriginData* | Set to blanks. |

For more information about message context, see Message context.

These are the default values and actions if no context options are specified.

**MQPMO_PASS_IDENTITY_CONTEXT**
The message is to have context information associated with it. Identity context is taken from the queue handle specified in the *Context* field. Origin context information is generated by the queue manager in the same way that it is for MQPMO_DEFAULT_CONTEXT (see the preceding table for values). For more information about message context, see Message context.

For the MQPUT call, the queue must have been opened with the MQOO_PASS_IDENTITY_CONTEXT option (or an option that implies it). For the MQPUT1 call, the same authorization check is carried out as for the MQOPEN call with the MQOO_PASS_IDENTITY_CONTEXT option.

**MQPMO_PASS_ALL_CONTEXT**
The message is to have context information associated with it. Context is taken from the queue handle specified in the *Context* field. For more information about message context, see Controlling context information.

For the MQPUT call, the queue must have been opened with the MQOO_PASS_ALL_CONTEXT option (or an option that implies it). For the MQPUT1 call, the same authorization check is carried out as for the MQOPEN call with the MQOO_PASS_ALL_CONTEXT option.

**MQPMO_SET_IDENTITY_CONTEXT**
The message is to have context information associated with it. The application specifies the identity context in the MQMD structure. Origin context information is generated by the queue manager in the same way that it is for MQPMO_DEFAULT_CONTEXT (see the preceding table for values). For more information about message context, see Message context.

For the MQPUT call, the queue must have been opened with the MQOO_SET_IDENTITY_CONTEXT option (or an option that implies it). For the MQPUT1 call, the same authorization check is carried out as for the MQOPEN call with the MQOO_SET_IDENTITY_CONTEXT option.

**MQPMO_SET_ALL_CONTEXT**
The message is to have context information associated with it. The application specifies the identity, origin, and user context in the MQMD structure. For more information about message context, see Message context.

For the MQPUT call, the queue must have been opened with the MQOO_SET_ALL_CONTEXT option. For the MQPUT1 call, the same authorization check is carried out as for the MQOPEN call with the MQOO_SET_ALL_CONTEXT option.

You can specify only one of the MQPMO_*_CONTEXT context options. If you specify none, MQPMO_DEFAULT_CONTEXT is assumed.

**Property options**. The following option relates to the properties of the message:

**MQPMO_MD_FOR_OUTPUT_ONLY**
The message descriptor parameter must only be used for output to return the message descriptor of the message that was put. The message descriptor fields associated with the *NewMsgHandle*, *OriginalMsgHandle*, or both fields, of the **MQPMO** structure must be used for input.

If a valid message handle is not provided then the call fails with reason code **MQRC_MD_ERROR**.

**Put response options**. The following options control the response returned to an MQPUT or MQPUT1 call. You can specify only one of these options. If MQPMO_ASYNC_RESPONSE and MQPMO_SYNC_RESPONSE are not specified, MQPMO_RESPONSE_AS_Q_DEF or MQPMO_RESPONSE_AS_TOPIC_DEF is assumed.

**MQPMO_ASYNC_RESPONSE**
The MQPMO_ASYNC_RESPONSE option requests that an MQPUT or MQPUT1 operation is completed without the application waiting for the queue manager to complete the call. Using this option can improve messaging performance, particularly for applications using client bindings. An application can periodically check, using the MQSTAT verb, whether an error has occurred during any previous asynchronous calls.

With this option, only the following fields are guaranteed to be completed in the MQMD;

- ApplIdentityData
- PutApplType
- PutApplName
- ApplOriginData

Additionally, if either or both of MQPMO_NEW_MSG_ID or MQPMO_NEW_CORREL_ID are specified as options, the MsgId and CorrelId returned are also completed. (MQPMO_NEW_MSG_ID can be implicitly specified by specifying a blank MsgId field).

Only the preceding specified fields are completed. Other information that would normally be returned in the MQMD or MQPMO structure is undefined.

When requesting asynchronous put response for MQPUT1, the ResolvedQName and ResolvedQMgrName returned in the MQOD structure are undefined.

When requesting asynchronous put response for MQPUT or MQPUT1, a CompCode and Reason of MQCC_OK and MQRC_NONE does not necessarily mean that the message was successfully put to a queue. When developing an MQI application that uses asynchronous put response and requires confirmation that messages have been put to a queue you must check both CompCode and Reason codes from the put operations and also use MQSTAT to query asynchronous error information.

Although the success or failure of each individual MQPUT or MQPUT1 call mightnot be returned immediately, the first error that occurred under an asynchronous call can be determined later through a call to MQSTAT.

If a persistent message under syncpoint fails to be delivered using asynchronous put response, and you attempt to commit the transaction, the commit fails and the transaction is backed out with a

completion code of MQCC_FAILED and a reason of MQRC_BACKED_OUT. The application can make a call to MQSTAT to determine the cause of a previous MQPUT or MQPUT1 failure.

**MQPMO_SYNC_RESPONSE**
Specifying this put response type ensures that the MQPUT or MQPUT1 operation is always issued synchronously. If the put operation is successful, all fields in the MQMD and MQPMO are completed.

This option ensures a synchronous response irrespective of the default put response value defined on the queue or topic object.

**MQPMO_RESPONSE_AS_Q_DEF**
If this value is specified for an MQPUT call, the put response type used is taken from the DEFPRESP value specified on the queue when it was first opened by the application. If a client application is connected to a queue manager at a level earlier than Version 7.0, it behaves as if MQPMO_SYNC_RESPONSE was specified.

If this option is specified for an MQPUT1 call, the value of the DEFPRESP attribute is not known before the request is sent to the server. By default, if the MQPUT1 call is using MQPMO_SYNCPOINT it behaves as for MQPMO_ASYNC_RESPONSE, and if it is using MQPMO_NO_SYNCPOINT it behaves as for MQPMO_SYNC_RESPONSE. However, you can override this default behavior by setting the Put1DefaultAlwaysSync property in the client configuration file, see CHANNELS stanza of the client configuration file.

**MQPMO_RESPONSE_AS_TOPIC_DEF**
MQPMO_RESPONSE_AS_TOPIC_DEF is a synonym for MQPMO_RESPONSE_AS_Q_DEF for use with topic objects.

**Other options**. The following options control authorization checking, what happens when the queue manager is quiescing, and resolving queue and queue manager names:

**MQPMO_ALTERNATE_USER_AUTHORITY**
MQPMO_ALTERNATE_USER_AUTHORITY indicates that the *AlternateUserId* field in the *ObjDesc* parameter of the MQPUT1 call contains a user identifier that is to be used to validate authority to put messages on the queue. The call can succeed only if *AlternateUserId* is authorized to open the queue with the specified options, regardless of whether the user identifier under which the application is running is authorized to do so. (This does not apply to the context options specified, however, which are always checked against the user identifier under which the application is running.)

This option is valid only with the MQPUT1 call.

**MQPMO_FAIL_IF_QUIESCING**
This option forces the MQPUT or MQPUT1 call to fail if the queue manager is in the quiescing state.

On z/OS, this option also forces the MQPUT or MQPUT1 call to fail if the connection (for a CICS or IMS application) is in the quiescing state.

The call returns completion code MQCC_FAILED with reason code MQRC_Q_MGR_QUIESCING or MQRC_CONNECTION_QUIESCING.

**MQPMO_RESOLVE_LOCAL_Q**
Use this option to fill *ResolvedQName* in the MQPMO structure with the name of the local queue to which the message is put, and *ResolvedQMgrName* with the name of the local queue manager that hosts the local queue. For more information about MQPMO_RESOLVE_LOCAL_Q, see topic MQOO_RESOLVE_LOCAL_Q.

If you are authorized to put to a queue, you have the required authority to specify this flag on the MQPUT call; no special authority is needed.

**Default option**. If you need none of the options described, use the following option:

**MQPMO_NONE**
Use this value to indicate that no other options have been specified; all options assume their default values. MQPMO_NONE is defined to aid program documentation; it is not intended that this option be used with any other, but as its value is zero, such use cannot be detected.

MQPMO_NONE is an input field. The initial value of the *Options* field is MQPMO_NONE.

*OriginalMsgHandle (MQHMSG)*

This is an optional handle to a message. It might have been previously retrieved from a queue. The use of this handle is subject to the value of the *Action* field; see also NewMsgHandle.

The contents of the original message handle will not be altered by the **MQPUT** or **MQPUT1** call.

This is an input field. The initial value of this field is **MQHM_NONE**. This field is ignored if Version is less than **MQPMO_VERSION_3**.

*PubLevel (MQLONG)*
The initial value of this field is 9. The level of subscription targeted by this publication. Only those subscriptions with the highest SubLevel less than or equal to this value receive this publication. This value must be in the range zero to 9; zero is the lowest level. However, if a publication has been retained, it is no longer available to subscribers at higher levels because it is republished at PubLevel 1.

For information, see Intercepting publications.

*PutMsgRecFields (MQLONG)*

This field contains flags that indicate which MQPMR fields are present in the put message records provided by the application. Use *PutMsgRecFields* only when the message is being put to a distribution list. The field is ignored if *RecsPresent* is zero, or both *PutMsgRecOffset* and *PutMsgRecPtr* are zero.

For fields that are present, the queue manager uses for each destination the values from the fields in the corresponding put message record. For fields that are absent, the queue manager uses the values from the MQMD structure.

Use one or more of the following flags to indicate which fields are present in the put message records:

**MQPMRF_MSG_ID**
Message-identifier field is present.

**MQPMRF_CORREL_ID**
Correlation-identifier field is present.

**MQPMRF_GROUP_ID**
Group-identifier field is present.

**MQPMRF_FEEDBACK**
Feedback field is present.

**MQPMRF_ACCOUNTING_TOKEN**
Accounting-token field is present.

If you specify this flag, specify either MQPMO_SET_IDENTITY_CONTEXT or MQPMO_SET_ALL_CONTEXT in the *Options* field; if this condition is not satisfied, the call fails with reason code MQRC_PMO_RECORD_FLAGS_ERROR.

If no MQPMR fields are present, the following can be specified:

**MQPMRF_NONE**
No put-message record fields are present.

If this value is specified, either *RecsPresent* must be zero, or both *PutMsgRecOffset* and *PutMsgRecPtr* must be zero.

MQPMRF_NONE is defined to aid program documentation. It is not intended that this constant be used with any other, but as its value is zero, such use cannot be detected.

If *PutMsgRecFields* contains flags that are not valid, or put message records are provided but *PutMsgRecFields* has the value MQPMRF_NONE, the call fails with reason code MQRC_PMO_RECORD_FLAGS_ERROR.

This is an input field. The initial value of this field is MQPMRF_NONE. This field is ignored if *Version* is less than MQPMO_VERSION_2.

*PutMsgRecOffset (MQLONG)*

This is the offset in bytes of the first MQPMR put message record from the start of the MQPMO structure. The offset can be positive or negative. *PutMsgRecOffset* is used only when the message is being put to a distribution list. The field is ignored if *RecsPresent* is zero.

When the message is being put to a distribution list, an array of one or more MQPMR put message records can be provided in order to specify certain properties of the message for each destination individually; these properties are:

- Message identifier
- Correlation identifier
- Group identifier
- Feedback value
- Accounting token

You do not need to specify all these properties, but whatever subset you choose, specify the fields in the correct order. See the description of the MQPMR structure for further details.

Usually, there must be as many put message records as there are object records specified by MQOD when the distribution list is opened; each put message record supplies the message properties for the queue identified by the corresponding object record. Queues in the distribution list that fail to open must still have put message records allocated for them at the appropriate positions in the array, although the message properties are ignored in this case.

The number of put message records can differ from the number of object records. If there are fewer put message records than object records, the message properties for the destinations that do not have put message records are taken from the corresponding fields in the message descriptor MQMD. If there are more put message records than object records, the excess are not used (although it must still be possible to access them). Put message records are optional, but if they are supplied there must be *RecsPresent* of them.

Provide the put message records in a similar way to the object records in MQOD, either by specifying an offset in *PutMsgRecOffset*, or by specifying an address in *PutMsgRecPtr* ; for details of how to do this, see the *ObjectRecOffset* field described in"MQOD - Object descriptor" on page 460.

No more than one of *PutMsgRecOffset* and *PutMsgRecPtr* can be used; the call fails with reason code MQRC_PUT_MSG_RECORDS_ERROR if both are nonzero.

This is an input field. The initial value of this field is 0. This field is ignored if *Version* is less than MQPMO_VERSION_2.

*PutMsgRecPtr (MQPTR)*

This is the address of the first MQPMR put message record. Use *PutMsgRecPtr* only when the message is being put to a distribution list. The field is ignored if *RecsPresent* is zero.

You can use either *PutMsgRecPtr* or *PutMsgRecOffset* can be used to specify the put message records, but not both; for details, see "PutMsgRecOffset (MQLONG)" on page 494. If you do not use *PutMsgRecPtr*, set it to the null pointer or null bytes.

This is an input field. The initial value of this field is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise. This field is ignored if *Version* is less than MQPMO_VERSION_2.

**Note:** On platforms where the programming language does not support the pointer data type, this field is declared as a byte string of the appropriate length, with the initial value being the all-null byte string.

*RecsPresent (MQLONG)*

This is the number of MQPMR put message records or MQRR response records that have been provided by the application. This number can be greater than zero only if the message is being put to a distribution list. Put message records and response records are optional; the application need not provide any

records, or it can choose to provide records of only one type. However, if the application provides records of both types, it must provide *RecsPresent* records of each type.

The value of *RecsPresent* need not be the same as the number of destinations in the distribution list. If too many records are provided, the excess are not used; if too few records are provided, default values are used for the message properties for those destinations that do not have put message records (see *PutMsgRecOffset*).

If *RecsPresent* is less than zero, or is greater than zero but the message is not being put to a distribution list, the call fails with reason code MQRC_RECS_PRESENT_ERROR.

This is an input field. The initial value of this field is 0. This field is ignored if *Version* is less than MQPMO_VERSION_2.

*ResolvedQMgrName (MQCHAR48)*

This is the name of the destination queue manager after name resolution has been performed by the local queue manager. The name returned is the name of the queue manager that owns the queue identified by *ResolvedQName*, and can be the name of the local queue manager.

If *ResolvedQName* is a shared queue that is owned by the queue-sharing group to which the local queue manager belongs, *ResolvedQMgrName* is the name of the queue-sharing group. If the queue is owned by some other queue-sharing group, *ResolvedQName* can be the name of the queue-sharing group or the name of a queue manager that is a member of the queue-sharing group (the nature of the value returned is determined by the queue definitions that exist at the local queue manager).

A nonblank value is returned only if the object is a single queue; if the object is a distribution list or a topic, the value returned is undefined.

This is an output field. The length of this field is given by MQ_Q_MGR_NAME_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*ResolvedQName (MQCHAR48)*

This is the name of the destination queue after name resolution has been performed by the local queue manager. The name returned is the name of a queue that exists on the queue manager identified by *ResolvedQMgrName*.

A nonblank value is returned only if the object is a single queue; if the object is a distribution list or a topic, the value returned is undefined.

This is an output field. The length of this field is given by MQ_Q_NAME_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*ResponseRecOffset (MQLONG)*

This is the offset in bytes of the first MQRR response record from the start of the MQPMO structure. The offset can be positive or negative. *ResponseRecOffset* is used only when the message is being put to a distribution list. The field is ignored if *RecsPresent* is zero.

When putting the message to a distribution list, you can provide an array of one or more MQRR response records to identify the queues to which the message was not sent successfully (*CompCode* field in MQRR), and the reason for each failure (*Reason* field in MQRR). The message might not have been sent either because the queue failed to open, or because the put operation failed. The queue manager sets the response records only when the outcome of the call is mixed (that is, some messages were sent successfully while others failed, or all failed but for differing reasons); reason code MQRC_MULTIPLE_REASONS from the call indicates this case. If the same reason code applies to all queues, that reason is returned in the *Reason* parameter of the MQPUT or MQPUT1 call, and the response records are not set.

Usually, there are as many response records as there are object records specified by MQOD when the distribution list is opened; when necessary, each response record is set to the completion code and reason code for the put to the queue identified by the corresponding object record. Queues in the distribution list that fail to open must still have response records allocated for them at the appropriate

positions in the array, although they are set to the completion code and reason code resulting from the open operation, rather than the put operation.

The number of response records can differ from the number of object records. If there are fewer response records than object records, the application might not be able to identify all the destinations for which the put operation failed, or the reasons for the failures. If there are more response records than object records, the excess are not used (although it must still be possible to access them). Response records are optional, but if they are supplied there must be *RecsPresent* of them.

Provide the response records in a similar way to the object records in MQOD, either by specifying an offset in *ResponseRecOffset*, or by specifying an address in *ResponseRecPtr* ; for details of how to do this, see the *ObjectRecOffset* field described in "MQOD - Object descriptor" on page 460. However, use no more than one of *ResponseRecOffset* and *ResponseRecPtr* ; the call fails with reason code MQRC_RESPONSE_RECORDS_ERROR if both are nonzero.

For the MQPUT1 call, this field must be zero. This is because the response information (if requested) is returned in the response records specified by the object descriptor MQOD.

This is an input field. The initial value of this field is 0. This field is ignored if *Version* is less than MQPMO_VERSION_2.

*ResponseRecPtr (MQPTR)*

This is the address of the first MQRR response record. *ResponseRecPtr* is used only when the message is being put to a distribution list. The field is ignored if *RecsPresent* is zero.

Use either *ResponseRecPtr* or *ResponseRecOffset* to specify the response records, but not both; for details, see "ResponseRecOffset (MQLONG)" on page 495. If you do not use *ResponseRecPtr* set it to the null pointer or null bytes.

For the MQPUT1 call, this field must be the null pointer or null bytes. This is because the response information (if requested) is returned in the response records specified by the object descriptor MQOD.

This is an input field. The initial value of this field is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise. This field is ignored if *Version* is less than MQPMO_VERSION_2.

**Note:** On platforms where the programming language does not support the pointer data type, this field is declared as a byte string of the appropriate length, with the initial value being the all-null byte string.

*StrucId (MQCHAR4)*

This is the structure identifier; the value must be:

**MQPMO_STRUC_ID**
Identifier for put-message options structure.

For the C programming language, the constant MQPMO_STRUC_ID_ARRAY is also defined; this has the same value as MQPMO_STRUC_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQPMO_STRUC_ID.

*Timeout (MQLONG)*

This is a reserved field; its value is not significant. The initial value of this field is -1.

*UnknownDestCount (MQLONG)*

This is the number of messages that the current MQPUT or MQPUT1 call has sent successfully to queues in the distribution list that resolve to remote queues. Messages that the queue manager retains temporarily in distribution-list form count as the number of individual destinations that those distribution lists contain. This field is also set when putting a message to a single queue that is not in a distribution list.

This is an output field. The initial value of this field is 0. This field is not set if *Version* is less than MQPMO_VERSION_1.

This field is undefined on z/OS because distribution lists are not supported.

*Version (MQLONG)*
Structure version number.

The value must be one of the following:

**MQPMO_VERSION_1**
Version-1 put-message options structure.

This version is supported in all environments.

**MQPMO_VERSION_2**
Version-2 put-message options structure.

This version is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

**MQPMO_VERSION_3**
Version-3 put-message options structure.

This version is supported in all environments.

Fields that exist only in the more-recent version of the structure are identified as such in the descriptions of the fields. The following constant specifies the version number of the current version:

**MQPMO_CURRENT_VERSION**
Current version of put-message options structure.

This is always an input field. The initial value of this field is MQPMO_VERSION_1.

## *Initial values and language declarations for MQPMO*

*Table 517. Initial values of fields in MQPMO*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQPMO_STRUC_ID | 'PMO¬' |
| *Version* | MQPMO_VERSION_1 | 1 |
| *Options* | MQPMO_NONE | 0 |
| *Timeout* | None | -1 |
| *Context* | None | 0 |
| *KnownDestCount* | None | 0 |
| *UnknownDestCount* | None | 0 |
| *InvalidDestCount* | None | 0 |
| *ResolvedQName* | None | Null string or blanks |
| *ResolvedQMgrName* | None | Null string or blanks |
| *RecsPresent* | None | 0 |
| *PutMsgRecFields* | MQPMRF_NONE | 0 |
| *PutMsgRecOffset* | None | 0 |
| *ResponseRecOffset* | None | 0 |
| *PutMsgRecPtr* | None | Null pointer or null bytes |
| *ResponseRecPtr* | None | Null pointer or null bytes |
| *OriginalMsgHandle* | MQHM_NONE | 0 |

| *Table 517. Initial values of fields in MQPMO (continued)* | | |
|---|---|---|
| **Field name** | **Name of constant** | **Value of constant** |
| *NewMsgHandle* | MQHM_NONE | 0 |
| *Action* | MQACTP_NEW | 0 |
| *PubLevel* | None | 9 |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
3. In the C programming language, the macro variable MQPMO_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQPMO MyPMO = {MQPMO_DEFAULT};
```

*C declaration*

```
typedef struct tagMQPMO MQPMO;
struct tagMQPMO {
  MQCHAR4   StrucId;            /* Structure identifier */

```

## MQPMR - Put-message record

The following table summarizes the fields in the structure.

| *Table 518. Fields in MQPMR* | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *MsgId* | Message identifier | MsgId |

| Table 518. Fields in MQPMR (continued) | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *CorrelId* | Correlation identifier | CorrelId |
| *GroupId* | Group identifier | GroupId |
| *Feedback* | Feedback or reason code | Feedback |
| *AccountingToken* | Accounting token | AccountingToken |

## *Overview for MQPMR*

**Availability**: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.

**Purpose**: Use the MQPMR structure to specify various message properties for a single destination when putting a message to a distribution list. MQPMR is an input/output structure for the MQPUT and MQPUT1 calls.

**Character set and encoding**: Data in MQPMR must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC_NATIVE. However, if the application is running as an MQ client, the structure must be in the character set and encoding of the client.

**Usage**: By providing an array of these structures on the MQPUT or MQPUT1 call, you can specify different values for each destination queue in a distribution list. Some of the fields are input only, others are input/output.

**Note:** This structure is unusual in that it does not have a fixed layout. The fields in this structure are optional, and the presence or absence of each field is indicated by the flags in the *PutMsgRecFields* field in MQPMO. Fields that are present ***must occur in the following order*** :

- *MsgId*
- *CorrelId*
- *GroupId*
- *Feedback*
- *AccountingToken*

Fields that are absent occupy no space in the record.

Because MQPMR does not have a fixed layout, no definition of it is provided in the header, COPY, and INCLUDE files for the supported programming languages. The application programmer must create a declaration containing the fields that are required by the application, and set the flags in *PutMsgRecFields* to indicate the fields that are present.

## *Fields for MQPMR*

The MQPMR structure contains the following fields; the fields are described in **alphabetical order**:

*AccountingToken (MQBYTE32)*

This is the accounting token to be used for the message sent to the queue with the name that was specified by the corresponding element in the array of MQOR structures provided on the MQOPEN or MQPUT1 call. It is processed in the same way as the *AccountingToken* field in MQMD for a put to a single queue. See the description of *AccountingToken* in “MQMD - Message descriptor” on page 402 for information about the content of this field.

If this field is not present, the value in MQMD is used.

This is an input field.

*CorrelId (MQBYTE24)*

This is the correlation identifier to be used for the message sent to the queue with a name that was specified by the corresponding element in the array of MQOR structures provided on the MQOPEN or MQPUT1 call. It is processed in the same way as the *CorrelId* field in MQMD for a put to a single queue.

If this field is not present in the MQPMR record, or there are fewer MQPMR records than destinations, the value in MQMD is used for those destinations that do not have an MQPMR record containing a *CorrelId* field.

If MQPMO_NEW_CORREL_ID is specified, a *single* new correlation identifier is generated and used for all the destinations in the distribution list, regardless of whether they have MQPMR records. This is different from the way that MQPMO_NEW_MSG_ID is processed (see *MsgId* field).

This is an input/output field.

*Feedback (MQLONG)*

This is the feedback code to be used for the message sent to the queue with the name that was specified by the corresponding element in the array of MQOR structures provided on the MQOPEN or MQPUT1 call. It is processed in the same way as the *Feedback* field in MQMD for a put to a single queue.

If this field is not present, the value in MQMD is used.

This is an input field.

*GroupId (MQBYTE24)*

GroupId is the group identifier to be used for the message sent to the queue with the name that was specified by the corresponding element in the array of MQOR structures provided on the MQOPEN or MQPUT1 call. It is processed in the same way as the *GroupId* field in MQMD for a put to a single queue.

If this field is not present in the MQPMR record, or there are fewer MQPMR records than destinations, the value in MQMD is used for those destinations that do not have an MQPMR record containing a *GroupId* field. The value is processed as documented in Physical order on a queue, but with the following differences:

- GroupId is created from the QMName and a timestamp. Therefore to keep a GroupId unique keep queue manager names unique too. Also do not set the clocks back on the queue managers machine.
- In those cases where a new group identifier would be used, the queue manager generates a different group identifier for each destination (that is, no two destinations have the same group identifier).
- In those cases where the value in the field would be used, the call fails with reason code MQRC_GROUP_ID_ERROR

This is an input/output field.

*MsgId (MQBYTE24)*

This is the message identifier to be used for the message sent to the queue with a name that was specified by the corresponding element in the array of MQOR structures provided on the MQOPEN or MQPUT1 call. It is processed in the same way as the *MsgId* field in MQMD for a put to a single queue.

If this field is not present in the MQPMR record, or there are fewer MQPMR records than destinations, the value in MQMD is used for those destinations that do not have an MQPMR record containing a *MsgId* field. If that value is MQMI_NONE, a new message identifier is generated for *each* of those destinations (that is, no two of those destinations have the same message identifier).

If MQPMO_NEW_MSG_ID is specified, new message identifiers are generated for all the destinations in the distribution list, regardless of whether they have MQPMR records. This is different from the way that MQPMO_NEW_CORREL_ID is processed (see *CorrelId* field).

This is an input/output field.

### *Initial values and language declarations for MQPMR*

There are no initial values defined for this structure, as no structure declarations are provided in the header, COPY, and INCLUDE files for the supported programming languages. The sample declarations show how to declare the structure if all the fields are required.

*C declaration*

```
typedef struct tagMQPMR MQPMR;
struct tagMQPMR {
  MQBYTE24  MsgId;            /* Message identifier */
  MQBYTE24  CorrelId;         /* Correlation identifier */
  MQBYTE24  GroupId;          /* Group identifier */
  MQLONG    Feedback;         /* Feedback or reason code */
  MQBYTE32  AccountingToken;  /* Accounting token */
};
```

*COBOL declaration*

```
**   MQPMR structure
  10 MQPMR.
**    Message identifier
   15 MQPMR-MSGID           PIC X(24).
**    Correlation identifier
   15 MQPMR-CORRELID        PIC X(24).
**    Group identifier
   15 MQPMR-GROUPID         PIC X(24).
**    Feedback or reason code
   15 MQPMR-FEEDBACK        PIC S9(9) BINARY.
**    Accounting token
   15 MQPMR-ACCOUNTINGTOKEN PIC X(32).
```

*PL/I declaration*

```
dcl
 1 MQPMR based,
  3 MsgId           char(24),      /* Message identifier */
  3 CorrelId        char(24),      /* Correlation identifier */
  3 GroupId         char(24),      /* Group identifier */
  3 Feedback        fixed bin(31), /* Feedback or reason code */
  3 AccountingToken char(32);      /* Accounting token */
```

*Visual Basic declaration*

```
Type MQPMR
  MsgId           As MQBYTE24 'Message identifier'
  CorrelId        As MQBYTE24 'Correlation identifier'
  GroupId         As MQBYTE24 'Group identifier'
  Feedback        As Long     'Feedback or reason code'
  AccountingToken As MQBYTE32 'Accounting token'
End Type
```

## MQRFH - Rules and formatting header

This section describes the rules and formatting header, what fields it contains, and initial values of those fields.

### *Overview for MQRFH*

**Availability**: All IBM MQ systems, plus IBM MQ MQI clients connected to these systems.

**Purpose**: The MQRFH structure defines the layout of the rules and formatting header. Use this header to send string data in the form of name/value pairs.

**Format name**: MQFMT_RF_HEADER.

**Character set and encoding**: The fields in the MQRFH structure (including *NameValueString*) are in the character set and encoding given by the *CodedCharSetId* and *Encoding* fields in the header structure that precedes the MQRFH, or by those fields in the MQMD structure if the MQRFH is at the start of the application message data.

The character set must be one that has single-byte characters for the characters that are valid in queue names.

## *Fields for MQRFH*

The MQRFH structure contains the following fields; the fields are described in **alphabetical order**:

*CodedCharSetId (MQLONG)*

This specifies the character set identifier of the data that follows *NameValueString* ; it does not apply to character data in the MQRFH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The following special value can be used:

**MQCCSI_INHERIT**
Character data in the data *following* this structure is in the same character set as this structure.

The queue manager changes this value in the structure sent in the message to the actual character-set identifier of the structure. Provided no error occurs, the value MQCCSI_INHERIT is not returned by the MQGET call.

MQCCSI_INHERIT cannot be used if the value of the *PutApplType* field in MQMD is MQAT_BROKER.

The initial value of this field is MQCCSI_UNDEFINED.

*Encoding (MQLONG)*

This specifies the numeric encoding of the data that follows *NameValueString* ; it does not apply to numeric data in the MQRFH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data.

The initial value of this field is MQENC_NATIVE.

*Flags (MQLONG)*

The following can be specified:

**MQRFH_NONE**
No flags.

The initial value of this field is MQRFH_NONE.

*Format (MQCHAR8)*

This specifies the format name of the data that follows *NameValueString*.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The rules for coding this field are the same as those for the *Format* field in MQMD.

The initial value of this field is MQFMT_NONE.

*NameValueString (MQCHARn)*

This is a variable-length character string containing name/value pairs in the form:

```
name1 value1 name2 value2 name3 value3 ...
```

Each name or value must be separated from the adjacent name or value by one or more blank characters; these blanks are not significant. A name or value can contain significant blanks by prefixing and suffixing the name or value with double quotation marks; all characters between the open double quotation mark

and the matching closing double quotation mark are treated as significant. In the following example, the name is FAMOUS_WORDS, and the value is Hello World:

```
FAMOUS_WORDS "Hello World"
```

A name or value can contain any characters other than the null character (which acts as a delimiter for *NameValueString*). However, to assist interoperability an application can restrict names to the following characters:

- First character: upper or lowercase alphabetic (A through Z, or a through z), or underscore.
- Subsequent characters: upper or lowercase alphabetic, decimal digit (0 through 9), underscore, hyphen, or dot.

If a name or value contains one or more double quotation marks, the name or value must be enclosed in double quotation marks, and each double quotation mark within the string must be doubled:

```
Famous_Words "The program displayed ""Hello World"""
```

Names and values are case sensitive, that is, lowercase letters are not considered to be the same as uppercase letters. For example, FAMOUS_WORDS and Famous_Words are two different names.

The length in bytes of *NameValueString* is equal to *StrucLength* minus MQRFH_STRUC_LENGTH_FIXED. To avoid problems converting the user data in some environments, make this length a multiple of four. Pad *NameValueString* with blanks to this length, or terminate it earlier by placing a null character following the last significant character in the string. The null character and the bytes following it, up to the specified length of *NameValueString*, are ignored.

**Note:** Because the length of this field is not fixed, the field is omitted from the declarations of the structure that are provided for the supported programming languages.

*StrucId (MQCHAR4)*

This is the structure identifier; the value must be:

**MQRFH_STRUC_ID**
Identifier for rules and formatting header structure.

For the C programming language, the constant MQRFH_STRUC_ID_ARRAY is also defined; this has the same value as MQRFH_STRUC_ID, but is an array of characters instead of a string.

The initial value of this field is MQRFH_STRUC_ID.

*StrucLength (MQLONG)*

This is the length in bytes of the MQRFH structure, including the *NameValueString* field at the end of the structure. The length does *not* include any user data that follows the *NameValueString* field.

To avoid problems converting the user data in some environments, *StrucLength* must be a multiple of four.

The following constant gives the length of the *fixed* part of the structure, that is, the length excluding the *NameValueString* field:

**MQRFH_STRUC_LENGTH_FIXED**
Length of fixed part of MQRFH structure.

The initial value of this field is MQRFH_STRUC_LENGTH_FIXED.

*Version (MQLONG)*

This is the structure version number; the value must be:

**MQRFH_VERSION_1**
Version-1 rules and formatting header structure.

The initial value of this field is MQRFH_VERSION_1.

### *Initial values and language declarations for MQRFH*

*Table 519. Initial values of fields in MQRFH for MQRFH*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQRFH_STRUC_ID | 'RFH¬' |
| *Version* | MQRFH_VERSION_1 | 1 |
| *StrucLength* | MQRFH_STRUC_LENGTH_FIXED | 32 |
| *Encoding* | MQENC_NATIVE | Depends on environment |
| *CodedCharSetId* | MQCCSI_UNDEFINED | 0 |
| *Format* | MQFMT_NONE | Blanks |
| *Flags* | MQRFH_NONE | 0 |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. In the C programming language, the macro variable MQRFH_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQRFH MyRFH = {MQRFH_DEFAULT};
```

*C declaration*

```
typedef struct tagMQRFH MQRFH;
struct tagMQRFH {
  MQCHAR4  StrucId;         /* Structure identifier */
  MQLONG   Version;         /* Structure version number */
  MQLONG   StrucLength;     /* Total length of MQRFH including
                               NameValueString */
  MQLONG   Encoding;        /* Numeric encoding of data that follows
                               NameValueString */
  MQLONG   CodedCharSetId;  /* Character set identifier of data that
                               follows NameValueString */
  MQCHAR8  Format;          /* Format name of data that follows
                               NameValueString */
  MQLONG   Flags;           /* Flags */
};
```

*COBOL declaration*

```
**   MQRFH structure
  10 MQRFH.
**    Structure identifier
   15 MQRFH-STRUCID        PIC X(4).
**    Structure version number
   15 MQRFH-VERSION        PIC S9(9) BINARY.
**    Total length of MQRFH including NAMEVALUESTRING
   15 MQRFH-STRUCLENGTH    PIC S9(9) BINARY.
**    Numeric encoding of data that follows NAMEVALUESTRING
   15 MQRFH-ENCODING       PIC S9(9) BINARY.
**    Character set identifier of data that follows NAMEVALUESTRING
   15 MQRFH-CODEDCHARSETID PIC S9(9) BINARY.
**    Format name of data that follows NAMEVALUESTRING
   15 MQRFH-FORMAT         PIC X(8).
**    Flags
   15 MQRFH-FLAGS          PIC S9(9) BINARY.
```

*PL/I declaration*

```
dcl
 1 MQRFH based,
  3 StrucId        char(4),       /* Structure identifier */
  3 Version        fixed bin(31), /* Structure version number */
  3 StrucLength    fixed bin(31), /* Total length of MQRFH including
                                     NameValueString */
  3 Encoding       fixed bin(31), /* Numeric encoding of data that
                                     follows NameValueString */
  3 CodedCharSetId fixed bin(31), /* Character set identifier of data
                                     that follows NameValueString */
  3 Format         char(8),       /* Format name of data that follows
                                     NameValueString */
  3 Flags          fixed bin(31); /* Flags */
```

*High Level Assembler declaration*

```
MQRFH                 DSECT
MQRFH_STRUCID         DS   CL4  Structure identifier
MQRFH_VERSION         DS   F    Structure version number
MQRFH_STRUCLENGTH     DS   F    Total length of MQRFH including
*                               NAMEVALUESTRING
MQRFH_ENCODING        DS   F    Numeric encoding of data that follows
*                               NAMEVALUESTRING
MQRFH_CODEDCHARSETID  DS   F    Character set identifier of data that
*                               follows NAMEVALUESTRING
MQRFH_FORMAT          DS   CL8  Format name of data that follows
*                               NAMEVALUESTRING
MQRFH_FLAGS           DS   F    Flags
*
MQRFH_LENGTH          EQU  *-MQRFH
                      ORG  MQRFH
MQRFH_AREA            DS   CL(MQRFH_LENGTH)
```

*Visual Basic declaration*

```
Type MQRFH
  StrucId        As String*4 'Structure identifier'
  Version        As Long     'Structure version number'
  StrucLength    As Long     'Total length of MQRFH including'
                             'NameValueString'
  Encoding       As Long     'Numeric encoding of data that follows'
                             'NameValueString'
  CodedCharSetId As Long     'Character set identifier of data that'
                             'follows NameValueString'
  Format         As String*8 'Format name of data that follows'
                             'NameValueString'
  Flags          As Long     'Flags'
End Type
```

## MQRFH2 - Rules and formatting header 2

This section describes the rules and formatting header 2, what fields it contains, and initial values of those fields.

### *Overview for MQRFH2*

### Availability

All IBM MQ systems, plus IBM MQ MQI clients connected to these systems.

### Purpose

The MQRFH2 header is based on the MQRFH header, but it allows Unicode strings to be transported without translation, and it can carry numeric data types.

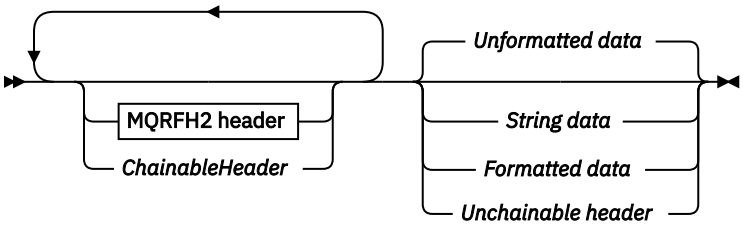
The MQRFH2 structure defines the format of the version-2 rules and formatting header. Use this header to send data that has been encoded using an XML-like syntax. A message can contain two or more MQRFH2 structures in series, with user data optionally following the last MQRFH2 structure in the series.

## Format name

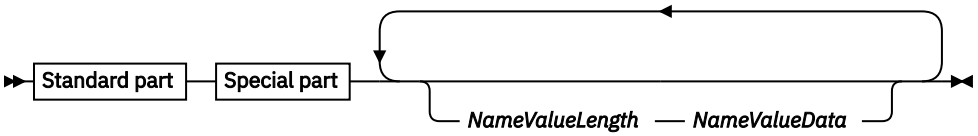
MQFMT_RF_HEADER_2

## Syntax

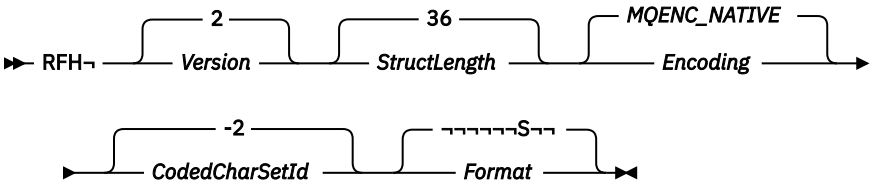
### IBM MQ Message



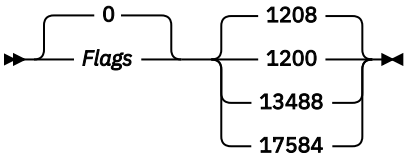
### MQRFH2 header



### Standard part



### Special part



## Character set and encoding

Special rules apply to the character set and encoding used for the MQRFH2 structure:

- Fields other than *NameValueData* are in the character set and encoding given by the *CodedCharSetId* and *Encoding* fields in the header structure that precedes MQRFH2, or by those fields in the MQMD structure if the MQRFH2 is at the start of the application message data.

  The character set must be one that has single-byte characters for the characters that are valid in queue names.

  When MQGMO_CONVERT is specified on the MQGET call, the queue manager converts the MQRFH2 fields, other than *NameValueData*, to the requested character set and encoding.
- *NameValueData* is in the character set given by the *NameValueCCSID* field. Only the listed Unicode character sets are valid for *NameValueCCSID* ; see the description of *NameValueCCSID* for details.

Some character sets have a representation that depends on the encoding. If *NameValueCCSID* is one of these character sets, *NameValueData* must be in the same encoding as the other fields in the MQRFH2.

When MQGMO_CONVERT is specified on the MQGET call, the queue manager converts *NameValueData* to the requested encoding, but does not change its character set.

## *Fields for MQRFH2*

The MQRFH2 structure contains the following fields; the fields are described in **alphabetical order**:

*CodedCharSetId (MQLONG)*

This specifies the character set identifier of the data that follows the last *NameValueData* field; it does not apply to character data in the MQRFH2 structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The following special value can be used:

**MQCCSI_INHERIT**
Character data in the data *following* this structure is in the same character set as this structure.

The queue manager changes this value in the structure sent in the message to the actual character-set identifier of the structure. Provided no error occurs, the value MQCCSI_INHERIT is not returned by the MQGET call.

MQCCSI_INHERIT cannot be used if the value of the *PutApplType* field in MQMD is MQAT_BROKER.

The initial value of this field is MQCCSI_INHERIT.

*Encoding (MQLONG)*

This specifies the numeric encoding of the data that follows the last *NameValueData* field; it does not apply to numeric data in the MQRFH2 structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data.

The initial value of this field is MQENC_NATIVE.

*Flags (MQLONG)*

The initial value of this field is MQRFH_NONE. MQRFH_NONE must be specified.

**MQRFH_NONE**
No flags.

**MQRFH_INTERNAL**
The MQRFH2 header contains internally set properties.

MQRFH_INTERNAL is for queue manager use.

The top 16 bits, MQRFH_FLAGS_RESTRICTED_MASK, are reserved for flags the queue manager sets. Flags that a user might set are defined in the bottom 16 bits.

*Format (MQCHAR8)*

This specifies the format name of the data that follows the last *NameValueData* field.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The rules for coding this field are the same as those for the *Format* field in MQMD.

The initial value of this field is MQFMT_NONE.

*NameValueCCSID (MQLONG)*

This specifies the coded character set identifier of the data in the *NameValueData* field. This is different from the character set of the other strings in the MQRFH2 structure, and can be different from the character set of the data (if any) that follows the last *NameValueData* field at the end of the structure.

*NameValueCCSID* must have one of the following values:

| CCSID | Meaning |
|---|---|
| 1200 | UCS-2 open-ended |
| 13488 | UCS-2 2.0 subset |
| 17584 | UCS-2 2.1 subset (includes the Euro symbol) |
| 1208 | UTF-8 |

For the UCS-2 character sets, the encoding (byte order) of the *NameValueData* must be the same as the encoding of the other fields in the MQRFH2 structure. Surrogate characters (X'D800' through X'DFFF') are not supported.

**Note:** If *NameValueCCSID* does not have one of the values listed above, and the MQRFH2 structure requires conversion on the MQGET call, the call completes with reason code MQRC_SOURCE_CCSID_ERROR and the message is returned unconverted.

The initial value of this field is 1208.

*NameValueData ( MQCHARn)*
*NameValueData* is a variable length field that contains a folder containing name/value pairs of message properties. A folder is a variable-length character string containing data encoded using an XML-like syntax. The length in bytes of the character string is given by the *NameValueLength* field that precedes the *NameValueData* field. The length must be a multiple of four.

The *NameValueLength* and *NameValueData* fields are optional, but if present they must occur as a pair and be adjacent. The pair of fields can be repeated as many times as required, for example:

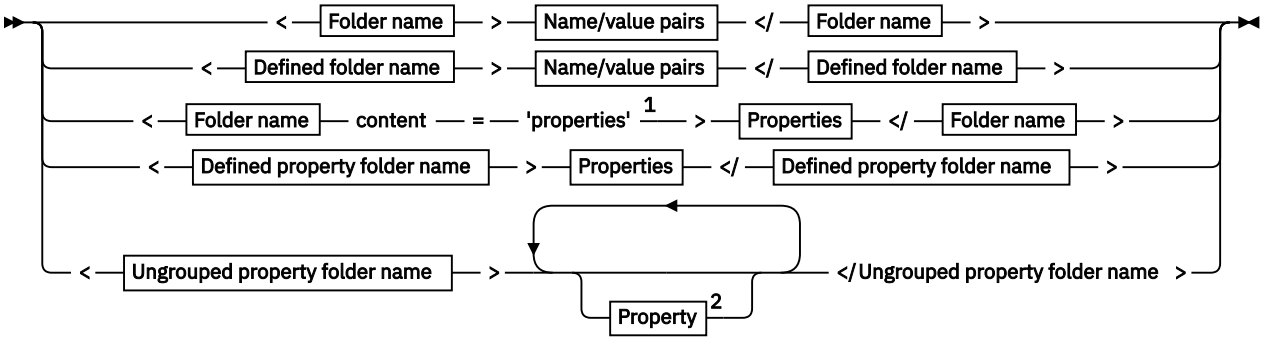
```
length1 data1 length2 data2 length3 data3
```

*NameValueData* is *not* converted to the character set specified on the MQGET call. Even if the message is retrieved with the MQGMO_CONVERT option in effect *NameValueData* remains in its original character set. However, *NameValueData is* converted to the encoding specified on the MQGET call.

**Note:**

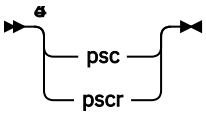
- Because these fields are optional, they are omitted from the declarations of the structure that are provided for the various programming languages supported.
- The terms "defined" and "reserved" are used in the syntax diagram. "Defined" means that the name is used by IBM MQ. "Reserved" means that the name is reserved for future use by IBM MQ.

## *NameValueData* syntax

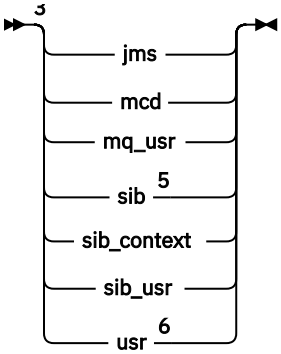


**Folder name**

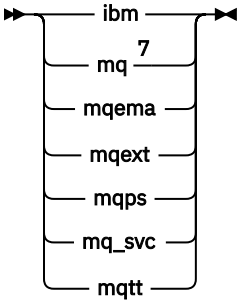
**Defined folder name**



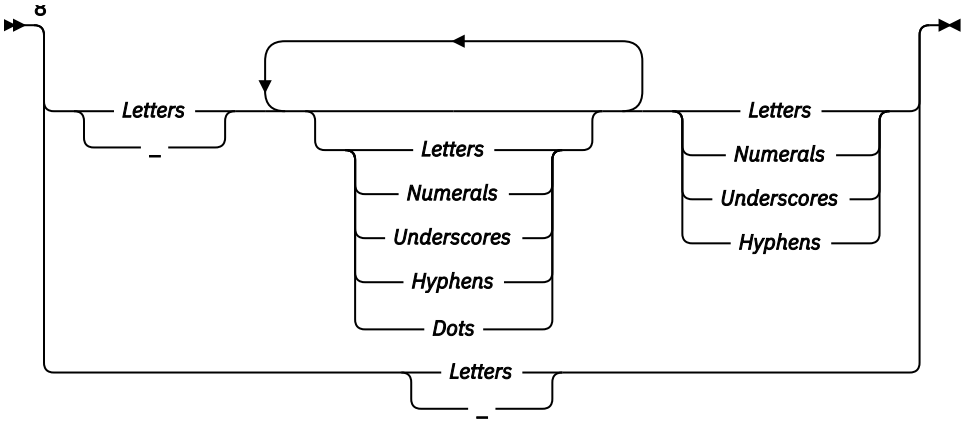
**Defined property folder name**



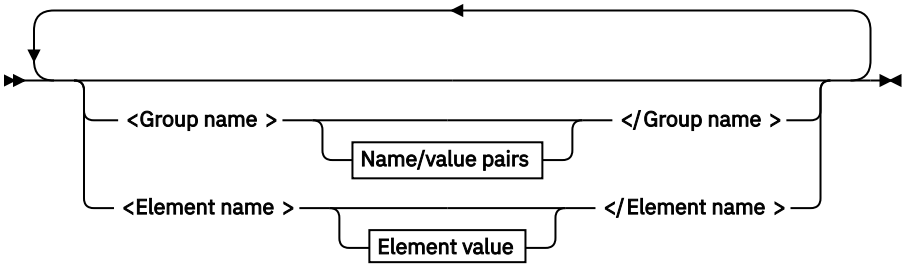
**Ungrouped property folder name**



**Name**



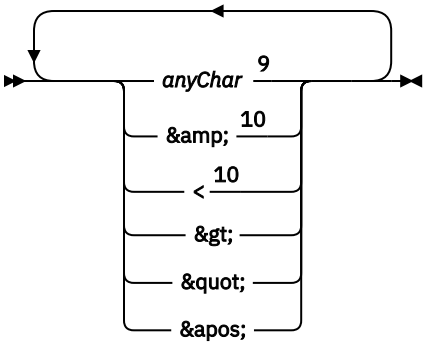
**Name/value pairs**



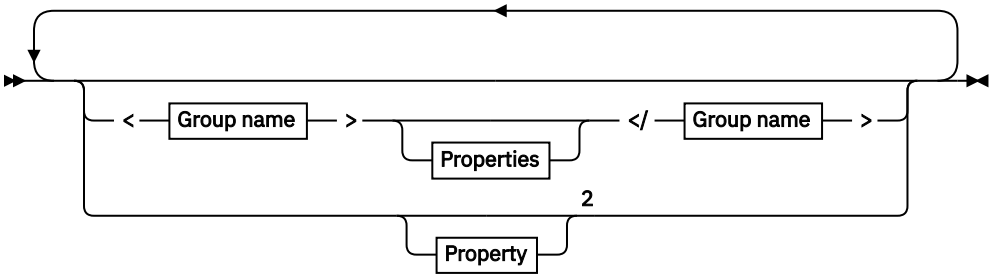
**Group name**

**Element name**

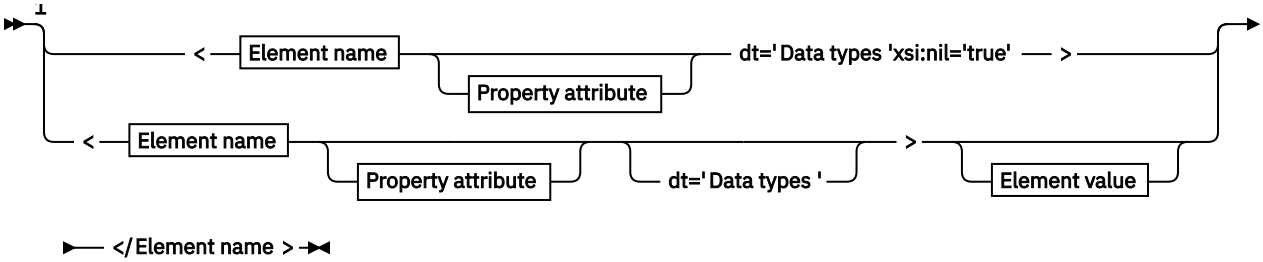
**Element value**



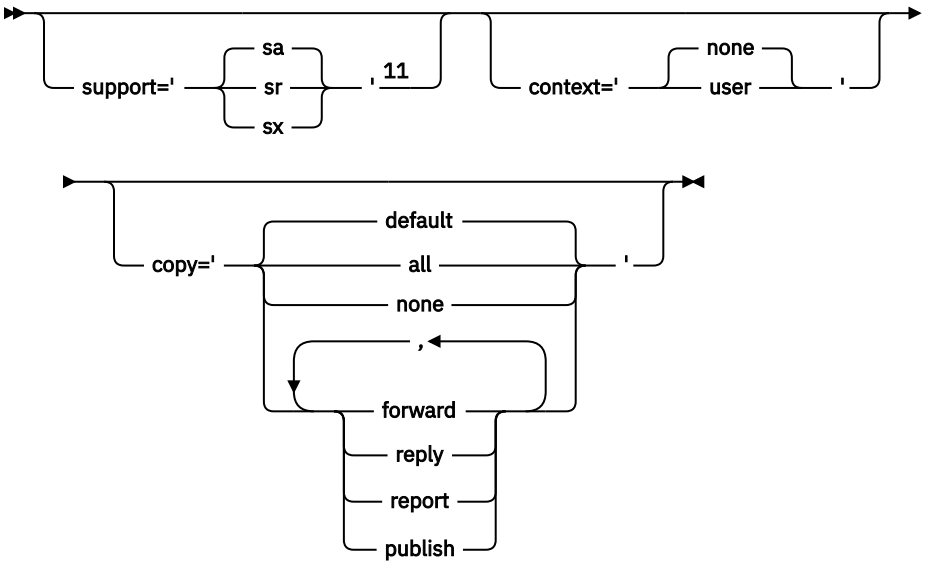
**Properties**



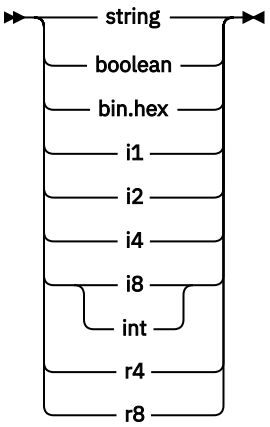
**Property**



**Property attribute**



**Data types**



Notes:

[1] Double quotation marks or single quotation marks are valid.
[2] Do not use an invalid property name; see “Invalid property name” on page 524. Use a reserved property name only for its defined purpose; see “Defined property names” on page 524.
[3] The name must be in lowercase.
[4] Only one `psc` and `pscr` folder is supported.
[5] Only properties in the first MQRFH2 header are significant. WebSphere Application Server Service Integration Bus ignores sib, sib_context, and sib_usr folders in subsequent MQRFH2 headers.
[6] Not more than one `usr` folder must be present in an MQRFH2. Properties in the `usr` folder must occur no more than once.
[7] Only properties in the first `mq` folder are significant. If the folder is `UTF-8`, only single byte `UTF-8` characters are supported. The only white space character is Unicode `U+0020`.
[8] Valid characters are defined in the W3C XML specification, and consist essentially of Unicode categories `Ll, Lu, Lo, Lt, Nl, Mc, Mn, Lm,` and `Nd` ; see Unicode character categories.
[9] All characters are significant. Leading and trailing blanks are part of the element value.
[10] Do not use an invalid character; see “Invalid characters” on page 523. Use an escape sequence, rather than these invalid characters.
[11] The support property attribute is only valid on the `mq` folder

## Folder name

*NameValueData* contains a single folder. To create multiple folders, create multiple *NameValueData* fields. You can create multiple *NameValueData* fields in a single MQRFH2 header within a message. Alternatively you can create multiple chained MQRFH2 headers, each containing multiple *NameValueData* fields.

The order of MQRFH2 headers, and the order of *NameValueData* fields makes no difference to the logical contents of a folder. If the same folder is present more than once in a message the folder is parsed as a whole. If the same property occurs in muliple instances of the same folder, it is parsed as a list.

A correct parse of an MQRFH2 is not affected by the alternative ways a folder can be physically stored in a message.

Four folders do not follow this rule. Only the first instance of the `mq`, `sib`, `sib_context`, and `sib_usr` folder are parsed.

If the same property occurs more than once in the combined contents of the chained MQRFH2 headers, only the first instance of the property is parsed. If a property is set using an API call, such as MQSETMP, and added to an MQRFH2 directly by an application, the API call takes precedence.

A folder name is the name of a folder containing name/value pairs or groups. Groups and name/value pairs can be mixed at the same level in the folder tree; see Figure 1 on page 514. Do not combine a group name and an element name; see Figure 2 on page 514

```
<group1><nvp1>value</nvp1></group1><group2><nvp2>value</nvp2></group2>
<group3><nvp1> value </nvp1></group3><nvp3> value </nvp3>
```

*Figure 1. Correct uses of groups and name/value pairs*

```
<group1><nvp1>value</nvp1>value</group1>
```

*Figure 2. Incorrect use of groups and name/value pairs*

Do not use an invalid or reserved folder name; see "Invalid path name" on page 523 and "Reserved folder or property folder name" on page 523. Use a defined folder name only for its defined purpose; see "Defined folder name" on page 515.

If you add the attribute `'content=properties'` to the folder name tag, the folder becomes a property folder; see Figure 3 on page 514.

```
<myFolder></myfolder>
<myPropertyFolder contents='properties'></myPropertyFolder>
```

*Figure 3. Example of a folder and a property folder*

Folder names are case-sensitive. Folder names and property folder names share the same namespace. They must have different names. `Folder1` in Figure 4 on page 514 must be a different name to `Folder2` in Figure 5 on page 514.

```
<Folder1><NVP1>value</NVP1></Folder1>
```

*Figure 4. `Folder1` namespace*

```
<Folder2 content='properties'><Property1>value</Property1></Folder2>
```

*Figure 5. `Folder2` namespace*

Groups, properties, and name/value pairs in different folders have different namespaces. `Property1` in Figure 5 on page 514 is a different property to `Property1` in Figure 6 on page 514.

```
<Folder3 content='properties'><Property1>value</Property1></Folder3>
```

*Figure 6. `Folder3` namespace*

Property folders are different to non-property folders in two important respects:

1. Property folders contain properties, and non-property folders contain name/value pairs. The folders differ slightly, syntactically.
2. Use the defined interfaces, such as the properties MQI, or JMS message properties, to access message properties. The interfaces ensure the property folders in the MQRFH2 are well-formed. A well-formed property folder is interoperable between queue managers on different platforms and different releases.

The message property MQI is a robust way to read and write an MQRFH2, and avoids the difficulties of parsing an MQRFH2 correctly.

## Defined folder name

A defined folder name is the name of a folder that is reserved for use by IBM MQ, or another product. Do not create a folder of the same name, and do not add your own name/value pairs to the folders. The defined folders are psc and pscr .

psc and pscr are used by queued publish/subscribe.

A segmented message put with either MQMF_SEGMENT or MQMF_SEGMENTATION_ALLOWED cannot contain an MQRFH2 with a defined folder name. The MQPUT fails with reason code 2443, MQRC_SEGMENTATION_NOT_ALLOWED.

## Defined property folder name

A defined property folder name is the name of a property folder that is used by IBM MQ, or another product. For the names of the folders and their contents, see Property folders. Defined property folder names are a subset of all the folder names reserved by IBM MQ; see “Reserved folder or property folder name” on page 523.

Any element stored in a defined property folder is a property. An element stored in a defined property folder must not have a content='properties' attribute.

You can add properties only to the defined property folders usr , mq_usr , and sib_usr . In other property folders, such as mq and sib , IBM MQ ignores or throws away properties it does not recognize.

The description of each defined property folder lists the properties that IBM MQ has defined that can be used by application programs. Some of the properties are accessed indirectly by setting or getting a JMS property, and some are accessed directly using the MQSETMP and MQINQMP MQI calls.

The defined property folders also contain other properties that IBM MQ has reserved, but which applications do not have access to. The names of the reserved properties are not listed. No reserved properties are present in the usr , mq_usr , and sib_usr property folders. But do not create properties with invalid property names; see “Invalid property name” on page 524.

## Property folders

### jms

jms contains JMS header fields, and JMSX properties that cannot be fully expressed in the MQMD. The jms folder is always present in a JMS MQRFH2.

*Table 520. jms property name, synonym, data type, and folder*

| Property synonym | Property name | Data type | Folder |
|---|---|---|---|
| JMSDestination | jms.Dst | string | <jms><Dst>*destination*</Dst></jms> |
| JMSExpiration | jms.Exp | i8 | <jms><Exp>*expiration*</Exp></jms> |
| JMSCorrelation | jms.Cid | string | <jms><Cid>*correlationId*</Cid></jms> |
| JMSDelivery | jms.Dlv | i4 | <jms><Dlv>*delivery*</Dlv></jms> |
| JMSPriority | jms.Pri | i4 | <jms><Pri>*priority*</Pri></jms> |

| *Table 520. jms property name, synonym, data type, and folder (continued)* | | | |
|---|---|---|---|
| **Property synonym** | **Property name** | **Data type** | **Folder** |
| JMSReplyTo | jms.Rto | string | <jms><Rto>*replyToURI*</Rto></jms> |
| JMSTimeStamp | jms.Tms | i8 | <jms><Tms>*timestamp*</Tms></jms> |
| JMSXGroupID | jms.Gid | string | <jms><Gid>*groupId*</Gid></jms> |
| JMSXGroupSeq | jms.Seq | i4 | <jms><Seq>*messageSequenceNo*</Seq></jms> |

Do not add your own properties in the jms folder.

**mcd**

mcd contains properties that describe the format of the message. For example, the message service domain Msd property identifies a JMS message as being JMSTextMessage, JMSBytesMessage, JMSStreamMessage, JMSMapMessage, JMSObjectMessage, or null.

The mcd folder is always present in a JMS message containing an MQRFH2.

It is always present in a message containing an MQRFH2 sent from IBM Integration Bus. It describes the domain, format, type, and message set of a message.

| *Table 521. mcd property name, synonym, data type, and folder* | | | |
|---|---|---|---|
| **Property synonym** | **Property name** | **Data type** | **Folder** |
| | mcd.Msd | string | <mcd><Msd>*messageDomain*</Msd></mcd> |
| | mcd.Set | string | <mcd><Set>*messageDomain*</Set></mcd> |
| | mcd.Type | string | <mcd><Type>*messageDomain*</Type></mcd> |
| | mcd.Fmt | string | <mcd><Fmt>*messageDomain*</Fmt></mcd> |

Do not add your own properties in the mcd folder.

**mq_usr**

mq_usr contains application-defined properties that are not exposed as JMS user-defined properties. Properties that do not meet JMS requirements can be placed in this folder.

You can create properties in the mq_usr folder. Properties you create in the mq_usr are like properties you create in new folders with the content='properties' attribute.

**sib**

sib contains WebSphere Application Server service integration bus (WAS/SIB) system message properties. sib properties are not exposed as JMS properties to IBM MQ JMS applications because they are not of the supported types. For example, some sib properties cannot be exposed as JMS properties because they are byte arrays. Some sib properties are exposed to WAS/SIB applications as JMS_IBM_* properties; these include forward and reverse routing paths properties.

Do not add your own properties in the sib folder.

**sib_context**

`sib_context` contains WAS/SIB system message properties that are not exposed to WAS/SIB user applications or as JMS properties. `sib_context` contains security and transactional properties that are used for web services.

Do not add your own properties in the `sib_context` folder.

**sib_usr**

`sib_usr` contains WAS/SIB user message properties that are not exposed as JMS user properties because they are not of supported types. `sib_usr` is exposed to WAS/SIB applications in the `SIMessage` interface. See Developing Service Integration.

The type of a `sib_usr` property must be `bin.hex`, and the value must be in the correct format. If an IBM MQ application writes a `bin.hex` typed element to the folder in the wrong format, the application receives an `IOException`. If the data type of the property is not `bin.hex` the application receives a `ClassCastException`.

Do not attempt to make JMS user properties available to WAS/SIB by using this folder; instead use the `usr` folder.

You can create properties in the `sib_usr` folder.

**usr**

`usr` contains application-defined JMS properties associated with the message. The `usr` folder is present only if an application has set an application-defined property.

`usr` is the default property folder. If a property is set without a folder name, it is placed in the `usr` folder.

*Table 522. `usr` property name, synonym, data type, and folder.*

The web services property values are described in MQRFH2 SOAP settings

| Property synonym | Property name | Data type | Folder |
|---|---|---|---|
| | `usr.contentType` | `string` | `<usr><contentType>text/xml; charset=utf-8</contentType></usr>` |
| | `usr.endPointURL` | `string` | `<usr><endPointURL>`*URI*`</endPointURL></usr>` |
| | `usr.targetService` | `string` | `<usr><targetService>`*serviceName*`</targetService></usr>` |
| | `usr.soapAction` | `string` | `<usr><soapAction>`*name*`</soapAction></usr>` |
| | `usr.transportVersion` | `string` | `<usr><transportVersion>`*version*`</transportVersion></usr>` |

You can create properties in the `usr` folder.

A segmented message put with either `MQMF_SEGMENT` or `MQMF_SEGMENTATION_ALLOWED` cannot contain an `MQRFH2` with a defined property folder name. The `MQPUT` fails with reason code 2443, `MQRC_SEGMENTATION_NOT_ALLOWED`.

## Ungrouped property folder name

**ibm**

ibm contains properties that are used only by IBM MQ.

*Table 523. ibm property name, synonym, data type, and folder*

| Property synonym | Property name | Data type | Folder |
|---|---|---|---|
| | ibm.rfp | string | <ibm><rfp>fingerprint</rfp></ibm> |

Do not add your own properties in the ibm folder.

**mq**

mq contains properties that are used only by IBM MQ.

The following restrictions apply to properties in the mq folder:

- Only properties in the first significant mq folder in the message are acted upon by MQ; properties in any other mq folder in the message are ignored.
- Only single-byte UTF-8 characters are allowed in the folder. A multi-byte character in the folder, can cause parsing to fail, and the message to be rejected.
- Do not use escape strings in the folder. An escape string is treated as the actual value of the element.
- Only Unicode character U+0020 is treated as white space within the folder. All other characters are treated as significant and can cause parsing of the folder to fail, and the message to be rejected.

If parsing of the mq folder fails, or if the folder does not observe these restrictions, the message is rejected with reason code 2527, MQRC_RFH_RESTRICTED_FORMAT_ERR.

Do not add your own properties in the mq folder.

**mqema**

mqema contains properties that are used only by WebSphere Application Server. The folder has been replaced by mqext.

Do not add your own properties in the mqema folder.

**mqext**

mqext contains the following types of property:

- Properties that are used only by WebSphere Application Server.
- Properties relating to delayed delivery of messages.

The folder is present if the application has either set at least one of the IBM defined properties or used delivery delay.

*Table 524. mqext property name, synonym, data type, and folder*

| Property synonym | Property name | Data type | Folder |
|---|---|---|---|
| JMSArmCorrelator | mqext.Arm | string | <mqext><Arm>*armCorrelator*</Arm></mqext> |
| JMSRMCorrelator | mqext.Wrm | string | <mqext><Wrm>*wrmCorrelator*</Wrm></mqext> |
| JMSDeliveryTime | mqext.Dlt | i8 | <mqext><Dlt>*DeliveryTime*</Dlt></mqext> |

| Table 524. mqext property name, synonym, data type, and folder (continued) | | | |
|---|---|---|---|
| **Property synonym** | **Property name** | **Data type** | **Folder** |
| JMSDeliveryDelay | mqext.Dly | i8 | <mqext><Dly>*DeliveryTime*</Dly></mqext> |

Do not add your own properties in the mqext folder.

**mqps**

mqps contains properties that are used only by IBM MQ publish/subscribe. The folder is present only if the application has set at least one of the integrated publish/subscribe properties.

| Table 525. mqps property name, synonym, data type, and folder | | | |
|---|---|---|---|
| **Property synonym** | **Property name** | **Data type** | **Folder** |
| MQTopicString | mqps.Top | string | <mqps><Top>*topicString*</Top></mqps> |
| MQSubUserData | mqps.Sud | string | <mqps><Sud>*subscriberUserData*</Sud></mqps> |
| MQIsRetained | mqps.Ret | boolean | <mqps><Ret>*isRetained*</Ret></mqps> |
| MQPubOptions | mqps.Pub | i8 | <mqps><Pub>*publicationOptions*</Pub></mqps> |
| MQPubLevel | mqps.Pbl | i8 | <mqps><Pbl>*publicationLevel*</Pbl></mqps> |
| MQPubTime | mqpse.Pts | string | <mqps><Pts>*publicationTime*</Pts></mqps> |
| MQPubSeqNum | mqpse.Seq | i8 | <mqps><Seq>*publicationSequenceNumber*</Seq></mqps> |
| MQPubStrIntData | mqpse.Sid | string | <mqps><Sid>*publicationData*</Sid></mqps> |
| MQPubFormat | mqpse.Pfmt | i8 | <mqps><Pfmt>*messageFormat*</Pfmt></mqps> |

Do not add your own properties in the mqps folder.

**mq_svc**

mq_svc contains properties used by SupportPac MA93.

Do not add your own properties in the mq_svc folder.

**mqtt**

mqtt contains properties use by IBM MQ Telemetry

| Table 526. mqtt property name, synonym, data type, and folder | | | |
|---|---|---|---|
| **Property synonym** | **Property name** | **Data type** | **Folder** |
| | mqtt.clientId | string | <mqtt><clientId>*topicString*</clientId></mqtt> |
| | mqtt.qos | i4 | <mqtt><qos>*qualityOfService*</qos></mqtt> |

| Table 526. mqtt property name, synonym, data type, and folder (continued) | | | |
|---|---|---|---|
| **Property synonym** | **Property name** | **Data type** | **Folder** |
| | mqtt.msgid | string | <mqtt><msgid>*messageIdentifier*</msgid></mqtt> |

Do not add your own properties in the mqtt folder.

A segmented message put with either MQMF_SEGMENT or MQMF_SEGMENTATION_ALLOWED cannot contain an MQRFH2 with an ungrouped property folder name. The MQPUT fails with reason code 2443, MQRC_SEGMENTATION_NOT_ALLOWED.

## Name/value pairs

In the syntax diagram, "Name/value pairs" describes the content of an ordinary folder. An ordinary folder contains groups, and elements. An element is a name/value pair. A group contains elements and other groups.

In terms of trees, elements are leaf nodes, and groups are internal nodes. An internal node, and the folder, which is the root node, can contain a mixture of internal nodes and leaf nodes. A node cannot be both an internal node and a leaf node at the same time; see Figure 2 on page 514.

## Properties

In the syntax diagram, "Properties" describes the content of a property folder. A property folder contains groups, and properties. A property is a name/value pair with an optional data type attribute. A group contains properties and other groups.

In terms of trees, properties are leaf nodes, and groups are internal nodes. An internal node, and the property folder, which is the root node, can contain a mixture of internal nodes and leaf nodes. A node cannot be both an internal node and a leaf node at the same time; see Figure 2 on page 514.

## Property

A message property is a name/value pair in a property folder. It can optionally include a data type attribute and a property attribute; for an example, see the following code. If the data type attribute is omitted, the property type is string.

```
<pf><p1 dt='i8' > value </p1></pf>
```

The name of a message property is its full path name, with the XML-like, <> syntax, replaced by dots. For example, myPropertyFolder1.myGroup1.myGroup2.myProperty1 is mapped to a *NameValueData* string as follows. The string is formatted for easier reading.

```
<myPropertyFolder1>
    <myGroup1>
        <myGroup2>
            <myProperty1>value</myProperty1>
        </myGroup2>
    </myGroup1>
</myPropertyFolder1>
```

A property folder can contain multiple properties. For example the properties in Figure 7 on page 521 are mapped to the property folder in Figure 8 on page 521

```
 myPropertyFolder1.myProperty4
myPropertyFolder1.myGroup1.myGroup2.myProperty1
myPropertyFolder1.myGroup1.myGroup2.myProperty2
myPropertyFolder1.myGroup1.myProperty3
```

*Figure 7. Multiple properties with the same root name*

```
<myPropertyFolder1>
    <myProperty4>value</myProperty4>
    <myGroup1>
        <myGroup2>
            <myProperty1>value</myProperty1>
            <myProperty2>value</myProperty2>
        </myGroup2>
        <myProperty3>value</myProperty3>
    </myGroup1>
</myPropertyFolder1>
```

*Figure 8. Multiple property name mapping*

## Name

A name must begin with a *Letter* or an *Underscore*. It must not contain a *Colon*, not end in a *Period* and contain only *Letters*, *Numerals*, *Underscores*, *Hyphens*, and *Dots*. Valid characters are defined in the W3C XML specification, and consist essentially of Unicode categories `Ll, Lu, Lo, Lt, Nl, Mc, Mn, Lm,` and `Nd` ; see Unicode character categories.

The complete path of a property or name/value pair must not break the rule described in "Invalid path name" on page 523. Paths are restricted to 4095 bytes, must not contain Unicode compatibility characters, and must not start with the string `XML`.

## Group name

A group name has the same syntax as a name. Group names are optional. Properties and name/value pairs can be placed in the root of a folder. Use groups if it helps to organize properties and name/value pairs.

## Element name

An element name has the same syntax as a name.

## Element value

An element value includes all the white space between the < *Element name* > tag and the < / *Element name* >. Do not use the two characters < and & in a value. Replace then with < and `&`.

## Property attributes

The property attributes map property descriptor fields: The mappings are as follows:

**Support**

**sa**
MQPD_SUPPORT_OPTIONAL

**sr**
MQPD_SUPPORT_REQUIRED

**sx**
MQPD_SUPPORT_REQUIRED_IF_LOCAL

**Context**

**none**
MQPD_NO_CONTEXT

**user**
MQPD_USER _CONTEXT

**CopyOptions**

**forward**
MQPD_COPY_FORWARD

**reply**
MQPD_COPY_REPLY

**report**
MQPD_COPY_REPORT

**publish**
MQPD_COPY_PUBLISH

**all**
MQPD_COPY_ALL

Do not use `all` in combination with other options.

**default**
MQPD_COPY_DEFAULT

Do not use `default` in combination with other options. `default` is the same as `forward` + `report` + `publish`

**none**
MQPD_COPY_NONE

Do not use none in combination with other options.

The Support property attributes are only applicable to properties in the `mq` folder.

The Context and CopyOptions property attributes are applicable to all property folders.

## Data types

MQRFH2 data types map to message property types as follows:

*Table 527. Data type mappings*

| **MQRFH2 data type** | **Message property type** |
|---|---|
| bin.hex | MQBYTE[] |
| boolean | MQBOOL |
| i1 | MQINT8 |
| i2 | MQINT16 |
| i4 | MQINT32 |
| i8 | MQINT64 |
| r4 | MQFLOAT32 |
| r8 | MQFLOAT64 |
| string | MQCHAR[] |

Any element without a data type is assumed to be of type `string`.

A null value is indicated by the element attribute `xsi:nil='true'`. Do not use the attribute `xsi:nil='false'` for non-null values. For example, the following property has a null value:

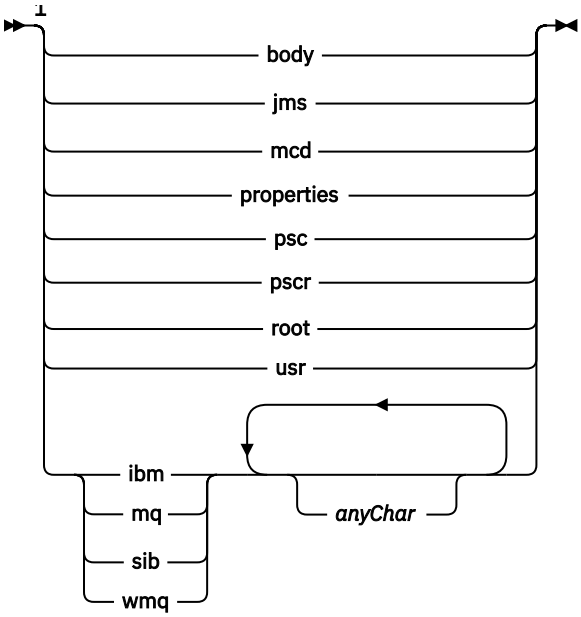
```
<NullProperty
xsi:nil='true'></NullProperty>
```

A byte or character string property can have an empty value. An empty value is represented by an MQRFH2 element with a zero length element value. For example, the following property has an empty value:

```
<EmptyProperty></EmptyProperty>
```

## Reserved folder or property folder name

Restrict the name of a folder or property folder not to start with any of the following strings. The prefixes are reserved for folder or property names created by IBM.

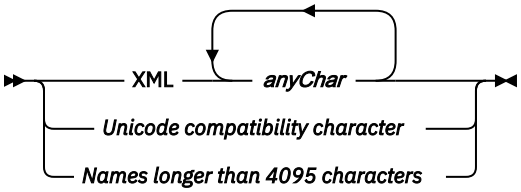


Notes:

[1] A reserved folder or property name contains any mixture of lower and uppercase letters.

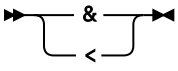
## Invalid path name

Restrict the complete path of a name/value pair or a property not to include any of the following strings.



## Invalid characters

Always use the escape sequences & and < instead of the literals "&" and "<".

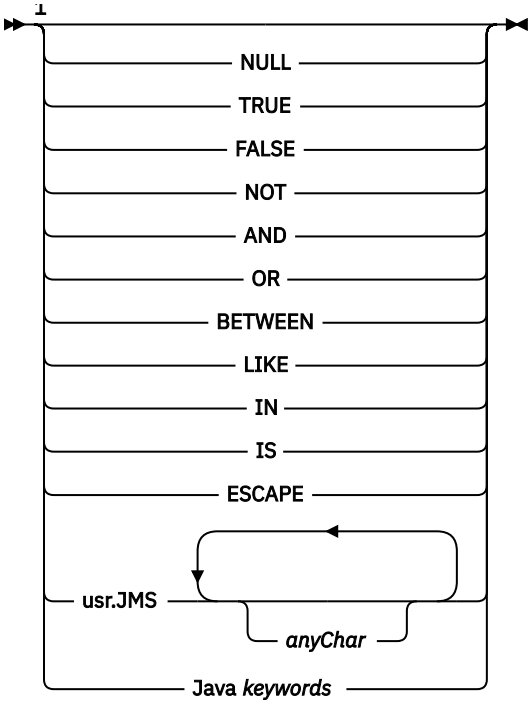


## Defined property names

Defined property names are the names of properties that are defined by IBM MQ, or other products, and used by IBM MQ and user applications. Defined properties exist only in defined property folders. Defined property names are described in the description of property folders; see Property folders.

## Invalid property name

Do not construct property names that match the following rule. The rule applies to the full property path that names a property, and not only to the property element name.



Notes:

[1] An invalid property name can contain any combination of upper and lowercase.

## Invalid attributes

Property folders and properties can include only supported “Property attributes” on page 521 and “Data types” on page 522.

Any non-supported XML-like attributes, for example, names with quoted string values, that are included in property folders or properties might be removed.

XML-like attributes included in non-property folders or non-property elements that remain in MQRFH2 headers.

*NameValueLength ( MQLONG)*
The length of the corresponding `NameValueData` field

This specifies the length in bytes of the data in the *`NameValueData`* field. *`NameValueLength`* must be a multiple of four.

**Note:** The *`NameValueLength`* and *`NameValueData`* fields are optional, but if present they must occur as a pair and be adjacent. The pair of fields can be repeated as many times as required, for example:

```
length1 data1 length2 data2 length3 data3
```

Because these fields are optional, they are omitted from the declarations of the structure that are provided for the various programming languages supported.

*StrucId (MQCHAR4)*

This is the structure identifier; the value must be:

**MQRFH_STRUC_ID**
Identifier for rules and formatting header structure.

For the C programming language, the constant MQRFH_STRUC_ID_ARRAY is also defined; this has the same value as MQRFH_STRUC_ID, but is an array of characters instead of a string.

The initial value of this field is MQRFH_STRUC_ID.

*StrucLength (MQLONG)*

This is the length in bytes of the MQRFH2 structure, including the *NameValueLength* and *NameValueData* fields at the end of the structure. It is valid for there to be multiple pairs of *NameValueLength* and *NameValueData* fields at the end of the structure, in the sequence:

```
length1, data1, length2, data2, ...
```

*StrucLength* does *not* include any user data that might follow the last *NameValueData* field at the end of the structure.

To avoid problems with converting the user data in some environments, *StrucLength* must be a multiple of four.

The following constant gives the length of the *fixed* part of the structure, that is, the length excluding the *NameValueLength* and *NameValueData* fields:

**MQRFH_STRUC_LENGTH_FIXED_2**
Length of fixed part of MQRFH2 structure.

The initial value of this field is MQRFH_STRUC_LENGTH_FIXED_2.

*Version (MQLONG)*

This is the structure version number; the value must be:

**MQRFH_VERSION_2**
Version-2 rules and formatting header structure.

The initial value of this field is MQRFH_VERSION_2.

## *Initial values and language declarations for MQRFH2*

*Table 528. Initial values of fields in MQRFH2 for MQRFH2*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQRFH_STRUC_ID | 'RFH¬' |
| *Version* | MQRFH_VERSION_2 | 2 |
| *StrucLength* | MQRFH_STRUC_LENGTH_FIXED_2 | 36 |
| *Encoding* | MQENC_NATIVE | Depends on environment |
| *CodedCharSetId* | MQCCSI_INHERIT | -2 |
| *Format* | MQFMT_NONE | Blanks |
| *Flags* | MQRFH_NONE | 0 |

*Table 528. Initial values of fields in MQRFH2 for MQRFH2 (continued)*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *NameValueCCSID* | None | 1208 |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. In the C programming language, the macro variable MQRFH2_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQRFH2 MyRFH2 = {MQRFH2_DEFAULT};
```

*C declaration*

```
typedef struct tagMQRFH2 MQRFH2;
struct tagMQRFH2 {
  MQCHAR4  StrucId;         /* Structure identifier */
  MQLONG   Version;         /* Structure version number */
  MQLONG   StrucLength;     /* Total length of MQRFH2 including all
                               NameValueLength and NameValueData
                               fields */
  MQLONG   Encoding;        /* Numeric encoding of data that follows

## MQRMH - Reference message header

The following table summarizes the fields in the structure.

*Table 529. Fields in MQRMH*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *StrucLength* | Total length of MQRMH, including strings at end of fixed fields, but not the bulk data | StrucLength |
| *Encoding* | Numeric encoding of bulk data | Encoding |
| *CodedCharSetId* | Character set identifier of bulk data | CodedCharSetId |
| *Format* | Format name of bulk data | Format |
| *Flags* | Reference message flags | Flags |

| Table 529. Fields in MQRMH (continued) | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *ObjectType* | Object type | ObjectType |
| *ObjectInstanceId* | Object instance identifier | ObjectInstanceId |
| *SrcEnvLength* | Length of source environment data | SrcEnvLength |
| *SrcEnvOffset* | Offset of source environment data | SrcEnvOffset |
| *SrcNameLength* | Length of source object name | SrcNameLength |
| *SrcNameOffset* | Offset of source object name | SrcNameOffset |
| *DestEnvLength* | Length of destination environment data | DestEnvLength |
| *DestEnvOffset* | Offset of destination environment data | DestEnvOffset |
| *DestNameLength* | Length of destination object name | DestNameLength |
| *DestNameOffset* | Offset of destination object name | DestNameOffset |
| *DataLogicalLength* | Length of bulk data | DataLogicalLength |
| *DataLogicalOffset* | Low offset of bulk data | DataLogicalOffset |
| *DataLogicalOffset2* | High offset of bulk data | DataLogicalOffset2 |

## *Overview for MQRMH*

**Availability**: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.

**Purpose**: The MQRMH structure defines the format of a reference message header. This header is used with user-written message channel exits to send extremely large amounts of data (called *bulk data* ) from one queue manager to another. The difference compared to normal messaging is that the bulk data is not stored on a queue; instead, only a *reference* to the bulk data is stored on the queue. This reduces the possibility of MQ resources being exhausted by a small number of extremely large messages.

**Format name**: MQFMT_REF_MSG_HEADER.

**Character set and encoding**: Character data in MQRMH, and the strings addressed by the offset fields, must be in the character set of the local queue manager; this is given by the *CodedCharSetId* queue-manager attribute. Numeric data in MQRMH must be in the native machine encoding; this is given by the value of MQENC_NATIVE for the C programming language.

Set the character set and encoding of the MQRMH into the *CodedCharSetId* and *Encoding* fields in:

- The MQMD (if the MQRMH structure is at the start of the message data), or
- The header structure that precedes the MQRMH structure (all other cases).

**Usage**: An application puts a message consisting of an MQRMH, but omitting the bulk data. When a message channel agent (MCA) reads the message from the transmission queue, a user-supplied message exit is invoked to process the reference message header. The exit can append to the reference message the bulk data identified by the MQRMH structure, before the MCA sends the message through the channel to the next queue manager.

At the receiving end, a message exit that waits for reference messages must exist. When a reference message is received, the exit must create the object from the bulk data that follows the MQRMH in the message, and then pass on the reference message without the bulk data. The reference message can later be retrieved by an application reading the reference message (without the bulk data) from a queue.

Normally, the MQRMH structure is all that is in the message. However, if the message is on a transmission queue, one or more additional headers precede the MQRMH structure.

A reference message can also be sent to a distribution list. In this case, the MQDH structure and its related records precede the MQRMH structure when the message is on a transmission queue.

**Note:** Do not send a reference message as a segmented message, because the message exit cannot process it correctly.

**Data conversion**: For data conversion purposes, converting the MQRMH structure includes conversion of the source environment data, source object name, destination environment data, and destination object name. Any other bytes within *StrucLength* bytes of the start of the structure are either discarded or have undefined values after data conversion. The bulk data is converted provided that all the following are true:

- The bulk data is present in the message when the data conversion is performed.
- The *Format* field in MQRMH has a value other than MQFMT_NONE.
- A user-written data-conversion exit exists with the format name specified.

Be aware, however, that usually the bulk data is *not* present in the message when the message is on a queue, and that as a result the bulk data is converted by the MQGMO_CONVERT option.

## *Fields for MQRMH*

The MQRMH structure contains the following fields; the fields are described in **alphabetical order**:

*CodedCharSetId (MQLONG)*

This specifies the character set identifier of the bulk data; it does not apply to character data in the MQRMH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The following special value can be used:

**MQCCSI_INHERIT**
Character data in the data *following* this structure is in the same character set as this structure.

The queue manager changes this value in the structure sent in the message to the actual character-set identifier of the structure. Provided no error occurs, the value MQCCSI_INHERIT is not returned by the MQGET call.

Do not use MQCCSI_INHERIT if the value of the *PutApplType* field in MQMD is MQAT_BROKER.

This value is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.

The initial value of this field is MQCCSI_UNDEFINED.

*DataLogicalLength (MQLONG)*

The *DataLogicalLength* field specifies the length of the bulk data referenced by the MQRMH structure.

If the bulk data is actually present in the message, the data begins at an offset of *StrucLength* bytes from the start of the MQRMH structure. The length of the entire message minus *StrucLength* gives the length of the bulk data present.

If data is present in the message, *DataLogicalLength* specifies the amount of that data that is relevant. The normal case is for *DataLogicalLength* to have the same value as the length of data present in the message.

If the MQRMH structure represents the remaining data in the object (starting from the specified logical offset), you can use the value zero for *DataLogicalLength*, provided that the bulk data is not actually present in the message.

If no data is present, the end of MQRMH coincides with the end of the message.

The initial value of this field is 0.

*DataLogicalOffset (MQLONG)*

This field specifies the low offset of the bulk data from the start of the object of which the bulk data forms part. The offset of the bulk data from the start of the object is called the *logical offset*. This is *not* the physical offset of the bulk data from the start of the MQRMH structure; that offset is given by *StrucLength*.

To allow large objects to be sent using reference messages, the logical offset is divided into two fields, and the actual logical offset is given by the sum of these two fields:

- *DataLogicalOffset* represents the remainder obtained when the logical offset is divided by 1 000 000 000. It is thus a value in the range 0 through 999 999 999.
- *DataLogicalOffset2* represents the result obtained when the logical offset is divided by 1 000 000 000. It is thus the number of complete multiples of 1 000 000 000 that exist in the logical offset. The number of multiples is in the range 0 through 999 999 999.

The initial value of this field is 0.

*DataLogicalOffset2 (MQLONG)*

This field specifies the high offset of the bulk data from the start of the object of which the bulk data forms part. It is a value in the range 0 through 999 999 999. See *DataLogicalOffset* for details.

The initial value of this field is 0.

*DestEnvLength (MQLONG)*

This is the length of the destination environment data. If this field is zero, there is no destination environment data, and *DestEnvOffset* is ignored.

*DestEnvOffset (MQLONG)*

This field specifies the offset of the destination environment data from the start of the MQRMH structure. Destination environment data can be specified by the creator of the reference message, if that data is known to the creator. For example, on Windows the destination environment data might be the directory path of the object where the bulk data is to be stored. However, if the creator does not know the destination environment data, it is the responsibility of the user-supplied message exit to determine any environment information needed.

The length of the destination environment data is given by *DestEnvLength* ; if this length is zero, there is no destination environment data, and *DestEnvOffset* is ignored. If present, the destination environment data must reside completely within *StrucLength* bytes from the start of the structure.

Applications must not assume that the destination environment data is contiguous with any of the data addressed by the *SrcEnvOffset*, *SrcNameOffset*, and *DestNameOffset* fields.

The initial value of this field is 0.

*DestNameLength (MQLONG)*

The length of the destination object name. If this field is zero, there is no destination object name, and *DestNameOffset* is ignored.

*DestNameOffset (MQLONG)*

This field specifies the offset of the destination object name from the start of the MQRMH structure. The destination object name can be specified by the creator of the reference message, if that data is known to the creator. However, if the creator does not know the destination object name, it is the responsibility of the user-supplied message exit to identify the object to be created or modified.

The length of the destination object name is given by *DestNameLength* ; if this length is zero, there is no destination object name, and *DestNameOffset* is ignored. If present, the destination object name must reside completely within *StrucLength* bytes from the start of the structure.

Applications must not assume that the destination object name is contiguous with any of the data addressed by the *SrcEnvOffset*, *SrcNameOffset*, and *DestEnvOffset* fields.

The initial value of this field is 0.

*Encoding (MQLONG)*

This specifies the numeric encoding of the bulk data; it does not apply to numeric data in the MQRMH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data.

The initial value of this field is MQENC_NATIVE.

*Flags (MQLONG)*

These are reference message flags. The following flags are defined:

**MQRMHF_LAST**
This flag indicates that the reference message represents or contains the last part of the referenced object.

**MQRMHF_NOT_LAST**
Reference message does not contain or represent last part of object. MQRMHF_NOT_LAST aids program documentation. It is not intended that this option be used with any other, but as its value is zero, such use cannot be detected.

The initial value of this field is MQRMHF_NOT_LAST.

*Format (MQCHAR8)*

This specifies the format name of the bulk data.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The rules for coding this field are the same as those for the *Format* field in MQMD.

The initial value of this field is MQFMT_NONE.

*ObjectInstanceId (MQBYTE24)*

Use this field to identify a specific instance of an object. If it is not needed, set it to the following value:

**MQOII_NONE**
No object instance identifier specified. The value is binary zero for the length of the field.

For the C programming language, the constant MQOII_NONE_ARRAY is also defined; this has the same value as MQOII_NONE, but is an array of characters instead of a string.

The length of this field is given by MQ_OBJECT_INSTANCE_ID_LENGTH. The initial value of this field is MQOII_NONE.

*ObjectType (MQCHAR8)*

This is a name that the message exit can use to recognize types of reference message that it supports. The name must conform to the same rules as the *Format* field, see "Format (MQCHAR8)" on page 531.

The initial value of this field is 8 blanks.

*SrcEnvLength (MQLONG)*

The length of the source environment data. If this field is zero, there is no source environment data, and *SrcEnvOffset* is ignored.

The initial value of this field is 0.

*SrcEnvOffset (MQLONG)*

This field specifies the offset of the source environment data from the start of the MQRMH structure. Source environment data can be specified by the creator of the reference message, if that data is known to the creator. For example, on Windows the source environment data might be the directory path of the object containing the bulk data. However, if the creator does not know the source environment data, the user-supplied message exit must determine any environment information needed.

The length of the source environment data is given by *SrcEnvLength* ; if this length is zero, there is no source environment data, and *SrcEnvOffset* is ignored. If present, the source environment data must reside completely within *StrucLength* bytes from the start of the structure.

Applications must not assume that the environment data starts immediately after the last fixed field in the structure or that it is contiguous with any of the data addressed by the *SrcNameOffset*, *DestEnvOffset*, and *DestNameOffset* fields.

The initial value of this field is 0.

*SrcNameLength (MQLONG)*

The length of the source object name. If this field is zero, there is no source object name, and *SrcNameOffset* is ignored.

The initial value of this field is 0.

*SrcNameOffset (MQLONG)*

This field specifies the offset of the source object name from the start of the MQRMH structure. The source object name can be specified by the creator of the reference message, if that data is known to the creator. However, if the creator does not know the source object name, the user-supplied message exit must identify the object to be accessed.

The length of the source object name is given by *SrcNameLength* ; if this length is zero, there is no source object name, and *SrcNameOffset* is ignored. If present, the source object name must reside completely within *StrucLength* bytes from the start of the structure.

Applications must not assume that the source object name is contiguous with any of the data addressed by the *SrcEnvOffset*, *DestEnvOffset*, and *DestNameOffset* fields.

The initial value of this field is 0.

*StrucId (MQCHAR4)*

This is the structure identifier; the value must be:

**MQRMH_STRUC_ID**
Identifier for reference message header structure.

For the C programming language, the constant MQRMH_STRUC_ID_ARRAY is also defined; this has the same value as MQRMH_STRUC_ID, but is an array of characters instead of a string.

The initial value of this field is MQRMH_STRUC_ID.

*StrucLength (MQLONG)*
The total length of MQRMH, including strings at the end of fixed fields, but not the bulk data.

The initial value of this field is zero.

*Version (MQLONG)*

The structure version number. The value must be:

**MQRMH_VERSION_1**
Version-1 reference message header structure.

The following constant specifies the version number of the current version:

**MQRMH_CURRENT_VERSION**
Current version of reference message header structure.

The initial value of this field is MQRMH_VERSION_1.

### *Initial values and language declarations for MQRMH*

*Table 530. Initial values of fields in MQRMH for MQRMH*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQRMH_STRUC_ID | 'RMH¬' |
| *Version* | MQRMH_VERSION_1 | 1 |
| *StrucLength* | None | 0 |
| *Encoding* | MQENC_NATIVE | Depends on environment |
| *CodedCharSetId* | MQCCSI_UNDEFINED | 0 |
| *Format* | MQFMT_NONE | Blanks |
| *Flags* | MQRMHF_NOT_LAST | 0 |
| *ObjectType* | None | Blanks |
| *ObjectInstanceId* | MQOII_NONE | Nulls |
| *SrcEnvLength* | None | 0 |
| *SrcEnvOffset* | None | 0 |
| *SrcNameLength* | None | 0 |
| *SrcNameOffset* | None | 0 |
| *DestEnvLength* | None | 0 |
| *DestEnvOffset* | None | 0 |
| *DestNameLength* | None | 0 |
| *DestNameOffset* | None | 0 |
| *DataLogicalLength* | None | 0 |
| *DataLogicalOffset* | None | 0 |
| *DataLogicalOffset2* | None | 0 |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. In the C programming language, the macro variable MQRMH_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQRMH MyRMH = {MQRMH_DEFAULT};
```

*C declaration*

```
typedef struct tagMQRMH MQRMH;
struct tagMQRMH {
  MQCHAR4   StrucId;             /* Structure identifier */
  MQLONG    Version;             /* Structure version number */

## MQRR - Response record

The following table summarizes the fields in the structure.

*Table 531. Fields in MQRR*

| Field | Description | Topic |
|---|---|---|
| *CompCode* | Completion code for queue | CompCode |
| *Reason* | Reason code for queue | Reason |

### *Overview for MQRR*

**Availability**: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.

**Purpose**: Use the MQRR structure to receive the completion code and reason code resulting from the open or put operation for a single destination queue, when the destination is a distribution list. MQRR is an output structure for the MQOPEN, MQPUT, and MQPUT1 calls.

**Character set and encoding**: Data in MQRR must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

**Usage**: By providing an array of these structures on the MQOPEN and MQPUT calls, or on the MQPUT1 call, you can determine the completion codes and reason codes for all the queues in a distribution list when the outcome of the call is mixed, that is, when the call succeeds for some queues in the list but fails for others. Reason code MQRC_MULTIPLE_REASONS from the call indicates that the response records (if provided by the application) have been set by the queue manager.

### *Fields for MQRR*

The MQRR structure contains the following fields; the fields are described in **alphabetical order**:

*CompCode (MQLONG)*

This is the completion code resulting from the open or put operation for the queue with the name that was specified by the corresponding element in the array of MQOR structures provided on the MQOPEN or MQPUT1 call.

This is always an output field. The initial value of this field is MQCC_OK.

*Reason (MQLONG)*

This is the reason code resulting from the open or put operation for the queue with the name that was specified by the corresponding element in the array of MQOR structures provided on the MQOPEN or MQPUT1 call.

This is always an output field. The initial value of this field is MQRC_NONE.

### *Initial values and language declarations for MQRR*

*Table 532. Initial values of fields in MQRR for MQRR*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *CompCode* | MQCC_OK | 0 |
| *Reason* | MQRC_NONE | 0 |

**Notes:**

1. In the C programming language, the macro variable MQRR_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQRR MyRR = {MQRR_DEFAULT};
```

*C declaration*

```
typedef struct tagMQRR MQRR;
struct tagMQRR {
  MQLONG  CompCode;  /* Completion code for queue */
  MQLONG  Reason;    /* Reason code for queue */
};
```

*COBOL declaration*

```
**   MQRR structure
  10 MQRR.
**    Completion code for queue
   15 MQRR-COMPCODE PIC S9(9) BINARY.
**    Reason code for queue
   15 MQRR-REASON   PIC S9(9) BINARY.
```

*PL/I declaration*

```
dcl
 1 MQRR based,
  3 CompCode fixed bin(31), /* Completion code for queue */
  3 Reason   fixed bin(31); /* Reason code for queue */
```

*Visual Basic declaration*

```
Type MQRR
  CompCode As Long 'Completion code for queue'
  Reason   As Long 'Reason code for queue'
End Type
```

## MQSCO - SSL configuration options

The following table summarizes the fields in the structure.

*Table 533. Fields in MQSCO*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *KeyRepository* | Location of key repository | KeyRepository |

| Table 533. Fields in MQSCO (continued) | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *CryptoHardware* | Details of cryptographic hardware | CryptoHardware |
| *AuthInfoRecCount* | Number of MQAIR records present | AuthInfoRecCount |
| *AuthInfoRecOffset* | Offset of first MQAIR record from start of MQSCO | AuthInfoRecOffset |
| *AuthInfoRecPtr* | Address of first MQAIR record | AuthInfoRecPtr |
| **Note:** The following two fields are ignored if *Version* is less than MQSCO_VERSION_2. | | |
| *KeyResetCount* | SSL secret key reset count | KeyResetCount |
| *FipsRequired* | Use FIPS-certified cryptographic algorithms in IBM MQ | "FipsRequired (MQLONG)" on page 540 |
| **Note:** The following field is ignored if *Version* is less than MQSCO_VERSION_3. | | |
| *EncryptionPolicySuiteB* | Use only Suite B cryptographic algorithms | EncryptionPolicySuiteB |
| **Note:** The following field is ignored if *Version* is less than MQSCO_VERSION_4. | | |
| *CertificateValPolicy* | Certificate validation policy | CertificateValPolicy |
| **Note:** The following field is ignored if *Version* is less than MQSCO_VERSION_5. | | |
| *CertificateLabel* | Details the certificate label that is being used. | CertificateLabel |

"MQCNO - Connect options" on page 310
The following table summarizes the fields in the structure.

"Overview for MQSCO" on page 538
**Availability**: AIX, HP-UX, IBM i, Solaris, Linux and Windows clients.

"Fields for MQSCO" on page 538

"Initial values and language declarations for MQSCO" on page 542

## *Overview for MQSCO*

**Availability**: AIX, HP-UX, IBM i, Solaris, Linux and Windows clients.

**Purpose**: The MQSCO structure (in conjunction with the SSL fields in the MQCD structure) allows an application running as an IBM MQ MQI client to specify configuration options that control the use of SSL for the client connection when the channel protocol is TCP/IP. The structure is an input parameter on the MQCONNX call.

If the channel protocol for the client channel is not TCP/IP, the MQSCO structure is ignored.

**Character set and encoding**: Data in MQSCO must be in the character set given by the *CodedCharSetId* queue-manager attribute, and encoding of the local queue manager given by MQENC_NATIVE.

## *Fields for MQSCO*

The MQSCO structure contains the following fields; the fields are described in **alphabetical order**:

*AuthInfoRecCount (MQLONG)*

This is the number of authentication information (MQAIR) records addressed by the *AuthInfoRecPtr* or *AuthInfoRecOffset* fields. For more information, see"MQAIR - Authentication information record"

on page 267. The value must be zero or greater. If the value is not valid, the call fails with reason code MQRC_AUTH_INFO_REC_COUNT_ERROR.

This is an input field. The initial value of this field is 0.

*AuthInfoRecOffset (MQLONG)*

This is the offset in bytes of the first authentication information record from the start of the MQSCO structure. The offset can be positive or negative. The field is ignored if *AuthInfoRecCount* is zero.

You can use either *AuthInfoRecOffset* or *AuthInfoRecPtr* to specify the MQAIR records, but not both; see the description of the *AuthInfoRecPtr* field for details.

This is an input field. The initial value of this field is 0.

*AuthInfoRecPtr (PMQAIR)*

This is the address of the first authentication information record. The field is ignored if *AuthInfoRecCount* is zero.

You can provide the array of MQAIR records in one of two ways:

- By using the pointer field *AuthInfoRecPtr*

  In this case, the application can declare an array of MQAIR records that is separate from the MQSCO structure, and set *AuthInfoRecPtr* to the address of the array.

  Consider using *AuthInfoRecPtr* for programming languages that support the pointer data type in a fashion that is portable to different environments (for example, the C programming language).
- By using the offset field *AuthInfoRecOffset*

  In this case, the application must declare a compound structure containing an MQSCO followed by the array of MQAIR records, and set *AuthInfoRecOffset* to the offset of the first record in the array from the start of the MQSCO structure. Ensure that this value is correct, and has a value that can be accommodated within an MQLONG (the most restrictive programming language is COBOL, for which the valid range is -999 999 999 through +999 999 999).

  Consider using *AuthInfoRecOffset* for programming languages that do not support the pointer data type, or that implement the pointer data type in a fashion that is not portable to different environments (for example, the COBOL programming language).

Whatever technique you choose, only one of *AuthInfoRecPtr* and *AuthInfoRecOffset* can be used; the call fails with reason code MQRC_AUTH_INFO_REC_ERROR if both are nonzero.

This is an input field. The initial value of this field is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise.

**Note:** On platforms where the programming language does not support the pointer data type, this field is declared as a byte string of the appropriate length.

*CertificateLabel (MQCHAR64)*
This field gives details of the certificate label being used.

IBM MQ initializes the default value for the *CertificateLabel* field as blanks.

This is interpreted at runtime as the default value, and is backwards compatible.

For example, specifying a MQSCO version less than 5.0, or using the default value of blanks for the *CertificateLabel* field, uses the preexisting default value of `ibmwebspheremq<user_id>`.

*CertificateValPolicy (MQLONG)*

This field specifies what type of certificate validation policy is used. The field can be set to one of the following values:

**MQ_CERT_VAL_POLICY_ANY**
Apply each of the certificate validation policies supported by the secure sockets library. Accept the certificate chain if any of the policies considers the certificate chain valid.

**MQ_CERT_VAL_POLICY_RFC5280**
Apply only the RFC5280 compliant certificate validation policy. This setting provides stricter validation than the ANY setting, but rejects some older digital certificates.

The initial value of this field is MQ_CERT_VAL_POLICY_ANY

*CryptoHardware (MQCHAR256)*
This field gives configuration details for cryptographic hardware connected to the client system.

Set the field to a string of the following format, or leave it blank or null:

```
GSK_PKCS11=< the PKCS #11 driver path and file name >;< the PKCS #11
token label >;< the PKCS #11 token password >; <symmetric cipher setting>;
```

To use cryptographic hardware which conforms to the PKCS #11 interface, for example, the IBM 4960 or IBM 4764, the PKCS #11 driver path, PKCS #11 token label, and PKCS #11 token password strings must be specified, each terminated by a semi-colon.

The PKCS #11 driver path is an absolute path to the shared library providing support for the PKCS #11 card. The PKCS #11 driver file name is the name of the shared library. An example of the value required for the PKCS #11 path and file name is:

```
/usr/lib/pkcs11/PKCS11_API.so
```

The PKCS #11 token label must match the label you configured your hardware with.

If no cryptographic hardware configuration is required, set the field to blank or null.

If the value is shorter than the length of the field, terminate the value with a null character, or pad it with blanks to the length of the field. If the value is not valid, or leads to a failure when used to configure the cryptographic hardware, the call fails with reason code MQRC_CRYPTO_HARDWARE_ERROR.

This is an input field. The length of this field is given by MQ_SSL_CRYPTO_HARDWARE_LENGTH. The initial value of this field is the null string in C, and blank characters in other programming languages.

*EncryptionPolicySuiteB(MQLONG)*

This field Specifies whether Suite B compliant cryptography is used and what level of strength is employed. The value can be one or more of:

- MQ_SUITE_B_NONE

  Suite B compliant cryptography is not used.
- MQ_SUITE_B_128_BIT

  Suite B 128-bit strength security is used.
- MQ_SUITE_B_192_BIT

  Suite B 192-bit strength security is used.

**Note:** Using the MQ_SUITE_B_NONE with any other value in this field is invalid.

*FipsRequired (MQLONG)*
IBM MQ can be configured with cryptographic hardware so that the cryptography modules used are those provided by the hardware product; these can be FIPS-certified to a particular level depending on the cryptographic hardware product in use. Use this field to specify that only FIPS-certified algorithms are used if the cryptography is provided in IBM MQ-provided software.

When IBM MQ is installed an implementation of SSL cryptography is also installed which provides some FIPS-certified modules.

The values can be:

**MQSSL_FIPS_NO**
This is the default value. When set to this value:

- Any CipherSpec supported on a particular platform can be used.
- If run without use of cryptographic hardware, the following CipherSpecs run using FIPS 140-2 certified cryptography on the IBM MQ platforms:
  - TLS_RSA_WITH_3DES_EDE_CBC_SHA
  - TLS_RSA_WITH_AES_128_CBC_SHA
  - TLS_RSA_WITH_AES_256_CBC_SHA

**MQSSL_FIPS_YES**
When set to this value, unless you are using cryptographic hardware to perform the cryptography, you can be sure that

- Only FIPS-certified cryptographic algorithms can be used in the CipherSpec applying to this client connection.
- Inbound and outbound SSL channel connections only succeed if one of the following Cipher Specs are used:
  - TLS_RSA_WITH_3DES_EDE_CBC_SHA
  - TLS_RSA_WITH_AES_128_CBC_SHA
  - TLS_RSA_WITH_AES_256_CBC_SHA

**Notes:**

1. CipherSpec TLS_RSA_WITH_3DES_EDE_CBC_SHA is deprecated.
2. Where possible, if FIPS-only CipherSpecs are configured then the MQI client rejects connections which specify a non-FIPS CipherSpec with MQRC_SSL_INITIALIZATION_ERROR. IBM MQ does not guarantee to reject all such connections and it is your responsibility to determine whether your IBM MQ configuration is FIPS-compliant.

*KeyRepository (MQCHAR256)*

This field is relevant only for IBM MQ MQI clients running on UNIX, Linux, and Windows systems. It specifies the location of the key database file in which keys and certificates are stored. The key database file must have a file name of the form `zzz.kdb`, where `zzz` is user-selectable. The *KeyRepository* field contains the path to this file, along with the file name stem (all characters in the file name up to but not including the final `.kdb`). The `.kdb` file suffix is added automatically.

Each key database file has an associated *password stash file*. This holds encoded passwords that are used to allow programmatic access to the key database. The password stash file must reside in the same directory and have the same file stem as the key database, and must end with the suffix `.sth`.

For example, if the *KeyRepository* field has the value `/xxx/yyy/key`, the key database file must be `/xxx/yyy/key.kdb`, and the password stash file must be `/xxx/yyy/key.sth`, where `xxx` and `yyy` represent directory names.

If the value is shorter than the length of the field, terminate the value with a null character, or pad it with blanks to the length of the field. The value is not checked; if there is an error in accessing the key repository, the call fails with reason code MQRC_KEY_REPOSITORY_ERROR.

To run an SSL connection from an IBM MQ MQI client, set *KeyRepository* to a valid key database file name.

This is an input field. The length of this field is given by MQ_SSL_KEY_REPOSITORY_LENGTH. The initial value of this field is the null string in C, and blank characters in other programming languages.

*KeyResetCount (MQLONG)*
This represents the total number of unencrypted bytes sent and received within an SSL or TLS conversation before the secret key is renegotiated.

The number of bytes includes control information sent by the MCA.

If you specify an SSL or TLS secret key reset count in the range 1 byte through 32 KB, SSL or TLS channels will use a secret key reset count of 32 KB. This is to avoid the processing cost of excessive key resets which would occur for small SSL or TLS secret key reset values.

This is an input field. The value is a number in the range 0 through 999 999 999, with a default value of 0. Use a value of 0 to indicate that secret keys are never renegotiated.

*StrucId (MQCHAR4)*

This is the structure identifier; the value must be:

**MQSCO_STRUC_ID**
Identifier for SSL configuration options structure.

For the C programming language, the constant MQSCO_STRUC_ID_ARRAY is also defined; this has the same value as MQSCO_STRUC_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQSCO_STRUC_ID.

*Version (MQLONG)*

This is the structure version number; the value must be:

**MQSCO_VERSION_1**
Version-1 SSL configuration options structure.

**MQSCO_VERSION_2**
Version-2 SSL configuration options structure.

**MQSCO_VERSION_3**
Version-3 SSL configuration options structure.

**MQSCO_VERSION_4**
Version-4 SSL configuration options structure.

**MQSCO_VERSION_5**
Version-5 SSL configuration options structure.

The following constant specifies the version number of the current version:

**MQSCO_CURRENT_VERSION**
Current version of SSL configuration options structure.

This is always an input field. The initial value of this field is MQSCO_VERSION_1.

## *Initial values and language declarations for MQSCO*

*Table 534. Initial values of fields in MQSCO*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQSCO_STRUC_ID | 'SCO¬' |
| *Version* | MQSCO_CURRENT_VERSION | 1 |
| *KeyRepository* | None | Null string or blanks |
| *CryptoHardware* | None | Null string or blanks |
| *AuthInfoRecCount* | None | 0 |
| *AuthInfoRecOffset* | None | 0 |
| *AuthInfoRecPtr* | None | Null pointer or null bytes |

| Table 534. Initial values of fields in MQSCO (continued) | | |
|---|---|---|
| **Field name** | **Name of constant** | **Value of constant** |
| *KeyResetCount* | MQSCO_RESET_COUNT_DEFAULT | 0 |
| *FipsRequired* | MQSSL_FIPS_NO | 0 |
| *EncryptionPolicySuiteB* | MQ_SUITE_B_NONE,<br>MQ_SUITE_B_NOT_AVAILABLE,<br>MQ_SUITE_B_NOT_AVAILABLE,<br>MQ_SUITE_B_NOT_AVAILABLE | 1,<br>0,<br>0,<br>0 |
| *CertificateValPolicy* | MQ_CERT_VAL_POLICY_DEFAULT | 0 |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. In the C programming language, the macro variable MQSCO_DEFAULT contains the values listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQSCO MySCO = {MQSCO_DEFAULT};
```

*C declaration*

```
typedef struct tagMQSCO MQSCO;
struct tagMQSCO {
   MQCHAR4    StrucId;                    /* Structure identifier */
   MQLONG     Version;                    /* Structure version number */
   MQCHAR256  KeyRepository;              /* Location of SSL key */
                                          /* repository */
   MQCHAR256  CryptoHardware;             /* Cryptographic hardware */
                                          /* configuration string */
   MQLONG     AuthInfoRecCount;           /* Number of MQAIR records */
                                          /* present */
   MQLONG     AuthInfoRecOffset;          /* Offset of first MQAIR */
                                          /* record from start of */
                                          /* MQSCO structure */
   PMQAIR     AuthInfoRecPtr;             /* Address of first MQAIR */
                                          /* record */
/* Ver:1 */

## MQSD - Subscription descriptor

The following table summarizes the fields in the structure.

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |

| Field | Description | Topic |
|---|---|---|
| *Version* | Structure version number | Version |
| *Options* | Options | Options |
| *ObjectName* | Object name | ObjectName |
| *AlternateUserId* | Alternate User Id | AlternateUserId |
| *AlternateSecurityId* | Alternate Security ID | AlternateSecurityId |
| *SubExpiry* | Subscription Expiry | SubExpiry |
| *ObjectString* | Object String | ObjectString |
| *SubName* | Subscription Name | SubName |
| *SubUserData* | Subscription user data | SubUserData |
| *SubCorrelId* | Subscription Correlation ID | SubCorrelId |
| *PubPriority* | Publication priority | PubPriority |
| *PubAccountingToken* | Publication Accounting Token | PubAccountingToken |
| *PubAppIdentityData* | Publication application identity data | PubAppIdentityData |
| *SelectionString* | String providing selection criteria | SelectionString |
| *SubLevel* | Subscription Level | SubLevel |
| *ResObjectString* | Long object name | ResObjectString |

## *Overview for MQSD*

**Availability**: AIX, HP-UX, IBM i, Solaris, Linux, Windows, z/OS, plus IBM MQ MQI clients connected to these systems.

**Purpose**: The MQSD structure is used to specify details about the subscription being made.

The structure is an input/output parameter on the MQSUB call. For more information, see MQSUB usage notes.

**Managed subscriptions**: If an application has no specific need to use a particular queue as the destination for those publications that match its subscription, it can use the managed subscription feature. If an application elects to use a managed subscription, the queue manager informs the subscriber about the destination where published messages are sent, by providing an object handle as an output from the MQSUB call. For more information, see Hobj (MQHOBJ) - input/output.

When the subscription is removed, the queue manager also undertakes to clean up messages that have not been retrieved from the managed destination, in the following situations:

- When the subscription is removed - by use of MQCLOSE with MQCO_REMOVE_SUB - and the managed Hobj is closed.
- By implicit means when the connection is lost to an application using a non-durable subscription (MQSO_NON_DURABLE)
- By expiration when a subscription is removed because it has expired and the managed Hobj is closed.

You must use managed subscriptions with non-durable subscriptions, so that this clean up can occur, and so that messages for closed non-durable subscriptions do not take up space in your queue manager. Durable subscriptions can also use managed destinations.

**Version**: The current version of MQSD is MQSD_VERSION_1.

**Character set and encoding**: Data in MQSD must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC_NATIVE. However, if

the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

### *Fields for MQSD*

The MQSD structure contains the following fields; the fields are described in alphabetical order:

*AlternateSecurityId (MQBYTE40)*

This is a security identifier that is passed with the AlternateUserId to the authorization service to allow appropriate authorization checks to be performed.

AlternateSecurityId is used only if MQSO_ALTERNATE_USER_AUTHORITY is specified, and the AlternateUserId field is not entirely blank up to the first null character or the end of the field.

On return from an MQSUB call using MQSO_RESUME, this field is unchanged.

See the description of "AlternateSecurityId (MQBYTE40)" on page 462 in the MQOD data type for more information.

*AlternateUserId (MQCHAR12)*

If you specify MQSO_ALTERNATE_USER_AUTHORITY, this field contains an alternative user identifier that is used to check the authorization for the subscription and for output to the destination queue (specified in the *Hobj* parameter of the MQSUB call), in place of the user identifier that the application is currently running under.

If successful, the user identifier specified in this field is recorded as the subscription owning user identifier in place of the user identifier that the application is currently running under.

If MQSO_ALTERNATE_USER_AUTHORITY is specified and this field is entirely blank up to the first null character or the end of the field, the subscription can succeed only if no user authorization is needed to subscribe to this topic with the options specified or the destination queue for output.

If MQSO_ALTERNATE_USER_AUTHORITY is not specified, this field is ignored.

The following differences exist in the environments indicated:

- On z/OS, only the first 8 characters of AlternateUserId are used to check the authorization for the subscription. However, the current user identifier must be authorized to specify this particular alternative user identifier; all 12 characters of the alternative user identifier are used for this check. The user identifier must contain only characters allowed by the external security manager.

On return from an MQSUB call using MQSO_RESUME, this field is unchanged.

This is an input field. The length of this field is given by MQ_USER_ID_LENGTH. The initial value of this field is the null string in C, and 12 blank characters in other programming languages.

*ObjectName (MQCHAR48)*

This is the name of the topic object as defined on the local queue manager.

The name can contain the following characters:

- Uppercase alphabetic characters (A through Z)
- Lowercase alphabetic characters (a through z)
- Numeric digits (0 through 9)
- Period (.), forward slash (/), underscore (_), percent (%)

The name must not contain leading or embedded blanks, but can contain trailing blanks. Use a null character to indicate the end of significant data in the name; the null and any characters following it are treated as blanks. The following restrictions apply in the environments indicated:

- On systems that use EBCDIC Katakana, lowercase characters cannot be used.
- On z/OS:
  - Avoid names that begin or end with an underscore; they cannot be processed by the operations and control panels.
  - The percent character has a special meaning to RACF. If RACF is used as the external security manager, names must not contain the percent. If they do, those names are not included in any security checks when RACF generic profiles are used.
- On IBM i, names containing lowercase characters, forward slash, or percent, must be enclosed in quotation marks when specified on commands. These quotation marks must not be specified for names that occur as fields in structures or as parameters on calls.

The *ObjectName* is used to form the full topic name.

The full topic name can be built from two different fields: *ObjectName* and *ObjectString*. For details of how these two fields are used, see "Using topic strings" on page 560.

If the object identified by the *ObjectName* field cannot be found, the call fails with reason code MQRC_UNKNOWN_OBJECT_NAME even if there is a string specified in *ObjectString*.

On return from an MQSUB call using the MQSO_RESUME option this field is unchanged.

The length of this field is given by MQ_TOPIC_NAME_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

If altering an existing subscription using the MQSO_ALTER option, the name of the topic object subscribed to cannot be changed. This field and the *ObjectString* field can be omitted. If they are provided, they must resolve to the same full topic name. If they do not, the call fails with MQRC_TOPIC_NOT_ALTERABLE.

*ObjectString (MQCHARV)*

This is the long object name to be used.

The *ObjectString* is used to form the Full topic name.

The full topic name can be built from two different fields: *ObjectName* and *ObjectString*. For details of how these two fields are used, see "Using topic strings" on page 560.

The maximum length of *ObjectString* is 10240.

If *ObjectString* is not specified correctly, according to the description of how to use the MQCHARV structure, or if it exceeds the maximum length, the call fails with reason code MQRC_OBJECT_STRING_ERROR.

This is an input field. The initial values of the fields in this structure are the same as those in the MQCHARV structure.

If there are wildcards in the *ObjectString* the interpretation of those wildcards can be controlled using the Wildcard options specified in the Options field of the MQSD.

On return from an MQSUB call using the MQSO_RESUME option this field is unchanged. The full topic name used is returned in the *ResObjectString* field if a buffer is provided.

If altering an existing subscription using the MQSO_ALTER option, the long name of the topic object subscribed to cannot be changed. This field and the *ObjectName* field can be omitted. If they are provided they must resolve to the same full topic name or the call fails with MQRC_TOPIC_NOT_ALTERABLE.

*Options (MQLONG)*
This provides options to control the action of the MQSUB call.

You must specify at least one of the following options:

- MQSO_ALTER
- MQSO_RESUME
- MQSO_CREATE

To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

Combinations that are not valid are noted in this topic; any other combinations are valid.

**Access or creation options**: Access and creation options control whether a subscription is created, or whether an existing subscription is returned or altered. You must specify at least one of these options. The table displays valid combinations of access and creation options.

| Combination of options | Notes |
|---|---|
| MQSO_CREATE | Creates a subscription if one does not exist. This combination fails if the subscription exists. |
| MQSO_RESUME | Resumes an existing subscription. This combination fails if no subscription exists. |
| MQSO_CREATE + MQSO_RESUME | Creates a subscription if one does not exist and resumes a matching one, if it does exist. This combination is useful when it is used in an application that is run a number of times. |
| MQSO_ALTER (see note) | Resumes an existing subscription, altering any fields to match that specified in the MQSD. This combination fails if no subscription exists. |
| MQSO_CREATE + MQSO_ALTER (see note) | Creates a subscription if one does not exist and resumes a matching one, if it does exist, altering any fields to match that specified in the MQSD. This combination is useful combination when used in an application that wants to ensure that its subscription is in a certain state before proceeding. |

**Note:**

Options specifying MQSO_ALTER can also specify MQSO_RESUME, but this combination has no additional effect to specifying MQSO_ALTER alone. MQSO_ALTER implies MQSO_RESUME, because calling MQSUB to alter a subscription implies that the subscription will also be resumed. The opposite is not true, however: resuming a subscription does not imply it is to be altered.

**MQSO_CREATE**

Create a new subscription for the topic specified. If a subscription using the same *SubName* exists, the call fails with MQRC_SUB_ALREADY_EXISTS. This failure can be avoided by combining the MQSO_CREATE option with MQSO_RESUME. The *SubName* is not always necessary. For more details, see the description of that field.

Combining MQSO_CREATE with MQSO_RESUME returns a handle to a pre-existing subscription for the specified *SubName* if one is found; if there is no existing subscription, a new one is created using all the fields provided in the MQSD.

MQSO_CREATE can also be combined with MQSO_ALTER to similar effect.

**MQSO_RESUME**

Return a handle to a pre-existing subscription which matches that specified by *SubName*. No changes are made to the matching subscriptions attributes and they are returned on output in the MQSD structure. Only the following MQSD fields are used: StrucId, Version, Options, AlternateUserId and AlternateSecurityId, and SubName.

The call fails with reason code MQRC_NO_SUBSCRIPTION if a subscription does not exist matching the full subscription name. This failure can be avoided by combining the MQSO_CREATE option with MQSO_RESUME.

The user ID of the subscription is the user ID that created the subscription, or if it has been later altered by a different user ID, it is the user ID of the most recent successful alteration. If an AlternateUserId is used, and use of alternate user IDs is allowed for that user, the alternate user ID is recorded as the user ID that created the subscription instead of the user ID under which the subscription was made.

If a matching subscription exists that was created without the MQSO_ANY_USERID option, and the user ID of the subscription is different from that of the application requesting a handle to the subscription, the call fails with reason code MQRC_IDENTITY_MISMATCH.

If a matching subscription exists and is currently in use, the call fails with MQRC_SUBSCRIPTION_IN_USE.

If the subscription named in SubName is not a valid subscription to resume or alter from an application, the call fails with MQRC_INVALID_SUBSCRIPTION.

MQSO_RESUME is implied by MQSO_ALTER so you do not need to combine it with that option. However, combining the two options does not cause an error.

**MQSO_ALTER**

Return a handle to a pre-existing subscription with the full subscription name matching that specified by the name in *SubName*. Any attributes of the subscription that are different from that specified in the MQSD are altered in the subscription unless alteration is disallowed for that attribute. Details are noted in the description of each attribute and are summarized in the following table. If you try to alter an attribute that cannot be changed, or to alter a subscription that has set the MQSO_IMMUTABLE option, the call fails with the reason code shown in the following table.

The call fails with reason code MQRC_NO_SUBSCRIPTION if a subscription matching the full subscription name does not exist. You can avoid this failure by combining the MQSO_CREATE option with MQSO_ALTER.

Combining MQSO_CREATE with MQSO_ALTER returns a handle to a pre-existing subscription for the specified *SubName* if one is found; if there is no existing subscription, a new one is created using all the fields provided in the MQSD.

The user ID of the subscription is the user ID that created the subscription, or if it is later altered by a different user ID, it is the user ID of the most recent, successful alteration. If an AlternateUserId is used, and use of alternate user IDs is allowed for that user, then the alternate user ID is recorded as the user ID that created the subscription instead of the user ID under which the subscription was made.

If a matching subscription exists that was created without the option MQSO_ANY_USERID and the user ID of the subscription is different from that of the application requesting a handle to the subscription, the call fails with reason code MQRC_IDENTITY_MISMATCH.

If a matching subscription exists and is currently in use, the call fails with MQRC_SUBSCRIPTION_IN_USE.

If the subscription named in SubName is not a valid subscription to resume or alter from an application, the call fails with MQRC_INVALID_SUBSCRIPTION.

The following table shows the ability of MQSO_ALTER to alter attribute values in MQSD and MQSUB.

*Table 535. Attributes in MQSD and MQSUB that can be altered*

| Data type descriptor or function call | Field name | Can this attribute be altered using MQSO_ALTER | Reason Code |
|---|---|---|---|
| MQSD | Durability options | No | MQRC_DURABILITY_NOT_ALTERABLE |
| MQSD | Destination Options | Yes | None |
| MQSD | Registration options | Yes (see note “1” on page 550) | MQRC_GROUPING_NOT_ALTERABLE if you try to alter MQSO_GROUP_SUB |
| MQSD | Publication options | Yes (see note “2” on page 550) | None |
| MQSD | Wildcard options | No | MQRC_TOPIC_NOT_ALTERABLE |
| MQSD | Other options | No (see note “3” on page 550) | None |
| MQSD | ObjectName | No | MQRC_TOPIC_NOT_ALTERABLE |
| MQSD | AlternateUserId | No (see note “4” on page 550) | None |
| MQSD | AlternateSecurityId | No (see note “4” on page 550) | None |
| MQSD | SubExpiry | Yes | None |
| MQSD | ObjectString | No | MQRC_TOPIC_NOT_ALTERABLE |
| MQSD | SubName | No (see note “5” on page 550 ) | None |
| MQSD | SubUserData | Yes | None |
| MQSD | SubCorrelId | Yes (see note “6” on page 550) | MQRC_GROUPING_NOT_ALTERABLE when in a grouped subscription |
| MQSD | PubPriority | Yes | None |
| MQSD | PubAccountingToken | Yes | None |
| MQSD | PubApplIdentityData | Yes | None |
| MQSD | SubLevel | No | MQRC_SUBLEVEL_NOT_ALTERABLE |
| MQSUB | Hobj | Yes (see note “6” on page 550) | MQRC_GROUPING_NOT_ALTERABLE when in a grouped subscription |

**Notes:**

1. MQSO_GROUP_SUB cannot be altered.
2. MQSO_NEW_PUBLICATIONS_ONLY cannot be altered because it is not part of the subscription
3. These options are not part of the subscription
4. This attribute is not part of the subscription
5. This attribute is the identity of the subscription being altered
6. Alterable except when part of a grouped sub (MQSO_GROUP_SUB)

**Durability options:** The following options control how durable the subscription is. You can specify only one of these options. If you are altering an existing subscription using the MQSO_ALTER option, you cannot change the durability of the subscription. On return from an MQSUB call using MQSO_RESUME, the appropriate durability option is set.

**MQSO_DURABLE**

Request that the subscription to this topic remains until it is explicitly removed using MQCLOSE with the MQCO_REMOVE_SUB option. If this subscription is not explicitly removed it will remain even after this applications connection to the queue manager is closed.

If a durable subscription is requested to a topic that is defined as not allowing durable subscriptions, the call fails with MQRC_DURABILITY_NOT_ALLOWED.

**MQSO_NON_DURABLE**
Request that the subscription to this topic is removed when the applications connection to the queue manager is closed, if it is not already explicitly removed. MQSO_NON_DURABLE is the opposite of the MQSO_DURABLE option, and is defined to aid program documentation. It is the default if neither is specified.

**Destination options:** The following option controls the destination that publications for a topic that has been subscribed to are sent to. If altering an existing subscription using the MQSO_ALTER option, the destination used for publications for the subscription can be changed. On return from an MQSUB call using MQSO_RESUME, this option is set if appropriate.

**MQSO_MANAGED**

Request that the destination that the publications are sent to is managed by the queue manager.

The object handle returned in *Hobj* represents a queue manager managed queue and is for use with subsequent MQGET, MQCB, MQINQ, or MQCLOSE calls.

An object handle returned from a previous MQSUB call cannot be provided in the *Hobj* parameter when MQSO_MANAGED is not specified.

**MQSO_NO_MULTICAST**

Request that the destination that the publications are sent to is not a multicast group address. This option is only valid when combined with the MQSO_MANAGED option. When a handle to a queue is provided in the *Hobj* parameter, multicast cannot be used for this subscription, and the option is not valid.

If the topic is defined to only allow multicast subscriptions, using the `MCAST(ONLY)` setting, then the call fails with reason code MQRC_MULTICAST_REQUIRED.

**Scope Option:** The following option controls the scope of the subscription being made. If altering an existing subscription using the MQSO_ALTER option, this subscription scope option cannot be changed. On returning from an MQSUB call using MQSO-RESUME, the appropriate scope option is set.

**MQSO_SCOPE_QMGR**
This subscription is made only on the local queue manager. No proxy subscription is distributed to other queue managers in the network. Only publications that are published at this queue manager are sent to this subscriber. This overrides any behavior set using the SUBSCOPE topic attribute.

**Note:** If not set, the subscription scope is determined by the SUBSCOPE topic attribute.

**Registration options:** The following options control the details of the registration that is made to the queue manager for this subscription. If altering an existing subscription using the MQSO_ALTER option, these registration options can be changed. On return from an MQSUB call using MQSO_RESUME the appropriate registration options is set.

**MQSO_GROUP_SUB**

This subscription is to be grouped with other subscriptions of the same SubLevel using the same queue and specifying the same correlation ID so that any publications to topics that would cause more than one publication message to be provided to the group of subscriptions, due to an overlapping set of topic strings being used, only causes one message to be delivered to the queue. If this option is not used, then each unique subscription (identified by SubName) that matches is provided with a copy of the publication which could mean more than one copy of the publication may be placed on the queue shared by a number of subscriptions.

Only the most significant subscription in the group is provided with a copy of the publication. The most significant subscription is based on the Full topic name up to the point where a wildcard is found. If a mixture of wildcard schemes is used within the group, only the position of the wildcard is important. You are advised not to combine different wildcard schemes within a group of subscriptions that share the same queue.

When creating a new grouped subscription it must still have a unique SubName, but if it matches the full topic name of an existing subscription in the group, the call fails with MQRC_DUPLICATE_GROUP_SUB.

If the most significant subscription in group also specifies MQSO_NOT_OWN_PUBS and this is a publication from the same application, then no publication is delivered to the queue.

When altering a subscription made with this option, the fields which imply the grouping, Hobj on the MQSUB call (representing the queue and queue manager name), and the SubCorrelId cannot be changed. Attempting to alter them causes the call to fail with MQRC_GROUPING_NOT_ALTERABLE.

This option must be combined with MQSO_SET_CORREL_ID with a SubCorrelId that is not set to MQCI_NONE, and cannot be combined with MQSO_MANAGED.

**MQSO_ANY_USERID**

When MQSO_ANY_USERID is specified, the identity of the subscriber is not restricted to a single user ID. This allows any user to alter or resume the subscription when they have suitable authority. Only a single user may have the subscription at any one time. An attempt to resume use of a subscription currently in use by another application causes the call to fail with MQRC_SUBSCRIPTION_IN_USE.

To add this option to an existing subscription the MQSUB call (using MQSO_ALTER) must come from the same user ID as the original subscription itself.

If an MQSUB call refers to an existing subscription with MQSO_ANY_USERID set, and the user ID differs from the original subscription, the call succeeds only if the new user ID has authority to subscribe to the topic. On successful completion, future publications to this subscriber are put to the subscribers queue with the new user ID set in the publication message.

Do not specify both MQSO_ANY_USERID and MQSO_FIXED_USERID. If neither is specified, the default is MQSO_FIXED_USERID.

**MQSO_FIXED_USERID**

When MQSO_FIXED_USERID is specified, the subscription can be altered or resumed by only the last user ID to alter the subscription. If the subscription has not been altered, it is the user ID that created the subscription.

If an MQSUB verb refers to an existing subscription with MQSO_ANY_USERID set and alters the subscription using MQSO_ALTER to use option MQSO_FIXED_USERID, the user ID of the subscription is now fixed at this new user ID. The call succeeds only if the new user ID has authority to subscribe to the topic.

If a user ID other than the one recorded as owning a subscription tries to resume or alter an MQSO_FIXED_USERID subscription, the call fails with MQRC_IDENTITY_MISMATCH. The owning user ID of a subscription can be viewed using the DISPLAY SBSTATUS command.

Do not specify both MQSO_ANY_USERID and MQSO_FIXED_USERID. If neither is specified, the default is MQSO_FIXED_USERID.

**Publication options:** The following options control the way publications are sent to this subscriber. If altering an existing subscription using the MQSO_ALTER option, these publication options can be changed.

**MQSO_NOT_OWN_PUBS**

Tells the broker that the application does not want to see any of its own publications. Publications are considered to originate from the same application if the connection handles are the same. On return from an MQSUB call using MQSO_RESUME, this option is set if appropriate.

**MQSO_NEW_PUBLICATIONS_ONLY**

No currently retained publications are to be sent, when this subscription is created, only new publications. This option only applies when MQSO_CREATE is specified. Any subsequent changes to a subscription do not alter the flow of publications and so any publications retained on a topic, will have already been sent to the subscriber as new publications.

If this option is specified without MQSO_CREATE the call fails with MQRC_OPTIONS_ERROR. On return from an MQSUB call using MQSO_RESUME, this option is not set even if the subscription was created using this option.

If this option is not used, previously retained messages are sent to the destination queue provided. If this action fails due to an error, either MQRC_RETAINED_MSG_Q_ERROR or MQRC_RETAINED_NOT_DELIVERED, the creation of the subscription fails.

**MQSO_PUBLICATIONS_ON_REQUEST**
Setting this option indicates that the subscriber will request information specifically when required. The queue manager does not send unsolicited messages to the subscriber. The retained publication (or possibly multiple publications if a wildcard is specified in the topic) is sent to the subscriber each time an MQSUBRQ call is made using the Hsub handle from a previous MQSUB call. No publications are sent as a result of the MQSUB call using this option. On return from an MQSUB call using MQSO_RESUME, this option is set if appropriate.

This option is not valid in combination with a SubLevel greater than 1.

**Read ahead options:** The following options control whether non-persistent messages are sent to an application ahead of the application requesting them.

**MQSO_READ_AHEAD_AS_Q_DEF**
If the MQSUB call uses a managed handle, the default read ahead attribute of the model queue associated with the topic subscribed to determines whether messages are sent to the application before the application requests them.

This is the default value.

**MQSO_NO_READ_AHEAD**
If the MQSUB call uses a managed handle, messages are not sent to the application before the application requests them.

**MQSO_READ_AHEAD**
If the MQSUB call uses a managed handle, messages might be sent to the application before the application requests them.

**Note:**

The following notes apply to the read ahead options:

1. Only one of these options can be specified. If both MQOO_READ_AHEAD and MQOO_NO_READ_AHEAD are specified, reason code MQRC_OPTIONS_ERROR is returned. These options are only applicable if MQSO_MANAGED is specified.
2. They are not applicable for MQSUB when a queue is passed which has been opened previously. Read ahead might not be enabled when requested. The MQGET options used on the first MQGET call might prevent read ahead from being enabled. Also, read ahead is disabled when the client is connecting to a queue manager where read ahead is not supported. If the application is not running as an IBM MQ client, these options are ignored.

**Wildcard options:** The following options control how wildcards are interpreted in the string provided in the ObjectString field of the MQSD. You can specify only one of these options. If altering an existing subscription using the MQSO_ALTER option, these wildcard options cannot be changed. On return from an MQSUB call using MQSO_RESUME, the appropriate wildcard option is set.

**MQSO_WILDCARD_CHAR**
Wildcards only operate on characters within the topic string.

The behavior defined by MQSO_WILDCARD_CHAR is shown in the following table.

| Special Character | Behavior |
|---|---|
| Forward slash (/) | No significance, just another character |
| Asterisk (*) | Wildcard, zero or more characters |
| Question mark (?) | Wildcard, 1 character |

| Special Character | Behavior |
|---|---|
| Percent sign (%) | Escape character to allow the characters (*), (?) or (%) to be used in a string and not be interpreted as a special character, for example, (%*), (%?) or (%%). |

For example, publishing on the following topic:

```
/level0/level1/level2/level3/level4
```

matches subscribers using the following topics:

```
*
/*
/ level0/level1/level2/level3/*
/ level0/level1/*/level3/level4
/ level0/level1/le?el2/level3/level4
```

**Note:** This use of wildcards supplies exactly the meaning provided in IBM MQ V6 and WebSphere MB V6 when using MQRFH1 formatted messages for publish/subscribe. It is recommended that this is not used for newly written applications and is only used for applications that were previously running against that version and have not been changed to use the default wildcard behavior as described in MQSO_WILDCARD_TOPIC.

**MQSO_WILDCARD_TOPIC**

Wildcards only operate on topic elements within the topic string. This is the default behavior if none is chosen.

The behavior required by MQSO_WILDCARD_TOPIC is shown in the following table:

| Special Character | Behavior |
|---|---|
| (/) | Topic level separator |
| Number sign (#) | Wildcard: multiple topic level |
| Plus sign (+) | Wildcard: single topic level |

**Notes:**

The (+) and (#) are not treated as wildcards if they are mixed in with other characters (including themselves) within a topic level. In the following string, the (#) and (+) characters are treated as ordinary characters.

```
level0/level1/#+/level3/level#
```

For example, publishing on the following topic:

```
/level0/level1/level2/level3/level4
```

matches subscribers using the following topics:

```
#
/#
/ level0/level1/level2/level3/#
/ level0/level1/+/level3/level4
```

**Other options:** The following options control the way the API call is issued rather than the subscription. On return from an MQSUB call using MQSO_RESUME, these options are unchanged. See “AlternateUserId (MQCHAR12)” on page 546 for more details.

**MQSO_ALTERNATE_USER_AUTHORITY**

The AlternateUserId field contains a user identifier to use to validate this MQSUB call. The call can succeed only if this AlternateUserId is authorized to open the object with the specified access options, regardless of whether the user identifier under which the application is running is authorized to do so.

**MQSO_SET_CORREL_ID**

The subscription is to use the correlation identifier supplied in the *SubCorrelId* field. If this option is not specified, a correlation identifier is automatically created by the queue manager at subscription time and is returned to the application in the *SubCorrelId* field. For more information, see "SubCorrelId (MQBYTE24)" on page 557 for more information.

This option cannot be combined with MQSO_MANAGED.

**MQSO_SET_IDENTITY_CONTEXT**

The subscription is to use the accounting token and application identity data supplied in the *PubAccountingToken* and *PubApplIdentityData* fields.

If this option is specified, the same authorization check is carried out as if the destination queue was accessed using an MQOPEN call with MQOO_SET_IDENTITY_CONTEXT, except in the case where the MQSO_MANAGED option is also used in which case there is no authorization check on the destination queue.

If this option is not specified, the publications sent to this subscriber have default context information associated with them as follows:

| Field in MQMD | Value used |
|---|---|
| *UserIdentifier* | The user ID associated with the subscription at the time the subscription was made. |
| *AccountingToken* | Determined from the environment if possible; Set to MQACT_NONE if not. |
| *ApplIdentityData* | Set to blanks |

This option is only valid with MQSO_CREATE and MQSO_ALTER. If used with MQSO_RESUME, the *PubAccountingToken* and *PubApplIdentityData* fields are ignored, so this option has no effect.

If a subscription is altered without using this option where previously the subscription supplied identity context information, default context information is generated for the altered subscription.

If a subscription allowing different user IDs to use it with option MQSO_ANY_USERID, is resumed by a different user ID, default identity context is generated for the new user ID now owning the subscription and any subsequent publications are delivered containing the new identity context.

**MQSO_FAIL_IF_QUIESCING**

The MQSUB call fails if the queue manager is in quiescing state. On z/OS, for a CICS or IMS application, this option also forces the MQSUB call to fail if the connection is in quiescing state.

*PubAccountingToken (MQBYTE32)*

This is the value that will be in the *AccountingToken* field of the Message Descriptor (MQMD) of all publication messages matching this subscription. *AccountingToken* is part of the identity context of the message. For more information about message context, see Message context. For more information about the *AccountingToken* field in the MQMD, see "AccountingToken (MQBYTE32)" on page 405

You can use the following special value for the *PubAccountingToken* field:

**MQACT_NONE**

No accounting token is specified.

The value is binary zero for the length of the field.

For the C programming language, the constant MQACT_NONE_ARRAY is also defined; this has the same value as MQACT_NONE, but is an array of characters instead of a string.

If the option MQSO_SET_IDENTITY_CONTEXT is not specified, the accounting token is generated by the queue manager as default context information and this field is an output field which contains the *AccountingToken* which will be set in each message published for this subscription.

If the option MQSO_SET_IDENTITY_CONTEXT is specified, the accounting token is being generated by the user and this field is an input field which contains the *AccountingToken* to be set in each publication for this subscription.

The length of this field is given by MQ_ACCOUNTING_TOKEN_LENGTH. The initial value of this field is MQACT_NONE.

If altering an existing subscription using the MQSO_ALTER option, the value of *AccountingToken* in any future publication messages can be changed.

On return from an MQSUB call using MQSO_RESUME, this field is set to the current *AccountingToken* being used for the subscription.

*PubApplIdentityData (MQCHAR32)*

This is the value that is in the *ApplIdentityData* field of the Message Descriptor (MQMD) of all publication messages matching this subscription. *ApplIdentityData* is part of the identity context of the message. For more information about message context, see Message context. For more information about the *ApplIdentityData* field in the MQMD, see “ApplIdentityData (MQCHAR32)” on page 406

If the option MQSO_SET_IDENTITY_CONTEXT is not specified, the *ApplIdentityData* which is set in each message published for this subscription is blanks, as default context information.

If the option MQSO_SET_IDENTITY_CONTEXT is specified, the *PubApplIdentityData* is being generated by the user and this field is an input field which contains the *ApplIdentityData* to be set in each publication for this subscription.

The length of this field is given by MQ_APPL_IDENTITY_DATA_LENGTH. The initial value of this field is the null string in C, and 32 blank characters in other programming languages.

If altering an existing subscription using the MQSO_ALTER option, the *ApplIdentityData* of any future publication messages can be changed.

On return from an MQSUB call using MQSO_RESUME, this field is set to the current *ApplIdentityData* being used for the subscription.

*PubPriority (MQLONG)*

This is the value that will be in the *Priority* field of the Message Descriptor (MQMD) of all publication messages matching this subscription. For more information about the *Priority* field in the MQMD, see “Priority (MQLONG)” on page 431.

The value must be greater than or equal to zero; zero is the lowest priority. The following special values can also be used:

**MQPRI_PRIORITY_AS_Q_DEF**

When a subscription queue is provided in the *Hobj* field in the MQSUB call, and is not a managed handle, then the priority for the message is taken from the *DefPriority* attribute of this queue. If the queue is a cluster queue or there is more than one definition in the queue-name resolution path then the priority is determined when the publication message is put to the queue as described for “Priority (MQLONG)” on page 431.

If the MQSUB call uses a managed handle, the priority for the message is taken from the *DefPriority* attribute of the model queue associated with the topic subscribed to.

**MQPRI_PRIORITY_AS_PUBLISHED**

The priority for the message is the priority of the original publication. This is the initial value of the field.

If altering an existing subscription using the MQSO_ALTER option, the *Priority* of any future publication messages can be changed.

On return from an MQSUB call using MQSO_RESUME, this field is set to the current priority being used for the subscription.

*ResObjectString (MQCHARV)*
This is the long object name after the queue manager resolves the name provided in *ObjectName*.

If the long object name is provided in *ObjectString* and nothing is provided in *ObjectName*, then the value returned in this field is the same as provided in *ObjectString*.

If this field is omitted (that is ResObjectString.VSBufSize is zero) then the *ResObjectString* is not returned, but the length is returned in ResObjectString.VSLength. If the length is shorter than the full ResObjectString then it is truncated and returns as many of the rightmost characters as can fit in the provided length.

If *ResObjectString* is specified incorrectly, according to the description of how to use the MQCHARV structure, or if it exceeds the maximum length, the call fails with reason code MQRC_RES_OBJECT_STRING_ERROR.

*SelectionString (MQCHARV)*
This is the string used to provide the selection criteria used when subscribing for messages from a topic.

This variable length field will be returned on output from an MQSUB call using the MQSO_RESUME option, if a buffer is provided, and also there is a positive buffer length in VSBufSize. If no buffer is provided on the call, only the length of the selection string will be returned in the VSLength field of the MQCHARV. If the buffer provided is smaller than the space required to return the field, only VSBufSize bytes are returned in the provided buffer.

If *SelectionString* is specified incorrectly, according to the description of how to use the "MQCHARV - Variable Length String" on page 288 structure, or if it exceeds the maximum length, the call fails with reason code MQRC_SELECTION_STRING_ERROR.

SelectionString usage is described in Selectors.

*StrucId (MQCHAR4)*

This is the structure identifier; the value must be:

**MQSD_STRUC_ID**
Identifier for Subscription Descriptor structure.

For the C programming language, the constant MQSD_STRUC_ID_ARRAY is also defined; this has the same value as MQSD_STRUC_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQSD_STRUC_ID.

*SubCorrelId (MQBYTE24)*
This field contains a correlation identifier common to all publications matching this subscription.

**Attention:** a correlation identifier can only be passed between queue managers in a publish/subscribe cluster, not a hierarchy.

All publications sent to match this subscription contain this correlation identifier in the message descriptor. If multiple subscriptions get their publications from the same queue, using MQGET by correlation identifier allows only publications for a specific subscription to be obtained. This correlation identifier can either be generated by the queue manager or by the user.

If the option MQSO_SET_CORREL_ID is not specified, the correlation identifier is generated by the queue manager and this field is an output field containing the correlation identifier that will be set in each

message published for this subscription. The generated correlation identifier consists of a 4-byte product identifier (AMQX or CSQM in either ASCII or EBCDIC) followed by a product specific implementation of a unique string.

If the option MQSO_SET_CORREL_ID is specified, the correlation identifier is generated by the user and this field is an input field containing the correlation identifier to be set in each publication for this subscription. In this case, if the field contains MQCI_NONE, the correlation identifier that is set in each message published for this subscription is the correlation identifier created by the original put of the message.

If the option MQSO_GROUP_SUB is specified and the correlation identifier specified is the same as an existing grouped subscription using the same queue and an overlapping topic string, only the most significant subscription in the group is provided with a copy of the publication.

The length of this field is given by MQ_CORREL_ID_LENGTH. The initial value of this field is MQCI_NONE.

If you are altering an existing subscription using the MQSO_ALTER option, and this field is an input field, then the subscription correlation identifier can be changed, unless the subscription is a grouped subscription, that is, it has been created using the option MQSO_GROUP_SUB, in which case the subscription correlation identifier cannot be changed.

On return from an MQSUB call using MQSO_RESUME, this field is set to the current correlation identifier for the subscription.

*SubExpiry (MQLONG)*

This is the time expressed in tenths of a second after which the subscription expires. No more publications will match this subscription after this interval has passed. As soon as a subscription expires, publications are no longer sent to the queue. However, the publications that are already there are not affected in any way. *SubExpiry* has no effect on publication expiry.

The following special value is recognized:

**MQEI_UNLIMITED**
The subscription has an unlimited expiration time.

If altering an existing subscription using the MQSO_ALTER option, the expiry of the subscription can be changed.

On return from an MQSUB call using the MQSO_RESUME option this field is set to the original expiry of the subscription and not the remaining expiry time.

*SubLevel (MQLONG)*
This is the level associated with the subscription. Publications are only delivered to this subscription if it is in the set of subscriptions with the highest SubLevel value less than or equal to the PubLevel used at publication time. However, if a publication has been retained, it is no longer available to subscribers at higher levels because it is republished at PubLevel 1.

The value must be in the range zero to 9. Zero is the lowest level.

The initial value of this field is 1.

For more information see Intercepting publications.

If altering an existing subscription using the MQSO_ALTER option, then the SubLevel cannot be changed.

Combining a SubLevel with a value greater than 1 with the option MQSO_PUBLICATIONS_ON_REQUEST is not allowed.

On return from an MQSUB call using MQSO_RESUME, this field is set to the current level being used for the subscription.

*SubUserData (MQCHARV)*

This specifies the subscription user data. The data provided on the subscription in this field will be included as the MQSubUserData message property of every publication sent to this subscription.

The maximum length of *SubUserData* is 10240.

If *SubUserData* is specified incorrectly, according to the description of how to use the MQCHARV structure, or if it exceeds the maximum length, the call fails with reason code MQRC_SUB_USER_DATA_ERROR.

This is an input field. The initial values of the fields in this structure are the same as those in the MQCHARV structure.

If altering an existing subscription using the MQSO_ALTER option, the subscription user data can be changed.

This variable length field is returned on output from an MQSUB call using the MQSO_RESUME option, if a buffer is provided and there is a positive buffer length in *VSBufLen*. If no buffer is provided on the call, only the length of the subscription user date is returned in the *VSLength* field of the MQCHARV. If the buffer provided is smaller than the space required to return the field, only *VSBufLen* bytes are returned in the provided buffer.

*SubName (MQCHARV)*

This specifies the subscription name. This field is only required if *Options* specifies the option MQSO_DURABLE, but if provided will be used by the queue manager for MQSO_NON_DURABLE as well.

If specified, *SubName* must be unique within the queue manager, because it is the method used to identify the subscription.

The maximum length of *SubName* is 10240.

This field serves two purposes. For an MQSO_DURABLE subscription, you use this field to identify a subscription so you can resume it after it has been created if you have either closed the handle to the subscription (using the MQCO_KEEP_SUB option) or have been disconnected from the queue manager. This is done using the MQSUB call with the MQSO_RESUME option. It is also displayed in the administrative view of subscriptions in the SUBNAME field in DISPLAY SBSTATUS.

If *SubName* is specified incorrectly, according to the description of how to use the MQCHARV structure, is left out when it is required (that is *SubName*. *VSLength* is zero), or if it exceeds the maximum length, the call fails with reason code MQRC_SUB_NAME_ERROR.

This is an input field. The initial values of the fields in this structure are the same as those in the MQCHARV structure.

If altering an existing subscription using the MQSO_ALTER option, the subscription name cannot be changed, because it is the identifying field used to find the referenced subscription. It is not changed on output from an MQSUB call with the MQSO_RESUME option.

*Version (MQLONG)*

This is the structure version number; the value must be:

**MQSD_VERSION_1**
Version-1 Subscription Descriptor structure.

The following constant specifies the version number of the current version:

**MQSD_CURRENT_VERSION**
Current version of Subscription Descriptor structure.

This is always an input field. The initial value of this field is MQSD_VERSION_1.

### *Using topic strings*

A topic is constructed from the subtopic identified in a topic object, and a subtopic provided by an application. You can use either subtopic as the topic name, or combine them to form a new topic name.

In an MQI program the full topic name is created by MQOPEN. It is composed of two fields used in publish/subscribe MQI calls, in the order listed:

1. The **TOPICSTR** attribute of the topic object, named in the **ObjectName** field.
2. The **ObjectString** parameter defining the subtopic provided by the application.

The resulting topic string is returned in the **ResObjectString** parameter.

These fields are considered to be present if the first character of each field is not a blank or null character, and the field length is greater than zero. If only one of the fields is present, it is used unchanged as the topic name. If neither field has a value, the call fails with reason code MQRC_UNKNOWN_OBJECT_NAME, or MQRC_TOPIC_STRING_ERROR if the full topic name is not valid.

If both fields are present, a ' / ' character is inserted between the two elements of the resultant combined topic name.

Table 536 on page 560 shows examples of topic string concatenation:

*Table 536. Topic string concatenation examples*

| TOPICSTR | ObjectString | Full topic name | Comment |
|---|---|---|---|
| Football/Scores | ' ' | Football/Scores | The TOPICSTR is used alone |
| ' ' | Football/Scores | Football/Scores | The ObjectString is used alone |
| Football | Scores | Football/Scores | A '/' character is added at the concatenation point |
| Football | /Scores | Football//Scores | An 'empty node' is produced between the two strings |
| /Football | Scores | /Football/Scores | The topic starts with an 'empty node' |

The ' / ' character is considered as a special character, providing structure to the full topic name in Topic trees, and must not be used for any other reason as the structure of the topic tree is affected. The topic " /Football " is not the same as the topic " Football ".

The following wildcard characters are special characters:

- plus sign ' + '
- number sign ' # '
- asterisk ' * '
- question mark ' ? '

These characters are not considered as invalid, however you must ensure to understand how they are used. You might prefer not to use these characters in your topic strings when publishing. Publishing on a topic string with ' # ' or ' + ' mixed in with other characters (including themselves) within a topic level, can be subscribed to with either wildcard scheme. Publishing on a topic string with ' # ' or ' + ' as the only character between two ' / ' characters produces a topic string that cannot be subscribed to explicitly by an application using the wildcard scheme MQSO_WILDCARD_TOPIC. This situation results in the application getting more publications than expected.

**Example code snippet**

This code snippet, extracted from the example program Example 2: Publisher to a variable topic, combines a topic object with a variable topic string.

```
MQOD     td = {MQOD_DEFAULT};  /* Object Descriptor      */
td.ObjectType = MQOT_TOPIC;    /* Object is a topic           */
td.Version = MQOD_VERSION_4;   /* Descriptor needs to be V4    */
strncpy(td.ObjectName, topicName,  MQ_TOPIC_NAME_LENGTH);
td.ObjectString.VSPtr = topicString;
td.ObjectString.VSLength = (MQLONG)strlen(topicString);
td.ResObjectString.VSPtr = resTopicStr;
td.ResObjectString.VSBufSize = sizeof(resTopicStr)-1;
MQOPEN(Hconn, &td, MQOO_OUTPUT | MQOO_FAIL_IF_QUIESCING, &Hobj, &CompCode, &Reason);
```

## *Initial values and language declarations for MQSD*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQSD_STRUC_ID | 'SD¬¬' |
| *Version* | MQSD_VERSION_1 | 1 |
| *Options* | MQSO_NON_DURABLE | 0 |
| *ObjectName* | None | Null string or blanks |
| *AlternateUserId* | None | Null string or blanks |
| *AlternateSecurityId* | MQSID_NONE | Nulls |
| *SubExpiry* | MQEI_UNLIMITED | -1 |
| *ObjectString* | None | Names and values as defined for MQCHARV |
| *SubName* | None | Names and values as defined for MQCHARV |
| *SubUserData* | None | Names and values as defined for MQCHARV |
| *SubCorrelId* | MQCI_NONE | Nulls |
| *PubPriority* | MQPRI_PRIORITY_AS_Q_DEF | -3 |
| *PubAccountingToken* | MQACT_NONE | Nulls |
| *PubApplIdentityData* | None | Null string or blanks |
| *SelectionString* | None | Names and values as defined for MQCHARV |
| *SubLevel* | None | 1 |
| *ResObjectString* | None | Names and values as defined for MQCHARV |

| Field name | Name of constant | Value of constant |
|---|---|---|

**Notes:**

1. The symbol ¬ represents a single blank character.
2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
3. In the C programming language, the macro variable MQSD_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQSD MySD = {MQSD_DEFAULT};
```

*C declaration*

```
typedef struct tagMQSD MQSD;
struct tagMQSD {
  MQCHAR4   StrucId;              /* Structure identifier */
  MQLONG    Version;              /* Structure version number */
  MQLONG    Options;              /* Options associated with subscribing */
  MQCHAR48  ObjectName;           /* Object name */
  MQCHAR12  AlternateUserId;      /* Alternate user identifier */
  MQBYTE40  AlternateSecurityId;  /* Alternate security identifier */
  MQLONG    SubExpiry;            /* Expiry of Subscription */
  MQCHARV   ObjectString;         /* Object Long name */
  MQCHARV   SubName;              /* Subscription name */
  MQCHARV   SubUserData;          /* Subscription User data */
  MQBYTE24  SubCorrelId;          /* Correlation Id related to this subscription */
  MQLONG    PubPriority;          /* Priority set in publications */
  MQBYTE32  PubAccountingToken;   /* Accounting Token set in publications */
  MQCHAR32  PubApplIdentityData;  /* Appl Identity Data set in publications */
  MQCHARV   SelectionString;      /* Message selector structure */
  MQLONG    SubLevel;             /* Subscription level */
  MQCHARV   ResObjectString;      /* Resolved Long object name*/
  /* Ver:1 */
};
```

*COBOL declaration*

## MQSMPO - Set message property options

The following table summarizes the fields in the structure.

| *Table 537. Fields in MQSMPO* | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *Options* | Options | Options |
| *ValueEncoding* | Property value encoding | ValueEncoding |
| *ValueCCSID* | Property value character set | ValueCCSID |

### *Overview for MQSMPO*

**Availability**: All IBM MQ systems and IBM MQ clients.

**Purpose**: The **MQSMPO** structure allows applications to specify options that control how properties of messages are set. The structure is an input parameter on the **MQSETMP** call.

**Character set and encoding**: Data in **MQSMPO** must be in the character set of the application and encoding of the application ( **MQENC_NATIVE** ).

### *Fields for MQSMPO*

The MQSMPO structure contains the following fields; the fields are described in **alphabetical order**:

*Options (MQLONG)*

**Location options:** The following options relate to the relative location of the property compared to the property cursor:

**MQSMPO_SET_FIRST**
Sets the value of the first property that matches the specified name, or if it does not exist, adds a new property after all other properties with a matching hierarchy.

**MQSMPO_SET_PROP_UNDER_CURSOR**
Sets the value of the property pointed to by the property cursor. The property pointed to by the property cursor is the one that was last inquired using either the MQIMPO_INQ_FIRST or the MQIMPO_INQ_NEXT option.

The property cursor is reset when the message handle is reused on an MQGET call, or when the message handle is specified in the *MsgHandle* field of the MQGMO or MQPMO structure on an MQPUT call.

If this option is used when the property cursor has not yet been established or if the property pointer to by the property cursor has been deleted, the call fails with completion code MQCC_FAILED and reason code MQRC_PROPERTY_NOT_AVAILABLE.

**MQSMPO_SET_PROP_BEFORE_CURSOR**
Sets a new property before the property pointed to by the property cursor. The property pointed to by the property cursor is the one that was last inquired using either the MQIMPO_INQ_FIRST or the MQIMPO_INQ_NEXT option.

The property cursor is reset when the message handle is reused on an MQGET call, or when the message handle is specified in the *MsgHandle* field of the MQGMO or MQPMO structure on an MQPUT call.

If this option is used when the property cursor has not yet been established or if the property pointer to by the property cursor has been deleted, the call fails with completion code MQCC_FAILED and reason code MQRC_PROPERTY_NOT_AVAILABLE.

**MQSMPO_SET_PROP_AFTER_CURSOR**
Sets a new property after the property pointed to by the property cursor. The property pointed to by the property cursor is the one that was last inquired using either the MQIMPO_INQ_FIRST or the MQIMPO_INQ_NEXT option.

The property cursor is reset when the message handle is reused on an MQGET call, or when the message handle is specified in the *MsgHandle* field of the MQGMO or MQPMO structure on an MQPUT call.

If this option is used when the property cursor has not yet been established or if the property pointer to by the property cursor has been deleted, the call fails with completion code MQCC_FAILED and reason code MQRC_PROPERTY_NOT_AVAILABLE.

**MQSMPO_APPEND_PROPERTY**
Causes a new property to be added after all other properties with a matching hierarchy. If at least one property exists which matches the specified name, then a new property is added at the end after the end of that list of properties.

This option allows a list of properties with the same name to be created.

If you need none of the options described, use the following option:

**MQSMPO_NONE**
No options specified.

This is always an input field. The initial value of this field is MQSMPO_SET_FIRST.

*StrucId (MQCHAR4)*

This is the structure identifier; the value must be:

**MQSMPO_STRUC_ID**

Identifier for set message property options structure.

For the C programming language, the constant **MQSMPO_STRUC_ID_ARRAY** is also defined; this has the same value as **MQSMPO_STRUC_ID**, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is **MQSMPO_STRUC_ID**.

*ValueCCSID (MQLONG)*

The character set of the property value to be set if the value is a character string.

This is always an input field. The initial value of this field is **MQCCSI_APPL**.

*ValueEncoding (MQLONG)*

The encoding of the property value to be set if the value is numeric.

This is always an input field. The initial value of this field is **MQENC_NATIVE**.

*Version (MQLONG)*

This is the structure version number; the value must be:

**MQSMPO_VERSION_1**
Version-1 set message property options structure.

The following constant specifies the version number of the current version:

**MQSMPO_CURRENT_VERSION**
Current version of set message property options structure.

This is always an input field. The initial value of this field is **MQSMPO_VERSION_1**.

## *Initial values and language declarations for MQSMPO*

*Table 538. Initial values of fields in MQSMPO*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQSMPO_STRUC_ID | 'SMPO' |
| *Version* | MQSMPO_VERSION_1 | 1 |
| *Options* | MQSMPO_NONE | 0 |
| *ValueEncoding* | MQENC_NATIVE | Depends on environment |
| *ValueCCSID* | MQCCSI_APPL | -3 |

**Notes:**

1. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
2. In the C programming language, the macro variable MQSMPO_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQSMPO MySMPO = {MQSMPO_DEFAULT};
```

*C declaration*

```
typedef struct tagMQSMPO MQSMPO;
struct tagMQSMPO {
  MQCHAR4   StrucId;         /* Structure identifier */
  MQLONG    Version;         /* Structure version number */
  MQLONG    Options;         /* Options that control the action of MQSETMP */
  MQLONG    ValueEncoding;   /* Encoding of Value */
  MQLONG    ValueCCSID;      /* Character set identifier of Value */
};
```

*COBOL declaration*

```
**   MQSMPO structure
  10 MQSMPO.
**    Structure identifier
   15 MQSMPO-STRUCID       PIC X(4).
**    Structure version number

```

## MQSRO - Subscription request options

This section describes subscription request options, what fields it contains, and initial values of those fields.

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *Options* | Options | Options |
| *NumPubs* | Number of publications | NumPubs |

### *Overview for MQSRO*

**Availability**: AIX, HP-UX, IBM i, Solaris, Linux, Windows, z/OS plus IBM MQ MQI clients connected to these systems.

**Purpose**: The MQSRO structure allows the application to specify options that control how a subscription request is made. The structure is an input/output parameter on the MQSUBRQ call.

**Version**: The current version of MQSRO is MQSRO_VERSION_1.

**Character set and encoding**: Data in MQSRO must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

### *Fields for MQSRO*

The MQSRO structure contains the following fields; the fields are described in alphabetical order:

*NumPubs (MQLONG)*

This is an output field, returned to the application to indicate the number of publications sent to the subscription queue as a result of this call. Although this number of publications have been sent as a result of this call, there is no guarantee that this many messages will be available for the application to get, especially if they are non-persistent messages.

There might be more than one publication if the topic subscribed to contained a wildcard. If no wildcards were present in the topic string when the subscription represented by *Hsub* was created, then at most one publication is sent as a result of this call.

*Options (MQLONG)*

One of the following options must be specified. Only one option can be specified.

**MQSRO_FAIL_IF_QUIESCING**

The MQSUBRQ call fails if the queue manager is in the quiescing state. On z/OS, for a CICS or IMS application, this option also forces the MQSUBRQ call to fail if the connection is in a quiescing state.

**Default option:** If the option described previously is not required, the following option must be used:

**MQSRO_NONE**

Use this value to indicate that no other options have been specified; all options assume their default values.

MQSRO_NONE helps program documentation. Although it is not intended that this option be used with any other, because its value is zero, this use cannot be detected.

*StrucId (MQCHAR4)*

This is the structure identifier; the value must be:

**MQSRO_STRUC_ID**
Identifier for Subscription Request Options structure.

For the C programming language, the constant MQSRO_STRUC_ID_ARRAY is also defined; this has the same value as MQSRO_STRUC_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQSRO_STRUC_ID.

*Version (MQLONG)*

This is the structure version number; the value must be:

**MQSRO_VERSION_1**
Version-1 Subscription Request Options structure.

The following constant specifies the version number of the current version:

**MQSRO_CURRENT_VERSION**
Current version of Subscription Request Options structure.

This is always an input field. The initial value of this field is MQSRO_VERSION_1.

## *Initial values and language declarations for MQSRO*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQSRO_STRUC_ID | 'SRO¬' |
| *Version* | MQSRO_VERSION_1 | 1 |
| *Options* | MQSRO_NONE | 0 |
| *NumPubs* | None | 0 |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. In the C programming language, the macro variable MQSRO_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQSRO MySRO = {MQSRO_DEFAULT};
```

*C declaration*

```
typedef struct tagMQSRO MQSRO;
struct tagMQSRO {
  MQCHAR4   StrucId;              /* Structure identifier */
  MQLONG    Version;              /* Structure version number */
  MQLONG    Options;              /* Options that control the action of MQSUBRQ */
  MQLONG    NumPubs;              /* Number of publications sent */
  /* Ver:1 */
};
```

*COBOL declaration*

```
** MQSRO structure
 10  MQSRO.
** Structure identifier
 15  MQSRO-STRUCID            PIC X(4).
** Structure version number
 15  MQSRO-VERSION            PIC S9(9) BINARY.
** Options that control the action of MQSUBRQ
 15  MQSRO-OPTIONS            PIC S9(9) BINARY.
** Number of publications sent
 15  MQSRO-NUMPUBS            PIC S9(9) BINARY.
```

*PL/I declaration*

```
dcl
 1 MQSRO based,
   3 StrucId        char(4),       /* Structure identifier */
   3 Version        fixed bin(31), /* Structure version number */
   3 Options        fixed bin(31), /* Options that control the action of MQSUBRQ */
   3 NumPubs        fixed bin(31); /* Number of publications sent */
```

*High Level Assembler declaration*

```

```

## MQSTS - Status reporting structure

The following table summarizes the fields in the structure.

*Table 539. Fields in MQSTS*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *CompCode* | Completion code of first error | CompCode |
| *Reason* | Reason code of first error | Reason |
| *PutSuccessCount* | Number of successful asynchronous put calls | SuccessCount |
| *PutWarningCount* | Number of asynchronous put calls which had warnings | WarningCount |

| Table 539. Fields in MQSTS (continued) | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *PutFailureCount* | Number of failed asynchronous put calls | FailureCount |
| *ObjectType* | Type of failing object | ObjectType |
| *ObjectName* | Name of failing object | ObjectName |
| *ObjectQMgrName* | Name of queue manager owning the failing object | ObjectQMgrName |
| *ResolvedObjectName* | Resolved name of destination queue | ResolvedObjectName |
| *ResolvedQMgrName* | Resolved name of destination queue manager | ResolvedQMgrName |
| **Note:** The remaining fields are ignored if Version is less than MQSTS_VERSION_2. | | |
| *ObjectString* | Long object name of failing object | ObjectString |
| *SubName* | Subscription name of failing subscription | SubName |
| *OpenOptions* | Open options associated with the failure | OpenOptions |
| *SubOptions* | Subscription options associated with the failure | SubOptions |

## *Overview for MQSTS*

**Purpose**: The MQSTS structure is an output parameter from the MQSTAT command.

**Character set and encoding**: Character data in MQSTS is in the character set of the local queue manager; this is given by the *CodedCharSetId* queue-manager attribute. Numeric data in MQSTS is in the native machine encoding; this is given by *Encoding*.

**Usage**: The MQSTAT command is used to retrieve status information. This information is returned in an MQSTS structure. For information about MQSTAT, see "MQSTAT - Retrieve status information" on page 763.

## *Fields for MQSTS*

The MQSTS structure contains the following fields; the fields are described in **alphabetical order**:

*CompCode (MQLONG)*
The completion code of the operation being reported on.

The interpretation of CompCode depends on the value of the MQSTAT Type parameter.

**MQSTAT_TYPE_ASYNC_ERROR**

This is the completion code resulting from a previous asynchronous put operation on the object specified in ObjectName.

**MQSTAT_TYPE_RECONNECTION**

If the connection is reconnecting or failed to reconnect this is the completion code that caused the connection to begin reconnecting.

If the connection is currently connected the value is MQCC_OK.

**MQSTAT_TYPE_RECONNECTION_ERROR**

If the connection failed to reconnect this is the completion code that caused the reconnection to fail.

If the connection is currently connected, or reconnecting, the value is MQCC_OK.

CompCode is always an output field. Its initial value is MQCC_OK.

*ObjectName (MQCHAR48)*
The name of the object being reported on.

The interpretation of ObjectName depends on the value of the MQSTAT Type parameter.

**MQSTAT_TYPE_ASYNC_ERROR**

This is the name of the queue or topic used in the put operation, the failure of which is reported in the *CompCode* and *Reason* fields in the MQSTS structure.

**MQSTAT_TYPE_RECONNECTION**

If the connection is reconnecting, this is the name of the queue manager associated with the connection.

**MQSTAT_TYPE_RECONNECTION_ERROR**

If the connection failed to reconnect, this is the name of the object which caused reconnection to fail. The reason for the failure is reported in the *CompCode* and *Reason* fields in the MQSTS structure.

ObjectName is an output field. Its initial value is the null string in C, and 48 blank characters in other programming languages.

*ObjectQMgrName (MQCHAR48)*
The name of the queue manager being reported on.

The interpretation of ObjectQMgrName depends on the value of the MQSTAT Type parameter.

**MQSTAT_TYPE_ASYNC_ERROR**

This is the name of the queue manager on which the *ObjectName* object is defined. A name that is entirely blank up to the first null character or the end of the field denotes the queue manager to which the application is connected (the local queue manager).

**MQSTAT_TYPE_RECONNECTION**

Blank.

**MQSTAT_TYPE_RECONNECTION_ERROR**

If the connection failed to reconnect, this is the name of the object which caused reconnection to fail. The reason for the failure is reported in the *CompCode* and *Reason* fields in the MQSTS structure.

ObjectQMgrName is an output field. Its value is the null string in C, and 48 blank characters in other programming languages.

*ObjectString (MQCHARV)*
Long object name of failing object being reported on. Present only in Version 2 of MQSTS or higher.

The interpretation of ObjectString depends on the value of the MQSTAT Type parameter.

**MQSTAT_TYPE_ASYNC_ERROR**

This is the long object name of the queue or topic used in the MQPUT operation, which failed.

**MQSTAT_TYPE_RECONNECTION**

Zero length string

**MQSTAT_TYPE_RECONNECTION_ERROR**

This is the long object name of the object that caused the reconnection to fail.

ObjectString is an output field. Its initial value is a zero length string.

*ObjectType (MQLONG)*
The type of the object named in *ObjectName* being reported on.

Possible values of ObjectType are listed in "MQOT_* (Object Types and Extended Object Types)" on page 161.

ObjectType is an output field. Its initial value is MQOT_Q.

*OpenOptions (MQLONG)*
The OpenOptions used to open the object being reported upon. Present only in Version 2 of MQSTS or higher.

The value of OpenOptions depends on the value of the MQSTAT Type parameter.

**MQSTAT_TYPE_ASYNC_ERROR**

Zero.

**MQSTAT_TYPE_RECONNECTION**

Zero.

**MQSTAT_TYPE_RECONNECTION_ERROR**

The OpenOptions used when the failure occurred. The reason for the failure is reported in the *CompCode* and *Reason* fields in the MQSTS structure.

OpenOptions is an output field. Its initial value is zero.

*PutFailureCount (MQLONG)*
The number of asynchronous put operations that failed.

The value of PutFailureCount depends on the value of the MQSTAT Type parameter.

**MQSTAT_TYPE_ASYNC_ERROR**

The number of asynchronous put operations to the object named in the MQSTS structure that completed with MQCC_FAILED.

**MQSTAT_TYPE_RECONNECTION**

Zero.

**MQSTAT_TYPE_RECONNECTION_ERROR**

Zero.

PutFailureCount is an output field. Its initial value is zero.

*PutSuccessCount (MQLONG)*
The number of asynchronous put operations that succeeded.

The value of PutSuccessCount depends on the value of the MQSTAT Type parameter.

**MQSTAT_TYPE_ASYNC_ERROR**

The number of asynchronous put operations to the object named in the MQSTS structure that completed with MQCC_OK.

**MQSTAT_TYPE_RECONNECTION**

Zero.

**MQSTAT_TYPE_RECONNECTION_ERROR**

Zero.

PutSuccessCount is an output field. Its initial value is zero.

*PutWarningCount (MQLONG)*
The number of asynchronous put operations that ended with a warning.

The value of PutWarningCount depends on the value of the MQSTAT Type parameter.

**MQSTAT_TYPE_ASYNC_ERROR**

The number of asynchronous put operations to the object named in the MQSTS structure that completed with MQCC_WARNING.

**MQSTAT_TYPE_RECONNECTION**

Zero.

**MQSTAT_TYPE_RECONNECTION_ERROR**

Zero.

PutWarningCount is an output field. Its initial value is zero.

*SubName (MQCHARV)*
The name of the failing subscription. Present only in Version 2 of MQSTS or higher.

The interpretation of SubName depends on the value of the MQSTAT Type parameter.

**MQSTAT_TYPE_ASYNC_ERROR**

Zero length string.

**MQSTAT_TYPE_RECONNECTION**

Zero length string.

**MQSTAT_TYPE_RECONNECTION_ERROR**

The name of the subscription that caused reconnection to fail. If no subscription name is available, or the failure is not related to a subscription, this is a zero-length string.

SubName is an output field. Its initial value is a zero length string.

*SubOptions (MQLONG)*
The SubOptions used to open the failing subscription. Present only in Version 2 of MQSTS or higher.

The interpretation of SubOptions depends on the value of the MQSTAT Type parameter.

**MQSTAT_TYPE_ASYNC_ERROR**

Zero.

**MQSTAT_TYPE_RECONNECTION**

Zero.

**MQSTAT_TYPE_RECONNECTION_ERROR**

The SubOptions used when the failure occurred. If the failure is not related to subscribing to a topic, the value returned is zero.

SubOptions is an output field. Its initial value is zero.

*Reason (MQLONG)*
The reason code of the operation being reported on.

The interpretation of Reason depends on the value of the MQSTAT Type parameter.

**MQSTAT_TYPE_ASYNC_ERROR**

This is the reason code resulting from a previous asynchronous put operation on the object specified in ObjectName.

**MQSTAT_TYPE_RECONNECTION**

If the connection is reconnecting or failed to reconnect this is the reason code that caused the reconnection to begin reconnecting.

If the connection is currently connected the value is MQRC_NONE.

**MQSTAT_TYPE_RECONNECTION_ERROR**

If the connection failed to reconnect this is the reason code that caused the reconnection to fail.

If the connection is currently connected, or reconnecting, the value is MQRC_NONE.

Reason is an output field. Its initial value is MQRC_NONE.

*ResolvedObjectName (MQCHAR48)*
The name of the object named in *ObjectName* after the local queue manager resolves the name.

The interpretation of ResolvedObjectName depends on the value of the MQSTAT Type parameter.

**MQSTAT_TYPE_ASYNC_ERROR**

ResolvedObjectName is the name of the object named in *ObjectName* after the local queue manager resolves the name. The name returned is the name of an object that exists on the queue manager identified by *ResolvedQMgrName*.

**MQSTAT_TYPE_RECONNECTION**

Blank.

**MQSTAT_TYPE_RECONNECTION_ERROR**

Blank.

ResolvedObjectName is an output field. Its initial value is the null string in C, and 48 blank characters in other programming languages.

*ResolvedQMgrName (MQCHAR48)*
The name of the destination queue manager after the local queue manager resolves the name.

The interpretation of ResolvedQMgrName depends on the value of the MQSTAT Type parameter.

**MQSTAT_TYPE_ASYNC_ERROR**

ResolvedQMgrName is the name of the destination queue manager after the local queue manager resolves the name. The name returned is the name of the queue manager that owns the object identified by *ResolvedObjectName*. *ResolvedQMgrName* might be the name of the local queue manager.

**MQSTAT_TYPE_RECONNECTION**

Blank.

**MQSTAT_TYPE_RECONNECTION_ERROR**

Blank.

ResolvedQMgrName is always an output field. Its initial value is the null string in C, and 48 blank characters in other programming languages.

*StrucId (MQCHAR4)*
The identifier for the status reporting structure, MQSTS.

StrucId is the structure identifier. The value must be:

**MQSTS_STRUC_ID**
Identifier for status reporting structure.

For the C programming language, the constant MQSTS_STRUC_ID_ARRAY is also defined; this has the same value as MQSTS_STRUC_ID, but is an array of characters instead of a string.

StrucId is always an input field. Its initial value is MQSTS_STRUC_ID.

*Version (MQLONG)*
The structure version number.

The value must be either:

**MQSTS_VERSION_1**
Version 1 status reporting structure.

**MQSTS_VERSION_2**
Version 2 status reporting structure.

The following constant specifies the version number of the current version:

**MQSTS_CURRENT_VERSION**
Current version of status reporting structure. The current version is MQSTS_VERSION_2.

Version is always an input field. Its initial value is MQSTS_VERSION_1.

## *Initial values and language declarations for MQSTS*

*Table 540. Initial values of fields in MQSTS*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQSTS_STRUC_ID | 'STAT¬' |
| *Version* | MQSTS_VERSION_1 | 1 |
| *CompCode* | MQCC_OK | 0 |
| *Reason* | MQRC_NONE | 0 |
| *PutSuccessCount* | None | 0 |
| *PutWarningCount* | None | 0 |
| *PutFailureCount* | None | 0 |
| *ObjectType* | MQOT_Q | 1 |
| *ObjectName* | None | Null string or blanks |
| *ObjectQMgrName* | None | Null string or blanks |
| *ResolvedObjectName* | None | Null string or blanks |
| *ResolvedQMgrName* | None | Null string or blanks |
| *ObjectString* | MQCHARV_DEFAULT | {NULL,0,0,0,-3} |
| *SubName* | MQCHARV_DEFAULT | {NULL,0,0,0,-3} |
| *OpenOptions* | None | 0 |
| *SubOptions* | None | 0 |

*Table 540. Initial values of fields in MQSTS (continued)*

| Field name | Name of constant | Value of constant |
|---|---|---|

**Notes:**

1. The symbol ¬ represents a single blank character.
2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
3. In the C programming language, the macro variable MQSTS_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQSTS MySTS = {MQSTS_DEFAULT};
```

*C declaration*

```
typedef struct tagMQSTS MQSTS;
struct tagMQSTS {
 MQCHAR4   StrucId;            /* Structure identifier */
 MQLONG    Version;            /* Structure version number */
 MQLONG    CompCode;           /* Completion Code of first error */
 MQLONG    Reason;             /* Reason Code of first error */
 MQLONG    PutSuccessCount;    /* Number of Async calls succeeded */
 MQLONG    PutWarningCount;    /* Number of Async calls had warnings */
 MQLONG    PutFailureCount;    /* Number of Async calls had failures */
 MQLONG    ObjectType;         /* Failing object type */
 MQCHAR48  ObjectName;         /* Failing object name */
 MQCHAR48  ObjectQMgrName;     /* Failing object queue manager name */
 MQCHAR48  ResolvedObjectName; /* Resolved name of destination queue */
 MQCHAR48  ResolvedQMgrName;   /* Resolved name of destination qmgr */
/* Ver:1 */
 MQCHARV   ObjectString;       /* Failing object long name */
 MQCHARV   SubName;            /* Failing subscription name */
 MQLONG    OpenOptions;        /* Failing open options */
 MQLONG    SubOptions;         /* Failing subscription options */
/* Ver:2 */
};
```

*COBOL declaration*

```
      ** MQSTS structure

## MQTM - Trigger message

The following table summarizes the fields in the structure.

*Table 541. Fields in MQTM*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *QName* | Name of triggered queue | QName |
| *ProcessName* | Name of process object | ProcessName |
| *TriggerData* | Trigger data | TriggerData |
| *ApplType* | Application type | ApplType |
| *ApplId* | Application identifier | ApplId |
| *EnvData* | Environment data | EnvData |
| *UserData* | User data | UserData |

### *Overview for MQTM*

**Purpose**: The MQTM structure describes the data in the trigger message that is sent by the queue manager to a trigger-monitor application when a trigger event occurs for a queue.

This structure is part of the IBM MQ Trigger Monitor Interface (TMI), which is one of the IBM MQ framework interfaces.

**Format name**: MQFMT_TRIGGER.

**Character set and encoding**: Character data in MQTM is in the character set of the queue manager that generates the MQTM. Numeric data in MQTM is in the machine encoding of the queue manager that generates the MQTM.

The character set and encoding of the MQTM are given by the *CodedCharSetId* and *Encoding* fields in:

- The MQMD (if the MQTM structure is at the start of the message data), or
- The header structure that precedes the MQTM structure (all other cases).

**Usage**: A trigger-monitor application might need to pass some or all of the information in the trigger message to the application that the trigger-monitor application starts. Information that might be needed by the started application includes *QName*, *TriggerData*, and *UserData*. The trigger-monitor application can pass the MQTM structure directly to the started application, or pass an MQTMC2 structure instead, depending on what is permitted by the environment and convenient for the started application. For information about MQTMC2, see "MQTMC2 - Trigger message 2 (character format)" on page 586.

- On z/OS, for an MQAT_CICS application that is started using the CKTI transaction, the entire trigger message structure MQTM is made available to the started transaction; the information can be retrieved by using the EXEC CICS RETRIEVE command.
- On IBM i, the trigger-monitor application provided with IBM MQ passes an MQTMC2 structure to the started application.

For information about using triggers, see Starting IBM MQ applications using triggers.

**MQMD for a trigger message**: The fields in the MQMD of a trigger message generated by the queue manager are set as follows:

| Field in MQMD | Value used |
|---|---|
| *StrucId* | MQMD_STRUC_ID |
| *Version* | MQMD_VERSION_1 |
| *Report* | MQRO_NONE |
| *MsgType* | MQMT_DATAGRAM |
| *Expiry* | MQEI_UNLIMITED |
| *Feedback* | MQFB_NONE |
| *Encoding* | MQENC_NATIVE |
| *CodedCharSetId* | Queue manager's *CodedCharSetId* attribute |
| *Format* | MQFMT_TRIGGER |
| *Priority* | Initiation queue's *DefPriority* attribute |
| *Persistence* | MQPER_NOT_PERSISTENT |
| *MsgId* | A unique value |
| *CorrelId* | MQCI_NONE |
| *BackoutCount* | 0 |
| *ReplyToQ* | Blanks |
| *ReplyToQMgr* | Name of queue manager |
| *UserIdentifier* | Blanks |
| *AccountingToken* | MQACT_NONE |
| *ApplIdentityData* | Blanks |
| *PutApplType* | MQAT_QMGR, or as appropriate for the message channel agent |
| *PutApplName* | First 28 bytes of the queue-manager name |
| *PutDate* | Date when trigger message is sent |
| *PutTime* | Time when trigger message is sent |
| *ApplOriginData* | Blanks |

An application that generates a trigger message is recommended to set similar values, except for the following:

- The *Priority* field can be set to MQPRI_PRIORITY_AS_Q_DEF (the queue manager will change this to the default priority for the initiation queue when the message is put).
- The *ReplyToQMgr* field can be set to blanks (the queue manager will change this to the name of the local queue manager when the message it put).
- Set the context fields as appropriate for the application.

## *Fields for MQTM*

The MQTM structure contains the following fields; the fields are described in **alphabetical order**:

*ApplId (MQCHAR256)*

This is a character string that identifies the application to be started, and is used by the trigger-monitor application that receives the trigger message. The queue manager initializes this field with the value of the *ApplId* attribute of the process object identified by the *ProcessName* field; see "Attributes for process definitions" on page 843 for details of this attribute. The content of this data is of no significance to the queue manager.

The meaning of *ApplId* is determined by the trigger-monitor application. The trigger monitor provided by IBM MQ requires *ApplId* to be the name of an executable program. The following notes apply to the environments indicated:

- On z/OS, *ApplId* is:
  - A CICS transaction identifier, for applications started using the CICS trigger-monitor transaction CKTI
  - An IMS transaction identifier, for applications started using the IMS trigger monitor CSQQTRMN
- On Windows systems, the program name can be prefixed with a drive and directory path.
- On IBM i, the program name can be prefixed with a library name and / character.
- On UNIX systems, the program name can be prefixed with a directory path.

The length of this field is given by MQ_PROCESS_APPL_ID_LENGTH. The initial value of this field is the null string in C, and 256 blank characters in other programming languages.

*ApplType (MQLONG)*

This identifies the nature of the program to be started, and is used by the trigger-monitor application that receives the trigger message. The queue manager initializes this field with the value of the *ApplType* attribute of the process object identified by the *ProcessName* field; see "Attributes for process definitions" on page 843 for details of this attribute. The content of this data is of no significance to the queue manager.

*ApplType* can have one of the following standard values. User-defined types can also be used, but should be restricted to values in the range MQAT_USER_FIRST through MQAT_USER_LAST:

**MQAT_AIX**
AIX application (same value as MQAT_UNIX).

**MQAT_BATCH**
Batch application

**MQAT_BROKER**
Broker application

**MQAT_CICS**
CICS transaction.

**MQAT_CICS_BRIDGE**
CICS bridge application.

**MQAT_CICS_VSE**
CICS/VSE transaction.

**MQAT_DOS**
IBM MQ MQI client application on PC DOS.

**MQAT_IMS**
IMS application.

**MQAT_IMS_BRIDGE**
IMS bridge application.

**MQAT_JAVA**
Java application.

**MQAT_MVS**
MVS or TSO application (same value as MQAT_ZOS).

**MQAT_NOTES_AGENT**
Lotus Notes Agent application.

**MQAT_NSK**
HP Integrity NonStop Server application.

**MQAT_OS390**
OS/390 application (same value as MQAT_ZOS).

**MQAT_OS400**
IBM i application.

**MQAT_RRS_BATCH**
RRS batch application.

**MQAT_UNIX**
UNIX application.

**MQAT_UNKNOWN**
Application of unknown type.

**MQAT_USER**
User-defined application type.

**MQAT_VOS**
Stratus VOS application.

**MQAT_WINDOWS**
16-bit Windows application.

**MQAT_WINDOWS_NT**
32-bit Windows application.

**MQAT_WLM**
z/OS workload manager application.

**MQAT_XCF**
XCF.

**MQAT_ZOS**
z/OS application.

**MQAT_USER_FIRST**
Lowest value for user-defined application type.

**MQAT_USER_LAST**
Highest value for user-defined application type.

The initial value of this field is `0`.

*EnvData (MQCHAR128)*

This is a character string that contains environment-related information pertaining to the application to be started, and is used by the trigger-monitor application that receives the trigger message. The queue manager initializes this field with the value of the *EnvData* attribute of the process object identified by the *ProcessName* field; see “Attributes for process definitions” on page 843 for details of this attribute. The content of this data is of no significance to the queue manager.

On z/OS, for a CICS application started using the CKTI transaction, or an IMS application to be started using the CSQQTRMN transaction, this information is not used.

The length of this field is given by MQ_PROCESS_ENV_DATA_LENGTH. The initial value of this field is the null string in C, and 128 blank characters in other programming languages.

*ProcessName (MQCHAR48)*

This is the name of the queue-manager process object specified for the triggered queue, and can be used by the trigger-monitor application that receives the trigger message. The queue manager initializes this field with the value of the *ProcessName* attribute of the queue identified by the *QName* field; see“Attributes for queues” on page 810for details of this attribute.

Names that are shorter than the defined length of the field are always padded to the right with blanks; they are not ended prematurely by a null character.

The length of this field is given by MQ_PROCESS_NAME_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*QName (MQCHAR48)*

This is the name of the queue for which a trigger event occurred, and is used by the application started by the trigger-monitor application. The queue manager initializes this field with the value of the *QName* attribute of the triggered queue; see“Attributes for queues” on page 810for details of this attribute.

Names that are shorter than the defined length of the field are padded to the right with blanks; they are not ended prematurely by a null character.

The length of this field is given by MQ_Q_NAME_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*StrucId (MQCHAR4)*

This is the structure identifier. The value must be:

**MQTM_STRUC_ID**
Identifier for trigger message structure.

For the C programming language, the constant MQTM_STRUC_ID_ARRAY is also defined; this has the same value as MQTM_STRUC_ID, but is an array of characters instead of a string.

The initial value of this field is MQTM_STRUC_ID.

*TriggerData (MQCHAR64)*

This is free-format data for use by the trigger-monitor application that receives the trigger message. The queue manager initializes this field with the value of the *TriggerData* attribute of the queue identified by the *QName* field; see “Attributes for queues” on page 810 for details of this attribute. The content of this data is of no significance to the queue manager.

On z/OS, for a CICS application started using the CKTI transaction, this information is not used.

The length of this field is given by MQ_TRIGGER_DATA_LENGTH. The initial value of this field is the null string in C, and 64 blank characters in other programming languages.

*UserData (MQCHAR128)*

This is a character string that contains user information relevant to the application to be started, and is used by the trigger-monitor application that receives the trigger message. The queue manager initializes this field with the value of the *UserData* attribute of the process object identified by the *ProcessName* field; see “Attributes for process definitions” on page 843 for details of this attribute. The content of this data is of no significance to the queue manager.

For Microsoft Windows, the character string must not contain double quotation marks if the process definition is going to be passed to **runmqtrm**.

The length of this field is given by MQ_PROCESS_USER_DATA_LENGTH. The initial value of this field is the null string in C, and 128 blank characters in other programming languages.

*Version (MQLONG)*

This is the structure version number. The value must be:

**MQTM_VERSION_1**
Version number for trigger message structure.

The following constant specifies the version number of the current version:

**MQTM_CURRENT_VERSION**
Current version of trigger message structure.

The initial value of this field is MQTM_VERSION_1.

## *Initial values and language declarations for MQTM*

*Table 542. Initial values of fields in MQTM for MQTM*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQTM_STRUC_ID | 'TM¬¬' |
| *Version* | MQTM_VERSION_1 | 1 |
| *QName* | None | Null string or blanks |
| *ProcessName* | None | Null string or blanks |
| *TriggerData* | None | Null string or blanks |
| *ApplType* | None | 0 |
| *ApplId* | None | Null string or blanks |
| *EnvData* | None | Null string or blanks |
| *UserData* | None | Null string or blanks |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
3. In the C programming language, the macro variable MQTM_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQTM MyTM = {MQTM_DEFAULT};
```

*C declaration*

```
typedef struct tagMQTM MQTM;
struct tagMQTM {
  MQCHAR4    StrucId;      /* Structure identifier */
  MQLONG     Version;      /* Structure version number */
  MQCHAR48   QName;        /* Name of triggered queue */
  MQCHAR48   ProcessName;  /* Name of process object */
  MQCHAR64   TriggerData;  /* Trigger data */
  MQLONG     ApplType;     /* Application type */
  MQCHAR256  ApplId;       /* Application identifier */
  MQCHAR128  EnvData;      /* Environment data */
  MQCHAR128  UserData;     /* User data */
};
```

*COBOL declaration*

```
**   MQTM structure
  10 MQTM.
**    Structure identifier
   15 MQTM-STRUCID     PIC X(4).
**    Structure version number
   15 MQTM-VERSION     PIC S9(9) BINARY.
**    Name of triggered queue
   15 MQTM-QNAME       PIC X(48).
**    Name of process object
   15 MQTM-PROCESSNAME PIC X(48).
**    Trigger data
   15 MQTM-TRIGGERDATA PIC X(64).
**    Application type
   15 MQTM-APPLTYPE    PIC S9(9) BINARY.
**    Application identifier
   15 MQTM-APPLID      PIC X(256).
**    Environment data
   15 MQTM-ENVDATA     PIC X(128).
**    User data
   15 MQTM-USERDATA    PIC X(128).
```

*PL/I declaration*

```

## MQTMC2 - Trigger message 2 (character format)

The following table summarizes the fields in the structure.

| *Table 543. Fields in MQTMC2* | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *QName* | Name of triggered queue | QName |
| *ProcessName* | Name of process object | ProcessName |
| *TriggerData* | Trigger data | TriggerData |
| *ApplType* | Application type | ApplType |
| *ApplId* | Application identifier | ApplId |
| *EnvData* | Environment data | EnvData |
| *UserData* | User data | UserData |
| *QMgrName* | Queue manager name | QMgrName |

### *Overview for MQTMC2*

**Purpose**: When a trigger-monitor application retrieves a trigger message (MQTM) from an initiation queue, the trigger monitor might need to pass some or all of the information in the trigger message to the application that the trigger monitor starts.

Information that the started application might need includes *QName*, *TriggerData*, and *UserData*. The trigger monitor application can pass the MQTM structure directly to the started application, or pass an MQTMC2 structure instead, depending on what is permitted by the environment and convenient for the started application.

This structure is part of the IBM MQ Trigger Monitor Interface (TMI), which is one of the IBM MQ framework interfaces.

**Character set and encoding**: Character data in MQTMC2 is in the character set of the local queue manager; this is given by the *CodedCharSetId* queue-manager attribute.

**Usage**: The MQTMC2 structure is very similar to the format of the MQTM structure. The difference is that the non-character fields in MQTM are changed in MQTMC2 to character fields of the same length, and the queue manager name is added at the end of the structure.

- On z/OS, for an MQAT_IMS application that is started using the CSQQTRMN application, an MQTMC2 structure is made available to the started application.
- On IBM i, the trigger monitor application provided with IBM MQ passes an MQTMC2 structure to the started application.

### *Fields for MQTMC2*

The MQTMC2 structure contains the following fields; the fields are described in **alphabetical order**:

*ApplId (MQCHAR256)*

Application identifier.

See the *ApplId* field in the MQTM structure.

*ApplType (MQCHAR4)*
Application type.

This field always contains blanks, whatever the value in the *ApplType* field in the MQTM structure of the original trigger message.

*EnvData (MQCHAR128)*
Environment data.

See the *EnvData* field in the MQTM structure.

*ProcessName (MQCHAR48)*
Name of process object.

See the *ProcessName* field in the MQTM structure.

*QMgrName (MQCHAR48)*
Queue manager name.

This is the name of the queue manager at which the trigger event occurred.

*QName (MQCHAR48)*
Name of triggered queue.

See the *QName* field in the MQTM structure.

*StrucId (MQCHAR4)*
Structure identifier.

The value must be:

**MQTMC_STRUC_ID**
Identifier for trigger message (character format) structure.

For the C programming language, the constant MQTMC_STRUC_ID_ARRAY is also defined; this has the same value as MQTMC_STRUC_ID, but is an array of characters instead of a string.

*TriggerData (MQCHAR64)*
Trigger data.

See the *TriggerData* field in the MQTM structure.

*UserData (MQCHAR128)*
User data.

See the *UserData* field in the MQTM structure.

*Version (MQCHAR4)*
Structure version number.

The value must be:

**MQTMC_VERSION_2**
Version 2 trigger message (character format) structure.

For the C programming language, the constant MQTMC_VERSION_2_ARRAY is also defined; this has the same value as MQTMC_VERSION_2, but is an array of characters instead of a string.

The following constant specifies the version number of the current version:

**MQTMC_CURRENT_VERSION**
Current version of trigger message (character format) structure.

### *Initial values and language declarations for MQTMC2*

*Table 544. Initial values of fields in MQTMC2 for MQTMC2*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQTMC_STRUC_ID | 'TMC¬' |
| *Version* | MQTMC_VERSION_2 | '¬¬¬2' |
| *QName* | None | Null string or blanks |
| *ProcessName* | None | Null string or blanks |
| *TriggerData* | None | Null string or blanks |
| *ApplType* | None | Blanks |
| *ApplId* | None | Null string or blanks |
| *EnvData* | None | Null string or blanks |
| *UserData* | None | Null string or blanks |
| *QMgrName* | None | Null string or blanks |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
3. In the C programming language, the macro variable MQTMC2_DEFAULT contains the values listed above. Use it in the following way to provide initial values for the fields in the structure:

```
MQTMC2 MyTMC = {MQTMC2_DEFAULT};
```

*C declaration*

```
typedef struct tagMQTMC2 MQTMC2;
struct tagMQTMC2 {
  MQCHAR4    StrucId;      /* Structure identifier */
  MQCHAR4    Version;      /* Structure version number */
  MQCHAR48   QName;        /* Name of triggered queue */
  MQCHAR48   ProcessName;  /* Name of process object */
  MQCHAR64   TriggerData;  /* Trigger data */
  MQCHAR4    ApplType;     /* Application type */
  MQCHAR256  ApplId;       /* Application identifier */

## MQWIH - Work information header

The following table summarizes the fields in the structure.

*Table 545. Fields in MQWIH*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |

| Table 545. Fields in MQWIH (continued) | | |
|---|---|---|
| **Field** | **Description** | **Topic** |
| *StrucLength* | Length of MQWIH structure | StrucLength |
| *Encoding* | Numeric encoding of data that follows MQWIH | Encoding |
| *CodedCharSetId* | Character-set identifier of data that follows MQWIH | CodedCharSetId |
| *Format* | Format name of data that follows MQWIH | Format |
| *Flags* | Flags | Flags |
| *ServiceName* | Service name | ServiceName |
| *ServiceStep* | Service step name | ServiceStep |
| *MsgToken* | Message token | MsgToken |
| *Reserved* | Reserved | Reserved |

## *Overview for MQWIH*

The MQWIH structure describes the header information for a message sent to z/OS workload management (WLM). For any IBM MQ supported platform you can create and transmit a message that includes the MQWIH structure, but only an IBM MQ for z/OS queue manager can interact with WLM. Therefore, for the message to get to WLM from a non-z/OS queue manager, your queue manager network must include at least one z/OS queue manager through which the message can be routed.

**Availability**: All IBM MQ systems, plus IBM MQ clients connected to these systems.

**Purpose**: The MQWIH structure describes the information that must be present at the start of a message that is to be handled by the z/OS workload manager.

**Format name**: MQFMT_WORK_INFO_HEADER.

**Character set and encoding**: The fields in the MQWIH structure are in the character set and encoding given by the *CodedCharSetId* and *Encoding* fields in the header structure that precedes MQWIH, or by those fields in the MQMD structure if the MQWIH is at the start of the application message data.

The character set must be one that has single-byte characters for the characters that are valid in queue names.

**Usage**: If a message is to be processed by the z/OS workload manager, the message must begin with an MQWIH structure.

## *Fields for MQWIH*

The MQWIH structure contains the following fields; the fields are described in **alphabetical order**:

*CodedCharSetId (MQLONG)*

This specifies the character set identifier of the data that follows the MQWIH structure; it does not apply to character data in the MQWIH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. You can use the following special value:

**MQCCSI_INHERIT**
Character data in the data *following* this structure is in the same character set as this structure.

The queue manager changes this value in the structure sent in the message to the actual character-set identifier of the structure. Provided no error occurs, the value MQCCSI_INHERIT is not returned by the MQGET call.

MQCCSI_INHERIT cannot be used if the value of the *PutApplType* field in MQMD is MQAT_BROKER.

The initial value of this field is MQCCSI_UNDEFINED.

*Encoding (MQLONG)*

This specifies the numeric encoding of the data that follows the MQWIH structure; it does not apply to numeric data in the MQWIH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data.

The initial value of this field is 0.

*Flags (MQLONG)*

The value must be:

**MQWIH_NONE**
No flags.

The initial value of this field is MQWIH_NONE.

*Format (MQCHAR8)*

This specifies the format name of the data that follows the MQWIH structure.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The rules for coding this field are the same as those for the *Format* field in MQMD.

The length of this field is given by MQ_FORMAT_LENGTH. The initial value of this field is MQFMT_NONE.

*MsgToken (MQBYTE16)*

This is a message token that uniquely identifies the message.

For the MQPUT and MQPUT1 calls, this field is ignored. The length of this field is given by MQ_MSG_TOKEN_LENGTH. The initial value of this field is MQMTOK_NONE.

*Reserved (MQCHAR32)*

This is a reserved field; it must be blank.

*ServiceName (MQCHAR32)*

This is the name of the service that is to process the message.

The length of this field is given by MQ_SERVICE_NAME_LENGTH. The initial value of this field is 32 blank characters.

*ServiceStep (MQCHAR8)*

This is the name of the step of *ServiceName* to which the message relates.

The length of this field is given by MQ_SERVICE_STEP_LENGTH. The initial value of this field is 8 blank characters.

*StrucId (MQCHAR4)*

This is the structure identifier. The value must be:

**MQWIH_STRUC_ID**
Identifier for work information header structure.

For the C programming language, the constant MQWIH_STRUC_ID_ARRAY is also defined; this has the same value as MQWIH_STRUC_ID, but is an array of characters instead of a string.

The initial value of this field is MQWIH_STRUC_ID.

*StrucLength (MQLONG)*

This is the length of the MQWIH structure. The value must be:

**MQWIH_LENGTH_1**
Length of version-1 work information header structure.

The following constant specifies the length of the current version:

**MQWIH_CURRENT_LENGTH**
Length of current version of work information header structure.

The initial value of this field is MQWIH_LENGTH_1.

*Version (MQLONG)*

This is the structure version number. The value must be:

**MQWIH_VERSION_1**
Version-1 work information header structure.

The following constant specifies the version number of the current version:

**MQWIH_CURRENT_VERSION**
Current version of work information header structure.

The initial value of this field is MQWIH_VERSION_1.

## *Initial values and language declarations for MQWIH*

*Table 546. Initial values of fields in MQWIH for MQWIH*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQWIH_STRUC_ID | 'WIH¬' |
| *Version* | MQWIH_VERSION_1 | 1 |
| *StrucLength* | MQWIH_LENGTH_1 | 120 |
| *Encoding* | None | 0 |
| *CodedCharSetId* | MQCCSI_UNDEFINED | 0 |
| *Format* | MQFMT_NONE | Blanks |
| *Flags* | MQWIH_NONE | 0 |
| *ServiceName* | None | Blanks |
| *ServiceStep* | None | Blanks |
| *MsgToken* | MQMTOK_NONE | Nulls |
| *Reserved* | None | Blanks |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. In the C programming language, the macro variable MQWIH_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQWIH MyWIH = {MQWIH_DEFAULT};
```

*C declaration*

```
typedef struct tagMQWIH MQWIH;
struct tagMQWIH {
  MQCHAR4   StrucId;         /* Structure identifier */
  MQLONG    Version;         /* Structure version number */
  MQLONG    StrucLength;     /* Length of MQWIH structure */
```

```
  MQLONG    Encoding;        /* Numeric encoding of data that follows
                                MQWIH */
  MQLONG    CodedCharSetId;  /* Character-set identifier of data that
                                follows MQWIH */
  MQCHAR8   Format;          /* Format name of data that follows
                                MQWIH */
  MQLONG    Flags;           /* Flags */
  MQCHAR32  ServiceName;     /* Service name */
  MQCHAR8   ServiceStep;     /* Service step name */

## MQXP - Exit parameter block

The following table summarizes the fields in the structure.

*Table 547. Fields in MQXP*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *ExitId* | Exit identifier | ExitId |
| *ExitReason* | Reason for invocation of exit | ExitReason |
| *ExitResponse* | Response from exit | ExitResponse |
| *ExitCommand* | API call code | ExitCommand |
| *ExitParmCount* | Parameter count | ExitParmCount |
| *ExitUserArea* | User area | ExitUserArea |

### z/OS *Overview for MQXP*

**Availability**: z/OS.

**Purpose**: The MQXP structure is used as an input/output parameter to the API-crossing exit. For more information about this exit, see The API-crossing exit.

**Character set and encoding**: Character data in MQXP is in the character set of the local queue manager; this is given by the *CodedCharSetId* queue-manager attribute. Numeric data in MQXP is in the native machine encoding; this is given by MQENC_NATIVE.

### *Fields for MQXP*

The MQXP structure contains the following fields; the fields are described in **alphabetical order**:

*ExitCommand (MQLONG)*

This field is set on entry to the exit routine. It identifies the API call that caused the exit to be invoked:

**MQXC_CALLBACK**
The CALLBACK call.

**MQXC_MQBACK**
The MQBACK call.

**MQXC_MQCB**
The MQCB call.

**MQXC_MQCLOSE**
The MQCLOSE call.

**MQXC_MQCMIT**
The MQCMIT call.

**MQXC_MQCTL**
The MQCTL call.

**MQXC_MQGET**
The MQGET call.

**MQXC_MQINQ**
The MQINQ call.

**MQXC_MQOPEN**
The MQOPEN call.

**MQXC_MQPUT**
The MQPUT call.

**MQXC_MQPUT1**
The MQPUT1 call.

**MQXC_MQSET**
The MQSET call.

**MQXC_MQSTAT**
The MQSTAT call.

**MQXC_MQSUB**
The MQSUB call.

**MQXC_MQSUBRQ**
The MQSUBRQ call.

This is an input field to the exit.

*ExitId (MQLONG)*

This is set on entry to the exit routine, and indicates the type of exit:

**MQXT_API_CROSSING_EXIT**
API-crossing exit for CICS.

This is an input field to the exit.

*ExitParmCount (MQLONG)*

This field is set on entry to the exit routine. It contains the number of parameters that the MQ call takes. These are:

| Call name | Number of parameters |
|---|---|
| MQBACK | 3 |
| MQCLOSE | 5 |
| MQCMIT | 3 |
| MQGET | 9 |
| MQINQ | 10 |

| Call name | Number of parameters |
|---|---|
| MQOPEN | 6 |
| MQPUT | 8 |
| MQPUT1 | 8 |
| MQSET | 10 |

This is an input field to the exit.

*ExitReason (MQLONG)*

This is set on entry to the exit routine. For the API-crossing exit it indicates whether the routine is called before or after execution of the API call:

**MQXR_BEFORE**
Before API execution.

**MQXR_AFTER**
After API execution.

This is an input field to the exit.

*ExitResponse (MQLONG)*

The value is set by the exit to communicate with the caller. The following values are defined:

**MQXCC_OK**
Exit completed successfully.

**MQXCC_SUPPRESS_FUNCTION**
Suppress function.

When this value is set by an API-crossing exit called *before* the API call, the API call is not performed. The *CompCode* for the call is set to MQCC_FAILED, the *Reason* is set to MQRC_SUPPRESSED_BY_EXIT, and all other parameters remain as the exit left them.

When this value is set by an API-crossing exit called *after* the API call, it is ignored by the queue manager.

**MQXCC_SKIP_FUNCTION**
Skip function.

When this value is set by an API-crossing exit called *before* the API call, the API call is not performed; the *CompCode* and *Reason* and all other parameters remain as the exit left them.

When this value is set by an API-crossing exit called *after* the API call, it is ignored by the queue manager.

This is an output field from the exit.

*ExitUserArea (MQBYTE16)*

This is a field that is available for the exit to use. It is initialized to binary zero for the length of the field before the first invocation of the exit for the task, and thereafter any changes made to this field by the exit are preserved across invocations of the exit. The following value is defined:

**MQXUA_NONE**
No user information.

The value is binary zero for the length of the field.

For the C programming language, the constant MQXUA_NONE_ARRAY is also defined; this has the same value as MQXUA_NONE, but is an array of characters instead of a string.

The length of this field is given by MQ_EXIT_USER_AREA_LENGTH. This is an input/output field to the exit.

*Reserved (MQLONG)*

This is a reserved field. Its value is not significant to the exit.

*StrucId (MQCHAR4)*

This is the structure identifier. The value must be:

**MQXP_STRUC_ID**
Identifier for exit parameter structure.

For the C programming language, the constant MQXP_STRUC_ID_ARRAY is also defined; this has the same value as MQXP_STRUC_ID, but is an array of characters instead of a string.

This is an input field to the exit.

*Version (MQLONG)*

This is the structure version number. The value must be:

**MQXP_VERSION_1**
Version number for exit parameter-block structure.

**Note:** When a new version of this structure is introduced, the layout of the existing part is not changed. The exit must therefore check that the version number is equal to or greater than the lowest version that contains the fields that the exit needs to use.

This is an input field to the exit.

## *Language declarations*

This structure is supported in the following programming languages.

*C declaration*

```
typedef struct tagMQXP MQXP;
struct tagMQXP {
  MQCHAR4   StrucId;        /* Structure identifier */
  MQLONG    Version;        /* Structure version number */
  MQLONG    ExitId;         /* Exit identifier */
  MQLONG    ExitReason;     /* Reason for invocation of exit */
  MQLONG    ExitResponse;   /* Response from exit */
  MQLONG    ExitCommand;    /* API call code */
  MQLONG    ExitParmCount;  /* Parameter count */
  MQLONG    Reserved;       /* Reserved */
  MQBYTE16  ExitUserArea;   /* User area */
};
```

*COBOL declaration*

```
**   MQXP structure
  10 MQXP.
**    Structure identifier
   15 MQXP-STRUCID       PIC X(4).
**    Structure version number
   15 MQXP-VERSION       PIC S9(9) BINARY.
**    Exit identifier
   15 MQXP-EXITID        PIC S9(9) BINARY.
**    Reason for invocation of exit
   15 MQXP-EXITREASON    PIC S9(9) BINARY.
**    Response from exit
   15 MQXP-EXITRESPONSE  PIC S9(9) BINARY.
**    API call code
   15 MQXP-EXITCOMMAND   PIC S9(9) BINARY.
**    Parameter count
   15 MQXP-EXITPARMCOUNT PIC S9(9) BINARY.
**    Reserved
   15 MQXP-RESERVED      PIC S9(9) BINARY.
**    User area
   15 MQXP-EXITUSERAREA  PIC X(16).
```

*PL/I declaration*

```
dcl

```

## MQXQH - Transmission-queue header

The following table summarizes the fields in the structure.

*Table 548. Fields in MQXQH*

| Field | Description | Topic |
|---|---|---|
| *StrucId* | Structure identifier | StrucId |
| *Version* | Structure version number | Version |
| *RemoteQName* | Name of destination queue | RemoteQName |
| *RemoteQMgrName* | Name of destination queue manager | RemoteQMgrName |
| *MsgDesc* | Original message descriptor | MsgDesc |

### *Overview for MQXQH*

**Availability**: All IBM MQ systems and IBM MQ clients.

**Purpose**: The MQXQH structure describes the information that is prefixed to the application message data of messages when they are on transmission queues. A transmission queue is a special type of local queue that temporarily holds messages destined for remote queues (that is, destined for queues that do not belong to the local queue manager). A transmission queue is denoted by the *Usage* queue attribute having the value MQUS_TRANSMISSION.

**Format name**: MQFMT_XMIT_Q_HEADER.

**Character set and encoding**: Data in MQXOH must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC_NATIVE.

Set the character set and encoding of the MQXQH into the *CodedCharSetId* and *Encoding* fields in:

- The separate MQMD (if the MQXQH structure is at the start of the message data), or
- The header structure that precedes the MQXQH structure (all other cases).

**Usage**: A message that is on a transmission queue has *two* message descriptors:

- One message descriptor is stored separately from the message data; this is called the *separate message descriptor*, and is generated by the queue manager when the message is placed on the transmission queue. Some of the fields in the separate message descriptor are copied from the message descriptor provided by the application on the MQPUT or MQPUT1 call.

  The separate message descriptor is the one that is returned to the application in the *MsgDesc* parameter of the MQGET call when the message is removed from the transmission queue.
- A second message descriptor is stored within the MQXQH structure as part of the message data; this is called the *embedded message descriptor*, and is a copy of the message descriptor that was provided by the application on the MQPUT or MQPUT1 call (with minor variations).

  The embedded message descriptor is always a version-1 MQMD. If the message put by the application has nondefault values for one or more of the version-2 fields in the MQMD, an MQMDE structure follows the MQXQH, and is in turn followed by the application message data (if any). The MQMDE is either:

  – Generated by the queue manager (if the application uses a version-2 MQMD to put the message), or
  – Already present at the start of the application message data (if the application uses a version-1 MQMD to put the message).

  The embedded message descriptor is the one that is returned to the application in the *MsgDesc* parameter of the MQGET call when the message is removed from the final destination queue.

**Fields in the separate message descriptor**: The fields in the separate message descriptor are set by the queue manager as shown. If the queue manager does not support the version-2 MQMD, a version-1 MQMD is used without loss of function.

| Field in separate MQMD | Value used |
|---|---|
| *StrucId* | MQMD_STRUC_ID |
| *Version* | MQMD_VERSION_2 |
| *Report* | Copied from the embedded message descriptor, but with the bits identified by MQRO_ACCEPT_UNSUP_IF_XMIT_MASK set to zero. (This prevents a COA or COD report message being generated when a message is placed on or removed from a transmission queue.) |
| *MsgType* | Copied from the embedded message descriptor. |
| *Expiry* | Copied from the embedded message descriptor. |
| *Feedback* | Copied from the embedded message descriptor. |
| *Encoding* | MQENC_NATIVE (see note) |
| *CodedCharSetId* | Queue manager's *CodedCharSetId* attribute. |
| *Format* | MQFMT_XMIT_Q_HEADER |
| *Priority* | Copied from the embedded message descriptor. |
| *Persistence* | Copied from the embedded message descriptor. |
| *MsgId* | A new value is generated by the queue manager. This message identifier is different from the *MsgId* that the queue manager may have generated for the embedded message descriptor described previously. |
| *CorrelId* | The *MsgId* from the embedded message descriptor. For messages being put to the SYSTEM.CLUSTER.TRANSMIT.QUEUE, *CorrelId* is reserved for internal use. |
| *BackoutCount* | 0 |
| *ReplyToQ* | Copied from the embedded message descriptor. |

| Field in separate MQMD | Value used |
|---|---|
| *ReplyToQMgr* | Copied from the embedded message descriptor. |
| *UserIdentifier* | Copied from the embedded message descriptor. |
| *AccountingToken* | Copied from the embedded message descriptor. For messages being put to the SYSTEM.CLUSTER.TRANSMIT.QUEUE, *AccountingToken* is reserved for internal use. |
| *ApplIdentityData* | Copied from the embedded message descriptor. |
| *PutApplType* | MQAT_QMGR |
| *PutApplName* | First 28 bytes of the queue-manager name. |
| *PutDate* | Date when message was put on transmission queue. |
| *PutTime* | Time when message was put on transmission queue. |
| *ApplOriginData* | Blanks |
| *GroupId* | MQGI_NONE |
| *MsgSeqNumber* | 1 |
| *Offset* | 0 |
| *MsgFlags* | MQMF_NONE |
| *OriginalLength* | MQOL_UNDEFINED |

- On Windows, the value of MQENC_NATIVE for Micro Focus COBOL differs from the value for C. The value in the *Encoding* field in the separate message descriptor is always the value for C in these environments; this value is 546 in decimal. Also, the integer fields in the MQXQH structure are in the encoding that corresponds to this value (the native Intel encoding).

**Fields in the embedded message descriptor**: The fields in the embedded message descriptor have the same values as those in the *MsgDesc* parameter of the MQPUT or MQPUT1 call, except for the following:

- The *Version* field always has the value MQMD_VERSION_1.
- If the *Priority* field has the value MQPRI_PRIORITY_AS_Q_DEF, it is replaced by the value of the queue's *DefPriority* attribute.
- If the *Persistence* field has the value MQPER_PERSISTENCE_AS_Q_DEF, it is replaced by the value of the queue's *DefPersistence* attribute.
- If the *MsgId* field has the value MQMI_NONE, or the MQPMO_NEW_MSG_ID option was specified, or the message is a distribution-list message, *MsgId* is replaced by a new message identifier generated by the queue manager.

  When a distribution-list message is split into smaller distribution-list messages placed on different transmission queues, the *MsgId* field in each of the new embedded message descriptors is the same as that in the original distribution-list message.
- If the MQPMO_NEW_CORREL_ID option was specified, *CorrelId* is replaced by a new correlation identifier generated by the queue manager.
- The context fields are set as indicated by the MQPMO_*_CONTEXT options specified in the *PutMsgOpts* parameter; the context fields are:
  - *AccountingToken*
  - *ApplIdentityData*
  - *ApplOriginData*
  - *PutApplName*
  - *PutApplType*
  - *PutDate*

  - *PutTime*
  - *UserIdentifier*
- The version-2 fields (if they were present) are removed from the MQMD, and moved into an MQMDE structure, if one or more of the version-2 fields has a nondefault value.

**Putting messages on remote queues**: When an application puts a message on a remote queue (either by specifying the name of the remote queue directly, or by using a local definition of the remote queue), the local queue manager:

- Creates an MQXQH structure containing the embedded message descriptor
- Appends an MQMDE if one is needed and is not already present
- Appends the application message data
- Places the message on an appropriate transmission queue

**Putting messages directly on transmission queues**: An application can also put a message directly on a transmission queue. In this case the application must prefix the application message data with an MQXQH structure, and initialize the fields with appropriate values. In addition, the *Format* field in the *MsgDesc* parameter of the MQPUT or MQPUT1 call must have the value MQFMT_XMIT_Q_HEADER.

Character data in the MQXQH structure created by the application must be in the character set of the local queue manager (defined by the *CodedCharSetId* queue-manager attribute), and integer data must be in the native machine encoding. In addition, character data in the MQXQH structure must be padded with blanks to the defined length of the field; the data must not be ended prematurely by using a null character, because the queue manager does not convert the null and subsequent characters to blanks in the MQXQH structure.

However, the queue manager does not check that an MQXQH structure is present, or that valid values have been specified for the fields.

Applications should not put their messages directly to the SYSTEM.CLUSTER.TRANSMIT.QUEUE.

**Getting messages from transmission queues**: Applications that get messages from a transmission queue must process the information in the MQXQH structure in an appropriate fashion. The presence of the MQXQH structure at the beginning of the application message data is indicated by the value MQFMT_XMIT_Q_HEADER being returned in the *Format* field in the *MsgDesc* parameter of the MQGET call. The values returned in the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter indicate the character set and encoding of the character and integer data in the MQXQH structure. The character set and encoding of the application message data are defined by the *CodedCharSetId* and *Encoding* fields in the embedded message descriptor.

## *Fields for MQXQH*

The MQXQH structure contains the following fields; the fields are described in **alphabetical order**:

*MsgDesc (MQMD1)*

This is the embedded message descriptor, and is a close copy of the message descriptor MQMD that was specified as the *MsgDesc* parameter on the MQPUT or MQPUT1 call when the message was originally put to the remote queue.

**Note:** This is a version-1 MQMD.

The initial values of the fields in this structure are the same as those in the MQMD structure.

*RemoteQMgrName (MQCHAR48)*

This is the name of the queue manager or queue-sharing group that owns the queue that is the apparent eventual destination for the message.

If the message is a distribution-list message, *RemoteQMgrName* is blank.

The length of this field is given by MQ_Q_MGR_NAME_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*RemoteQName (MQCHAR48)*

This is the name of the message queue that is the apparent eventual destination for the message (this might prove not to be the eventual destination if, for example, this queue is defined at *RemoteQMgrName* to be a local definition of another remote queue).

If the message is a distribution-list message (that is, the *Format* field in the embedded message descriptor is MQFMT_DIST_HEADER), *RemoteQName* is blank.

The length of this field is given by MQ_Q_NAME_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*StrucId (MQCHAR4)*

This is the structure identifier. The value must be:

**MQXQH_STRUC_ID**
Identifier for transmission-queue header structure.

For the C programming language, the constant MQXQH_STRUC_ID_ARRAY is also defined; this has the same value as MQXQH_STRUC_ID, but is an array of characters instead of a string.

The initial value of this field is MQXQH_STRUC_ID.

*Version (MQLONG)*

This is the structure version number. The value must be:

**MQXQH_VERSION_1**
Version number for transmission-queue header structure.

The following constant specifies the version number of the current version:

**MQXQH_CURRENT_VERSION**
Current version of transmission-queue header structure.

The initial value of this field is MQXQH_VERSION_1.

## *Initial values and language declarations for MQXQH*

*Table 549. Initial values of fields in MQXQH for MQXQH*

| Field name | Name of constant | Value of constant |
|---|---|---|
| *StrucId* | MQXQH_STRUC_ID | 'XQH¬' |
| *Version* | MQXQH_VERSION_1 | 1 |
| *RemoteQName* | None | Null string or blanks |
| *RemoteQMgrName* | None | Null string or blanks |
| *MsgDesc* | Same names and values as MQMD; see Table 504 on page 448 | - |

**Notes:**

1. The symbol ¬ represents a single blank character.
2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
3. In the C programming language, the macro variable MQXQH_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQXQH MyXQH = {MQXQH_DEFAULT};
```

*C declaration*

```
typedef struct tagMQXQH MQXQH;
struct tagMQXQH {
  MQCHAR4   StrucId;         /* Structure identifier */
  MQLONG    Version;         /* Structure version number */
  MQCHAR48  RemoteQName;     /* Name of destination queue */
  MQCHAR48  RemoteQMgrName;  /* Name of destination queue manager */
  MQMD1     MsgDesc;         /* Original message descriptor */
};
```

*COBOL declaration*

```

# Function calls

This section gives information on all of the MQI calls that are possible. Descriptions, syntax, parameter information, usage notes, and language invocations for each possible language are given for each of the different calls.

## Call descriptions

This section describes MQI calls.

- “MQBACK - Back out changes” on page 607
- “MQBEGIN - Begin unit of work” on page 611
- “MQBUFMH - Convert buffer into message handle” on page 614
- “MQCB - Manage callback” on page 618
- “MQCB_FUNCTION - Callback function” on page 628
- “MQCLOSE - Close object” on page 629
- “MQCMIT - Commit changes” on page 637
- “MQCONN - Connect queue manager” on page 641
- “MQCONNX - Connect queue manager (extended)” on page 649
- “MQCRTMH - Create message handle” on page 654
- “MQCTL - Control callbacks” on page 658
- “MQDISC - Disconnect queue manager” on page 664
- “MQDLTMH - Delete message handle” on page 668
- “MQDLTMP - Delete message property” on page 670
- “MQGET - Get message” on page 673
- “MQINQ - Inquire object attributes” on page 685
- “MQINQMP - Inquire message property” on page 702
- “MQMHBUF - Convert message handle into buffer” on page 707
- “MQOPEN - Open object” on page 711
- “MQPUT - Put message” on page 729
- “MQPUT1 - Put one message” on page 742
- “MQSET - Set object attributes” on page 752
- “MQSETMP - Set message property” on page 758

- “MQSTAT - Retrieve status information” on page 763
- “MQMHBUF - Convert message handle into buffer” on page 707
- “MQSUB - Register subscription” on page 767
- “MQSUBRQ - Subscription request” on page 773

Online help on the UNIX platforms, in the form of *man* pages, is available for these calls.

**Note:** The calls associated with data conversion, MQXCNVC and MQ_DATA_CONV_EXIT, are in “Data-conversion exit” on page 879.

## *Conventions used in the call descriptions*

For each call, this collection of topics gives a description of the parameters and usage of the call in a format that is independent of programming language. This is followed by typical invocations of the call, and typical declarations of its parameters, in each of the supported programming languages.

**Important:** When coding IBM MQ API calls you must ensure that all relevant parameters (as described in the following sections) are provided. Failure to do so can produce unpredictable results.

The description of each call contains the following sections:

**Call name**
The call name, followed by a brief description of the purpose of the call.

**Parameters**
For each parameter, the name is followed by its data type in parentheses ( ) and one of the following:

**input**
You supply information in the parameter when you make the call.

**output**
The queue manager returns information in the parameter when the call completes or fails.

**input/output**
You supply information in the parameter when you make the call, and the queue manager changes the information when the call completes or fails.

For example:

*Compcode* (MQLONG) - output

In some cases, the data type is a structure. In all cases, there is more information about the data type or structure in “Elementary data types” on page 232.

The last two parameters in each call are a completion code and a reason code. The completion code indicates whether the call completed successfully, partially, or not at all. Further information about the partial success or the failure of the call is given in the reason code. For more information about each completion and reason code, see “Return codes” on page 847.

**Usage notes**
Additional information about the call, describing how to use it and any restrictions on its use.

**Assembler language invocation**
Typical invocation of the call, and declaration of its parameters, in assembler language.

**C invocation**
Typical invocation of the call, and declaration of its parameters, in C.

**COBOL invocation**
Typical invocation of the call, and declaration of its parameters, in COBOL.

**PL/I invocation**
Typical invocation of the call, and declaration of its parameters, in PL/I.

All parameters are passed by reference.

**Visual Basic invocation**
Typical invocation of the call, and declaration of its parameters, in Visual Basic.

Other notation conventions are:

**Constants**
Names of constants are shown in uppercase; for example, MQOO_OUTPUT. A set of constants having the same prefix is shown as follows: MQIA_*. See “Constants” on page 61 for the value of a constant.

**Arrays**
In some calls, parameters are arrays of character strings that do not have fixed sizes. In the descriptions of these parameters, a lowercase n represents a numeric constant. When you code the declaration for that parameter, replace the n with the numeric value that you require.

### *Using the calls in the C language*

Parameters that are *input only* and of type MQHCONN, MQHOBJ, MQHMSG, or MQLONG are passed by value. For all other parameters, the *address* of the parameter is passed by value.

You do not need to specify all parameters that are passed by address every time that you invoke a function. Where you do not need a particular parameter, specify a null pointer as the parameter on the function invocation, in place of the address of parameter data. Parameters for which this is possible are identified in the call descriptions.

No parameter is returned as the value of the call; in C terminology, this means that all calls return `void` .

*Declaring the Buffer parameter*

The `MQGET` , `MQPUT` , and `MQPUT1` calls each have one parameter that has an undefined data type: the *Buffer* parameter. Use this parameter to send and receive the application's message data.

Parameters of this sort are shown in the C examples as arrays of MQBYTE. You can declare the parameters in this way, but it is usually more convenient to declare them as the particular structure that describes the layout of the data in the message. The function prototype declares the parameter as a pointer-to-void, so that you can specify the address of any sort of data as the parameter on the call invocation.

Pointer-to-void is a pointer to data of undefined format. It is defined as:

```
typedef void *PMQVOID;
```

## MQBACK - Back out changes

The MQBACK call indicates to the queue manager that all the message gets and puts that have occurred since the last sync point are to be backed out.

Messages put as part of a unit of work are deleted; messages retrieved as part of a unit of work are reinstated on the queue.

- On z/OS, this call is used only by batch programs (including IMS batch DL/I programs).
- On IBM i, this call is not supported for applications running in compatibility mode.

**Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

### Syntax

MQBACK (*Hconn*, *Compcode*, *Reason*)

### Parameters

***Hconn***
Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

***Compcode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_WARNING**
Warning (partial completion).

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_WARNING:

**MQRC_OUTCOME_PENDING**
(2124, X'84C') Result of back-out operation is pending.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_API_EXIT_ERROR**
(2374, X'946') API exit failed.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_CALL_IN_PROGRESS**
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC_CF_STRUC_IN_USE**
(2346, X'92A') Coupling-facility structure in use.

**MQRC_CONNECTION_BROKEN**
(2009, X'7D9') Connection to queue manager lost.

**MQRC_ENVIRONMENT_ERROR**
(2012, X'7DC') Call not valid in environment.

**MQRC_HCONN_ERROR**
(2018, X'7E2') Connection handle not valid.

**MQRC_OBJECT_DAMAGED**
(2101, X'835') Object damaged.

**MQRC_OUTCOME_MIXED**
(2123, X'84B') Result of commit or back-out operation is mixed.

**MQRC_Q_MGR_STOPPING**
(2162, X'872') Queue manager shutting down.

**MQRC_RESOURCE_PROBLEM**
(2102, X'836') Insufficient system resources available.

**MQRC_STORAGE_MEDIUM_FULL**
(2192, X'890') External storage medium is full.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Messages and reason codes

## Usage notes

1. You can use this call only when the queue manager itself coordinates the unit of work. This can be:
   - A local unit of work, where the changes affect only MQ resources.
   - A global unit of work, where the changes can affect resources belonging to other resource managers, as well as affecting MQ resources.

   For further details about local and global units of work, see "MQBEGIN - Begin unit of work" on page 611.
2. In environments where the queue manager does not coordinate the unit of work, use the appropriate back-out call instead of MQBACK. The environment might also support an implicit back out caused by the application terminating abnormally.
   - On z/OS, use the following calls:
     - Batch programs (including IMS batch DL/I programs) can use the MQBACK call if the unit of work affects only MQ resources. However, if the unit of work affects both MQ resources and resources belonging to other resource managers (for example, Db2®), use the SRRBACK call provided by the z/OS Recoverable Resource Service (RRS). The SRRBACK call backs out changes to resources belonging to the resource managers that have been enabled for RRS coordination.
     - CICS applications must use the `EXEC CICS SYNCPOINT ROLLBACK` command to back out the unit of work. Do not use the MQBACK call for CICS applications.
     - IMS applications (other than batch DL/I programs) must use IMS calls such as `ROLB` to back out the unit of work. Do not use the MQBACK call for IMS applications (other than batch DL/I programs).
   - On IBM i, use this call for local units of work coordinated by the queue manager. This means that a commitment definition must not exist at job level, that is, the `STRCMTCTL` command with the `CMTSCOPE(*JOB)` parameter must not have been issued for the job.
3. If an application ends with uncommitted changes in a unit of work, the disposition of those changes depends on whether the application ends normally or abnormally. See the usage notes in "MQDISC - Disconnect queue manager" on page 664 for further details.
4. When an application puts or gets messages in groups or segments of logical messages, the queue manager retains information relating to the message group and logical message for the last successful MQPUT and MQGET calls. This information is associated with the queue handle, and includes such things as:
   - The values of the *GroupId*, *MsgSeqNumber*, *Offset*, and *MsgFlags* fields in MQMD.
   - Whether the message is part of a unit of work.
   - For the MQPUT call: whether the message is persistent or nonpersistent.

   The queue manager keeps *three* sets of group and segment information, one set for each of the following:
   - The last successful MQPUT call (this can be part of a unit of work).
   - The last successful MQGET call that removed a message from the queue (this can be part of a unit of work).
   - The last successful MQGET call that browsed a message on the queue (this *cannot* be part of a unit of work).
5. The information associated with the MQGET call is restored to the value that it had before the first successful MQGET call for that queue handle in the current unit of work.

Queues that were updated by the application after the unit of work started, but outside the scope of the unit of work, do not have their group and segment information restored if the unit of work is backed out.

Restoring the group and segment information to its previous value when a unit of work is backed out allows the application to spread a large message group or large logical message consisting of many segments across several units of work, and to restart at the correct point in the message group or logical message if one of the units of work fails.

Using several units of work might be advantageous if the local queue manager has only limited queue storage. However, the application must maintain sufficient information to be able to restart putting or getting messages at the correct point if a system failure occurs.

For details of how to restart at the correct point after a system failure, see the MQPMO_LOGICAL_ORDER option described in "MQPMO - Put-message options" on page 480, and the MQGMO_LOGICAL_ORDER option described in "MQGMO - Get-message options" on page 355.

The remaining usage notes apply only when the queue manager coordinates the units of work.

6. A unit of work has the same scope as a connection handle. All MQ calls that affect a particular unit of work must be performed using the same connection handle. Calls issued using a different connection handle (for example, calls issued by another application) affect a different unit of work. See the *Hconn* parameter described in "MQCONN - Connect queue manager" on page 641 for information about the scope of connection handles.
7. Only messages that were put or retrieved as part of the current unit of work are affected by this call.
8. A long-running application that issues MQGET, MQPUT, or MQPUT1 calls within a unit of work, but that never issues a commit or backout call, can fill queues with messages that are not available to other applications. To guard against this possibility, the administrator must set the *MaxUncommittedMsgs* queue-manager attribute to a value that is low enough to prevent runaway applications filling the queues, but high enough to allow the expected messaging applications to work correctly.

## C invocation

```
MQBACK (Hconn, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;     /* Connection handle */
MQLONG   CompCode;  /* Completion code */
MQLONG   Reason;    /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQBACK' USING HCONN, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN     PIC S9(9) BINARY.
**   Completion code
 01  COMPCODE  PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON    PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQBACK (Hconn, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn     fixed bin(31);  /* Connection handle */
dcl CompCode  fixed bin(31);  /* Completion code */
dcl Reason    fixed bin(31);  /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
CALL MQBACK,(HCONN,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN     DS  F  Connection handle
COMPCODE  DS  F  Completion code
REASON    DS  F  Reason code qualifying COMPCODE
```

### Visual Basic invocation

```
MQBACK Hconn, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Hconn    As Long 'Connection handle'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

## MQBEGIN - Begin unit of work

The MQBEGIN call begins a unit of work that is coordinated by the queue manager, and that can involve external resource managers.

### Syntax

MQBEGIN (*Hconn*, *BeginOptions*, *Compcode*, *Reason*)

### Parameters

***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

*Hconn* must be a nonshared connection handle. If a shared connection handle is specified, the call fails with reason code MQRC_HCONN_ERROR. See the description of the MQCNO_HANDLE_SHARE_* options in “MQCNO - Connect options” on page 310 for more information about shared and nonshared handles.

***BeginOptions***

Type: MQBO - input/output

These are options that control the action of MQBEGIN, as described in “MQBO - Begin options” on page 273.

If no options are required, programs written in C or S/390 assembler can specify a null parameter address, instead of specifying the address of an MQBO structure.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_WARNING**
Warning (partial completion).

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_WARNING:

**MQRC_NO_EXTERNAL_PARTICIPANTS**
(2121, X'849') No participating resource managers registered.

**MQRC_PARTICIPANT_NOT_AVAILABLE**
(2122, X'84A') Participating resource manager not available.

If *CompCode* is MQCC_FAILED:

**MQRC_API_EXIT_ERROR**
(2374, X'946') API exit failed.

**MQRC_BO_ERROR**
(2134, X'856') Begin-options structure not valid.

**MQRC_CALL_IN_PROGRESS**
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC_CONNECTION_BROKEN**
(2009, X'7D9') Connection to queue manager lost.

**MQRC_ENVIRONMENT_ERROR**
(2012, X'7DC') Call not valid in environment.

**MQRC_HCONN_ERROR**
(2018, X'7E2') Connection handle not valid.

**MQRC_OPTIONS_ERROR**
(2046, X'7FE') Options not valid or not consistent.

**MQRC_Q_MGR_STOPPING**
(2162, X'872') Queue manager shutting down.

**MQRC_RESOURCE_PROBLEM**
(2102, X'836') Insufficient system resources available.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

**MQRC_UOW_IN_PROGRESS**
(2128, X'850') Unit of work already started.

For more information about these reason codes, see Messages and reason codes.

## Usage notes

1. Use the MQBEGIN call to start a unit of work that is coordinated by the queue manager and that might involve changes to resources owned by other resource managers. The queue manager supports three types of unit-of-work:
   - **Queue-manager-coordinated local unit of work**: A unit of work in which the queue manager is the only resource manager participating, and so the queue manager acts as the unit-of-work coordinator.
     - To start this type of unit of work, specify the MQPMO_SYNCPOINT or MQGMO_SYNCPOINT option on the first MQPUT, MQPUT1, or MQGET call in the unit of work.
     - To commit or back out this type of unit of work, use the MQCMIT or MQBACK call.
   - **Queue-manager-coordinated global unit of work**: A unit of work in which the queue manager acts as the unit-of-work coordinator, both for MQ resources *and* for resources belonging to other resource managers. Those resource managers cooperate with the queue manager to ensure that all changes to resources in the unit of work are committed or backed out together.
     - To start this type of unit of work, use the MQBEGIN call.
     - To commit or back out this type of unit of work, use the MQCMIT and MQBACK calls.
   - **Externally-coordinated global unit of work**: A unit of work in which the queue manager is a participant, but the queue manager does not act as the unit-of-work coordinator. Instead, there is an external unit-of-work coordinator with which the queue manager cooperates.
     - To start this type of unit of work, use the relevant call provided by the external unit-of-work coordinator.

       If the MQBEGIN call is used to try to start the unit of work, the call fails with reason code MQRC_ENVIRONMENT_ERROR.
     - To commit or back out this type of unit of work, use the commit and back-out calls provided by the external unit-of-work coordinator.

       If you use the MQCMIT or MQBACK call to commit or back out the unit of work, the call fails with reason code MQRC_ENVIRONMENT_ERROR.
2. If the application ends with uncommitted changes in a unit of work, the disposition of those changes depends on whether the application ends normally or abnormally. See the usage notes in "MQDISC - Disconnect queue manager" on page 664 for further details.
3. An application can participate in only one unit of work at a time. The MQBEGIN call fails with reason code MQRC_UOW_IN_PROGRESS if there is already a unit of work in existence for the application, regardless of which type of unit of work it is.
4. The MQBEGIN call is not valid in an MQ MQI client environment. An attempt to use the call fails with reason code MQRC_ENVIRONMENT_ERROR.
5. When the queue manager is acting as the unit-of-work coordinator for global units of work, the resource managers that can participate in the unit of work are defined in the queue manager configuration file.
6. On IBM i, the three types of unit of work are supported as follows:
   - **Queue-manager-coordinated local unit of work** can be used only when a commitment definition does not exist at the job level, that is, the STRCMTCTL command with the CMTSCOPE(*JOB) parameter must not have been issued for the job.
   - **Queue-manager-coordinated global unit of work** is not supported.
   - **Externally-coordinated global unit of work** can be used only when a commitment definition exists at job level, that is, the STRCMTCTL command with the CMTSCOPE(*JOB) parameter must have been issued for the job. If this has been done, the IBM i COMMIT and ROLLBACK operations apply to MQ resources as well as to resources belonging to other participating resource managers.

### C invocation

```
MQBEGIN (Hconn, &BeginOptions, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;         /* Connection handle */
MQBO     BeginOptions;  /* Options that control the action of MQBEGIN */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

### COBOL invocation

```
CALL 'MQBEGIN' USING HCONN, BEGINOPTIONS, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN         PIC S9(9) BINARY.
**   Options that control the action of MQBEGIN
 01  BEGINOPTIONS.
     COPY CMQBOV.
**   Completion code
 01  COMPCODE      PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON        PIC S9(9) BINARY.
```

### PL/I invocation

```
call MQBEGIN (Hconn, BeginOptions, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn         fixed bin(31);  /* Connection handle */
dcl BeginOptions  like MQBO;      /* Options that control the action of
                                     MQBEGIN */
dcl CompCode      fixed bin(31);  /* Completion code */
dcl Reason        fixed bin(31);  /* Reason code qualifying CompCode */
```

### Visual Basic invocation

```
MQBEGIN Hconn, BeginOptions, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Hconn        As Long 'Connection handle'
Dim BeginOptions As MQBO 'Options that control the action of MQBEGIN'
Dim CompCode     As Long 'Completion code'
Dim Reason       As Long 'Reason code qualifying CompCode'
```

## MQBUFMH - Convert buffer into message handle

The MQBUFMH function call converts a buffer into a message handle and is the inverse of the MQMHBUF call.

This call takes a message descriptor and MQRFH2 properties in the buffer and makes them available through a message handle. The MQRFH2 properties in the message data are, optionally, removed. The

*Encoding*, *CodedCharSetId*, and *Format* fields of the message descriptor are updated, if necessary, to correctly describe the contents of the buffer after the properties have been removed.

## Syntax

MQBUFMH (*Hconn*, *Hmsg*, *BufMsgHOpts*, *MsgDesc*, *BufferLength*, *Buffer*, *DataLength*, *Compcode*, *Reason*)

## Parameters

***Hconn***
Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* must match the connection handle that was used to create the message handle specified in the *Hmsg* parameter.

If the message handle was created using MQHC_UNASSOCIATED_HCONN, a valid connection must be established on the thread converting a buffer into a message handle. If a valid connection is not established, the call fails with MQRC_CONNECTION_BROKEN.

***Hmsg***
Type: MQHMQSG - input

This is the message handle for which a buffer is required. The value was returned by a previous MQCRTMH call.

***BufMsgHOpts***
Type: MQBMHO - input

The MQBMHO structure allows applications to specify options that control how message handles are produced from buffers.

See "MQBMHO - Buffer to message handle options" on page 271 for details.

***MsgDesc***
Type: MQMD - input/output

The *MsgDesc* structure contains the message descriptor properties and describes the contents of the buffer area.

On output from the call, the properties are optionally removed from the buffer area and, in this case, the message descriptor is updated to correctly describe the buffer area.

Data in this structure must be in the character set and encoding of the application.

***BufferLength***
Type: MQLONG - input

*BufferLength* is the length of the Buffer area, in bytes.

A *BufferLength* of zero bytes is valid, and indicates that the buffer area contains no data.

***Buffer***
Type: MQBYTExBufferLength - input/output

These are options that control the action of MQBEGIN, as described in "MQBEGIN - Begin unit of work" on page 611.

*Buffer* defines the area containing the message buffer. For most data, you should align the buffer on a 4-byte boundary.

If *Buffer* contains character or numeric data, set the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter to the values appropriate to the data; this enables the data to be converted, if necessary.

If properties are found in the message buffer they are optionally removed; they later become available from the message handle on return from the call.

In the C programming language, the parameter is declared as a pointer-to-void, which means the address of any type of data can be specified as the parameter.

If the *BufferLength* parameter is zero, *Buffer* is not referred to; in this case, the parameter address passed by programs written in C or System/390 assembler can be null.

***DataLength***
Type: MQLONG - output

The length, in bytes, of the buffer which might have the properties removed.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'089C') Adapter not available.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_BMHO_ERROR**
(2489, X'09B9') Buffer to message handle options structure not valid.

**MQRC_BUFFER_ERROR**
(2004, X'07D4') Buffer parameter not valid.

**MQRC_BUFFER_LENGTH_ERROR**
(2005, X'07D5') Buffer length parameter not valid.

**MQRC_CALL_IN_PROGRESS**
(2219, X'08AB') MQI call entered before previous call completed.

**MQRC_CONNECTION_BROKEN**
(2009, X'07D9') Connection to queue manager lost.

**MQRC_HMSG_ERROR**
(2460, X'099C') Message handle not valid.

**MQRC_MD_ERROR**
(2026, X'07EA') Message descriptor not valid.

**MQRC_MSG_HANDLE_IN_USE**
(2499, X'09C3') Message handle already in use.

**MQRC_OPTIONS_ERROR**
(2046, X'07FE') Options not valid or not consistent.

**MQRC_RFH_ERROR**
(2334, X'091E') MQRFH2 structure not valid.

**MQRC_RFH_FORMAT_ERROR**
(2421, X'0975') An MQRFH2 folder containing properties could not be parsed.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Messages and reason codes.

## Usage notes

MQBUFMH calls cannot be intercepted by API exits - a buffer is converted into a message handle in the application space; the call does not reach the queue manager.

## C invocation

```
MQBUFMH (Hconn, Hmsg, &BufMsgHOpts, &MsgDesc, BufferLength, Buffer,
         &DataLength, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN Hconn;        /* Connection handle */
MQHMSG  Hmsg;         /* Message handle */
MQBMHO  BufMsgHOpts;  /* Options that control the action of MQBUFMH */
MQMD    MsgDesc;      /* Message descriptor */
MQLONG  BufferLength; /* Length in bytes of the Buffer area */
MQBYTE  Buffer[n];    /* Area to contain the message buffer */
MQLONG  DataLength;   /* Length of the output buffer */
MQLONG  CompCode;     /* Completion code */
MQLONG  Reason;       /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQBUFMH' USING HCONN, HMSG, BUFMSGHOPTS, MSGDESC, BUFFERLENGTH,
                           BUFFER, DATALENGTH, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN         PIC S9(9) BINARY.
**   Message handle
 01  HMSG          PIC S9(18) BINARY.
**   Options that control the action of MQBUFMH
 01  BUFMSGHOPTS.
     COPY CMQBMHOV.
**   Message descriptor
 01  MSGDESC.
     COPY CMQMD.
**   Length in bytes of the Buffer area
 01  BUFFERLENGTH  PIC S9(9) BINARY.
**   Area to contain the message buffer
 01  BUFFER        PIC X(n).
**   Length of the output buffer
 01  DATALENGTH    PIC S9(9) BINARY.
**   Completion code
 01  COMPCODE      PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON        PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQBUFMH (Hconn, Hmsg, BufMsgHOpts, MsgDesc, BufferLength, Buffer,
DataLength, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn        fixed bin(31); /* Connection handle */
dcl Hmsg         fixed bin(63); /* Message handle */
dcl BufMsgHOpts  like MQBMHO;   /* Options that control the action of
                                   MQBUFMH */
dcl MsgDesc      like MQMD;     /* Message descriptor */
dcl BufferLength fixed bin(31); /* Length in bytes of the Buffer area */
dcl Buffer       char(n);       /* Area to contain the message buffer */
dcl DataLength   fixed bin(31); /* Length of the output buffer */
dcl CompCode     fixed bin(31); /* Completion code */
dcl Reason       fixed bin(31); /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
CALL MQBUFMH,(HCONN,HMSG,BUFMSGHOPTS,MSGDESC,BUFFERLENGTH,BUFFER,
               DATALENGTH,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN        DS       F      Connection handle
HMSG         DS       D      Message handle
BUFMSGHOPTS  CMQBMHOA ,      Options that control the action of MQBUFMH
MSGDESC      CMQMDA   ,      Message descriptor
BUFFERLENGTH DS       F      Length in bytes of the BUFFER area
BUFFER       DS       CL(n)  Area to contain the properties
DATALENGTH   DS       F      Length of the output buffer
COMPCODE     DS       F      Completion code
REASON       DS       F      Reason code qualifying COMPCODE
```

## MQCB - Manage callback

The MQCB call registers a callback for the specified object handle and controls activation and changes to the callback.

A callback is a piece of code (specified as either the name of a function that can be dynamically linked or as function pointer) that is called by IBM MQ when certain events occur.

To use MQCB and MQCTL on a client you must be connected to a server where the negotiated **SHARECNV** parameter of the channel has agreed a non-zero value.

The types of callback that can be defined are:

**Message consumer**
A message consumer callback function is called when a message, meeting the selection criteria specified, is available on an object handle.

Only one callback function can be registered against each object handle. If a single queue is to be read with multiple selection criteria then the queue must be opened multiple times and a consumer function registered on each handle.

**Event handler**
The event handler is called for conditions that affect the whole callback environment.

The function is called when an event condition occurs, for example, a queue manager or connection stopping or quiescing.

The function is not called for conditions that are specific to a single message consumer, for example MQRC_GET_INHIBITED; it is called however if a callback function does not end normally.

### Syntax

MQCB (*Hconn*, *Operation*, *CallbackDesc*, *Hobj*, *MsgDesc*, *GetMsgOpts*, *CompCode*, *Reason*)

## Parameters

***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, you can specify the following special value for *MQHC_DEF_HCONN* to use the connection handle associated with this execution unit.

**Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

***Operation***

Type: MQLONG - input

The operation being processed on the callback defined for the specified object handle. You must specify one of the following options. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

**MQOP_REGISTER**

Define the callback function for the specified object handle. This operation defines the function to be called and the selection criteria to be used.

If a callback function is already defined for the object handle the definition is replaced. If an error is detected while replacing the callback, the function is deregistered.

If a callback is registered in the same callback function in which it was previously deregistered, this is treated as a replace operation; any initial or final calls are not invoked.

You can use MQOP_REGISTER with MQOP_SUSPEND or MQOP_RESUME.

**MQOP_DEREGISTER**

Stop the consuming of messages for the object handle and removes the handle from those eligible for a callback.

A callback is automatically deregistered if the associated handle is closed.

If MQOP_DEREGISTER is called from within a consumer, and the callback has a stop call defined, it is invoked upon return from the consumer.

If this operation is issued against an *Hobj* with no registered consumer, the call returns with MQRC_CALLBACK_NOT_REGISTERED.

**MQOP_SUSPEND**

Suspends the consuming of messages for the object handle.

If this operation is applied to an event handler, the event handler does not get events while suspended, and any events missed while in the suspended state are not provided to the operation when it is resumed.

While suspended, the consumer function continues to get the control type callbacks.

**MQOP_RESUME**

Resume the consuming of messages for the object handle.

If this operation is applied to an event handler, the event handler does not get events while suspended, and any events missed while in the suspended state are not provided to the operation when it is resumed.

***CallbackDesc***

Type: MQCBD - input

This is a structure that identifies the callback function that is being registered by the application and the options used when registering it.

See MQCBD for details of the structure.

Callback descriptor is required only for the MQOP_REGISTER option; if the descriptor is not required, the parameter address passed can be null.

***Hobj***

Type: MQHOBJ - input

This handle represents the access that has been established to the object from which a message is to be consumed. This is a handle that has been returned from a previous MQOPEN or MQSUB call (in the *Hobj* parameter).

*Hobj* is not required when defining an event handler routine (MQCBT_EVENT_HANDLER) and should be specified as MQHO_NONE.

If *Hobj* has been returned from an MQOPEN call, the queue must have been opened with one or more of the following options:

- MQOO_INPUT_SHARED
- MQOO_INPUT_EXCLUSIVE
- MQOO_INPUT_AS_Q_DEF
- MQOO_BROWSE

***MsgDesc***

Type: MQMD - input

This structure describes the attributes of the message required, and the attributes of the message retrieved.

The *MsgDesc* parameter defines the attributes of the messages required by the consumer, and the version of the MQMD to be passed to the message consumer.

The *MsgId*, *CorrelId*, *GroupId*, *MsgSeqNumber*, and *Offset* in the MQMD are used for message selection, depending on the options specified in the *GetMsgOpts* parameter.

The *Encoding* and *CodedCharSetId* are used for message conversion if you specify the MQGMO_CONVERT option.

See MQMD for details.

*MsgDesc* is used for MQOP_REGISTER and if you require values other than the default for any fields. *MsgDesc* is not used for an event handler.

If the descriptor is not required the parameter address passed can be null.

Note, that if multiple consumers are registered against the same queue with overlapping selectors, the chosen consumer for each message is undefined.

***GetMsgOpts***

Type: MQGMO - input

The *GetMsgOpts* parameter controls how the message consumer gets messages. All options of this parameter have meanings as described in "MQGMO - Get-message options" on page 355, when used on an MQGET call, except:

**MQGMO_SET_SIGNAL**
This option is not permitted.

**MQGMO_BROWSE_FIRST, MQGMO_BROWSE_NEXT, MQGMO_MARK_***
The order of messages delivered to a browsing consumer is dictated by the combinations of these options. Significant combinations are:

**MQGMO_BROWSE_FIRST**
The first message on the queue is delivered repeatedly to the consumer. This is useful when the consumer destructively consumes the message in the callback. Use this option with care.

**MQGMO_BROWSE_NEXT**
The consumer is given each message on the queue, from the current cursor position until the end of the queue is reached.

**MQGMO_BROWSE_FIRST + MQGMO_BROWSE_NEXT**
The cursor is reset to the start of the queue. The consumer is then given each message until the cursor reaches the end of the queue.

**MQGMO_BROWSE_FIRST + MQGMO_MARK_***
Starting at the beginning of the queue, the consumer is given the first nonmarked message on the queue, which is then marked for this consumer. This combination ensures that the consumer can receive new messages added behind the current cursor point.

**MQGMO_BROWSE_NEXT + MQGMO_MARK_***
Starting at the cursor position, the consumer is given the next nonmarked message on the queue, which is then marked for this consumer. Use this combination with care because messages can be added to the queue behind the current cursor position.

**MQGMO_BROWSE_FIRST + MQGMO_BROWSE_NEXT + MQGMO_MARK_***
This combination is not permitted. If used the call returns MQRC_OPTIONS_ERROR.

**MQGMO_NO_WAIT, MQGMO_WAIT, and WaitInterval**
These options control how the consumer is invoked.

**MQGMO_NO_WAIT**
The consumer is never called with MQRC_NO_MSG_AVAILABLE. The consumer is only called for messages and events.

**MQGMO_WAIT with a zero WaitInterval**
The MQRC_NO_MSG_AVAILABLE code is passed to the consumer when there are no messages available and either the consumer has been started or the consumer has been delivered at least one message since the last "no messages" reason code.

This prevents the consumer from polling in a busy loop when a zero wait interval is specified.

**MQGMO_WAIT and a positive WaitInterval**
The consumer is called after the specified wait interval with reason code MQRC_NO_MSG_AVAILABLE. This call is made regardless of whether any messages have been delivered to the consumer. This allows the user to perform heartbeat or batch type processing.

**MQGMO_WAIT and WaitInterval of MQWI_UNLIMITED**
This specifies an infinite wait before returning MQRC_NO_MSG_AVAILABLE. The consumer is never called with MQRC_NO_MSG_AVAILABLE.

*GetMsgOpts* is used only for MQOP_REGISTER and if you require values other than the default for any fields. *GetMsgOpts* is not used for an event handler.

If the *GetMsgOpts* are not required, the parameter address passed can be null. Using this parameter is the same as specifying MQGMO_DEFAULT together with MQGMO_FAIL_IF_QUIESCING.

If a message properties handle is provided in the MQGMO structure, a copy is provided in the MQGMO structure that is passed into the consumer callback. On return from the MQCB call, the application can delete the message properties handle.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_WARNING**
Warning (partial completion).

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

The reason codes in the following list are the ones that the queue manager can return for the *Reason* parameter.

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'89C') Adapter not available.

**MQRC_ADAPTER_CONV_LOAD_ERROR**
(2133, X'855') Unable to load data conversion services modules.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_API_EXIT_ERROR**
(2374, X'946') API exit failed.

**MQRC_API_EXIT_LOAD_ERROR**
(2183, X'887') Unable to load API exit.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_BUFFER_LENGTH_ERROR**
(2005, X'7D5') Buffer length parameter not valid.

**MQRC_CALL_IN_PROGRESS**
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC_CALLBACK_LINK_ERROR**
(2487, X'9B7') Incorrect callback type field.

**MQRC_CALLBACK_NOT_REGISTERED**
(2448, X'990') Unable to unregister, suspend, or resume because there is no registered callback.

**MQRC_CALLBACK_ROUTINE_ERROR**
(2486, X'9B6') Either *CallbackFunction* or *CallbackName* must be specified but not both.

**MQRC_CALLBACK_TYPE_ERROR**
(2483, X'9B3') Incorrect callback type field.

**MQRC_CBD_OPTIONS_ERROR**
(2484, X'9B4') Incorrect MQCBD options field.

**MQRC_CICS_WAIT_FAILED**
(2140, X'85C') Wait request rejected by CICS.

**MQRC_CONNECTION_BROKEN**
(2009, X'7D9') Connection to queue manager lost.

**MQRC_CONNECTION_NOT_AUTHORIZED**
(2217, X'8A9') Not authorized for connection.

**MQRC_CONNECTION_QUIESCING**
(2202, X'89A') Connection quiescing.

**MQRC_CONNECTION_STOPPING**
(2203, X'89B') Connection shutting down.

**MQRC_CORREL_ID_ERROR**
(2207, X'89F') Correlation-identifier error.

**MQRC_DATA_LENGTH_ERROR**
(2010, X'7DA') Data length parameter not valid.

**MQRC_FUNCTION_NOT_SUPPORTED**
(2298, X'8FA') The function requested is not available in the current environment.

**MQRC_GET_INHIBITED**
(2016, X'7E0') Gets inhibited for the queue.

**MQRC_GLOBAL_UOW_CONFLICT**
(2351, X'92F') Global units of work conflict.

**MQRC_GMO_ERROR**
(2186, X'88A') Get-message options structure not valid.

**MQRC_HANDLE_IN_USE_FOR_UOW**
(2353, X'931') Handle in use for global unit of work.

**MQRC_HCONN_ERROR**
(2018, X'7E2') Connection handle not valid.

**MQRC_HOBJ_ERROR**
(2019, X'7E3') Object handle not valid.

**MQRC_INCONSISTENT_BROWSE**
(2259, X'8D3') Inconsistent browse specification.

**MQRC_INCONSISTENT_UOW**
(2245, X'8C5') Inconsistent unit-of-work specification.

**MQRC_INVALID_MSG_UNDER_CURSOR**
(2246, X'8C6') Message under cursor not valid for retrieval.

**MQRC_LOCAL_UOW_CONFLICT**
(2352, X'930') Global unit of work conflicts with local unit of work.

**MQRC_MATCH_OPTIONS_ERROR**
(2247, X'8C7') Match options not valid.

**MQRC_MAX_MSG_LENGTH_ERROR**
(2485, X'9B4') Incorrect *MaxMsgLength* field.

**MQRC_MD_ERROR**
(2026, X'7EA') Message descriptor not valid.

**MQRC_MODULE_ENTRY_NOT_FOUND**
(2497, X'9C1') The specified function entry point could not be found in the module.

**MQRC_MODULE_INVALID**
(2496, X'9C0') Module found, however it is of the wrong type; not 32 bit, 64 bit, or a valid dynamic link library.

**MQRC_MODULE_NOT_FOUND**
(2495, X'9BF') Module not found in the search path or not authorized to load.

**MQRC_MSG_SEQ_NUMBER_ERROR**
(2250, X'8CA') Message sequence number not valid.

**MQRC_MSG_TOKEN_ERROR**
(2331, X'91B') Use of message token not valid.

**MQRC_NO_MSG_AVAILABLE**
(2033, X'7F1') No message available.

**MQRC_NO_MSG_UNDER_CURSOR**
(2034, X'7F2') Browse cursor not positioned on message.

**MQRC_NOT_OPEN_FOR_BROWSE**
(2036, X'7F4') Queue not open for browse.

**MQRC_NOT_OPEN_FOR_INPUT**
(2037, X'7F5') Queue not open for input.

**MQRC_OBJECT_CHANGED**
(2041, X'7F9') Object definition changed since opened.

**MQRC_OBJECT_DAMAGED**
(2101, X'835') Object damaged.

**MQRC_OPERATION_ERROR**
(2206, X'89E') Incorrect operation code on API Call.

**MQRC_OPTIONS_ERROR**
(2046, X'7FE') Options not valid or not consistent.

**MQRC_PAGESET_ERROR**
(2193, X'891') Error accessing page-set data set.

**MQRC_Q_DELETED**
(2052, X'804') Queue has been deleted.

**MQRC_Q_INDEX_TYPE_ERROR**
(2394, X'95A') Queue has wrong index type.

**MQRC_Q_MGR_NAME_ERROR**
(2058, X'80A') Queue manager name not valid or not known.

**MQRC_Q_MGR_NOT_AVAILABLE**
(2059, X'80B') Queue manager not available for connection.

**MQRC_Q_MGR_QUIESCING**
(2161, X'871') Queue manager quiescing.

**MQRC_Q_MGR_STOPPING**
(2162, X'872') Queue manager shutting down.

**MQRC_RESOURCE_PROBLEM**
(2102, X'836') Insufficient system resources available.

**MQRC_SIGNAL_OUTSTANDING**
(2069, X'815') Signal outstanding for this handle.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_SUPPRESSED_BY_EXIT**
(2109, X'83D') Call suppressed by exit program.

**MQRC_SYNCPOINT_LIMIT_REACHED**
(2024, X'7E8') No more messages can be handled within current unit of work.

**MQRC_SYNCPOINT_NOT_AVAILABLE**
(2072, X'818') Sync point support not available.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

**MQRC_UOW_ENLISTMENT_ERROR**
(2354, X'932') Enlistment in global unit of work failed.

**MQRC_UOW_MIX_NOT_SUPPORTED**
(2355, X'933') Mixture of unit-of-work calls not supported.

**MQRC_UOW_NOT_AVAILABLE**
(2255, X'8CF') Unit of work not available for the queue manager to use.

**MQRC_WAIT_INTERVAL_ERROR**
(2090, X'82A') Wait interval in MQGMO not valid.

**MQRC_WRONG_GMO_VERSION**
(2256, X'8D0') Wrong version of MQGMO supplied.

**MQRC_WRONG_MD_VERSION**
(2257, X'8D1') Wrong version of MQMD supplied.

For detailed information about these codes, see Messages and reason codes.

## Usage notes

1. MQCB is used to define the action to be invoked for each message, matching the specified criteria, available on the queue. When the action is processed, either the message is removed from the queue and passed to the defined message consumer, or a message token is provided, which is used to retrieve the message.
2. MQCB can be used to define callback routines before starting consumption with MQCTL or it can be used from within a callback routine.
3. To use MQCB from outside of a callback routine, you must first suspend message consumption by using MQCTL and resume consumption afterward.
4. MQCB is not supported within the IMS adapter.

## Message consumer callback sequence

You can configure a consumer to invoke callback at key points during the lifecycle of the consumer. For example:

- when the consumer is first registered,
- when the connection is started,
- when the connection is stopped and
- when the consumer is deregistered, either explicitly, or implicitly by an MQCLOSE.

*Table 550. MQCTL verb definitions*

| **Verb** | **Meaning** |
|---|---|
| MQCTL(START) | MQCTL call using the MQOP_START Operation |
| MQCTL(STOP) | MQCTL call using the MQOP_STOP Operation |
| MQCTL(WAIT) | MQCTL call using the MQOP_START_WAIT Operation |

This allows the consumer to maintain state associated with the consumer. When a callback is requested by an application, the rules for consumer invocation are as follows:

**REGISTER**
Is always the first type of invocation of the callback.

Is always called on the same thread, as the MQCB(REGISTER) call.

**START**
Is always called synchronously with the MQCTL(START) verb.

- All START callbacks are completed before the MQCTL(START) verb returns.

Is on the same thread as the message delivery if THREAD_AFFINITY is requested.

The call with start is not guaranteed if, for example, a previous callback issues MQCTL(STOP) during the MQCTL(START).

**STOP**
No further messages or events are delivered after this call until the connection is restarted.

A STOP is guaranteed if the application was previously called for START, or a message, or an event.

**DEREGISTER**
Is always the last type of invocation of the callback.

Ensure that your application performs thread-based initialization and cleanup in the START and STOP callbacks. You can do non-thread based initialization and cleanup with REGISTER and DEREGISTER callbacks.

Do not make any assumptions about the life and availability of the thread other than what is stated. For example, do not rely on a thread staying alive beyond the last call to DEREGISTER. Similarly, when you have chosen not to use THREAD_AFFINITY, do not assume that the thread exists whenever the connection is started.

If your application has particular requirements for thread characteristics, it can always create a thread accordingly, then use MQCTL(WAIT). This has the effect of 'donating' the thread to IBM MQ for asynchronous message delivery.

## Message consumer connection usage

You can configure a consumer to invoke callback at key points during the lifecycle of the consumer. For example:

- when the consumer is first registered,
- when the connection is started,
- when the connection is stopped and
- when the consumer is deregistered, either explicitly, or implicitly by an MQCLOSE.

*Table 551. MQCTL verb definitions*

| **Verb** | **Meaning** |
|---|---|
| MQCTL(START) | MQCTL call using the MQOP_START Operation |
| MQCTL(STOP) | MQCTL call using the MQOP_STOP Operation |
| MQCTL(WAIT) | MQCTL call using the MQOP_START_WAIT Operation |

This allows the consumer to maintain state associated with the consumer. When a callback is requested by an application, the rules for consumer invocation are as follows:

**REGISTER**
Is always the first type of invocation of the callback.

Is always called on the same thread, as the MQCB(REGISTER) call.

**START**
Is always called synchronously with the MQCTL(START) verb.

- All START callbacks are completed before the MQCTL(START) verb returns.

Is on the same thread as the message delivery if THREAD_AFFINITY is requested.

The call with start is not guaranteed if, for example, a previous callback issues MQCTL(STOP) during the MQCTL(START).

**STOP**
No further messages or events are delivered after this call until the connection is restarted.

A STOP is guaranteed if the application was previously called for START, or a message, or an event.

**DEREGISTER**
Is always the last type of invocation of the callback.

Ensure that your application performs thread-based initialization and cleanup in the START and STOP callbacks. You can do non-thread based initialization and cleanup with REGISTER and DEREGISTER callbacks.

Do not make any assumptions about the life and availability of the thread other than what is stated. For example, do not rely on a thread staying alive beyond the last call to DEREGISTER. Similarly, when you have chosen not to use THREAD_AFFINITY, do not assume that the thread exists whenever the connection is started.

If your application has particular requirements for thread characteristics, it can always create a thread accordingly, then use MQCTL(WAIT). This has the effect of 'donating' the thread to IBM MQ for asynchronous message delivery.

## C invocation

```
MQCB (Hconn, Operation, CallbackDesc, Hobj, MsgDesc,
GetMsgOpts, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;         /* Connection handle */
MQLONG   Operation;     /* Operation being processed */
MQCBD    CallbackDesc;  /* Callback descriptor */
MQHOBJ   HObj           /* Object handle */
MQMD     MsgDesc        /* Message descriptor attributes */
MQGMO    GetMsgOpts     /* Message options */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQCB' USING HCONN, OPERATION, CBDESC, HOBJ, MSGDESC,
           GETMSGOPTS, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN    PIC S9(9) BINARY.
**   Operation
 01  OPERATION PIC S9(9) BINARY.
**   Callback Descriptior
 01  CBDESC.
     COPY CMQCBDV.
01  HOBJ     PIC S9(9) BINARY.
**   Message Descriptior
 01  MSGDESC.
     COPY CMQMDV.
**   Get Message Options
 01  GETMSGOPTS.
     COPY CMQGMOV.
**   Completion code
 01  COMPCODE PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON   PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQCB(Hconn, Operation, CallbackDesc, Hobj, MsgDesc, GetMsgOpts,
          CompCode, Reason)
```

Declare the parameters as follows:

```
dcl Hconn        fixed bin(31); /* Connection handle */
dcl Operation    fixed bin(31); /* Operation */
dcl CallbackDesc like MQCBD;    /* Callback Descriptor */
dcl Hobj         fixed bin(31); /* Object Handle */
dcl MsgDesc      like MQMD;     /* Message Descriptor */
dcl GetMsgOpts   like MQGMO;    /* Get Message Options */
dcl CompCode     fixed bin(31); /* Completion code */
dcl Reason       fixed bin(31); /* Reason code qualifying CompCode */
```

## MQCB_FUNCTION - Callback function

The MQCB_FUNCTION function call is the callback function for event handling and asynchronous message consumption.

The MQCB_FUNCTION call definition is provided solely to describe the parameters that are passed to the callback function. No entry point called MQCB_FUNCTION is provided by the queue manager.

The specification of the actual function to be called is an input to the MQCB call and is passed in through the MQCBD structure.

### Syntax

MQCB_FUNCTION (*Hconn*, *MsgDesc*, *GetMsgOpts*, *Buffer*, *Context*)

### Parameters

***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call. On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for Hconn:

**MQHC_DEF_CONN**

Default connection handle.

**Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

***MsgDesc***

Type: MQMD - input

This structure describes the attributes of the message retrieved.

See “MQMD - Message descriptor” on page 402 for details.

The version of MQMD passed is the same version as passed on the MQCB call that defined the consumer function.

The address of the MQMD is passed as null characters if a version 4 MQGMO was used to request that a Message Handle be returned instead of an MQMD.

This is an input field to the message consumer function; it is not relevant to an event handler function.

***GetMsgOpts***

Type: MQGMO - input

Options used to control the actions of the message consumer. This parameter also contains additional information about the message returned.

See MQGMO for details.

The version of MQGMO passed is the latest version supported.

This is an input field to the message consumer function; it is not relevant to an event handler function.

***Buffer***

Type: MQBYTExBufferLength - input

This is the area containing the message data.

If no message is available for this call, or if the message contains no message data, the address of the *Buffer* is passed as nulls.

This is an input field to the message consumer function; it is not relevant to an event handler function.

***Context***
Type: MQCBC - input/output

This structure provides context information to the callback functions. See "MQCBC - Callback context" on page 275 for details.

### Usage notes

1. Be aware that if your callback routines use services that could delay or block the thread, for example, MQGET with wait, could delay the dispatch of other callbacks.
2. A separate unit of work is not automatically established for each invocation of a callback routine, so routines can either issue a commit call, or defer committing, until a logical batch of work has been processed. When the batch of work is committed, it commits the messages for all callback functions that have been invoked since the last sync point.
3. Programs invoked by CICS LINK or CICS START retrieve parameters using CICS services through named objects known as channel containers. The container names are the same as the parameter names. For more information, see your CICS documentation.
4. Callback routines can issue an MQDISC call, but not for their own connection. For example, if a callback routine has created a connection, then it can also disconnect the connection.
5. A callback routine should not, in general, rely on being invoked from the same thread each time. If required, use the MQCTLO_THREAD_AFFINITY when the connection is started.
6. When a callback routine receives a nonzero reason code, it must take appropriate action.
7. MQCB_FUNCTION is not supported within the IMS adapter.

## MQCLOSE - Close object

The MQCLOSE call relinquishes access to an object, and is the inverse of the MQOPEN and MQSUB calls.

### Syntax

MQCLOSE (*Hconn*, *Hobj*, *Options*, *CompCode*, *Reason*)

### Parameters

***Hconn***
Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, you can omit the MQCONN call, and specify the following value for *Hconn*:

**MQHC_DEF_HCONN**
Default connection handle.

***Hobj***
Type: MQHOBJ - input/output

This handle represents the object that is being closed. The object can be of any type. The value of *Hobj* was returned by a previous MQOPEN call.

On successful completion of the call, the queue manager sets this parameter to a value that is not a valid handle for the environment. This value is:

**MQHO_UNUSABLE_HOBJ**
Unusable object handle.

On z/OS, *Hobj* is set to a value that is undefined.

***Options***

Type: MQLONG - input

This parameter controls how the object is closed.

Only permanent dynamic queues and subscriptions can be closed in more than one way, because they must be either retained or deleted; these are queues with the *DefinitionType* attribute that has the value MQQDT_PERMANENT_DYNAMIC (see the *DefinitionType* attribute described in "Attributes for queues" on page 810 ). The close options are summarized in this topic.

Durable subscriptions can either be kept or removed; these are created using the MQSUB call with the MQSO_DURABLE option.

When closing the handle to a managed destination (that is the *Hobj* parameter returned on an MQSUB call which used the MQSO_MANAGED option) the queue manager cleans up any publications that have not been retrieved when the associated subscription has also been removed. The subscription is removed using the MQCO_REMOVE_SUB option on the *Hsub* parameter returned on an MQSUB call. Note MQCO_REMOVE_SUB is the default behavior on MQCLOSE for a non-durable subscription.

When closing a handle to a non-managed destination you are responsible for cleaning up the queue where publications are sent. Close the subscription using MQCO_REMOVE_SUB first and then process messages off the queue until none remain.

You must specify one option only from the following:

**Dynamic queue options:** These options control how permanent dynamic queues are closed.

**MQCO_DELETE**

The queue is deleted if either of the following is true:

- It is a permanent dynamic queue, created by a previous MQOPEN call, and there are no messages on the queue and no uncommitted get or put requests outstanding for the queue (either for the current task or any other task).
- It is the temporary dynamic queue that was created by the MQOPEN call that returned *Hobj*. In this case, all the messages on the queue are purged.

In all other cases, including the case where the *Hobj* was returned on an MQSUB call, the call fails with reason code MQRC_OPTION_NOT_VALID_FOR_TYPE, and the object is not deleted.

On z/OS, if the queue is a dynamic queue that has been logically deleted, and this is the last handle for it, the queue is physically deleted. See "Usage notes" on page 634 for further details.

**MQCO_DELETE_PURGE**

The queue is deleted, and any messages on it purged, if either of the following is true:

- It is a permanent dynamic queue, created by a previous MQOPEN call, and there are no uncommitted get or put requests outstanding for the queue (either for the current task or any other task).
- It is the temporary dynamic queue that was created by the MQOPEN call that returned *Hobj*.

In all other cases, including the case where the *Hobj* was returned on an MQSUB call, the call fails with reason code MQRC_OPTION_NOT_VALID_FOR_TYPE, and the object is not deleted.

The table shows which close options are valid, and whether the object is retained or deleted.

| Type of object or queue | MQCO_NONE | MQCO_DELETE | MQCO_DELETE_PURGE |
|---|---|---|---|
| Object other than a queue | Retained | Not valid | Not valid |
| Predefined queue | Retained | Not valid | Not valid |
| Permanent dynamic queue | Retained | Deleted if empty and no pending updates | Messages deleted; queue deleted if no pending updates |

| The table shows which close options are valid, and whether the object is retained or deleted. *(continued)* | | | |
|---|---|---|---|
| **Type of object or queue** | **MQCO_NONE** | **MQCO_DELETE** | **MQCO_DELETE_PURGE** |
| Temporary dynamic queue (call issued by creator of queue) | Deleted | Deleted | Deleted |
| Temporary dynamic queue (call not issued by creator of queue) | Retained | Not valid | Not valid |
| Distribution list | Retained | Not valid | Not valid |
| Managed subscription destination | Retained | Not valid | Not valid |
| Distribution list (subscription has been removed) | Messages deleted; queue deleted | Not valid | Not valid |

**Subscription closure options:** These options control whether durable subscriptions are removed when the handle is closed, and whether publications still waiting to be read by the application are cleaned up. These options are only valid for use with an object handle returned in the *Hsub* parameter of an MQSUB call.

**MQCO_KEEP_SUB**
The handle to the subscription is closed but the subscription made is kept. Publications continue to be sent to the destination specified in the subscription. This option is only valid if the subscription was made with the option MQSO_DURABLE.

MQCO_KEEP_SUB is the default if the subscription is durable

**MQCO_REMOVE_SUB**
The subscription is removed and the handle to the subscription is closed.

The *Hobj* parameter of the MQSUB call is not invalidated by closure of the *Hsub* parameter and might continue to be used for MQGET or MQCB to receive the remaining publications. When the *Hobj* parameter of the MQSUB call is also closed, if it was a managed destination any unretrieved publications are removed.

MQCO_REMOVE_SUB is the default if the subscription is non-durable.

Successful completion of MQCO_REMOVE_SUB does not mean that the action completed. To check that this call has completed, see the DELETE SUB step in Checking that async commands for distributed networks have finished.

These subscription closure options are summarized in the following tables.

To close a durable subscription handle but retain the subscription, use the following subscription closure options:

| **Task** | **Subscription closure option** |
|---|---|
| Keep publications on an MQOPENed handle | MQCO_KEEP_SUB |
| Remove publications on an MQOPENed handle | Action not allowed |
| Keep publications on an MQSO_MANAGED handle | MQCO_KEEP_SUB |
| Remove publications on an MQSO_MANAGED handle | Action not allowed |

To unsubscribe, either by closing a durable subscription handle and unsubscribing it or closing a non-durable subscription handle, use the following subscription closure options:

| Task | Subscription closure option |
|---|---|
| Keep publications on an MQOPENed handle | MQCO_REMOVE_SUB |
| Remove publications on an MQOPENed handle | Action not allowed |
| Keep publications on an MQSO_MANAGED handle | MQCO_REMOVE_SUB |

**Read ahead options**: The following options control what happens to non-persistent messages which have been sent to the client before an application requested them and have not yet been consumed by the application. These messages are stored in the client read ahead buffer waiting to be requested by the application and can either be discarded or consumed from the queue before the MQCLOSE is completed.

**MQCO_IMMEDIATE**
The object is closed immediately and any messages which have been sent to the client before an application requested them are discarded and are not available to be consumed by any application. This is the default value.

**MQCO_QUIESCE**
A request to close the object is made, but if any messages which have been sent to the client before an application requested them, still reside in the client read ahead buffer, the MQCLOSE call returns with a warning of MQRC_READ_AHEAD_MSGS and the object handle remains valid.

The application can then continue to use the object handle to retrieve messages until no more are available, and then close the object again. No more messages are sent to the client ahead of an application requesting them, read ahead is now turned off.

Applications are advised to use MQCO_QUIESCE rather than trying to reach a point where there are no more messages in the client read ahead buffer, because a message could arrive between the last MQGET call and the following MQCLOSE which would be discarded if MQCO_IMMEDIATE was used.

If an MQCLOSE with MQCO_QUIESCE is issued from within an asynchronous callback function, the same behavior of reading ahead messages applies. If the warning MQRC_READ_AHEAD_MSGS is returned, then the callback function is called at least one more time. When the last remaining message that was read ahead has been passed to the callback function the MQCBC ConsumerFlags field is set to MQCBCF_READA_BUFFER_EMPTY.

**Default option:** If you require none of the options described previously, you can use the following option:

**MQCO_NONE**
No optional close processing required.

This *must* be specified for:

- Objects other than queues
- Predefined queues
- Temporary dynamic queues (but only in those cases where *Hobj* is *not* the handle returned by the MQOPEN call that created the queue).
- Distribution lists

In all the above cases, the object is retained and not deleted.

If this option is specified for a temporary dynamic queue:

- The queue is deleted, if it was created by the MQOPEN call that returned *Hobj* ; any messages that are on the queue are purged.
- In all other cases the queue (and any messages on it) are retained.

If this option is specified for a permanent dynamic queue, the queue is retained and not deleted.

On z/OS, if the queue is a dynamic queue that has been logically deleted, and this is the last handle for it, the queue is physically deleted. See "Usage notes" on page 634 for further details.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_WARNING**
Warning (partial completion).

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

The reason codes listed are the ones that the queue manager can return for the *Reason* parameter.

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_WARNING:

**MQRC_INCOMPLETE_GROUP**
(2241, X'8C1') Message group not complete.

**MQRC_INCOMPLETE_MSG**
(2242, X'8C2') Logical message not complete.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'89C') Adapter not available.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_API_EXIT_ERROR**
(2374, X'946') API exit failed.

**MQRC_API_EXIT_LOAD_ERROR**
(2183, X'887') Unable to load API exit.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_CALL_IN_PROGRESS**
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC_CF_NOT_AVAILABLE**
(2345, X'929') Coupling facility not available.

**MQRC_CF_STRUC_FAILED**
(2373, X'945') Coupling-facility structure failed.

**MQRC_CF_STRUC_IN_USE**
(2346, X'92A') Coupling-facility structure in use.

**MQRC_CICS_WAIT_FAILED**
(2140, X'85C') Wait request rejected by CICS.

**MQRC_CONNECTION_BROKEN**
(2009, X'7D9') Connection to queue manager lost.

**MQRC_CONNECTION_NOT_AUTHORIZED**
(2217, X'8A9') Not authorized for connection.

**MQRC_CONNECTION_STOPPING**
(2203, X'89B') Connection shutting down.

**MQRC_DB2_NOT_AVAILABLE**
(2342, X'926') Db2 subsystem not available.

**MQRC_HCONN_ERROR**
(2018, X'7E2') Connection handle not valid.

**MQRC_HOBJ_ERROR**
(2019, X'7E3') Object handle not valid.

**MQRC_NOT_AUTHORIZED**
(2035, X'7F3') Not authorized for access.

**MQRC_OBJECT_DAMAGED**
(2101, X'835') Object damaged.

**MQRC_OPTION_NOT_VALID_FOR_TYPE**
(2045, X'7FD') On an MQOPEN or MQCLOSE call: option not valid for object type.

**MQRC_OPTIONS_ERROR**
(2046, X'7FE') Options not valid or not consistent.

**MQRC_PAGESET_ERROR**
(2193, X'891') Error accessing page-set data set.

**MQRC_Q_MGR_NAME_ERROR**
(2058, X'80A') Queue manager name not valid or not known.

**MQRC_Q_MGR_NOT_AVAILABLE**
(2059, X'80B') Queue manager not available for connection.

**MQRC_Q_MGR_STOPPING**
(2162, X'872') Queue manager shutting down.

**MQRC_Q_NOT_EMPTY**
(2055, X'807') Queue contains one or more messages or uncommitted put or get requests.

**MQRC_READ_AHEAD_MSGS**
(nnnn, X'xxx') The client has read ahead messages that have not yet been consumed by the application.

**MQRC_RESOURCE_PROBLEM**
(2102, X'836') Insufficient system resources available.

**MQRC_SECURITY_ERROR**
(2063, X'80F') Security error occurred.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_SUPPRESSED_BY_EXIT**
(2109, X'83D') Call suppressed by exit program.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Messages and reason codes.

## Usage notes

1. When an application issues the MQDISC call, or ends either normally or abnormally, any objects that were opened by the application and are still open are closed automatically with the MQCO_NONE option.
2. The following points apply if the object being closed is a *queue*:

- If operations on the queue are performed as part of a unit of work, the queue can be closed before or after the sync point occurs without affecting the outcome of the sync point. If the queue is triggered, performing a rollback before closing the queue can cause a trigger message to be issued. For more information about trigger messages, see Properties of trigger messages.
- If the queue was opened with the MQOO_BROWSE option, the browse cursor is destroyed. If the queue is then reopened with the MQOO_BROWSE option, a new browse cursor is created (see MQOO_BROWSE ).
- If a message is currently locked for this handle at the time of the MQCLOSE call, the lock is released (see MQGMO_LOCK ).
- On z/OS, if there is an MQGET request with the MQGMO_SET_SIGNAL option outstanding against the queue handle being closed, the request is canceled (see MQGMO_SET_SIGNAL ). Signal requests for the same queue but lodged against different handles (*Hobj*) are not affected (unless a dynamic queue is being deleted, in which case they are also canceled).

3. The following points apply if the object being closed is a *dynamic queue* (either permanent or temporary):
   - For a dynamic queue, you can specify the MQCO_DELETE and MQCO_DELETE_PURGE options regardless of the options specified on the corresponding MQOPEN call.
   - When a dynamic queue is deleted, all MQGET calls with the MQGMO_WAIT option that are outstanding against the queue are canceled and reason code MQRC_Q_DELETED is returned. See MQGMO_WAIT.

     Although applications cannot access a deleted queue, the queue is not removed from the system, and associated resources are not freed, until all handles that reference the queue have been closed, and all units of work that affect the queue have been either committed or backed out.

     On z/OS, a queue that has been logically deleted but not yet removed from the system prevents the creation of a new queue with the same name as the deleted queue; the MQOPEN call fails with reason code MQRC_NAME_IN_USE in this case. Also, such a queue can still be displayed using MQSC commands, even though it cannot be accessed by applications.
   - When a permanent dynamic queue is deleted, if the *Hobj* handle specified on the MQCLOSE call is *not* the one that was returned by the MQOPEN call that created the queue, a check is made that the user identifier that was used to validate the MQOPEN call is authorized to delete the queue. If the MQOO_ALTERNATE_USER_AUTHORITY option was specified on the MQOPEN call, the user identifier checked is the *AlternateUserId*.

     This check is not performed if:

     – The handle specified is the one returned by the MQOPEN call that created the queue.

     – The queue being deleted is a temporary dynamic queue.
   - When a temporary dynamic queue is closed, if the *Hobj* handle specified on the MQCLOSE call is the one that was returned by the MQOPEN call that created the queue, the queue is deleted. This occurs regardless of the close options specified on the MQCLOSE call. If there are messages on the queue, they are discarded; no report messages are generated.

     If there are uncommitted units of work that affect the queue, the queue and its messages are still deleted, but the units of work do not fail. However, as described previously, the resources associated with the units of work are not freed until each of the units of work has been either committed or backed out.

4. The following points apply if the object being closed is a *distribution list*:
   - The only valid close option for a distribution list is MQCO_NONE; the call fails with reason code MQRC_OPTIONS_ERROR or MQRC_OPTION_NOT_VALID_FOR_TYPE if any other options are specified.
   - When a distribution list is closed, individual completion codes and reason codes are not returned for the queues in the list; only the *CompCode* and *Reason* parameters of the call are available for diagnostic purposes.

If a failure occurs closing one of the queues, the queue manager continues processing and attempts to close the remaining queues in the distribution list. The *CompCode* and *Reason* parameters of the call are set to return information describing the failure. It is possible for the completion code to be MQCC_FAILED, even though most of the queues were closed successfully. The queue that encountered the error is not identified.

If there is a failure on more than one queue, it is not defined which failure is reported in the *CompCode* and *Reason* parameters.

5. On IBM i, if the application was connected implicitly when the first MQOPEN call was issued, an implicit MQDISC occurs when the last MQCLOSE is issued.

   Only applications running in compatibility mode can be connected implicitly; other applications must issue the MQCONN or MQCONNX call to connect to the queue manager explicitly.

   **Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

## C invocation

```
MQCLOSE (Hconn, &Hobj, Options, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;     /* Connection handle */
MQHOBJ   Hobj;      /* Object handle */
MQLONG   Options;   /* Options that control the action of MQCLOSE */
MQLONG   CompCode;  /* Completion code */
MQLONG   Reason;    /* Reason code qualifying CompCode */
```

## COBOL invocation

```
     CALL 'MQCLOSE' USING HCONN, HOBJ, OPTIONS, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN     PIC S9(9) BINARY.
**   Object handle
 01  HOBJ      PIC S9(9) BINARY.
**   Options that control the action of MQCLOSE
 01  OPTIONS   PIC S9(9) BINARY.
**   Completion code
 01  COMPCODE  PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON    PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQCLOSE (Hconn, Hobj, Options, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn     fixed bin(31);  /* Connection handle */
dcl Hobj      fixed bin(31);  /* Object handle */
dcl Options   fixed bin(31);  /* Options that control the action of
                                 MQCLOSE */
dcl CompCode  fixed bin(31);  /* Completion code */
dcl Reason    fixed bin(31);  /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
CALL MQCLOSE,(HCONN,HOBJ,OPTIONS,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN     DS  F  Connection handle
HOBJ      DS  F  Object handle
OPTIONS   DS  F  Options that control the action of MQCLOSE
COMPCODE  DS  F  Completion code
REASON    DS  F  Reason code qualifying COMPCODE
```

### Visual Basic invocation

```
MQCLOSE Hconn, Hobj, Options, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Hconn    As Long 'Connection handle'
Dim Hobj     As Long 'Object handle'
Dim Options  As Long 'Options that control the action of MQCLOSE'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

## MQCMIT - Commit changes

The MQCMIT call indicates to the queue manager that the application has reached a sync point, and that all the message gets and puts that have occurred since the last sync point are to be made permanent.

Messages put as part of a unit of work are made available to other applications; messages retrieved as part of a unit of work are deleted.

- z/OS On z/OS, the call is used only by batch programs (including IMS batch DL/I programs).
- IBM i On IBM i, this call is not supported for applications running in compatibility mode.

  **Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

### Syntax

MQCMIT (*Hconn*, *CompCode*, *Reason*)

### Parameters

***Hconn***
Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_WARNING**
Warning (partial completion).

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

The reason codes listed are the ones that the queue manager can return for the *Reason* parameter.

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_WARNING:

**MQRC_BACKED_OUT**
(2003, X'7D3') Unit of work backed out.

**MQRC_OUTCOME_PENDING**
(2124, X'84C') Result of commit operation is pending.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_API_EXIT_ERROR**
(2374, X'946') API exit failed.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_CALL_IN_PROGRESS**
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC_CALL_INTERRUPTED**
(2549, X'9F5') MQPUT or MQCMIT was interrupted and reconnection processing cannot reestablish a definite outcome.

**MQRC_CF_STRUC_IN_USE**
(2346, X'92A') Coupling-facility structure in use.

**MQRC_CONNECTION_BROKEN**
(2009, X'7D9') Connection to queue manager lost.

**MQRC_ENVIRONMENT_ERROR**
(2012, X'7DC') Call not valid in environment.

**MQRC_HCONN_ERROR**
(2018, X'7E2') Connection handle not valid.

**MQRC_OBJECT_DAMAGED**
(2101, X'835') Object damaged.

**MQRC_OUTCOME_MIXED**
(2123, X'84B') Result of commit or back-out operation is mixed.

**MQRC_Q_MGR_STOPPING**
(2162, X'872') Queue manager shutting down.

**MQRC_RECONNECT_FAILED**
(2548, X'9F4') After reconnecting, an error occurred reinstating the handles for a reconnectable connection.

**MQRC_RESOURCE_PROBLEM**
(2102, X'836') Insufficient system resources available.

**MQRC_STORAGE_MEDIUM_FULL**
(2192, X'890') External storage medium is full.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Messages and reason codes.

## Usage notes

1. Use this call only when the queue manager itself coordinates the unit of work. This can be:
   - A local unit of work, where the changes affect only IBM MQ resources.
   - A global unit of work, where the changes can affect resources belonging to other resource managers, as well as affecting IBM MQ resources.

   For further details about local and global units of work, see "MQBEGIN - Begin unit of work" on page 611.
2. In environments where the queue manager does not coordinate the unit of work, the appropriate commit call must be used instead of MQCMIT. The environment might also support an implicit commit caused by the application terminating normally.
   - On z/OS, use the following calls:
     - Batch programs (including IMS batch DL/I programs) can use the MQCMIT call if the unit of work affects only IBM MQ resources. However, if the unit of work affects both IBM MQ resources and resources belonging to other resource managers (for example, Db2 ), use the SRRCMIT call provided by the z/OS Recoverable Resource Service (RRS). The SRRCMIT call commits changes to resources belonging to the resource managers that have been enabled for RRS coordination.
     - CICS applications must use the `EXEC CICS SYNCPOINT` command to commit the unit of work explicitly. Alternatively, ending the transaction results in an implicit commit of the unit of work. The MQCMIT call cannot be used for CICS applications.
     - IMS applications (other than batch DL/I programs) must use IMS calls such as `GU` and `CHKP` to commit the unit of work. The MQCMIT call cannot be used for IMS applications (other than batch DL/I programs).
   - On IBM i, use this call for local units of work coordinated by the queue manager. This means that a commitment definition must not exist at job level, that is, the `STRCMTCTL` command with the `CMTSCOPE(*JOB)` parameter must not have been issued for the job.
3. If an application ends with uncommitted changes in a unit of work, the disposition of those changes depends on whether the application ends normally or abnormally. See MQDISC usage notes for further details.
4. When an application puts or gets messages in groups or segments of logical messages, the queue manager retains information relating to the message group and logical message for the last successful MQPUT and MQGET calls. This information is associated with the queue handle, and includes such things as:
   - The values of the *GroupId*, *MsgSeqNumber*, *Offset*, and *MsgFlags* fields in MQMD.
   - Whether the message is part of a unit of work.
   - For the MQPUT call: whether the message is persistent or nonpersistent.

   When a unit of work is committed, the queue manager retains the group and segment information, and the application can continue putting or getting messages in the current message group or logical message.

   Retaining the group and segment information when a unit of work is committed allows the application to spread a large message group or large logical message consisting of many segments across several units of work. Using several units of work is advantageous if the local queue manager has only limited queue storage. However, the application must maintain sufficient information to restart putting or getting messages at the correct point if a system failure occurs. For details of how to restart at the correct point after a system failure, see MQPMO_LOGICAL_ORDER and MQGMO_LOGICAL_ORDER.

   The remaining usage notes apply only when the queue manager coordinates the units of work:

5. A unit of work has the same scope as a connection handle; all IBM MQ calls that affect a particular unit of work must be performed using the same connection handle. Calls issued using a different connection handle (for example, calls issued by another application) affect a different unit of work. See the *Hconn* parameter described in MQCONN for information about the scope of connection handles.
6. Only messages that were put or retrieved as part of the current unit of work are affected by this call.
7. A long-running application that issues MQGET, MQPUT, or MQPUT1 calls within a unit of work, but that never issues a commit or back-out call, can fill queues with messages that are not available to other applications. To guard against this, the administrator must set the *MaxUncommittedMsgs* queue-manager attribute to a value that is low enough to prevent runaway applications filling the queues, but high enough to allow the expected messaging applications to work correctly.
8. On UNIX and Windows systems, if the *Reason* parameter is MQRC_CONNECTION_BROKEN (with a *CompCode* of MQCC_FAILED), or MQRC_UNEXPECTED_ERROR it is possible that the unit of work was successfully committed.

## C invocation

```
MQCMIT (Hconn, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;     /* Connection handle */
MQLONG   CompCode;  /* Completion code */
MQLONG   Reason;    /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQCMIT' USING HCONN, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN     PIC S9(9) BINARY.
**   Completion code
 01  COMPCODE  PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON    PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQCMIT (Hconn, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn     fixed bin(31);  /* Connection handle */
dcl CompCode  fixed bin(31);  /* Completion code */
dcl Reason    fixed bin(31);  /* Reason code qualifying CompCode */
```

## High Level Assembler invocation

```
CALL MQCMIT,(HCONN,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN     DS  F  Connection handle
COMPCODE  DS  F  Completion code
REASON    DS  F  Reason code qualifying COMPCODE
```

### Visual Basic invocation

```
MQCMIT Hconn, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Hconn    As Long 'Connection handle'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

## MQCONN - Connect queue manager

The MQCONN call connects an application program to a queue manager.

It provides a queue manager connection handle, which the application uses on subsequent message queuing calls.

- On z/OS, CICS applications do not have to issue this call. These applications are connected automatically to the queue manager to which the CICS system is connected. However, the MQCONN and MQDISC calls are still accepted from CICS applications.
- On IBM i, applications running in compatibility mode do not have to issue this call. These applications are connected automatically to the queue manager when they issue the first MQOPEN call. However, the MQCONN and MQDISC calls are still accepted from IBM i applications.

  **Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

  Other applications (that is, applications not running in compatibility mode) must use the MQCONN or MQCONNX call to connect to the queue manager, and the MQDISC call to disconnect from the queue manager. This is the recommended style of programming.

A client connection cannot be made on a server only installation, and a local connection cannot be made on a client only installation.

### Syntax

MQCONN (*QMgrName*, *Hconn*, *CompCode*, *Reason*)

### Parameters

***QMgrName***

Type: MQCHAR48 - input

This is the name of the queue manager to which the application wants to connect. The name can contain the following characters:

- Uppercase alphabetic characters (A through Z)
- Lowercase alphabetic characters (a through z)
- Numeric digits (0 through 9)
- Period (.), forward slash (/), underscore (_), percent (%)

The name must not contain leading or embedded blanks, but can contain trailing blanks. A null character can be used to indicate the end of significant data in the name; the null and any characters following it are treated as blanks. The following restrictions apply in the environments indicated:

- On systems that use EBCDIC Katakana, lowercase characters cannot be used.
- On z/OS, names that begin or end with an underscore cannot be processed by the operations and control panels. For this reason, avoid such names.
- On IBM i, enclose names containing lowercase characters, forward slash, or percent in quotation marks when specified on commands. Do not specify these quotation marks in the *QMgrName* parameter.

If the name consists entirely of blanks, the name of the *default* queue manager is used. However, note the use of blank queue manager names described in the section on IBM MQ MQI client applications.

The name specified for *QMgrName* must be the name of a *connectable* queue manager or, if queue manager groups are being used, the name of the queue manager group..

On z/OS, the queue managers to which it is possible to connect are determined by the environment:

- For CICS, you can use only the queue manager to which the CICS system is connected. The *QMgrName* parameter must still be specified, but its value is ignored; blank characters are a suitable option.
- For IMS, only queue managers that are listed in the subsystem definition table (CSQQDEFV), *and* listed in the SSM table in IMS, are connectable (see usage note 6 ).
- For z/OS batch and TSO, only queue managers that reside on the same system as the application are connectable (see usage note 6 ).

**Queue-sharing groups**: On systems where several queue managers exist and are configured to form a queue-sharing group, the name of the queue-sharing group can be specified for *QMgrName* in place of the name of a queue manager. This allows the application to connect to *any* queue manager that is available in the queue-sharing group and that is on the same z/OS image as the application. The system can also be configured so that using a blank *QMgrName* connects to the queue-sharing group instead of to the default queue manager.

If *QMgrName* specifies the name of the queue-sharing group, but there is also a queue manager with that name on the system, connection is made to the latter in preference to the former. Only if that connection fails is connection to one of the queue managers in the queue-sharing group attempted.

If the connection is successful, you can use the handle returned by the MQCONN or MQCONNX call to access *all* the resources (both shared and nonshared) that belong to the queue manager to which connection has been made. Access to these resources is subject to the typical authorization controls.

If the application issues two MQCONN or MQCONNX calls to establish concurrent connections, and one or both calls specifies the name of the queue-sharing group, the second call returns completion code MQCC_WARNING and reason code MQRC_ALREADY_CONNECTED when it connects to the same queue manager as the first call.

Queue-sharing groups are supported only on z/OS. Connection to a queue-sharing group is supported only in the batch, RRS batch, CICS, and TSO environments. For CICS, you can use only the queue sharing group to which the CICS system is connected. You must still specify the **QMgrName** parameter, but its value is ignored; blank characters are a suitable option.

**Attention:** IMS is unable to connect to a queue sharing group.

**IBM MQ MQI client applications**: For IBM MQ MQI client applications, a connection is attempted for each client-connection channel definition with the specified queue-manager name, until one is successful. The queue manager, however, must have the same name as the specified name. If an all-blank name is specified, each client-connection channel with an all-blank queue-manager name is tried until one is successful; in this case there is no check against the actual name of the queue manager.

IBM MQ client applications are not supported in z/OS, but z/OS can act as an IBM MQ server, to which IBM MQ client applications can connect.

**IBM MQ MQI client queue-manager groups**: If the specified name starts with an asterisk (*), the queue manager to which connection is made might have a different name from that specified by the

application. The specified name (without the asterisk) defines a *group* of queue managers that are eligible for connection. The implementation selects one from the group by trying each one in turn until one is found to which a connection can be made. The order in which connections are attempted is influenced by the client channel weight and connection affinity values of the candidate channels. If none of the queue managers in the group is available for connection, the call fails. Each queue manager is tried once only. If an asterisk alone is specified for the name, an implementation-defined default queue-manager group is used.

Queue-manager groups are supported only for applications running in an MQ-client environment; the call fails if a non-client application specifies a queue-manager name beginning with an asterisk. A group is defined by providing several client connection channel definitions with the same queue-manager name (the specified name without the asterisk), to communicate with each of the queue managers in the group. The default group is defined by providing one or more client connection channel definitions, each with a blank queue-manager name (specifying an all-blank name therefore has the same effect as specifying a single asterisk for the name for a client application).

After connecting to one queue manager of a group, an application can specify blanks in the typical way in the queue-manager name fields in the message and object descriptors to mean the name of the queue manager to which the application has connected (the *local queue manager* ). If the application needs to know this name, use the MQINQ call to inquire the *QMgrName* queue-manager attribute.

Prefixing an asterisk to the connection name implies that the application does not depend on connecting to a particular queue manager in the group. Suitable applications are:

- Applications that put messages but do not get messages.
- Applications that put request messages and then get the reply messages from a *temporary dynamic* queue.

Unsuitable applications are ones that need to get messages from a particular queue at a particular queue manager; such applications must not prefix the name with an asterisk.

If you specify an asterisk, the maximum length of the remainder of the name is 47 characters.

The length of this parameter is given by MQ_Q_MGR_NAME_LENGTH.

***Hconn***

Type: MQHCONN - output

This handle represents the connection to the queue manager. Specify it on all subsequent message queuing calls issued by the application. It ceases to be valid when the MQDISC call is issued, or when the unit of processing that defines the scope of the handle terminates.

IBM MQ now supplies the mqm library with client packages as well as server packages. This means that when an MQI call that is found in the mqm library is made, the connection type is checked to see if it is a client or server connection, and then the correct underlying call is made. Therefore an exit which is passed an *Hconn* can now be linked against the mqm library, but used on a client installation.

*Handle scope*: The scope of the handle returned depends on the call used to connect to the queue manager (MQCONN or MQCONNX). If the call used is MQCONNX, the scope of the handle also depends on the MQCNO_HANDLE_SHARE_* option specified in the *Options* field of the MQCNO structure.

- If the call is MQCONN, or the MQCNO_HANDLE_SHARE_NONE option is specified, the handle returned is a *nonshared* handle.

  The scope of a nonshared handle is the smallest unit of parallel processing supported by the platform on which the application is running (see Table 552 on page 644 for details); the handle is not valid outside the unit of parallel processing from which the call was issued.
- If you specify the MQCNO_HANDLE_SHARE_BLOCK or MQCNO_HANDLE_SHARE_NO_BLOCK option, the handle returned is a *shared* handle.

The scope of a shared handle is the process that owns the thread from which the call was issued; the handle can be used from any thread that belongs to that process. Not all platforms support threads.

- If the MQCONN or MQCONNX call fails with completion code equal to MQCC_FAILED, then the Hconn value is undefined.

*Table 552. Scope of nonshared handles on various platforms*

| Platform | Scope of nonshared handle |
|---|---|
| z/OS | • CICS: the CICS task<br>• IMS: the task, up to the next sync point (excluding subtasks of the task)<br>• z/OS batch and TSO: the task (excluding subtasks of the task) |
| IBM i | Job |
| UNIX systems | Thread |
| 16 bit Windows applications | Process |
| 32 bit Windows applications | Thread |

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the value returned is:

**MQHC_DEF_HCONN**
Default connection handle.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_WARNING**
Warning (partial completion).

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_WARNING:

**MQRC_ALREADY_CONNECTED**
(2002, X'7D2') Application already connected.

**MQRC_CLUSTER_EXIT_LOAD_ERROR**
(2267, X'8DB') Unable to load cluster workload exit.

**MQRC_SSL_ALREADY_INITIALIZED**
(2391, X'957') SSL already initialized.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_CONN_LOAD_ERROR**
(2129, X'851') Unable to load adapter connection module.

**MQRC_ADAPTER_DEFS_ERROR**
(2131, X'853') Adapter subsystem definition module not valid.

**MQRC_ADAPTER_DEFS_LOAD_ERROR**
(2132, X'854') Unable to load adapter subsystem definition module.

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'89C') Adapter not available.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_ADAPTER_STORAGE_SHORTAGE**
(2127, X'84F') Insufficient storage for adapter.

**MQRC_ANOTHER_Q_MGR_CONNECTED**
(2103, X'837') Another queue manager already connected.

**MQRC_API_EXIT_ERROR**
(2374, X'946') API exit failed.

**MQRC_API_EXIT_INIT_ERROR**
(2375, X'947') API exit initialization failed.

**MQRC_API_EXIT_TERM_ERROR**
(2376, X'948') API exit termination failed.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_BUFFER_LENGTH_ERROR**
(2005, X'7D5') Buffer length parameter not valid.

**MQRC_CALL_IN_PROGRESS**
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC_CONN_ID_IN_USE**
(2160, X'870') Connection identifier already in use.

**MQRC_CONNECTION_BROKEN**
(2009, X'7D9') Connection to queue manager lost.

**MQRC_CONNECTION_ERROR**
(2273, X'8E1') Error processing MQCONN call.

**MQRC_CONNECTION_NOT_AVAILABLE**
(2568, X'A08') Occurs on an MQCONN or MQCONNX call when the queue manager is unable to provide a connection of the requested connection type on the current installation. A client connection cannot be made on a server only installation. A local connection cannot be made on a client only installation.

**MQRC_CONNECTION_QUIESCING**
(2202, X'89A') Connection quiescing.

**MQRC_CONNECTION_STOPPING**
(2203, X'89B') Connection shutting down.

**MQRC_CRYPTO_HARDWARE_ERROR**
(2382, X'94E') Cryptographic hardware configuration error.

**MQRC_DUPLICATE_RECOV_COORD**
(2163, X'873') Recovery coordinator exists.

**MQRC_ENVIRONMENT_ERROR**
(2012, X'7DC') Call not valid in environment.

Additionally, on the MQCONNX call, passing the “MQCSP - Security parameters” on page 325 control block from a CICS or IMS application.

**MQRC_HCONN_ERROR**
(2018, X'7E2') Connection handle not valid.

**MQRC_HOST_NOT_AVAILABLE**
(2538, X'9EA') An MQCONN call was issued from a client to connect to a queue manager but the attempt to allocate a conversation to the remote system failed.

**MQRC_INSTALLATION_MISMATCH**
(2583, X'A17') Mismatch between queue manager installation and selected library.

**MQRC_KEY_REPOSITORY_ERROR**
(2381, X'94D') Key repository not valid.

**MQRC_MAX_CONNS_LIMIT_REACHED**
(2025, X'7E9') Maximum number of connections reached.

**MQRC_NOT_AUTHORIZED**
(2035, X'7F3') Not authorized for access.

**MQRC_OPEN_FAILED**
(2137, X'859') Object not opened successfully.

**MQRC_Q_MGR_NAME_ERROR**
(2058, X'80A') Queue manager name not valid or not known.

**MQRC_Q_MGR_NOT_AVAILABLE**
(2059, X'80B') Queue manager not available for connection.

**MQRC_Q_MGR_QUIESCING**
(2161, X'871') Queue manager quiescing.

**MQRC_Q_MGR_STOPPING**
(2162, X'872') Queue manager shutting down.

**MQRC_RESOURCE_PROBLEM**
(2102, X'836') Insufficient system resources available.

**MQRC_SECURITY_ERROR**
(2063, X'80F') Security error occurred.

**MQRC_SSL_INITIALIZATION_ERROR**
(2393, X'959') SSL initialization error.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Messages and reason codes.

## Usage notes

1. The queue manager to which connection is made using the MQCONN call is called the *local queue manager*.
2. Queues that are owned by the local queue manager appear to the application as local queues. It is possible to put messages on and get messages from these queues.

   Shared queues that are owned by the queue-sharing group to which the local queue manager belongs appear to the application as local queues. It is possible to put messages on and get messages from these queues.

   Queues that are owned by remote queue managers appear as remote queues. It is possible to put messages on these queues, but not to get messages from these queues.
3. If the queue manager fails while an application is running, the application must issue the MQCONN call again to obtain a new connection handle to use on subsequent IBM MQ calls. The application can issue the MQCONN call periodically until the call succeeds.

   If an application is not sure whether it is connected to the queue manager, the application can safely issue an MQCONN call to obtain a connection handle. If the application is already connected, the

handle returned is the same as that returned by the previous MQCONN call, but with completion code MQCC_WARNING and reason code MQRC_ALREADY_CONNECTED.

4. When the application has finished using IBM MQ calls, the application must use the MQDISC call to disconnect from the queue manager.
5. If the MQCONN call fails with completion code equal to MQCC_FAILED, then the Hconn value is undefined.
6. On z/OS:
   - Batch, TSO, and IMS applications must issue the MQCONN call to use the other IBM MQ calls. These applications can connect to more than one queue manager concurrently.

     If the queue manager fails, the application must issue the call again after the queue manager has restarted to obtain a new connection handle.

     Although IMS applications can issue the MQCONN call repeatedly, even when already connected, this is not recommended for online message processing programs (MPPs).
   - CICS applications do not have to issue the MQCONN call to use the other IBM MQ calls, but can do so if they want; both the MQCONN call and the MQDISC call are accepted. However, it is not possible to connect to more than one queue manager concurrently.

     If the queue manager fails, these applications are automatically reconnected when the queue manager restarts, and so do not need to issue the MQCONN call.
7. On z/OS, to define the available queue managers:
   - For batch applications, system programmers can use the CSQBDEF macro to create a module (CSQBDEFV) that defines the default queue-manager name, or queue-sharing group name.
   - For IMS applications, system programmers can use the CSQQDEFX macro to create a module (CSQQDEFV) that defines the names of the available queue managers and specifies the default queue manager.

     In addition, each queue manager must be defined to the IMS control region and to each dependent region accessing that queue manager. To do this, you must create a subsystem member in the IMS.PROCLIB library and identify the subsystem member to the applicable IMS regions. If an application attempts to connect to a queue manager that is not defined in the subsystem member for its IMS region, the application abends.

   z/OS For more information about using these macros, see Macros intended for customer use.
8. On IBM i, applications written for previous releases of the queue manager can run without recompiling. This is called *compatibility mode*. This mode of operation provides a compatible runtime environment for applications. It comprises the following:
   - The service program AMQZSTUB residing in the library QMQM.

     AMQZSTUB provides the same public interface as previous releases, and has the same signature. Use this service program to access the MQI through bound procedure calls.
   - The program QMQM residing in the library QMQM.

     QMQM provides a means of accessing the MQI through dynamic program calls.
   - Programs MQCLOSE, MQCONN, MQDISC, MQGET, MQINQ, MQOPEN, MQPUT, MQPUT1, and MQSET residing in the library QMQM.

     These programs also provide a means of accessing the MQI through dynamic program calls, but with a parameter list that corresponds to the standard descriptions of the IBM MQ calls.

   These three interfaces do not include capabilities that were introduced in IBM MQ Version 5.1. For example, the MQBACK, MQCMIT, and MQCONNX calls are not supported. The support provided by these interfaces is for single-threaded applications only.

   Support for the new IBM MQ calls in single-threaded applications, and for all IBM MQ calls in multi-threaded applications, is provided through the service programs LIBMQM and LIBMQM_R.

**Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

9. On IBM i, programs that end abnormally are not automatically disconnected from the queue manager. Write applications to allow for the possibility of the MQCONN or MQCONNX call returning completion code MQCC_WARNING and reason code MQRC_ALREADY_CONNECTED. Use the connection handle returned in this situation as normal.

## C invocation

```
MQCONN (QMgrName, &Hconn, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQCHAR48  QMgrName;  /* Name of queue manager */
MQHCONN   Hconn;     /* Connection handle */
MQLONG    CompCode;  /* Completion code */
MQLONG    Reason;    /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQCONN' USING QMGRNAME, HCONN, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Name of queue manager
 01  QMGRNAME  PIC X(48).
**   Connection handle
 01  HCONN     PIC S9(9) BINARY.
**   Completion code
 01  COMPCODE  PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON    PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQCONN (QMgrName, Hconn, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl QMgrName  char(48);       /* Name of queue manager */
dcl Hconn     fixed bin(31);  /* Connection handle */
dcl CompCode  fixed bin(31);  /* Completion code */
dcl Reason    fixed bin(31);  /* Reason code qualifying CompCode */
```

## High Level Assembler invocation

```
CALL MQCONN,(QMGRNAME,HCONN,COMPCODE,REASON)
```

Declare the parameters as follows:

```
QMGRNAME  DS  CL48  Name of queue manager
HCONN     DS  F     Connection handle
COMPCODE  DS  F     Completion code
REASON    DS  F     Reason code qualifying COMPCODE
```

### Visual Basic invocation

```
MQCONN QMgrName, Hconn, CompCode, Reason
```

Declare the parameters as follows:

```
Dim QMgrName As String*48 'Name of queue manager'
Dim Hconn    As Long      'Connection handle'
Dim CompCode As Long      'Completion code'
Dim Reason   As Long      'Reason code qualifying CompCode'
```

## MQCONNX - Connect queue manager (extended)

The MQCONNX call connects an application program to a queue manager. It provides a queue manager connection handle, which is used by the application on subsequent IBM MQ calls.

The MQCONNX call is like the MQCONN call, except that MQCONNX allows options to be specified to control the way that the call works.

- This call is supported on all IBM MQ systems, and IBM MQ clients connected to these systems.
- On IBM i, this call is not supported for applications running in compatibility mode.

A client connection cannot be made on a server only installation, and a local connection cannot be made on a client only installation.

### Syntax

MQCONNX (*QMgrName*, *ConnectOpts*, *Hconn*, *CompCode*, *Reason*)

### Parameters

***QMgrName***
Type: MQCHAR48 - input

See the *QMgrName* parameter described in “MQCONN - Connect queue manager” on page 641 for details.

***ConnectOpts***
Type: MQCNO - input/output

See “MQCNO - Connect options” on page 310 for details.

***Hconn***
Type: MQHCONN - output

This handle represents the connection to the queue manager. Specify it on all subsequent message queuing calls issued by the application. It ceases to be valid when the MQDISC call is issued, or when the unit of processing that defines the scope of the handle terminates.

IBM MQ now supplies the mqm library with client packages as well as server packages. This means that when an MQI call that is found in the mqm library is made, the connection type is checked to see if it is a client or server connection, and then the correct underlying call is made. Therefore an exit which is passed an *Hconn* can now be linked against the mqm library, but used on a client installation.

*Handle scope*: The scope of the handle returned depends on the call used to connect to the queue manager (MQCONN or MQCONNX). If the call used is MQCONNX, the scope of the handle also depends on the MQCNO_HANDLE_SHARE_* option specified in the *Options* field of the MQCNO structure.

- If the call is MQCONN, or the MQCNO_HANDLE_SHARE_NONE option is specified, the handle returned is a *nonshared* handle.

The scope of a nonshared handle is the smallest unit of parallel processing supported by the platform on which the application is running (see Table 553 on page 650 for details); the handle is not valid outside the unit of parallel processing from which the call was issued.

- If you specify the MQCNO_HANDLE_SHARE_BLOCK or MQCNO_HANDLE_SHARE_NO_BLOCK option, the handle returned is a *shared* handle.

  The scope of a shared handle is the process that owns the thread from which the call was issued; the handle can be used from any thread that belongs to that process. Not all platforms support threads.

- If the MQCONN or MQCONNX call fails with completion code equal to MQCC_FAILED, then the Hconn value is undefined.

*Table 553. Scope of nonshared handles on various platforms*

| Platform | Scope of nonshared handle |
|---|---|
| z/OS | • CICS: the CICS task<br>• IMS: the task, up to the next sync point (excluding subtasks of the task)<br>• z/OS batch and TSO: the task (excluding subtasks of the task) |
| IBM i | Job |
| UNIX systems | Thread |
| 16 bit Windows applications | Process |
| 32 bit Windows applications | Thread |

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the value returned is:

**MQHC_DEF_HCONN**
Default connection handle.

***CompCode***
Type: MQLONG - output

See the *CompCode* parameter described in "MQCONN - Connect queue manager" on page 641 for details.

***Reason***
Type: MQLONG - output

The following codes can be returned by the MQCONN and MQCONNX calls. For a list of additional codes that can be returned by the MQCONNX call, see the following codes.

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_WARNING:

**MQRC_ALREADY_CONNECTED**
(2002, X'7D2') Application already connected.

**MQRC_CLUSTER_EXIT_LOAD_ERROR**
(2267, X'8DB') Unable to load cluster workload exit.

**MQRC_SSL_ALREADY_INITIALIZED**
(2391, X'957') SSL already initialized.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_CONN_LOAD_ERROR**
(2129, X'851') Unable to load adapter connection module.

**MQRC_ADAPTER_DEFS_ERROR**
(2131, X'853') Adapter subsystem definition module not valid.

**MQRC_ADAPTER_DEFS_LOAD_ERROR**
(2132, X'854') Unable to load adapter subsystem definition module.

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'89C') Adapter not available.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_ADAPTER_STORAGE_SHORTAGE**
(2127, X'84F') Insufficient storage for adapter.

**MQRC_ANOTHER_Q_MGR_CONNECTED**
(2103, X'837') Another queue manager already connected.

**MQRC_API_EXIT_ERROR**
(2374, X'946') API exit failed.

**MQRC_API_EXIT_INIT_ERROR**
(2375, X'947') API exit initialization failed.

**MQRC_API_EXIT_TERM_ERROR**
(2376, X'948') API exit termination failed.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_BUFFER_LENGTH_ERROR**
(2005, X'7D5') Buffer length parameter not valid.

**MQRC_CALL_IN_PROGRESS**
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC_CONN_ID_IN_USE**
(2160, X'870') Connection identifier already in use.

**MQRC_CONNECTION_BROKEN**
(2009, X'7D9') Connection to queue manager lost.

**MQRC_CONNECTION_ERROR**
(2273, X'8E1') Error processing MQCONN call.

**MQRC_CONNECTION_NOT_AVAILABLE**
(2568, X'A08') Occurs on an MQCONN or MQCONNX call when the queue manager is unable to provide a connection of the requested connection type on the current installation. A client connection cannot be made on a server only installation. A local connection cannot be made on a client only installation.

**MQRC_CONNECTION_QUIESCING**
(2202, X'89A') Connection quiescing.

**MQRC_CONNECTION_STOPPING**
(2203, X'89B') Connection shutting down.

**MQRC_CRYPTO_HARDWARE_ERROR**
(2382, X'94E') Cryptographic hardware configuration error.

**MQRC_DUPLICATE_RECOV_COORD**
(2163, X'873') Recovery coordinator exists.

**MQRC_ENVIRONMENT_ERROR**
(2012, X'7DC') Call not valid in environment.

Additionally, on the MQCONNX call, passing the "MQCSP - Security parameters" on page 325 control block from a CICS or IMS application.

**MQRC_HCONN_ERROR**
(2018, X'7E2') Connection handle not valid.

**MQRC_HOST_NOT_AVAILABLE**
(2538, X'9EA') An MQCONN call was issued from a client to connect to a queue manager but the attempt to allocate a conversation to the remote system failed.

**MQRC_INSTALLATION_MISMATCH**
(2583, X'A17') Mismatch between queue manager installation and selected library.

**MQRC_KEY_REPOSITORY_ERROR**
(2381, X'94D') Key repository not valid.

**MQRC_MAX_CONNS_LIMIT_REACHED**
(2025, X'7E9') Maximum number of connections reached.

**MQRC_NOT_AUTHORIZED**
(2035, X'7F3') Not authorized for access.

**MQRC_OPEN_FAILED**
(2137, X'859') Object not opened successfully.

**MQRC_Q_MGR_NAME_ERROR**
(2058, X'80A') Queue manager name not valid or not known.

**MQRC_Q_MGR_NOT_AVAILABLE**
(2059, X'80B') Queue manager not available for connection.

**MQRC_Q_MGR_QUIESCING**
(2161, X'871') Queue manager quiescing.

**MQRC_Q_MGR_STOPPING**
(2162, X'872') Queue manager shutting down.

**MQRC_RESOURCE_PROBLEM**
(2102, X'836') Insufficient system resources available.

**MQRC_SECURITY_ERROR**
(2063, X'80F') Security error occurred.

**MQRC_SSL_INITIALIZATION_ERROR**
(2393, X'959') SSL initialization error.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

The following additional reason codes can be returned by the MQCONNX call:

If *CompCode* is MQCC_FAILED:

**MQRC_AIR_ERROR**
(2385, X'951') Authentication information record not valid.

**MQRC_AUTH_INFO_CONN_NAME_ERROR**
(2387, X'953') Authentication information connection name not valid.

**MQRC_AUTH_INFO_REC_COUNT_ERROR**
(2383, X'94F') Authentication information record count not valid.

**MQRC_AUTH_INFO_REC_ERROR**
(2384, X'950') Authentication information record fields not valid.

**MQRC_AUTH_INFO_TYPE_ERROR**
(2386, X'952') Authentication information type not valid.

**MQRC_CD_ERROR**
(2277, X'8E5') Channel definition not valid.

**MQRC_CLIENT_CONN_ERROR**
(2278, X'8E6') Client connection fields not valid.

**MQRC_CNO_ERROR**
(2139, X'85B') Connect-options structure not valid.

**MQRC_CONN_TAG_IN_USE**
(2271, X'8DF') Connection tag in use.

**MQRC_CONN_TAG_NOT_USABLE**
(2350, X'92E') Connection tag not usable.

**MQRC_LDAP_PASSWORD_ERROR**
(2390, X'956') LDAP password not valid.

**MQRC_LDAP_USER_NAME_ERROR**
(2388, X'954') LDAP user name fields not valid.

**MQRC_LDAP_USER_NAME_LENGTH_ERR**
(2389, X'955') LDAP user name length not valid.

**MQRC_OPTIONS_ERROR**
(2046, X'7FE') Options not valid or not consistent.

**MQRC_SCO_ERROR**
(2380, X'94C') SSL configuration options structure not valid.

**MQRC_SSL_CONFIG_ERROR**
(2392, X'958') SSL configuration error.

For detailed information about these codes, see Messages and reason codes.

## Usage notes

For the Visual Basic programming language, the following point applies:

- The *ConnectOpts* parameter is declared as being of type MQCNO. If the application is running as an IBM MQ MQI client, and you want to specify the parameters of the client-connection channel, declare the *ConnectOpts* parameter as being of type Any, so that the application can specify an MQCNOCD structure on the call in place of an MQCNO structure. However, this means that the *ConnectOpts* parameter cannot be checked to ensure that it is the correct data type.

## C invocation

```
MQCONNX (QMgrName, &ConnectOpts, &Hconn, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQCHAR48  QMgrName;     /* Name of queue manager */
MQCNO     ConnectOpts;  /* Options that control the action of MQCONNX */
MQHCONN   Hconn;        /* Connection handle */
MQLONG    CompCode;     /* Completion code */
MQLONG    Reason;       /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQCONNX' USING QMGRNAME, CONNECTOPTS, HCONN, COMPCODE,
REASON.
```

Declare the parameters as follows:

```
**   Name of queue manager
 01  QMGRNAME     PIC X(48).
**   Options that control the action of MQCONNX
 01  CONNECTOPTS.
     COPY CMQCNOV.
**   Connection handle
```

```
 01  HCONN        PIC S9(9) BINARY.
**   Completion code
 01  COMPCODE     PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON       PIC S9(9) BINARY.
```

### PL/I invocation

```
call MQCONNX (QMgrName, ConnectOpts, Hconn, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl QMgrName     char(48);       /* Name of queue manager */
dcl ConnectOpts  like MQCNO;     /* Options that control the action of
                                    MQCONNX */
dcl Hconn        fixed bin(31);  /* Connection handle */
dcl CompCode     fixed bin(31);  /* Completion code */
dcl Reason       fixed bin(31);  /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
CALL MQCONNX,(QMGRNAME,CONNECTOPTS,HCONN,COMPCODE,REASON)
```

Declare the parameters as follows:

```
QMGRNAME     DS       CL48  Name of queue manager
CONNECTOPTS  CMQCNOA  ,     Options that control the action of MQCONNX
HCONN        DS       F     Connection handle
COMPCODE     DS       F     Completion code
REASON       DS       F     Reason code qualifying COMPCODE
```

### Visual Basic invocation

```
MQCONNX QMgrName, ConnectOpts, Hconn, CompCode, Reason
```

Declare the parameters as follows:

```
Dim QMgrName    As String*48 'Name of queue manager'
Dim ConnectOpts As MQCNO     'Options that control the action of'
                             'MQCONNX'
Dim Hconn       As Long      'Connection handle'
Dim CompCode    As Long      'Completion code'
Dim Reason      As Long      'Reason code qualifying CompCode'
```

## MQCRTMH - Create message handle

The MQCRTMH call returns a message handle.

An application can use the MQCRTMH call on subsequent message queuing calls:

- Use the MQSETMP call to set a property of the message handle.
- Use the MQINQMP call to inquire on the value of a property of the message handle.
- Use the MQDLTMP call to delete a property of the message handle.

The message handle can be used on the MQPUT and MQPUT1 calls to associate the properties of the message handle with those of the message being put. Similarly by specifying a message handle on the MQGET call, the properties of the message being retrieved can be accessed using the message handle when the MQGET call completes.

Use MQDLTMH to delete the message handle.

## Syntax

MQCRTMH (*Hconn*, *CrtMsgHOpts*, *Hmsg*, *CompCode*, *Reason*)

## Parameters

***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call. If the connection to the queue manager ceases to be valid and no IBM MQ call is operating on the message handle, MQDLTMH is implicitly called to delete the message.

Alternatively, you can specify the following value:

**MQHC_UNASSOCIATED_HCONN**
The connection handle does not represent a connection to any particular queue manager.

When this value is used, the message handle must be deleted with an explicit call to MQDLTMH in order to release any storage allocated to it; IBM MQ never implicitly deletes the message handle.

There must be at least one valid connection to a queue manager established on the thread creating the message handle, otherwise the call fails with MQRC_HCONN_ERROR.

In an environment with multiple installations on a single system, the MQHC_UNASSOCIATED_HCONN value is limited to use with the first installation loaded into the process. The reason code MQRC_HMSG_NOT_AVAILABLE is returned if the message handle is supplied to a different installation.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and you can specify the following value for *Hconn* :

**MQHC_DEF_CONN**
Default connection handle

**Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

***CrtMsgHOpts***

Type: MQCMHO - input

The options that control the action of MQCRTMH. See MQCMHO for details.

***Hmsg***

Type: MQHMSG - output

On output a message handle is returned that can be used to set, inquire, and delete properties of the message handle. Initially the message handle contains no properties.

A message handle also has an associated message descriptor. Initially this contains the default values. The values of the associated message descriptor fields can be set and inquired using the MQSETMP and MQINQMP calls. The MQDLTMP call resets a field of the message descriptor back to its default value.

If the *Hconn* parameter is specified as the value MQHC_UNASSOCIATED_HCONN then the returned message handle can be used on MQGET, MQPUT, or MQPUT1 calls with any connection within the unit of processing, but can only be in use by one IBM MQ call at a time. If the handle is in use when a second IBM MQ call attempts to use the same message handle, the second IBM MQ call fails with reason code MQRC_MSG_HANDLE_IN_USE.

If the *Hconn* parameter is not MQHC_UNASSOCIATED_HCONN then the returned message handle can only be used on the specified connection.

The same *Hconn* parameter value must be used on the subsequent MQI calls where this message handle is used:

- MQDLTMH
- MQSETMP
- MQINQMP
- MQDLTMP
- MQMHBUF
- MQBUFMH

The returned message handle ceases to be valid when the MQDLTMH call is issued for the message handle, or when the unit of processing that defines the scope of the handle terminates. MQDLTMH is called implicitly if a specific connection is supplied when the message handle is created and the connection to the queue manager ceases to be valid, for example, if MQDBC is called.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'089C') Adapter not available.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_CALL_IN_PROGRESS**
(2219, X'08AB') MQI call entered before previous call completed.

**MQRC_CMHO_ERROR**
(2461, X'099D') Create message handle options structure not valid.

**MQRC_CONNECTION_BROKEN**
(2273, X'7D9') Connection to queue manager lost.

**MQRC_HANDLE_NOT_AVAILABLE**
(2017, X'07E1') No more handles available.

**MQRC_HCONN_ERROR**
(2018, X'7E2') Connection handle not valid.

**MQRC_HMSG_ERROR**
(2460, X'099C') Message handle pointer not valid.

**MQRC_OPTIONS_ERROR**
(2046, X'07FE') Options not valid or not consistent.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Messages and reason codes.

## C

```
MQCRTMH (Hconn, &CrtMsgHOpts, &Hmsg, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;       /* Connection handle */
MQCMHO   CrtMsgHOpts; /* Options that control the action of MQCRTMH */
MQHMSG   Hmsg;        /* Message handle */
MQLONG   CompCode;    /* Completion code */
MQLONG   Reason;      /* Reason code qualifying CompCode */
```

## COBOL

```
CALL 'MQCRTMH' USING HCONN, CRTMSGOPTS, HMSG, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN     PIC S9(9) BINARY.
**   Options that control the action of MQCRTMH
 01  CRTMSGHOPTS.
     COPY CMQCMHOV.
**   Message handle
 01  HMSG    PIC S9(18) BINARY.
**   Completion code
 01  COMPCODE  PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON    PIC S9(9) BINARY.
```

## PL/I

```
call MQCRTMH (Hconn, CrtMsgHOpts, Hmsg, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn       fixed bin(31);  /* Connection handle */
dcl CrtMsgHOpts like MQCMHO;    /* Options that control the action of MQCRTMH */
dcl Hmsg        fixed bin(63);  /* Message handle */
dcl CompCode    fixed bin(31);  /* Completion code */
dcl Reason      fixed bin(31);  /* Reason code qualifying CompCode */
```

## High Level Assembler

```
CALL MQCRTMH,(HCONN,CRTMSGHOPTS,HMSG,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN          DS        F  Connection handle
CRTMSGHOPTS    CMQCMHOA  ,  Options that control the action of MQCRTMH
```

```
HMSG            DS        D  Message handle
COMPCODE        DS        F  Completion code
REASON          DS        F  Reason code qualifying COMPCODE
```

## MQCTL - Control callbacks

The MQCTL call performs controlling actions on callbacks and the object handles opened for a connection.

### Syntax

MQCTL (*Hconn*, *Operation*, *ControlOpts*, *CompCode*, *Reason*)

### Parameters

***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and you can specify the following special value for *Hconn* :

**MQHC_DEF_HCONN**
Default connection handle.

**Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

***Operation***

Type: MQLONG - input

The operation being processed on the callback defined for the specified object handle. You must specify one, and one only, of the following options:

**MQOP_START**

Start the consuming of messages for all defined message consumer functions for the specified connection handle.

Callbacks run on a thread started by the system, which is different from any of the application threads.

This operation gives control of the provided connection handle to system. The only MQI calls which can be issued by a thread other than the consumer thread are:

- MQCTL with Operation MQOP_STOP
- MQCTL with Operation MQOP_SUSPEND
- MQDISC - Performs MQCTL with Operation MQOP_STOP before disconnection the HConn.

MQRC_HCONN_ASYNC_ACTIVE is returned if an IBM MQ API call is issued while the connection handle is started, and the call does not originate from a message consumer function.

If a message consumer stops the connection during the MQCBCT_START_CALL then the MQCTL call returns with a failure reason code of MQRC_CONNECTION_STOPPED.

This can be issued in a consumer function. For the same connection as the callback routine, its only purpose is to cancel a previously issued MQOP_STOP operation.

This option is not supported in the following environments: CICS on z/OS or if the application is bound with a nonthreaded IBM MQ library.

**MQOP_START_WAIT**
Start the consuming of messages for all defined message consumer functions for the specified connection handle.

Message consumers run on the same thread and control is not returned to the caller of MQCTL until:

- Released by the use of the MQCTL MQOP_STOP or MQOP_SUSPEND operations, or
- All consumer routines have been deregistered or suspended.

If all consumers are deregistered or suspended, an implicit MQOP_STOP operation is issued.

This option cannot be used from within a callback routine, either for the current connection handle or any other connection handle. If the call is attempted it returns with MQRC_ENVIRONMENT_ERROR.

If, at any time during an MQOP_START_WAIT operation there are no registered, non-suspended consumers the call fails with a reason code of MQRC_NO_CALLBACKS_ACTIVE.

If, during an MQOP_START_WAIT operation, the connection is suspended, the MQCTL call returns a warning reason code of MQRC_CONNECTION_SUSPENDED; the connection remains 'started'.

The application can choose to issue MQOP_STOP or MQOP_RESUME. In this instance, the MQOP_RESUME operation blocks.

This option is not supported in a single threaded client.

**MQOP_STOP**
Stop the consuming of messages, and wait for all consumers to complete their operations before this option completes. This operation releases the connection handle.

If issued from within a callback routine, this option does not take effect until the routine exits. No more message consumer routines are called after the consumer routines for messages already read have completed, and after stop calls (if requested) to callback routines have been made.

If issued outside a callback routine, control does not return to the caller until the consumer routines for messages already read have completed, and after stop calls (if requested) to callbacks have been made. The callbacks themselves, however, remain registered.

This function has no effect on read ahead messages. You must ensure that consumers run MQCLOSE(MQCO_QUIESCE), from within the callback function, to determine whether there are any further messages available to be delivered.

**MQOP_SUSPEND**
Pause the consuming of messages. This operation releases the connection handle.

This does not have any effect on the reading ahead of messages for the application. If you intend to stop consuming messages for a long time, consider closing the queue and reopening it when consumption continues.

If issued from within a callback routine, it does not take effect until the routine exits. No more message consumer routines will be called after the current routine exits.

If issued outside a callback, control does not return to the caller until the current consumer routine has completed and no more are called.

**MQOP_RESUME**
Resume the consuming of messages.

This option is normally issued from the main application thread, but it can also be used from within a callback routine to cancel an earlier suspension request issued in the same routine.

If the MQOP_RESUME is used to resume an MQOP_START_WAIT then the operation blocks.

***ControlOpts***
Type: MQCTLO - input

Options that control the action of MQCTL

See MQCTLO for details of the structure.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_WARNING**
Warning (partial completion).

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_CONV_LOAD_ERROR**
(2133, X'855') Unable to load data conversion services modules.

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'89C') Adapter not available.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_API_EXIT_ERROR**
(2374, X'946') API exit failed.

**MQRC_API_EXIT_LOAD_ERROR**
(2183, X'887') Unable to load API exit.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_BUFFER_LENGTH_ERROR**
(2005, X'7D5') Buffer length parameter not valid.

**MQRC_CALLBACK_LINK_ERROR**
(2487, X'9B7') Unable to call the callback routine

**MQRC_CALLBACK_NOT_ REGISTERED**
(2448, X'990') Unable to Deregister, Suspend, or Resume because there is no registered callback

**MQRC_CALLBACK_ROUTINE_ERROR**
(2486, X'9B6') Either, both CallbackFunction and CallbackName have been specified on an MQOP_REGISTER call.

Or either CallbackFunction or CallbackName have been specified but does not match the currently registered callback function.

**MQRC_CALLBACK_TYPE_ERROR**
(2483, X'9B3') Incorrect CallBackType field.

**MQRC_CALL_IN_PROGRESS**
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC_CBD_ERROR**
(2444, X'98C') Option block is incorrect.

**MQRC_CBD_OPTIONS_ERROR**
(2484, X'9B4') Incorrect MQCBD options field.

**MQRC_CICS_WAIT_FAILED**
(2140, X'85C') Wait request rejected by CICS.

**MQRC_CONNECTION_BROKEN**
(2009, X'7D9') Connection to queue manager lost.

**MQRC_CONNECTION_NOT_AUTHORIZED**
(2217, X'8A9') Not authorized for connection.

**MQRC_CONNECTION_QUIESCING**
(2202, X'89A') Connection quiescing.

**MQRC_CONNECTION_STOPPING**
(2203, X'89B') Connection shutting down.

**MQRC_CORREL_ID_ERROR**
(2207, X'89F') Correlation-identifier error.

**MQRC_FUNCTION_NOT_SUPPORTED**
(2298, X'8FA') The function requested is not available in the current environment.

**MQRC_GET_INHIBITED**
(2016, X'7E0') Gets inhibited for the queue.

**MQRC_GLOBAL_UOW_CONFLICT**
(2351, X'92F') Global units of work conflict.

**MQRC_GMO_ERROR**
(2186, X'88A') Get-message options structure not valid.

**MQRC_HANDLE_IN_USE_FOR_UOW**
(2353, X'931') Handle in use for global unit of work.

**MQRC_HCONN_ERROR**
(2018, X'7E2') Connection handle not valid.

**MQRC_HOBJ_ERROR**
(2019, X'7E3') Object handle not valid.

**MQRC_INCONSISTENT_BROWSE**
(2259, X'8D3') Inconsistent browse specification.

**MQRC_INCONSISTENT_UOW**
(2245, X'8C5') Inconsistent unit-of-work specification.

**MQRC_INVALID_MSG_UNDER_CURSOR**
(2246, X'8C6') Message under cursor not valid for retrieval.

**MQRC_LOCAL_UOW_CONFLICT**
(2352, X'930') Global unit of work conflicts with local unit of work.

**MQRC_MATCH_OPTIONS_ERROR**
(2247, X'8C7') Match options not valid.

**MQRC_MAX_MSG_LENGTH_ERROR**
(2485, X'9B5') Incorrect MaxMsgLength field

**MQRC_MD_ERROR**
(2026, X'7EA') Message descriptor not valid.

**MQRC_MODULE_ENTRY_NOT_FOUND**
(2497, X'9C1')The specified function entry point could not be found in the module.

**MQRC_MODULE_INVALID**
(2496, X'9C0') Module is found but is of the wrong type (32 bit/64 bit) or is not a valid dll.

**MQRC_MODULE_NOT_FOUND**
(2495, X'9BF') Module not found in the search path or not authorized to load.

**MQRC_MSG_ID_ERROR**
(2206, X'89E') Message-identifier error.

**MQRC_MSG_SEQ_NUMBER_ERROR**
(2250, X'8CA') Message sequence number not valid.

**MQRC_MSG_TOKEN_ERROR**
(2331, X'91B') Use of message token not valid.

**MQRC_NOT_OPEN_FOR_BROWSE**
(2036, X'7F4') Queue not open for browse.

**MQRC_NOT_OPEN_FOR_INPUT**
(2037, X'7F5') Queue not open for input.

**MQRC_OBJECT_CHANGED**
(2041, X'7F9') Object definition changed since opened.

**MQRC_OBJECT_DAMAGED**
(2101, X'835') Object damaged.

**MQRC_OPERATION_ERROR**
(2488, X'9B8') Incorrect Operation code on API Call

**MQRC_OPTIONS_ERROR**
(2046, X'7FE') Options not valid or not consistent.

**MQRC_PAGESET_ERROR**
(2193, X'891') Error accessing page-set data set.

**MQRC_Q_DELETED**
(2052, X'804') Queue has been deleted.

**MQRC_Q_INDEX_TYPE_ERROR**
(2394, X'95A') Queue has wrong index type.

**MQRC_Q_MGR_NAME_ERROR**
(2058, X'80A') Queue manager name not valid or not known.

**MQRC_Q_MGR_NOT_AVAILABLE**
(2059, X'80B') Queue manager not available for connection.

**MQRC_Q_MGR_QUIESCING**
(2161, X'871') Queue manager quiescing.

**MQRC_Q_MGR_STOPPING**
(2162, X'872') Queue manager shutting down.

**MQRC_RESOURCE_PROBLEM**
(2102, X'836') Insufficient system resources available.

**MQRC_SIGNAL_OUTSTANDING**
(2069, X'815') Signal outstanding for this handle.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_SUPPRESSED_BY_EXIT**
(2109, X'83D') Call suppressed by exit program.

**MQRC_SYNCPOINT_NOT_AVAILABLE**
(2072, X'818') Syncpoint support not available.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

**MQRC_UOW_ENLISTMENT_ERROR**
(2354, X'932') Enlistment in global unit of work failed.

**MQRC_UOW_MIX_NOT_SUPPORTED**
(2355, X'933') Mixture of unit-of-work calls not supported.

**MQRC_UOW_NOT_AVAILABLE**
(2255, X'8CF') Unit of work not available for the queue manager to use.

**MQRC_WAIT_INTERVAL_ERROR**
(2090, X'82A') Wait interval in MQGMO not valid.

**MQRC_WRONG_GMO_VERSION**
(2256, X'8D0') Wrong version of MQGMO supplied.

**MQRC_WRONG_MD_VERSION**
(2257, X'8D1') Wrong version of MQMD supplied.

For detailed information about these codes, see Messages and reason codes.

## Usage notes

1. Callback routines must check the responses from all services they invoke, and if the routine detects a condition that cannot be resolved, it must issue an MQCB MQOP_DEREGISTER command to prevent repeated calls to the callback routine.
2. If you are using asynchronous consume in an application where an XA Transaction Manager is managing global transactions, including updates to IBM MQ, you need to consider the following additional points:
   a. It is not valid to call MQCTL(MQOP_START) for an **HConn**, after it has been created, after calling **xa_open**.

      The reason is, that the **HConn** has become attached to an XA context, and so cannot then be accessed on the separate thread, or threads, in use by the asynchronous consume mechanism.
   b. If you call MQCTL(MQOP_START) in that scenario the call fails with reason code MQRC_ASYNC_XA_CONFLICT (2350).
   c. It is valid to call MQCTL(MQOP_START_WAIT) for an **HConn**, after it has been created, after calling **xa_open**.

      The reason is, that this method of starting the asynchronous consume mechanism causes all further callbacks for the **HConn** to run on the thread where the MQCTL call is made. Therefore, the link between the **HConn** and the thread is not lost.
3. z/OS On z/OS, when Operation is MQOP_START:
   - Programs which use asynchronous callback routines must be authorized to use z/OS UNIX System Services (USS).
   - Language Environment (LE) programs which use asynchronous callback routines must use the LE runtime option POSIX(ON).
   - Non-LE programs which use asynchronous callback routines must not use the USS pthread_create interface (callable service BPX1PTC).
4. z/OS MQCTL is not supported within the IMS adapter.

**Note:** In CICS, MQOP_START is not supported. Instead, use the MQOP_START_WAIT function call.

## C invocation

```
MQCTL (Hconn, Operation, &ControlOpts, &CompCode, &Reason)
```

Declare the parameters as follows:

```
MQHCONN  Hconn;         /* Connection handle */
MQLONG   Operation;     /* Operation being processed */
MQCTLO   ControlOpts    /* Options that control the action of MQCTL */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQCTL' USING HCONN, OPERATION, CTLOPTS, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN    PIC S9(9) BINARY.
**   Operation
 01  OPERATION PIC S9(9) BINARY.
**   Control Options
 01  CTLOPTS.
     COPY CMQCTLOV.
**   Completion code
 01  COMPCODE PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON   PIC S9(9) BINARY.
```

### PL/I invocation

```
call MQCTL(Hconn, Operation, CtlOpts, CompCode, Reason)
```

Declare the parameters as follows:

```
dcl Hconn        fixed bin(31); /* Connection handle */
dcl Operation    fixed bin(31); /* Operation */
dcl CtlOpts like MQCTLO;        /* Options that control the action of MQCTL */
dcl CompCode     fixed bin(31); /* Completion code */
dcl Reason       fixed bin(31); /* Reason code qualifying CompCode */
```

## MQDISC - Disconnect queue manager

The MQDISC call breaks the connection between the queue manager and the application program, and is the inverse of the MQCONN or MQCONNX call.

- On z/OS, all applications that use asynchronous message consumption, event handling or callback, the main control thread must issue an MQDISC call before ending. See Asynchronous consumption of IBM MQ messages for more details.
- On z/OS, CICS applications do not need to issue this call to disconnect from the queue manager.

  If a CICS application does make this call it has no effect unless an earlier MQCONNX call was made, specifying one of the:

  MQCNO_SERIALIZE_CONN_TAG_Q_MGR
  MQCNO_SERIALIZE_CONN_TAG_QSG
  MQCNO_RESTRICT_CONN_TAG_Q_MGR or
  MQCNO_RESTRICT_CONN_TAG_QSG

  options, in which case all currently open object handles are closed.
- On IBM i, applications running in compatibility mode do not need to issue this call. See "MQCONN - Connect queue manager" on page 641 for more information.

  **Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

### Syntax

MQDISC (*Hconn*, *CompCode*, *Reason*)

### Parameters

***Hconn***
Type: MQHCONN - input/output

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, you can omit the MQCONN call, and specify the following value for *Hconn*:

**MQHC_DEF_HCONN**
Default connection handle.

On successful completion of the call, the queue manager sets *Hconn* to a value that is not a valid handle for the environment. This value is:

**MQHC_UNUSABLE_HCONN**
Unusable connection handle.

On z/OS, *Hconn* is set to a value that is undefined.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following codes:

**MQCC_OK**
Successful completion.

**MQCC_WARNING**
Warning (partial completion).

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_WARNING:

**MQRC_BACKED_OUT**
(2003, X'7D3') Unit of work backed out.

**MQRC_CONN_TAG_NOT_RELEASED**
(2344, X'928') Connection tag not released.

**MQRC_OUTCOME_PENDING**
(2124, X'84C') Result of commit operation is pending.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_DISC_LOAD_ERROR**
(2138, X'85A') Unable to load adapter disconnection module.

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'89C') Adapter not available.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_API_EXIT_ERROR**
(2374, X'946') API exit failed.

**MQRC_API_EXIT_INIT_ERROR**
(2375, X'947') API exit initialization failed.

**MQRC_API_EXIT_TERM_ERROR**
(2376, X'948') API exit termination failed.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_CALL_IN_PROGRESS**
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC_CONNECTION_BROKEN**
(2009, X'7D9') Connection to queue manager lost.

**MQRC_CONNECTION_STOPPING**
(2203, X'89B') Connection shutting down.

**MQRC_HCONN_ERROR**
(2018, X'7E2') Connection handle not valid.

**MQRC_OUTCOME_MIXED**
(2123, X'84B') Result of commit or back-out operation is mixed.

**MQRC_PAGESET_ERROR**
(2193, X'891') Error accessing page-set data set.

**MQRC_Q_MGR_NAME_ERROR**
(2058, X'80A') Queue manager name not valid or not known.

**MQRC_Q_MGR_NOT_AVAILABLE**
(2059, X'80B') Queue manager not available for connection.

**MQRC_Q_MGR_STOPPING**
(2162, X'872') Queue manager shutting down.

**MQRC_RESOURCE_PROBLEM**
(2102, X'836') Insufficient system resources available.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Messages and reason codes.

## Usage notes

1. If an MQDISC call is issued when the connection still has objects open under that connection, the queue manager closes those objects, with the close options set to MQCO_NONE.
2. If the application ends with uncommitted changes in a unit of work, the disposition of those changes depends on how the application ends:
   a. If the application issues the MQDISC call before ending:
      - For a queue-manager-coordinated unit of work, the queue manager issues the MQCMIT call on behalf of the application. The unit of work is committed if possible, and backed out if not.
      - For an externally coordinated unit of work, there is no change in the status of the unit of work; however, the queue manager typically indicates that the unit of work must be committed when asked by the unit-of-work coordinator.

        On z/OS, CICS, IMS (other than batch DL/1 programs), and RRS applications are like this.

   b. If the application ends normally but without issuing the MQDISC call, the action taken depends on the environment:
      - On z/OS, except for MQ Java or MQ JMS applications, the actions described in note 2a occur.
      - In all other cases, the actions described in note 2c occur.

      Because of the differences between environments, ensure that applications that you want to port either commit or back out the unit of work before they end.
   c. If the application ends *abnormally* without issuing the MQDISC call, the unit of work is backed out.
3. On z/OS, the following points apply:
   - CICS applications do not have to issue the MQDISC call to disconnect from the queue manager, because the CICS system itself connects to the queue manager, and the MQDISC call has no effect on this connection.

- CICS, IMS (other than batch DL/1 programs), and RRS applications use units of work that are coordinated by an external unit-of-work coordinator. As a result, the MQDISC call does not affect the status of the unit of work (if any) that exists when the call is issued.

  However the MQDISC call *does* indicate the end of use of the connection tag *ConnTag* that was associated with the connection by an earlier MQCONNX call issued by the application. If there is an active unit of work that references the connection tag when the MQDISC call is issued, the call completes with completion code MQCC_WARNING and reason code MQRC_CONN_TAG_NOT_RELEASED. The connection tag does not become available for reuse until the external unit-of-work coordinator has resolved the unit of work.

4. On IBM i, applications running in compatibility mode do not have to issue this call; see the MQCONN call for more details.

**Note:** In CICS, MQOP_START is not supported. Instead, use the MQOP_START_WAIT function call.

## C invocation

```
MQDISC (&Hconn, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;     /* Connection handle */
MQLONG   CompCode;  /* Completion code */
MQLONG   Reason;    /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQDISC' USING HCONN, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN     PIC S9(9) BINARY.
**   Completion code
 01  COMPCODE  PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON    PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQDISC (Hconn, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn     fixed bin(31);  /* Connection handle */
dcl CompCode  fixed bin(31);  /* Completion code */
dcl Reason    fixed bin(31);  /* Reason code qualifying CompCode */
```

## System/390 assembler invocation

```
CALL MQDISC,(HCONN,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN     DS  F  Connection handle
```

```
COMPCODE  DS  F  Completion code
REASON    DS  F  Reason code qualifying COMPCODE
```

### Visual Basic invocation

```
MQDISC Hconn, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Hconn    As Long 'Connection handle'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

## MQDLTMH - Delete message handle

The MQDLTMH call deletes a message handle and is the inverse of the MQCRTMH call.

### Syntax

MQDLTMH (*Hconn*, *Hmsg*, *DltMsgHOpts*, *CompCode*, *Reason*)

### Parameters

***Hconn***
Type: MQHCONN - input

This handle represents the connection to the queue manager.

The value must match the connection handle that was used to create the message handle specified in the *Hmsg* parameter.

If the message handle was created using MQHC_UNASSOCIATED_HCONN then a valid connection must be established on the thread deleting the message handle, otherwise the call fails with MQRC_CONNECTION_BROKEN.

***Hmsg***
Type: MQHMSG - input/output

This is the message handle to be deleted. The value was returned by a previous MQCRTMH call.

On successful completion of the call, the handle is set to an invalid value for the environment. This value is:

**MQHM_UNUSABLE_HMSG**
Unusable message handle.

The message handle cannot be deleted if another IBM MQ call is in progress that was passed the same message handle.

***DltMsgHOpts***
Type: MQDMHO - input

See MQDMHO for details.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'089C') Adapter not available.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_CALL_IN_PROGRESS**
(2219, X'08AB') MQI call entered before previous call completed.

**MQRC_CONNECTION_BROKEN**
(2009, X'07D9') Connection to queue manager lost.

**MQRC_DMHO_ERROR**
(2462, X'099E') Delete message handle options structure not valid.

**MQRC_HMSG_ERROR**
(2460, X'099C') Message handle pointer not valid.

**MQRC_MSG_HANDLE_IN_USE**
(2499, X'09C3') Message handle already in use.

**MQRC_OPTIONS_ERROR**
(2046, X'07FE') Options not valid or not consistent.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Messages and reason codes.

## C invocation

```
MQDLTMH (Hconn, &Hmsg, &DltMsgHOpts, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;       /* Connection handle */
MQHMSG   Hmsg;        /* Message handle */
MQDMHO   DltMsgHOpts; /* Options that control the action of MQDLTMH */
MQLONG   CompCode;    /* Completion code */
MQLONG   Reason;      /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQDLTMH' USING HCONN, HMSG, DLTMSGOPTS, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**  Connection handle
01   HCONN   PIC S9(9) BINARY.
```

```
**  Options that control the action of MQDLTMH
01   DLTMSGHOPTS.
COPY CMQDLMHOV.

**  Completion code
01  COMPCODE   PIC S9(9) BINARY.

** Reason code qualifying COMPCODE
01   REASON      PIC S9(9) BINARY.
```

### PL/I invocation

```
call MQDLTMH (Hconn, Hmsg, DltMsgHOpts, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn          /* Connection handle */
dcl Hmsg           /* Message handle */
dcl DltMsgHOpts like MQDMHO;    /* Options that control the action of MQDLTMH */
dcl CompCode       /* Completion code */
dcl Reason         /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
CALL MQDLTMH,(HCONN,HMSG,DLTMSGHOPTS,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN          DS        F  Connection handle
HMSG           DS        D  Message handle
DLTMSGHOPTS    CMQDMHOA  ,  Options that control the action of MQDLTMH
COMPCODE       DS        F  Completion code
REASON         DS        F  Reason code qualifying COMPCODE
```

## MQDLTMP - Delete message property

The MQDLTMP call deletes a property from a message handle and is the inverse of the MQSETMP call.

### Syntax

MQDLTMP (*Hconn*, *Hmsg*, *DltPropOpts*, *Name*, *CompCode*, *Reason*)

### Parameters

***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value must match the connection handle that was used to create the message handle specified in the *Hmsg* parameter.

If the message handle was created using MQHC_UNASSOCIATED_HCONN then a valid connection must be established on the thread deleting the message handle otherwise the call fails with MQRC_CONNECTION_BROKEN.

***Hmsg***

Type: MQHMSG - input

This is the message handle containing the property to be deleted. The value was returned by a previous MQCRTMH call.

***DltPropOpts***

Type: MQDMPO - input

See the MQDMPO data type for details.

***Name***
Type: MQCHARV - input

The name of the property to delete. See Property names for further information about property names.

Wildcards are not allowed in the property name.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_WARNING**
Warning (partial completion).

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_WARNING:

**MQRC_PROPERTY_NOT_AVAILABLE**
(2471, X'09A7') Property not available.

**MQRC_RFH_FORMAT_ERROR**
(2421, X'0975') An MQRFH2 folder containing properties could not be parsed.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'089C') Adapter not available.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'0852') Unable to load adapter service module.

**MQRC_ASID_MISMATCH**
(2157, X'086D') Primary and home ASIDs differ.

**MQRC_CALL_IN_PROGRESS**
(2219, X'08AB') MQI call entered before previous call completed.

**MQRC_CONNECTION_BROKEN**
(2009, X'07D9') Connection to queue manager lost.

**MQRC_DMPO_ERROR**
(2481, X'09B1') Delete message property options structure not valid.

**MQRC_HMSG_ERROR**
(2460, X'099C') Message handle not valid.

**MQRC_MSG_HANDLE_IN_USE**
(2499, X'09C3') Message handle already in use.

**MQRC_OPTIONS_ERROR**
(2046, X'07FE') Options not valid or not consistent.

**MQRC_PROPERTY_NAME_ERROR**
(2442, X'098A') Invalid property name.

**MQRC_SOURCE_CCSID_ERROR**
(2111, X'083F') Property name coded character set identifier not valid.

**MQRC_UNEXPECTED_ERROR**
(2195, X'0893') Unexpected error occurred.

For detailed information about these codes, see:

- Messages and reason codes for IBM MQ for z/OS
- API completion and reason codes for other IBM MQ platforms

.

## C invocation

```
MQDLTMP (Hconn, Hmsg, &DltPropOpts, &Name, &CompCode, &Reason)
```

Declare the parameters as follows:

```
MQHCONN Hconn;       /* Connection handle */
MQHMSG  Hmsg;        /* Message handle */
MQDMPO  DltPropOpts; /* Options that control the action of MQDLTMP */
MQCHARV Name;        /* Property name */
MQLONG  CompCode;    /* Completion code */
MQLONG  Reason;      /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQDLTMP' USING HCONN, HMSG, DLTPROPOPTS, NAME, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN    PIC S9(9) BINARY.
**   Message handle
 01  HMSG         PIC S9(18) BINARY.
**   Options that control the action of MQDLTMP
 01  DLTPROPOPTS.
     COPY CMQDMPOV.
**   Property name
 01  NAME
     COPY CMQCHRVV.
**   Completion code
 01  COMPCODE PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON   PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQDLTMP (Hconn, Hmsg, DltPropOpts, Name, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn       fixed bin(31); /* Connection handle */
dcl Hmsg        fixed bin(63); /* Message handle */
dcl DltPropOpts like MQDMPO;   /* Options that control the action of MQDLTMP */
dcl Name        like MQCHARV;  /* Property name */
dcl CompCode    fixed bin(31); /* Completion code */
dcl Reason      fixed bin(31); /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
CALL MQDLTMP,(HCONN,HMSG,DLTPROPOPTS,NAME,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN        DS         F     Connection handle
HMSG         DS         D     Message handle
DLTPROPOPTS  CMQDMPOA   ,     Options that control the action of MQDLTMP
NAME         CMQCHRVA   ,     Property name
COMPCODE     DS         F     Completion code
REASON       DS         F     Reason code qualifying COMPCODE
```

## MQGET - Get message

The MQGET call retrieves a message from a local queue that has been opened using the MQOPEN call.

### Syntax

MQGET (*Hconn*, *Hobj*, *MsgDesc*, *GetMsgOpts*, *BufferLength*, *Buffer*, *DataLength*, *CompCode*, *Reason*)

### Parameters

***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn* :

**MQHC_DEF_HCONN**
Default connection handle.

**Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

***Hobj***

Type: MQHOBJ - input

This handle represents the queue from which a message is to be retrieved. The value of *Hobj* was returned by a previous MQOPEN call. The queue must have been opened with one or more of the following options (see “MQOPEN - Open object” on page 711 for details):

- MQOO_INPUT_SHARED
- MQOO_INPUT_EXCLUSIVE
- MQOO_INPUT_AS_Q_DEF
- MQOO_BROWSE

***MsgDesc***

Type: MQMD - input/output

This structure describes the attributes of the message required, and the attributes of the message retrieved. See “MQMD - Message descriptor” on page 402 for details.

If *BufferLength* is less than the message length, *MsgDesc* is filled by the queue manager, whether MQGMO_ACCEPT_TRUNCATED_MSG is specified on the *GetMsgOpts* parameter (see MQGMO - Options field ).

If the application provides a version-1 MQMD, the message returned has an MQMDE prefixed to the application message data, but *only* if one or more of the fields in the MQMDE has a nondefault value. If all the fields in the MQMDE have default values, the MQMDE is omitted. A format name of MQFMT_MD_EXTENSION in the *Format* field in MQMD indicates that an MQMDE is present.

The application does not need to provide an MQMD structure if a valid message handle is supplied in the *MsgHandle* field. If nothing is provided in this field, the descriptor of the message is taken from the descriptor associated with the message handles.

If the application provides a message handle rather than an MQMD structure, and specifies MQGMO_PROPERTIES_FORCE_MQRFH2, the call fails with reason code MQRC_MD_ERROR. The call also fails, with reason code MQRC_MD_ERROR, if the application does not provide an MQMD structure and specifies MQGMO_PROPERTIES_AS_Q_DEF, and the *PropertyControl* queue attribute is MQPROP_FORCE_MQRFH2.

If match options are specified and the message descriptor associated with the message handle is being used, the input fields used for matching come from the message handle.

***GetMsgOpts***
Type: MQGMO - input/output

See "MQGMO - Get-message options" on page 355 for details.

***BufferLength***
Type: MQLONG - input

This is the length in bytes of the *Buffer* area. Specify zero for messages that have no data, or if the message is to be removed from the queue and the data discarded (you must specify MQGMO_ACCEPT_TRUNCATED_MSG in this case).

**Note:** The length of the longest message that it is possible to read from the queue is given by the *MaxMsgLength* queue attribute; see "Attributes for queues" on page 810.

***Buffer***
Type: MQBYTExBufferLength - output

This is the area to contain the message data. Align the buffer on a boundary appropriate to the nature of the data in the message. 4 byte alignment is suitable for most messages (including messages containing IBM MQ header structures), but some messages might require more stringent alignment. For example, a message containing a 64 bit binary integer might require 8-byte alignment.

If *BufferLength* is less than the message length, as much of the message as possible is moved into *Buffer* ; this happens whether MQGMO_ACCEPT_TRUNCATED_MSG is specified on the *GetMsgOpts* parameter (see MQGMO - Options field for more information).

The character set and encoding of the data in *Buffer* are given by the *CodedCharSetId* and *Encoding* fields returned in the *MsgDesc* parameter. If these values are different from the values required by the receiver, the receiver must convert the application message data to the character set and encoding required. The MQGMO_CONVERT option can be used (with a user-written exit if necessary) to convert the message data; see "MQGMO - Get-message options" on page 355 for details of this option.

**Note:** All the other parameters on the MQGET call are in the character set and encoding of the local queue manager (given by the *CodedCharSetId* queue-manager attribute and MQENC_NATIVE).

If the call fails, the contents of the buffer might still have changed.

In the C programming language, the parameter is declared as a pointer-to-void: the address of any type of data can be specified as the parameter.

If the *BufferLength* parameter is zero, *Buffer* is not referred to; in this case, the parameter address passed by programs written in C or System/390 assembler can be null.

***DataLength***
Type: MQLONG - output

This is the length in bytes of the application data *in the message*. If this value is greater than *BufferLength*, only *BufferLength* bytes are returned in the *Buffer* parameter (that is, the message is truncated). If the value is zero, the message contains no application data.

If *BufferLength* is less than the message length, *DataLength* is still completed by the queue manager, whether MQGMO_ACCEPT_TRUNCATED_MSG is specified on the *GetMsgOpts* parameter (see MQGMO - Options field for more information). This allows the application to determine the size of the buffer required to accommodate the message data, and then reissue the call with a buffer of the appropriate size.

However, if the MQGMO_CONVERT option is specified, and the converted message data is too long to fit in *Buffer*, the value returned for *DataLength* is:

- The length of the *unconverted* data, for queue-manager defined formats.

  In this case, if the nature of the data causes it to expand during conversion, the application must allocate a buffer bigger than the value returned by the queue manager for *DataLength*.
- The value returned by the data-conversion exit, for application-defined formats.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_WARNING**
Warning (partial completion).

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

The reason codes listed are the ones that the queue manager can return for the *Reason* parameter. If the application specifies the MQGMO_CONVERT option, and a user-written exit is invoked to convert some or all the message data, the exit decides what value is returned for the *Reason* parameter. As a result, values other than those values documented are possible.

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_WARNING:

**MQRC_CONVERTED_MSG_TOO_BIG**
(2120, X'848') Converted data too large for buffer.

**MQRC_CONVERTED_STRING_TOO_BIG**
(2190, X'88E') Converted string too large for field.

**MQRC_DBCS_ERROR**
(2150, X'866') DBCS string not valid.

**MQRC_FORMAT_ERROR**
(2110, X'83E') Message format not valid.

**MQRC_INCOMPLETE_GROUP**
(2241, X'8C1') Message group not complete.

**MQRC_INCOMPLETE_MSG**
(2242, X'8C2') Logical message not complete.

**MQRC_INCONSISTENT_CCSIDS**
(2243, X'8C3') Message segments have differing CCSIDs.

**MQRC_INCONSISTENT_ENCODINGS**
(2244, X'8C4') Message segments have differing encodings.

**MQRC_INCONSISTENT_UOW**
(2245, X'8C5') Inconsistent unit-of-work specification.

**MQRC_MSG_TOKEN_ERROR**
(2331, X'91B') Invalid use of message token.

**MQRC_NO_MSG_LOCKED**
(2209, X'8A1') No message locked.

**MQRC_NOT_CONVERTED**
(2119, X'847') Message data not converted.

**MQRC_OPTIONS_CHANGED**
(nnnn, X'xxx') Options that were required to be consistent have been changed.

**MQRC_PARTIALLY_CONVERTED**
(2272, X'8E0') Message data partially converted.

**MQRC_SIGNAL_REQUEST_ACCEPTED**
(2070, X'816') No message returned (but signal request accepted).

**MQRC_SOURCE_BUFFER_ERROR**
(2145, X'861') Source buffer parameter not valid.

**MQRC_SOURCE_CCSID_ERROR**
(2111, X'83F') Source coded character set identifier not valid.

**MQRC_SOURCE_DECIMAL_ENC_ERROR**
(2113, X'841') Packed-decimal encoding in message not recognized.

**MQRC_SOURCE_FLOAT_ENC_ERROR**
(2114, X'842') Floating-point encoding in message not recognized.

**MQRC_SOURCE_INTEGER_ENC_ERROR**
(2112, X'840') Source integer encoding not recognized.

**MQRC_SOURCE_LENGTH_ERROR**
(2143, X'85F') Source length parameter not valid.

**MQRC_TARGET_BUFFER_ERROR**
(2146, X'862') Target buffer parameter not valid.

**MQRC_TARGET_CCSID_ERROR**
(2115, X'843') Target coded character set identifier not valid.

**MQRC_TARGET_DECIMAL_ENC_ERROR**
(2117, X'845') Packed-decimal encoding specified by receiver not recognized.

**MQRC_TARGET_FLOAT_ENC_ERROR**
(2118, X'846') Floating-point encoding specified by receiver not recognized.

**MQRC_TARGET_INTEGER_ENC_ERROR**
(2116, X'844') Target integer encoding not recognized.

**MQRC_TRUNCATED_MSG_ACCEPTED**
(2079, X'81F') Truncated message returned (processing completed).

**MQRC_TRUNCATED_MSG_FAILED**
(2080, X'820') Truncated message returned (processing not completed).

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'89C') Adapter not available.

**MQRC_ADAPTER_CONV_LOAD_ERROR**
(2133, X'855') Unable to load data conversion services modules.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_API_EXIT_ERROR**
(2374, X'946') API exit failed.

**MQRC_API_EXIT_LOAD_ERROR**
(2183, X'887') Unable to load API exit.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_BACKED_OUT**
(2003, X'7D3') Unit of work backed out.

**MQRC_BUFFER_ERROR**
(2004, X'7D4') Buffer parameter not valid.

**MQRC_BUFFER_LENGTH_ERROR**
(2005, X'7D5') Buffer length parameter not valid.

**MQRC_CALL_IN_PROGRESS**
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC_CF_NOT_AVAILABLE**
(2345, X'929') Coupling facility not available.

**MQRC_CF_STRUC_FAILED**
(2373, X'945') Coupling-facility structure failed.

**MQRC_CF_STRUC_IN_USE**
(2346, X'92A') Coupling-facility structure in use.

**MQRC_CF_STRUC_LIST_HDR_IN_USE**
(2347, X'92B') Coupling-facility structure list-header in use.

**MQRC_CICS_WAIT_FAILED**
(2140, X'85C') Wait request rejected by CICS.

**MQRC_CONNECTION_BROKEN**
(2009, X'7D9') Connection to queue manager lost.

**MQRC_CONNECTION_NOT_AUTHORIZED**
(2217, X'8A9') Not authorized for connection.

**MQRC_CONNECTION_QUIESCING**
(2202, X'89A') Connection quiescing.

**MQRC_CONNECTION_STOPPING**
(2203, X'89B') Connection shutting down.

**MQRC_CORREL_ID_ERROR**
(2207, X'89F') Correlation-identifier error.

**MQRC_DATA_LENGTH_ERROR**
(2010, X'7DA') Data length parameter not valid.

**MQRC_DB2_NOT_AVAILABLE**
(2342, X'926') Db2 subsystem not available.

**MQRC_GET_INHIBITED**
(2016, X'7E0') Gets inhibited for the queue.

**MQRC_GLOBAL_UOW_CONFLICT**
(2351, X'92F') Global units of work conflict.

**MQRC_GMO_ERROR**
(2186, X'88A') Get-message options structure not valid.

**MQRC_HANDLE_IN_USE_FOR_UOW**
(2353, X'931') Handle in use for global unit of work.

**MQRC_HCONN_ERROR**
(2018, X'7E2') Connection handle not valid.

**MQRC_HOBJ_ERROR**
(2019, X'7E3') Object handle not valid.

**MQRC_INCONSISTENT_BROWSE**
(2259, X'8D3') Inconsistent browse specification.

**MQRC_INCONSISTENT_UOW**
(2245, X'8C5') Inconsistent unit-of-work specification.

**MQRC_INVALID_MSG_UNDER_CURSOR**
(2246, X'8C6') Message under cursor not valid for retrieval.

**MQRC_LOCAL_UOW_CONFLICT**
(2352, X'930') Global unit of work conflicts with local unit of work.

**MQRC_MATCH_OPTIONS_ERROR**
(2247, X'8C7') Match options not valid.

**MQRC_MD_ERROR**
(2026, X'7EA') Message descriptor not valid.

**MQRC_MSG_ID_ERROR**
(2206, X'89E') Message-identifier error.

**MQRC_MSG_SEQ_NUMBER_ERROR**
(2250, X'8CA') Message sequence number not valid.

**MQRC_MSG_TOKEN_ERROR**
(2331, X'91B') Use of message token not valid.

**MQRC_NO_MSG_AVAILABLE**
(2033, X'7F1') No message available.

**MQRC_NO_MSG_UNDER_CURSOR**
(2034, X'7F2') Browse cursor not positioned on message.

**MQRC_NOT_OPEN_FOR_BROWSE**
(2036, X'7F4') Queue not open for browse.

**MQRC_NOT_OPEN_FOR_INPUT**
(2037, X'7F5') Queue not open for input.

**MQRC_OBJECT_CHANGED**
(2041, X'7F9') Object definition changed since opened.

**MQRC_OBJECT_DAMAGED**
(2101, X'835') Object damaged.

**MQRC_OPTIONS_ERROR**
(2046, X'7FE') Options not valid or not consistent.

**MQRC_PAGESET_ERROR**
(2193, X'891') Error accessing page-set data set.

**MQRC_Q_DELETED**
(2052, X'804') Queue has been deleted.

**MQRC_Q_INDEX_TYPE_ERROR**
(2394, X'95A') Queue has wrong index type.

**MQRC_Q_MGR_NAME_ERROR**
(2058, X'80A') Queue manager name not valid or not known.

**MQRC_Q_MGR_NOT_AVAILABLE**
(2059, X'80B') Queue manager not available for connection.

**MQRC_Q_MGR_QUIESCING**
(2161, X'871') Queue manager quiescing.

**MQRC_Q_MGR_STOPPING**
(2162, X'872') Queue manager shutting down.

**MQRC_RESOURCE_PROBLEM**
(2102, X'836') Insufficient system resources available.

**MQRC_SECOND_MARK_NOT_ALLOWED**
(2062, X'80E') A message is already marked.

**MQRC_SIGNAL_OUTSTANDING**
(2069, X'815') Signal outstanding for this handle.

**MQRC_SIGNAL1_ERROR**
(2099, X'833') Signal field not valid.

**MQRC_STORAGE_MEDIUM_FULL**
(2192, X'890') External storage medium is full.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_SUPPRESSED_BY_EXIT**
(2109, X'83D') Call suppressed by exit program.

**MQRC_SYNCPOINT_LIMIT_REACHED**
(2024, X'7E8') No more messages can be handled within current unit of work.

**MQRC_SYNCPOINT_NOT_AVAILABLE**
(2072, X'818') sync point support not available.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

**MQRC_UOW_ENLISTMENT_ERROR**
(2354, X'932') Enlistment in global unit of work failed.

**MQRC_UOW_MIX_NOT_SUPPORTED**
(2355, X'933') Mixture of unit-of-work calls not supported.

**MQRC_UOW_NOT_AVAILABLE**
(2255, X'8CF') Unit of work not available for the queue manager to use.

**MQRC_WAIT_INTERVAL_ERROR**
(2090, X'82A') Wait interval in MQGMO not valid.

**MQRC_WRONG_GMO_VERSION**
(2256, X'8D0') Wrong version of MQGMO supplied.

**MQRC_WRONG_MD_VERSION**
(2257, X'8D1') Wrong version of MQMD supplied.

For detailed information about these codes, see Messages and reason codes.

## Usage notes

1. The message retrieved is normally deleted from the queue. This deletion can occur as part of the MQGET call itself, or as part of a sync point.

   The browse options are: MQGMO_BROWSE_FIRST, MQGMO_BROWSE_NEXT, and MQGMO_BROWSE_MSG_UNDER_CURSOR.

2. If the MQGMO_LOCK option is specified with one of the browse options, the browsed message is locked so that it is visible only to this handle.

   If the MQGMO_UNLOCK option is specified, a previously locked message is unlocked. No message is retrieved in this case, and the *MsgDesc*, *BufferLength*, *Buffer*, and *DataLength* parameters are not checked or altered.

3. For applications issuing an MQGET call, the message retrieved can be lost if the application terminates abnormally or the connection is severed while processing the call. This issue arises because the surrogate running on the same platform as the queue manager that issues the MQGET call on behalf of the application cannot detect the loss of the application until the surrogate is about to return the message to the application, *after* the message has been removed from the queue. This issue can occur for both persistent messages and nonpersistent messages.

   To eliminate the risk of losing messages in this way, always retrieve messages within units of work. That is, by specifying the MQGMO_SYNCPOINT option on the MQGET call, and using the MQCMIT or MQBACK calls to commit or back out the unit of work when message processing is complete. If MQGMO_SYNCPOINT is specified, and the client terminates abnormally or the connection is severed,

the surrogate backs out the unit of work on the queue manager and the message is reinstated on the queue. For more information about sync points, see Syncpoint considerations in IBM MQ applications.

This situation can arise with IBM MQ clients as well as with applications that are running on the same platform as the queue-manager.

4. If an application puts a sequence of messages on a particular queue within a single unit of work, and then commits that unit of work successfully, the messages become available for retrieval as follows:
   - If the queue is a *nonshared* queue (that is, a local queue), all messages within the unit of work become available at the same time.
   - If the queue is a *shared* queue, messages within the unit of work become available in the order in which they were put, but not all at the same time. When the system is heavily laden, it is possible for the first message in the unit of work to be retrieved successfully, but for the MQGET call for the second or subsequent message in the unit of work to fail with MQRC_NO_MSG_AVAILABLE. If this issue occurs, the application must wait a short while and then try the operation again.
5. If an application puts a sequence of messages on the same queue without using message groups, the order of those messages is preserved if certain conditions are satisfied. See MQPUT usage notes for details. If the conditions are satisfied, the messages are presented to the receiving application in the order in which they were sent, if:
   - Only one receiver is getting messages from the queue.

     If there are two or more applications getting messages from the queue, they must agree with the sender the mechanism to be used to identify messages that belong to a sequence. For example, the sender might set all the *CorrelId* fields in the messages in a sequence to a value that was unique to that sequence of messages.
   - The receiver does not deliberately change the order of retrieval, for example by specifying a particular *MsgId* or *CorrelId*.

   If the sending application puts the messages as a message group, the messages are presented to the receiving application in the correct order if the receiving application specifies the MQGMO_LOGICAL_ORDER option on the MQGET call. For more information about message groups, see:
   - MQMD - MsgFlags field
   - MQPMO_LOGICAL_ORDER
   - MQGMO_LOGICAL_ORDER

   If the user is getting messages in a group under sync point, they must ensure that the complete group is processed before attempting to finish the transaction.
6. Applications must test for the feedback code MQFB_QUIT in the *Feedback* field of the *MsgDesc* parameter, and end if they find this value. See MQMD - Feedback field for more information.
7. If the queue identified by *Hobj* was opened with the MQOO_SAVE_ALL_CONTEXT option, and the completion code from the MQGET call is MQCC_OK or MQCC_WARNING, the context associated with the queue handle *Hobj* is set to the context of the message that has been retrieved (unless the MQGMO_BROWSE_FIRST, MQGMO_BROWSE_NEXT, or MQGMO_BROWSE_MSG_UNDER_CURSOR option is set, in which case the context is marked as not available).

   You can use the saved context on a subsequent MQPUT or MQPUT1 call by specifying the MQPMO_PASS_IDENTITY_CONTEXT or MQPMO_PASS_ALL_CONTEXT options. This enables the context of the message received to be transferred in whole or in part to another message (for example, when the message is forwarded to another queue). For more information about message context, see Message context.
8. If you include the MQGMO_CONVERT option in the *GetMsgOpts* parameter, the application message data is converted to the representation requested by the receiving application, before the data is placed in the *Buffer* parameter:

- The *Format* field in the control information in the message identifies the structure of the application data, and the *CodedCharSetId* and *Encoding* fields in the control information in the message specify its character-set identifier and encoding.
- The application issuing the MQGET call specifies in the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter the character-set identifier and encoding to which to convert the application message data.

When conversion of the message data is necessary, the conversion is performed either by the queue manager itself or by a user-written exit, depending on the value of the *Format* field in the control information in the message:

- The following format names are formats that are converted by the queue manager; these formats are called "built-in" formats:
  - MQFMT_ADMIN
  - MQFMT_CICS ( z/OS only)
  - MQFMT_COMMAND_1
  - MQFMT_COMMAND_2
  - MQFMT_DEAD_LETTER_HEADER
  - MQFMT_DIST_HEADER
  - MQFMT_EVENT version 1
  - MQFMT_EVENT version 2 ( z/OS only)
  - MQFMT_IMS
  - MQFMT_IMS_VAR_STRING
  - MQFMT_MD_EXTENSION
  - MQFMT_PCF
  - MQFMT_REF_MSG_HEADER
  - MQFMT_RF_HEADER
  - MQFMT_RF_HEADER_2
  - MQFMT_STRING
  - MQFMT_TRIGGER
  - MQFMT_WORK_INFO_HEADER ( z/OS only)
  - MQFMT_XMIT_Q_HEADER
- The format name MQFMT_NONE is a special value that indicates that the nature of the data in the message is undefined. As a consequence, the queue manager does not attempt conversion when the message is retrieved from the queue.

  **Note:** If MQGMO_CONVERT is specified on the MQGET call for a message that has a format name of MQFMT_NONE, and the character set or encoding of the message differs from that specified in the *MsgDesc* parameter, the message is returned in the *Buffer* parameter (assuming no other errors), but the call completes with completion code MQCC_WARNING and reason code MQRC_FORMAT_ERROR.

  You can use MQFMT_NONE either when the nature of the message data means that it does not require conversion, or when the sending and receiving applications have agreed between themselves the form in which to send the message data.
- All other format names pass the message to a user-written exit for conversion. The exit has the same name as the format, apart from environment-specific additions. User-specified format names must not begin with the letters IBM MQ.

  See "Data-conversion exit" on page 879 for details of the data-conversion exit.

User data in the message can be converted between any supported character sets and encodings. However, be aware that, if the message contains one or more IBM MQ header

structures, the message cannot be converted from or to a character set that has double-byte or multi-byte characters for any of the characters that are valid in queue names. Reason code MQRC_SOURCE_CCSID_ERROR or MQRC_TARGET_CCSID_ERROR results if this is attempted, and the message is returned unconverted. Unicode character set UCS-2 is an example of such a character set.

On return from MQGET, the following reason code indicates that the message was converted successfully:

- MQRC_NONE

The following reason code indicates that the message *might* have been converted successfully; the application must check the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter to find out:

- MQRC_TRUNCATED_MSG_ACCEPTED

All other reason codes indicate that the message was not converted.

**Note:** The interpretation of this reason code is true for conversions performed by a user-written exit *only* if the exit conforms to the processing guidelines described in "Data-conversion exit" on page 879.

9. When using the object-oriented interface to get messages, you can choose not to specify a buffer to hold the message data for an MQGET call. However, in versions of IBM MQ, prior to version 7, it was possible for MQGET to fail with reason code MQRC_CONVERTED_MSG_TO_BIG, even when a buffer was not specified. From IBM MQ Version 7, when you get a message using an object-oriented application without restricting the size of the receive message buffer, the application does not fail with MQRC_CONVERTED_MSG_TOO_BIG, and receives the converted message. This is true of the following environments:

   - .NET, including fully managed applications
   - C++
   - Java ( IBM MQ classes for Java )

   **Note:** For all clients, if the value of *sharingConversations* is zero, the channel operates as it did before IBM WebSphere MQ 7.0, and message handling reverts to Version 6 behavior. In this situation, if the buffer is too small to receive the converted message, the unconverted message is returned, with reason code MQRC_CONVERTED_MSG_TOO_BIG. For more information about *sharingConversations*, see Using sharing conversations in a client application.

10. For the built-in formats, the queue manager can perform *default conversion* of character strings in the message when the MQGMO_CONVERT option is specified. Default conversion allows the queue manager to use an installation-specified default character set that approximates the actual character set, when converting string data. As a result, the MQGET call can succeed with completion code MQCC_OK, instead of completing with MQCC_WARNING and reason code MQRC_SOURCE_CCSID_ERROR or MQRC_TARGET_CCSID_ERROR.

    **Note:** The result of using an approximate character set to convert string data is that some characters might be converted incorrectly. To avoid this, use characters in the string that are common to both the actual character set and the default character set.

    Default conversion applies both to the application message data and to character fields in the MQMD and MQMDE structures:

    - Default conversion of the application message data occurs only when *all* the following are true:
      - The application specifies MQGMO_CONVERT.
      - The message contains data that must be converted either from or to a character set that is not supported.
      - Default conversion was enabled when the queue manager was installed or restarted.

- Default conversion of the character fields in the MQMD and MQMDE structures occurs as necessary, if default conversion is enabled for the queue manager. The conversion is performed even if the MQGMO_CONVERT option is not specified by the application on the MQGET call.

11. For the Visual Basic programming language, the following points apply:
    - If the size of the *Buffer* parameter is less than the length specified by the *BufferLength* parameter, the call fails with reason code MQRC_STORAGE_NOT_AVAILABLE.
    - The *Buffer* parameter is declared as being of type `String`. If the data to be retrieved from the queue is not of type `String`, use the MQGETAny call in place of MQGET.

      The MQGETAny call has the same parameters as the MQGET call, except that the *Buffer* parameter is declared as being of type `Any`, allowing any type of data to be retrieved. However, this means that *Buffer* cannot be checked to ensure that it is at least *BufferLength* bytes in size.
12. Not all MQGET options are supported when read ahead is enabled. The following table indicated which options are allowed and whether they can be altered between MQGET calls.

*Table 554. MQGET options permitted when read ahead is enabled*

| | **Permitted when read ahead is enabled and can be altered between MQGET calls** | **Permitted when read ahead is enabled but cannot be altered between MQGET calls** [a] | **MQGET options that are not permitted when read ahead is enabled** [b] |
|---|---|---|---|
| MQGET MD values | MsgId [c]<br>CorrelId [c] | Encoding<br>CodedCharSetId | |
| MQGET MQGMO options | MQGMO_WAIT<br>MQGMO_NO_WAIT<br>MQGMO_FAIL_IF_QUIESCING<br>MQGMO_BROWSE_FIRST [d]<br>MQGMO_BROWSE_NEXT [d]<br>MQGMO_BROWSE_MESSAGE<br>_UNDER_CURSOR [d] | MQGMO_SYNCPOINT_IF_PERSISTENT<br>MQGMO_NO_SYNCPOINT<br>MQGMO_ACCEPT_TRUNCATED_MSG<br>MQGMO_CONVERT<br>MQGMO_LOGICAL_ORDER<br>MQGMO_COMPLETE_MSG<br>MQGMO_ALL_MSGS_AVAILABLE<br>MQGMO_ALL_SEGMENTS_AVAILABLE<br>MQGMO_MARK_BROWSE_HANDLE<br>MQGMO_MARK_BROWSE_CO_OP<br>MQGMO_UNMARK_BROWSE_CO_OP<br>MQGMO_UNMARK_BROWSE_HANDLE<br>MQGMO_UNMARKED_BROWSE_MSG<br>MQGMO_PROPERTIES_FORCE_MQRFH2<br>MQGMO_NO_PROPERTIES<br>MQGMO_PROPERTIES_IN_HANDLE<br>MQGMO_PROPERTIES_COMPATIBILITY | MQGMO_SET_SIGNAL<br>MQGMO_SYNCPOINT<br>MQGMO_MARK_SKIP<br>_BACKOUT<br>MQGMO_MSG_UNDER<br>_CURSOR [d]<br>MQGMO_LOCK<br>MQGMO_UNLOCK |
| MQGMO values | | MsgHandle | |

    a. If these options are altered between MQGET calls an MQRC_OPTIONS_CHANGED reason code is returned.

    b. If these options are specified on the first MQGET call then read ahead is disabled. If these options are specified on a subsequent MQGET call a reason code MQRC_OPTIONS_ERROR is returned.

    c. The client applications need to be aware that if the MsgId and CorrelId values are altered between MQGET calls messages with the previous values might have already been sent to the client and remain in the client read ahead buffer until consumed (or automatically purged).

    d. The first MQGET call determines whether messages are to be browsed or got from a queue when read ahead is enabled. If the application attempts to use a combination of browse and get an MQRC_OPTIONS_CHANGED reason code is returned.

    e. MQGMO_MSG_UNDER_CURSOR is not possible with read ahead. Messages can be browsed or got when read ahead is enabled but not a combination of both.

13. Applications can destructively get uncommitted messages only if those messages are put in the same local unit of work as the get. Applications cannot get uncommitted messages nondestructively.
14. Messages under a browse cursor can be retrieved in a unit of work. It is not possible to retrieve an uncommitted message in this way.

## C invocation

```
MQGET (Hconn, Hobj, &MsgDesc, &GetMsgOpts, BufferLength, Buffer,
      &DataLength, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;         /* Connection handle */
MQHOBJ   Hobj;          /* Object handle */
MQMD     MsgDesc;       /* Message descriptor */
MQGMO    GetMsgOpts;    /* Options that control the action of MQGET */
MQLONG   BufferLength;  /* Length in bytes of the Buffer area */
MQBYTE   Buffer[n];     /* Area to contain the message data */
MQLONG   DataLength;    /* Length of the message */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQGET' USING HCONN, HOBJ, MSGDESC, GETMSGOPTS, BUFFERLENGTH,
BUFFER, DATALENGTH, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN         PIC S9(9) BINARY.
**   Object handle
 01  HOBJ          PIC S9(9) BINARY.
**   Message descriptor
 01  MSGDESC.
     COPY CMQMDV.
**   Options that control the action of MQGET
 01  GETMSGOPTS.
     COPY CMQGMOV.
**   Length in bytes of the BUFFER area
 01  BUFFERLENGTH  PIC S9(9) BINARY.
**   Area to contain the message data
 01  BUFFER        PIC X(n).
**   Length of the message
 01  DATALENGTH    PIC S9(9) BINARY.
**   Completion code
 01  COMPCODE      PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON        PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQGET (Hconn, Hobj, MsgDesc, GetMsgOpts, BufferLength, Buffer,
           DataLength, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn         fixed bin(31);  /* Connection handle */
dcl Hobj          fixed bin(31);  /* Object handle */
dcl MsgDesc       like MQMD;      /* Message descriptor */
dcl GetMsgOpts    like MQGMO;     /* Options that control the action of
                                     MQGET */
dcl BufferLength  fixed bin(31);  /* Length in bytes of the Buffer
                                     area */
dcl Buffer        char(n);        /* Area to contain the message data */
dcl DataLength    fixed bin(31);  /* Length of the message */
dcl CompCode      fixed bin(31);  /* Completion code */
dcl Reason        fixed bin(31);  /* Reason code qualifying CompCode */
```

## High Level Assembler invocation

```
         CALL MQGET,(HCONN,HOBJ,MSGDESC,GETMSGOPTS,BUFFERLENGTH,
               BUFFER,DATALENGTH,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN         DS       F      Connection handle
HOBJ          DS       F      Object handle
MSGDESC       CMQMDA   ,      Message descriptor
GETMSGOPTS    CMQGMOA  ,      Options that control the action of MQGET
BUFFERLENGTH  DS       F      Length in bytes of the BUFFER area
BUFFER        DS       CL(n)  Area to contain the message data
DATALENGTH    DS       F      Length of the message
COMPCODE      DS       F      Completion code
REASON        DS       F      Reason code qualifying COMPCODE
```

### Visual Basic invocation

```
MQGET Hconn, Hobj, MsgDesc, GetMsgOpts, BufferLength, Buffer,
DataLength, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Hconn        As Long   'Connection handle'
Dim Hobj         As Long   'Object handle'
Dim MsgDesc      As MQMD   'Message descriptor'
Dim GetMsgOpts   As MQGMO  'Options that control the action of MQGET'
Dim BufferLength As Long   'Length in bytes of the Buffer area'
Dim Buffer       As String 'Area to contain the message data'
Dim DataLength   As Long   'Length of the message'
Dim CompCode     As Long   'Completion code'
Dim Reason       As Long   'Reason code qualifying CompCode'
```

## MQINQ - Inquire object attributes

The MQINQ call returns an array of integers and a set of character strings containing the attributes of an object.

The following types of object are valid:

- Queue manager
- Queue
- Namelist
- Process definition

### Syntax

MQINQ (*Hconn*, *Hobj*, *SelectorCount*, *Selectors*, *IntAttrCount*, *IntAttrs*, *CharAttrLength*, *CharAttrs*, *CompCode*, *Reason*)

### Parameters

***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn* :

**MQHC_DEF_HCONN**
Default connection handle.

**Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

***Hobj***

Type: MQHOBJ - input

This handle represents the object (of any type) with attributes that are required. The handle must be returned by a previous MQOPEN call that specified the MQOO_INQUIRE option.

***SelectorCount***

Type: MQLONG - input

This is the count of selectors that are supplied in the *Selectors* array. It is the number of attributes that are to be returned. Zero is a valid value. The maximum number allowed is 256.

***Selectors***

Type: MQLONG x *SelectorCount* - input

This is an array of *SelectorCount* attribute selectors; each selector identifies an attribute (integer or character) with a value that is required.

Each selector must be valid for the type of object that *Hobj* represents, otherwise the call fails with completion code MQCC_FAILED and reason code MQRC_SELECTOR_ERROR.

In the special case of queues:

- If the selector is not valid for queues of any type, the call fails with completion code MQCC_FAILED and reason code MQRC_SELECTOR_ERROR.
- If the selector applies only to queues of types other than the type of the object, the call succeeds with completion code MQCC_WARNING and reason code MQRC_SELECTOR_NOT_FOR_TYPE.
- If the queue being inquired is a cluster queue, the selectors that are valid depend on how the queue was resolved; see "Usage notes" on page 699 for further details.

You can specify selectors in any order. Attribute values that correspond to integer attribute selectors ( MQIA_* selectors) are returned in *IntAttrs* in the same order in which these selectors occur in *Selectors*. Attribute values that correspond to character attribute selectors ( MQCA_* selectors) are returned in *CharAttrs* in the same order in which those selectors occur. MQIA_* selectors can be interleaved with the MQCA_* selectors; only the relative order within each type is important.

**Note:**

1. The integer and character attribute selectors are allocated within two different ranges; the MQIA_* selectors reside within the range MQIA_FIRST through MQIA_LAST, and the MQCA_* selectors within the range MQCA_FIRST through MQCA_LAST.

   For each range, the constants MQIA_LAST_USED and MQCA_LAST_USED define the highest value that the queue manager accepts.
2. If all the MQIA_* selectors occur first, the same element numbers can be used to address corresponding elements in the *Selectors* and *IntAttrs* arrays.
3. If the *SelectorCount* parameter is zero, *Selectors* is not referred to. In this case, the parameter address passed by programs written in C or S/390 assembler might be null.

The attributes that can be inquired are listed in the following tables. For the MQCA_* selectors, the constant that defines the length in bytes of the resulting string in *CharAttrs* is provided in parentheses.

The tables that follow list the selectors, by object, in alphabetical order, as follows:

- Table 555 on page 687 MQINQ attribute selectors for queues
- Table 556 on page 689 MQINQ attribute selectors for namelists
- Table 557 on page 689 MQINQ attribute selectors for process definitions
- Table 558 on page 690 MQINQ attribute selectors for the queue manager

All selectors are supported on all IBM MQ platforms, except where indicated in the **Note** column as follows:

**Not z/OS**
Supported on all platforms **except** z/OS

**z/OS**
Supported **only** on z/OS

*Table 555. MQINQ attribute selectors for queues*

| Selector | Length of field | Description | Note |
|---|---|---|---|
| MQCA_ALTERATION_DATE | MQ_DATE_LENGTH | Date of most-recent alteration | |
| MQCA_ALTERATION_TIME | MQ_TIME_LENGTH | Time of most-recent alteration | |
| MQCA_BACKOUT_REQ_Q_NAME | MQ_Q_NAME_LENGTH | Excessive backout requeue name | |
| MQCA_BASE_Q_NAME | MQ_Q_NAME_LENGTH | Name of queue that alias resolves to | |
| MQCA_CF_STRUC_NAME | MQ_CF_STRUC_NAME_LENGTH | Coupling-facility structure name | z/OS |
| MQCA_CLUS_CHL_NAME | MQ_CHANNEL_NAME_LENGTH | Name of the cluster-sender channel that uses this queue as a transmission queue. | |
| MQCA_CLUSTER_NAME | MQ_CLUSTER_NAME_LENGTH | Cluster name | |
| MQCA_CLUSTER_NAMELIST | MQ_NAMELIST_NAME_LENGTH | Cluster namelist | |
| MQCA_CREATION_DATE | MQ_CREATION_DATE_LENGTH | Queue creation date | |
| MQCA_CREATION_TIME | MQ_CREATION_TIME_LENGTH | Queue creation time | |
| MQCA_CUSTOM | MQ_CUSTOM_LENGTH | The custom attribute for new features | |
| MQCA_INITIATION_Q_NAME | MQ_Q_NAME_LENGTH | Initiation queue name | |
| MQCA_PROCESS_NAME | MQ_PROCESS_NAME_LENGTH | Name of process definition | |
| MQCA_Q_DESC | MQ_Q_DESC_LENGTH | Queue description | |
| MQCA_Q_NAME | MQ_Q_NAME_LENGTH | Queue name | |
| MQCA_REMOTE_Q_MGR_NAME | MQ_Q_MGR_NAME_LENGTH | Name of remote queue manager | |
| MQCA_REMOTE_Q_NAME | MQ_Q_NAME_LENGTH | Name of remote queue as known on remote queue manager | |
| MQCA_STORAGE_CLASS | MQ_STORAGE_CLASS_LENGTH | Name of storage class | z/OS |
| MQCA_TRIGGER_DATA | MQ_TRIGGER_DATA_LENGTH | Trigger data | |
| MQCA_XMIT_Q_NAME | MQ_Q_NAME_LENGTH | Transmission queue name | |
| MQIA_ACCOUNTING_Q | MQLONG | Controls collection of accounting data for queue | Not z/OS |
| MQIA_BACKOUT_THRESHOLD | MQLONG | Backout threshold | |

*Table 555. MQINQ attribute selectors for queues (continued)*

| Selector | Length of field | Description | Note |
|---|---|---|---|
| MQIA_CLWL_Q_PRIORITY | MQLONG | Priority of queue | |
| MQIA_CLWL_Q_RANK | MQLONG | Rank of queue | |
| MQIA_CLWL_USEQ | MQLONG | Use remote queues | |
| MQIA_CURRENT_Q_DEPTH | MQLONG | Number of messages on queue | |
| MQIA_DEF_BIND | MQLONG | Default binding | |
| MQIA_DEF_INPUT_OPEN_OPTION | MQLONG | Default open-for-input option | |
| MQIA_DEF_PERSISTENCE | MQLONG | Default message persistence | |
| MQIA_DEF_PRIORITY | MQLONG | Default message priority | |
| MQIA_DEFINITION_TYPE | MQLONG | Queue definition type | |
| MQIA_DIST_LISTS | MQLONG | Distribution list support | Not z/OS |
| MQIA_HARDEN_GET_BACKOUT | MQLONG | Whether to harden backout count | |
| MQIA_INDEX_TYPE | MQLONG | Type of index maintained for queue | z/OS |
| MQIA_INHIBIT_GET | MQLONG | Whether get operations are allowed | |
| MQIA_INHIBIT_PUT | MQLONG | Whether put operations are allowed | |
| MQIA_MAX_MSG_LENGTH | MQLONG | Maximum message length | |
| MQIA_MAX_Q_DEPTH | MQLONG | Maximum number of messages allowed on queue | |
| MQIA_MSG_DELIVERY_SEQUENCE | MQLONG | Whether message priority is relevant | |
| MQIA_NPM_CLASS | MQLONG | Level of reliability for nonpersistent messages | |
| MQIA_OPEN_INPUT_COUNT | MQLONG | Number of MQOPEN calls that have the queue open for input | |
| MQIA_OPEN_OUTPUT_COUNT | MQLONG | Number of MQOPEN calls that have the queue open for output | |
| MQIA_PROPERTY_CONTROL | MQLONG | Property control attribute | |
| MQIA_Q_DEPTH_HIGH_EVENT | MQLONG | Control attribute for queue depth high events | Not z/OS |
| MQIA_Q_DEPTH_HIGH_LIMIT | MQLONG | High limit for queue depth | Not z/OS |
| MQIA_Q_DEPTH_LOW_EVENT | MQLONG | Control attribute for queue depth low events | Not z/OS |
| MQIA_Q_DEPTH_LOW_LIMIT | MQLONG | Low limit for queue depth | Not z/OS |
| MQIA_Q_DEPTH_MAX_EVENT | MQLONG | Control attribute for queue depth max events | Not z/OS |

| *Table 555. MQINQ attribute selectors for queues (continued)* | | | |
|---|---|---|---|
| **Selector** | **Length of field** | **Description** | **Note** |
| MQIA_Q_SERVICE_INTERVAL | MQLONG | Limit for queue service interval | Not z/OS |
| MQIA_Q_SERVICE_INTERVAL_EVENT | MQLONG | Control attribute for queue service interval events | Not z/OS |
| MQIA_Q_TYPE | MQLONG | Queue type | |
| MQIA_QSG_DISP | MQLONG | Queue-sharing group disposition | z/OS |
| MQIA_RETENTION_INTERVAL | MQLONG | Queue retention interval | |
| MQIA_SCOPE | MQLONG | Queue definition scope | Not z/OS |
| MQIA_SHAREABILITY | MQLONG | Whether queue can be shared for input | |
| MQIA_STATISTICS_Q | MQLONG | Controls collection of statistics data for queue | Not z/OS |
| MQIA_TRIGGER_CONTROL | MQLONG | Trigger control | |
| MQIA_TRIGGER_DEPTH | MQLONG | Trigger depth | |
| MQIA_TRIGGER_MSG_PRIORITY | MQLONG | Threshold message priority for triggers | |
| MQIA_TRIGGER_TYPE | MQLONG | Trigger type | |
| MQIA_USAGE | MQLONG | Usage | |

| *Table 556. MQINQ attribute selectors for namelists* | | | |
|---|---|---|---|
| **Selector** | **Length of field** | **Description** | **Note** |
| MQCA_ALTERATION_DATE | MQ_DATE_LENGTH | Date of most-recent alteration | |
| MQCA_ALTERATION_TIME | MQ_TIME_LENGTH | Time of most-recent alteration | |
| MQCA_NAMELIST_DESC | MQ_NAMELIST_DESC_LENGTH | Namelist description | |
| MQCA_NAMELIST_NAME | MQ_NAMELIST_NAME_LENGTH | Name of namelist object | |
| MQIA_NAMELIST_TYPE | MQLONG | Namelist type | z/OS |
| MQCA_NAMES | MQ_Q_NAME_LENGTH x *Number of names in the list* | Names in the namelist | |
| MQIA_NAME_COUNT | MQLONG | Number of names in the namelist | |
| MQIA_QSG_DISP | MQLONG | Queue-sharing group disposition | z/OS |

| MQCA_ALTERATION_DATE | MQ_DATE_LENGTH | Date of most-recent alteration | |
| MQCA_ALTERATION_TIME | MQ_TIME_LENGTH | Time of most-recent alteration | |
| MQCA_CHANNEL_AUTO_DEF_EXIT | MQ_EXIT_NAME_LENGTH | Automatic channel definition exit name | |
| MQCA_CHINIT_SERVICE_PARM | | Reserved for use by IBM | |
| MQCA_CLUSTER_WORKLOAD_DATA | MQ_EXIT_DATA_LENGTH | Data passed to cluster workload exit | |
| MQCA_CLUSTER_WORKLOAD_EXIT | MQ_EXIT_NAME_LENGTH | Name of cluster workload exit | |
| MQCA_COMMAND_INPUT_Q_NAME | MQ_Q_NAME_LENGTH | System command input queue name | |
| MQCA_CUSTOM | MQ_CUSTOM_LENGTH | The custom attribute for new features | |
| MQCA_DEAD_LETTER_Q_NAME | MQ_Q_NAME_LENGTH | Name of dead-letter queue | |
| MQCA_DEF_XMIT_Q_NAME | MQ_Q_NAME_LENGTH | Default transmission queue name | |
| MQCA_DNS_GROUP | MQ_DNS_GROUP_NAME_LENGTH | Name of the group for the TCP listener that handles inbound transmissions for the queue-sharing group to join. The name applies when using Workload Manager Dynamic Domain Name Services. | z/OS |
| MQCA_IGQ_USER_ID | MQ_USER_ID_LENGTH | Intra-group queuing user identifier | z/OS |
| MQCA_INSTALLATION_DESC | MQ_INSTALLATION_DESC_LENGTH | Description of the associated installation | Not z/OS. Not IBM i |

*Table 558. MQINQ attribute selectors for the queue manager (continued)*

| Selector | Length of field | Description | Note |
|---|---|---|---|
| MQCA_INSTALLATION_NAME | MQ_INSTALLATION_NAME_LENGTH | Name of the installation associated with the queue manager | Not z/OS. Not IBM i |
| MQCA_INSTALLATION_PATH | MQ_INSTALLATION_PATH_LENGTH | Path where the associated IBM MQ is installed | Not z/OS. Not IBM i |
| MQCA_LU_GROUP_NAME | MQ_LU_NAME_LENGTH | Generic LU name for the LU 6.2 listener that handles inbound transmissions for the queue-sharing group to use | z/OS |
| MQCA_LU_NAME | MQ_LU_NAME_LENGTH | Name of the LU to use for outbound LU 6.2 transmissions. Set this name to the same LU that the listener uses for inbound transmissions | z/OS |
| MQCA_LU62_ARM_SUFFIX | MQ_ARM_SUFFIX_LENGTH | Suffix of the SYS1.PARMLIB member APPCPM *xx* , that nominates the LUADD for this channel initiator | z/OS |
| MQCA_PARENT | MQ_Q_MGR_NAME_LENGTH | Name of a hierarchically connected queue manager that is nominated as the parent of this queue manager | |
| MQCA_Q_MGR_DESC | MQ_Q_MGR_DESC_LENGTH | Queue manager description | |
| MQCA_Q_MGR_IDENTIFIER | MQ_Q_MGR_IDENTIFIER_LENGT | Queue-manager identifier (H) | |
| MQCA_Q_MGR_NAME | MQ_Q_MGR_NAME_LENGTH | Name of local queue manager | |
| MQCA_QSG_NAME | MQ_QSG_NAME_LENGTH | Queue-sharing group name | z/OS |
| MQCA_REPOSITORY_NAME | MQ_CLUSTER_NAME_LENGTH | Name of cluster for which queue manager provides repository services | |
| MQCA_REPOSITORY_NAMELIST | MQ_NAMELIST_NAME_LENGTH | Name of namelist object containing names of clusters for which queue manager provides repository services | |
| MQCA_TCP_NAME | MQ_TCP_NAME_LENGTH | Name of the TCP/IP system that you are using | z/OS |
| MQIA_ACCOUNTING_CONN_OVERRIDE | MQLONG | Override accounting settings | Not z/OS |
| MQIA_ACCOUNTING_INTERVAL | MQLONG | How often to write intermediate accounting records | Not z/OS |
| MQIA_ACCOUNTING_MQI | MQLONG | Controls collection of accounting information for MQI data | Not z/OS |
| MQIA_ACCOUNTING_Q | MQLONG | Controls collection of accounting information for queues | Not z/OS |
| MQIA_ACTIVE_CHANNELS | MQLONG | Maximum number of channels that can be active at any time | z/OS |

*Table 558. MQINQ attribute selectors for the queue manager (continued)*

| Selector | Length of field | Description | Note |
|---|---|---|---|
| MQIA_ADOPTNEWMCA_CHECK | MQLONG | Elements that are checked to determine whether to adopt an MCA. The check is performed when a new inbound channel is detected that has the same name as an MCA that is already active. | z/OS |
| MQIA_ADOPTNEWMCA_INTERVAL | MQLONG | Amount of time, in seconds, that the new channel waits for the orphaned channel to end | Not z/OS |
| MQIA_ADOPTNEWMCA_TYPE | MQLONG | Whether to restart an orphaned instance of an MCA of a particular channel type automatically when a new inbound channel request matching the AdoptNewMCACheck parameters is detected | z/OS |
| MQIA_AUTHORITY_EVENT | MQLONG | Control attribute for authority events | Not z/OS |
| MQIA_BRIDGE_EVENT | MQLONG | Control attribute for IMS bridge events | z/OS |
| MQIA_CHANNEL_AUTO_DEF | MQLONG | Control attribute for automatic channel definition | Not z/OS |
| MQIA_CHANNEL_AUTO_DEF_EVENT | MQLONG | Control attribute for automatic channel definition events | Not z/OS |
| MQIA_CHANNEL_EVENT | MQLONG | Control attribute for channel events | |
| MQIA_CHINIT_ADAPTERS | MQLONG | Number of adapter subtasks to use for processing IBM MQ calls | z/OS |
| MQIA_CHINIT_DISPATCHERS | MQLONG | Number of dispatchers to use for the channel initiator | z/OS |
| MQIA_CHINIT_TRACE_AUTO_START | MQLONG | Whether to start channel initiator trace automatically | z/OS |
| MQIA_CHINIT_TRACE_TABLE_SIZE | MQLONG | Size of the trace data space (in MB) of the channel initiator | z/OS |
| MQIA_CLUSTER_WORKLOAD_LENGTH | MQLONG | Cluster workload length. | |
| MQIA_CLWL_MRU_CHANNELS | MQLONG | Number of most recently used channels for cluster workload balancing | |
| MQIA_CLWL_USEQ | MQLONG | Use remote queues | |
| MQIA_CODED_CHAR_SET_ID | MQLONG | Coded character set identifier | |
| MQIA_COMMAND_EVENT | MQLONG | Control attribute for command events | |
| MQIA_COMMAND_LEVEL | MQLONG | Command level supported by queue manager | |
| MQIA_CONFIGURATION_EVENT | MQLONG | Control attribute for configuration events | Not z/OS |

*Table 558. MQINQ attribute selectors for the queue manager (continued)*

| Selector | Length of field | Description | Note |
|---|---|---|---|
| MQIA_DEF_CLUSTER_XMIT_Q_TYPE | MQLONG | Default transmission queue type to be used for cluster-sender channels. | |
| MQIA_DIST_LISTS | MQLONG | Distribution list support | Not z/OS |
| MQIA_DNS_WLM | MQLONG | Whether the TCP listener that handles inbound transmissions for the queue-sharing group registers with Workload Manager for Dynamic Domain Name Services | z/OS |
| MQIA_EXPIRY_INTERVAL | MQLONG | Interval between scans for expired messages | z/OS |
| MQIA_GROUP_UR | MQLONG | Control attribute for whether GROUP units of recovery are enabled for this queue manager. The GROUP unit of recovery disposition is only available if the queue manager is a member of a queue-sharing group | z/OS |
| MQIA_IGQ_PUT_AUTHORITY | MQLONG | Intra-group queuing put authority | z/OS |
| MQIA_INHIBIT_EVENT | MQLONG | Control attribute for inhibit events | Not z/OS |
| MQIA_INTRA_GROUP_queuing | MQLONG | Intra-group queuing support | z/OS |
| MQIA_LISTENER_TIMER | MQLONG | Time interval (in seconds) between IBM MQ attempts to restart the listener if APPC or TCP/IP failed. | z/OS |
| MQIA_LOCAL_EVENT | MQLONG | Control attribute for local events | Not z/OS |
| MQIA_LOGGER_EVENT | MQLONG | Control attribute for inhibit events | Not z/OS |
| MQIA_LU62_CHANNELS | MQLONG | Maximum number of channels that can be current, or clients that can be connected, using the LU 6.2 transmission protocol | z/OS |
| MQIA_MSG_MARK_BROWSE_INTERVAL | MQLONG | Time interval (in milliseconds) after which the queue manager can automatically remove a mark from browse messages.<br>**Attention:** You should not set this value below the default of 5000. | |
| MQIA_MAX_CHANNELS | MQLONG | Maximum number of channels that can be current (including server-connection channels with connected clients) | z/OS |
| MQIA_MAX_HANDLES | MQLONG | Maximum number of handles | |

*Table 558. MQINQ attribute selectors for the queue manager (continued)*

| Selector | Length of field | Description | Note |
|---|---|---|---|
| MQIA_MAX_MSG_LENGTH | MQLONG | Maximum message length | |
| MQIA_MAX_PRIORITY | MQLONG | Maximum priority | |
| MQIA_MAX_UNCOMMITTED_MSGS | MQLONG | Maximum number of uncommitted messages within a unit of work | |
| MQIA_OUTBOUND_PORT_MAX | MQLONG | With MQIA_OUTBOUND_PORT_MIN, defines range of port numbers to use when binding outgoing channels | z/OS |
| MQIA_OUTBOUND_PORT_MIN | MQLONG | With MQIA_OUTBOUND_PORT_MAX, defines range of port numbers to use when binding outgoing channels | z/OS |
| MQIA_PERFORMANCE_EVENT | MQLONG | Control attribute for performance events | Not z/OS |
| MQIA_PLATFORM | MQLONG | Platform on which the queue manager resides | |
| MQIA_PROT_POLICY_CAPABILITY | MQLONG | Indicates whether security capabilities of IBM MQ Advanced Message Security are available for a queue manager. | |
| MQIA_PUBSUB_MAXMSG_RETRY_COUNT | MQLONG | The number of attempts to reprocess a failed command message under sync point | |
| MQIA_PUBSUB_MODE | MQLONG | Whether the publish/subscribe engine and the queued publish/subscribe interface are running. Applications to publish or subscribe using the application programming interface require the publish/subscribe engine. Queues that are monitored by the queued publish/subscribe interface require the queued publish/subscribe interface to be running. | |
| MQIA_PUBSUB_NP_MSG | MQLONG | Whether to discard (or keep) an undelivered input message | |
| MQIA_PUBSUB_NP_RESP | MQLONG | Controls the behavior of undelivered response messages | |
| MQIA_PUBSUB_SYNC_PT | MQLONG | Whether only persistent (or all) messages are processed under sync point | |
| MQIA_QMGR_CFCONLOS | MQLONG | Specifies the action to be taken when the queue manager loses connectivity to the administration structure or any CF structures with CFCONLOS set to ASQMGR | z/OS |

*Table 558. MQINQ attribute selectors for the queue manager (continued)*

| Selector | Length of field | Description | Note |
|---|---|---|---|
| MQIA_RECEIVE_TIMEOUT | MQLONG | Approximately how long a TCP/IP channel waits to receive data, including heartbeats, from its partner, before returning to the inactive state. The value is numeric, qualified by MQIA_RECEIVE_TIMEOUT_TYPE. | z/OS |
| MQIA_RECEIVE_TIMEOUT_MIN | MQLONG | Minimum time that a TCP/IP channel waits to receive data, including heartbeats, from its partner, before returning to the inactive state | z/OS |
| MQIA_RECEIVE_TIMEOUT_TYPE | MQLONG | Approximately how long a TCP/IP channel waits to receive data, including heartbeats, from its partner, before returning to the inactive state. MQIA_RECEIVE_TIMEOUT_TYPE is the qualifier applied to MQIA_RECEIVE_TIMEOUT. | z/OS |
| MQIA_REMOTE_EVENT | MQLONG | Control attribute for remote events | Not z/OS |
| MQIA_SECURITY_CASE | MQLONG | Case of security profiles | z/OS |
| MQIA_SSL_EVENT | MQLONG | Control attribute for channel events | |
| MQIA_SSL_FIPS_REQUIRED | MQLONG | Use only FIPS-certified algorithms for cryptography | |
| MQIA_SSL_RESET_COUNT | MQLONG | SSL key reset count | |
| MQIA_START_STOP_EVENT | MQLONG | Control attribute for start stop events | Not z/OS |
| MQIA_STATISTICS_AUTO_CLUSSDR | MQLONG | Controls collection of statistics monitoring information for cluster sender channels | |
| MQIA_STATISTICS_CHANNEL | MQLONG | Controls collection of statistics data for channels | |
| MQIA_STATISTICS_INTERVAL | MQLONG | How often to write statistics monitoring data | Not z/OS |
| MQIA_STATISTICS_MQI | MQLONG | Controls collection of statistics monitoring information for queue manager | Not z/OS |
| MQIA_STATISTICS_Q | MQLONG | Controls collection of statistics data for queues | Not z/OS |
| MQIA_SYNCPOINT | MQLONG | sync point availability | |
| MQIA_TCP_CHANNELS | MQLONG | Maximum number of channels that can be current, or clients that can be connected, using the TCP/IP transmission protocol | z/OS |

| *Table 558. MQINQ attribute selectors for the queue manager (continued)* | | | |
|---|---|---|---|
| **Selector** | **Length of field** | **Description** | **Note** |
| MQIA_TCP_KEEP_ALIVE | MQLONG | Whether to use the TCP KEEPALIVE facility to check that the other end of the connection is still available | z/OS |
| MQIA_TCP_STACK_TYPE | MQLONG | Whether the channel initiator can use only the TCP/IP address space specified in TCPNAME, or can optionally bind to any selected TCP/IP address | z/OS |
| MQIA_TRACE_ROUTE_RECORDING | MQLONG | Controls recording of trace-route information | z/OS |
| MQIA_TREE_LIFE_TIME | MQLONG | Lifetime of unused non-administrative topics | |
| MQIA_TRIGGER_INTERVAL | MQLONG | Trigger interval | |

***IntAttrCount***
Type: MQLONG - input

This is the number of elements in the *IntAttrs* array. Zero is a valid value.

If IntAttrCount is at least the number of MQIA_* selectors in the *Selectors* parameter, all integer attributes requested are returned.

***IntAttrs***
Type: MQLONG x *IntAttrCount* - output

This is an array of *IntAttrCount* integer attribute values.

Integer attribute values are returned in the same order as the MQIA_* selectors in the *Selectors* parameter. If the array contains more elements than the number of MQIA_* selectors, the excess elements are unchanged.

If *Hobj* represents a queue, but an attribute selector does not apply to that type of queue, the specific value MQIAV_NOT_APPLICABLE is returned. It is returned for the corresponding element in the *IntAttrs* array.

If the *IntAttrCount* or *SelectorCount* parameter is zero, *IntAttrs* is not referred to. In this case, the parameter address passed by programs written in C or S/390 assembler might be null.

***CharAttrLength***
Type: MQLONG - input

This is the length in bytes of the *CharAttrs* parameter.

CharAttrLength must be at least the sum of the lengths of the requested character attributes (see Selectors ). Zero is a valid value.

***CharAttrs***
Type: MQCHAR x *CharAttrLength* - output

This is the buffer in which the character attributes are returned, concatenated together. The length of the buffer is given by the *CharAttrLength* parameter.

Character attributes are returned in the same order as the MQCA_* selectors in the *Selectors* parameter. The length of each attribute string is fixed for each attribute (see Selectors ), and the value in it is padded to the right with blanks if necessary. You can provider a buffer larger than needed to contain all the requested character attributes and padding. The bytes beyond the last attribute value returned are unchanged.

If *Hobj* represents a queue, but an attribute selector does not apply to that type of queue, a character string consisting entirely of asterisks (*) is returned. The asterisk is returned as the value of that attribute in *CharAttrs*.

If the *CharAttrLength* or *SelectorCount* parameter is zero, *CharAttrs* is not referred to. In this case, the parameter address passed by programs written in C or S/390 assembler might be null.

***CompCode***
Type: MQLONG - output

The completion code:

**MQCC_OK**
Successful completion.

**MQCC_WARNING**
Warning (partial completion).

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_WARNING:

**MQRC_CHAR_ATTRS_TOO_SHORT**
(2008, X'7D8') Not enough space allowed for character attributes.

**MQRC_INT_ATTR_COUNT_TOO_SMALL**
(2022, X'7E6') Not enough space allowed for integer attributes.

**MQRC_SELECTOR_NOT_FOR_TYPE**
(2068, X'814') Selector not applicable to queue type.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'89C') Adapter not available.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_API_EXIT_ERROR**
(2374, X'946') API exit failed.

**MQRC_API_EXIT_LOAD_ERROR**
(2183, X'887') Unable to load API exit.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_CALL_IN_PROGRESS**
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC_CF_STRUC_FAILED**
(2373, X'945') Coupling-facility structure failed.

**MQRC_CF_STRUC_IN_USE**
(2346, X'92A') Coupling-facility structure in use.

**MQRC_CHAR_ATTR_LENGTH_ERROR**
(2006, X'7D6') Length of character attributes not valid.

**MQRC_CHAR_ATTRS_ERROR**
(2007, X'7D7') Character attributes string not valid.

**MQRC_CICS_WAIT_FAILED**
(2140, X'85C') Wait request rejected by CICS.

**MQRC_CONNECTION_BROKEN**
(2009, X'7D9') Connection to queue manager lost.

**MQRC_CONNECTION_NOT_AUTHORIZED**
(2217, X'8A9') Not authorized for connection.

**MQRC_CONNECTION_STOPPING**
(2203, X'89B') Connection shutting down.

**MQRC_HCONN_ERROR**
(2018, X'7E2') Connection handle not valid.

**MQRC_HOBJ_ERROR**
(2019, X'7E3') Object handle not valid.

**MQRC_INT_ATTR_COUNT_ERROR**
(2021, X'7E5') Count of integer attributes not valid.

**MQRC_INT_ATTRS_ARRAY_ERROR**
(2023, X'7E7') Integer attributes array not valid.

**MQRC_NOT_OPEN_FOR_INQUIRE**
(2038, X'7F6') Queue not open for inquire.

**MQRC_OBJECT_CHANGED**
(2041, X'7F9') Object definition changed since opened.

**MQRC_OBJECT_DAMAGED**
(2101, X'835') Object damaged.

**MQRC_PAGESET_ERROR**
(2193, X'891') Error accessing page-set data set.

**MQRC_Q_DELETED**
(2052, X'804') Queue deleted.

**MQRC_Q_MGR_NAME_ERROR**
(2058, X'80A') Queue manager name not valid or not known.

**MQRC_Q_MGR_NOT_AVAILABLE**
(2059, X'80B') Queue manager not available for connection.

**MQRC_Q_MGR_STOPPING**
(2162, X'872') Queue manager shutting down.

**MQRC_RESOURCE_PROBLEM**
(2102, X'836') Insufficient system resources available.

**MQRC_SELECTOR_COUNT_ERROR**
(2065, X'811') Count of selectors not valid.

**MQRC_SELECTOR_ERROR**
(2067, X'813') Attribute selector not valid.

**MQRC_SELECTOR_LIMIT_EXCEEDED**
(2066, X'812') Count of selectors too large.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_SUPPRESSED_BY_EXIT**
(2109, X'83D') Call suppressed by exit program.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

For detailed information about these codes; see Messages and reason codes

## Usage notes

1. The values returned are a snapshot of the selected attributes. There is no guarantee that the attributes remain the same before the application can act upon the returned values.
2. When you open a model queue, a dynamic local queue is created. A dynamic local queue is created even if you open the model queue to inquire about its attributes.

   The attributes of the dynamic queue are largely the same as the attributes of the model queue at the time that the dynamic queue is created. If you then use the MQINQ call on this queue, the queue manager returns the attributes of the dynamic queue, and not the attributes of the model queue. See Table 561 on page 812 for details of which attributes of the model queue are inherited by the dynamic queue.
3. If the object being inquired is an alias queue, the attribute values returned by the MQINQ call are the attributes of the alias queue. The are not the attributes of the base queue or topic to which the alias resolves.
4. If the object being inquired is a cluster queue, the attributes that can be inquired depend on how the queue is opened:

   - You can open a cluster queue for inquire plus one or more of the input, browse, or set operations. To do so, there must be a local instance of the cluster queue for the open to succeed. In this case, the attributes that can be inquired are the attributes that are valid for local queues.

     If the cluster queue is open for inquire without input, browse, or set specified, the call returns completion code MQCC_WARNING and reason code MQRC_SELECTOR_NOT_FOR_TYPE (2068) if you attempt to inquire attributes which are valid only for local queues, and not cluster queues.
   - You can open a cluster queue for inquire while passing the base queue manager name of the connected queue manager.

     To do so, there must be a local instance of the cluster queue for the open to succeed. If the base queue manager is not passed, the call returns completion code MQCC_WARNING and reason code MQRC_SELECTOR_NOT_FOR_TYPE (2068) if you attempt to inquire attributes which are valid only for local queues, and not cluster queues
   - If the cluster queue is opened for inquire alone, or inquire and output, only the attributes listed can be inquired. The **QType** attribute has the value MQQT_CLUSTER in this case:
     - MQCA_Q_DESC
     - MQCA_Q_NAME
     - MQIA_DEF_BIND
     - MQIA_DEF_PERSISTENCE
     - MQIA_DEF_PRIORITY
     - MQIA_INHIBIT_PUT
     - MQIA_Q_TYPE

     You can open the cluster queue with no fixed binding. You can open it with MQOO_BIND_NOT_FIXED specified on the MQOPEN call. Alternatively, specify MQOO_BIND_AS_Q_DEF, and set the **DefBind** attribute of the queue to MQBND_BIND_NOT_FIXED. If you open a cluster queue with no fixed binding, successive MQINQ calls for the queue might inquire different instances of the cluster queue. However, it is typical for all the instances have the same attribute values.
   - An alias queue object can be defined for a cluster. Because TARGTYPE and TARGET are not cluster attributes, the process performing an MQOPEN process on the alias queue is not aware of the object to which the alias resolves.

     During the initial MQOPEN, the alias queue resolves to a queue manager and a queue in the cluster. Name resolution takes place again at the remote queue manager and it is here that the TARGTPYE of the alias queue is resolved.

     If the alias queue resolves to a topic alias, then publication of messages put to the alias queue takes place at this remote queue manager.

See Cluster queues

5. You might want to inquire a number of attributes, and then set some of them using the MQSET call. To program inquire and set efficiently, position the attributes to be set at the beginning of the selector arrays. If you do so, the same arrays with reduced counts can be used for MQSET.
6. If more than one of the warning situations arise (see the *CompCode* parameter), the reason code returned is the first one in the following list that applies:
   a. MQRC_SELECTOR_NOT_FOR_TYPE
   b. MQRC_INT_ATTR_COUNT_TOO_SMALL
   c. MQRC_CHAR_ATTRS_TOO_SHORT
7. The following topic have information about object attributes:
   - "Attributes for queues" on page 810
   - "Attributes for namelists" on page 841
   - "Attributes for process definitions" on page 843
   - "Attributes for the queue manager" on page 777

## C invocation

```
MQINQ (Hconn, Hobj, SelectorCount, Selectors, IntAttrCount, IntAttrs,
      CharAttrLength, CharAttrs, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;           /* Connection handle */
MQHOBJ   Hobj;            /* Object handle */
MQLONG   SelectorCount;   /* Count of selectors */
MQLONG   Selectors[n];    /* Array of attribute selectors */
MQLONG   IntAttrCount;    /* Count of integer attributes */
MQLONG   IntAttrs[n];     /* Array of integer attributes */
MQLONG   CharAttrLength;  /* Length of character attributes buffer */
MQCHAR   CharAttrs[n];    /* Character attributes */
MQLONG   CompCode;        /* Completion code */
MQLONG   Reason;          /* Reason code qualifying CompCode */
```

## COBOL invocation

```
     CALL 'MQINQ' USING HCONN, HOBJ, SELECTORCOUNT, SELECTORS-TABLE,
                        INTATTRCOUNT, INTATTRS-TABLE, CHARATTRLENGTH,
                        CHARATTRS, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN            PIC S9(9) BINARY.
**   Object handle
 01  HOBJ             PIC S9(9) BINARY.
**   Count of selectors
 01  SELECTORCOUNT    PIC S9(9) BINARY.
**   Array of attribute selectors
 01  SELECTORS-TABLE.
  02  SELECTORS        PIC S9(9) BINARY OCCURS n TIMES.
**   Count of integer attributes
 01  INTATTRCOUNT     PIC S9(9) BINARY.
**   Array of integer attributes
 01  INTATTRS-TABLE.
  02  INTATTRS         PIC S9(9) BINARY OCCURS n TIMES.
**   Length of character attributes buffer
 01  CHARATTRLENGTH   PIC S9(9) BINARY.
**   Character attributes
 01  CHARATTRS        PIC X(n).
**   Completion code
```

```
 01  COMPCODE         PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON           PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQINQ (Hconn, Hobj, SelectorCount, Selectors, IntAttrCount,
           IntAttrs, CharAttrLength, CharAttrs, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn           fixed bin(31);  /* Connection handle */
dcl Hobj            fixed bin(31);  /* Object handle */
dcl SelectorCount   fixed bin(31);  /* Count of selectors */
dcl Selectors(n)    fixed bin(31);  /* Array of attribute selectors */
dcl IntAttrCount    fixed bin(31);  /* Count of integer attributes */
dcl IntAttrs(n)     fixed bin(31);  /* Array of integer attributes */
dcl CharAttrLength  fixed bin(31);  /* Length of character attributes
                                       buffer */
dcl CharAttrs       char(n);        /* Character attributes */
dcl CompCode        fixed bin(31);  /* Completion code */
dcl Reason          fixed bin(31);  /* Reason code qualifying
                                       CompCode */
```

## High Level Assembler invocation

```
         CALL MQINQ,(HCONN,HOBJ,SELECTORCOUNT,SELECTORS,INTATTRCOUNT,  X
               INTATTRS,CHARATTRLENGTH,CHARATTRS,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN           DS  F      Connection handle
HOBJ            DS  F      Object handle
SELECTORCOUNT   DS  F      Count of selectors
SELECTORS       DS  (n)F   Array of attribute selectors
INTATTRCOUNT    DS  F      Count of integer attributes
INTATTRS        DS  (n)F   Array of integer attributes
CHARATTRLENGTH  DS  F      Length of character attributes buffer
CHARATTRS       DS  CL(n)  Character attributes
COMPCODE        DS  F      Completion code
REASON          DS  F      Reason code qualifying COMPCODE
```

## Visual Basic invocation

```
MQINQ Hconn, Hobj, SelectorCount, Selectors, IntAttrCount, IntAttrs,
      CharAttrLength, CharAttrs, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Hconn          As Long   'Connection handle'
Dim Hobj           As Long   'Object handle'
Dim SelectorCount  As Long   'Count of selectors'
Dim Selectors      As Long   'Array of attribute selectors'
Dim IntAttrCount   As Long   'Count of integer attributes'
Dim IntAttrs       As Long   'Array of integer attributes'
Dim CharAttrLength As Long   'Length of character attributes buffer'
Dim CharAttrs      As String 'Character attributes'
Dim CompCode       As Long   'Completion code'
Dim Reason         As Long   'Reason code qualifying CompCode'
```

## MQINQMP - Inquire message property

The MQINQMP call returns the value of a property of a message.

### Syntax

MQINQMP (*Hconn*, *Hmsg*, *InqPropOpts*, *Name*, *PropDesc*, *Type*, *ValueLength*, *Value*, *DataLength*, *CompCode*, *Reason*)

### Parameters

***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* must match the connection handle that was used to create the message handle specified in the *Hmsg* parameter.

If the message handle was created using MQHC_UNASSOCIATED_HCONN then a valid connection must be established on the thread inquiring a property of the message handle otherwise the call fails with MQRC_CONNECTION_BROKEN.

***Hmsg***

Type: MQHMSG - input

This is the message handle to be inquired. The value was returned by a previous **MQCRTMH** call.

***InqPropOpts***

Type: MQIMPO - input/output

See the MQIMPO data type for details.

***Name***

Type: MQCHARV - input/output

The name of the property to inquire.

If no property with this name can be found, the call fails with reason MQRC_PROPERTY_NOT_AVAILABLE.

You can use the wildcard character percent sign (%) at the end of the property name. The wildcard matches zero or more characters, including the period (.) character. This allows an application to inquire the value of many properties. Call MQINQMP with option MQIMPO_INQ_FIRST to get the first matching property and again with the option MQIMPO_INQ_NEXT to get the next matching property. When no more matching properties are available, the call fails with MQRC_PROPERTY_NOT_AVAILABLE. If the *ReturnedName* field of the InqPropOpts structure is initialized with an address or offset for the returned name of the property, this is completed on return from MQINQMP with the name of the property that has been matched. If the *VSBufSize* field of the *ReturnedName* in the InqPropOpts structure is less than the length of the returned property name the completion code is set MQCC_FAILED with reason MQRC_PROPERTY_NAME_TOO_BIG.

Properties that have known synonyms are returned as follows:

1. Properties with the prefix "mqps." are returned as the IBM MQ property name. For example, "MQTopicString" is the returned name rather than "mqps.Top"
2. Properties with the prefix "jms." or "mcd." are returned as the JMS header field name, for example, "JMSExpiration" is the returned name rather than "jms.Exp".
3. Properties with the prefix "usr." are returned without that prefix, for example, "Color" is returned rather than "usr.Color".

Properties with synonyms are only returned once.

In the C programming language, the following macro variables are defined for inquiring on all properties and then all properties that begin "usr.":

**MQPROP_INQUIRE_ALL**
Inquire on all properties of the message.

MQPROP_INQUIRE_ALL can be used in the following way:

```
MQCHARV Name = {MQPROP_INQUIRE_ALL};
```

**MQPROP_INQUIRE_ALL_USR**
Inquire on all properties of the message that start "usr.". The returned name is returned without the "usr." prefix.

If MQIMP_INQ_NEXT is specified but Name has changed since the previous call or this is the first call, then MQIMPO_INQ_FIRST is implied.

See Property names and Property name restrictions for further information about the use of property names.

***PropDesc***
Type: MQPD - output

This structure is used to define the attributes of a property, including what happens if the property is not supported, what message context the property belongs to, and what messages the property should be copied into. See MQPD for details of this structure.

***Type***
Type: MQLONG - input/output

On return from the MQINQMP call this parameter is set to the data type of *Value*. The data type can be any of the following:

**MQTYPE_BOOLEAN**
A boolean.

**MQTYPE_BYTE_STRING**
a byte string.

**MQTYPE_INT8**
An 8-bit signed integer.

**MQTYPE_INT16**
A 16-bit signed integer.

**MQTYPE_INT32**
A 32-bit signed integer.

**MQTYPE_INT64**
A 64-bit signed integer.

**MQTYPE_FLOAT32**
A 32-bit floating-point number.

**MQTYPE_FLOAT64**
A 64-bit floating-point number.

**MQTYPE_STRING**
A character string.

**MQTYPE_NULL**
The property exists but has a null value.

If the data type of the property value is not recognized then MQTYPE_STRING is returned and a string representation of the value is placed into the *Value* area. A string representation of the data type can be found in the *TypeString* field of the *InqPropOpts* parameter. A warning completion code is returned with reason MQRC_PROP_TYPE_NOT_SUPPORTED.

Additionally, if the option MQIMPO_CONVERT_TYPE is specified, conversion of the property value is requested. Use *Type* as an input to specify the data type that you want the property to be returned

as. See the description of the MQIMPO_CONVERT_TYPE option of the MQIMPO structure for details of data type conversion.

If you do not request type conversion, you can use the following value on input:

**MQTYPE_AS_SET**
The value of the property is returned without converting its data type.

***ValueLength***
Type: MQLONG - input

The length in bytes of the Value area. Specify zero for properties that you do not require the value returned for. These could be properties which are designed by an application to have a null value or an empty string. Also specify zero if the MQIMPO_QUERY_LENGTH option has been specified; in this case no value is returned.

***Value***
Type: MQBYTEx *ValueLength* - output

This is the area to contain the inquired property value. The buffer should be aligned on a boundary appropriate for the value being returned. Failure to do so can result in an error when the value is later accessed.

If *ValueLength* is less than the length of the property value, as much of the property value as possible is moved into *Value* and the call fails with completion code MQCC_FAILED and reason MQRC_PROPERTY_VALUE_TOO_BIG.

The character set of the data in *Value* is given by the ReturnedCCSID field in the InqPropOpts parameter. The encoding of the data in *Value* is given by the ReturnedEncoding field in the InqPropOpts parameter.

In the C programming language, the parameter is declared as a pointer-to-void; the address of any type of data can be specified as the parameter.

If the *ValueLength* parameter is zero, *Value* is not referred to and its value passed by programs written in C or System/390 assembler can be null.

***DataLength***
Type: MQLONG - output

This is the length in bytes of the actual property value as returned in the *Value* area.

If *DataLength* is less than the property value length, *DataLength* is still filled in on return from the MQINQMP call. This allows the application to determine the size of the buffer required to accommodate the property value, and then reissue the call with a buffer of the appropriate size.

The following values can also be returned.

If the *Type* parameter is set to MQTYPE_STRING or MQTYPE_BYTE_STRING:

**MQVL_EMPTY_STRING**
The property exists but contains no characters or bytes.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_WARNING**
Warning (partial completion).

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_WARNING:

**MQRC_PROP_NAME_NOT_CONVERTED**
(2492, X'09BC') Returned property name not converted.

**MQRC_PROP_VALUE_NOT_CONVERTED**
(2466, X'09A2') Property value not converted.

**MQRC_PROP_TYPE_NOT_SUPPORTED**
(2467, X'09A3') Property data type is not supported.

**MQRC_RFH_FORMAT_ERROR**
(2421, X'0975') An MQRFH2 folder containing properties could not be parsed.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'089C') Adapter not available.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'0852') Unable to load adapter service module.

**MQRC_ASID_MISMATCH**
(2157, X'086D') Primary and home ASIDs differ.

**MQRC_BUFFER_ERROR**
(2004, X'07D4') Value parameter not valid.

**MQRC_BUFFER_LENGTH_ERROR**
(2005, X'07D5') Value length parameter not valid.

**MQRC_CALL_IN_PROGRESS**
(2219, X'08AB') MQI call entered before previous call completed.

**MQRC_CONNECTION_BROKEN**
(2009, X'07D9') Connection to queue manager lost.

**MQRC_DATA_LENGTH_ERROR**
(2010, X'07DA') Data length parameter not valid.

**MQRC_IMPO_ERROR**
(2464, X'09A0') Inquire message property options structure not valid.

**MQRC_HMSG_ERROR**
(2460, X'099C') Message handle not valid.

**MQRC_MSG_HANDLE_IN_USE**
(2499, X'09C3') Message handle already in use.

**MQRC_OPTIONS_ERROR**
(2046, X'07F8') Options not valid or not consistent.

**MQRC_PD_ERROR**
(2482, X'09B2') Property descriptor structure not valid.

**MQRC_PROP_CONV_NOT_SUPPORTED**
(2470, X'09A6') Conversion from the actual to requested data type not supported.

**MQRC_PROPERTY_NAME_ERROR**
(2442, X'098A') Invalid property name.

**MQRC_PROPERTY_NAME_TOO_BIG**
(2465, X'09A1') Property name too large for returned name buffer.

**MQRC_PROPERTY_NOT_AVAILABLE**
(2471, X'09A7) Property not available.

**MQRC_PROPERTY_VALUE_TOO_BIG**
(2469, X'09A5') Property value too large for the Value area.

**MQRC_PROP_NUMBER_FORMAT_ERROR**
(2472, X'09A8') Number format error encountered in value data.

**MQRC_PROPERTY_TYPE_ERROR**
(2473, X'09A9') Invalid requested property type.

**MQRC_SOURCE_CCSID_ERROR**
(2111, X'083F') Property name coded character set identifier not valid.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'0871') Insufficient storage available.

**MQRC_UNEXPECTED_ERROR**
(2195, X'0893') Unexpected error occurred.

For detailed information about these codes, see Messages and reason codes.

## C invocation

```
MQINQMP (Hconn, Hmsg, &InqPropOpts, &Name, &PropDesc, &Type,
ValueLength, Value, &DataLength, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN Hconn;       /* Connection handle */
MQHMSG  Hmsg;        /* Message handle */
MQIMPO  InqPropOpts; /* Options that control the action of MQINQMP */
MQCHARV Name;        /* Property name */
MQPD    PropDesc;    /* Property descriptor */
MQLONG  Type;        /* Property data type */
MQLONG  ValueLength; /* Length in bytes of the Value area */
MQBYTE  Value[n];    /* Area to contain the property value */
MQLONG  DataLength;  /* Length of the property value */
MQLONG  CompCode;    /* Completion code */
MQLONG  Reason;      /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQINQMP' USING HCONN, HMSG, INQMSGOPTS, NAME, PROPDESC, TYPE,
VALUELENGTH, VALUE, DATALENGTH, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN       PIC S9(9) BINARY.
**   Message handle
 01  HMSG            PIC S9(18) BINARY.
**   Options that control the action of MQINQMP
 01  INQMSGOPTS.
     COPY CMQIMPOV.
**   Property name
 01  NAME.
     COPY CMQCHRVV.
**   Property descriptor
 01  PROPDESC.
     COPY CMQPDV.
**   Property data type
 01  TYPE        PIC S9(9) BINARY.
**   Length in bytes of the VALUE area
 01  VALUELENGTH PIC S9(9) BINARY.
**   Area to contain the property value
 01  VALUE       PIC X(n).
**   Length of the property value
 01  DATALENGTH  PIC S9(9) BINARY.
**   Completion code
 01  COMPCODE    PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON      PIC S9(9) BINARY.
```

### PL/I invocation

```
call MQINQMP (Hconn, Hmsg, InqPropOpts, Name, PropDesc, Type,
ValueLength, Value, DataLength, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn       fixed bin(31);  /* Connection handle */
dcl Hmsg        fixed bin(63);  /* Message handle */
dcl InqPropOpts like MQIMPO;    /* Options that control the action of MQINQMP */
dcl Name        like MQCHARV;   /* Property name */
dcl PropDesc    like MQPD;      /* Property descriptor */
dcl Type        fixed bin (31); /* Property data type */
dcl ValueLength fixed bin (31); /* Length in bytes of the Value area */
dcl Value       char (n);       /* Area to contain the property value */
dcl DataLength  fixed bin (31); /* Length of the property value */
dcl CompCode    fixed bin (31); /* Completion code */
dcl Reason      fixed bin (31); /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
CALL MQINQMP,(HCONN,HMSG,INQMSGOPTS,NAME,PROPDESC,TYPE,
VALUELENGTH,VALUE,DATALENGTH,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN        DS         F     Connection handle
HMSG         DS         D     Message handle
INQMSGOPTS   CMQIMPOA   ,     Options that control the action of MQINQMP
NAME         CMQCHRVA   ,     Property name
PROPDESC     CMQPDA     ,     Property descriptor
TYPE         DS         F     Property data type
VALUELENGTH  DS         F     Length in bytes of the VALUE area
VALUE        DS         CL(n) Area to contain the property value
DATALENGTH   DS         F     Length of the property value
COMPCODE     DS         F     Completion code
REASON       DS         F     Reason code qualifying COMPCODE
```

## MQMHBUF - Convert message handle into buffer

The MQMHBUF call converts a message handle into a buffer and is the inverse of the MQBUFMH call.

### Syntax

MQMHBUF (*Hconn*, *Hmsg*, *MsgHBufOpts*, *Name*, *MsgDesc*, *BufferLength*, *Buffer*, *DataLength*, *CompCode*, *Reason*)

### Parameters

***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* must match the connection handle that was used to create the message handle specified in the *Hmsg* parameter.

If the message handle was created using MQHC_UNASSOCIATED_HCONN, a valid connection must be established on the thread deleting the message handle. If a valid connection is not established, the call fails with MQRC_CONNECTION_BROKEN.

***Hmsg***

Type: MQHMSG - input

This is the message handle for which a buffer is required. The value was returned by a previous MQCRTMH call.

***MsgHBufOpts***
Type: MQMHBO - input

The MQMHBO structure allows applications to specify options that control how buffers are produced from message handles.

See "MQMHBO - Message handle to buffer options" on page 458 for details.

***Name***
Type: MQCHARV - input

The name of the property or properties to put into the buffer.

If no property matching the name can be found, the call fails with MQRC_PROPERTY_NOT_AVAILABLE.

You can use a wildcard to put more than one property into the buffer. To do this, use the wildcard character '%' at the end of the property name. This wildcard matches zero or more characters, including the '.' character.

In the C programming language, the following macro variables are defined for inquiring on all properties and all properties that begin 'usr':

**MQPROP_INQUIRE_ALL**
Put all properties of the message into the buffer

**MQPROP_INQUIRE_ALL_USR**
Put all properties of the message that start with the characters 'usr.' into the buffer.

See Property names and Property name restrictions for further information about the use of property names.

***MsgDesc***
Type: MQMD - input/output

The *MsgDesc* structure describes the contents of the buffer area.

On output, the *Encoding*, *CodedCharSetId* and *Format* fields are set to correctly describe the encoding, character set identifier, and format of the data in the buffer area as written by the call.

Data in this structure is in the character set and encoding of the application.

***BufferLength***
Type: MQLONG - input

*BufferLength* is the length of the Buffer area, in bytes.

***Buffer***
Type: MQBYTExBufferLength - output

*Buffer* defines the area to contain the message properties. You must align the buffer on a 4-byte boundary.

If *BufferLength* is less than the length required to store the properties in *Buffer*, MQMHBUF fails with MQRC_PROPERTY_VALUE_TOO_BIG.

The contents of the buffer can change even if the call fails.

***DataLength***
Type: MQLONG - output

*DataLength* is the length, in bytes, of the returned properties in the buffer. If the value is zero, no properties matched the value given in *Name* and the call fails with reason code MQRC_PROPERTY_NOT_AVAILABLE.

If *BufferLength* is less than the length required to store the properties in the buffer, the MQMHBUF call fails with MQRC_PROPERTY_VALUE_TOO_BIG, but a value is still entered into *DataLength*. This

allows the application to determine the size of the buffer required to accommodate the properties, and then reissue the call with the required *BufferLength*.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

The reason code qualifying *CompCode*.

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'089C') Adapter not available.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_MHBO_ERROR**
(2501, X'095C') Message handle to buffer options structure not valid.

**MQRC_BUFFER_ERROR**
(2004, X'07D4') Buffer parameter not valid.

**MQRC_BUFFER_LENGTH_ERROR**
(2005, X'07D5') Buffer length parameter not valid.

**MQRC_CALL_IN_PROGRESS**
(2219, X'08AB') MQI call entered before previous call completed.

**MQRC_CONNECTION_BROKEN**
(2009, X'07D9') Connection to queue manager lost.

**MQRC_DATA_LENGTH_ERROR**
(2010, X'07DA') Data length parameter not valid.

**MQRC_HMSG_ERROR**
(2460, X'099C') Message handle not valid.

**MQRC_MD_ERROR**
(2026, X'07EA') Message descriptor not valid.

**MQRC_MSG_HANDLE_IN_USE**
(2499, X'09C3') Message handle already in use.

**MQRC_OPTIONS_ERROR**
(2046, X'07FE') Options not valid or not consistent.

**MQRC_PROPERTY_NAME_ERROR**
(2442, X'098A') Property name is not valid.

**MQRC_PROPERTY_NOT_AVAILABLE**
(2471, X'09A7') Property not available.

**MQRC_PROPERTY_VALUE_TOO_BIG**
(2469, X'09A5') BufferLength value is too small to contain specified properties.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Messages and reason codes.

## C invocation

```
MQMHBUF (Hconn, Hmsg, &MsgHBufOpts, &Name, &MsgDesc, BufferLength, Buffer,
         &DataLength, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN Hconn;        /* Connection handle */
MQHMSG  Hmsg;         /* Message handle */
MQMHBO  MsgHBufOpts;  /* Options that control the action of MQMHBUF */
MQCHARV Name;         /* Property name */
MQMD    MsgDesc;      /* Message descriptor */
MQLONG  BufferLength; /* Length in bytes of the Buffer area */
MQBYTE  Buffer[n];    /* Area to contain the properties */
MQLONG  DataLength;   /* Length of the properties */
MQLONG  CompCode;     /* Completion code */
MQLONG  Reason;       /* Reason code qualifying CompCode */
```

## Usage notes

MQMHBUF converts a message handle into a buffer.

You can use it with an MQGET API exit to access certain properties, using the message property APIs, and then pass these in a buffer back to an application designed to use MQRFH2 headers rather than message handles.

This call is the inverse of the MQBUFMH call, which you can use to parse message properties from a buffer into a message handle.

## COBOL invocation

```
     CALL 'MQMHBUF' USING HCONN, HMSG, MSGHBUFOPTS, NAME, MSGDESC,
                          BUFFERLENGTH, BUFFER, DATALENGTH, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN         PIC S9(9) BINARY.
**   Message handle
 01  HMSG          PIC S9(18) BINARY.
**   Options that control the action of MQMHBUF
 01  MSGHBUFOPTS.
     COPY CMQMHBOV.
**   Property name
 01  NAME
     COPY CMQCHRVV.
**   Message descriptor
 01  MSGDESC
     COPY CMQMDV.
**   Length in bytes of the Buffer area */
 01  BUFFERLENGTH  PIC S9(9) BINARY.
**   Area to contain the properties
 01  BUFFER        PIC X(n).
**   Length of the properties
 01  DATALENGTH    PIC S9(9) BINARY.
**   Completion code
 01  COMPCODE      PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON        PIC S9(9) BINARY.
```

### PL/I invocation

```
call MQMHBUF (Hconn, Hmsg, MsgHBufOpts, Name, MsgDesc, BufferLength, Buffer,
DataLength, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn        fixed bin(31); /* Connection handle */
dcl Hmsg         fixed bin(63); /* Message handle */
dcl MsgHBufOpts  like MQMHBO;   /* Options that control the action of MQMHBUF */
dcl Name         like MQCHARV;  /* Property name */
dcl MsgDesc      like MQMD;     /* Message descriptor */
dcl BufferLength fixed bin(31); /* Length in bytes of the Buffer area */
dcl Buffer       char(n);       /* Area to contain the properties */
dcl DataLength   fixed bin(31); /* Length of the properties */
dcl CompCode     fixed bin(31); /* Completion code */
dcl Reason       fixed bin(31); /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
CALL MQMHBUF,(HCONN,HMSG,MSGHBUFOPTS,NAME,MSGDESC,BUFFERLENGTH,
               BUFFER,DATALENGTH,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN        DS       F      Connection handle
HMSG         DS       D      Message handle
MSGHBUFOPTS  CMQMHBOA ,      Options that control the action of MQMHBUF
NAME         CMQCHRVA ,      Property name
MSGDESC      CMQMDA   ,      Message descriptor
BUFFERLENGTH DS       F      Length in bytes of the BUFFER area
BUFFER       DS       CL(n)  Area to contain the properties
DATALENGTH   DS       F      Length of the properties
COMPCODE     DS       F      Completion code
REASON       DS       F      Reason code qualifying COMPCODE
```

## MQOPEN - Open object

The MQOPEN call establishes access to an object.

The following types of object are valid:

- Queue (including distribution lists)
- Namelist
- Process definition
- Queue manager
- Topic

### Syntax

MQOPEN (*Hconn*, *ObjDesc*, *Options*, *Hobj*, *CompCode*, *Reason*)

### Parameters

***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn* :

**MQHC_DEF_HCONN**
Default connection handle.

**Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

***ObjDesc***
Type: MQOD - input/output

This is a structure that identifies the object to be opened; see "MQOD - Object descriptor" on page 460 for details.

If the *ObjectName* field in the *ObjDesc* parameter is the name of a model queue, a dynamic local queue is created with the attributes of the model queue; this happens whatever options you specify on the *Options* parameter. Subsequent operations using the *Hobj* returned by the MQOPEN call are performed on the new dynamic queue, and not on the model queue. This is true even for the MQINQ and MQSET calls. The name of the model queue in the *ObjDesc* parameter is replaced with the name of the dynamic queue created. The type of the dynamic queue is determined by the value of the *DefinitionType* attribute of the model queue (see "Attributes for queues" on page 810 ). For information about the close options applicable to dynamic queues, see the description of the MQCLOSE call.

***Options***
Type: MQLONG - input

You must specify at least one of the following options:

- MQOO_BROWSE
- MQOO_INPUT_* (only one of these)
- MQOO_INQUIRE
- MQOO_OUTPUT
- MQOO_SET
- MQOO_BIND_* (only one of these)

See the following table for details of these options; other options can be specified as required. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations). Combinations that are not valid are noted; all other combinations are valid. Only options that are applicable to the type of object specified by *ObjDesc* are allowed. The following table shows valid MQOPEN options for queries and topics.

| Option | Alias [1] | Local and Model | Remote | Nonlocal Cluster | Distribution list | Topic |
|---|---|---|---|---|---|---|
| MQOO_INPUT_AS_Q_DEF | Yes | Yes | No | No | No | No |
| MQOO_INPUT_SHARED | Yes | Yes | No | No | No | No |
| MQOO_INPUT_EXCLUSIVE | Yes | Yes | No | No | No | No |
| MQOO_OUTPUT | Yes | Yes | Yes | Yes | Yes | Yes |
| MQOO_BROWSE | Yes | Yes | No | No | No | No |
| MQOO_CO_OP | Yes | Yes | No | No | No | No |
| MQOO_INQUIRE | Yes | Yes | [2] | Yes | No | No |
| MQOO_SET | Yes | Yes | [2] | No | No | No |
| MQOO_BIND_ON_OPEN [3] | Yes | Yes | Yes | Yes | Yes | No |

| Option | Alias [1] | Local and Model | Remote | Nonlocal Cluster | Distribution list | Topic |
|---|---|---|---|---|---|---|
| MQOO_BIND_NOT_FIXED [3] | Yes | Yes | Yes | Yes | Yes | No |
| MQOO_BIND_ON_GROUP [3] | Yes | Yes | Yes | Yes | Yes | No |
| MQOO_BIND_AS_Q_DEF [3] | Yes | Yes | Yes | Yes | Yes | No |
| MQOO_SAVE_ALL_CONTEXT | Yes | Yes | No | No | No | No |
| MQOO_PASS_IDENTITY_CONTEXT | Yes | Yes | Yes | Yes | Yes | [4] |
| MQOO_PASS_ALL_CONTEXT | Yes | Yes | Yes | Yes | Yes | Yes |
| MQOO_SET_IDENTITY_CONTEXT | Yes | Yes | Yes | Yes | Yes | [4] |
| MQOO_SET_ALL_CONTEXT | Yes | Yes | Yes | Yes | Yes | Yes |
| MQOO_NO_READ_AHEAD | Yes | Yes | No | No | No | No |
| MQOO_READ_AHEAD | Yes | Yes | No | No | No | No |
| MQOO_READ_AHEAD_AS_Q_DEF | Yes | Yes | No | No | No | No |
| MQOO_ALTERNATE_USER_AUTHORITY | Yes | Yes | Yes | Yes | Yes | Yes |
| MQOO_FAIL_IF_QUIESCING | Yes | Yes | Yes | Yes | Yes | Yes |
| MQOO_RESOLVE_LOCAL_Q | Yes | Yes | Yes | Yes | No | No |
| MQOO_RESOLVE_LOCAL_TOPIC | No | No | No | No | No | Yes |
| MQOO_NO_MULTICAST | No | No | No | No | No | Yes |

**Notes:**

1. The validity of options for aliases depends on the validity of the option for the queue to which the alias resolves.
2. This option is valid only for the local definition of a remote queue.
3. This option can be specified for any queue type, but is ignored if the queue is not a cluster queue. However, the *DefBind* queue attribute overrides the base queue even when the alias queue is not in a cluster.
4. These attributes can be used with a topic, but affect only the context set for the retained message, not the context fields sent to any subscriber.

**Access options**: The following options control the type of operations that can be performed on the object:

**MQOO_INPUT_AS_Q_DEF**
Open queue to get messages using queue-defined default.

The queue is opened for use with subsequent MQGET calls. The type of access is either shared or exclusive, depending on the value of the *DefInputOpenOption* queue attribute; see "Attributes for queues" on page 810 for details.

This option is valid only for local, alias, and model queues; it is not valid for remote queues, distribution lists, and objects that are not queues.

**MQOO_INPUT_SHARED**
Open queue to get messages with shared access.

The queue is opened for use with subsequent MQGET calls. The call can succeed if the queue is currently open by this or another application with MQOO_INPUT_SHARED, but fails with reason code MQRC_OBJECT_IN_USE if the queue is currently open with MQOO_INPUT_EXCLUSIVE.

This option is valid only for local, alias, and model queues; it is not valid for remote queues, distribution lists, and objects that are not queues.

**MQOO_INPUT_EXCLUSIVE**
Open queue to get messages with exclusive access.

The queue is opened for use with subsequent MQGET calls. The call fails with reason code MQRC_OBJECT_IN_USE if the queue is currently open by this or another application for input of any type (MQOO_INPUT_SHARED or MQOO_INPUT_EXCLUSIVE).

This option is valid only for local, alias, and model queues; it is not valid for remote queues, distribution lists, and objects that are not queues.

**MQOO_OUTPUT**

Open queue to put messages, or a topic or topic string to publish messages.

The queue or topic is opened for use with subsequent MQPUT calls.

An MQOPEN call with this option can succeed even if the *InhibitPut* queue attribute is set to MQQA_PUT_INHIBITED (although subsequent MQPUT calls fail while the attribute is set to this value).

This option is valid for all types of queue, including distribution lists, and topics.

The following notes apply to these options:

- Only one of these options can be specified.
- An MQOPEN call with one of these options can succeed even if the *InhibitGet* queue attribute is set to MQQA_GET_INHIBITED (although subsequent MQGET calls fail while the attribute is set to this value).
- If the queue is defined as not being shareable (that is, the *Shareability* queue attribute has the value MQQA_NOT_SHAREABLE), attempts to open the queue for shared access are treated as attempts to open the queue with exclusive access.
- If an alias queue is opened with one of these options, the test for exclusive use (or for whether another application has exclusive use) is against the base queue to which the alias resolves.
- These options are not valid if *ObjectQMgrName* is the name of a queue manager alias; this is true even if the value of the *RemoteQMgrName* attribute in the local definition of a remote queue used for queue-manager aliasing is the name of the local queue manager.

**MQOO_BROWSE**

Open queue to browse messages.

The queue is opened for use with subsequent MQGET calls with one of the following options:

- MQGMO_BROWSE_FIRST
- MQGMO_BROWSE_NEXT
- MQGMO_BROWSE_MSG_UNDER_CURSOR

This is allowed even if the queue is currently open for MQOO_INPUT_EXCLUSIVE. An MQOPEN call with the MQOO_BROWSE option establishes a browse cursor, and positions it logically before the first message on the queue; see MQGMO - Options field for further information.

This option is valid only for local, alias, and model queues; it is not valid for remote queues, distribution lists, and objects that are not queues. It is also not valid if *ObjectQMgrName* is the name of a queue manager alias; this is true even if the value of the *RemoteQMgrName* attribute in the local definition of a remote queue used for queue-manager aliasing is the name of the local queue manager.

**MQOO_CO_OP**

Open as a cooperating member of the set of handles.

This option is valid only with the MQOO_BROWSE option. If it is specified without MQOO_BROWSE, MQOPEN returns with MQRC_OPTIONS_ERROR.

The handle returned is considered to be a member of a cooperating set of handles for subsequent MQGET calls with one of the following options:

- MQGMO_MARK_BROWSE_CO_OP
- MQGMO_UNMARKED_BROWSE_MSG

- MQGMO_UNMARK_BROWSE_CO_OP

This option is valid only for local, alias, and model queues; it is not valid for remote queues, distribution lists, and objects that are not queues.

**MQOO_INQUIRE**
Open object to inquire attributes.

The queue, namelist, process definition, or queue manager is opened for use with subsequent MQINQ calls.

This option is valid for all types of object other than distribution lists. It is not valid if *ObjectQMgrName* is the name of a queue manager alias; this is true even if the value of the *RemoteQMgrName* attribute in the local definition of a remote queue used for queue-manager aliasing is the name of the local queue manager.

**MQOO_SET**
Open queue to set attributes.

The queue is opened for use with subsequent MQSET calls.

This option is valid for all types of queue other than distribution lists. It is not valid if *ObjectQMgrName* is the name of a local definition of a remote queue; this is true even if the value of the *RemoteQMgrName* attribute in the local definition of a remote queue used for queue-manager aliasing is the name of the local queue manager.

**Binding options**: The following options apply when the object being opened is a cluster queue; these options control the binding of the queue handle to an instance of the cluster queue:

**MQOO_BIND_ON_OPEN**
The local queue manager binds the queue handle to an instance of the destination queue when the queue is opened. As a result, all messages put using this handle are sent to the same instance of the destination queue, and by the same route.

This option is valid only for queues, and affects only cluster queues. If specified for a queue that is not a cluster queue, the option is ignored.

**MQOO_BIND_NOT_FIXED**
This stops the local queue manager binding the queue handle to an instance of the destination queue. As a result, successive MQPUT calls using this handle send the messages to *different* instances of the destination queue, or to the same instance but by different routes. It also allows the instance selected to be changed later by the local queue manager, by a remote queue manager, or by a message channel agent (MCA), according to network conditions.

**Note:** Client and server applications that need to exchange a *series* of messages to complete a transaction must not use MQOO_BIND_NOT_FIXED (or MQOO_BIND_AS_Q_DEF when *DefBind* has the value MQBND_BIND_NOT_FIXED), because successive messages in the series might be sent to different instances of the server application.

If MQOO_BROWSE or one of the MQOO_INPUT_* options is specified for a cluster queue, the queue manager is forced to select the local instance of the cluster queue. As a result, the binding of the queue handle is fixed, even if MQOO_BIND_NOT_FIXED is specified.

If MQOO_INQUIRE is specified with MQOO_BIND_NOT_FIXED, successive MQINQ calls using that handle might inquire different instances of the cluster queue, although typically all the instances have the same attribute values.

MQOO_BIND_NOT_FIXED is valid only for queues, and affects only cluster queues. If specified for a queue that is not a cluster queue, the option is ignored.

**MQOO_BIND_ON_GROUP**
Allows an application to request that a group of messages are all allocated to the same destination instance.

This option is valid only for queues, and affects only cluster queues. If specified for a queue that is not a cluster queue, the option is ignored.

**MQOO_BIND_AS_Q_DEF**
The local queue manager binds the queue handle in the way defined by the *DefBind* queue attribute. The value of this attribute is either MQBND_BIND_ON_OPEN, MQBND_BIND_NOT_FIXED, or MQBND_BIND_ON_GROUP.

MQOO_BIND_AS_Q_DEF is the default when MQOO_BIND_ON_OPEN, MQOO_BIND_NOT_FIXED, or MQOO_BIND_ON_GROUP is not specified.

MQOO_BIND_AS_Q_DEF aids program documentation. It is not intended that this option is used with either of the other two bind options, but because its value is zero such use cannot be detected.

**Context options**: The following options control the processing of message context:

**MQOO_SAVE_ALL_CONTEXT**
Context information is associated with this queue handle. This information is set from the context of any message retrieved using this handle. For more information about message context, see Message context and Controlling context information.

This context information can be passed to a message that is then put on a queue using the MQPUT or MQPUT1 calls. See the MQPMO_PASS_IDENTITY_CONTEXT and MQPMO_PASS_ALL_CONTEXT options described in "MQPMO - Put-message options" on page 480.

Until a message has been successfully retrieved, context cannot be passed to a message being put on a queue.

A message retrieved using one of the MQGMO_BROWSE_* browse options does not have its context information saved (although the context fields in the *MsgDesc* parameter are set after a browse).

This option is valid only for local, alias, and model queues; it is not valid for remote queues, distribution lists, and objects that are not queues. One of the MQOO_INPUT_* options must be specified.

**MQOO_PASS_IDENTITY_CONTEXT**
This allows the MQPMO_PASS_IDENTITY_CONTEXT option to be specified in the *PutMsgOpts* parameter when a message is put on a queue; this gives the message the identity context information from an input queue that was opened with the MQOO_SAVE_ALL_CONTEXT option. For more information about message context, see Message context and Controlling context information.

The MQOO_OUTPUT option must be specified.

This option is valid for all types of queue, including distribution lists.

**MQOO_PASS_ALL_CONTEXT**
This allows the MQPMO_PASS_ALL_CONTEXT option to be specified in the *PutMsgOpts* parameter when a message is put on a queue; this gives the message the identity and origin context information from an input queue that was opened with the MQOO_SAVE_ALL_CONTEXT option. For more information about message context, see Message context and Controlling context information.

This option implies MQOO_PASS_IDENTITY_CONTEXT, which need not therefore be specified. The MQOO_OUTPUT option must be specified.

This option is valid for all types of queue, including distribution lists.

**MQOO_SET_IDENTITY_CONTEXT**
This allows the MQPMO_SET_IDENTITY_CONTEXT option to be specified in the *PutMsgOpts* parameter when a message is put on a queue; this gives the message the identity context information contained in the *MsgDesc* parameter specified on the MQPUT or MQPUT1 call. For more information about message context, see Message context and Controlling context information.

This option implies MQOO_PASS_IDENTITY_CONTEXT, which need not therefore be specified. The MQOO_OUTPUT option must be specified.

This option is valid for all types of queue, including distribution lists.

**MQOO_SET_ALL_CONTEXT**
This allows the MQPMO_SET_ALL_CONTEXT option to be specified in the *PutMsgOpts* parameter when a message is put on a queue; this gives the message the identity and origin context information contained in the *MsgDesc* parameter specified on the MQPUT or MQPUT1 call. For more information about message context, see Message context and Controlling context information.

This option implies the following options, which need not therefore be specified:

- MQOO_PASS_IDENTITY_CONTEXT
- MQOO_PASS_ALL_CONTEXT
- MQOO_SET_IDENTITY_CONTEXT

The MQOO_OUTPUT option must be specified.

This option is valid for all types of queue, including distribution lists.

**Read ahead options**:

When you call MQOPEN with MQOO_READ_AHEAD, the IBM MQ client only enables read-ahead if certain conditions are met. These conditions include:

- Both the client and remote queue manager must be at WebSphere MQ Version 7 or later.
- The client application must be compiled and linked against the threaded IBM MQ MQI client libraries.
- The client channel must be using TCP/IP protocol
- The channel must have a non-zero SharingConversations (SHARECNV) setting in both the client and server channel definitions.

The following options control whether non-persistent messages are sent to the client before an application requests them. The following notes apply to the read ahead options:

- Only one of these options can be specified.
- These options are valid only for local, alias, and model queues. They are not valid for remote queues, distribution lists, topics or queue managers.
- These options are only applicable when one of MQOO_BROWSE, MQOO_INPUT_SHARED and MQOO_INPUT_EXCLUSIVE are also specified although it is not an error to specify these options with MQOO_INQUIRE or MQOO_SET.
- If the application is not running as an IBM MQ client, these options are ignored.

**MQOO_NO_READ_AHEAD**
Non-persistent messages are not sent the client before an application requests them.

**MQOO_READ_AHEAD**
Non-persistent messages are sent to the client before an application requests them.

**MQOO_READ_AHEAD_AS_Q_DEF**
Read ahead behavior is determined by the default read ahead attribute of the queue being opened. This is the default value.

**Other options**: The following options control authorization checking, what happens when the queue manager is quiescing, whether to resolve the local queue name, and multicast:

**MQOO_ALTERNATE_USER_AUTHORITY**
The *AlternateUserId* field in the *ObjDesc* parameter contains a user identifier to use to validate this MQOPEN call. The call can succeed only if this *AlternateUserId* is authorized to open the object with the specified access options, regardless of whether the user identifier under which the application is running is authorized to do so. This does not apply to any context

options specified, however, which are always checked against the user identifier under which the application is running.

This option is valid for all types of object.

**MQOO_FAIL_IF_QUIESCING**
The MQOPEN call fails if the queue manager is in quiescing state.

On z/OS, for a CICS or IMS application, this option also forces the MQOPEN call to fail if the connection is in quiescing state.

This option is valid for all types of object.

For information about client channels see Overview of IBM MQ MQI clients.

**MQOO_RESOLVE_LOCAL_Q**
Fill the ResolvedQName in the MQOD structure with the name of the local queue that was opened. Similarly, the ResolvedQMgrName is filled with the name of the local queue manager hosting the local queue. If the MQOD structure is less than Version 3, MQOO_RESOLVE_LOCAL_Q is ignored with no error being returned.

The local queue is always returned when either a local, alias, or model queue is opened, but this is not the case when, for example, a remote queue or a non-local cluster queue is opened without the MQOO_RESOLVE_LOCAL_Q option; the ResolvedQName and ResolvedQMgrName are filled with the RemoteQName and RemoteQMgrName found in the remote queue definition, or similarly with the chosen remote cluster queue.

If you specify MQOO_RESOLVE_LOCAL_Q when opening, for example, a remote queue, ResolvedQName is the transmission queue to which messages are put. The ResolvedQMgrName is filled with the name of the local queue manager hosting the transmission queue.

If you are authorized for browse, input, or output on a queue, you have the required authority to specify this flag on the MQOPEN call. No special authority is needed.

This option is valid only for queues and queue managers.

**MQOO_RESOLVE_LOCAL_TOPIC**
Fill the ResolvedQName in the MQOD structure with the name of the administrative topic opened.

**MQOO_NO_MULTICAST**
Publication messages are not sent using multicast.

This option is valid only with the MQOO_OUTPUT option. If it is specified without MQOO_OUTPUT, MQOPEN returns with MQRC_OPTIONS_ERROR.

This option is valid only for a topic.

***Hobj***
Type: MQHOBJ - output

This handle represents the access that has been established to the object. It must be specified on subsequent IBM MQ calls that operate on the object. It ceases to be valid when the MQCLOSE call is issued, or when the unit of processing that defines the scope of the handle terminates.

The scope of the object handle returned is the same as the scope of the connection handle specified on the call. See MQCONN - Hconn parameter for information about handle scope.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_WARNING**
Warning (partial completion).

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

The reason code qualifying *CompCode*.

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_WARNING:

**MQRC_MULTIPLE_REASONS**
(2136, X'858') Multiple reason codes returned.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'89C') Adapter not available.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_ALIAS_BASE_Q_TYPE_ERROR**
(2001, X'7D1') Alias base queue not a valid type.

**MQRC_API_EXIT_ERROR**
(2374, X'946') API exit failed.

**MQRC_API_EXIT_LOAD_ERROR**
(2183, X'887') Unable to load API exit.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_CALL_IN_PROGRESS**
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC_CF_NOT_AVAILABLE**
(2345, X'929') Coupling facility not available.

**MQRC_CF_STRUC_AUTH_FAILED**
(2348, X'92C') Coupling-facility structure authorization check failed.

**MQRC_CF_STRUC_ERROR**
(2349, X'92D') Coupling-facility structure not valid.

**MQRC_CF_STRUC_FAILED**
(2373, X'945') Coupling-facility structure failed.

**MQRC_CF_STRUC_IN_USE**
(2346, X'92A') Coupling-facility structure in use.

**MQRC_CF_STRUC_LIST_HDR_IN_USE**
(2347, X'92B') Coupling-facility structure list-header in use.

**MQRC_CICS_WAIT_FAILED**
(2140, X'85C') Wait request rejected by CICS.

**MQRC_CLUSTER_EXIT_ERROR**
(2266, X'8DA') Cluster workload exit failed.

**MQRC_CLUSTER_PUT_INHIBITED**
(2268, X'8DC') Put calls inhibited for all queues in cluster.

**MQRC_CLUSTER_RESOLUTION_ERROR**
(2189, X'88D') Cluster name resolution failed.

**MQRC_CLUSTER_RESOURCE_ERROR**
(2269, X'8DD') Cluster resource error.

**MQRC_CONNECTION_BROKEN**
(2009, X'7D9') Connection to queue manager lost.

**MQRC_CONNECTION_NOT_AUTHORIZED**
(2217, X'8A9') Not authorized for connection.

**MQRC_CONNECTION_QUIESCING**
(2202, X'89A') Connection quiescing.

**MQRC_CONNECTION_STOPPING**
(2203, X'89B') Connection shutting down.

**MQRC_DB2_NOT_AVAILABLE**
(2342, X'926') Db2 subsystem not available.

**MQRC_DEF_XMIT_Q_TYPE_ERROR**
(2198, X'896') Default transmission queue not local.

**MQRC_DEF_XMIT_Q_USAGE_ERROR**
(2199, X'897') Default transmission queue usage error.

**MQRC_DYNAMIC_Q_NAME_ERROR**
(2011, X'7DB') Name of dynamic queue not valid.

**MQRC_HANDLE_NOT_AVAILABLE**
(2017, X'7E1') No more handles available.

**MQRC_HCONN_ERROR**
(2018, X'7E2') Connection handle not valid.

**MQRC_HOBJ_ERROR**
(2019, X'7E3') Object handle not valid.

**MQRC_MULTIPLE_REASONS**
(2136, X'858') Multiple reason codes returned.

**MQRC_NAME_IN_USE**
(2201, X'899') Name in use.

**MQRC_NAME_NOT_VALID_FOR_TYPE**
(2194, X'892') Object name not valid for object type.

**MQRC_NOT_AUTHORIZED**
(2035, X'7F3') Not authorized for access.

**MQRC_OBJECT_ALREADY_EXISTS**
(2100, X'834') Object exists.

**MQRC_OBJECT_DAMAGED**
(2101, X'835') Object damaged.

**MQRC_OBJECT_IN_USE**
(2042, X'7FA') Object already open with conflicting options.

**MQRC_OBJECT_LEVEL_INCOMPATIBLE**
(2360, X'938') Object level not compatible.

**MQRC_OBJECT_NAME_ERROR**
(2152, X'868') Object name not valid.

**MQRC_OBJECT_NOT_UNIQUE**
(2343, X'927') Object not unique.

**MQRC_OBJECT_Q_MGR_NAME_ERROR**
(2153, X'869') Object queue-manager name not valid.

**MQRC_OBJECT_RECORDS_ERROR**
(2155, X'86B') Object records not valid.

**MQRC_OBJECT_STRING_ERROR**
(2441, X'0989') Objectstring field not valid

**MQRC_OBJECT_TYPE_ERROR**
(2043, X'7FB') Object type not valid.

**MQRC_OD_ERROR**
(2044, X'7FC') Object descriptor structure not valid.

**MQRC_OPTION_NOT_VALID_FOR_TYPE**
(2045, X'7FD') Option not valid for object type.

**MQRC_OPTIONS_ERROR**
(2046, X'7FE') Options not valid or not consistent.

**MQRC_PAGESET_ERROR**
(2193, X'891') Error accessing page-set data set.

**MQRC_PAGESET_FULL**
(2192, X'890') External storage medium is full.

**MQRC_Q_DELETED**
(2052, X'804') Queue has been deleted.

**MQRC_Q_MGR_NAME_ERROR**
(2058, X'80A') Queue manager name not valid or not known.

**MQRC_Q_MGR_NOT_AVAILABLE**
(2059, X'80B') Queue manager not available for connection.

**MQRC_Q_MGR_QUIESCING**
(2161, X'871') Queue manager quiescing.

**MQRC_Q_MGR_STOPPING**
(2162, X'872') Queue manager shutting down.

**MQRC_Q_TYPE_ERROR**
(2057, X'809') Queue type not valid.

**MQRC_RECS_PRESENT_ERROR**
(2154, X'86A') Number of records present not valid.

**MQRC_REMOTE_Q_NAME_ERROR**
(2184, X'888') Remote queue name not valid.

**MQRC_RESOURCE_PROBLEM**
(2102, X'836') Insufficient system resources available.

**MQRC_RESPONSE_RECORDS_ERROR**
(2156, X'86C') Response records not valid.

**MQRC_SECURITY_ERROR**
(2063, X'80F') Security error occurred.

**MQRC_SELECTOR_SYNTAX_ERROR**
2459 (X'099B') An MQOPEN, MQPUT1 or MQSUB call was issued but a selection string was specified which contained a syntax error.

**MQRC_STOPPED_BY_CLUSTER_EXIT**
(2188, X'88C') Call rejected by cluster workload exit.

**MQRC_STORAGE_MEDIUM_FULL**
(2192, X'890') External storage medium is full.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_SUPPRESSED_BY_EXIT**
(2109, X'83D') Call suppressed by exit program.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

**MQRC_UNKNOWN_ALIAS_BASE_Q**
(2082, X'822') Unknown alias base queue.

**MQRC_UNKNOWN_DEF_XMIT_Q**
(2197, X'895') Unknown default transmission queue.

**MQRC_UNKNOWN_OBJECT_NAME**
(2085, X'825') Unknown object name.

**MQRC_UNKNOWN_OBJECT_Q_MGR**
(2086, X'826') Unknown object queue manager.

**MQRC_UNKNOWN_REMOTE_Q_MGR**
(2087, X'827') Unknown remote queue manager.

**MQRC_UNKNOWN_XMIT_Q**
(2196, X'894') Unknown transmission queue.

**MQRC_WRONG_CF_LEVEL**
(2366, X'93E') Coupling-facility structure is wrong level.

**MQRC_XMIT_Q_TYPE_ERROR**
(2091, X'82B') Transmission queue not local.

**MQRC_XMIT_Q_USAGE_ERROR**
(2092, X'82C') Transmission queue with wrong usage.

For detailed information about these codes, see:

- z/OS IBM MQ for z/OS messages, completion, and reason codes for IBM MQ for z/OS.
- Messages and reason codes for all other IBM MQ platforms except z/OS.

## General usage notes

1. The object opened is one of the following:
   - A queue to:
     - Get or browse messages (using the MQGET call)
     - Put messages (using the MQPUT call)
     - Inquire about the attributes of the queue (using the MQINQ call)
     - Set the attributes of the queue (using the MQSET call)

     If the queue named is a model queue, a dynamic local queue is created. See the *ObjDesc* parameter described in "MQOPEN - Open object" on page 711.

     A distribution list is a special type of queue object that contains a list of queues. It can be opened to put messages, but not to get or browse messages, or to inquire or set attributes. See usage note 8 for further details.

     A queue that has QSGDISP(GROUP) is a special type of queue definition that cannot be used with the MQOPEN or MQPUT1 calls.
   - A namelist to inquire about the names of the queues in the list (using the MQINQ call).
   - A process definition to inquire about the process attributes (using the MQINQ call).
   - The queue manager to inquire about the attributes of the local queue manager (using the MQINQ call).
   - A topic to publish a message (using the MQPUT call)
2. An application can open the same object more than once. A different object handle is returned for each open. Each handle that is returned can be used for the functions for which the corresponding open was performed.
3. If the object being opened is a queue other than a cluster queue, all name resolution within the local queue manager takes place at the time of the MQOPEN call. This can include:
   - Resolution of the name of a local definition of a remote queue to the name of the remote queue manager, and the name by which the queue is known at the remote queue manager
   - Resolution of the remote queue-manager name to the name of a local transmission queue

- ( z/OS only) Resolution of the remote queue-manager name to the name of the shared transmission queue used by the IGQ agent (applies only if the local and remote queue managers belong to the same queue-sharing group)
- Alias resolution to the name of a base queue or a topic object.

However, be aware that subsequent MQINQ or MQSET calls for the handle relate solely to the name that has been opened, and not to the object resulting after name resolution has occurred. For example, if the object opened is an alias, the attributes returned by the MQINQ call are the attributes of the alias, not the attributes of the base queue or a topic object to which the alias resolves.

If the object being opened is a cluster queue, name resolution can occur at the time of the MQOPEN call, or be deferred until later. The point at which resolution occurs is controlled by the MQOO_BIND_* options specified on the MQOPEN call:

- MQOO_BIND_ON_OPEN
- MQOO_BIND_NOT_FIXED
- MQOO_BIND_AS_Q_DEF
- MQOO_BIND_ON_GROUP

See Name resolution for more information about name resolution for cluster queues.

4. An MQOPEN call with the MQOO_BROWSE option establishes a browse cursor, for use with MQGET calls that specify the object handle and one of the browse options. This allows the queue to be scanned without altering its contents. A message that has been found by browsing can be removed from the queue by using the MQGMO_MSG_UNDER_CURSOR option.

   Multiple browse cursors can be active for a single application by issuing several MQOPEN requests for the same queue.
5. Applications started by a trigger monitor are passed the name of the queue that is associated with the application when the application is started. This queue name can be specified in the *ObjDesc* parameter to open the queue. See “MQTMC2 - Trigger message 2 (character format)” on page 586 for further details.
6. On IBM i, applications running in compatibility mode are connected automatically to the queue manager by the first MQOPEN call issued by the application (if the application has not already connected to the queue manager by using the MQCONN call).

   Applications not running in compatibility mode must issue the MQCONN or MQCONNX call to connect to the queue manager explicitly, before using the MQOPEN call to open an object.

   **Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

## Read ahead options

When you call MQOPEN with MQOO_READ_AHEAD, the IBM MQ client only enables read-ahead if certain conditions are met. These conditions include:

- Both the client and remote queue manager must be at WebSphere MQ Version 7 or later.
- The client application must be compiled and linked against the threaded IBM MQ MQI client libraries.
- The client channel must be using TCP/IP protocol
- The channel must have a non-zero SharingConversations (SHARECNV) setting in both the client and server channel definitions.

The following notes apply to the use of read ahead options.

1. The read ahead options are applicable only when one, and only one, of the MQOO_BROWSE, MQOO_INPUT_SHARED and MQOO_INPUT_EXCLUSIVE options are also specified. An error is not thrown if a read ahead options are specified with the MQOO_ INQUIRE or MQOO_SET options.

2. Read ahead is not enabled when requested if the options used on the first MQGET call are not supported for use with read ahead. Also, read ahead is disabled when the client is connecting to a queue manager that does not support read ahead.
3. If the application is not running as an IBM MQ client, read ahead options are ignored.

## Cluster queues

The following notes apply to the use of cluster queues.

1. When a cluster queue is opened for the first time, and the local queue manager is not a full repository queue manager, the local queue manager obtains information about the cluster queue from a full repository queue manager. When the network is busy, it can take several seconds for the local queue manager to receive the needed information from the repository queue manager. As a result, the application issuing the MQOPEN call might have to wait for up to 10 seconds before control returns from the MQOPEN call. If the local queue manager does not receive the needed information about the cluster queue within this time, the call fails with reason code MQRC_CLUSTER_RESOLUTION_ERROR.
2. When a cluster queue is opened and there are multiple instances of the queue in the cluster, the instance opened depends on the options specified on the MQOPEN call:
   - If the options specified include any of the following:
     - MQOO_BROWSE
     - MQOO_INPUT_AS_Q_DEF
     - MQOO_INPUT_EXCLUSIVE
     - MQOO_INPUT_SHARED
     - MQOO_SET

     the instance of the cluster queue opened must be the local instance. If there is no local instance of the queue, the MQOPEN call fails.
   - If the options specified include none of the options described previously, but include one or both of the following:
     - MQOO_INQUIRE
     - MQOO_OUTPUT

     the instance opened is the local instance if there is one, and a remote instance otherwise (if using the CLWLUSEQ defaults). The instance chosen by the queue manager can, however, be altered by a cluster workload exit (if there is one).
3. If there is a subscription for the queue, but it is not acknowledged by a full repository, the object is not present in the cluster and the call fails with reason code MQRC_OBJECT_NAME.

For more information about cluster queues, see Cluster queues.

## Distribution lists

The following notes apply to the use of distribution lists.

Distribution lists are supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

1. Fields in the MQOD structure must be set as follows when opening a distribution list:
   - *Version* must be MQOD_VERSION_2 or greater.
   - *ObjectType* must be MQOT_Q.
   - *ObjectName* must be blank or the null string.
   - *ObjectQMgrName* must be blank or the null string.
   - *RecsPresent* must be greater than zero.
   - One of *ObjectRecOffset* and *ObjectRecPtr* must be zero and the other nonzero.

- No more than one of *ResponseRecOffset* and *ResponseRecPtr* can be nonzero.
- There must be *RecsPresent* object records, addressed by either *ObjectRecOffset* or *ObjectRecPtr*. The object records must be set to the names of the destination queues to be opened.
- If one of *ResponseRecOffset* and *ResponseRecPtr* is nonzero, there must be *RecsPresent* response records present. They are set by the queue manager if the call completes with reason code MQRC_MULTIPLE_REASONS.

A version-2 MQOD can also be used to open a single queue that is not in a distribution list, by ensuring that *RecsPresent* is zero.

2. Only the following open options are valid in the *Options* parameter:
   - MQOO_OUTPUT
   - MQOO_PASS_*_CONTEXT
   - MQOO_SET_*_CONTEXT
   - MQOO_ALTERNATE_USER_AUTHORITY
   - MQOO_FAIL_IF_QUIESCING
3. The destination queues in the distribution list can be local, alias, or remote queues, but they cannot be model queues. If a model queue is specified, that queue fails to open, with reason code MQRC_Q_TYPE_ERROR. However, this does not prevent other queues in the list being opened successfully.
4. The completion code and reason code parameters are set as follows:
   - If the open operations for the queues in the distribution list all succeed or fail in the same way, the completion code and reason code parameters are set to describe the common result. The MQRR response records (if provided by the application) are not set in this case.

     For example, if every open succeeds, the completion code is set to MQCC_OK and the reason code is set to MQRC_NONE; if every open fails because none of the queues exists, the parameters are set to MQCC_FAILED and MQRC_UNKNOWN_OBJECT_NAME.
   - If the open operations for the queues in the distribution list do not all succeed or fail in the same way:
     - The completion code parameter is set to MQCC_WARNING if at least one open succeeded, and to MQCC_FAILED if all failed.
     - The reason code parameter is set to MQRC_MULTIPLE_REASONS.
     - The response records (if provided by the application) are set to the individual completion codes and reason codes for the queues in the distribution list.
5. When a distribution list has been opened successfully, the handle *Hobj* returned by the call can be used on subsequent MQPUT calls to put messages to queues in the distribution list, and on an MQCLOSE call to relinquish access to the distribution list. The only valid close option for a distribution list is MQCO_NONE.

   The MQPUT1 call can also be used to put a message to a distribution list; the MQOD structure defining the queues in the list is specified as a parameter on that call.
6. Each successfully opened destination in the distribution list counts as a separate handle when checking whether the application has exceeded the permitted maximum number of handles (see the *MaxHandles* queue-manager attribute). This is true even when two or more of the destinations in the distribution list resolve to the same physical queue. If the MQOPEN or MQPUT1 call for a distribution list would cause the number of handles in use by the application to exceed *MaxHandles*, the call fails with reason code MQRC_HANDLE_NOT_AVAILABLE.
7. Each destination that is opened successfully has the value of its *OpenOutputCount* attribute incremented by one. If two or more of the destinations in the distribution list resolve to the same physical queue, that queue has its *OpenOutputCount* attribute incremented by the number of destinations in the distribution list that resolve to that queue.

8. Any change to the queue definitions that would have caused a handle to become invalid had the queues been opened individually (for example, a change in the resolution path), does not cause the distribution-list handle to become invalid. However, it does result in a failure for that particular queue when the distribution-list handle is used on a subsequent MQPUT call.
9. A distribution list can contain only one destination.

## Remote queues

The following notes apply to the use of remote queues.

A remote queue can be specified in one of two ways in the *ObjDesc* parameter of this call.

- By specifying for *ObjectName* the name of a local definition of the remote queue. In this case, *ObjectQMgrName* refers to the local queue manager, and can be specified as blanks or (in the C programming language) a null string.

  The security validation performed by the local queue manager verifies that the user is authorized to open the local definition of the remote queue.
- By specifying for *ObjectName* the name of the remote queue as known to the remote queue manager. In this case, *ObjectQMgrName* is the name of the remote queue manager.

  The security validation performed by the local queue manager verifies that the user is authorized to send messages to the transmission queue resulting from the name resolution process.

In either case:

- No messages are sent by the local queue manager to the remote queue manager to check that the user is authorized to put messages on the queue.
- When a message arrives at the remote queue manager, the remote queue manager might reject it because the user originating the message is not authorized.

See the *ObjectName* and *ObjectQMgrName* fields described in "MQOD - Object descriptor" on page 460 for more information.

## Objects

## Security

The following notes relate to the security aspects of using MQOPEN.

The queue manager performs security checks when an MQOPEN call is issued, to verify that the user identifier under which the application is running has the appropriate level of authority before access is permitted. The authority check is made on the name of the object being opened, and not on the name, or names, resulting after a name has been resolved.

If the object being opened is an alias queue which points at a topic object, the queue manager performs a security check on the alias queue name, before performing a security check for the topic as if the topic object had been used directly.

If the object being opened is a topic object, whether with *ObjectName* alone or by using the *ObjectString* (with or without a basing *ObjectName*), the queue manager performs the security check by using the resultant topic string, taken from within the topic object specified in *ObjectName*, and if required concatenating it with that provided in *ObjectString*, and then finding the closest topic object at or above that point in the topic tree to perform the security check against. This might not be the same topic object that was specified in *ObjectName*.

If the object being opened is a model queue, the queue manager performs a full security check against both the name of the model queue and the name of the dynamic queue that is created. If the resulting dynamic queue is then opened explicitly, a further resource security check is performed against the name of the dynamic queue.

On z/OS, the queue manager performs security checks only if security is enabled. For more information about security checking, see Setting up security on z/OS .

## Attributes

The following notes relate to attributes.

The attributes of an object can change while an application has the object open. In many cases, the application does not notice this, but for certain attributes the queue manager marks the handle as no longer valid. These attributes are:

- Any attribute that affects the name resolution of the object. This applies regardless of the open options used, and includes the following:
  - A change to the *BaseQName* attribute of an alias queue that is open.
  - A change to the *TargetType* attribute of an alias queue that is open.
  - A change to the *RemoteQName* or *RemoteQMgrName* queue attributes, for any handle that is open for this queue, or for a queue that resolves through this definition as a queue-manager alias.
  - Any change that causes a currently open handle for a remote queue to resolve to a different transmission queue, or to fail to resolve to one at all. For example, this can include:
    - A change to the *XmitQName* attribute of the local definition of a remote queue, whether the definition is being used for a queue, or for a queue-manager alias.
    - ( z/OS only) A change to the value of the *IntraGroupqueuing* queue-manager attribute, or a change in the definition of the shared transmission queue (SYSTEM.QSG.TRANSMIT.QUEUE) used by the IGQ agent.

    There is one exception to this: the creation of a new transmission queue. A handle that would have resolved to this queue had it been present when the handle was opened, but instead resolved to the default transmission queue, is not made invalid.
  - A change to the *DefXmitQName* queue-manager attribute. In this case all open handles that resolved to the previously named queue (that resolved to it only because it was the default transmission queue) are marked as invalid. Handles that resolved to this queue for other reasons are not affected.
- The *Shareability* queue attribute, if there are two or more handles that are currently providing MQOO_INPUT_SHARED access for this queue, or for a queue that resolves to this queue. If so, *all* handles that are open for this queue, or for a queue that resolves to this queue, are marked as invalid, regardless of the open options.

  On z/OS, the handles previously described are marked as invalid if one or more handles is currently providing MQOO_INPUT_SHARED or MQOO_INPUT_EXCLUSIVE access to the queue.
- The *Usage* queue attribute, for all handles that are open for this queue, or for a queue that resolves to this queue, regardless of the open options.

When a handle is marked as invalid, all subsequent calls (other than MQCLOSE) using this handle fail with reason code MQRC_OBJECT_CHANGED. The application must issue an MQCLOSE call (using the original handle) and then reopen the queue. Any uncommitted updates against the old handle from previous successful calls can still be committed or backed out, as required by the application logic.

If changing an attribute causes this to happen, use a special force version of the call.

## C invocation

```
MQOPEN (Hconn, &ObjDesc, Options, &Hobj, &CompCode,
       &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;     /* Connection handle */
MQOD     ObjDesc;   /* Object descriptor */
```

```
MQLONG   Options;   /* Options that control the action of MQOPEN */
MQHOBJ   Hobj;      /* Object handle */
MQLONG   CompCode;  /* Completion code */
MQLONG   Reason;    /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQOPEN' USING HCONN, OBJDESC, OPTIONS, HOBJ, COMPCODE, REASON
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN     PIC S9(9) BINARY.
**   Object descriptor
 01  OBJDESC.
     COPY CMQODV.
**   Options that control the action of MQOPEN
 01  OPTIONS   PIC S9(9) BINARY.
**   Object handle
 01  HOBJ      PIC S9(9) BINARY.
**   Completion code
 01  COMPCODE  PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON    PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQOPEN (Hconn, ObjDesc, Options, Hobj, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn     fixed bin(31);  /* Connection handle */
dcl ObjDesc   like MQOD;      /* Object descriptor */
dcl Options   fixed bin(31);  /* Options that control the action of
                                 MQOPEN */
dcl Hobj      fixed bin(31);  /* Object handle */
dcl CompCode  fixed bin(31);  /* Completion code */
dcl Reason    fixed bin(31);  /* Reason code qualifying CompCode */
```

## High Level Assembler invocation

```
CALL MQOPEN,(HCONN,OBJDESC,OPTIONS,HOBJ,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN     DS      F  Connection handle
OBJDESC   CMQODA  ,  Object descriptor
OPTIONS   DS      F  Options that control the action of MQOPEN
HOBJ      DS      F  Object handle
COMPCODE  DS      F  Completion code
REASON    DS      F  Reason code qualifying COMPCODE
```

## Visual Basic invocation

```
MQOPEN Hconn, ObjDesc, Options, Hobj, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Hconn    As Long 'Connection handle'
```

```
Dim ObjDesc  As MQOD 'Object descriptor'
Dim Options  As Long 'Options that control the action of MQOPEN'
Dim Hobj     As Long 'Object handle'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

## MQPUT - Put message

The MQPUT call puts a message on a queue or distribution list, or to a topic. The queue, distribution list, or topic must already be open.

### Syntax

MQPUT (*Hconn*, *Hobj*, *MsgDesc*, *PutMsgOpts*, *BufferLength*, *Buffer*, *CompCode*, *Reason*)

### Parameters

***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn* :

**MQHC_DEF_HCONN**
Default connection handle.

**Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

***Hobj***

Type: MQHOBJ - input

This handle represents the queue to which the message is added, or the topic to which the message is published. The value of *Hobj* was returned by a previous MQOPEN call that specified the MQOO_OUTPUT option.

***MsgDesc***

Type: MQMD - input/output

This structure describes the attributes of the message being sent, and receives information about the message after the put request is complete. See “MQMD - Message descriptor” on page 402 for details.

If the application provides a version-1 MQMD, the message data can be prefixed with an MQMDE structure to specify values for the fields that exist in the version-2 MQMD but not the version-1. The *Format* field in the MQMD must be set to MQFMT_MD_EXTENSION to indicate that an MQMDE is present. See “MQMDE - Message descriptor extension” on page 452 for more details.

The application does not need to provide an MQMD structure if a valid message handle is supplied in the *OriginalMsgHandle* or *NewMsgHandle* fields of the MQPMO structure. If nothing is provided in one of these fields, the descriptor of the message is taken from the descriptor associated with the message handles.

If you use, or plan to use, API exits then we recommend that you explicitly supply an MQMD structure and do not use the message descriptors associated with the message handles. This is because the API Exit associated with MQPUT or MQPUT1 call is unable to ascertain which MQMD values are used by the queue manager to complete the MQPUT or MQPUT1 request.

***PutMsgOpts***

Type: MQPMO - input/output

See “MQPMO - Put-message options” on page 480 for details.

***BufferLength***

Type: MQLONG - input

The length of the message in *Buffer*. Zero is valid, and indicates that the message contains no application data. The upper limit for *BufferLength* depends on various factors:

- If the destination is a local queue or resolves to a local queue, the upper limit depends on whether:
  - The local queue manager supports segmentation.
  - The sending application specifies the flag that allows the queue manager to segment the message. This flag is MQMF_SEGMENTATION_ALLOWED, and can be specified either in a version-2 MQMD, or in an MQMDE used with a version-1 MQMD.

  If both of these conditions are satisfied, *BufferLength* cannot exceed 999 999 999 minus the value of the *Offset* field in MQMD. The longest logical message that can be put is therefore 999 999 999 bytes (when *Offset* is zero). However, resource constraints imposed by the operating system or environment in which the application is running might result in a lower limit.

  If one or both of the previous conditions is not satisfied, *BufferLength* cannot exceed the smaller of the queue's *MaxMsgLength* attribute and queue-manager's *MaxMsgLength* attribute.
- If the destination is a remote queue or resolves to a remote queue, the conditions for local queues apply, *but at each queue manager through which the message must pass in order to reach the destination queue* ; in particular:
  1. The local transmission queue used to store the message temporarily at the local queue manager
  2. Intermediate transmission queues (if any) used to store the message at queue managers on the route between the local and destination queue managers
  3. The destination queue at the destination queue manager

  The longest message that can be put is therefore governed by the most restrictive of these queues and queue managers.

  When a message is on a transmission queue, additional information resides with the message data, and this reduces the amount of application data that can be carried. In this situation, subtract MQ_MSG_HEADER_LENGTH bytes from the *MaxMsgLength* values of the transmission queues when determining the limit for *BufferLength*.

  **Note:** Only failure to comply with condition 1 can be diagnosed synchronously (with reason code MQRC_MSG_TOO_BIG_FOR_Q or MQRC_MSG_TOO_BIG_FOR_Q_MGR) when the message is put. If conditions 2 or 3 are not satisfied, the message is redirected to a dead-letter (undelivered-message) queue, either at an intermediate queue manager or at the destination queue manager. If this happens, a report message is generated if one was requested by the sender.

***Buffer***

Type: MQBYTExBufferLength - input

This is a buffer containing the application data to be sent. The buffer must be aligned on a boundary appropriate to the nature of the data in the message. 4-byte alignment is suitable for most messages (including messages containing IBM MQ header structures), but some messages might require more stringent alignment. For example, a message containing a 64-bit binary integer might require 8-byte alignment.

If *Buffer* contains character or numeric data, set the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter to the values appropriate to the data; this enables the receiver of the message to convert the data (if necessary) to the character set and encoding used by the receiver.

**Note:** All the other parameters on the MQPUT call must be in the character set and encoding of the local queue manager (given by the *CodedCharSetId* queue-manager attribute and MQENC_NATIVE).

In the C programming language, the parameter is declared as a pointer-to-void; the address of any type of data can be specified as the parameter.

If the *BufferLength* parameter is zero, *Buffer* is not referred to; in this case, the parameter address passed by programs written in C or System/390 assembler can be null.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_WARNING**
Warning (partial completion).

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

The reason code qualifying *CompCode*.

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_WARNING:

**MQRC_INCOMPLETE_GROUP**
(2241, X'8C1') Message group not complete.

**MQRC_INCOMPLETE_MSG**
(2242, X'8C2') Logical message not complete.

**MQRC_INCONSISTENT_PERSISTENCE**
(2185, X'889') Inconsistent persistence specification.

**MQRC_INCONSISTENT_UOW**
(2245, X'8C5') Inconsistent unit-of-work specification.

**MQRC_MULTIPLE_REASONS**
(2136, X'858') Multiple reason codes returned.

**MQRC_PRIORITY_EXCEEDS_MAXIMUM**
(2049, X'801') Message Priority exceeds maximum value supported.

**MQRC_UNKNOWN_REPORT_OPTION**
(2104, X'838') Report option(s) in message descriptor not recognized.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'89C') Adapter not available.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_ALIAS_TARGTYPE_CHANGED**
(2480, X'09B0') Subscription target type has changed from queue to topic object.

**MQRC_API_EXIT_ERROR**
(2374, X'946') API exit failed.

**MQRC_API_EXIT_LOAD_ERROR**
(2183, X'887') Unable to load API exit.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_BACKED_OUT**
(2003, X'7D3') Unit of work backed out.

**MQRC_BUFFER_ERROR**
(2004, X'7D4') Buffer parameter not valid.

**MQRC_BUFFER_LENGTH_ERROR**
(2005, X'7D5') Buffer length parameter not valid.

**MQRC_CALL_IN_PROGRESS**
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC_CALL_INTERRUPTED**
(2549, X'9F5') MQPUT or MQCMIT was interrupted and reconnection processing cannot reestablish a definite outcome.

**MQRC_CF_NOT_AVAILABLE**
(2345, X'929') Coupling facility not available.

**MQRC_CF_STRUC_FAILED**
(2373, X'945') Coupling-facility structure failed.

**MQRC_CF_STRUC_IN_USE**
(2346, X'92A') Coupling-facility structure in use.

**MQRC_CFGR_ERROR**
(2416, X'970') PCF group parameter structure MQCFGR in the message data is not valid.

**MQRC_CFH_ERROR**
(2235, X'8BB') PCF header structure not valid.

**MQRC_CFIF_ERROR**
(2414, X'96E') PCF integer filter parameter structure in the message data is not valid.

**MQRC_CFIL_ERROR**
(2236, X'8BC') PCF integer list parameter structure or PCIF*64 integer list parameter structure not valid.

**MQRC_CFIN_ERROR**
(2237, X'8BD') PCF integer parameter structure or PCIF*64 integer parameter structure not valid.

**MQRC_CFSF_ERROR**
(2415, X'96F') PCF string filter parameter structure in the message data is not valid.

**MQRC_CFSL_ERROR**
(2238, X'8BE') PCF string list parameter structure not valid.

**MQRC_CFST_ERROR**
(2239, X'8BF') PCF string parameter structure not valid.

**MQRC_CICS_WAIT_FAILED**
(2140, X'85C') Wait request rejected by CICS.

**MQRC_CLUSTER_EXIT_ERROR**
(2266, X'8DA') Cluster workload exit failed.

**MQRC_CLUSTER_RESOLUTION_ERROR**
(2189, X'88D') Cluster name resolution failed.

**MQRC_CLUSTER_RESOURCE_ERROR**
(2269, X'8DD') Cluster resource error.

**MQRC_COD_NOT_VALID_FOR_XCF_Q**
(2106, X'83A') COD report option not valid for XCF queue.

**MQRC_CONNECTION_BROKEN**
(2009, X'7D9') Connection to queue manager lost.

**MQRC_CONNECTION_NOT_AUTHORIZED**
(2217, X'8A9') Not authorized for connection.

**MQRC_CONNECTION_QUIESCING**
(2202, X'89A') Connection quiescing.

**MQRC_CONNECTION_STOPPING**
(2203, X'89B') Connection shutting down.

**MQRC_CONTENT_ERROR**
2554 (X'09FA') Message content could not be parsed to determine whether the message should be delivered to a subscriber with an extended message selector.

**MQRC_CONTEXT_HANDLE_ERROR**
(2097, X'831') Queue handle referred to does not save context.

**MQRC_CONTEXT_NOT_AVAILABLE**
(2098, X'832') Context not available for queue handle referred to.

**MQRC_DATA_LENGTH_ERROR**
(2010, X'7DA') Data length parameter not valid.

**MQRC_DH_ERROR**
(2135, X'857') Distribution header structure not valid.

**MQRC_DLH_ERROR**
(2141, X'85D') Dead letter header structure not valid.

**MQRC_EPH_ERROR**
(2420, X'974') Embedded PCF structure not valid.

**MQRC_EXPIRY_ERROR**
(2013, X'7DD') Expiry time not valid.

**MQRC_FEEDBACK_ERROR**
(2014, X'7DE') Feedback code not valid.

**MQRC_GLOBAL_UOW_CONFLICT**
(2351, X'92F') Global units of work conflict.

**MQRC_GROUP_ID_ERROR**
(2258, X'8D2') Group identifier not valid.

**MQRC_HANDLE_IN_USE_FOR_UOW**
(2353, X'931') Handle in use for global unit of work.

**MQRC_HCONN_ERROR**
(2018, X'7E2') Connection handle not valid.

**MQRC_HEADER_ERROR**
(2142, X'85E') MQ header structure not valid.

**MQRC_HOBJ_ERROR**
(2019, X'7E3') Object handle not valid.

**MQRC_IIH_ERROR**
(2148, X'864') IMS information header structure not valid.

**MQRC_INCOMPLETE_GROUP**
(2241, X'8C1') Message group not complete.

**MQRC_INCOMPLETE_MSG**
(2242, X'8C2') Logical message not complete.

**MQRC_INCONSISTENT_PERSISTENCE**
(2185, X'889') Inconsistent persistence specification.

**MQRC_INCONSISTENT_UOW**
(2245, X'8C5') Inconsistent unit-of-work specification.

**MQRC_LOCAL_UOW_CONFLICT**
(2352, X'930') Global unit of work conflicts with local unit of work.

**MQRC_MD_ERROR**
(2026, X'7EA') Message descriptor not valid.

**MQRC_MDE_ERROR**
(2248, X'8C8') Message descriptor extension not valid.

**MQRC_MISSING_REPLY_TO_Q**
(2027, X'7EB') Missing reply-to queue or MQPMO_SUPPRESS_REPLYTO was used

**MQRC_MISSING_WIH**
(2332, X'91C') Message data does not begin with MQWIH.

**MQRC_MSG_FLAGS_ERROR**
(2249, X'8C9') Message flags not valid.

**MQRC_MSG_SEQ_NUMBER_ERROR**
(2250, X'8CA') Message sequence number not valid.

**MQRC_MSG_TOO_BIG_FOR_Q**
(2030, X'7EE') Message length greater than maximum for queue.

**MQRC_MSG_TOO_BIG_FOR_Q_MGR**
(2031, X'7EF') Message length greater than maximum for queue manager.

**MQRC_MSG_TYPE_ERROR**
(2029, X'7ED') Message type in message descriptor not valid.

**MQRC_MULTIPLE_REASONS**
(2136, X'858') Multiple reason codes returned.

**MQRC_NO_DESTINATIONS_AVAILABLE**
(2270, X'8DE') No destination queues available.

**MQRC_NOT_OPEN_FOR_OUTPUT**
(2039, X'7F7') Queue not open for output.

**MQRC_NOT_OPEN_FOR_PASS_ALL**
(2093, X'82D') Queue not open for pass all context.

**MQRC_NOT_OPEN_FOR_PASS_IDENT**
(2094, X'82E') Queue not open for pass identity context.

**MQRC_NOT_OPEN_FOR_SET_ALL**
(2095, X'82F') Queue not open for set all context.

**MQRC_NOT_OPEN_FOR_SET_IDENT**
(2096, X'830') Queue not open for set identity context.

**MQRC_OBJECT_CHANGED**
(2041, X'7F9') Object definition changed since opened.

**MQRC_OBJECT_DAMAGED**
(2101, X'835') Object damaged.

**MQRC_OFFSET_ERROR**
(2251, X'8CB') Message segment offset not valid.

**MQRC_OPEN_FAILED**
(2137, X'859') Object not opened successfully.

**MQRC_OPTIONS_ERROR**
(2046, X'7FE') Options not valid or not consistent.

**MQRC_ORIGINAL_LENGTH_ERROR**
(2252, X'8CC') Original length not valid.

**MQRC_PAGESET_ERROR**
(2193, X'891') Error accessing page-set data set.

**MQRC_PAGESET_FULL**
(2192, X'890') External storage medium is full.

**MQRC_PCF_ERROR**
(2149, X'865') PCF structures not valid.

**MQRC_PERSISTENCE_ERROR**
(2047, X'7FF') Persistence not valid.

**MQRC_PERSISTENT_NOT_ALLOWED**
(2048, X'800') Queue does not support persistent messages.

**MQRC_PMO_ERROR**
(2173, X'87D') Put-message options structure not valid.

**MQRC_PMO_RECORD_FLAGS_ERROR**
(2158, X'86E') Put message record flags not valid.

**MQRC_PRIORITY_ERROR**
(2050, X'802') Message priority not valid.

**MQRC_PUBLICATION_FAILURE**
(2502, X'9C6') The publication has not been delivered to any of the subscribers.

**MQRC_PUT_INHIBITED**
(2051, X'803') Put calls inhibited for the queue, for the queue to which this queue resolves, or the topic.

**MQRC_PUT_MSG_RECORDS_ERROR**
(2159, X'86F') Put message records not valid.

**MQRC_PUT_NOT_RETAINED**
(2479, X'09AF') Publication could not be retained

**MQRC_Q_DELETED**
(2052, X'804') Queue has been deleted.

**MQRC_Q_FULL**
(2053, X'805') Queue already contains maximum number of messages.

**MQRC_Q_MGR_NAME_ERROR**
(2058, X'80A') Queue manager name not valid or not known.

**MQRC_Q_MGR_NOT_AVAILABLE**
(2059, X'80B') Queue manager not available for connection.

**MQRC_Q_MGR_QUIESCING**
(2161, X'871') Queue manager quiescing.

**MQRC_Q_MGR_STOPPING**
(2162, X'872') Queue manager shutting down.

**MQRC_Q_SPACE_NOT_AVAILABLE**
(2056, X'808') No space available on disk for queue.

**MQRC_RECONNECT_FAILED**
(2548, X'9F4') After reconnecting, an error occurred reinstating the handles for a reconnectable connection.

**MQRC_RECS_PRESENT_ERROR**
(2154, X'86A') Number of records present not valid.

**MQRC_REPORT_OPTIONS_ERROR**
(2061, X'80D') Report options in message descriptor not valid.

**MQRC_RESOURCE_PROBLEM**
(2102, X'836') Insufficient system resources available.

**MQRC_RESPONSE_RECORDS_ERROR**
(2156, X'86C') Response records not valid.

**MQRC_RFH_ERROR**
(2334, X'91E') MQRFH or MQRFH2 structure not valid.

**MQRC_RMH_ERROR**
(2220, X'8AC') Reference message header structure not valid.

**MQRC_SEGMENT_LENGTH_ZERO**
(2253, X'8CD') Length of data in message segment is zero.

**MQRC_SEGMENTS_NOT_SUPPORTED**
(2365, X'93D') Segments not supported.

**MQRC_SELECTION_NOT_AVAILABLE**
2551 (X'09F7') A possible subscriber for the publication exists, but the queue manager cannot check whether to send the publication to the subscriber.

**MQRC_STOPPED_BY_CLUSTER_EXIT**
(2188, X'88C') Call rejected by cluster workload exit.

**MQRC_STORAGE_CLASS_ERROR**
(2105, X'839') Storage class error.

**MQRC_STORAGE_MEDIUM_FULL**
(2192, X'890') External storage medium is full.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_SUPPRESSED_BY_EXIT**
(2109, X'83D') Call suppressed by exit program.

**MQRC_SYNCPOINT_LIMIT_REACHED**
(2024, X'7E8') No more messages can be handled within current unit of work.

**MQRC_SYNCPOINT_NOT_AVAILABLE**
(2072, X'818') Syncpoint support not available.

**MQRC_TM_ERROR**
(2265, X'8D9') Trigger message structure not valid.

**MQRC_TMC_ERROR**
(2191, X'88F') Character trigger message structure not valid.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

**MQRC_UOW_ENLISTMENT_ERROR**
(2354, X'932') Enlistment in global unit of work failed.

**MQRC_UOW_MIX_NOT_SUPPORTED**
(2355, X'933') Mixture of unit-of-work calls not supported.

**MQRC_UOW_NOT_AVAILABLE**
(2255, X'8CF') Unit of work not available for the queue manager to use.

**MQRC_WIH_ERROR**
(2333, X'91D') MQWIH structure not valid.

**MQRC_WRONG_MD_VERSION**
(2257, X'8D1') Wrong version of MQMD supplied.

**MQRC_XQH_ERROR**
(2260, X'8D4') Transmission queue header structure not valid.

For detailed information about these codes, see Messages and reason codes.

## Topic usage notes

1. The following notes apply to the use of topics:

   a. When using MQPUT to publish messages on a topic, where one or more subscribers to that topic cannot be given the publication due to a problem with their subscriber queue (for example it is full), the Reason code returned to the MQPUT call and the delivery behavior is dependent on the setting of the PMSGDLV or NPMSGDLV attributes on the TOPIC. Note delivery of a publication to the dead letter queue when MQRO_DEAD_LETTER_Q is specified, or discarding the message when MQRO_DISCARD_MSG is specified, is considered as a successful delivery of the message. If none of the publications are delivered, the MQPUT returns with MQRC_PUBLICATION_FAILURE. This can happen in the following cases:

   - A message is published to a TOPIC with PMSGDLV or NPMSGDLV (depending on the persistence of the message) set to ALL and any subscription (durable or not) has a queue which cannot receive the publication.
   - A message is published to a TOPIC with PMSGDLV or NPMSGDLV (depending on the persistence of the message) set to ALLDUR and a durable subscription has a queue which cannot receive the publication.

The MQPUT can return with MQRC_NONE even though publications could not be delivered to some subscribers in the following cases:

- A message is published to a TOPIC with PMSGDLV or NPMSGDLV (depending on the persistence of the message) set to ALLAVAIL and any subscription, durable or not, has a queue which cannot receive the publication.
- A message is published to a TOPIC with PMSGDLV or NPMSGDLV (depending on the persistence of the message) set to ALLDUR and a non-durable subscription has a queue which cannot receive the publication.

You can use the USEDLQ topic attribute to determine whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue. For more information about the use of USEDLQ, see DEFINE TOPIC.

b. If there are no subscribers to the topic being used, the message published is not sent to any queue and is discarded. It does not matter whether the message is persistent or non-persistent, or whether it has unlimited expiry or has an expiry time, it is still discarded if there are no subscribers. The exception to this is if the message is to be retained, in which case, although it is not sent to any subscribers' queues, it is stored against the topic to be delivered to any new subscriptions or to any subscribers that ask for retained publications using MQSUBRQ.

## MQPUT and MQPUT1

You can use both the MQPUT and MQPUT1 calls to put messages on a queue; which call to use depends on the circumstances

- Use the MQPUT call to place multiple messages on the *same* queue.

  An MQOPEN call specifying the MQOO_OUTPUT option is issued first, followed by one or more MQPUT requests to add messages to the queue; finally the queue is closed with an MQCLOSE call. This gives better performance than repeated use of the MQPUT1 call.
- Use the MQPUT1 call to put only *one* message on a queue.

  This call encapsulates the MQOPEN, MQPUT, and MQCLOSE calls into a single call, minimizing the number of calls that must be issued.

## Destination Queues

The following notes apply to the use of destination queues:

1. If an application puts a sequence of messages on the same queue without using message groups, the order of those messages is preserved if the conditions detailed are satisfied. Some conditions apply to both local and remote destination queues; other conditions apply only to remote destination queues.

   **Conditions that apply to local and remote destination queues**

   - All the MQPUT calls are within the same unit of work, or none of them is within a unit of work.

     Be aware that when messages are put onto a particular queue within a single unit of work, messages from other applications might be interspersed with the sequence of messages on the queue.
   - All the MQPUT calls are made using the same object handle *Hobj*.

     In some environments, message sequence is also preserved when different object handles are used, if the calls are made from the same application. The meaning of *same application* is determined by the environment:

     – On z/OS, the application is:

       - For CICS, the CICS task
       - For IMS, the task
       - For z/OS batch, the task

     – On IBM i, the application is the job.

– On Windows and UNIX systems, the application is the thread.

- The messages all have the same priority.
- The messages are not put to a cluster queue with MQOO_BIND_NOT_FIXED specified (or with MQOO_BIND_AS_Q_DEF in effect when the DefBind queue attribute has the value MQBND_BIND_NOT_FIXED).

**Additional conditions that apply to remote destination queues**

- There is only one path from the sending queue manager to the destination queue manager.

  If some messages in the sequence might go on a different path (for example, because of reconfiguration, traffic balancing, or path selection based on message size), the order of the messages at the destination queue manager cannot be guaranteed.
- Messages are not placed temporarily on dead-letter queues at the sending, intermediate, or destination queue managers.

  If one or more of the messages is put temporarily on a dead-letter queue (for example, because a transmission queue or the destination queue is temporarily full), the messages can arrive on the destination queue out of sequence.
- The messages are either all persistent or all nonpersistent.

  If a channel on the route between the sending and destination queue managers has its *NonPersistentMsgSpeed* attribute set to MQNPMS_FAST, nonpersistent messages can jump ahead of persistent messages, resulting in the order of persistent messages relative to nonpersistent messages not being preserved. However, the order of persistent messages relative to each other, and of nonpersistent messages relative to each other, is preserved.

If these conditions are not satisfied, you can use message groups to preserve message order, but this requires both the sending and receiving applications to use the message-grouping support. For more information about message groups, see:

- MQMD - MsgFlags field
- MQPMO_LOGICAL_ORDER
- MQGMO_LOGICAL_ORDER

## Distribution Lists

The following notes apply to the use of distribution lists.

Distribution lists are supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

1. You can put messages to a distribution list using either a version-1 or a version-2 MQPMO. If you use a version-1 MQPMO (or a version-2 MQPMO with *RecsPresent* equal to zero), the application can provide no put message records or response records. You cannot identify the queues that encounter errors if the message is sent successfully to some queues in the distribution list and not others.

   If the application provides put message records or response records, set the *Version* field to MQPMO_VERSION_2.

   You can also use a version-2 MQPMO to send messages to a single queue that is not in a distribution list, by ensuring that *RecsPresent* is zero.
2. The completion code and reason code parameters are set as follows:

   - If the puts to the queues in the distribution list all succeed or fail in the same way, the completion code and reason code parameters are set to describe the common result. The MQRR response records (if provided by the application) are not set in this case.

     For example, if every put succeeds, the completion code and reason code are set to MQCC_OK and MQRC_NONE; if every put fails because all the queues are inhibited for puts, the parameters are set to MQCC_FAILED and MQRC_PUT_INHIBITED.

- If the puts to the queues in the distribution list do not all succeed or fail in the same way:
  - The completion code parameter is set to MQCC_WARNING if at least one put succeeded, and to MQCC_FAILED if all failed.
  - The reason code parameter is set to MQRC_MULTIPLE_REASONS.
  - The response records (if provided by the application) are set to the individual completion codes and reason codes for the queues in the distribution list.

  If the put to a destination fails because the open for that destination failed, the fields in the response record are set to MQCC_FAILED and MQRC_OPEN_FAILED; that destination is included in *InvalidDestCount*.

3. If a destination in the distribution list resolves to a local queue, the message is placed on that queue in normal form (that is, not as a distribution-list message). If more than one destination resolves to the same local queue, one message is placed on the queue for each such destination.

   If a destination in the distribution list resolves to a remote queue, a message is placed on the appropriate transmission queue. Where several destinations resolve to the same transmission queue, a single distribution-list message containing those destinations can be placed on the transmission queue, even if those destinations were not adjacent in the list of destinations provided by the application. However, this can be done only if the transmission queue supports distribution-list messages (see DistLists ).

   If the transmission queue does not support distribution lists, one copy of the message in normal form is placed on the transmission queue for each destination that uses that transmission queue.

   If a distribution list with the application message data is too large for a transmission queue, the distribution list message is split into smaller distribution-list messages, each containing fewer destinations. If the application message data only just fits on the queue, distribution-list messages cannot be used at all, and the queue manager generates one copy of the message in normal form for each destination that uses that transmission queue.

   If different destinations have different message priority or message persistence (this can occur when the application specifies MQPRI_PRIORITY_AS_Q_DEF or MQPER_PERSISTENCE_AS_Q_DEF), the messages are not held in the same distribution-list message. Instead, the queue manager generates as many distribution-list messages as are necessary to accommodate the differing priority and persistence values.

4. A put to a distribution list can result in:
   - A single distribution-list message, or
   - A number of smaller distribution-list messages, or
   - A mixture of distribution list messages and normal messages, or
   - Normal messages only.

   Which of the above occurs depends on whether:
   - The destinations in the list are local, remote, or a mixture.
   - The destinations have the same message priority and message persistence.
   - The transmission queues can hold distribution-list messages.
   - The transmission queues' maximum message lengths are large enough to accommodate the message in distribution-list form.

   However, regardless of which of the above occurs, each *physical* message resulting (that is, each normal message or distribution-list message resulting from the put) counts as only *one* message when:
   - Checking whether the application has exceeded the permitted maximum number of messages in a unit of work (see the *MaxUncommittedMsgs* queue-manager attribute).
   - Checking whether the triggering conditions are satisfied.
   - Incrementing queue depths and checking whether the queues' maximum queue depth would be exceeded.

5. Any change to the queue definitions that would have caused a handle to become invalid had the queues been opened individually (for example, a change in the resolution path), does not cause the distribution-list handle to become invalid. However, it does result in a failure for that particular queue when the distribution-list handle is used on a subsequent MQPUT call.

## Headers

If a message is put with one or more IBM MQ header structures at the beginning of the application message data, the queue manager performs certain checks on the header structures to verify that they are valid. If the queue manager detects an error, the call fails with an appropriate reason code. The checks performed vary according to the particular structures that are present:

- Checks are performed only if a version-2 or later MQMD is used on the MQPUT or MQPUT1 call. Checks are not performed if a version-1 MQMD is used, even if an MQMDE is present at the start of the message data.
- Structures that are not supported by the local queue manager, and structures following the first MQDLH in the message, are not validated.
- The MQDH and MQMDE structures are validated completely by the queue manager.
- Other structures are validated partially by the queue manager (not all fields are checked).

General checks performed by the queue manager include the following:

- The *StrucId* field must be valid.
- The *Version* field must be valid.
- The *StrucLength* field must specify a value that is large enough to include the structure plus any variable-length data that forms part of the structure.
- The *CodedCharSetId* field must not be zero, or a negative value that is not valid (MQCCSI_DEFAULT, MQCCSI_EMBEDDED, MQCCSI_Q_MGR, and MQCCSI_UNDEFINED are *not* valid in most IBM MQ header structures).
- The *BufferLength* parameter of the call must specify a value that is large enough to include the structure (the structure must not extend beyond the end of the message).

In addition to general checks on structures, the following conditions must be satisfied:

- The sum of the lengths of the structures in a PCF message must equal the length specified by the *BufferLength* parameter on the MQPUT or MQPUT1 call. A PCF message is a message that has a format name of MQFMT_ADMIN, MQFMT_EVENT, or MQFMT_PCF.
- An IBM MQ structure must not be truncated, except in the following situations where truncated structures are permitted:
  - Messages that are report messages.
  - PCF messages.
  - Messages containing an MQDLH structure. (Structures *following* the first MQDLH can be truncated; structures preceding the MQDLH cannot.)
- An IBM MQ structure must not be split over two or more segments; the structure must be contained entirely within one segment.

## Buffer

For the Visual Basic programming language, the following points apply:

- If the size of the *Buffer* parameter is less than the length specified by the *BufferLength* parameter, the call fails with reason code MQRC_BUFFER_LENGTH_ERROR.
- The *Buffer* parameter is declared as being of type `String`. If the data to be placed on the queue is not of type `String`, use the MQPUTAny call in place of MQPUT.

The MQPUTAny call has the same parameters as the MQPUT call, except that the *Buffer* parameter is declared as being of type Any, allowing any type of data to be placed on the queue. However, this means that *Buffer* cannot be checked to ensure that it is at least *BufferLength* bytes in size.

## C invocation

```
MQPUT (Hconn, Hobj, &MsgDesc, &PutMsgOpts, BufferLength, Buffer,
      &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;         /* Connection handle */
MQHOBJ   Hobj;          /* Object handle */
MQMD     MsgDesc;       /* Message descriptor */
MQPMO    PutMsgOpts;    /* Options that control the action of MQPUT */
MQLONG   BufferLength;  /* Length of the message in Buffer */
MQBYTE   Buffer[n];     /* Message data */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

## COBOL invocation

```
     CALL 'MQPUT' USING HCONN, HOBJ, MSGDESC, PUTMSGOPTS, BUFFERLENGTH,
                        BUFFER, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN         PIC S9(9) BINARY.
**   Object handle
 01  HOBJ          PIC S9(9) BINARY.
**   Message descriptor
 01  MSGDESC.
     COPY CMQMDV.
**   Options that control the action of MQPUT
 01  PUTMSGOPTS.
     COPY CMQPMOV.
**   Length of the message in BUFFER
 01  BUFFERLENGTH  PIC S9(9) BINARY.
**   Message data
 01  BUFFER        PIC X(n).
**   Completion code
 01  COMPCODE      PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON        PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQPUT (Hconn, Hobj, MsgDesc, PutMsgOpts, BufferLength, Buffer,
           CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn         fixed bin(31);  /* Connection handle */
dcl Hobj          fixed bin(31);  /* Object handle */
dcl MsgDesc       like MQMD;      /* Message descriptor */
dcl PutMsgOpts    like MQPMO;     /* Options that control the action of
                                     MQPUT */
dcl BufferLength  fixed bin(31);  /* Length of the message in Buffer */
dcl Buffer        char(n);        /* Message data */
dcl CompCode      fixed bin(31);  /* Completion code */
dcl Reason        fixed bin(31);  /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
CALL MQPUT,(HCONN,HOBJ,MSGDESC,PUTMSGOPTS,BUFFERLENGTH, X
               BUFFER,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN         DS       F      Connection handle
HOBJ          DS       F      Object handle
MSGDESC       CMQMDA   ,      Message descriptor
PUTMSGOPTS    CMQPMOA  ,      Options that control the action of MQPUT
BUFFERLENGTH  DS       F      Length of the message in BUFFER
BUFFER        DS       CL(n)  Message data
COMPCODE      DS       F      Completion code
REASON        DS       F      Reason code qualifying COMPCODE
```

### Visual Basic invocation

```
MQPUT Hconn, Hobj, MsgDesc, PutMsgOpts, BufferLength, Buffer, CompCode,
      Reason
```

Declare the parameters as follows:

```
Dim Hconn        As Long   'Connection handle'
Dim Hobj         As Long   'Object handle'
Dim MsgDesc      As MQMD   'Message descriptor'
Dim PutMsgOpts   As MQPMO  'Options that control the action of MQPUT'
Dim BufferLength As Long   'Length of the message in Buffer'
Dim Buffer       As String 'Message data'
Dim CompCode     As Long   'Completion code'
Dim Reason       As Long   'Reason code qualifying CompCode'
```

## MQPUT1 - Put one message

The MQPUT1 call puts one message on a queue, or distribution list, or to a topic.

The queue, distribution list, or topic does not need to be open.

### Syntax

MQPUT1 (*Hconn*, *ObjDesc*, *MsgDesc*, *PutMsgOpts*, *BufferLength*, *Buffer*, *CompCode*, *Reason*)

### Parameters

***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn* :

**MQHC_DEF_HCONN**
Default connection handle.

**Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

***ObjDesc***

Type: MQOD - input/output

This is a structure that identifies the queue to which the message is added, or the topic to which the message is published. See "MQOD - Object descriptor" on page 460 for details.

If the structure is a queue, the user must be authorized to open the queue for output. The queue must **not** be a model queue.

***MsgDesc***
Type: MQMD - input/output

This structure describes the attributes of the message being sent, and receives feedback information after the put request is complete. See "MQMD - Message descriptor" on page 402 for details.

If the application provides a version-1 MQMD, the message data can be prefixed with an MQMDE structure to specify values for the fields that exist in the version-2 MQMD but not the version-1. Set the *Format* field in the MQMD to MQFMT_MD_EXTENSION to indicate that an MQMDE is present. See "MQMDE - Message descriptor extension" on page 452 for more details.

The application does not need to provide an MQMD structure if a valid message handle is supplied in the *MsgHandle* field of the MQGMO structure or in the *OriginalMsgHandle* or *NewMsgHandle* fields of the MQPMO structure. If nothing is provided in one of these fields, the descriptor of the message is taken from the descriptor associated with the message handles.

***PutMsgOpts***
Type: MQPMO - input/output

See "MQPMO - Put-message options" on page 480 for details.

***BufferLength***
Type: MQLONG - input

The length of the message in *Buffer*. Zero is valid, and indicates that the message contains no application data. The upper limit depends on various factors; see "MQPUT - Put message" on page 729 for the description of the *BufferLength* parameter.

***Buffer***
Type: MQBYTExBufferLength - input

This is a buffer containing the application message data to be sent. Align the buffer on a boundary appropriate to the nature of the data in the message. 4-byte alignment is suitable for most messages (including messages containing IBM MQ header structures), but some messages might require more stringent alignment. For example, a message containing a 64-bit binary integer might require 8-byte alignment.

If *Buffer* contains character or numeric data, set the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter to the values appropriate to the data; this enables the receiver of the message to convert the data (if necessary) to the character set and encoding used by the receiver.

**Note:** All the other parameters on the MQPUT1 call must be in the character set and encoding of the local queue manager (given by the *CodedCharSetId* queue-manager attribute and MQENC_NATIVE).

In the C programming language, the parameter is declared as a pointer-to-void; the address of any type of data can be specified as the parameter.

If the *BufferLength* parameter is zero, *Buffer* is not referred to; in this case, the parameter address passed by programs written in C or System/390 assembler can be null.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_WARNING**
Warning (partial completion).

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

The reason code qualifying *CompCode*.

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_WARNING:

**MQRC_MULTIPLE_REASONS**
(2136, X'858') Multiple reason codes returned.

**MQRC_INCOMPLETE_GROUP**
(2241, X'8C1') Message group not complete.

**MQRC_INCOMPLETE_MSG**
(2242, X'8C2') Logical message not complete.

**MQRC_PRIORITY_EXCEEDS_MAXIMUM**
(2049, X'801') Message Priority exceeds maximum value supported.

**MQRC_UNKNOWN_REPORT_OPTION**
(2104, X'838') Report options in message descriptor not recognized.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'89C') Adapter not available.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_ALIAS_BASE_Q_TYPE_ERROR**
(2001, X'7D1') Alias base queue not a valid type.

**MQRC_API_EXIT_ERROR**
(2374, X'946') API exit failed.

**MQRC_API_EXIT_LOAD_ERROR**
(2183, X'887') Unable to load API exit.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_BACKED_OUT**
(2003, X'7D3') Unit of work backed out.

**MQRC_BUFFER_ERROR**
(2004, X'7D4') Buffer parameter not valid.

**MQRC_BUFFER_LENGTH_ERROR**
(2005, X'7D5') Buffer length parameter not valid.

**MQRC_CALL_IN_PROGRESS**
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC_CF_NOT_AVAILABLE**
(2345, X'929') coupling facility not available.

**MQRC_CF_STRUC_AUTH_FAILED**
(2348, X'92C') Coupling-facility structure authorization check failed.

**MQRC_CF_STRUC_ERROR**
(2349, X'92D') Coupling-facility structure not valid.

**MQRC_CF_STRUC_FAILED**
(2373, X'945') Coupling-facility structure failed.

**MQRC_CF_STRUC_IN_USE**
(2346, X'92A') Coupling-facility structure in use.

**MQRC_CF_STRUC_LIST_HDR_IN_USE**
(2347, X'92B') Coupling-facility structure list-header in use.

**MQRC_CFGR_ERROR**
(2416, X'970') PCF group parameter structure MQCFGR in the message data is not valid.

**MQRC_CFH_ERROR**
(2235, X'8BB') PCF header structure not valid.

**MQRC_CFIF_ERROR**
(2414, X'96E') PCF integer filter parameter structure in the message data is not valid.

**MQRC_CFIL_ERROR**
(2236, X'8BC') PCF integer list parameter structure or PCIF*64 integer list parameter structure not valid.

**MQRC_CFIN_ERROR**
(2237, X'8BD') PCF integer parameter structure or PCIF*64 integer parameter structure not valid.

**MQRC_CFSF_ERROR**
(2415, X'96F') PCF string filter parameter structure in the message data is not valid.

**MQRC_CFSL_ERROR**
(2238, X'8BE') PCF string list parameter structure not valid.

**MQRC_CFST_ERROR**
(2239, X'8BF') PCF string parameter structure not valid.

**MQRC_CICS_WAIT_FAILED**
(2140, X'85C') Wait request rejected by CICS.

**MQRC_CLUSTER_EXIT_ERROR**
(2266, X'8DA') Cluster workload exit failed.

**MQRC_CLUSTER_RESOLUTION_ERROR**
(2189, X'88D') Cluster name resolution failed.

**MQRC_CLUSTER_RESOURCE_ERROR**
(2269, X'8DD') Cluster resource error.

**MQRC_COD_NOT_VALID_FOR_XCF_Q**
(2106, X'83A') COD report option not valid for XCF queue.

**MQRC_CONNECTION_BROKEN**
(2009, X'7D9') Connection to queue manager lost.

**MQRC_CONNECTION_NOT_AUTHORIZED**
(2217, X'8A9') Not authorized for connection.

**MQRC_CONNECTION_QUIESCING**
(2202, X'89A') Connection quiescing.

**MQRC_CONNECTION_STOPPING**
(2203, X'89B') Connection shutting down.

**MQRC_CONTENT_ERROR**
2554 (X'09FA') Message content could not be parsed to determine whether the message can be delivered to a subscriber with an extended message selector.

**MQRC_CONTEXT_HANDLE_ERROR**
(2097, X'831') Queue handle referred to does not save context.

**MQRC_CONTEXT_NOT_AVAILABLE**
(2098, X'832') Context not available for queue handle referred to.

**MQRC_DATA_LENGTH_ERROR**
(2010, X'7DA') Data length parameter not valid.

**MQRC_DB2_NOT_AVAILABLE**
(2342, X'926') Db2 subsystem not available.

**MQRC_DEF_XMIT_Q_TYPE_ERROR**
(2198, X'896') Default transmission queue not local.

**MQRC_DEF_XMIT_Q_USAGE_ERROR**
(2199, X'897') Default transmission queue usage error.

**MQRC_DH_ERROR**
(2135, X'857') Distribution header structure not valid.

**MQRC_DLH_ERROR**
(2141, X'85D') Dead letter header structure not valid.

**MQRC_EPH_ERROR**
(2420, X'974') Embedded PCF structure not valid.

**MQRC_EXPIRY_ERROR**
(2013, X'7DD') Expiry time not valid.

**MQRC_FEEDBACK_ERROR**
(2014, X'7DE') Feedback code not valid.

**MQRC_GLOBAL_UOW_CONFLICT**
(2351, X'92F') Global units of work conflict.

**MQRC_GROUP_ID_ERROR**
(2258, X'8D2') Group identifier not valid.

**MQRC_HANDLE_IN_USE_FOR_UOW**
(2353, X'931') Handle in use for global unit of work.

**MQRC_HANDLE_NOT_AVAILABLE**
(2017, X'7E1') No more handles available.

**MQRC_HCONN_ERROR**
(2018, X'7E2') Connection handle not valid.

**MQRC_HEADER_ERROR**
(2142, X'85E') IBM MQ header structure not valid.

**MQRC_IIH_ERROR**
(2148, X'864') IMS information header structure not valid.

**MQRC_LOCAL_UOW_CONFLICT**
(2352, X'930') Global unit of work conflicts with local unit of work.

**MQRC_MD_ERROR**
(2026, X'7EA') Message descriptor not valid.

**MQRC_MDE_ERROR**
(2248, X'8C8') Message descriptor extension not valid.

**MQRC_MISSING_REPLY_TO_Q**
(2027, X'7EB') Missing reply-to queue.

**MQRC_MISSING_WIH**
(2332, X'91C') Message data does not begin with MQWIH.

**MQRC_MSG_FLAGS_ERROR**
(2249, X'8C9') Message flags not valid.

**MQRC_MSG_SEQ_NUMBER_ERROR**
(2250, X'8CA') Message sequence number not valid.

**MQRC_MSG_TOO_BIG_FOR_Q**
(2030, X'7EE') Message length greater than maximum for queue.

**MQRC_MSG_TOO_BIG_FOR_Q_MGR**
(2031, X'7EF') Message length greater than maximum for queue manager.

**MQRC_MSG_TYPE_ERROR**
(2029, X'7ED') Message type in message descriptor not valid.

**MQRC_MULTIPLE_REASONS**
(2136, X'858') Multiple reason codes returned.

**MQRC_NO_DESTINATIONS_AVAILABLE**
(2270, X'8DE') No destination queues available.

**MQRC_NOT_AUTHORIZED**
(2035, X'7F3') Not authorized for access.

**MQRC_OBJECT_DAMAGED**
(2101, X'835') Object damaged.

**MQRC_OBJECT_IN_USE**
(2042, X'7FA') Object already open with conflicting options.

**MQRC_OBJECT_LEVEL_INCOMPATIBLE**
(2360, X'938') Object level not compatible.

**MQRC_OBJECT_NAME_ERROR**
(2152, X'868') Object name not valid.

**MQRC_OBJECT_NOT_UNIQUE**
(2343, X'927') Object not unique.

**MQRC_OBJECT_Q_MGR_NAME_ERROR**
(2153, X'869') Object queue-manager name not valid.

**MQRC_OBJECT_RECORDS_ERROR**
(2155, X'86B') Object records not valid.

**MQRC_OBJECT_TYPE_ERROR**
(2043, X'7FB') Object type not valid.

**MQRC_OD_ERROR**
(2044, X'7FC') Object descriptor structure not valid.

**MQRC_OFFSET_ERROR**
(2251, X'8CB') Message segment offset not valid.

**MQRC_OPTIONS_ERROR**
(2046, X'7FE') Options not valid or not consistent.

**MQRC_ORIGINAL_LENGTH_ERROR**
(2252, X'8CC') Original length not valid.

**MQRC_PAGESET_ERROR**
(2193, X'891') Error accessing page-set data set.

**MQRC_PAGESET_FULL**
(2192, X'890') External storage medium is full.

**MQRC_PCF_ERROR**
(2149, X'865') PCF structures not valid.

**MQRC_PERSISTENCE_ERROR**
(2047, X'7FF') Persistence not valid.

**MQRC_PERSISTENT_NOT_ALLOWED**
(2048, X'800') Queue does not support persistent messages.

**MQRC_PMO_ERROR**
(2173, X'87D') Put-message options structure not valid.

**MQRC_PMO_RECORD_FLAGS_ERROR**
(2158, X'86E') Put message record flags not valid.

**MQRC_PRIORITY_ERROR**
(2050, X'802') Message priority not valid.

**MQRC_PUBLICATION_FAILURE**
(2502, X'9C6') The publication has not been delivered to any of the subscribers.

**MQRC_PUT_INHIBITED**
(2051, X'803') Put calls inhibited for the queue.

**MQRC_PUT_MSG_RECORDS_ERROR**
(2159, X'86F') Put message records not valid.

**MQRC_Q_DELETED**
(2052, X'804') Queue has been deleted.

**MQRC_Q_FULL**
(2053, X'805') Queue already contains maximum number of messages.

**MQRC_Q_MGR_NAME_ERROR**
(2058, X'80A') Queue manager name not valid or not known.

**MQRC_Q_MGR_NOT_AVAILABLE**
(2059, X'80B') Queue manager not available for connection.

**MQRC_Q_MGR_QUIESCING**
(2161, X'871') Queue manager quiescing.

**MQRC_Q_MGR_STOPPING**
(2162, X'872') Queue manager shutting down.

**MQRC_Q_SPACE_NOT_AVAILABLE**
(2056, X'808') No space available on disk for queue.

**MQRC_Q_TYPE_ERROR**
(2057, X'809') Queue type not valid.

**MQRC_RECS_PRESENT_ERROR**
(2154, X'86A') Number of records present not valid.

**MQRC_REMOTE_Q_NAME_ERROR**
(2184, X'888') Remote queue name not valid.

**MQRC_REPORT_OPTIONS_ERROR**
(2061, X'80D') Report options in message descriptor not valid.

**MQRC_RESOURCE_PROBLEM**
(2102, X'836') Insufficient system resources available.

**MQRC_RESPONSE_RECORDS_ERROR**
(2156, X'86C') Response records not valid.

**MQRC_RFH_ERROR**
(2334, X'91E') MQRFH or MQRFH2 structure not valid.

**MQRC_RMH_ERROR**
(2220, X'8AC') Reference message header structure not valid.

**MQRC_SECURITY_ERROR**
(2063, X'80F') Security error occurred.

**MQRC_SEGMENT_LENGTH_ZERO**
(2253, X'8CD') Length of data in message segment is zero.

**MQRC_SELECTION_NOT_AVAILABLE**
2551 (X'09F7') A possible subscriber for the publication exists, but the queue manager cannot check whether to send the publication to the subscriber.

**MQRC_STOPPED_BY_CLUSTER_EXIT**
(2188, X'88C') Call rejected by cluster workload exit.

**MQRC_STORAGE_CLASS_ERROR**
(2105, X'839') Storage class error.

**MQRC_STORAGE_MEDIUM_FULL**
(2192, X'890') External storage medium is full.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_SUPPRESSED_BY_EXIT**
(2109, X'83D') Call suppressed by exit program.

**MQRC_SYNCPOINT_LIMIT_REACHED**
(2024, X'7E8') No more messages can be handled within current unit of work.

**MQRC_SYNCPOINT_NOT_AVAILABLE**
(2072, X'818') Syncpoint support not available.

**MQRC_TM_ERROR**
(2265, X'8D9') Trigger message structure not valid.

**MQRC_TMC_ERROR**
(2191, X'88F') Character trigger message structure not valid.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

**MQRC_UNKNOWN_ALIAS_BASE_Q**
(2082, X'822') Unknown alias base queue.

**MQRC_UNKNOWN_DEF_XMIT_Q**
(2197, X'895') Unknown default transmission queue.

**MQRC_UNKNOWN_OBJECT_NAME**
(2085, X'825') Unknown object name.

**MQRC_UNKNOWN_OBJECT_Q_MGR**
(2086, X'826') Unknown object queue manager.

**MQRC_UNKNOWN_REMOTE_Q_MGR**
(2087, X'827') Unknown remote queue manager.

**MQRC_UNKNOWN_XMIT_Q**
(2196, X'894') Unknown transmission queue.

**MQRC_UOW_ENLISTMENT_ERROR**
(2354, X'932') Enlistment in global unit of work failed.

**MQRC_UOW_MIX_NOT_SUPPORTED**
(2355, X'933') Mixture of unit-of-work calls not supported.

**MQRC_UOW_NOT_AVAILABLE**
(2255, X'8CF') Unit of work not available for the queue manager to use.

**MQRC_WIH_ERROR**
(2333, X'91D') MQWIH structure not valid.

**MQRC_WRONG_CF_LEVEL**
(2366, X'93E') Coupling-facility structure is wrong level.

**MQRC_WRONG_MD_VERSION**
(2257, X'8D1') Wrong version of MQMD supplied.

**MQRC_XMIT_Q_TYPE_ERROR**
(2091, X'82B') Transmission queue not local.

**MQRC_XMIT_Q_USAGE_ERROR**
(2092, X'82C') Transmission queue with wrong usage.

**MQRC_XQH_ERROR**
(2260, X'8D4') Transmission queue header structure not valid.

For detailed information about these codes, see Messages and reason codes.

## Usage notes

1. Both the MQPUT and MQPUT1 calls can be used to put messages on a queue; which call to use depends on the circumstances:

   - Use the MQPUT call to place multiple messages on the *same* queue.

     An MQOPEN call specifying the MQOO_OUTPUT option is issued first, followed by one or more MQPUT requests to add messages to the queue; finally the queue is closed with an MQCLOSE call. This gives better performance than repeated use of the MQPUT1 call.

   - Use the MQPUT1 call to put only *one* message on a queue.

This call encapsulates the MQOPEN, MQPUT, and MQCLOSE calls into a single call, minimizing the number of calls that must be issued.

2. If an application puts a sequence of messages on the same queue without using message groups, the order of those messages is preserved if certain conditions are satisfied. However, in most environments the MQPUT1 call does not satisfy these conditions, and so does not preserve message order. The MQPUT call must be used instead in these environments. See MQPUT usage notes for details.
3. The MQPUT1 call can be used to put messages to distribution lists. For general information about this, see the usage notes for the MQOPEN and MQPUT calls.

   Distribution lists are supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.

   The following differences apply when using the MQPUT1 call:

   a. If the application provides MQRR response records, they must be provided using the MQOD structure; they cannot be provided using the MQPMO structure.
   b. The reason code MQRC_OPEN_FAILED is never returned by MQPUT1 in the response records; if a queue fails to open, the response record for that queue contains the reason code resulting from the open operation.

      If an open operation for a queue succeeds with a completion code of MQCC_WARNING, the completion code and reason code in the response record for that queue are replaced by the completion and reason codes resulting from the put operation.

      As with the MQOPEN and MQPUT calls, the queue manager sets the response records (if provided) only when the outcome of the call is not the same for all queues in the distribution list; this is indicated by the call completing with reason code MQRC_MULTIPLE_REASONS.
4. If the MQPUT1 call is used to put a message on a cluster queue, the call behaves as though MQOO_BIND_NOT_FIXED had been specified on the MQOPEN call.
5. If a message is put with one or more IBM MQ header structures at the beginning of the application message data, the queue manager performs certain checks on the header structures to verify that they are valid. For more information about this, see the usage notes for the MQPUT call.
6. If more than one of the warning situations arise (see the *CompCode* parameter), the reason code returned is the *first* one in the following list that applies:

   a. MQRC_MULTIPLE_REASONS
   b. MQRC_INCOMPLETE_MSG
   c. MQRC_INCOMPLETE_GROUP
   d. MQRC_PRIORITY_EXCEEDS_MAXIMUM or MQRC_UNKNOWN_REPORT_OPTION
7. For the Visual Basic programming language, the following points apply:

   - If the size of the *Buffer* parameter is less than the length specified by the *BufferLength* parameter, the call fails with reason code MQRC_BUFFER_LENGTH_ERROR.
   - The *Buffer* parameter is declared as being of type `String`. If the data to be placed on the queue is not of type `String`, use the MQPUT1Any call in place of MQPUT1.

     The MQPUT1Any call has the same parameters as the MQPUT1 call, except that the *Buffer* parameter is declared as being of type `Any`, allowing any type of data to be placed on the queue. However, this means that *Buffer* cannot be checked to ensure that it is at least *BufferLength* bytes in size.
8. When an MQPUT1 call is issued with MQPMO_SYNCPOINT, the default behavior changes, so that the put operation is completed asynchronously. This might cause a change in the behavior of some applications that rely on certain fields in the MQOD and MQMD structures being returned, but which now contain undefined values. An application can specify MQPMO_SYNC_RESPONSE to ensure that the put operation is performed synchronously and that all the appropriate field values are completed.

## C invocation

```
MQPUT1 (Hconn, &ObjDesc, &MsgDesc, &PutMsgOpts,
       BufferLength, Buffer, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;         /* Connection handle */
MQOD     ObjDesc;       /* Object descriptor */
MQMD     MsgDesc;       /* Message descriptor */
MQPMO    PutMsgOpts;    /* Options that control the action of MQPUT1 */
MQLONG   BufferLength;  /* Length of the message in Buffer */
MQBYTE   Buffer[n];     /* Message data */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

## COBOL invocation

```
     CALL 'MQPUT1' USING HCONN, OBJDESC, MSGDESC, PUTMSGOPTS,
                         BUFFERLENGTH, BUFFER, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN         PIC S9(9) BINARY.
**   Object descriptor
 01  OBJDESC.
     COPY CMQODV.
**   Message descriptor
 01  MSGDESC.
     COPY CMQMDV.
**   Options that control the action of MQPUT1
 01  PUTMSGOPTS.
     COPY CMQPMOV.
**   Length of the message in BUFFER
 01  BUFFERLENGTH  PIC S9(9) BINARY.
**   Message data
 01  BUFFER        PIC X(n).
**   Completion code
 01  COMPCODE      PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON        PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQPUT1 (Hconn, ObjDesc, MsgDesc, PutMsgOpts, BufferLength, Buffer,
            CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn         fixed bin(31);  /* Connection handle */
dcl ObjDesc       like MQOD;      /* Object descriptor */
dcl MsgDesc       like MQMD;      /* Message descriptor */
dcl PutMsgOpts    like MQPMO;     /* Options that control the action of
                                     MQPUT1 */
dcl BufferLength  fixed bin(31);  /* Length of the message in Buffer */
dcl Buffer        char(n);        /* Message data */
dcl CompCode      fixed bin(31);  /* Completion code */
dcl Reason        fixed bin(31);  /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
        CALL MQPUT1,(HCONN,OBJDESC,MSGDESC,PUTMSGOPTS,BUFFERLENGTH,   X
              BUFFER,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN         DS       F      Connection handle
OBJDESC       CMQODA   ,      Object descriptor
MSGDESC       CMQMDA   ,      Message descriptor
PUTMSGOPTS    CMQPMOA  ,      Options that control the action of MQPUT1
BUFFERLENGTH  DS       F      Length of the message in BUFFER
BUFFER        DS       CL(n)  Message data
COMPCODE      DS       F      Completion code
REASON        DS       F      Reason code qualifying COMPCODE
```

### Visual Basic invocation

```
MQPUT1 Hconn, ObjDesc, MsgDesc, PutMsgOpts, BufferLength, Buffer,
       CompCode, Reason
```

Declare the parameters as follows:

```
Dim Hconn        As Long   'Connection handle'
Dim ObjDesc      As MQOD   'Object descriptor'
Dim MsgDesc      As MQMD   'Message descriptor'
Dim PutMsgOpts   As MQPMO  'Options that control the action of MQPUT1'
Dim BufferLength As Long   'Length of the message in Buffer'
Dim Buffer       As String 'Message data'
Dim CompCode     As Long   'Completion code'
Dim Reason       As Long   'Reason code qualifying CompCode'
```

## MQSET - Set object attributes

Use the MQSET call to change the attributes of an object represented by a handle. The object must be a queue.

### Syntax

MQSET (*Hconn*, *Hobj*, *SelectorCount*, *Selectors*, *IntAttrCount*, *IntAttrs*, *CharAttrLength*, *CharAttrs*, *Compcode*, *Reason*)

### Parameters

***Hconn***
Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn* :

**MQHC_DEF_HCONN**
Default connection handle.

**Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

***Hobj***
Type: MQHOBJ - input

This handle represents the queue object with attributes that are to be set. The handle was returned by a previous MQOPEN call that specified the MQOO_SET option.

***SelectorCount***

Type: MQLONG - input

This is the count of selectors that are supplied in the *Selectors* array. It is the number of attributes that are to be set. Zero is a valid value. The maximum number allowed is 256.

***Selectors***

Type: MQLONGxSelectorCount - input

This is an array of *SelectorCount* attribute selectors; each selector identifies an attribute (integer or character) with a value that is to be set.

Each selector must be valid for the type of queue that *Hobj* represents. Only certain MQIA_* and MQCA_* values are allowed; as listed later.

Selectors can be specified in any order. Attribute values that correspond to integer attribute selectors (MQIA_* selectors) must be specified in *IntAttrs* in the same order in which these selectors occur in *Selectors*. Attribute values that correspond to character attribute selectors (MQCA_* selectors) must be specified in *CharAttrs* in the same order in which those selectors occur. MQIA_* selectors can be interleaved with the MQCA_* selectors; only the relative order within each type is important.

You can specify the same selector more than once; if you do, the last value specified for a particular selector is the one that takes effect.

**Note:**

1. The integer and character attribute selectors are allocated within two different ranges; the MQIA_* selectors reside within the range MQIA_FIRST through MQIA_LAST, and the MQCA_* selectors within the range MQCA_FIRST through MQCA_LAST.

   For each range, the constants MQIA_LAST_USED and MQCA_LAST_USED define the highest value that the queue manager accepts.
2. If all the MQIA_* selectors occur first, the same element numbers can be used to address corresponding elements in the *Selectors* and *IntAttrs* arrays.
3. If the *SelectorCount* parameter is zero, *Selectors* is not referred to; in this case, the parameter address passed by programs written in C or System/390 assembler might be null.

The attributes that can be set are listed in the following table. No other attributes can be set using this call. For the MQCA_* attribute selectors, the constant that defines the length in bytes of the string that is required in *CharAttrs* is supplied in parentheses.

*Table 559. MQSET attribute selectors for queues*

| Selector | Description | Note |
|---|---|---|
| MQCA_TRIGGER_DATA | Trigger data (MQ_TRIGGER_DATA_LENGTH). | |
| MQIA_DIST_LISTS | Distribution list support. | 1 |
| MQIA_INHIBIT_GET | Whether get operations are allowed. | |
| MQIA_INHIBIT_PUT | Whether put operations are allowed. | |
| MQIA_TRIGGER_CONTROL | Trigger control. | |
| MQIA_TRIGGER_DEPTH | Trigger depth. | |
| MQIA_TRIGGER_MSG_PRIORITY | Threshold message priority for triggers. | |
| MQIA_TRIGGER_TYPE | Trigger type. | |

**Note:**

1. Supported only on AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

***IntAttrCount***
Type: MQLONG - input

This is the number of elements in the *IntAttrs* array, and must be at least the number of MQIA_* selectors in the *Selectors* parameter. Zero is a valid value if there are none.

***IntAttrs***
Type: MQLONGxIntAttrCount - input

This is an array of *IntAttrCount* integer attribute values. These attribute values must be in the same order as the MQIA_* selectors in the *Selectors* array.

If the *IntAttrCount* or *SelectorCount* parameter is zero, *IntAttrs* is not referred to; in this case, the parameter address passed by programs written in C or System/390 assembler might be null.

***CharAttrLength***
Type: MQLONG - input

This is the length in bytes of the *CharAttrs* parameter, and must be at least the sum of the lengths of the character attributes specified in the *Selectors* array. Zero is a valid value if there are no MQCA_* selectors in *Selectors*.

***CharAttrs***
Type: MQCHARxCharAttrLength - input

This is the buffer containing the character attribute values, concatenated together. The length of the buffer is given by the *CharAttrLength* parameter.

The characters attributes must be specified in the same order as the MQCA_* selectors in the *Selectors* array. The length of each character attribute is fixed (see Selectors ). If the value to be set for an attribute contains fewer nonblank characters than the defined length of the attribute, pad the value in *CharAttrs* to the right with blanks to make the attribute value match the defined length of the attribute.

If the *CharAttrLength* or *SelectorCount* parameter is zero, *CharAttrs* is not referred to; in this case, the parameter address passed by programs written in C or System/390 assembler might be null.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

The reason code qualifying *CompCode*.

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'89C') Adapter not available.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_API_EXIT_ERROR**
(2374, X'946') API exit failed.

**MQRC_API_EXIT_LOAD_ERROR**
(2183, X'887') Unable to load API exit.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_CALL_IN_PROGRESS**
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC_CF_NOT_AVAILABLE**
(2345, X'929') Coupling facility not available.

**MQRC_CF_STRUC_FAILED**
(2373, X'945') Coupling-facility structure failed.

**MQRC_CF_STRUC_IN_USE**
(2346, X'92A') Coupling-facility structure in use.

**MQRC_CF_STRUC_LIST_HDR_IN_USE**
(2347, X'92B') Coupling-facility structure list-header in use.

**MQRC_CHAR_ATTR_LENGTH_ERROR**
(2006, X'7D6') Length of character attributes not valid.

**MQRC_CHAR_ATTRS_ERROR**
(2007, X'7D7') Character attributes string not valid.

**MQRC_CICS_WAIT_FAILED**
(2140, X'85C') Wait request rejected by CICS.

**MQRC_CONNECTION_BROKEN**
(2009, X'7D9') Connection to queue manager lost.

**MQRC_CONNECTION_NOT_AUTHORIZED**
(2217, X'8A9') Not authorized for connection.

**MQRC_CONNECTION_STOPPING**
(2203, X'89B') Connection shutting down.

**MQRC_DB2_NOT_AVAILABLE**
(2342, X'926') Db2 subsystem not available.

**MQRC_HCONN_ERROR**
(2018, X'7E2') Connection handle not valid.

**MQRC_HOBJ_ERROR**
(2019, X'7E3') Object handle not valid.

**MQRC_INHIBIT_VALUE_ERROR**
(2020, X'7E4') Value for inhibit-get or inhibit-put queue attribute not valid.

**MQRC_INT_ATTR_COUNT_ERROR**
(2021, X'7E5') Count of integer attributes not valid.

**MQRC_INT_ATTRS_ARRAY_ERROR**
(2023, X'7E7') Integer attributes array not valid.

**MQRC_NOT_OPEN_FOR_SET**
(2040, X'7F8') Queue not open for set.

**MQRC_OBJECT_CHANGED**
(2041, X'7F9') Object definition changed since opened.

**MQRC_OBJECT_DAMAGED**
(2101, X'835') Object damaged.

**MQRC_PAGESET_ERROR**
(2193, X'891') Error accessing page-set data set.

**MQRC_Q_DELETED**
(2052, X'804') Queue has been deleted.

**MQRC_Q_MGR_NAME_ERROR**
(2058, X'80A') Queue manager name not valid or not known.

**MQRC_Q_MGR_NOT_AVAILABLE**
(2059, X'80B') Queue manager not available for connection.

**MQRC_Q_MGR_STOPPING**
(2162, X'872') Queue manager shutting down.

**MQRC_RESOURCE_PROBLEM**
(2102, X'836') Insufficient system resources available.

**MQRC_SELECTOR_COUNT_ERROR**
(2065, X'811') Count of selectors not valid.

**MQRC_SELECTOR_ERROR**
(2067, X'813') Attribute selector not valid.

**MQRC_SELECTOR_LIMIT_EXCEEDED**
(2066, X'812') Count of selectors too large.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_SUPPRESSED_BY_EXIT**
(2109, X'83D') Call suppressed by exit program.

**MQRC_TRIGGER_CONTROL_ERROR**
(2075, X'81B') Value for trigger-control attribute not valid.

**MQRC_TRIGGER_DEPTH_ERROR**
(2076, X'81C') Value for trigger-depth attribute not valid.

**MQRC_TRIGGER_MSG_PRIORITY_ERR**
(2077, X'81D') Value for trigger-message-priority attribute not valid.

**MQRC_TRIGGER_TYPE_ERROR**
(2078, X'81E') Value for trigger-type attribute not valid.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Messages and reason codes.

## Usage notes

1. Using this call, the application can specify an array of integer attributes, or a collection of character attribute strings, or both. If no errors occur, the attributes specified are all set simultaneously. If an error occurs (for example, if a selector is not valid, or an attempt is made to set an attribute to a value that is not valid), the call fails and no attributes are set.
2. The values of attributes can be determined using the MQINQ call; see "MQINQ - Inquire object attributes" on page 685 for details.

   **Note:** Not all attributes with values that can be inquired using the MQINQ call can have their values changed using the MQSET call. For example, no process-object or queue-manager attributes can be set with this call.
3. Attribute changes are preserved across restarts of the queue manager (other than alterations to temporary dynamic queues, which do not survive restarts of the queue manager).
4. You cannot change the attributes of a model queue using the MQSET call. However, if you open a model queue using the MQOPEN call with the MQOO_SET option, you can use the MQSET call to set the attributes of the dynamic local queue that is created by the MQOPEN call.
5. If the object being set is a cluster queue, there must be a local instance of the cluster queue for the open to succeed.

For more information about object attributes, see:

- "Attributes for queues" on page 810

- “Attributes for namelists” on page 841
- “Attributes for process definitions” on page 843
- “Attributes for the queue manager” on page 777

## C invocation

```
MQSET (Hconn, Hobj, SelectorCount, Selectors, IntAttrCount, IntAttrs,
      CharAttrLength, CharAttrs, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;           /* Connection handle */
MQHOBJ   Hobj;            /* Object handle */
MQLONG   SelectorCount;   /* Count of selectors */
MQLONG   Selectors[n];    /* Array of attribute selectors */
MQLONG   IntAttrCount;    /* Count of integer attributes */
MQLONG   IntAttrs[n];     /* Array of integer attributes */
MQLONG   CharAttrLength;  /* Length of character attributes buffer */
MQCHAR   CharAttrs[n];    /* Character attributes */
MQLONG   CompCode;        /* Completion code */
MQLONG   Reason;          /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQSET' USING HCONN, HOBJ, SELECTORCOUNT, SELECTORS-TABLE,
                   INTATTRCOUNT, INTATTRS-TABLE, CHARATTRLENGTH,
                   CHARATTRS, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN            PIC S9(9) BINARY.
**   Object handle
 01  HOBJ             PIC S9(9) BINARY.
**   Count of selectors
 01  SELECTORCOUNT    PIC S9(9) BINARY.
**   Array of attribute selectors
 01  SELECTORS-TABLE.
  02  SELECTORS        PIC S9(9) BINARY OCCURS n TIMES.
**   Count of integer attributes
 01  INTATTRCOUNT     PIC S9(9) BINARY.
**   Array of integer attributes
 01  INTATTRS-TABLE.
  02  INTATTRS         PIC S9(9) BINARY OCCURS n TIMES.
**   Length of character attributes buffer
 01  CHARATTRLENGTH   PIC S9(9) BINARY.
**   Character attributes
 01  CHARATTRS        PIC X(n).
**   Completion code
 01  COMPCODE         PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON           PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQSET (Hconn, Hobj, SelectorCount, Selectors, IntAttrCount,
           IntAttrs, CharAttrLength, CharAttrs, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn           fixed bin(31);  /* Connection handle */
dcl Hobj            fixed bin(31);  /* Object handle */
dcl SelectorCount   fixed bin(31);  /* Count of selectors */
```

```
dcl Selectors(n)    fixed bin(31);  /* Array of attribute selectors */
dcl IntAttrCount    fixed bin(31);  /* Count of integer attributes */
dcl IntAttrs(n)     fixed bin(31);  /* Array of integer attributes */
dcl CharAttrLength  fixed bin(31);  /* Length of character attributes
                                       buffer */
dcl CharAttrs       char(n);        /* Character attributes */
dcl CompCode        fixed bin(31);  /* Completion code */
dcl Reason          fixed bin(31);  /* Reason code qualifying
                                       CompCode */
```

### High Level Assembler invocation

```
CALL MQSET,(HCONN,HOBJ,SELECTORCOUNT,SELECTORS,INTATTRCOUNT,  X
             INTATTRS,CHARATTRLENGTH,CHARATTRS,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN           DS  F      Connection handle
HOBJ            DS  F      Object handle
SELECTORCOUNT   DS  F      Count of selectors
SELECTORS       DS  (n)F   Array of attribute selectors
INTATTRCOUNT    DS  F      Count of integer attributes
INTATTRS        DS  (n)F   Array of integer attributes
CHARATTRLENGTH  DS  F      Length of character attributes buffer
CHARATTRS       DS  CL(n)  Character attributes
COMPCODE        DS  F      Completion code
REASON          DS  F      Reason code qualifying COMPCODE
```

### Visual Basic invocation

```
MQSET Hconn, Hobj, SelectorCount, Selectors, IntAttrCount, IntAttrs,
      CharAttrLength, CharAttrs, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Hconn          As Long   'Connection handle'
Dim Hobj           As Long   'Object handle'
Dim SelectorCount  As Long   'Count of selectors'
Dim Selectors      As Long   'Array of attribute selectors'
Dim IntAttrCount   As Long   'Count of integer attributes'
Dim IntAttrs       As Long   'Array of integer attributes'
Dim CharAttrLength As Long   'Length of character attributes buffer'
Dim CharAttrs      As String 'Character attributes'
Dim CompCode       As Long   'Completion code'
Dim Reason         As Long   'Reason code qualifying CompCode'
```

## MQSETMP - Set message property

Use the MQSETMP call to set or modify a property of a message handle.

### Syntax

MQSETMP (*Hconn*, *Hmsg*, *SetPropOpts*, *Name*, *PropDesc*, *Type*, *ValueLength*, *Value*, *Compcode*, *Reason*)

### Parameters

***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager.

The value must match the connection handle that was used to create the message handle specified in the *Hmsg* parameter. If the message handle was created using MQHC_UNASSOCIATED_HCONN,

a valid connection must be established on the thread setting a property of the message handle, otherwise the call fails with reason code MQRC_CONNECTION_BROKEN.

***Hmsg***
Type: MQHMSG - input

This is the message handle to be modified. The value was returned by a previous MQCRTMH call.

***SetPropOpts***
Type: MQSMPO - input

Control how message properties are set.

This structure allows applications to specify options that control how message properties are set. The structure is an input parameter on the MQSETMP call. See MQSMPO for further information.

***Name***
Type: MQCHARV- input

This is the name of the property to set.

See Property names and Property name restrictions for further information about the use of property names.

***PropDesc***
Type: MQPD - input/output

This structure is used to define the attributes of a property, including:

- what happens if the property is not supported
- what message context the property belongs to
- what messages the property is copied into as it flows

See MQPD for further information about this structure.

***Type***
Type: MQLONG - input

The data type of the property being set. It can be one of the following:

**MQTYPE_BOOLEAN**
A Boolean. *ValueLength* must be 4.

**MQTYPE_BYTE_STRING**
A byte string. *ValueLength* must be zero or greater.

**MQTYPE_INT8**
An 8-bit signed integer. *ValueLength* must be 1.

**MQTYPE_INT16**
A 16-bit signed integer. *ValueLength* must be 2.

**MQTYPE_INT32**
A 32-bit signed integer. *ValueLength* must be 4.

**MQTYPE_INT64**
A 64-bit signed integer. *ValueLength* must be 8.

**MQTYPE_FLOAT32**
A 32-bit floating-point number. *ValueLength* must be 4.

Note: this type is not supported with applications using IBM COBOL for z/OS.

**MQTYPE_FLOAT64**
A 64-bit floating-point number. *ValueLength* must be 8.

Note: this type is not supported with applications using IBM COBOL for z/OS.

**MQTYPE_STRING**
A character string. *ValueLength* must be zero or greater, or the special value MQVL_NULL_TERMINATED.

**MQTYPE_NULL**
The property exists but has a null value. *ValueLength* must be zero.

***ValueLength***
Type: MQLONG - input

The length in bytes of the property value in the *Value* parameter. Zero is valid only for null values or for strings or byte strings. Zero indicates that the property exists but that the value contains no characters or bytes.

The value must be greater than or equal to zero or the following special value if the *Type* parameter has MQTYPE_STRING set:

**MQVL_NULL_TERMINATED**
The value is delimited by the first null encountered in the string. The null is not included as part of the string. This value is invalid if MQTYPE_STRING is not also set.

Note: The null character used to terminate a string if MQVL_NULL_TERMINATED is set is a null from the character set of the Value.

***Value***
Type: MQBYTExValueLength - input

The value of the property to be set. The buffer must be aligned on a boundary appropriate to the nature of the data in the value.

In the C programming language, the parameter is declared as a pointer-to-void; the address of any type of data can be specified as the parameter.

If *ValueLength* is zero, *Value* is not referred to. In this case, the parameter address passed by programs written in C or System/390 assembler can be null.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

The reason code qualifying *CompCode*.

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_WARNING:

**MQRC_RFH_FORMAT_ERROR**
(2421, X'0975') An MQRFH2 folder containing properties could not be parsed.

If *CompCode* is MQCC_FAILED:

**MQRC_ADAPTER_NOT_AVAILABLE**
(2204, X'089C') Adapter not available.

**MQRC_ADAPTER_SERV_LOAD_ERROR**
(2130, X'852') Unable to load adapter service module.

**MQRC_ASID_MISMATCH**
(2157, X'86D') Primary and home ASIDs differ.

**MQRC_BUFFER_ERROR**
(2004, X'07D4') Value parameter not valid.

**MQRC_BUFFER_LENGTH_ERROR**
(2005, X'07D5') Value length parameter not valid.

**MQRC_CALL_IN_PROGRESS**
(2219, X'08AB') MQI call entered before previous call completed.

**MQRC_HMSG_ERROR**
(2460, X'099C') Message handle pointer not valid.

**MQRC_MSG_HANDLE_IN_USE**
(2499, X'09C3') Message handle already in use.

**MQRC_OPTIONS_ERROR**
(2046, X'07FE') Options not valid or not consistent.

**MQRC_PD_ERROR**
(2482, X'09B2') Property descriptor structure not valid.

**MQRC_PROPERTY_NAME_ERROR**
(2442, X'098A') Invalid property name.

**MQRC_PROPERTY_TYPE_ERROR**
(2473, X'09A9') Invalid property data type.

**MQRC_PROP_NUMBER_FORMAT_ERROR**
(2472, X'09A8') Number format error encountered in value data.

**MQRC_SMPO_ERROR**
(2463, X'099F') Set message property options structure not valid.

**MQRC_SOURCE_CCSID_ERROR**
(2111, X'083F') Property name coded character set identifier not valid.

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Messages and reason codes.

## C invocation

```
MQSETMP (Hconn, Hmsg, &SetPropOpts, &Name, &PropDesc, Type,
ValueLength, &Value, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;       /* Connection handle */
MQHMSG   Hmsg;        /* Message handle */
MQSMPO   SetPropOpts; /* Options that control the action of MQSETMP */
MQCHARV  Name;        /* Property name */
MQPD     PropDesc;    /* Property descriptor */
MQLONG   Type;        /* Property data type */
MQLONG   ValueLength; /* Length of property value in Value */
MQBYTE   Value[n];    /* Property value */
MQLONG   CompCode;    /* Completion code */
MQLONG   Reason;      /* Reason code qualifying CompCode */
```

## COBOL invocation

```
     CALL 'MQSETMP' USING HCONN, HMSG, SETMSGOPTS, NAME, PROPDESC, TYPE,
                          VALUELENGTH, VALUE, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN     PIC S9(9) BINARY.
**   Message handle
 01  HMSG    PIC S9(18) BINARY.
**   Options that control the action of MQSETMP
 01  SETMSGOPTS.
     COPY CMQSMPOV.
**   Property name
 01  NAME
    COPY CMQCHRVV.
**   Property descriptor
 01  PROPDESC.
     COPY CMQPDV.
**   Property data type
 01  TYPE          PIC S9(9) BINARY.
**   Length of property value in VALUE
 01  VALUELENGTH   PIC S9(9) BINARY.
**   Property value
 01  VALUE         PIC X(n).
**   Completion code
 01  COMPCODE  PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON    PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQSETMP (Hconn, Hmsg, SetPropOpts, Name, PropDesc, Type, ValueLength,
              Value, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn       fixed bin(31);  /* Connection handle */
dcl Hmsg        fixed bin(63);  /* Message handle */
dcl SetPropOpts like MQSMPO;    /* Options that control the action of MQSETMP */
dcl Name        like MQCHARV;   /* Property name */
dcl PropDesc    like MQPD;      /* Property descriptor */
dcl Type        fixed bin(31);  /* Property data type */
dcl ValueLength fixed bin(31);  /* Length of property value in Value */
dcl Value       char(n);        /* Property value */
dcl CompCode    fixed bin(31);  /* Completion code */
dcl Reason      fixed bin(31);  /* Reason code qualifying CompCode */
```

## High Level Assembler invocation

```
        CALL MQSETMP,(HCONN,HMSG,SETMSGHOPTS,NAME,PROPDESC,TYPE,VALUELENGTH,
               VALUE,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN        DS         F     Connection handle
HMSG         DS         D     Message handle
SETMSGOPTS   CMQSMPOA   ,     Options that control the action of MQSETMP
NAME         CMQCHRVA   ,     Property name
PROPDESC     CMQPDA     ,     Property descriptor
TYPE         DS         F     Property data type
VALUELENGTH  DS         F     Length of property value in VALUE
VALUE        DS         CL(n) Property value
COMPCODE     DS         F     Completion code
REASON       DS         F     Reason code qualifying COMPCODE
```

## MQSTAT - Retrieve status information

Use the MQSTAT call to retrieve status information. The type of status information returned is determined by the Type value specified on the call.

### Syntax

MQSTAT (*Hconn*, *Type*, *Stat*, *Compcode*, *Reason*)

### Parameters

***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn* :

**MQHC_DEF_HCONN**
Default connection handle.

**Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

***Type***

Type: MQLONG - input

Type of status information being requested. The > valid values are:

**MQSTAT_TYPE_ASYNC_ERROR**
Return information about previous asynchronous put operations.

**MQSTAT_TYPE_RECONNECTION**

Return information about reconnection. If the connection is reconnecting or failed to reconnect, the information describes the failure which caused the connection to begin reconnecting.

This value is only valid for client connections. For other types of connection, the call fails with reason code **MQRC_ENVIRONMENT_ERROR**

**MQSTAT_TYPE_RECONNECTION_ERROR**

Return information about a previous failure related to reconnect. If the connection failed to reconnect, the information describes the failure which caused reconnection to fail.

This value is only valid for client connections. For other types of connection, the call fails with reason code **MQRC_ENVIRONMENT_ERROR**.

***Stat***

Type: MQSTS - input/output

Status information structure. See “MQSTS - Status reporting structure” on page 570 for details.

***CompCode***

Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion.

**MQCC_FAILED**
Call failed.

***Reason***
Type: MQLONG - output

The reason code qualifying *CompCode*.

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_FAILED:

**MQRC_API_EXIT_ERROR**
(2374, X'946') API exit failed

**MQRC_API_EXIT_LOAD_ERROR**
(2183, X'887') Unable to load API exit.

**MQRC_CALL_IN_PROGRESS**
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC_CONNECTION_BROKEN**
(2009, X'7D9') Connection to queue manager lost.

**MQRC_CONNECTION_STOPPING**
(2203, X'89B') Connection shutting down.

**MQRC_FUNCTION_NOT_SUPPORTED**
(2298, X'8FA') The function requested is not available in the current environment.

**MQRC_HCONN_ERROR**
(2018, X'7E2') Connection handle not valid.

**MQRC_Q_MGR_STOPPING**
(2162,X'872' - Queue manager stopping

**MQRC_RESOURCE_PROBLEM**
(2102, X'836') Insufficient system resources available.

**MQRC_STAT_TYPE_ERROR**
(2430, X'97E' Error with MQSTAT type

**MQRC_STORAGE_NOT_AVAILABLE**
(2071, X'817') Insufficient storage available.

**MQRC_STS_ERROR**
(2426, X'97A') Error with MQSTS structure

**MQRC_UNEXPECTED_ERROR**
(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Messages and reason codes.

## Usage notes

1. A call to MQSTAT specifying a type of MQSTAT_TYPE_ASYNC_ERROR returns information about previous asynchronous MQPUT and MQPUT1 operations. The MQSTS structure passed back on return from the MQSTAT call contains the first recorded asynchronous warning or error information for that connection. If further errors or warnings follow the first, they do not normally alter these values. However, if an error occurs with a completion code of MQCC_WARNING, a subsequent failure with a completion code of MQCC_FAILED is returned instead.
2. If no errors have occurred since the connection was established or since the last call to MQSTAT then a CompCode of MQCC_OK and Reason of MQRC_NONE are returned in the MQSTS structure.
3. Counts of the number of asynchronous calls that have been processed under the connection handle are returned by way of three counter fields; PutSuccessCount, PutWarningCount and PutFailureCount. These counters are incremented by the queue manager each time an asynchronous operation is processed successfully, has a warning, or fails (note that for accounting

purposes a put to a distribution list counts once per destination queue rather than once per distribution list). A counter is not incremented beyond the maximum positive value AMQ_LONG_MAX.

4. A successful call to MQSTAT results in any previous error information or counts being reset.
5. The behavior of MQSTAT depends on the value of the MQSTAT  Type parameter you provide.
6. **MQSTAT_TYPE_ASYNC_ERROR**
    a. A call to MQSTAT specifying a type of MQSTAT_TYPE_ASYNC_ERROR returns information about previous asynchronous MQPUT and MQPUT1 operations. The MQSTS structure passed back on return from the MQSTAT call contains the first recorded asynchronous warning or error information for that connection. If further errors or warnings follow the first, they do not normally alter these values. However, if an error occurs with a completion code of MQCC_WARNING, a subsequent failure with a completion code of MQCC_FAILED is returned instead.
    b. If no errors have occurred since the connection was established or since the last call to MQSTAT then a CompCode of MQCC_OK and Reason of MQRC_NONE are returned in the MQSTS structure.
    c. Counts of the number of asynchronous calls that have been processed under the connection handle are returned by way of three counter fields; PutSuccessCount, PutWarningCount and PutFailureCount. These counters are incremented by the queue manager each time an asynchronous operation is processed successfully, has a warning, or fails (note that for accounting purposes a put to a distribution list counts once per destination queue rather than once per distribution list). A counter is not incremented beyond the maximum positive value AMQ_LONG_MAX.
    d. A successful call to MQSTAT results in any previous error information or counts being reset.

**MQSTAT_TYPE_RECONNECTION**

Suppose you call MQSTAT with Type set to MQSTAT_TYPE_RECONNECTION inside an event handler during reconnection. Consider these examples.

**The client is attempting reconnection or failed to reconnect.**
CompCode in the MQSTS structure is MQCC_FAILED and Reason might be either MQRC_CONNECTION_BROKEN or MQRC_Q_MGR_QUIESCING. ObjectType is MQOT_Q_MGR, ObjectName is the name of the queue manager, and ObjectQMgrName is blank.

**The client completed reconnection successfully or was never disconnected.**
CompCode in the MQSTS structure is MQCC_OK and the Reason is MQRC_NONE

Subsequent calls to MQSTAT return the same results.

**MQSTAT_TYPE_RECONNECTION_ERROR**

Suppose you call MQSTAT with Type set to MQSTAT_TYPE_RECONNECTION_ERROR in response to receiving MQRC_RECONNECT_FAILED to an MQI call. Consider these examples.

**An authorization failure occurred when a queue was being reopened during reconnection to a different queue manager.**
CompCode in the MQSTS structure is MQCC_FAILED and Reason is the reason that the reconnection failed, such as MQRC_NOT_AUTHORIZED. ObjectType is the type of object that caused the problem, such as MQOT_QUEUE, ObjectName is the name of the queue and ObjectQMgrName the name of the queue manager owning the queue.

**A socket connection error occurred during reconnection.**
CompCode in the MQSTS structure is MQCC_FAILED and Reason is the reason that the reconnection failed, such as MQRC_HOST_NOT_AVAILABLE. ObjectType is MQOT_Q_MGR, ObjectName is the name of the queue manager, and ObjectQMgrName is blank.

Subsequent calls to MQSTAT return the same results.

## C invocation

```
MQSTAT (Hconn, StatType, &Stat, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN Hconn;        /* Connection Handle */
MQLONG StatType;    /* Status type */
MQSTS Stat;            /* Status information structure */
MQLONG CompCode;    /* Completion code */
MQLONG Reason;        /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQSTAT' USING HCONN, STATTYPE, STAT, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**    Connection handle
 01    HCONN      PIC S9(9)      BINARY.
**    Status type
 01    STATTYPE   PIC S9(9)      BINARY.
**    Status information
 01    STAT.
    COPY CMQSTSV.
**    Completion code
 01    COMPCODE   PIC S9(9)      BINARY.
**    Reason code qualifying COMPCODE
 01    REASON     PIC S9(9)      BINARY.
```

## PL/I invocation

```
call MQSTAT (Hconn, StatType, Stat, Compcode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn       fixed bin(31); /* Connection handle */
dcl StatType    fixed bin(31); /* Status type */
dcl Stat        like MQSTS;    /* Status information structure */
dcl CompCode    fixed bin(31); /* Completion code */
dcl Reason      fixed bin(31); /* Reason code qualifying CompCode */
```

## System/390 Assembler invocation

```
CALL MQSTAT,(HCONN,STATTYPE,STAT,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN     DS     F    Connection handle
STATTYPE  DS     F    Status type
STAT      CMQSTSA,    Status information structure
COMPCODE  DS     F    Completion code
REASON    DS     F    Reason code qualifying COMPCODE
```

## MQSUB - Register subscription

Use the MQSUB call to register the applications subscription to a particular topic.

### Syntax

MQSUB (*Hconn*, *SubDesc*, *Hobj*, *Hsub*, *Compcode*, *Reason*)

### Parameters

***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn* :

**MQHC_DEF_HCONN**
Default connection handle.

**Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

***SubDesc***

Type: MQSD - input/output

This is a structure that identifies the object in use that is being registered by the application. See “MQSD - Subscription descriptor” on page 544 for more information.

***Hobj***

Type: MQHOBJ - input/output

This handle represents the access that has been established to obtain the messages sent to this subscription. These messages can either be stored on a specific queue or the queue manager can manage their storage without using a specific queue.

To use a specific queue, you must associate it with the subscription when the subscription is created. You can do this in two ways:

- By using the DEFINE SUB MQSC command and provided that command with the name of a queue object.
- By providing this handle when calling MQSUB with the MQSO_CREATE

  If this handle is provided as an input parameter on the call, it must be a valid object handle returned from a previous MQOPEN call of a queue using at least one of the following options:

  – MQOO_INPUT_*
  – MQOO_BROWSE
  – MQOO_OUTPUT (if the queue is a remote queue)

  If this is not the case, the call fails with MQRC_HOBJ_ERROR. It cannot be an object handle to an alias queue that resolves to a topic object. If so, the call fails with MQRC_HOBJ_ERROR.

If the queue manager is to manage the storage of messages sent to this subscription, this should be set when you create the subscription, by using the MQSO_MANAGED option. The queue manager then returns this handle as an output parameter on the call. The handle that is returned is known as a managed handle. If MQHO_NONE is specified but MQSO_MANAGED is not specified, the call fails with MQRC_HOBJ_ERROR.

When a managed handle is returned to you by the queue manager, you can use it on an MQGET or MQCB call with or without browse options, on an MQINQ call, or on MQCLOSE. You cannot

use it on MQPUT, MQSUB, MQSET; attempting to do so fails with MQRC_NOT_OPEN_FOR_OUTPUT, MQRC_HOBJ_ERROR, or MQRC_NOT_OPEN_FOR_SET.

If this subscription is being resumed using the MQSO_RESUME option in the MQSD structure, the handle can be returned to the application in this parameter by setting MQSO_MANAGED to MQHO_NONE. You can do this whether the subscription is using a managed handle or not and it can be useful to provide subscriptions created using DEFINE SUB with the handle to the subscription queue defined on that command. In the case where an administratively created subscription is being resumed, the queue opens with MQOO_INPUT_AS_Q_DEF and MQOO_BROWSE. If you need to specify other options, the application must open the subscription queue explicitly and provide the object handle on the call. If there is a problem opening the queue the call fails with MQRC_INVALID_DESTINATION. If the *Hobj* is provided, it must be equivalent to the *Hobj* in the original MQSUB call. This means if an object handle returned from an MQOPEN call is being provided, the handle must be to the same queue as previously used. If it is not the same queue, the call fails with MQRC_HOBJ_ERROR.

If this subscription is being altered using the MQSO_ALTER option in the MQSD structure, then a different *Hobj* can be provided. Any publications that have been delivered to the queue and were previously identified through this parameter stay on that queue and it is the responsibility of the application to retrieve those messages if the *Hobj* parameter now represents a different queue.

The table summarizes the use of this parameter with various subscription options:

| **Options** | ***Hobj*** | **Description** |
|---|---|---|
| MQSO_CREATE + MQSO_MANAGED | Ignored on input | Creates a subscription with storage of messages managed by the queue manager |
| MQSO_CREATE | A valid object handle | Creates a subscription providing a specific queue as the destination for messages. |
| MQSO_RESUME | MQHO_NONE | Resumes a previously created subscription whether it was managed or not, and has the queue manager return the object handle for use by the application. |
| MQSO_RESUME | A valid, matching, object handle | Resumes a previously created subscription that uses a specific queue as the destination for messages and use an object handle with specific open options. |
| MQSO_ALTER + MQSO_MANAGED | MQHO_NONE | Alters an existing subscription that was previously using a specific queue, so it is now a managed subscription. The class of destination (managed or not) cannot be changed. |
| MQSO_ALTER | A valid object handle | Alters an existing subscription, whether it was managed or not, so that it now uses a specific queue. When the MQSO_MANAGED option is not used, the queue provided can be changed, but the class of destination (managed or not) cannot be changed. |

Whether it was provided or returned, *Hobj* must be specified on subsequent MQGET or MQCB calls that want to receive the publication messages sent to this subscription.

The *Hobj* handle is no longer valid when the MQCLOSE call is issued on it, or when the unit of processing that defines the scope of the handle terminates (until the application disconnects). The scope of the object handle returned is the same as that of the connection handle specified on the call. See Hconn (MQHCONN) - output for information about handle scope. An MQCLOSE of the *Hobj* handle does not affect the *Hsub* handle.

***Hsub***
Type: MQHOBJ - output

This handle represents the subscription that has been made. It can be used for two further operations:

- It can be used on a subsequent MQSUBRQ call to request that publications be sent when the MQSO_PUBLICATIONS_ON_REQUEST option has been used when making the subscription.
- It can be used on a subsequent MQCLOSE call to remove the subscription that has been made. The *Hsub* handle ceases to be valid when the MQCLOSE call is issued, or when the unit of processing that defines the scope of the handle terminates. The scope of the object handle returned is the same as that of the connection handle specified on the call. An MQCLOSE of the *Hsub* handle does not affect the *Hobj* handle.

This handle cannot be passed to an MQGET or MQCB call. You must use the *Hobj* parameter. You cannot use this handle on any IBM MQ call other than MQCLOSE or MQSUBRQ. Passing this handle to any other IBM MQ call results in MQRC_HOBJ_ERROR.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion

**MQCC_WARNING**
Warning (partial completion)

**MQCC_FAILED**
Call failed

***Reason***
Type: MQLONG - output

The reason code qualifying *CompCode*.

If *CompCode* is MQCC_OK, the reason code is as follows:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_FAILED, the reason code is one of the following:

**MQRC_CLUSTER_RESOLUTION_ERROR**
(2189, X'88D') Cluster name resolution failed.

**MQRC_DURABILITY_NOT_ALLOWED**
2436 (X'0984') An MQSUB call using the MQSO_DURABLE option failed.

**MQRC_FUNCTION_NOT_SUPPORTED**
2298 (X'08FA') The function requested is not available in the current environment.

**MQRC_HOBJ_ERROR**
2019 (X'07E3') Object handle Hobj not valid.

**MQRC_IDENTITY_MISMATCH**
2434 (X'0982') Subscription name matches existing subscription.

**MQRC_NOT_AUTHORIZED**
2035 (X'07F3') The user is not authorized to perform the operation.

**MQRC_NO_SUBSCRIPTION**
2428 (X'097C') The identified subscription name does not exist.

**MQRC_OBJECT_STRING_ERROR**
2441 (X'0989') Objectstring field not valid.

**MQRC_OPTIONS_ERROR**
2046 (X'07FE') Options parameter or field contains options that are not valid, or a combination of options that is not valid.

**MQRC_Q_MGR_QUIESCING**
2161 (X'0871') Queue manager quiescing.

**MQRC_RECONNECT_Q_MGR_REQD**
2555 (X'09FB'X) The MQCNO_RECONNECT_Q_MGR option is required.

**MQRC_RETAINED_MSG_Q_ERROR**
2525 (X'09DD') Retained publications which exist for the subscribed topic string, cannot be retrieved.

**MQRC_RETAINED_NOT_DELIVERED**
2526 (X'09DE') The retained publications which exist for the subscribed topic string, cannot be delivered to the subscription destination queue, and cannot be delivered to the dead-letter queue.

**MQRC_SD_ERROR**
2424 (X'0978') Subscription descriptor (MQSD) not valid.

**MQRC_SELECTION_NOT_AVAILABLE**
2551 (X'09F7') The selection string does not follow the IBM MQ selector syntax and no extended message selection provider was available.

**MQRC_SELECTION_STRING_ERROR**
2519 (X'09D7') The selection string must be specified as described in the MQCHARV structure documentation.

**MQRC_SELECTOR_SYNTAX_ERROR**
2459 (X'099B') An MQOPEN, MQPUT1, or MQSUB call was issued but a selection string was specified which contained a syntax error.

**MQRC_SUB_USER_DATA_ERROR**
2431 (X'097F') SubUserData field not valid.

**MQRC_SUB_NAME_ERROR**
2440 (X'0988') SubName field not valid.

**MQRC_SUB_ALREADY_EXISTS**
2432 (X'0980') Subscription already exists.

**MQRC_SUB_USER_DATA_ERROR**
2431 (X'097F') SubUserData field not valid.

**MQRC_TOPIC_STRING_ERROR**
2425 (X'0979') Topic string is not valid.

**MQRC_UNKNOWN_OBJECT_NAME**
2085 (X'0825') Object identified in the MQSD ObjectName field cannot be found.

For detailed information about these codes, see Messages and reason codes.

## Usage notes

- The subscription is made to a topic, named either using the short name of a pre-defined topic object, the full name of the topic string, or it is formed by the concatenation of two parts. See the description of *ObjectName* and *ObjectString* in "MQSD - Subscription descriptor" on page 544.
- The queue manager performs security checks when an MQSUB call is issued, to verify that the user identifier under which the application is running has the appropriate level of authority before access

is permitted. The appropriate topic object is located in the topic hierarchy and an authority check is made on this topic object to ensure authority to subscribe is set. If the MQSO_MANAGED option is not used, an authority check is made on the destination queue to ensure that authority for output is set. If the MQSO_MANAGED option is used, no authority check is made on the managed queue for output or inquire access.

- If you do not provide an Hobj as input, the MQSUB call allocates two handles, an object handle (Hobj) and a subscription handle (Hsub).
- The Hobj returned on the MQSUB call when the MQSO_MANAGED option is used, can be inquired in order to find out attributes such as the Backout threshold and the Excessive backout requeue name. You can also inquire the name of the managed queue, but you must not attempt to directly open this queue.
- Subscriptions can be grouped allowing only a single publication to be delivered to the group of subscriptions even where more than one of the group matched the publication. Subscriptions are grouped using the MQSO_GROUP_SUB option and in order to group subscriptions they must be
  - using the same named queue (that is not using the MQSO_MANAGED option) on the same queue manager - represented by the Hobj parameter on the MQSUB call
  - share the same SubCorrelId
  - be of the same SubLevel

  These attributes define the set of subscriptions considered to be in the group, and are also the attributes that cannot be altered if a subscription is grouped. Alteration of SubLevel results in MQRC_SUBLEVEL_NOT_ALTERABLE, and alteration of any of the others (which can be changed if a subscription is not grouped) results in MQRC_GROUPING_NOT_ALTERABLE.
- Successful completion of the MQSUB call does not mean that the action completed. To check that this call has completed, see the DEFINE SUB step in Checking that async commands for distributed networks have finished.
- Fields in the MQSD are filled in on return from an MQSUB call which uses the MQSO_RESUME option. The MQSD returned can be passed directly into an MQSUB call which uses the MQSO_ALTER option with any changes you need to make to the subscription applied to the MQSD. Some fields have special considerations as noted in the table.

| MQSD output from MQSUB | |
|---|---|
| **Field name in MQSD** | **Special considerations** |
| Access or creation options | Some of the options can be reset on return from the MQSUB call. If you then reuse the MQSD in an MQSUB call, the option you require must be explicitly set. |
| Durability options, Destination options, Registration Options & Wildcard options | These options are set as appropriate |
| Publication options | These options are set as appropriate, except for MQSO_NEW_PUBLICATIONS_ONLY which is only applicable to MQSO_CREATE. |
| Other options | These options are unchanged on return from an MQSUB call. They control how the API call is issued and are not stored with the subscription. They must be set as required on any subsequent MQSUB call reusing the MQSD. |
| ObjectName | This input only field is unchanged on return from an MQSUB call. |
| ObjectString | This input only field is unchanged on return from an MQSUB call. The Full topic name used is returned in the *ResObjectString* field, if a buffer is provided. |

| MQSD output from MQSUB *(continued)* | |
|---|---|
| **Field name in MQSD** | **Special considerations** |
| AlternateUserId and AlternateSecurityId | These input only fields are unchanged on return from an MQSUB call. They control how the API call is issued and are not stored with the subscription. They must set as required on any subsequent MQSUB call reusing the MQSD. |
| SubExpiry | On return from an MQSUB call using the MQSO_RESUME option, this field is set to the original expiry of the subscription and not the remaining expiry time. If you then reuse the MQSD in an MQSUB call using the MQSO_ALTER option you reset the expiry of the subscription to start counting down again. |
| SubName | This field is an input field on an MQSUB call and is not changed on output. |
| SubUserData and SelectionString | These variable length fields are returned on output from an MQSUB call using the MQSO_RESUME option, if a buffer is provided, and also a positive buffer length in *VSBufSize*. If no buffer is provided only the length is returned in the *VSLength* field of the MQCHARV. If the buffer provided is smaller than the space required to return the field, only *VSBufSize* bytes are returned in the provided buffer.<br>If you then reuse the MQSD in an MQSUB call using the MQSO_ALTER option and a buffer is not provided but a non-zero *VSLength* is provided, if that length matches the existing length of the field, no alteration is made to the field. |
| SubCorrelId and PubAccountingToken | If you do not use MQSO_SET_CORREL_ID, then the *SubCorrelId* is generated by the queue manager. If you do not use MQSO_SET_IDENTITY_CONTEXT, then the *PubAccountingToken* is generated by the queue manager.<br>These fields are returned in the MQSD from an MQSUB call using the MQSO_RESUME option. If they are generated by the queue manager, the generated value is returned on an MQSUB call using the MQSO_CREATE or MQSO_ALTER option. |
| PubPriority, SubLevel & PubApplIdentityData | These fields are returned in the MQSD. |
| ResObjectString | This output only field is returned in the MQSD if a buffer is provided. |

## C invocation

```
MQSUB (Hconn, &SubDesc, &Hobj, &Hsub, &CompCode, &Reason)
```

Declare the parameters as follows:

```
MQHCONN Hconn;    /* Connection handle */
```

```
MQSD    SubDesc;  /* Subscription descriptor */
MQHOBJ  Hobj;     /* Object handle */
MQHOBJ  Hsub;     /* Subscription handle */
MQLONG  CompCode; /* Completion code */
MQLONG  Reason;   /* Reason code qualifying CompCode */
```

### COBOL invocation

```
CALL 'MQSUB' USING HCONN, SUBDESC, HOBJ, HSUB, COMPCODE, REASON.
```

Declare the parameters as follows:

```
**   Connection handle
 01  HCONN    PIC S9(9) BINARY.
**   Subscription descriptor
 01  SUBDESC.
     COPY CMQSDV.
**   Object handle
 01  HOBJ     PIC S9(9) BINARY.
**   Subscription handle
 01  HSUB     PIC S9(9) BINARY.
**   Completion code
 01  COMPCODE PIC S9(9) BINARY.
**   Reason code qualifying COMPCODE
 01  REASON   PIC S9(9) BINARY.
```

### PL/I invocation

```
call MQSUB (Hconn, SubDesc, Hobj, Hsub, CompCode, Reason)
```

Declare the parameters as follows:

```
dcl Hconn    fixed bin(31); /* Connection handle */
dcl SubDesc  like MQSD;     /* Subscription descriptor */
dcl Hobj     fixed bin(31); /* Object handle */
dcl Hsub     fixed bin(31); /* Subscription handle */
dcl CompCode fixed bin(31); /* Completion code */
dcl Reason   fixed bin(31); /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
CALL MQSUB,(HCONN,SUBDESC,HOBJ,HSUB,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN    DS      F  Connection handle
SUBDESC  CMQSDA  ,  Subscription descriptor
HOBJ     DS      F  Object handle
HSUB     DS      F  Subscription handle
COMPCODE DS      F  Completion code
REASON   DS      F  Reason code qualifying COMPCODE
```

## MQSUBRQ - Subscription request

Use the MQSUBRQ call to make a request for the retained publication, when the subscriber has been registered with MQSO_PUBLICATIONS_ON_REQUEST.

### Syntax

MQSUBRQ (*Hconn*, *Hsub*, *Action*, *SubRqOpts*, *Compcode*, *Reason*)

## Parameters

***Hconn***
Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn* :

**MQHC_DEF_HCONN**
Default connection handle.

**Important:** IBM i If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

***Hsub***
Type: MQHOBJ - input

This handle represents the subscription for which an update is to be requested. The value of *Hsub* was returned from a previous MQSUB call.

***Action***
Type: MQLONG - input

This parameter controls the particular action that is being requested on the subscription. The following value must be specified:

**MQSR_ACTION_PUBLICATION**

This action requests that an update publication is sent for the specified topic. It can be used only if the subscriber specified the option MQSO_PUBLICATIONS_ON_REQUEST on the MQSUB call when it made the subscription. If the queue manager has a retained publication for the topic, this is sent to the subscriber. If not, the call fails. If an application is sent a publication which was retained, this is indicated by the MQIsRetained message property of that publication.

Since the topic in the existing subscription represented by the Hsub parameter can contain wildcards, the subscriber might receive multiple retained publications.

***SubRqOpts***
Type: MQSRO - input/output

These options control the action of MQSUBRQ, see “MQSRO - Subscription request options” on page 568 for details.

If no options are required, programs written in C or S/390 assembler can specify a null parameter address instead of specifying the address of an MQSRO structure.

***CompCode***
Type: MQLONG - output

The completion code; it is one of the following:

**MQCC_OK**
Successful completion

**MQCC_WARNING**
Warning (partial completion)

**MQCC_FAILED**
Call failed

***Reason***
Type: MQLONG - output

The reason code qualifying *CompCode*.

If *CompCode* is MQCC_OK:

**MQRC_NONE**
(0, X'000') No reason to report.

If *CompCode* is MQCC_FAILED:

**MQRC_FUNCTION_NOT_SUPPORTED**
2298 (X'08FA') The function requested is not available in the current environment.

**MQRC_NO_RETAINED_MSG**
2437 (X'0985') There are no retained publications currently stored for this topic.

**MQRC_OPTIONS_ERROR**
2046 (X'07FE') Options parameter or field contains options that are not valid, or a combination of options that is not valid.

**MQRC_Q_MGR_QUIESCING**
2161 (X'0871') Queue manager quiescing.

**MQRC_SRO_ERROR**
2438 (X'0986') On the MQSUBRQ call, the Subscription Request Options MQSRO is not valid.

**MQRC_RETAINED_MSG_Q_ERROR**
2525 (X'09DD') Retained publications which exist for the subscribed topic string, cannot be retrieved.

**MQRC_RETAINED_NOT_DELIVERED**
2526 (X'09DE') The retained publications which exist for the subscribed topic string, cannot be delivered to the subscription destination queue, and cannot be delivered to the dead-letter queue.

For detailed information about these codes, see Messages and reason codes.

## Usage notes

The following usage notes apply to the use of the Action code MQSR_ACTION_PUBLICATION:

1. If this verb completes successfully, the retained publications matching the subscription specified have been sent to the subscription and can be received by using MQGET or MQCB using the Hobj returned on the original MQSUB verb that created the subscription.
2. If the topic subscribed to by the original MQSUB verb that created the subscription contained a wildcard, more than one retained publication can be sent. The number of publications sent as a result of this call is recorded in the NumPubs field in the SubRqOpts structure.
3. If this verb completes with a reason code of MQRC_NO_RETAINED_MSG then there were no currently retained publications for the topic specified.#
4. If this verb completes with a reason code of MQRC_RETAINED_MSG_Q_ERROR or MQRC_RETAINED_NOT_DELIVERED then there are currently retained publications for the topic specified but an error has occurred that that meant they were unable to be delivered.
5. The application must have a current subscription to the topic before it can make this call. If the subscription was made in a previous instance of the application and a valid handle to the subscription is not available, the application must first call MQSUB with the MQSO_RESUME option to obtain a handle to it for use in this call.
6. The publications are sent to the destination that is registered for use with the current subscription of this application. If the publications must be sent somewhere else, the subscription must first be altered using the MQSUB call with the MQSO_ALTER option.

## C invocation

```
MQSUB (Hconn, Hsub, Action, &SubRqOpts, &CompCode, &Reason)
```

Declare the parameters as follows:

```
MQHCONN Hconn;     /* Connection handle */
MQHOBJ  Hsub;      /* Subscription handle */
MQLONG  Action;    /* Action requested by MQSUBRQ */
MQSRO   SubRqOpts; /* Options that control the action of MQSUBRQ */
MQLONG  CompCode;  /* Completion code */
MQLONG  Reason;    /* Reason code qualifying CompCode */
```

### COBOL invocation

```
CALL 'MQSUBRQ' USING HCONN, HSUB, ACTION, SUBRQOPTS, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle
01 HCONN PIC S9(9) BINARY.
** Subscription handle
01 HSUB PIC S9(9) BINARY.
** Action requested by MQSUBRQ
01 ACTION PIC S9(9) BINARY.
** Options that control the action of MQSUBRQ
01 SUBRQOPTS.
COPY CMQSROV.
** Completion code
01 COMPCODE PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON PIC S9(9) BINARY.
```

### PL/I invocation

```
call MQSUBRQ (Hconn, Hsub, Action, SubRqOpts, CompCode, Reason)
```

Declare the parameters as follows:

```
dcl Hconn fixed bin(31);    /* Connection handle */
dcl Hsub fixed bin(31);     /* Subscription handle */
dcl Action fixed bin(31);   /* Action requested by MQSUBRQ */
dcl SubRqOpts like MQSRO;   /* Options that control the action of MQSUBRQ */
dcl CompCode fixed bin(31); /* Completion code */
dcl Reason fixed bin(31);   /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
CALL MQSUBRQ,(HCONN, HSUB, ACTION, SUBRQOPTS,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN DS F Connection handle
HSUB DS F Subscription handle
ACTION DS F Action requested by MQSUBRQ
SUBRQOPTS CMQSROA , Options that control the action of MQSUBRQ
COMPCODE DS F Completion code
REASON DS F Reason code qualifying COMPCODE
```

## Attributes of objects

This collection of topics lists only those IBM MQ objects that can be the subject of an MQINQ function call, and gives details of the attributes that can be inquired on and the selectors to be used.

## Attributes for the queue manager

Some queue-manager attributes are fixed for particular implementations; others can be changed by using the MQSC command `ALTER QMGR`.

The attributes can also be displayed by using the command `DISPLAY QMGR`. Most queue-manager attributes can be inquired by opening a special MQOT_Q_MGR object, and using the MQINQ call with the handle returned.

The following table summarizes the attributes that are specific to the queue manager. The attributes are described in alphabetical order.

**Note:** The names of the attributes shown in this section are descriptive names used with the MQINQ call; the names are the same as for the PCF commands. When MQSC commands are used to define, alter, or display attributes, alternative short names are used; see Script (MQSC) Commands for more information.

*Table 560. Attributes for the queue manager*

| Attribute | Description |
|---|---|
| AccountingConnOverride | Override accounting settings. |
| AccountingInterval | How often to write intermediate accounting records. |
| ActivityConnOverride | Override activity settings. |
| ActivityTrace | Controls the collection of IBM MQ MQI application activity trace. |
| AdoptNewMCACheck | Elements checked to determine whether to adopt new MCA. |
| AdoptNewMCAType | Whether to restart automatically an orphaned instance of an MCA of a particular channel type. |
| AlterationDate | Date when definition was last changed |
| AlterationTime | Time when definition was last changed |
| AuthorityEvent | Controls whether authorization (Not Authorized) events are generated |
| BridgeEvent | Control attribute for bridge events. |
| ChannelAutoDef | Controls whether automatic channel definition is permitted |
| ChannelAutoDefEvent | Controls whether channel automatic-definition events are generated |
| ChannelAutoDefExit | Name of user exit for automatic channel definition |
| ChannelEvent | Control attribute for channel events. |
| ChannelInitiatorControl | Control attribute for channel initiator |
| ChannelMonitoring | Online monitoring data for channels |
| ChannelStatistics | Controls collection of statistics data for channels. |
| ChinitAdapters | Number of adapter subtasks for processing IBM MQ calls. |
| ChinitDispatchers | Number of dispatchers to use for the channel initiator. |
| | Reserved for IBM use. |
| ChinitTraceAutoStart | Whether channel initiator trace should start automatically. |
| ChinitTraceTableSize | Size of channel initiator's trace data space. |
| ClusterSenderMonitoringDefault | Online monitoring data default for cluster sender channels |
| ClusterSenderStatistics | Controls collection of statistics monitoring information for cluster sender channels. |
| ClusterWorkloadData | User data for cluster workload exit |
| ClusterWorkloadExit | Name of user exit for cluster workload management |
| ClusterWorkloadLength | Maximum length of message data passed to cluster workload exit |
| CLWLMRUChannels | Number of most recently used channels for cluster workload balancing |
| CLWLUseQ | Cluster workload use remote queue. |
| CodedCharSetId | Coded character set identifier |
| CommandEvent | Control attribute for command events. |
| CommandInputQName attribute | Command input queue name |

| *Table 560. Attributes for the queue manager (continued)* | |
|---|---|
| **Attribute** | **Description** |
| CommandLevel | Command level |
| CommandServerControl attribute | Control attribute for command server. |
| Configuration Event attribute | Control attribute for configuration events. |
| DeadLetterQName | Name of dead-letter queue |
| DEFCLXQ | Default cluster transmission queue type |
| DefXmitQName | Default transmission queue name |
| DistLists | Distribution list support |
| DNSGroup | Name of group for TCP listener when using Workload Manager Dynamic Domain Name Services support. |
| DNSWLM | Whether TCP listener registers with Workload Manager for Dynamic Domain Name Services. |
| ExpiryInterval | Interval between scans for expired messages |
| IGQPutAuthority | Intra-group queuing put authority |
| IGQUserId | Intra-group queuing user identifier |
| InhibitEvent | Controls whether inhibit (Inhibit Get and Inhibit Put) events are generated |
| IPAddressVersion | Version of the Internet Protocol address |
| IntraGroupqueuing | Intra-group queuing support |
| ListenerTimer | Time interval between attempts to restart listener after APPC or TCP/IP failure. |
| LocalEvent | Controls whether local error events are generated |
| LoggerEvent | Controls whether logger events are generated |
| LUGroupName | Generic LU name for LU 6.2 listener that handles inbound transmissions for queue-sharing group. |
| LUName | Name of LU to use for outbound LU 6.2 transmissions. |
| LU62ARMSuffix | Suffix of SYS1.PARMLIB member APPCPMxx, that nominates LUADD for this channel initiator. |
| LU62Channels | Maximum number of current channels or connected clients that use LU 6.2. |
| MaxActiveChannels | Maximum number of channels that can be active at any time. |
| MaxChannels | Maximum number of current channels. |
| MaxHandles | Maximum number of handles |
| MaxMsgLength | Maximum message length in bytes |
| MaxPriority attribute | Maximum priority |
| MaxPropertiesLength | Maximum length of property data in bytes |
| MaxUncommittedMsgs | Maximum number of uncommitted messages within a unit of work |
| MQIAccounting | Controls collection of accounting information for MQI data. |
| MQIStatistics | Controls collection of statistics monitoring information for queue manager. |
| MsgMarkBrowseInterval | Interval after which the queue manager can remove the mark from browsed messages. |
| OutboundPortMin | With *OutboundPortMin*, defines range of port numbers to use when binding outgoing channels. |
| OutboundPortMin | With *OutboundPortMax*, defines range of port numbers to use when binding outgoing channels. |
| PerformanceEvent | Controls whether performance-related events are generated |
| Platform | Platform on which the queue manager is running |
| PubSubNPInputMsg | Whether to discard (or keep) an undelivered input message |
| PubSubNPResponse | Controls the behavior of undelivered |
| PubSubMaxMsgRetryCount | The number of retries when processing (under syncpoint) a failed command message |
| PubSubSyncPoint | Whether only persistent (or all) messages should be processed under syncpoint |
| PubSubMode | Whether the queued publish/subscribe interface is running |
| QMgrDesc | Queue manager description |
| QMgrIdentifier | Unique internally generated identifier of queue manager |

| *Table 560. Attributes for the queue manager (continued)* | |
|---|---|
| **Attribute** | **Description** |
| QMgrName | Queue manager name |
| QSGName | Name of queue-sharing group |
| QueueAccounting | Controls collection of accounting information for queues. |
| QueueMonitoring | Online monitoring data for queues |
| QueueStatistics | Controls collection of statistics data for queues. |
| ReceiveTimeout | How long TCP/IP channel waits for data before returning to inactive state. |
| ReceiveTimeoutMin | Qualifier for *ReceiveTimeout*. |
| ReceiveTimeoutType | Minimum time that TCP/IP channel waits for data before returning to inactive state. |
| RemoteEvent | Controls whether remote error events are generated |
| RepositoryName | Name of cluster for which this queue manager provides repository services |
| RepositoryNamelist | Name of namelist object containing names of clusters for which this queue manager provides repository services |
| ScyCase | Case of security profiles |
| SharedQMgrName | Shared queue queue-manager name |
| "SPLCAP" on page 806 | IBM MQ Advanced Message security protection for a queue manager turned on or off. |
| SSLCRLNamelist 1 | Name of namelist object containing names of authentication information objects. |
| SSLCryptoHardware 1 | Cryptographic hardware configuration string. |
| SSLEvent | Control attribute for SSL events. |
| SSLFIPSRequired | Use only FIPS-certified algorithms for cryptography. |
| SSLKeyRepository 1 | Location of SSL key repository. |
| SSLKeyResetCount | SSL key reset count. |
| SSLTasks 1 | Number of server subtasks for processing SSL calls. |
| StatisticsInterval | How often to write statistics monitoring data. |
| StartStopEvent | Controls whether start and stop events are generated |
| SyncPoint | Syncpoint availability |
| TCPChannels | Maximum number of current channels or connected clients that use TCP/IP. |
| TCPKeepAlive | Whether to use TCP KEEPALIVE to check other end of connection. |
| TCPName | Name of TCP/IP system that you are using. |
| TCPStackType | How channel initiator can use TCP/IP addresses. |
| TraceRouteRecording attribute | Controls recording of trace-route information. |
| TriggerInterval | Trigger-message interval |
| Version | Version |
| XrCapability | Specifies whether Telemetry commands are supported. |

**Notes:**

1. This attribute cannot be inquired using the MQINQ call, and is not described in this section. See Change Queue Manager for details of this attribute.

**Related tasks**

Specifying that only FIPS-certified CipherSpecs are used at run time on the MQI client

**Related reference**

Federal Information Processing Standards (FIPS) for UNIX, Linux and Windows

## *AccountingConnOverride (MQLONG)*

This allows applications to override the setting of the ACCTMQI and ACCTQDATA values in the Qmgr attribute.

The value is one of the following:

**MQMON_DISABLED**
Applications cannot override the setting of the ACCTMQI and ACCTQ Qmgr attributes using the Options field in the MQCNO structure on the MQCONNX call. This is the default value.

**MQMON_ENABLED**
Applications can override the ACCTQ and ACCTMQI Qmgr attributes using the Options field in the MQCNO structure.

Changes to this value are only effective for connections to the queue manager after the change to the attribute.

This attribute is supported only on IBM i, Unix systems, and Windows.

To determine the value of this attribute, use the MQIA_ACCOUNTING_CONN_OVERRIDE selector with the MQINQ call.

### *AccountingInterval (MQLONG)*

This specifies how long before intermediate accounting records are written (in seconds).

The value is an integer in the range 0 to 604800, with a default value of 1800 (30 minutes). Specify 0 to turn off intermediate records.

This attribute is supported only on IBM i, Windows, UNIX, and Linux systems.

To determine the value of this attribute, use the MQIA_ACCOUNTING_INTERVAL selector with the MQINQ call.

### *ActivityConnOverride (MQLONG)*

This allows applications to override the setting of the ACTVTRC value in the queue manager attribute.

The value is one of the following:

**MQMON_DISABLED**
Applications cannot override the setting of the ACTVTRC queue manager attribute using the Options field in the MQCNO structure on the MQCONNX call. This is the default value.

**MQMON_ENABLED**
Applications can override the ACTVTRC queue manager attribute using the Options field in the MQCNO structure.

Changes to this value are only effective for connections to the queue manager after the change to the attribute.

This attribute is supported only on IBM i, Unix systems, and Windows.

To determine the value of this attribute, use the MQIA_ACTIVITY_CONN_OVERRIDE selector with the MQINQ call.

### *ActivityTrace (MQLONG)*

This controls the collection of IBM MQ MQI application activity trace.

The value is one of the following:

**MQMON_ON**
Collect IBM MQ MQI application activity trace.

**MQMON_OFF**
Do not collect IBM MQ MQI application activity trace. This is the default value.

If you set the queue manager attribute ACTVCONO to ENABLED, this value might be overridden for individual connections using the Options field in the MQCNO structure.

Changes to this value are only effective for connections to the queue manager after the change to the attribute.

This attribute is supported only on IBM i, Unix systems, and Windows.

To determine the value of this attribute, use the MQIA_ACTIVITY_TRACE selector with the MQINQ call.

### *AdoptNewMCACheck (MQLONG)*

This defines the elements to check to determine whether to adopt an MCA when a new inbound channel is detected that has the same name as an MCA that is already active

The value is one of the following:

**MQADOPT_CHECK_Q_MGR_NAME**
Check the queue manager name.

**MQADOPT_CHECK_NET_ADDR**
Check the network address.

**MQADOPT_CHECK_ALL**
Check the queue manager name and network address. If possible, perform this check to protect your channels from being shut down, inadvertently or maliciously. This is the default value.

**MQADOPT_CHECK_NONE**
Do not check any elements.

Changes to this attribute take effect the next time that a channel attempts to adopt a channel.

This attribute is supported only on z/OS.

To determine the value of this attribute, use the MQIA_ADOPTNEWMCA_CHECK selector with the MQINQ call.

### *AdoptNewMCAType (MQLONG)*

This specifies whether to restart automatically an orphaned instance of an MCA of a particular channel type when a new inbound channel request matching the AdoptNewMCACheck attribute is detected

It is one of the following values:

**MQADOPT_TYPE_NO**
Adopting orphaned channel instances is not required. This is the default value.

**MQADOPT_TYPE_ALL**
Adopt all channel types.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA_ADOPTNEWMCA_TYPE selector with the MQINQ call.

### *AlterationDate (MQCHAR12)*

This is the date when the definition was last changed. The format of the date is YYYY-MM-DD, padded with two trailing blanks to make the length 12 bytes.

To determine the value of this attribute, use the MQCA_ALTERATION_DATE selector with the MQINQ call. The length of this attribute is given by MQ_DATE_LENGTH.

### *AlterationTime (MQCHAR8)*

This is the time when the definition was last changed. The format of the time is HH.MM.SS.

To determine the value of this attribute, use the MQCA_ALTERATION_TIME selector with the MQINQ call. The length of this attribute is given by MQ_TIME_LENGTH.

### *AuthorityEvent (MQLONG)*

This controls whether authorization (Not Authorized) events are generated. It is one of the following values:

**MQEVR_DISABLED**
Event reporting disabled.

**MQEVR_ENABLED**
Event reporting enabled.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the MQIA_AUTHORITY_EVENT selector with the MQINQ call.

### *BridgeEvent (MQLONG)*

This specifies whether IMS bridge events are generated.

The value is one of the following:

**MQEVR_ENABLED**
Generate IMS bridge events, as follows:

MQRC_BRIDGE_STARTED
MQRC_BRIDGE_STOPPED

**MQEVR_DISABLED**
Do not generate IMS bridge events; this is the default value.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA_BRIDGE_EVENT selector with the MQINQ call.

### *ChannelAutoDef (MQLONG)*

This attribute controls the automatic definition of channels of type MQCHT_RECEIVER and MQCHT_SVRCONN. Automatic definition of MQCHT_CLUSSDR channels is always enabled. The value is one of the following:

**MQCHAD_DISABLED**
Channel auto-definition disabled.

**MQCHAD_ENABLED**
Channel auto-definition enabled.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, and Windows.

To determine the value of this attribute, use the MQIA_CHANNEL_AUTO_DEF selector with the MQINQ call.

### *ChannelAutoDefEvent (MQLONG)*

This controls whether channel automatic-definition events are generated. It applies to channels of type MQCHT_RECEIVER, MQCHT_SVRCONN, and MQCHT_CLUSSDR. The value is one of the following:

**MQEVR_DISABLED**
Event reporting disabled.

**MQEVR_ENABLED**
Event reporting enabled.

For more information about events, see Event monitoring.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, and Windows.

To determine the value of this attribute, use the MQIA_CHANNEL_AUTO_DEF_EVENT selector with the MQINQ call.

### *ChannelAutoDefExit (MQCHARn)*

This is the name of the user exit for automatic channel definition. If this name is nonblank, and *ChannelAutoDef* has the value MQCHAD_ENABLED, the exit is called each time that the queue manager is about to create a channel definition. This applies to channels of type MQCHT_RECEIVER, MQCHT_SVRCONN, and MQCHT_CLUSSDR. The exit can then do one of the following:

- Create the channel definition without change.
- Modify the attributes of the channel definition that is created.
- Suppress creation of the channel entirely.

**Note:** Both the length and the value of this attribute are environment specific. See the introduction to the MQCD structure in "MQCD - Channel definition" on page 1501 for details of the value of this attribute in various environments.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, Windows, and z/OS. On z/OS, it applies only to cluster-sender and cluster-receiver channels.

To determine the value of this attribute, use the MQCA_CHANNEL_AUTO_DEF_EXIT selector with the MQINQ call. The length of this attribute is given by MQ_EXIT_NAME_LENGTH.

### *ChannelEvent (MQLONG)*

This specifies whether channel events are generated.

It is one of the following values:

**MQEVR_EXCEPTION**
Only generate the following channel events:

- MQRC_CHANNEL_ACTIVATED
- MQRC_CHANNEL_CONV_ERROR
- MQRC_CHANNEL_NOT_ACTIVATED
- MQRC_CHANNEL_STOPPED with the following ReasonQualifiers:

  MQRQ_CHANNEL_STOPPED_ERROR
  MQRQ_CHANNEL_STOPPED_RETRY
  MQRQ_CHANNEL_STOPPED_DISABLED

  MQRC_CHANNEL_STOPPED_BY_USER

**MQEVR_ENABLED**
Generate all channel events. That is, in addition to those generated by EXCEPTION, generate the following channel events:

- MQRC_CHANNEL_STARTED
- MQRC_CHANNEL_STOPPED with the following ReasonQualifier:

  MQRQ_CHANNEL_STOPPED_OK

**MQEVR_DISABLED**
Do not generate channel events; this is the default value.

To determine the value of this attribute, use the MQIA_CHANNEL_EVENT selector with the MQINQ call.

### *ChannelInitiatorControl (MQLONG)*

This specifies whether the channel initiator is to be started when the queue manager starts.

It is one of the following values:

**MQSVC_CONTROL_MANUAL**
The channel initiator is not to be started automatically.

**MQSVC_CONTROL_Q_MGR**
The channel initiator is to be started automatically when the queue manager starts.

To determine the value of this attribute, use the MQIA_CHINIT_CONTROL selector with the MQINQ call.

### IBM i distributed *ChannelMonitoring (MQLONG)*

This attribute specifies online monitoring data for channels.

The value is one of the following:

**MQMON_NONE**
Disable data collection for channel monitoring for all channels regardless of the setting of the MONCHL channel attribute. This is the default value.

**MQMON_OFF**
Turn monitoring data collection off for channels that specify QMGR in the MONCHL channel attribute.

**MQMON_LOW**
Turn monitoring data collection on with a low ratio of data collection for channels specifying QMGR in the MONCHL channel attribute.

**MQMON_MEDIUM**
Turn monitoring data collection on with a moderate ratio of data collection for channels specifying QMGR in the MONCHL channel attribute.

**MQMON_HIGH**
Turn monitoring data collection on with a high ratio of data collection for channels specifying QMGR in the MONCHL channel attribute.

On z/OS, this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

To determine the value of this attribute, use the MQIA_MONITORING_CHANNEL selector with the MQINQ call.

### IBM i distributed *ChannelStatistics (MQLONG)*

This controls the collection of statistics data for channels.

The value is one of the following:

**MQMON_NONE**
Disable data collection for channel statistics for all channels regardless of the setting of the STATCHL channel attribute. This is the default value.

**MQMON_OFF**
Turn statistics data collection off for channels that specify QMGR in the STATCHL channel attribute.

**MQMON_LOW**
Turn statistics data collection on with a low ratio of data collection for channels specifying QMGR in the STATCHL channel attribute.

**MQMON_MEDIUM**
Turn statistics data collection on with a moderate ratio of data collection for channels specifying QMGR in the STATCHL channel attribute.

**MQMON_HIGH**
Turn statistics data collection on with a high ratio of data collection for channels specifying QMGR in the STATCHL channel attribute.

For most systems you are recommended to use MEDIUM. However, for a channel that processes a high volume of messages each second, you might want to reduce the sampling level by selecting LOW. Also, for a channel that processes only a few messages, and for which the most current information is important, you might want to select HIGH.

On z/OS, this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

To determine the value of this attribute, use the MQIA_STATISTICS_CHANNEL selector with the MQINQ call.

### *ChinitAdapters (MQLONG)*

This is the number of adapter subtasks to use to process IBM MQ calls. The value must be 0 - 9999, with a default value of 8.

The ratio of adapters to dispatchers (the ChinitDispatchers attribute) should be about 8 to 5. However, if you have only few channels, you do not have to decrease the value of this parameter from the default value. You can use the following values: for a test system, 8 (default); for a production system, 20. Ideally, you should have 20 adapters, which gives greater parallelism of IBM MQ calls. This is important for persistent messages. Fewer adapters might be better for nonpersistent messages.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA_CHINIT_ADAPTERS selector with the MQINQ call.

### *ChinitDispatchers (MQLONG)*

This is the number of dispatchers to use for the channel initiator. The value must be 0 - 9999, with a default value of 5.

As a guideline, allow one dispatcher for 50 current channels. However, if you have only few channels, you do not have to decrease the value of this attribute from the default value. If you are using TCP/IP, the greatest number of dispatchers that are used for TCP/IP channels is 100, even if you specify a larger value here. You can use the following settings: test systems, 5 (the default); production systems, 20 (you need 20 dispatchers to handle up to 1000 active channels).

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA_CHINIT_DISPATCHERS selector with the MQINQ call.

### *ChinitTraceAutoStart (MQLONG)*

This specifies whether to start channel initiator trace automatically.

The value is one of the following:

**MQTRAXSTR_YES**
Start channel initiator trace automatically. This is the default value.

**MQTRAXSTR_NO**
Do not start channel initiator trace automatically.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA_CHINIT_TRACE_AUTO_START selector with the MQINQ call.

### *ChinitTraceTableSize (MQLONG)*

This is the size of the channel initiator's trace data space (in MB).

The value must be in the range 0 through 2048, with a default value of 2.

**Note:** Whenever you use large z/OS data spaces, ensure that you have sufficient auxiliary storage on your system to support any related z/OS paging activity. You might also need to increase the size of your SYS1.DUMP data sets.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA_CHINIT_TRACE_TABLE_SIZE selector with the MQINQ call.

### *ClusterSenderMonitoringDefault (MQLONG)*

This specifies the value to be substituted for the ChannelMonitoring attribute of automatically-defined cluster sender channels.

The value is one of the following:

**MQMON_Q_MGR**
Collection of online monitoring data is inherited from the setting of the queue manager *ChannelMonitoring* attribute. This is the default value.

**MQMON_OFF**
Monitoring for the channel is switched off

**MQMON_LOW**
Unless *ChannelMonitoring* is MQMON_NONE, monitoring is switched on with a low rate of data collection with a minimal effect on system performance. The data collected is not likely to be the most current.

**MQMON_MEDIUM**
Unless *ChannelMonitoring* is MQMON_NONE, monitoring is switched on with a moderate rate of data collection with limited effect on system performance.

**MQMON_HIGH**
Unless *ChannelMonitoring* is MQMON_NONE, monitoring is switched on with a high rate of data collection with a likely effect on system performance. The data collected is the most current available.

To determine the value of this attribute, use the MQIA_MONITORING_AUTO_CLUSSDR selector with the MQINQ call.

## *ClusterSenderStatistics (MQLONG)*

Because cluster sender channels can be automatically defined from the definition of CLUSRCVR in the repository, you cannot alter the setting of the STATCHL attribute for these auto-defined cluster sender channels using ALTER channel. For these channels the decision of whether to collect online monitoring data is based on the setting of this queue manager attribute.

The value is one of the following:

**MQMON_Q_MGR**
Statistics data collection for auto-defined cluster sender channels is based on the value of the queue manager attribute STATCHL. This is the default value.

**MQMON_OFF**
Switch off statistics data collection for auto-defined cluster sender channels.

**MQMON_LOW**
Switch on statistics data collection for auto-defined cluster sender channels with a low ratio of data collection.

**MQMON_MEDIUM**
Switch on statistics data collection for auto-defined cluster sender channels with a moderate ratio of data collection.

**MQMON_HIGH**
Switch on statistics data collection for auto-defined cluster sender channels with a high ratio of data collection.

For most systems we recommend MEDIUM. However, for an auto-defined cluster sender channel that processes a high volume of messages each second, you might want to reduce the sampling level by selecting LOW. Also, for a channel that processes only a few messages, and for which the most current information is important, you might want to select HIGH.

On z/OS, this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

To determine the value of this attribute, use the MQIA_STATISTICS_AUTO_CLUSSDR selector with the MQINQ call.

## *ClusterWorkloadData (MQCHAR32)*

This is a user-defined 32-byte character string that is passed to the cluster workload exit when it is called. If there is no data to pass to the exit, the string is blank.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, Windows and z/OS.

To determine the value of this attribute, use the MQCA_CLUSTER_WORKLOAD_DATA selector with the MQINQ call.

### *ClusterWorkloadExit (MQCHARn)*

This is the name of the user exit for cluster workload management. If this name is not blank, the exit is called each time that a message is put to a cluster queue or moved from one cluster-sender queue to another. The exit can then either accept the queue instance selected by the queue manager as the destination for the message, or select another queue instance.

**Note:** Both the length and the value of this attribute are environment specific.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, Windows and z/OS.

To determine the value of this attribute, use the MQCA_CLUSTER_WORKLOAD_EXIT selector with the MQINQ call. The length of this attribute is given by MQ_EXIT_NAME_LENGTH.

### *ClusterWorkloadLength (MQLONG)*

This is the maximum length of message data that is passed to the cluster workload exit. The actual length of data passed to the exit is the minimum of the following:

- The length of the message.
- The queue-manager's *MaxMsgLength* attribute.
- The *ClusterWorkloadLength* attribute.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, Windows and z/OS.

To determine the value of this attribute, use the MQIA_CLUSTER_WORKLOAD_LENGTH selector with the MQINQ call.

### *CLWLMRUChannels (MQLONG)*

This specifies the maximum number of most-recently-used cluster channels, to be considered for use by the cluster workload choice algorithm.

This is a value in the range 1 through 999999999.

To determine the value of this attribute, use the MQIA_CLWL_MRU_CHANNELS selector with the MQINQ call.

### *CLWLUseQ (MQLONG)*

This specifies whether to use remote queues for the cluster workload.

The value is one of the following:

**MQCLWL_USEQ_ANY**
Use both local and remote queues.

**MQCLWL_USEQ_LOCAL**
Do not use remote queues. This is the default value.

To determine the value of this attribute, use the MQIA_CLWL_USEQ selector with the MQINQ call.

### *CodedCharSetId (MQLONG)*

This defines the character set used by the queue manager for all character string fields defined in the MQI such as the names of objects, and queue creation date and time. The character set must be one that has single-byte characters for the characters that are valid in object names. It does not apply to application data carried in the message. The value depends on the environment:

- On z/OS, the value is set from the system parameters when the queue manager is started; the default value is 500.
- On Windows, the value is the primary CODEPAGE of the user creating the queue manager.
- On IBM i, the value is that which is set in the environment when the queue manager is first created.
- On UNIX systems, the value is the default CODESET for the locale of the user creating the queue manager.

To determine the value of this attribute, use the MQIA_CODED_CHAR_SET_ID selector with the MQINQ call.

### *CommandEvent (MQLONG)*

This specifies whether command events are generated, as follows:

**MQEVR_DISABLED**
Do not generate command events. This is the default.

**MQEVR_ENABLED**
Generate command events.

**MQEVR_NO_DISPLAY**
Command events are generated for all successful commands other than MQINQ.

To determine the value of this attribute, use the MQIA_COMMAND_EVENT selector with the MQINQ call.

### *CommandInputQName (MQCHAR48)*

This is the name of the command input queue defined on the local queue manager. This is a queue to which users can send commands, if authorized to do so. The name of the queue depends on the environment:

- On z/OS, the name of the queue is SYSTEM.COMMAND.INPUT; MQSC and PCF commands can be sent to it. See The MQSC commands for details of MQSC commands and Definitions of the Programmable Command Formats for details of PCF commands.
- In all other environments, the name of the queue is SYSTEM.ADMIN.COMMAND.QUEUE, and only PCF commands can be sent to it. However, an MQSC command can be sent to this queue if the MQSC command is enclosed within a PCF command of type MQCMD_ESCAPE. See Escape for information about the Escape command.

To determine the value of this attribute, use the MQCA_COMMAND_INPUT_Q_NAME selector with the MQINQ call. The length of this attribute is given by MQ_Q_NAME_LENGTH.

### *CommandLevel (MQLONG)*

This indicates the level of system control commands supported by the queue manager. This can be one of the following values:

**MQCMDL_LEVEL_600**
Level 600 of system control commands.

This value is returned by the following versions:

- IBM WebSphere MQ for AIX Version 6.0
- IBM WebSphere MQ for HP-UX Version 6.0
- IBM WebSphere MQ for iSeries Version 6.0
- IBM WebSphere MQ for Linux Version 6.0
- IBM WebSphere MQ for Solaris Version 6.0
- IBM WebSphere MQ for Windows Version 6.0
- IBM WebSphere MQ for z/OS Version 6.0

**MQCMDL_LEVEL_700**
Level 700 of system control commands.

This value is returned by the following versions:

- IBM WebSphere MQ for AIX Version 7.0
- IBM WebSphere MQ for HP-UX Version 7.0
- IBM WebSphere MQ for IBM i Version 7.0

- IBM WebSphere MQ for Linux Version 7.0
- IBM WebSphere MQ for Solaris Version 7.0
- IBM WebSphere MQ for Windows Version 7.0
- IBM WebSphere MQ for z/OS Version 7.0

**MQCMDL_LEVEL_701**
Level 701 of system control commands.

This value is returned by the following versions:

- IBM WebSphere MQ for AIX Version 7.0.1
- IBM WebSphere MQ for HP-UX Version 7.0.1
- IBM WebSphere MQ for IBM i Version 7.0.1
- IBM WebSphere MQ for Linux Version 7.0.1
- IBM WebSphere MQ for Solaris Version 7.0.1
- IBM WebSphere MQ for Windows Version 7.0.1
- IBM WebSphere MQ for z/OS Version 7.0.1

**MQCMDL_LEVEL_710**
Level 710 of system control commands.

This value is returned by the following versions:

- IBM WebSphere MQ for AIX Version 7.1
- IBM WebSphere MQ for HP-UX Version 7.1
- IBM WebSphere MQ for IBM i Version 7.1
- IBM WebSphere MQ for Linux Version 7.1
- IBM WebSphere MQ for Solaris Version 7.1
- IBM WebSphere MQ for Windows Version 7.1
- IBM WebSphere MQ for z/OS Version 7.1

**MQCMDL_LEVEL_750**
Level 750 of system control commands.

This value is returned by the following versions:

- IBM WebSphere MQ for AIX Version 7.5
- IBM WebSphere MQ for HP-UX Version 7.5
- IBM WebSphere MQ for IBM i Version 7.5
- IBM WebSphere MQ for Linux Version 7.5
- IBM WebSphere MQ for Solaris Version 7.5
- IBM WebSphere MQ for Windows Version 7.5

**MQCMDL_LEVEL_800**
Level 800 of system control commands.

This value is returned by the following versions:

- IBM WebSphere MQ for AIX Version 8.0
- IBM WebSphere MQ for HP-UX Version 8.0
- IBM WebSphere MQ for IBM i Version 8.0
- IBM WebSphere MQ for Linux Version 8.0
- IBM WebSphere MQ for Solaris Version 8.0
- IBM WebSphere MQ for Windows Version 8.0
- IBM WebSphere MQ for z/OS Version 8.0

V 8.0.0.2 **MQCMDL_LEVEL_801**
Level 801 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX Version 8.0.0.2
- IBM MQ for HP-UX Version 8.0.0.2
- IBM MQ for IBM i Version 8.0.0.2
- IBM MQ for Linux Version 8.0.0.2
- IBM MQ for Solaris Version 8.0.0.2

V 8.0.0.3 **MQCMDL_LEVEL_802**
Level 802 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX Version 8.0.0.3
- IBM MQ for HP-UX Version 8.0.0.3
- IBM MQ for IBM i Version 8.0.0.3
- IBM MQ for Linux Version 8.0.0.3
- IBM MQ for Solaris Version 8.0.0.3
- IBM MQ for Windows Version 8.0.0.3

The set of system control commands that corresponds to a particular value of the *CommandLevel* attribute varies according to the value of the *Platform* attribute; both must be used to decide which system control commands are supported.

To determine the value of this attribute, use the MQIA_COMMAND_LEVEL selector with the MQINQ call.

## *CommandServerControl (MQLONG)*

Specifies whether the command server is to be started when the queue manager starts.

The value can be any of the following values:

**MQSVC_CONTROL_MANUAL**
The command server is not to be started automatically.

**MQSVC_CONTROL_Q_MGR**
The command server is to be started automatically when the queue manager starts.

This attribute is not supported on z/OS.

To determine the value of this attribute, use the MQIA_CMD_SERVER_CONTROL selector with the MQINQ call.

## *ConfigurationEvent (MQLONG)*

Controls whether configuration events are generated.

To determine the value of this attribute, use the MQIA_CONFIGURATION_EVENT selector with the MQINQ call.

The value can be any of the following values:

**MQEVR_DISABLED**
Event reporting disabled.

**MQEVR_ENABLED**
Event reporting enabled.

### *DeadLetterQName (MQCHAR48)*

This is the name of a queue defined on the local queue manager as the dead-letter (undelivered-message) queue. Messages are sent to this queue if they cannot be routed to their correct destination.

For example, messages are put on this queue when:

- A message arrives at a queue manager, destined for a queue that is not yet defined on that queue manager
- A message arrives at a queue manager, but the queue for which it is destined cannot receive it because, possibly:
  - The queue is full
  - Put requests are inhibited
  - The sending node does not have authority to put messages on the queue

Applications can also put messages on the dead-letter queue.

Report messages are treated in the same way as ordinary messages; if the report message cannot be delivered to its destination queue (usually the queue specified by the *ReplyToQ* field in the message descriptor of the original message), the report message is placed on the dead-letter (undelivered-message) queue.

**Note:** Messages that have passed their expiry time (see MQMD - Expiry field ) are **not** transferred to this queue when they are discarded. However, an expiration report message (MQRO_EXPIRATION) is still generated and sent to the *ReplyToQ* queue, if requested by the sending application.

Messages are not put on the dead-letter (undelivered-message) queue when the application that issued the put request has been notified synchronously of the problem by means of the reason code returned by the MQPUT or MQPUT1 call (for example, a message put on a local queue for which put requests are inhibited).

Messages on the dead-letter (undelivered-message) queue sometimes have their application message data prefixed with an MQDLH structure. This structure contains extra information that indicates why the message was placed on the dead-letter (undelivered-message) queue. See "MQDLH - Dead-letter header" on page 338 for more details of this structure.

This queue must be a local queue, with a *Usage* attribute of MQUS_NORMAL.

If a queue manager does not support a dead-letter (undelivered-message) queue, or one has not been defined, the name is all blanks. All IBM MQ queue managers support a dead-letter (undelivered-message) queue, but by default it is not defined.

If the dead-letter (undelivered-message) queue is not defined, full, or unusable for some other reason, a message which would have been transferred to it by a message channel agent is retained instead on the transmission queue.

To determine the value of this attribute, use the MQCA_DEAD_LETTER_Q_NAME selector with the MQINQ call. The length of this attribute is given by MQ_Q_NAME_LENGTH.

### *DefClusterXmitQueueType (MQLONG)*

The `DefClusterXmitQueueType` attribute controls which transmission queue is selected by default by cluster-sender channels to get messages from, to send the messages to cluster-receiver channels.

The values of **DefClusterXmitQueueType** are `MQCLXQ_SCTQ` or `MQCLXQ_CHANNEL`.

**MQCLXQ_SCTQ**

All cluster-sender channels send messages from `SYSTEM.CLUSTER.TRANSMIT.QUEUE`. The `correlID` of messages placed on the transmission queue identifies which cluster-sender channel the message is destined for.

`SCTQ` is set when a queue manager is defined. This behavior is implicit in versions of IBM WebSphere MQ, earlier than Version 7.5. In earlier versions, the queue manager attribute `DefClusterXmitQueueType` was not present.

**MQCLXQ_CHANNEL**
Each cluster-sender channel sends messages from a different transmission queue. Each transmission queue is created as a permanent dynamic queue from the model queue SYSTEM.CLUSTER.TRANSMIT.MODEL.QUEUE.

If the queue manager attribute, DefClusterXmitQueueType, is set to CHANNEL, the default configuration is changed to cluster-sender channels being associated with individual cluster transmission queues. The transmission queues are permanent-dynamic queues created from the model queue SYSTEM.CLUSTER.TRANSMIT.MODEL.QUEUE. Each transmission queue is associated with one cluster-sender channel. As one cluster-sender channel services a cluster transmission queue, the transmission queue contains messages for only one queue manager in one cluster. You can configure clusters so that each queue manager in a cluster contains only one cluster queue. In this case, the message traffic from a queue manager to each cluster queue is transferred separately from messages to other queues.

To query the value, call MQINQ, or send an Inquire Queue Manager ( MQCMD_INQUIRE_Q_MGR) PCF command, setting the MQIA_DEF_CLUSTER_XMIT_Q_TYPE selector. To change the value, send a Change Queue Manager ( MQCMD_CHANGE_Q_MGR) PCF command, setting the MQIA_DEF_CLUSTER_XMIT_Q_TYPE selector.

**Related reference**
Change Queue Manager
Inquire Queue Manager
"MQINQ - Inquire object attributes" on page 685
The MQINQ call returns an array of integers and a set of character strings containing the attributes of an object.

## *DefXmitQName (MQCHAR48)*

This is the name of the transmission queue that is used for the transmission of messages to remote queue managers, if there is no other indication of which transmission queue to use.

If there is no default transmission queue, the name is entirely blank. The initial value of this attribute is blank.

To determine the value of this attribute, use the MQCA_DEF_XMIT_Q_NAME selector with the MQINQ call. The length of this attribute is given by MQ_Q_NAME_LENGTH.

## *DistLists (MQLONG)*

This indicates whether the local queue manager supports distribution lists on the MQPUT and MQPUT1 calls. It is one of the following values:

**MQDL_SUPPORTED**
Distribution lists supported.

**MQDL_NOT_SUPPORTED**
Distribution lists not supported.

To determine the value of this attribute, use the MQIA_DIST_LISTS selector with the MQINQ call.

## *DNSGroup (MQCHAR18)*

This parameter is no longer used. Refer to WLM/DNS no longer supported.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQCA_DNS_GROUP selector with the MQINQ call. The length of this attribute is given by MQ_DNS_GROUP_NAME_LENGTH.

## *DNSWLM (MQLONG)*

This parameter is no longer used. Refer to WLM/DNS no longer supported.

The value is one of the following:

**MQDNSWLM_YES**
This value may be seen on a queue manager migrated from an earlier release. The value is ignored.

**MQDNSWLM_NO**
This is the only value supported by the queue manager.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA_DNS_WLM selector with the MQINQ call.

## *ExpiryInterval (MQLONG)*

This indicates the frequency with which the queue manager scans the queues looking for expired messages. It is either a time interval in seconds in the range 1 through 99 999 999, or the following special value:

**MQEXPI_OFF**
The queue manager does not scan the queues looking for expired messages.

To determine the value of this attribute, use the MQIA_EXPIRY_INTERVAL selector with the MQINQ call.

This attribute is supported only on z/OS.

## *IGQPutAuthority (MQLONG)*

This attribute applies only if the local queue manager is a member of a queue-sharing group. It indicates the type of authority checking that is performed when the local intra-group queuing agent (IGQ agent) removes a message from the shared transmission queue and places the message on a local queue. The value is one of the following:

**MQIGQPA_DEFAULT**
The user identifier checked for authorization is the value of the *UserIdentifier* field in the *separate* MQMD that is associated with the message when the message is on the shared transmission queue. This is the user identifier of the program that placed the message on the shared transmission queue, and is usually the same as the user identifier under which the remote queue manager is running.

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the user identifier of the local IGQ agent (*IGQUserId*) is also checked.

**MQIGQPA_CONTEXT**
The user identifier checked for authorization is the value of the *UserIdentifier* field in the *separate* MQMD that is associated with the message when the message is on the shared transmission queue. This is the user identifier of the program that placed the message on the shared transmission queue, and is usually the same as the user identifier under which the remote queue manager is running.

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the user identifier of the local IGQ agent (*IGQUserId*) and the value of the *UserIdentifier* field in the *embedded* MQMD are also checked. The latter user identifier is usually the user identifier of the application that originated the message.

**MQIGQPA_ONLY_IGQ**
The user identifier checked for authorization is the user identifier of the local IGQ agent (*IGQUserId*).

If the RESLEVEL profile indicates that more than one user identifier is to be checked, this user identifier is used for all checks.

**MQIGQPA_ALTERNATE_OR_IGQ**
The user identifier checked for authorization is the user identifier of the local IGQ agent (*IGQUserId*).

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the value of the *UserIdentifier* field in the *embedded* MQMD is also checked. This user identifier is usually the user identifier of the application that originated the message.

To determine the value of this attribute, use the MQIA_IGQ_PUT_AUTHORITY selector with the MQINQ call.

This attribute is supported only on z/OS.

### *IGQUserId (MQLONG)*

This attribute is applicable only if the local queue manager is a member of a queue-sharing group. It specifies the user identifier that is associated with the local intra-group queuing agent (IGQ agent). This identifier is one of the user identifiers that can be checked for authorization when the IGQ agent puts messages on local queues. The actual user identifiers checked depend on the setting of the *IGQPutAuthority* attribute, and on external security options.

If *IGQUserId* is blank, no user identifier is associated with the IGQ agent and the corresponding authorization check is not performed (although other user identifiers might still be checked for authorization).

To determine the value of this attribute, use the MQCA_IGQ_USER_ID selector with the MQINQ call. The length of this attribute is given by MQ_USER_ID_LENGTH.

This attribute is supported only on z/OS.

### *InhibitEvent (MQLONG)*

This controls whether inhibit (Inhibit Get and Inhibit Put) events are generated. The value is one of the following:

**MQEVR_DISABLED**
Event reporting disabled.

**MQEVR_ENABLED**
Event reporting enabled.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the MQIA_INHIBIT_EVENT selector with the MQINQ call.

On z/OS, you cannot use the MQINQ call to determine the value of this attribute.

### *IntraGroupqueuing (MQLONG)*

This attribute applies only if the local queue manager is a member of a queue-sharing group. It indicates whether intra-group queuing is enabled for the queue-sharing group. The value is one of the following:

**MQIGQ_DISABLED**
All messages destined for other queue managers in the queue-sharing group are transmitted using conventional channels..

**MQIGQ_ENABLED**
Messages destined for other queue managers in the queue-sharing group are transmitted using the shared transmission queue if the following condition is satisfied:

- The length of the message data plus transmission header does not exceed 63 KB (64 512 bytes).

  It is recommended that somewhat more space than the size of MQXQH be allocated for the transmission header; the constant MQ_MSG_HEADER_LENGTH is provided for this purpose.

If this condition is not satisfied, the message is transmitted using conventional channels.

**Note:** When intra-group queuing is enabled, the order of messages transmitted using the shared transmission queue is not preserved relative to those transmitted using conventional channels.

To determine the value of this attribute, use the MQIA_INTRA_GROUP_queuing selector with the MQINQ call.

This attribute is supported only on z/OS.

### *IPAddressVersion (MQLONG)*

Specifies which IP address version, either IPv4 or IPv6, is used.

This attribute is only relevant for systems that run both IPv4 and IPv6 and only affects channels defined as having a *TransportType* of MQXPY_TCP when one of the following conditions is true:

- The channel's *ConnectionName* is a host name that resolves to both an IPv4 and IPv6 address and its *LocalAddress* parameter is not specified.
- The channel's *ConnectionName* and *LocalAddress* are both host names that resolve to both IPv4 and IPv6 addresses.

The value can be any of the following values:

**MQIPADDR_IPv4**
IPv4 is used.

**MQIPADDR_IPv6**
IPv6 is used.

To determine the value of this attribute, use the MQIA_IP_ADDRESS_VERSION selector with the MQINQ call.

### *ListenerTimer (MQLONG)*

This is the time interval (in seconds) between IBM MQ attempts to restart the listener if there has been an APPC or TCP/IP failure. The value must be between 5 and 9999, with a default value of 60.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA_LISTENER_TIMER selector with the MQINQ call.

### *LocalEvent (MQLONG)*

This controls whether local error events are generated. The value is one of the following:

**MQEVR_DISABLED**
Event reporting disabled.

**MQEVR_ENABLED**
Event reporting enabled.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the MQIA_LOCAL_EVENT selector with the MQINQ call.

On z/OS, you cannot use the MQINQ call to determine the value of this attribute.

### *LoggerEvent (MQLONG)*

This controls whether recovery log events are generated. The value is one of the following:

**MQEVR_DISABLED**
Event reporting disabled.

**MQEVR_ENABLED**
Event reporting enabled.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the MQIA_LOGGER_EVENT selector with the MQINQ call.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, and Windows.

### *LUGroupName (MQCHAR8)*

This is the generic LU name for the LU 6.2 listener that handles inbound transmissions for the queue-sharing group. If you leave this name blank, you cannot use this listener.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQCA_LU_GROUP_NAME selector with the MQINQ call. The length of this attribute is given by MQ_LU_NAME_LENGTH.

### *LUName (MQCHAR8)*

This is the name of the LU to use for outbound LU 6.2 transmissions. Set this to the same LU that the listener uses for inbound transmissions. If you leave this name blank, the APPC/MVS default LU is used; this is variable, so always set LUName if you are using LU6.2.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQCA_LU_NAME selector with the MQINQ call. The length of this attribute is given by MQ_LU_NAME_LENGTH.

### *LU62ARMSuffix (MQCHAR2)*

This is the suffix of the SYS1.PARMLIB member APPCPMxx, that nominates the LUADD for this channel initiator. The z/OS command SET APPC=xx is issued when ARM restarts the channel initiator. If you leave this name is blank, no SET APPC=xx is issued.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQCA_LU62_ARM_SUFFIX selector with the MQINQ call. The length of this attribute is given by MQ_ARM_SUFFIX_LENGTH.

### *LU62Channels (MQLONG)*

This is the maximum number of channels that can be current, or clients that can be connected, that use the LU 6.2 transmission protocol.

The value must be in the range 0 through 9999, with a default value of 200. If you set this to zero, the LU 6.2 transmission protocol is not used.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA_LU62_CHANNELS selector with the MQINQ call.

### *MaxActiveChannels (MQLONG)*

This attribute is the maximum number of channels that can be *active* at any time.

The default is the value specified for the `MaxChannels` attribute.

For z/OS, the value must be in the range 1 through 9 999.

For all other platforms, the value must be in the range 1 through 65 535.

The **MaxActiveChannels** parameter is a queue manager attribute on z/OS only. On the other platforms, **MaxActiveChannels** is an attribute in the `qm.ini` file. See Configuration file stanzas for distributed queuing for information on how you set the **MaxActiveChannels** attribute on other platforms.

To determine the value of this attribute, use the MQIA_ACTIVE_CHANNELS selector with the **MQINQ** call.

**Related concepts**

Channel states

### *MaxChannels (MQLONG)*

This attribute is the maximum number of channels that can be *current* (including server-connection channels with connected clients).

For z/OS, the value must be in the range 1 through 9 999, with a default value of 200.

For all other platforms, the value must be in the range 1 through 65 535, with a default value of 100.

A system that is busy serving connections from the network might need a higher number than the default setting. Determine the value that is correct for your environment, ideally by observing the behavior of your system during testing.

The **MaxChannels** parameter is a queue manager attribute on z/OS only. On the other platforms, **MaxChannels** is an attribute in the `qm.ini` file. See Configuration file stanzas for distributed queuing for information on how you set the **MaxChannels** attribute on other platforms.

To determine the value of this attribute, use the MQIA_MAX_CHANNELS selector with the **MQINQ** call.

**Related concepts**
Channel states

### *MaxHandles (MQLONG)*

This is the maximum number of open handles that any one task can use concurrently. Each successful MQOPEN call for a single queue (or for an object that is not a queue) uses one handle. That handle becomes available for reuse when the object is closed. However, when a distribution list is opened, each queue in the distribution list is allocated a separate handle, and so that MQOPEN call uses as many handles as there are queues in the distribution list. This must be taken into account when deciding on a suitable value for *MaxHandles*.

The MQPUT1 call performs an MQOPEN call as part of its processing; as a result, MQPUT1 uses as many handles as MQOPEN would, but the handles are used only for the duration of the MQPUT1 call itself.

On z/OS, *task* means a CICS task, an MVS task, or an IMS dependent region.

The value is in the range 1 through 999 999 999. The default value is determined by the environment:

- On z/OS, the default value is 100.
- In all other environments, the default value is 256.

To determine the value of this attribute, use the MQIA_MAX_HANDLES selector with the MQINQ call.

### *MaxMsgLength (MQLONG)*

This is the length of the longest *physical* message that the queue manager can handle. However, because the *MaxMsgLength* queue-manager attribute can be set independently of the *MaxMsgLength* queue attribute, the longest physical message that can be placed on a queue is the lesser of those two values.

If the queue manager supports segmentation, an application can put a *logical* message that is longer than the lesser of the two *MaxMsgLength* attributes, but only if the application specifies the MQMF_SEGMENTATION_ALLOWED flag in MQMD. If that flag is specified, the upper limit for the length of a logical message is 999 999 999 bytes, but usually resource constraints imposed by the operating system, or by the environment in which the application is running, result in a lower limit.

The lower limit for the *MaxMsgLength* attribute is 32 KB (32 768 bytes). The upper limit is 100 MB (104 857 600 bytes).

To determine the value of this attribute, use the MQIA_MAX_MSG_LENGTH selector with the MQINQ call.

### *MaxPriority (MQLONG)*

This is the maximum message priority supported by the queue manager. Priorities range from zero (lowest) to *MaxPriority* (highest).

To determine the value of this attribute, use the MQIA_MAX_PRIORITY selector with the MQINQ call.

### *MaxPropertiesLength (MQLONG)*

This is used to control the size of the properties that can flow with a message. This includes both the property name in bytes and the size of the property value also in bytes.

To determine the value of this attribute, use the MQIA_MAX_PROPERTIES_LENGTH selector with the MQINQ call.

### *MaxUncommittedMsgs (MQLONG)*

This is the maximum number of uncommitted messages that can exist within a unit of work. The number of uncommitted messages is the sum of the following since the start of the current unit of work:

- Messages put by the application with the MQPMO_SYNCPOINT option
- Messages retrieved by the application with the MQGMO_SYNCPOINT option

- Trigger messages and COA report messages generated by the queue manager for messages put with the MQPMO_SYNCPOINT option
- COD report messages generated by the queue manager for messages retrieved with the MQGMO_SYNCPOINT option

The following are *not* counted as uncommitted messages:

- Messages put or retrieved by the application outside a unit of work
- Trigger messages or COA/COD report messages generated by the queue manager as a result of messages put or retrieved outside a unit of work
- Expiration report messages generated by the queue manager (even if the call causing the expiration report message specified MQGMO_SYNCPOINT)
- Event messages generated by the queue manager (even if the call causing the event message specified MQPMO_SYNCPOINT or MQGMO_SYNCPOINT)

**Note:**

1. Exception report messages are generated by the Message Channel Agent (MCA), or by the application, and are treated in the same way as ordinary messages put or retrieved by the application.
2. When a message or segment is put with the MQPMO_SYNCPOINT option, the number of uncommitted messages is incremented by one regardless of how many physical messages actually result from the put. (More than one physical message might result if the queue manager must subdivide the message or segment.)
3. When a distribution list is put with the MQPMO_SYNCPOINT option, the number of uncommitted messages is incremented by one *for each physical message that is generated*. This can be as small as one, or as great as the number of destinations in the distribution list.

The lower limit for this attribute is 1; the upper limit is 999 999 999. The default value is 10000.

To determine the value of this attribute, use the MQIA_MAX_UNCOMMITTED_MSGS selector with the MQINQ call.

### *MQIAccounting (MQLONG)*

This controls the collection of accounting information for MQI data.

The value is one of the following:

**MQMON_ON**
Collect API accounting data.

**MQMON_OFF**
Do not collect API accounting data. This is the default value.

If you set the queue manager attribute ACCTCONO to ENABLED, this value might be overridden for individual connections using the Options field in the MQCNO structure. Changes to this value are only effective for connections to the queue manager that occur after the change to the attribute.

This attribute is supported only on IBM i, UNIX systems, and Windows.

To determine the value of this attribute, use the MQIA_ACCOUNTING_MQI selector with the MQINQ call.

### *MQIStatistics (MQLONG)*

This controls the collection of statistics monitoring information for the queue manager.

The value is one of the following:

**MQMON_ON**
Collect MQI statistics.

**MQMON_OFF**
Do not collect MQI statistics. This is the default value.

This attribute is supported only on IBM i, UNIX and Linux systems, and Windows.

To determine the value of this attribute, use the MQIA_STATISTICS_MQI selector with the MQINQ call.

### *MsgMarkBrowseInterval (MQLONG)*

Time interval in milliseconds after which the queue manager can automatically remove the mark from browse messages.

This is a time interval (in milliseconds) after which the queue manager can automatically remove the mark from browse messages.

This attribute describes the time interval for which messages that have been marked as browsed by a call to MQGET, using the get message option MQGMO_MARK_BROWSE_CO_OP, are expected to remain marked as browsed.

The queue manager might automatically unmark browsed messages that have been marked as browsed for the cooperating set of handles when they have been marked for more than this approximate interval.

This does not affect the state of any message marked as browse, that was obtained by a call to MQGET, using the get message option MQGMO_MARK_BROWSE_HANDLE.

The maximum value is 999 999 999 and the default value is 5000. A special value of -1 for *MsgMarkBrowseInterval* represents an unlimited time interval.

**Attention:** This value should not be below the default of 5000.

To determine the value of this attribute, use the MQIA_MSG_MARK_BROWSE_INTERVAL selector with the MQINQ call.

### *OutboundPortMax (MQLONG)*

This is the highest port number in the range, defined by OutboundPortMin and OutboundPortMax, of port numbers to be used to bind outgoing channels.

The value is an integer in the range 0 through 65535, and must be equal to or greater than the OutboundPortMin value. The default value is 0.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA_OUTBOUND_PORT_MAX selector with the MQINQ call.

### *OutboundPortMin (MQLONG)*

This is the lowest port number in the range, defined by OutboundPortMin and OutboundPortMax, of port numbers to be used to bind outgoing channels.

The value is an integer in the range 0 through 65535, and must be equal to or less than the OutboundPortMax value. The default value is 0.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA_OUTBOUND_PORT_MIN selector with the MQINQ call.

### *PerformanceEvent (MQLONG)*

This controls whether performance-related events are generated. It is one of the following values:

**MQEVR_DISABLED**
Event reporting disabled.

**MQEVR_ENABLED**
Event reporting enabled.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the MQIA_PERFORMANCE_EVENT selector with the MQINQ call.

### *Platform (MQLONG)*

This indicates the operating system on which the queue manager is running:

**MQPL_AIX**
AIX (same value as MQPL_UNIX).

V 8.0.0.2 **MQPL_APPLIANCE**
IBM MQ Appliance

**MQPL_MVS**
z/OS (same value as MQPL_ZOS).

**MQPL_NSK**
HP Integrity NonStop Server.

**MQPL_OS390**
z/OS (same value as MQPL_ZOS).

**MQPL_OS400**
IBM i.

**MQPL_UNIX**
UNIX systems.

**MQPL_WINDOWS_NT**
Windows systems.

**MQPL_ZOS**
z/OS.

To determine the value of this attribute, use the MQIA_PLATFORM selector with the MQINQ call.

### *PubSubNPInputMsg (MQLONG)*

Whether to discard or keep an undelivered input message.

The value is one of the following:

**MQUNDELIVERED_DISCARD**
Non-persistent input messages may be discarded if they cannot be processed.

This is the default value.

**MQUNDELIVERED_KEEP**
Non-persistent input messages will not be discarded if they cannot be processed. In this situation the queued publish/subscribe interface will continue to retry the process at appropriate intervals and does not continue processing subsequent messages.

To determine the value of this attribute, use the MQIA_PUBSUB_NP_MSG selector with the MQINQ call.

### *PubSubNPResponse (MQLONG)*

Controls the behavior of undelivered response messages.

The value is one of the following:

**MQUNDELIVERED_NORMAL**
Non-persistent responses which cannot be placed on the reply queue are put on the dead letter queue, if they cannot be placed on the DLQ then they are discarded.

**MQUNDELIVERED_SAFE**
Non-persistent responses which cannot be placed on the reply queue are put on the dead letter queue. If the response cannot be set and cannot be placed on the DLQ then the queued publish/subscribe interface will roll back the current operation and then retry at appropriate intervals and does not continue processing subsequent messages.

**MQUNDELIVERED_DISCARD**
Non-persistent responses are not placed on the reply queue are discarded.

This is the default value for new queue managers.

**MQUNDELIVERED_KEEP**
Non-persistent responses are not placed on the dead letter queue or discarded. Instead, the queued publish/subscribe interface will back out the current operation and then retry it at appropriate intervals.

To determine the value of this attribute, use the MQIA_PUBSUB_NP_RESP selector with the MQINQ call.

### Default value for migrated queue managers.

If the queue manager has been migrated from IBM MQ V6.0, the initial value of this attribute depends on the values of *DiscardNonPersistentResponse* and *DLQNonPersistentResponse* before migration, as shown in the following table.

| | | DLQNonPersistentResponse | | |
|---|---|---|---|---|
| | | **Yes** | **No** | **Not set** |
| **DiscardNonPersistentResponse** | **Yes** | MQUNDELIVERED_NORMAL | MQUNDELIVERED_DISCARD | MQUNDELIVERED_NORMAL |
| | **No** | MQUNDELIVERED_SAFE | MQUNDELIVERED_KEEP | MQUNDELIVERED_SAFE |
| | **Not set** | If SyncPointPersistent = No, MQUNDELIVERED_SAFE else MQUNDELIVERED_NORMAL | If SyncPointPersistent = No, MQUNDELIVERED_KEEP else MQUNDELIVERED_DISCARD | If SyncPointPersistent = No, MQUNDELIVERED_SAFE else MQUNDELIVERED_NORMAL |

## *PubSubMaxMsgRetryCount (MQLONG)*

The number of retries when processing a failed command message under syncpoint.

The value is one of the following:

**0 - 999 999 999**
The default value is 5.

To determine the value of this attribute, use the MQIA_PUBSUB_MAXMSG_RETRY_COUNT selector with the MQINQ call.

## *PubSubSyncPoint (MQLONG)*

Whether only persistent messages or all messages are processed under syncpoint.

The value is one of the following:

**MQSYNCPOINT_IFPER**
This makes the queued publish/subscribe interface receive non-persistent messages outside syncpoint. If the daemon receives a publication outside syncpoint, the daemon forwards the publication to subscribers known to it outside syncpoint.

This is the default value.

**MQSYNCPOINT_YES**
This makes the queued publish/subscribe interface receive all messages under syncpoint.

To determine the value of this attribute, use the MQIA_PUBSUB_SYNC_PT selector with the MQINQ call.

## *PubSubMode (MQLONG)*

Whether the publish/subscribe engine and the queued publish/subscribe interface are running, therefore allowing applications to publish/subscribe by using the application programming interface and the queues that are being monitored by the queued publish/subscribe interface.

The value is one of the following:

**MQPSM_COMPAT**
The publish/subscribe engine is running. It is therefore possible to publish/subscribe by using the application programming interface. The queued publish/subscribe interface is not running, therefore any message that is put to the queues that are monitored by the queued publish/subscribe interface is not acted on. This setting is used for compatibility with WebSphere Message Broker V6 or earlier versions using this queue manager, because it must read the same queues from which the queued publish/subscribe interface normally reads.

**MQPSM_DISABLED**
The publish/subscribe engine and the queued publish/subscribe interface are not running. It is therefore not possible to publish/subscribe by using the application programming interface. Any publish/subscribe messages that are put to the queues that are monitored by the queued publish/subscribe interface are not acted on.

**MQPSM_ENABLED**
The publish/subscribe engine and the queued publish/subscribe interface are running. It is therefore possible to publish/subscribe by using the application programming interface and the queues that are being monitored by the queued publish/subscribe interface. This is the queue manager's initial default value.

To determine the value of this attribute, use the MQIA_PUBSUB_MODE selector with the MQINQ call.

## *QMgrDesc (MQCHAR64)*

Use this field for a commentary describing the queue manager. The content of the field is of no significance to the queue manager, but the queue manager might require that the field contain only characters that can be displayed. It cannot contain any null characters; if necessary, it is padded to the right with blanks. In a DBCS installation, this field can contain DBCS characters (subject to a maximum field length of 64 bytes).

**Note:** If this field contains characters that are not in the queue manager's character set (as defined by the *CodedCharSetId* queue manager attribute), those characters might be translated incorrectly if this field is sent to another queue manager.

- On z/OS, the default value is the product name and version number.
- In all other environments, the default value is blanks.

To determine the value of this attribute, use the MQCA_Q_MGR_DESC selector with the MQINQ call. The length of this attribute is given by MQ_Q_MGR_DESC_LENGTH.

## *QMgrIdentifier (MQCHAR48)*

This is an internally-generated unique name for the queue manager.

To determine the value of this attribute, use the MQCA_Q_MGR_IDENTIFIER selector with the MQINQ call. The length of this attribute is given by MQ_Q_MGR_IDENTIFIER_LENGTH.

This attribute is supported in the following environments: AIX, HP-UX, z/OS, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.

## *QMgrName (MQCHAR48)*

This is the name of the local queue manager, that is, the name of the queue manager to which the application is connected.

The first 12 characters of the name are used to construct a unique message identifier (see MQMD - MsgId field ). Queue managers that can intercommunicate must therefore have names that differ in the first 12 characters, in order for message identifiers to be unique in the queue-manager network.

On z/OS, the name is the same as the subsystem name, which is limited to 4 nonblank characters.

To determine the value of this attribute, use the MQCA_Q_MGR_NAME selector with the MQINQ call. The length of this attribute is given by MQ_Q_MGR_NAME_LENGTH.

## *QSGName (MQCHAR4)*

This is the name of the queue-sharing group to which the local queue manager belongs. If the local queue manager does not belong to a queue-sharing group, the name is blank.

To determine the value of this attribute, use the MQCA_QSG_NAME selector with the MQINQ call. The length of this attribute is given by MQ_QSG_NAME_LENGTH.

This attribute is supported only on z/OS.

### *QueueAccounting (MQLONG)*

This controls the collection of accounting information for queues.

The value is one of the following:

**MQMON_NONE**
Do not collect accounting data for queues, regardless of the setting of the queue accounting attribute ACCTQ. This is the default value.

**MQMON_OFF**
Do not collect accounting data for queues that specify QMGR in the ACCTQ queue attribute.

**MQMON_ON**
Collect accounting data for queues that specify QMGR in the ACCTQ queue attribute.

Changes to this value are only effective for connections to the queue manager that occur after the change to the attribute.

To determine the value of this attribute, use the MQIA_ACCOUNTING_Q selector with the MQINQ call.

### *QueueMonitoring (MQLONG)*

This specifies the default setting for online monitoring of queues.

If the *QueueMonitoring* queue attribute is set to MQMON_Q_MGR, this attribute specifies the value which is assumed by the channel. The value can be:

**MQMON_OFF**
Online monitoring data collection is turned off. This is the queue manager's initial default value.

**MQMON_NONE**
Online monitoring data collection is turned off for queues regardless of the setting of their *QueueMonitoring* attribute.

**MQMON_LOW**
Online monitoring data collection is turned on, with a low ratio of data collection.

**MQMON_MEDIUM**
Online monitoring data collection is turned on, with a moderate ratio of data collection.

**MQMON_HIGH**
Online monitoring data collection is turned on, with a high ratio of data collection.

To determine the value of this attribute, use the MQIA_MONITORING_Q selector with the MQINQ call.

### *QueueStatistics (MQLONG)*

This controls the collection of statistics data for queues.

It is one of the following values:

**MQMON_NONE**
Do not collect queue statistics for queues, regardless of the setting of the *QueueStatistics* queue attribute. This is the default value.

**MQMON_OFF**
Do not collect statistics data for queues that specify Queue Manager in the *QueueStatistics* queue attribute.

**MQMON_ON**
Collect statistics data for queues that specify Queue Manager in the *QueueStatistics* queue attribute.

To determine the value of this attribute, use the MQIA_STATISTICS_Q selector with the MQINQ call.

### *ReceiveTimeout (MQLONG)*

This specifies how long a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state. It applies only to message channels and not to MQI channels.

The exact meaning of the ReceiveTimeout is altered by the value specified in ReceiveTimeoutType. ReceiveTimeoutType can be set to one of the following:

- MQRCVTIME_EQUAL - this value is the number in seconds for the channel to wait. Specify a value in the range 0 - 999999.
- MQRCVTIME_ADD - this value is the number in seconds to add to the negotiated HBINT, and it determines how long a channel waits. Specify a value in the range 1 - 999999.
- MQRCVTIME_MULTIPLY - this value is a multiplier to apply to the negotiated HBINT. Specify a value of 0 or a value in the range 2 - 99.

The default value is 0.

Set ReceiveTimeoutType to MQRCVTIME_MULTIPLY or MQRCVTIME_EQUAL, and ReceiveTimeout to 0, to stop a channel from timing out its wait to receive data from its partner.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA_RECEIVE_TIMEOUT selector with the MQINQ call.

### *ReceiveTimeoutMin (MQLONG)*

This is the minimum time, in seconds, that a TCP/IP channel waits to receive data, including heartbeats, from its partner, before returning to the inactive state.

It applies only to message channels, not to MQI channels. The value must be in the range 0 through 999999, with a default of 0.

If you use ReceiveTimeoutType to specify that the TCP/IP channel wait time is to be calculated relative to the negotiated value of HBINT, and the resultant value is less than the value of this parameter, this value is used instead.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA_RECEIVE_TIMEOUT_MIN selector with the MQINQ call.

### *ReceiveTimeoutType (MQLONG)*

This is the qualifier, applied to ReceiveTimeout to define how long a TCP/IP channel waits to receive data, including heartbeats, from its partner, before returning to the inactive state. It applies only to message channels, not to MQI channels.

The value is one of the following:

**MQRCVTIME_MULTIPLY**
ReceiveTimeout is a multiplier to apply to the negotiated HBINT value to determine how long a channel waits. This is the default value.

**MQRCVTIME_ADD**
ReceiveTimeout is a value, in seconds, to add to the negotiated HBINT value to determine how long a channel waits.

**MQRCVTIME_EQUAL**
ReceiveTimeout is a value, in seconds, that the channel waits.

To stop a channel timing out its wait to receive data from its partner, set ReceiveTimeoutType to MQRCVTIME_MULTIPLY or MQRCVTIME_EQUAL, and ReceiveTimeout to 0.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA_RECEIVE_TIMEOUT_TYPE selector with the MQINQ call.

### *RemoteEvent (MQLONG)*

This controls whether remote error events are generated. It is one of the following values:

**MQEVR_DISABLED**
Event reporting disabled.

**MQEVR_ENABLED**
Event reporting enabled.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the MQIA_REMOTE_EVENT selector with the MQINQ call.

### *RepositoryName (MQCHAR48)*

This is the name of a cluster for which this queue manager provides a repository-manager service. If the queue manager provides this service for more than one cluster, *RepositoryNamelist* specifies the name of a namelist object that identifies the clusters, and *RepositoryName* is blank. At least one of *RepositoryName* and *RepositoryNamelist* must be blank.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, Windows, and z/OS.

To determine the value of this attribute, use the MQCA_REPOSITORY_NAME selector with the MQINQ call. The length of this attribute is given by MQ_Q_MGR_NAME_LENGTH.

### *RepositoryNamelist (MQCHAR48)*

This is the name of a namelist object that contains the names of clusters for which this queue manager provides a repository-manager service. If the queue manager provides this service for only one cluster, the namelist object contains only one name. Alternatively, *RepositoryName* can be used to specify the name of the cluster, in which case *RepositoryNamelist* is blank. At least one of *RepositoryName* and *RepositoryNamelist* must be blank.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, Windows, and z/OS.

To determine the value of this attribute, use the MQCA_REPOSITORY_NAMELIST selector with the MQINQ call. The length of this attribute is given by MQ_NAMELIST_NAME_LENGTH.

### *ScyCase(MQCHAR8)*

Specifies whether the queue manager supports security profile names in mixed case, or in uppercase only.

The value is one of the following:

**MQSCYC_UPPER**
Security profile names must be in uppercase.

**MQSCYC_MIXED**
Security profile names can be in uppercase or in mixed case.

Changes to this attribute take effect when a Refresh Security command is run with *SecurityType(MQSECTYPE_CLASSES)* specified.

This attribute is supported only on z/OS.

To determine the value of this attribute, use the MQIA_SECURITY_CASE selector with the MQINQ call.

### *SharedQMgrName (MQLONG)*

This specifies whether the *ObjectQmgrName* should be used or treated as the local queue manager on an MQOPEN call, for a shared queue, when the *ObjectQmgrName* is that of another queue manager in the queue-sharing group.

The value can be any of the following values:

**MQSQQM_USE**
*ObjectQmgrName* is used and the appropriate transmission queue is opened.

**MQSQQM_IGNORE**
If the target queue is shared, and the *ObjectQmgrName* is that of a queue manager in the same queue-sharing group, the open is performed locally.

This attribute is valid only on z/OS.

To determine the value of this attribute, use the MQIA_SHARED_Q_Q_MGR_NAME selector with the MQINQ call.

### *SPLCAP*
Indicates whether security capabilities of IBM MQ Advanced Message Security are available for a queue manager.

**MQCAP_SUPPORTED**
This is the default value if the IBM MQ AMS component is installed for the installation that the queue manager is running under.

**MQCAP_NOT_SUPPORTED**

### *SSLEvent (MQLONG)*
This specifies whether SSL events are generated.

It is one of the following values:

**MQEVR_ENABLED**
Generate SSL events, as follows:

MQRC_CHANNEL_SSL_ERROR

**MQEVR_DISABLED**
Do not generate SSL events; this is the default value.

To determine the value of this attribute, use the MQIA_SSL_EVENT selector with the MQINQ call.

### *SSLFIPSRequired (MQLONG)*

This lets you specify that only FIPS-certified algorithms are to be used if the cryptography is executed in IBM MQ, rather than in cryptographic hardware. If cryptographic hardware is configured, the cryptography modules used are those modules provided by the hardware product; these modules might or might not be FIPS-certified to a particular level depending on the hardware product in use.

The value is one of the following values:

**MQSSL_FIPS_NO**
Use any CipherSpec supported on the platform in use. This value is the default value.

**MQSSL_FIPS_YES**
Use only FIPS-certified cryptographic algorithms in the CipherSpecs allowed on all SSL connections from and to this queue manager.

This parameter is valid only on UNIX, Linux, Windows, and z/OS platforms.

To determine the value of this attribute, use the MQIA_SSL_FIPS_REQUIRED selector with the MQINQ call.

**Related tasks**
Specifying that only FIPS-certified CipherSpecs are used at run time on the MQI client
**Related reference**
Federal Information Processing Standards (FIPS) for UNIX, Linux and Windows

### *SSLKeyResetCount (MQLONG)*

This specifies when SSL channel message channel agents (MCAs) that initiate communication reset the secret key used for encryption on the channel.

The value represents the total number of unencrypted bytes that are sent and received on the channel before the secret key is renegotiated. The number of bytes includes control information sent by the MCA.

The value is a number in the range 0 through 999 999 999, with a default value of 0. If you specify an SSL/TLS secret key reset count in the range 1 byte through 32 KB, SSL/TLS channels will use a secret key reset count of 32 KB. This is to avoid the processing cost of excessive key resets which would occur for small SSL/TLS secret key reset values.

The secret key is renegotiated when the total number of unencrypted bytes sent and received by the initiating channel MCA exceeds the specified value, or if channel heartbeats are enabled before data is sent or received following a channel heartbeat, whichever occurs first.

The count of bytes sent and received for renegotiation includes control information sent and received by the channel MCA and is reset whenever a renegotiation occurs.

Use a value of 0 to indicate that secret keys are never renegotiated.

To determine the value of this attribute, use the MQIA_SSL_RESET_COUNT selector with the MQINQ call.

### *StartStopEvent (MQLONG)*

This controls whether start and stop events are generated. The value is one of the following:

**MQEVR_DISABLED**
Event reporting disabled.

**MQEVR_ENABLED**
Event reporting enabled.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the MQIA_START_STOP_EVENT selector with the MQINQ call.

### *StatisticsInterval (MQLONG)*

This specifies how often (in seconds) to write statistics monitoring data to the monitoring queue.

The value is an integer in the range 0 to 604800, with a default value of 1800 (30 minutes).

To determine the value of this attribute, use the MQIA_STATISTICS_INTERVAL selector with the MQINQ call.

### *SyncPoint (MQLONG)*

This indicates whether the local queue manager supports units of work and syncpointing with the MQGET, MQPUT, and MQPUT1 calls.

**MQSP_AVAILABLE**
Units of work and syncpointing available.

**MQSP_NOT_AVAILABLE**
Units of work and syncpointing not available.

- On z/OS this value is never returned.

To determine the value of this attribute, use the MQIA_SYNCPOINT selector with the MQINQ call.

### *TCPChannels (MQLONG)*

This is the maximum number of channels that can be current, or clients that can be connected, that use the TCP/IP transmission protocol.

The value must be in the range 0 through 9999, with a default value of 200. If you specify 0, TCP/IP is not used.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA_TCP_CHANNELS selector with the MQINQ call.

### *TCPKeepAlive (MQLONG)*

This specifies whether to use TCP KEEPALIVE to check that the other end of the connection is still available. If it is not available, the channel is closed.

The value is one of the following:

**MQTCPKEEP_YES**
Use TCP KEEPALIVE as specified in the TCP profile configuration data set. If you specify the channel attribute KeepAliveInterval (KAINT), the value to which it is set is used.

**MQTCPKEEP_NO**
Do not use TCP KEEPALIVE. This is the default value.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA_TCP_KEEP_ALIVE selector with the MQINQ call.

### *TCPName (MQCHAR8)*

This is the name of either the only or preferred TCP/IP stack that will be used, depending on the value of TCPStackType. This parameter is only applicable in CINET multiple stack environments. The default value is TCPIP.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQCA_TCP_NAME selector with the MQINQ call. The length of this attribute is given by MQ_TCP_NAME_LENGTH.

### *TCPStackType (MQLONG)*

This specifies whether the channel initiator can use only the TCP/IP stack specified in TCPName, or can optionally bind to any selected TCP/IP stack. This parameter is only applicable in CINET multiple stack environments.

The value is one of the following:

**MQTCPSTACK_SINGLE**
The channel initiator can use only the TCP/IP address spaces named in TCPName. This is the default value.

**MQTCPSTACK_MULTIPLE**
The channel initiator can use any TCP/IP address space available to it. It defaults to the one specified in TCPName if no other is specified for a channel or listener.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA_TCP_STACK_TYPE selector with the MQINQ call.

### *TraceRouteRecording (MQLONG)*

This controls the recording of trace- route information.

The value is one of the following:

**MQRECORDING_DISABLED**
No appending to trace- route messages allowed.

**MQRECORDING_Q**
Put trace- route messages to fixed named queue.

**MQRECORDING_MSG**
Put trace- route messages to a queue determined using the message itself. This is the default value

To determine the value of this attribute, use the MQIA_TRACE_ROUTE_RECORDING selector with the MQINQ call.

### *TriggerInterval (MQLONG)*

This is a time interval (in milliseconds) used to restrict the number of trigger messages. This is relevant only when the *TriggerType* is MQTT_FIRST. In this case trigger messages are usually generated only when a suitable message arrives on the queue, and the queue was previously empty. Under certain circumstances, however, an additional trigger message can be generated with MQTT_FIRST triggering even if the queue was not empty. These additional trigger messages are not generated more often than every *TriggerInterval* milliseconds.

For more information on triggering, see Triggering channels.

The value is not less than 0 and not greater than 999 999 999. The default value is 999 999 999.

To determine the value of this attribute, use the MQIA_TRIGGER_INTERVAL selector with the MQINQ call.

### *TriggerInterval (MQLONG)*

This is a time interval (in milliseconds) used to restrict the number of trigger messages. This is relevant only when the *TriggerType* is MQTT_FIRST. In this case trigger messages are usually generated only when a suitable message arrives on the queue, and the queue was previously empty. Under certain circumstances, however, an additional trigger message can be generated with MQTT_FIRST triggering even if the queue was not empty. These additional trigger messages are not generated more often than every *TriggerInterval* milliseconds.

For more information on triggering, see Triggering channels.

The value is not less than 0 and not greater than 999 999 999. The default value is 999 999 999.

To determine the value of this attribute, use the MQIA_TRIGGER_INTERVAL selector with the MQINQ call.

### *Version (MQCFST)*

This is the version of the IBM MQ code as VVRRMMFF, where:

VV - Version

RR - Release

MM - Maintenance level

FF - Fix level

### *XrCapability(MQLONG)*

This controls whether IBM MQ Telemetry commands are supported by the queue manager.

The value is one of the following:

**MQCAP_SUPPORTED**
IBM MQ Telemetry component installed and Telemetry commands are supported.

**MQCAP_NOT_SUPPORTED**
IBM MQ Telemetry component not installed.

This attribute is supported only on IBM i, Unix systems, and Windows.

To determine the value of this attribute, use the MQIA_XR_CAPABILITY selector with the MQINQ call.

## Attributes for queues

There are five types of queue definition. Some queue attributes apply to all types of queue; other queue attributes apply only to certain types of queue.

### Types of queue

The queue manager supports the following types of queue definition:

**Local queue**

You can store messages on a local queue.

z/OS On z/OS you can make it a shared or private queue.

A queue is known to a program as *local* if it is owned by the queue manager to which the program is connected. You can get messages from, and put messages on, local queues.

The queue definition object holds the definition information of the queue as well as the physical messages put on the queue.

**Local queue manager queue**

The queue exists on the local queue manager.

z/OS The queue is known as a private queue on z/OS.

z/OS **Shared queue (z/OS only)**

The queue exists in a shared repository that is accessible to all the queue managers that belong to the queue-sharing group that owns the shared repository.

Applications connected to any queue manager in the queue-sharing group can place messages on and remove messages from queues of this type. Such queues are effectively the same as local queues. The value of the **QType** queue attribute is `MQQT_LOCAL`.

Applications connected to the local queue manager can place messages on and remove messages from queues of this type. The value of the **QType** queue attribute is `MQQT_LOCAL`.

**Cluster queue**

You can store messages on a cluster queue on the queue manager where it is defined. A cluster queue is a queue that is hosted by a cluster queue manager and made available to other queue managers in the cluster. The value of the **QType** queue attribute is `MQQT_CLUSTER`.

A cluster queue definition is advertised to other queue managers in the cluster. The other queue managers in the cluster can put messages to a cluster queue without needing a corresponding remote-queue definition. A cluster queue can be advertised in more than one cluster by using a cluster namelist.

When a queue is advertised, any queue manager in the cluster can put messages to it. To put a message, the queue manager must find out, from the full repositories, where the queue is hosted. Then it adds some routing information to the message and puts the message on a cluster transmission queue.

A queue manager can store messages for other queue managers in a cluster on multiple transmission queues. You can configure a queue manager to store messages on multiple cluster transmission queues in two different ways. If you set the queue manager attribute **DEFCLXQ** to `CHANNEL`, a different cluster transmission queue is created automatically from `SYSTEM.CLUSTER.TRANSMIT.MODEL.QUEUE` for each cluster-sender channel. If you set the `CLCHNAME` transmission queue option to match one or more cluster-senders channel, the queue manager can store messages for the matching channels on that transmission queue.

**Attention:** If you are using dedicated `SYSTEM.CLUSTER.TRANSMIT.QUEUES` with a queue manager that was upgraded from a version of the product earlier than IBM WebSphere MQ 7.5, ensure that the `SYSTEM.CLUSTER.TRANSMIT.MODEL.QUEUE` has the SHARE/NOSHARE option set to **SHARE**.

z/OS A cluster queue can be a queue that is shared by members of a queue-sharing group in IBM MQ for z/OS.

**Remote queue**
A remote queue is not a physical queue; it is the local definition of a queue that exists on a remote queue manager. The local definition of the remote queue contains information that tells the local queue manager how to route messages to the remote queue manager.

Applications connected to the local queue manager can place messages on queues of this type; the messages are placed on the local transmission queue used to route messages to the remote queue manager. Applications cannot remove messages from remote queues. The value of the **QType** queue attribute is `MQQT_REMOTE`.

You can also use a remote queue definition for:

- Reply-queue aliasing

  In this case the name of the definition is the name of a reply-to queue. For more information, see Reply-to queue aliases and clusters.
- Queue-manager aliasing

  In this case the name of the definition is an alias for a queue manager, and not the name of a queue. For more information, see Queue manager aliases and clusters.

**Alias queue**
This is not a physical queue; it is an alternative name for a local queue, a shared queue, a cluster queue, or a remote queue. The name of the queue to which the alias resolves is part of the definition of the alias queue.

Applications connected to the local queue manager can place messages on queues of this type; the messages are placed on the queue to which the alias resolves. Applications can remove messages from queues of this type if the alias resolves to a local queue, a shared queue, or a cluster queue that has a local instance. The value of the **QType** queue attribute is `MQQT_ALIAS`.

**Model queue**
This is not a physical queue; it is a set of queue attributes from which a local queue can be created.

Messages cannot be stored on queues of this type.

## Queue limits

V 8.0.0.15

From Version 8.0.0, Fix Pack 15, the queue manager limits the maximum queue file size to 2 TB by default.

## Queue attributes

Some queue attributes apply to all types of queue; other queue attributes apply only to certain types of queue. The types of queue to which an attribute applies are shown in Table 561 on page 812 and subsequent tables.

Table 561 on page 812 summarizes the attributes that are specific to queues. The attributes are described in alphabetical order.

**Note:** The names of the attributes shown in this section are descriptive names used with the `MQINQ` and `MQSET` calls; the names are the same as for the PCF commands. When MQSC commands are used to define, alter, or display attributes, alternative short names are used; see Script (MQSC) commands for details.

*Table 561. Attributes for queues.* The columns apply as follows:

- The column for local queues applies also to shared queues.
- The column for model queues indicates which attributes are inherited by the local queue created from the model queue.
- The column for cluster queues indicates the attributes that can be inquired when the cluster queue is opened for inquire alone, or for inquire and output. If any other attributes are inquired, the call returns completion code MQCC_WARNING and reason code MQRC_SELECTOR_NOT_FOR_TYPE (2068).

  If the cluster queue is opened for inquire plus one or more of input, browse, or set, the column for local queues applies instead.

  If the cluster queue is opened for inquire alone, or for inquire and output, plus specifying the base queue manager name, the column for local queues applies instead.

| Attribute | Description | Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|---|---|
| AlterationDate | Date when definition was last changed | ✓ | | ✓ | ✓ | |
| AlterationTime | Time when definition was last changed | ✓ | | ✓ | ✓ | |
| BackoutRequeueQName | Excessive backout requeue queue name | ✓ | ✓ | | | |
| BackoutThreshold | Backout threshold | ✓ | ✓ | | | |
| BaseQName | Queue name to which alias resolves | | | ✓ | | |
| CFStrucName | Coupling-facility structure name | ✓ | ✓ | | | |
| CLCHNAME | Cluster-sender channel names | ✓ | ✓ | | | |
| ClusterName | Name of cluster to which queue belongs | ✓ | | ✓ | ✓ | ✓ |
| ClusterNamelist | Name of namelist object containing names of clusters to which queue belongs | ✓ | | ✓ | ✓ | |
| CLWLQueuePriority | Cluster workload queue priority | ✓ | | ✓ | ✓ | ✓ |
| CLWLQueueRank | Cluster workload queue rank | ✓ | | ✓ | ✓ | ✓ |
| CLWLUseQ | Use remote queue | ✓ | | | | |
| CreationDate | Date that the queue was created | ✓ | | | | |
| CreationTime | Time that the queue was created | ✓ | | | | |
| CurrentQDepth | Current queue depth | ✓ | | | | |
| DefaultPutResponse | Default put response | ✓ | ✓ | ✓ | ✓ | |
| DefBind | Default binding | ✓ | | ✓ | ✓ | ✓ |
| DefinitionType attribute | Queue definition type | ✓ | ✓ | | | |
| DefInputOpenOption | Default input open option | ✓ | ✓ | | | |
| DefPersistence | Default message persistence | ✓ | ✓ | ✓ | ✓ | ✓ |
| DefPriority | Default message priority | ✓ | ✓ | ✓ | ✓ | ✓ |
| DefReadAhead | Default read ahead | ✓ | ✓ | ✓ | | |
| DistLists | Distribution list support | ✓ | ✓ | | | |
| HardenGetBackout | Whether to maintain an accurate backout count | ✓ | ✓ | | | |
| IndexType | Index type | ✓ | ✓ | | | |

| InhibitPut | Whether put operations for the queue are allowed | ✓ | ✓ | ✓ | ✓ | ✓ |

*Table 561. Attributes for queues.* The columns apply as follows:

- The column for local queues applies also to shared queues.
- The column for model queues indicates which attributes are inherited by the local queue created from the model queue.
- The column for cluster queues indicates the attributes that can be inquired when the cluster queue is opened for inquire alone, or for inquire and output. If any other attributes are inquired, the call returns completion code MQCC_WARNING and reason code MQRC_SELECTOR_NOT_FOR_TYPE (2068).

  If the cluster queue is opened for inquire plus one or more of input, browse, or set, the column for local queues applies instead.

  If the cluster queue is opened for inquire alone, or for inquire and output, plus specifying the base queue manager name, the column for local queues applies instead.

*(continued)*

| Attribute | Description | Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|---|---|
| InitiationQName | Name of initiation queue | ✓ | ✓ | | | |

**Related concepts**

Cluster queues

Local queues

## *AlterationDate (MQCHAR12)*

Date when definition was last changed.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | | X | X | |

This is the date when the definition was last changed. The format of the date is YYYY-MM-DD, padded with two trailing blanks to make the length 12 bytes (for example, 1992-09-23¬¬, where ¬¬ represents two blank characters).

The values of certain attributes (for example, *CurrentQDepth*) change as the queue manager operates. Changes to these attributes do not affect *AlterationDate*.

To determine the value of this attribute, use the MQCA_ALTERATION_DATE selector with the MQINQ call. The length of this attribute is given by MQ_DATE_LENGTH.

## *AlterationTime (MQCHAR8)*

Time when definition was last changed.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | | X | X | |

This is the time when the definition was last changed. The format of the time is HH.MM.SS using the 24-hour clock, with a leading zero if the hour is less than 10 (for example 09.10.20).

- On z/OS, the time is Greenwich Mean Time (GMT), subject to the system clock being set accurately to GMT.
- In other environments, the time is local time.

The values of certain attributes (for example, *CurrentQDepth*) change as the queue manager operates. Changes to these attributes do not affect *AlterationTime*.

To determine the value of this attribute, use the MQCA_ALTERATION_TIME selector with the MQINQ call. The length of this attribute is given by MQ_TIME_LENGTH.

### *BackoutRequeueQName (MQCHAR48)*

This is the excessive backout requeue queue name. Apart from allowing its value to be queried, the queue manager takes no action based on the value of this attribute.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | X | | | |

Applications running inside WebSphere Application Server and those that use the IBM MQ Application Server Facilities use this attribute to determine where messages that have been backed out should go. For all other applications, the queue manager takes no action based on the value of the attribute.

IBM MQ classes for JMS uses this attribute to determine where to transfer a message that has already been backed out the maximum number of times as specified by the *BackoutThreshold* attribute.

To determine the value of this attribute, use the MQCA_BACKOUT_REQ_Q_NAME selector with the MQINQ call. The length of this attribute is given by MQ_Q_NAME_LENGTH.

### *BackoutThreshold (MQLONG)*

This is the backout threshold. Apart from allowing its value to be queried, the queue manager takes no action based on the value of this attribute.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | X | | | |

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine if a message should be backed out. For all other applications, the queue manager takes no action based on the value of the attribute.

IBM MQ classes for JMS uses this attribute to determine how many times to allow a message to be backed out before transferring the message to the queue specified by the *BackoutRequeueQName* attribute.

To determine the value of this attribute, use the MQIA_BACKOUT_THRESHOLD selector with the MQINQ call.

### *BaseQName (MQCHAR48)*

This is the name of a queue that is defined to the local queue manager.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| | | X | | |

(For more information on queue names, see MQOD - ObjectName field.) The queue is one of the following types:

**MQQT_LOCAL**
Local queue.

**MQQT_REMOTE**
Local definition of a remote queue.

**MQQT_CLUSTER**
Cluster queue.

To determine the value of this attribute, use the MQCA_BASE_Q_NAME selector with the MQINQ call. The length of this attribute is given by MQ_Q_NAME_LENGTH.

### *BaseType (MQCFIN)*
The type of object to which the alias resolves.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| | | X | | |

It is one of the following values:

**MQOT_Q**
Base object type is a queue

**MQOT_TOPIC**
Base object type is a topic

### *CFStrucName (MQCHAR12)*
This is the name of the coupling-facility structure where the messages on the queue are stored. The first character of the name is in the range A through Z, and the remaining characters are in the range A through Z, 0 through 9, or blank.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | X | | | |

To get the full name of the structure in the coupling facility, suffix the value of the *QSGName* queue-manager attribute with the value of the *CFStrucName* queue attribute.

This attribute applies only to shared queues; it is ignored if *QSGDisp* does not have the value MQQSGD_SHARED.

To determine the value of this attribute, use the MQCA_CF_STRUC_NAME selector with the MQINQ call. The length of this attribute is given by MQ_CF_STRUC_NAME_LENGTH.

This attribute is supported only on z/OS.

### *ClusterChannelName ( MQCHAR20)*
`ClusterChannelName` is the generic name of the cluster-sender channels that use this queue as a transmission queue. The attribute specifies which cluster-sender channels send messages to a cluster-receiver channel from this cluster transmission queue.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| ✓ | ✓ | | | |

The default queue manager configuration is for all cluster-sender channels to send messages from a single transmission queue, `SYSTEM.CLUSTER.TRANSMIT.QUEUE`. The default configuration can be changed by modified by changing the queue manager attribute, **DefClusterXmitQueueType**. The default value of the attribute is `SCTQ`. You can change the value to `CHANNEL`. If you set the

**DefClusterXmitQueueType** attribute to CHANNEL, each cluster-sender channel defaults to using a specific cluster transmission queue, SYSTEM.CLUSTER.TRANSMIT.*ChannelName*.

You can also set the transmission queue attribute ClusterChannelName attribute to a cluster-sender channel manually. Messages that are destined for the queue manager connected by the cluster-sender channel are stored in the transmission queue that identifies the cluster-sender channel. They are not stored in the default cluster transmission queue. If you set the ClusterChannelName attribute to blanks, the channel switches to the default cluster transmission queue when the channel restarts. The default queue is either SYSTEM.CLUSTER.TRANSMIT.*ChannelName* or SYSTEM.CLUSTER.TRANSMIT.QUEUE, depending on the value of the queue manager DefClusterXmitQueueType attribute.

By specifying asterisks, "*", in **ClusterChannelName**, you can associate a transmission queue with a set of cluster-sender channels. The asterisks can be at the beginning, end, or any number of places in the middle of the channel name string. **ClusterChannelName** is limited to a length of 20 characters: MQ_CHANNEL_NAME_LENGTH.

### *ClusterName (MQCHAR48)*

This is the name of the cluster to which the queue belongs.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | | X | X | X |

If the queue belongs to more than one cluster, *ClusterNamelist* specifies the name of a namelist object that identifies the clusters, and *ClusterName* is blank. At least one of *ClusterName* and *ClusterNamelist* must be blank.

To determine the value of this attribute, use the MQCA_CLUSTER_NAME selector with the MQINQ call. The length of this attribute is given by MQ_CLUSTER_NAME_LENGTH.

### *ClusterNamelist (MQCHAR48)*

This is the name of a namelist object that contains the names of clusters to which this queue belongs.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | | X | X | |

If the queue belongs to only one cluster, the namelist object contains only one name. Alternatively, *ClusterName* can be used to specify the name of the cluster, in which case *ClusterNamelist* is blank. At least one of *ClusterName* and *ClusterNamelist* must be blank.

To determine the value of this attribute, use the MQCA_CLUSTER_NAMELIST selector with the MQINQ call. The length of this attribute is given by MQ_NAMELIST_NAME_LENGTH.

### *CLWLQueuePriority (MQLONG)*

This is the cluster workload queue priority, a value in the range 0 through 9 representing the priority of the queue.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | | X | X | X |

For more information, see Cluster queues.

To determine the value of this attribute, use the MQIA_CLWL_Q_PRIORITY selector with the MQINQ call.

### *CLWLQueueRank (MQLONG)*

This is the cluster workload queue rank, a value in the range 0 through 9 representing the rank of the queue.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | | X | X | X |

For more information, see Cluster queues.

To determine the value of this attribute, use the MQIA_CLWL_Q_RANK selector with the MQINQ call.

### *CLWLUseQ (MQLONG)*

This defines the behavior of an MQPUT when the target queue has both a local instance and at least one remote cluster instance. If the put originates from a cluster channel, this attribute does not apply.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | | | | |

The value is one of the following:

**MQCLWL_USEQ_ANY**
Use remote and local queues.

**MQCLWL_USEQ_LOCAL**
Do not use remote queues.

**MQCLWL_USEQ_AS_Q_MGR**
Inherit definition from queue manager's MQIA_CLWL_USEQ.

For more information, see Cluster queues.

To determine the value of this attribute, use the MQCA_CLWL_USEQ selector with the MQINQ call. The length of this attribute is given by MQ_CLWL_USEQ_LENGTH.

### *CreationDate (MQCHAR12)*

This is the date when the queue was created.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | | | | |

The format of the date is YYYY-MM-DD, padded with two trailing blanks to make the length 12 bytes (for example, 2013-09-23¬¬, where ¬¬ represents 2 blank characters).

- On IBM i, the creation date of a queue can differ from that of the underlying operating system entity (file or userspace) that represents the queue.

To determine the value of this attribute, use the MQCA_CREATION_DATE selector with the MQINQ call. The length of this attribute is given by MQ_CREATION_DATE_LENGTH.

### *CreationTime (MQCHAR8)*

This is the time when the queue was created.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | | | | |

The format of the time is HH.MM.SS using the 24-hour clock, with a leading zero if the hour is less than 10 (for example 09.10.20).

- On z/OS, the time is Greenwich Mean Time (GMT), subject to the system clock being set accurately to GMT.

- In other environments, the time is local time.
- On IBM i, the creation time of a queue can differ from that of the underlying operating system entity (file or userspace) that represents the queue.

To determine the value of this attribute, use the MQCA_CREATION_TIME selector with the MQINQ call. The length of this attribute is given by MQ_CREATION_TIME_LENGTH.

### *CurrentQDepth (MQLONG)*

This is the number of messages currently on the queue.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | | | | |

It is incremented during an MQPUT call, and during backout of an MQGET call. It is decremented during a nonbrowse MQGET call, and during backout of an MQPUT call. The effect of this is that the count includes messages that have been put on the queue within a unit of work, but that have not yet been committed, even though they are not eligible to be retrieved by the MQGET call. Similarly, it excludes messages that have been retrieved within a unit of work using the MQGET call, but that have yet to be committed.

The count also includes messages that have passed their expiry time but have not yet been discarded, although these messages are not eligible to be retrieved. See MQMD - Expiry field for more information.

Unit-of-work processing and the segmentation of messages can both cause *CurrentQDepth* to exceed *MaxQDepth*. However, this does not affect the retrievability of the messages; *all* messages on the queue can be retrieved using the MQGET call in the normal way.

The value of this attribute fluctuates as the queue manager operates.

To determine the value of this attribute, use the MQIA_CURRENT_Q_DEPTH selector with the MQINQ call.

### *DefaultPutResponse (MQLONG)*

Specifies the type of response to be used for put operations to the queue when an application specifies MQPMO_RESPONSE_AS_Q_DEF.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | X | X | X | |

It is one of the following values:

**MQPRT_SYNC_RESPONSE**
The put operation is issued synchronously, returning a response.

**MQPRT_ASYNC_RESPONSE**
The put operation is issued asynchronously, returning a subset of MQMD fields.

### *DefBind (MQLONG)*

This is the default binding that is used when MQOO_BIND_AS_Q_DEF is specified on the MQOPEN call and the queue is a cluster queue.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | | X | X | X |

The value is one of the following:

**MQBND_BIND_ON_OPEN**
Binding fixed by MQOPEN call.

**MQBND_BIND_NOT_FIXED**
Binding not fixed.

**MQBND_BIND_ON_GROUP**
Allows an application to request that a group of messages are all allocated to the same destination instance. Because this value is new in IBM WebSphere MQ 7.1, it must not be used if any of the applications opening this queue are connecting to IBM WebSphere MQ 7.0.1 or earlier queue managers.

To determine the value of this attribute, use the MQIA_DEF_BIND selector with the MQINQ call.

## *DefinitionType (MQLONG)*

This indicates how the queue was defined.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | X | | | |

The value is one of the following:

**MQQDT_PREDEFINED**
The queue is a permanent queue created by the system administrator; only the system administrator can delete it.

Predefined queues are created using the DEFINE MQSC command, and can be deleted only by using the DELETE MQSC command. Predefined queues cannot be created from model queues.

Commands can be issued either by an operator, or by an authorized user sending a command message to the command input queue (see CommandInputQName attribute for more information).

**MQQDT_PERMANENT_DYNAMIC**
The queue is a permanent queue that was created by an application issuing an MQOPEN call with the name of a model queue specified in the object descriptor MQOD. The model queue definition had the value MQQDT_PERMANENT_DYNAMIC for the *DefinitionType* attribute.

This type of queue can be deleted using the MQCLOSE call. See “MQCLOSE - Close object” on page 629 for more details.

The value of the *QSGDisp* attribute for a permanent dynamic queue is MQQSGD_Q_MGR.

**MQQDT_TEMPORARY_DYNAMIC**
The queue is a temporary queue that was created by an application issuing an MQOPEN call with the name of a model queue specified in the object descriptor MQOD. The model queue definition had the value MQQDT_TEMPORARY_DYNAMIC for the *DefinitionType* attribute.

This type of queue is deleted automatically by the MQCLOSE call when it is closed by the application that created it.

The value of the *QSGDisp* attribute for a temporary dynamic queue is MQQSGD_Q_MGR.

**MQQDT_SHARED_DYNAMIC**
The queue is a shared permanent queue that was created by an application issuing an MQOPEN call with the name of a model queue specified in the object descriptor MQOD. The model queue definition had the value MQQDT_SHARED_DYNAMIC for the *DefinitionType* attribute.

This type of queue can be deleted using the MQCLOSE call. See “MQCLOSE - Close object” on page 629 for more details.

The value of the *QSGDisp* attribute for a shared dynamic queue is MQQSGD_SHARED.

This attribute in a model queue definition does not indicate how the model queue was defined, because model queues are always predefined. Instead, the value of this attribute in the model queue is used to determine the *DefinitionType* of each of the dynamic queues created from the model queue definition using the MQOPEN call.

To determine the value of this attribute, use the MQIA_DEFINITION_TYPE selector with the MQINQ call.

### *DefInputOpenOption (MQLONG)*

This is the default way in which to open the queue for input.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | X | | | |

It applies if the MQOO_INPUT_AS_Q_DEF option is specified on the MQOPEN call when the queue is opened. The value is one of the following:

**MQOO_INPUT_EXCLUSIVE**
Open queue to get messages with exclusive access.

The queue is opened for use with subsequent MQGET calls. The call fails with reason code MQRC_OBJECT_IN_USE if the queue is currently open by this or another application for input of any type (MQOO_INPUT_SHARED or MQOO_INPUT_EXCLUSIVE).

**MQOO_INPUT_SHARED**
Open queue to get messages with shared access.

The queue is opened for use with subsequent MQGET calls. The call can succeed if the queue is currently open by this or another application with MQOO_INPUT_SHARED, but fails with reason code MQRC_OBJECT_IN_USE if the queue is currently open with MQOO_INPUT_EXCLUSIVE.

To determine the value of this attribute, use the MQIA_DEF_INPUT_OPEN_OPTION selector with the MQINQ call.

### *DefPersistence (MQLONG)*

This is the default persistence of messages on the queue. It applies if MQPER_PERSISTENCE_AS_Q_DEF is specified in the message descriptor when the message is put.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | X | X | X | X |

If there is more than one definition in the queue-name resolution path, the default persistence is taken from the value of this attribute in the *first* definition in the path at the time of the MQPUT or MQPUT1 call. This could be:

- An alias queue
- A local queue
- A local definition of a remote queue
- A queue-manager alias
- A transmission queue (for example, the *DefXmitQName* queue)

The value is one of the following:

**MQPER_PERSISTENT**
The message survives system failures and queue manager restarts. Persistent messages cannot be placed on:

- Temporary dynamic queues
- Shared queues that map to a CFSTRUCT object at CFLEVEL(2) or below, or where the CFSTRUCT object is defined as RECOVER(NO).

Persistent messages can be placed on permanent dynamic queues, and predefined queues.

**MQPER_NOT_PERSISTENT**
The message does not normally survive system failures or queue manager restarts. This applies even if an intact copy of the message is found on auxiliary storage during a queue manager restart.

In the case of shared queues, nonpersistent messages *do* survive restarts of queue managers in the queue-sharing group, but do not survive failures of the coupling facility used to store messages on the shared queues.

Both persistent and nonpersistent messages can exist on the same queue.

To determine the value of this attribute, use the MQIA_DEF_PERSISTENCE selector with the MQINQ call.

### *DefPriority (MQLONG)*

This is the default priority for messages on the queue. This applies if MQPRI_PRIORITY_AS_Q_DEF is specified in the message descriptor when the message is put on the queue.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | X | X | X | X |

If there is more than one definition in the queue-name resolution path, the default priority for the message is taken from the value of this attribute in the *first* definition in the path at the time of the put operation. This could be:

- An alias queue
- A local queue
- A local definition of a remote queue
- A queue-manager alias
- A transmission queue (for example, the *DefXmitQName* queue)

The way in which a message is placed on a queue depends on the value of the queue's *MsgDeliverySequence* attribute:

- If the *MsgDeliverySequence* attribute is MQMDS_PRIORITY, the logical position at which a message is placed on the queue depends on the value of the *Priority* field in the message descriptor.
- If the *MsgDeliverySequence* attribute is MQMDS_FIFO, messages are placed on the queue as though they had a priority equal to the *DefPriority* of the resolved queue, regardless of the value of the *Priority* field in the message descriptor. However, the *Priority* field retains the value specified by the application that put the message. See MsgDeliverySequence attribute for more information.

Priorities are in the range zero (lowest) through *MaxPriority* (highest); see MaxPriority attribute.

To determine the value of this attribute, use the MQIA_DEF_PRIORITY selector with the MQINQ call.

### *DefReadAhead (MQLONG)*

Specifies the default read ahead behavior for non-persistent messages delivered to the client.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | X | X | | |

DefReadAhead can be set to one of the following values::

**MQREADA_NO**
Non-persistent messages are not sent ahead to the client before an applications requests them. A maximum of one non-persistent message can be lost if the client ends abnormally.

**MQREADA_YES**
Non-persistent messages are sent ahead to the client before an application requests them. Non-persistent messages can be lost if the client ends abnormally or if the client does not consume all the messages it is sent.

**MQREADA_DISABLED**
Read ahead of non-persistent messages in not enabled for this queue. Messages are not sent ahead to the client regardless of whether read ahead is requested by the client application.

To determine the value of this attribute, use the MQIA_DEF_READ_AHEAD selector with the MQINQ call.

### *DefPResp (MQLONG)*

The default put response type (DEFPRESP) attribute defines the value used by applications when the PutResponseType within MQPMO has been set to MQPMO_RESPONSE_AS_Q_DEF. This attribute is valid for all queue types.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| Yes | Yes | Yes | Yes | Yes |

The value is one of the following:

**SYNC**
The put operation is issued synchronously returning a response.

**ASYNC**
The put operation is issued asynchronously, returning a subset of MQMD fields.

To determine the value of this attribute, use the MQIA_DEF_PUT_RESPONSE_TYPE selector with the MQINQ call.

### *DistLists (MQLONG)*

This indicates whether distribution-list messages can be placed on the queue.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | X | | | |

A message channel agent (MCA) sets the attribute to inform the local queue manager whether the queue manager at the other end of the channel supports distribution lists. This latter queue manager (called the *partnering* queue manager) is the one that next receives the message, after it has been removed from the local transmission queue by a sending MCA.

The sending MCA sets the attribute whenever it establishes a connection to the receiving MCA on the partnering queue manager. In this way, the sending MCA can cause the local queue manager to place on the transmission queue only messages that the partnering queue manager can process correctly.

This attribute is primarily for use with transmission queues, but the processing described is performed regardless of the usage defined for the queue (see Usage attribute ).

The value is one of the following:

**MQDL_SUPPORTED**
Distribution-list messages can be stored on the queue, and transmitted to the partnering queue manager in that form. This reduces the amount of processing required to send the message to multiple destinations.

**MQDL_NOT_SUPPORTED**
Distribution-list messages cannot be stored on the queue, because the partnering queue manager does not support distribution lists. If an application puts a distribution-list message, and that message is to be placed on this queue, the queue manager splits the distribution-list message and places the individual messages on the queue instead. This increases the amount of processing required to send the message to multiple destinations, but ensures that the messages are processed correctly by the partnering queue manager.

To determine the value of this attribute, use the MQIA_DIST_LISTS selector with the MQINQ call. To change the value of this attribute, use the MQSET call.

This attribute is not supported on z/OS.

### *HardenGetBackout (MQLONG)*

For each message, a count is kept of the number of times that the message is retrieved by an MQGET call within a unit of work, and that unit of work subsequently backed out.

| Local | Model | Alias | Remote | Cluster |
|---|---|---|---|---|
| X | X | | | |

This count is available in the *BackoutCount* field in the message descriptor after the MQGET call has completed.

The message backout count survives restarts of the queue manager. However, to ensure that the count is accurate, information has to be *hardened* (recorded on disk or other permanent storage device) each time that an MQGET call retrieves a message within a unit of work for this queue. If this is not done, the queue manager fails, and the MQGET call backs out, the count might or might not be incremented.

Hardening information for each MQGET call within a unit of work, however, imposes additional processing cost, so set the *HardenGetBackout* attribute to MQQA_BACKOUT_HARDENED only if it is essential that the count is accurate.
